# NUMERICAL RADIUS IN HILBERT $C^{*}$-MODULES 

ALI ZAMANI

#### Abstract

Utilizing the linking algebra of a Hilbert $C^{*}$-module $(\mathscr{V},\|\cdot\|)$, we introduce $\Omega(x)$ as a definition of numerical radius for an element $x \in \mathscr{V}$ and then show that $\Omega(\cdot)$ is a norm on $\mathscr{V}$ such that $\frac{1}{2}\|x\| \leq \Omega(x) \leq\|x\|$. In addition, we obtain an equivalent condition for $\Omega(x)=\frac{1}{2}\|x\|$. Moreover, we present a refinement of the triangle inequality for the norm $\Omega(\cdot)$. Some other related results are also discussed.

## 1. Introduction and preliminaries

The notion of Hilbert $C^{*}$-module is a natural generalization of that of Hilbert space arising under replacement of the field of scalars $\mathbb{C}$ by a $C^{*}$-algebra. This concept plays a significant role in the theory of operator algebras, quantum groups, noncommutative geometry and $K$-theory; see $[10,11]$.

Let us give that some necessary background and set up our notation. An element $a$ in a $C^{*}$-algebra $\mathscr{A}$ is called positive (we write $0 \leq a$ ) if $a=b^{*} b$ for some $b \in \mathscr{A}$. For an element $a$ of $\mathscr{A}$, we denote by

$$
\operatorname{Re} a=\frac{1}{2}\left(a+a^{*}\right), \quad \operatorname{Im} a=\frac{1}{2 i}\left(a-a^{*}\right)
$$

the real and the imaginary part of $a$. By $\mathscr{A}^{\prime}$ we denote the dual space of $\mathscr{A}$. A positive linear functional of $\mathscr{A}$ is a map $\varphi \in \mathscr{A}^{\prime}$ such that $0 \leq \varphi(a)$ whenever $0 \leq a$. The set of all states of $\mathscr{A}$, that is, the set of all positive linear functionals of $\mathscr{A}$ of norm 1 , is denoted by $\mathcal{S}(\mathscr{A})$. An inner product module over $\mathscr{A}$ is a (left) $\mathscr{A}$-module $\mathscr{V}$ equipped with an $\mathscr{A}$-valued inner product $\langle\cdot, \cdot\rangle$, which is $\mathbb{C}$-linear and $\mathscr{A}$-linear in the first variable and has the properties $\langle x, y\rangle^{*}=\langle y, x\rangle$ as well as $0 \leq\langle x, x\rangle$ with equality if and only if $x=0$. The $\mathscr{A}$-module $\mathscr{V}$ is called a Hilbert $\mathscr{A}$-module if it is complete with respect to the norm $\|x\|=\|\langle x, x\rangle\|^{\frac{1}{2}}$. In a Hilbert $\mathscr{A}$-module $\mathscr{V}$ we have the following version of the Cauchy-Schwarz inequality:

$$
\begin{equation*}
\langle y, x\rangle\langle x, y\rangle \leq\|x\|^{2}\langle y, y\rangle, \quad(x, y \in \mathscr{V}) . \tag{1.1}
\end{equation*}
$$

Every $C^{*}$-algebra $\mathscr{A}$ can be regarded as a Hilbert $C^{*}$-module over itself where the inner product is defined by $\langle a, b\rangle=a^{*} b$. Let $\mathscr{V}$ and $\mathscr{W}$ be two Hilbert $\mathscr{A}$ modules. A mapping $T: \mathscr{V} \longrightarrow \mathscr{W}$ is called adjointable if there exists a mapping $S: \mathscr{W} \longrightarrow \mathscr{V}$ such that $\langle T x, y\rangle=\langle x, S y\rangle$ for all $x \in \mathscr{V}, y \in \mathscr{W}$. The unique mapping $S$ is denoted by $T^{*}$ and is called the adjoint operator of $T$. The space

[^0]$\mathbb{B}(\mathscr{V}, \mathscr{W})$ of all adjointable maps between Hilbert $\mathscr{A}$-modules $\mathscr{V}$ and $\mathscr{W}$ is a Banach space, while $\mathbb{B}(\mathscr{V}):=\mathbb{B}(\mathscr{V}, \mathscr{V})$ is a $C^{*}$-algebra. By $\mathbb{K}(\mathscr{V}, \mathscr{W})$ we denote the closed linear subspace of $\mathbb{B}(\mathscr{V}, \mathscr{W})$ spanned by $\left\{\theta_{x, y}: x \in \mathscr{W}, y \in \mathscr{V}\right\}$, where $\theta_{x, y}$ is defined by $\theta_{x, y}(z)=x\langle y, z\rangle$. Elements of $\mathbb{K}(\mathscr{V}, \mathscr{W})$ are often referred to as "compact" operators. We write $\mathbb{K}(\mathscr{V})$ for $\mathbb{K}(\mathscr{V}, \mathscr{V})$. Given a Hilbert $\mathscr{A}$-module $\mathscr{V}$, the linking algebra $\mathbb{L}(\mathscr{V})$ is defined as the matrix algebra of the form
\[

\mathbb{L}(\mathscr{V})=\left[$$
\begin{array}{cc}
\mathbb{K}(\mathscr{A}) & \mathbb{K}(\mathscr{V}, \mathscr{A}) \\
\mathbb{K}(\mathscr{A}, \mathscr{V}) & \mathbb{K}(\mathscr{V})
\end{array}
$$\right]
\]

Then $\mathbb{L}(\mathscr{V})$ has a canonical embedding as a closed subalgebra of the adjointable operators on the Hilbert $\mathscr{A}$-module $\mathscr{A} \oplus \mathscr{V}$ via

$$
\left[\begin{array}{cc}
X & Y \\
Z & W
\end{array}\right]\left[\begin{array}{l}
a \\
x
\end{array}\right]=\left[\begin{array}{l}
X a+Y x \\
Z a+W x
\end{array}\right]
$$

which makes $\mathbb{L}(\mathscr{V})$ a $C^{*}$-algebra (cf. [15], Lemma 2.32 and Corollary 3.21). Each $x \in \mathscr{V}$ induces the maps $r_{x} \in \mathbb{B}(\mathscr{A}, \mathscr{V})$ and $l_{x} \in \mathbb{B}(\mathscr{V}, \mathscr{A})$ given by $r_{x}(a)=x a$ and $l_{x}(y)=\langle x, y\rangle$, respectively, such that $r_{x}^{*}=l_{x}$. The map $x \mapsto r_{x}$ is an isometric linear isomorphism of $\mathscr{V}$ to $\mathbb{K}(\mathscr{A}, \mathscr{V})$ and $x \mapsto l_{x}$ is an isometric conjugate linear isomorphism of $\mathscr{V}$ to $\mathbb{K}(\mathscr{V}, \mathscr{A})$. Further, every $a \in \mathscr{A}$ induces the map $T_{a} \in$ $\mathbb{K}(\mathscr{A})$ given by $T_{a}(b)=a b$. The map $a \mapsto T_{a}$ defines an isomorphism between $C^{*}$-algebras $\mathscr{A}$ and $\mathbb{K}(\mathscr{A})$. Therefore, we may write

$$
\mathbb{L}(\mathscr{V})=\left\{\left[\begin{array}{ll}
T_{a} & l_{y} \\
r_{x} & T
\end{array}\right]: a \in \mathscr{A}, x, y \in \mathscr{V}, T \in \mathbb{K}(\mathscr{V})\right\}
$$

and identify the $C^{*}$-subalgebras of compact operators with the corresponding corners in the linking algebra: $\mathbb{K}(\mathscr{A})=\mathbb{K}(\mathscr{A} \oplus 0) \subseteq \mathbb{K}(\mathscr{A} \oplus \mathscr{V})=\mathbb{L}(\mathscr{V})$ and $\mathbb{K}(\mathscr{V})=\mathbb{K}(0 \oplus \mathscr{V}) \subseteq \mathbb{K}(\mathscr{A} \oplus \mathscr{V})=\mathbb{L}(\mathscr{V})$. We refer the reader to [10, 11] for more information on Hilbert $C^{*}$-modules and linking algebras.

Now, let $\mathbb{B}(\mathscr{H})$ denote the $C^{*}$-algebra of all bounded linear operators on a complex Hilbert space $\mathscr{H}$ with inner product $[\cdot, \cdot]$. The numerical range of an element $A \in \mathbb{B}(\mathscr{H})$ is defined

$$
W(A):=\{[A \xi, \xi]: \xi \in \mathscr{H},\|\xi\|=1\} .
$$

It is known that $W(A)$ is a nonempty bounded convex subset of $\mathbb{C}$ (not necessarily closed). This concept is useful in studying linear operators and have attracted the attention of many authors in the last few decades (e.g., see [8], and references therein). The numerical radius of $A$ is given by

$$
w(A)=\sup \{|[A \xi, \xi]|: \xi \in \mathscr{H},\|\xi\|=1\} .
$$

It is known that $w(\cdot)$ is a norm on $\mathbb{B}(\mathscr{H})$ and satisfies

$$
\frac{1}{2}\|A\| \leq w(A) \leq\|A\|
$$

for each $A \in \mathbb{B}(\mathscr{H})$. Some generalizations of the numerical radius $A \in \mathbb{B}(\mathscr{H})$ can be found in [2, 22].

In the next section, we first utilize the linking algebra $\mathbb{L}(\mathscr{V})$ of a Hilbert $\mathscr{A}$ module $\mathscr{V}$ to introduce $\Phi(x)$ as a definition of numerical range for an arbitrary
element $x \in \mathscr{V}$. We then use this set to define numerical radius of $x$ and denote it by $\Omega(x)$. In particular, we show that $\Omega(\cdot)$ is a norm on $\mathscr{V}$, which is equivalent to the norm $\|\cdot\|$ and the following inequalities hold for every $x \in \mathscr{V}$ :

$$
\begin{equation*}
\frac{1}{2}\|x\| \leq \Omega(x) \leq\|x\| . \tag{1.2}
\end{equation*}
$$

We also establish an inequality that refines the first inequality in (1.2). In addition, we prove that $\Omega(x)=\frac{1}{2}\|x\|$ if and only if $\|x\|=\left\|\left[\begin{array}{cc}0 & \bar{\lambda} l_{x} \\ \lambda r_{x} & 0\end{array}\right]\right\|$ for all complex unit $\lambda$. Furthermore, for $x \in \mathscr{V}$ and $a \in \mathscr{A}$ we prove that

$$
\Omega\left(x a \pm x a^{*}\right) \leq 2\left\|a \pm a^{*}\right\| \Omega(x) .
$$

We finally present a refinement of the triangle inequality for the norm $\Omega(\cdot)$.

## 2. Main Results

We start our work with the following definition.
Definition 2.1. Let $\mathscr{V}$ be a Hilbert $\mathscr{A}$-module and let $\mathbb{L}(\mathscr{V})$ be the linking algebra of $\mathscr{V}$. The numerical range of $x \in \mathscr{V}$ is defined as the set

$$
\Phi(x):=\left\{\varphi\left(\left[\begin{array}{cc}
0 & 0 \\
r_{x} & 0
\end{array}\right]\right): \varphi \in \mathcal{S}(\mathbb{L}(\mathscr{V}))\right\} .
$$

Next, we present some properties of the numerical range in Hilbert $C^{*}$-modules.
Theorem 2.2. Let $x$ and $y$ be elements of a Hilbert $\mathscr{A}$-module $\mathscr{V}$ and let $\alpha \in \mathbb{C}$. Then
(i) $\Phi(\alpha x)=\alpha \Phi(x)$ (homogeneous).
(ii) $\Phi(x+y) \subseteq \Phi(x)+\Phi(y)$ (subadditive).
(iii) $\Phi(x)$ is a nonempty compact convex subset of $\mathbb{C}$.

Proof. Let $\mathbb{L}(\mathscr{V})$ be the linking algebra of $\mathscr{V}$. For every $a \in \mathscr{A}$, we have

$$
r_{\alpha x}(a)=(\alpha x) a=\alpha(x a)=\left(\alpha r_{x}\right)(a)
$$

and

$$
r_{x+y}(a)=(x+y) a=x a+y a=\left(r_{x}+r_{y}\right)(a) .
$$

Hence $r_{\alpha x}=\alpha r_{x}$ and $r_{x+y}=r_{x}+r_{y}$. Thus (i) and (ii) follow easily from the definition.

We now prove (iii). Since the existence of states on $\mathbb{L}(\mathscr{V})$ is guaranteed by the Hahn-Banach theorem, we have $\Phi(x) \neq \emptyset$. The convexity of $\Phi(x)$ is an easy consequence of the fact that a convex combination of two states is also a state. As for the compactness, note that the set $\mathcal{S}(\mathbb{L}(\mathscr{V}))$ is a weak*-closed subset of the unit ball $\left\{\varphi \in \mathbb{L}^{\prime}(\mathscr{V}):\|\varphi\| \leq 1\right\}$ of $\mathbb{L}^{\prime}(\mathscr{V})$. Since, by the Banach-Alaoglu theorem, the latter is weak*-compact, the same is true for $\mathcal{S}(\mathbb{L}(\mathscr{V}))$. Hence $\Phi(x)$, the image of the weak*-continuous mapping $\varphi \mapsto \varphi\left(\left[\begin{array}{cc}0 & 0 \\ r_{x} & 0\end{array}\right]\right)$ for $\varphi \in \mathcal{S}(\mathbb{L}(\mathscr{V}))$, is compact in $\mathbb{C}$.

Remark 2.3. It is known that the set of all states of a unital $C^{*}$-algebra $\mathscr{A} \subseteq$ $\mathbb{B}(\mathscr{H})$ is a weak*-closed convex hull of the set of all vector states of $\mathscr{A}$, i.e., the states of $\mathscr{A}$ of the form $A \rightarrow[A \xi, \xi]$ for some unit vector $\xi$ in $\mathscr{H}$. Also, for the Hilbert module $\mathscr{V}=\mathbb{B}(\mathscr{H})$ over the $C^{*}$-algebra $\mathbb{B}(\mathscr{H})$ is well known to be valid $\mathbb{K}(\mathbb{B}(\mathscr{H}))=\mathbb{K}(\mathscr{V}, \mathbb{B}(\mathscr{H}))=\mathbb{K}(\mathbb{B}(\mathscr{H}), \mathscr{V})=\mathbb{K}(\mathscr{V})=\mathbb{B}(\mathscr{H})$ (see $[5$, Remark 1.13]), so all corners in the linking algebra $\mathbb{L}(\mathscr{V})$ are equal to $\mathbb{B}(\mathscr{H})$. Hence, for $A \in \mathbb{B}(\mathscr{H})$, we have $\Phi(A)=\overline{W(A)}$.

Now, we are in a position to introduce numerical radius for elements of a Hilbert $C^{*}$-module. Some other related topics can be found in $[3,6,12,16,17,19]$.
Definition 2.4. Let $\mathscr{V}$ be a Hilbert $\mathscr{A}$-module and let $\mathbb{L}(\mathscr{V})$ be the linking algebra of $\mathscr{V}$. The numerical radius of an element $x \in \mathscr{V}$ is defined as

$$
\Omega(x):=\sup \left\{\left|\varphi\left(\left[\begin{array}{ll}
0 & 0 \\
r_{x} & 0
\end{array}\right]\right)\right|: \varphi \in \mathcal{S}(\mathbb{L}(\mathscr{V}))\right\} .
$$

In the following theorem, we prove that $\Omega(\cdot)$ is a norm on Hilbert $C^{*}$-module $\mathscr{V}$, which is equivalent to the norm $\|\cdot\|$.

Theorem 2.5. Let $\mathscr{V}$ be a Hilbert $\mathscr{A}$-module. Then $\Omega(\cdot)$ is a norm on $\mathscr{V}$ and the following inequalities hold for every $x \in \mathscr{V}$ :

$$
\frac{1}{2}\|x\| \leq \Omega(x) \leq\|x\|
$$

Proof. Let $\mathbb{L}(\mathscr{V})$ be the linking algebra of $\mathscr{V}$. Let $x \in \mathscr{V}$. Clearly, $\Omega(x) \geq 0$. Let us now suppose $\Omega(x)=0$. Then, by Definition 2.4, $\left[\begin{array}{cc}0 & 0 \\ r_{x} & 0\end{array}\right]=0$. Since $\left\|\left[\begin{array}{cc}0 & 0 \\ r_{x} & 0\end{array}\right]\right\|=\|x\|$, we get $\|x\|=0$ and therefore, $x=0$. Further, by Theorem 2.2 (i)-(ii), for $y, z \in \mathscr{V}$ and $\alpha \in \mathbb{C}$ we have $\Omega(\alpha y)=|\alpha| \Omega(y)$ and $\Omega(y+z) \leq$ $\Omega(y)+\Omega(z)$. Thus $\Omega(\cdot)$ is a norm on $\mathscr{V}$.

On the other hands, for every $\varphi \in \mathcal{S}(\mathbb{L}(\mathscr{V}))$, we have

$$
\left|\varphi\left(\left[\begin{array}{cc}
0 & 0 \\
r_{x} & 0
\end{array}\right]\right)\right| \leq\left\|\left[\begin{array}{cc}
0 & 0 \\
r_{x} & 0
\end{array}\right]\right\|=\|x\| .
$$

So, by taking the supremum over $\varphi \in \mathcal{S}(\mathbb{L}(\mathscr{V}))$ in the above inequality, we deduce that

$$
\begin{equation*}
\Omega(x) \leq\|x\| . \tag{2.1}
\end{equation*}
$$

Now let $\left[\begin{array}{cc}0 & 0 \\ r_{x} & 0\end{array}\right]=\operatorname{Re}\left(\left[\begin{array}{cc}0 & 0 \\ r_{x} & 0\end{array}\right]\right)+i \operatorname{Im}\left(\left[\begin{array}{cc}0 & 0 \\ r_{x} & 0\end{array}\right]\right)$ be the Cartesian decomposition of $\left[\begin{array}{cc}0 & 0 \\ r_{x} & 0\end{array}\right]$. By [13, Theorem 3.3.6], there exist $\varphi_{1}, \varphi_{2} \in \mathcal{S}(\mathbb{L}(\mathscr{V}))$ such that

$$
\left|\varphi_{1}\left(\operatorname{Re}\left(\left[\begin{array}{cc}
0 & 0  \tag{2.2}\\
r_{x} & 0
\end{array}\right]\right)\right)\right|=\left\|\operatorname{Re}\left(\left[\begin{array}{cc}
0 & 0 \\
r_{x} & 0
\end{array}\right]\right)\right\|
$$

and

$$
\left|\varphi_{2}\left(\operatorname{Im}\left(\left[\begin{array}{cc}
0 & 0  \tag{2.3}\\
r_{x} & 0
\end{array}\right]\right)\right)\right|=\left\|\operatorname{Im}\left(\left[\begin{array}{cc}
0 & 0 \\
r_{x} & 0
\end{array}\right]\right)\right\| .
$$

Therefore, by (2.2) and (2.3), we have

$$
\begin{aligned}
\frac{1}{2}\|x\| & =\frac{1}{2}\left\|\left[\begin{array}{cc}
0 & 0 \\
r_{x} & 0
\end{array}\right]\right\| \\
& \leq \frac{1}{2}\left\|\operatorname{Re}\left(\left[\begin{array}{ll}
0 & 0 \\
r_{x} & 0
\end{array}\right]\right)\right\|+\frac{1}{2}\left\|\operatorname{Im}\left(\left[\begin{array}{ll}
0 & 0 \\
r_{x} & 0
\end{array}\right]\right)\right\| \\
& =\frac{1}{2}\left|\varphi_{1}\left(\operatorname{Re}\left(\left[\begin{array}{ll}
0 & 0 \\
r_{x} & 0
\end{array}\right]\right)\right)\right|+\frac{1}{2}\left|\varphi_{2}\left(\operatorname{Im}\left(\left[\begin{array}{ll}
0 & 0 \\
r_{x} & 0
\end{array}\right]\right)\right)\right| \\
& =\frac{1}{4}\left|\varphi_{1}\left(\left[\begin{array}{cc}
0 & 0 \\
r_{x} & 0
\end{array}\right]\right)+\overline{\varphi_{1}}\left(\left[\begin{array}{cc}
0 & 0 \\
r_{x} & 0
\end{array}\right]\right)\right|+\frac{1}{4}\left|\varphi_{2}\left(\left[\begin{array}{cc}
0 & 0 \\
r_{x} & 0
\end{array}\right]\right)-\overline{\varphi_{2}}\left(\left[\begin{array}{cc}
0 & 0 \\
r_{x} & 0
\end{array}\right]\right)\right| \\
& \leq \frac{1}{2}\left|\varphi_{1}\left(\left[\begin{array}{cc}
0 & 0 \\
r_{x} & 0
\end{array}\right]\right)\right|+\frac{1}{2}\left|\varphi_{2}\left(\left[\begin{array}{cc}
0 & 0 \\
r_{x} & 0
\end{array}\right]\right)\right| \leq \frac{1}{2} \Omega(x)+\frac{1}{2} \Omega(x)=\Omega(x),
\end{aligned}
$$

whence

$$
\begin{equation*}
\frac{1}{2}\|x\| \leq \Omega(x) \tag{2.4}
\end{equation*}
$$

From (2.1) and (2.4), we deduce the desired result.
For $A \in \mathbb{B}(\mathscr{H})$, we note that (see [20]) $w(A)=\sup _{\lambda \in \mathbb{T}}\|\operatorname{Re}(\lambda A)\|$. Here, as usual, $\mathbb{T}$ is the unit circle of the complex plane $\mathbb{C}$. This motivates the following result.

Theorem 2.6. Let $\mathscr{V}$ be a Hilbert $\mathscr{A}$-module and let $\mathbb{L}(\mathscr{V})$ be the linking algebra of $\mathscr{V}$. Then

$$
\Omega(x)=\frac{1}{2} \sup _{\lambda \in \mathbb{T}}\left\|\left[\begin{array}{cc}
0 & \bar{\lambda} l_{x} \\
\lambda r_{x} & 0
\end{array}\right]\right\|,
$$

for every $x \in \mathscr{V}$.
Proof. Let $x \in \mathscr{V}$. First, we show that

$$
\sup _{\lambda \in \mathbb{T}}\left|\operatorname{Re}\left(\lambda \varphi\left(\left[\begin{array}{cc}
0 & 0  \tag{2.5}\\
r_{x} & 0
\end{array}\right]\right)\right)\right|=\left|\varphi\left(\left[\begin{array}{cc}
0 & 0 \\
r_{x} & 0
\end{array}\right]\right)\right|
$$

for every $\varphi \in \mathcal{S}(\mathbb{L}(\mathscr{V}))$.
Let $\varphi \in \mathcal{S}(\mathbb{L}(\mathscr{V}))$. We may assume that $\varphi\left(\left[\begin{array}{cc}0 & 0 \\ r_{x} & 0\end{array}\right]\right) \neq 0$, otherwise (2.5) trivially holds. Put

$$
\lambda_{0}=\frac{\bar{\varphi}\left(\left[\begin{array}{cc}
0 & 0 \\
r_{x} & 0
\end{array}\right]\right)}{\left|\varphi\left(\left[\begin{array}{cc}
0 & 0 \\
r_{x} & 0
\end{array}\right]\right)\right|}
$$

Then we have

$$
\begin{aligned}
\left|\varphi\left(\left[\begin{array}{ll}
0 & 0 \\
r_{x} & 0
\end{array}\right]\right)\right| & =\left|\operatorname{Re}\left(\lambda_{0} \varphi\left(\left[\begin{array}{cc}
0 & 0 \\
r_{x} & 0
\end{array}\right]\right)\right)\right| \\
& \leq \sup _{\lambda \in \mathbb{T}}\left|\operatorname{Re}\left(\lambda \varphi\left(\left[\begin{array}{ll}
0 & 0 \\
r_{x} & 0
\end{array}\right]\right)\right)\right| \\
& \leq \sup _{\lambda \in \mathbb{T}}\left|\lambda \varphi\left(\left[\begin{array}{cc}
0 & 0 \\
r_{x} & 0
\end{array}\right]\right)\right|=\left|\varphi\left(\left[\begin{array}{cc}
0 & 0 \\
r_{x} & 0
\end{array}\right]\right)\right|
\end{aligned}
$$

and hence (2.5) holds.
Now, since $\left[\begin{array}{cc}0 & \bar{\lambda} l_{x} \\ \lambda r_{x} & 0\end{array}\right]$ is self adjoint for any $\lambda \in \mathbb{T}$, by [13, Theorem 3.3.6], we obtain

$$
\left\|\left[\begin{array}{cc}
0 & \bar{\lambda} l_{x}  \tag{2.6}\\
\lambda r_{x} & 0
\end{array}\right]\right\|=\sup _{\varphi \in \mathcal{S}(\mathbb{L}(\mathscr{Y}))}\left|\varphi\left(\left[\begin{array}{cc}
0 & \bar{\lambda} l_{x} \\
\lambda r_{x} & 0
\end{array}\right]\right)\right| .
$$

Therefore,

$$
\begin{aligned}
\sup _{\lambda \in \mathbb{T}}\left\|\left[\begin{array}{cc}
0 & \bar{\lambda} l_{x} \\
\lambda r_{x} & 0
\end{array}\right]\right\| & \stackrel{(2.6)}{=} \sup _{\lambda \in \mathbb{T}} \sup _{\varphi \in \mathcal{S}(\mathbb{L}(\mathscr{V}))}\left|\varphi\left(\left[\begin{array}{cc}
0 & \bar{\lambda} l_{x} \\
\lambda r_{x} & 0
\end{array}\right]\right)\right| \\
& =2 \sup _{\lambda \in \mathbb{T}} \sup _{\varphi \in \mathcal{S}(\mathbb{L}(\mathscr{V}))}\left|\varphi\left(\operatorname{Re}\left(\lambda\left[\begin{array}{cc}
0 & 0 \\
r_{x} & 0
\end{array}\right]\right)\right)\right| \\
& =2 \sup _{\lambda \in \mathbb{T}} \sup _{\varphi \in \mathcal{S}(\mathbb{L}(\mathscr{V}))}\left|\operatorname{Re}\left(\lambda \varphi\left(\left[\begin{array}{cc}
0 & 0 \\
r_{x} & 0
\end{array}\right]\right)\right)\right| \\
& =2 \sup _{\varphi \in \mathcal{S}(\mathbb{L}(\mathscr{V}))} \sup _{\lambda \in \mathbb{T}}\left|\operatorname{Re}\left(\lambda \varphi\left(\left[\begin{array}{cc}
0 & 0 \\
r_{x} & 0
\end{array}\right]\right)\right)\right| \\
& \stackrel{(2.5)}{=} 2 \sup _{\varphi \in \mathcal{S}(\mathbb{L}(\mathscr{V}))}\left|\varphi\left(\left[\begin{array}{cc}
0 & 0 \\
r_{x} & 0
\end{array}\right]\right)\right|=2 \Omega(x) .
\end{aligned}
$$

Thus

$$
\frac{1}{2} \sup _{\lambda \in \mathbb{T}}\left\|\left[\begin{array}{cc}
0 & \bar{\lambda} l_{x} \\
\lambda r_{x} & 0
\end{array}\right]\right\|=\Omega(x)
$$

We can obtain a refinement of inequality (2.4) as follows.
Theorem 2.7. Let $\mathscr{V}$ be a Hilbert $\mathscr{A}$-module and let $\mathbb{L}(\mathscr{V})$ be the linking algebra of $\mathscr{V}$. For $x \in \mathscr{V}$ the following inequality holds:

$$
\frac{1}{8}\left(4\|x\|+2\left|\Gamma-\Gamma^{\prime}\right|+\Delta+\Delta^{\prime}\right) \leq \Omega(x)
$$

where $\Gamma=\max \left\{\|x\|,\left\|\left[\begin{array}{cc}0 & l_{x} \\ r_{x} & 0\end{array}\right]\right\|\right\}, \Gamma^{\prime}=\max \left\{\|x\|,\left\|\left[\begin{array}{cc}0 & -l_{x} \\ r_{x} & 0\end{array}\right]\right\|\right\}, \Delta=\left\lvert\,\|x\|-\left\|\left[\begin{array}{cc}0 & l_{x} \\ r_{x} & 0\end{array}\right]\right\|\right. \|$ and $\Delta^{\prime}=\left\lvert\,\|x\|-\left\|\left[\begin{array}{cc}0 & -l_{x} \\ r_{x} & 0\end{array}\right]\right\|\right. \|$.

Proof. Since $\Omega(x)=\frac{1}{2} \sup _{\lambda \in \mathbb{T}}\left\|\left[\begin{array}{cc}0 & \bar{\lambda} l_{x} \\ \lambda r_{x} & 0\end{array}\right]\right\|$, by taking $\lambda=1$ and $\lambda=i$, we have

$$
\Omega(x) \geq \frac{1}{2}\left\|\left[\begin{array}{cc}
0 & l_{x}  \tag{2.7}\\
r_{x} & 0
\end{array}\right]\right\| \quad \text { and } \quad \Omega(x) \geq \frac{1}{2}\left\|\left[\begin{array}{cc}
0 & -l_{x} \\
r_{x} & 0
\end{array}\right]\right\| .
$$

So, by (2.4) and (2.7) we have $\Omega(x) \geq \frac{1}{2} \max \left\{\Gamma, \Gamma^{\prime}\right\}$. Therefore,

$$
\begin{aligned}
\Omega(x) & \geq \\
& \frac{\Gamma+\Gamma^{\prime}}{4}+\frac{\left|\Gamma-\Gamma^{\prime}\right|}{4} \\
= & \frac{1}{4}\left(\frac{1}{2}\left(\|x\|+\left\|\left[\begin{array}{cc}
0 & l_{x} \\
r_{x} & 0
\end{array}\right]\right\|\right)+\frac{1}{2} \Delta\right) \\
& +\frac{1}{4}\left(\frac{1}{2}\left(\|x\|+\left\|\left[\begin{array}{cc}
0 & -l_{x} \\
r_{x} & 0
\end{array}\right]\right\|\right)+\frac{1}{2} \Delta^{\prime}\right)+\frac{\left|\Gamma-\Gamma^{\prime}\right|}{4} \\
= & \frac{1}{8}\left(\left\|\left[\begin{array}{cc}
0 & l_{x} \\
r_{x} & 0
\end{array}\right]\right\|+\left\|\left[\begin{array}{cc}
0 & -l_{x} \\
r_{x} & 0
\end{array}\right]\right\|\right)+\frac{1}{4}\|x\|+\frac{\Delta+\Delta^{\prime}}{8}+\frac{\left|\Gamma-\Gamma^{\prime}\right|}{4} \\
\geq & \frac{1}{8}\left\|\left[\begin{array}{cc}
0 & l_{x} \\
r_{x} & 0
\end{array}\right]+\left[\begin{array}{cc}
0 & -l_{x} \\
r_{x} & 0
\end{array}\right]\right\|+\frac{1}{4}\|x\|+\frac{\Delta+\Delta^{\prime}}{8}+\frac{\left|\Gamma-\Gamma^{\prime}\right|}{4} \\
= & \frac{1}{4}\left\|\left[\begin{array}{cc}
0 & 0 \\
r_{x} & 0
\end{array}\right]\right\|+\frac{1}{4}\|x\|+\frac{\Delta+\Delta^{\prime}}{8}+\frac{\left|\Gamma-\Gamma^{\prime}\right|}{4} \\
& =\frac{1}{4}\|x\|+\frac{1}{4}\|x\|+\frac{\Delta+\Delta^{\prime}}{8}+\frac{\left|\Gamma-\Gamma^{\prime}\right|}{4} \\
& =\frac{1}{2}\|x\|+\frac{\Delta+\Delta^{\prime}}{8}+\frac{\left|\Gamma-\Gamma^{\prime}\right|}{4} .
\end{aligned}
$$

Thus

$$
\frac{1}{2}\|x\|+\frac{\Delta+\Delta^{\prime}}{8}+\frac{\left|\Gamma-\Gamma^{\prime}\right|}{4} \leq \Omega(x)
$$

In the following result, we state a necessary and sufficient condition for the equality case in the inequality (2.4).

Corollary 2.8. Let $\mathscr{V}$ be a Hilbert $\mathscr{A}$-module and let $\mathbb{L}(\mathscr{V})$ be the linking algebra of $\mathscr{V}$. Let $x \in \mathscr{V}$. Then $\Omega(x)=\frac{1}{2}\|x\|$ if and only if $\|x\|=\left\|\left[\begin{array}{cc}0 & \bar{\lambda} l_{x} \\ \lambda r_{x} & 0\end{array}\right]\right\|$ for all $\lambda \in \mathbb{T}$.

Proof. Let us first suppose that $\Omega(x)=\frac{1}{2}\|x\|$. For every $\lambda \in \mathbb{T}$ then we have $\Omega(\lambda x)=\frac{1}{2}\|\lambda x\|$. Therefore, by Theorem 2.7, we obtain

$$
\Delta=\left\lvert\,\|\lambda x\|-\left\|\left[\begin{array}{cc}
0 & l_{\lambda x} \\
r_{\lambda x} & 0
\end{array}\right]\right\|\right. \|=0
$$

From this it follows that $\|x\|=\left\|\left[\begin{array}{cc}0 & \bar{\lambda} l_{x} \\ \lambda r_{x} & 0\end{array}\right]\right\|$.

Conversely, if $\|x\|=\left\|\left[\begin{array}{cc}0 & \bar{\lambda} l_{x} \\ \lambda r_{x} & 0\end{array}\right]\right\|$ for all $\lambda \in \mathbb{T}$, then

$$
\frac{1}{2} \sup _{\lambda \in \mathbb{T}}\left\|\left[\begin{array}{cc}
0 & \bar{\lambda} l_{x} \\
\lambda r_{x} & 0
\end{array}\right]\right\|=\frac{1}{2}\|x\|,
$$

and so, by Theorem 2.6, $\Omega(x)=\frac{1}{2}\|x\|$.
For every $a \in \mathscr{A}$ and $x \in \mathscr{V}$, by the inequalities (2.1) and (2.4), we have

$$
\Omega\left(x a+x a^{*}\right) \leq\left\|x a+x a^{*}\right\| \leq 2\|a\|\|x\| \leq 4\|a\| \Omega(x),
$$

and hence

$$
\begin{equation*}
\Omega\left(x a+x a^{*}\right) \leq 4\|a\| \Omega(x) . \tag{2.8}
\end{equation*}
$$

In the following theorem, we improve the inequality (2.8).
Theorem 2.9. Let $\mathscr{V}$ be a Hilbert $\mathscr{A}$-module. Let $a \in \mathscr{A}$ and $x \in \mathscr{V}$. Then

$$
\Omega\left(x a+x a^{*}\right) \leq 2\left\|a+a^{*}\right\| \Omega(x) .
$$

Proof. Let $\mathbb{L}(\mathscr{V})$ be the linking algebra of $\mathscr{V}$. For every $b \in \mathscr{A}$ and $y \in \mathscr{V}$, we have

$$
r_{x a}(b)=(x a) b=x(a b)=x\left(T_{a}(b)\right)=r_{x} T_{a}(b)
$$

and

$$
l_{x a}(y)=\langle x a, y\rangle=a^{*}\langle x, y\rangle=a^{*}\left(l_{x}(y)\right)=T_{a^{*}} l_{x}(y) .
$$

Hence $r_{x a}=r_{x} T_{a}$ and $l_{x a}=T_{a^{*}} l_{x}$. Now, let $\lambda \in \mathbb{T}$. Therefore,

$$
\begin{aligned}
\left\|\left[\begin{array}{cc}
0 & \bar{\lambda} l_{\left(x a+x a^{*}\right)} \\
\lambda r_{\left(x a+x a^{*}\right)} & 0
\end{array}\right]\right\| & =\left\|\left[\begin{array}{cc}
0 & \bar{\lambda}\left(T_{a^{*}} l_{x}+T_{a} l_{x}\right) \\
\lambda\left(r_{x} T_{a}+r_{x} T_{a^{*}}\right) & 0
\end{array}\right]\right\| \\
& =\left\|\left[\begin{array}{cc}
0 & \bar{\lambda} T_{a+a^{*}} l_{x} \\
\lambda r_{x} T_{a+a^{*}} & 0
\end{array}\right]\right\| \\
& =\left\|\left[\begin{array}{cc}
0 & \bar{\lambda} l_{x} \\
r_{x} & 0
\end{array}\right]\left[\begin{array}{cc}
T_{a+a^{*}} & 0 \\
0 & 0
\end{array}\right]+\left[\begin{array}{cc}
T_{a+a^{*}} & 0 \\
0 & 0
\end{array}\right]\left[\begin{array}{cc}
0 & \bar{\lambda} l_{x} \\
\lambda r_{x} & 0
\end{array}\right]\right\| \\
& \leq 2\left\|\left[\begin{array}{cc}
T_{a+a^{*}} & 0 \\
0 & 0
\end{array}\right]\right\|\left\|\left[\begin{array}{cc}
0 & \bar{\lambda} l_{x} \\
\lambda r_{x} & 0
\end{array}\right]\right\| \\
& \leq 4\left\|a+a^{*}\right\| \Omega(x),
\end{aligned}
$$

and so

$$
\frac{1}{2}\left\|\left[\begin{array}{cc}
0 & \bar{\lambda} l_{\left(x a+x a^{*}\right)} \\
\lambda r_{\left(x a+x a^{*}\right)} & 0
\end{array}\right]\right\| \leq 2\left\|a+a^{*}\right\| \Omega(x)
$$

Taking the supremum over $\lambda \in \mathbb{T}$ in the above inequality, we deduce that

$$
\Omega\left(x a+x a^{*}\right) \leq 2\left\|a+a^{*}\right\| \Omega(x) .
$$

As an immediate consequence of Theorem 2.9, we have the following result.

Corollary 2.10. Let $\mathscr{V}$ be a Hilbert $\mathscr{A}$-module and let $a \in \mathscr{A}$ and $x \in \mathscr{V}$. If $x a=x a^{*}$, then

$$
\Omega(x a) \leq\left\|a+a^{*}\right\| \Omega(x) .
$$

Remark 2.11. Let $\mathscr{V}$ be a Hilbert $\mathscr{A}$-module and let $a \in \mathscr{A}$ and $x \in \mathscr{V}$. Replace $a$ by $i a$ in Theorem 2.9, to obtain $\Omega\left(x a-x a^{*}\right) \leq 2\left\|a-a^{*}\right\| \Omega(x)$. Thus

$$
\Omega\left(x a \pm x a^{*}\right) \leq 2\left\|a \pm a^{*}\right\| \Omega(x)
$$

In what follows, $r(a)$ stands for the spectral radius of an arbitrary element $a$ in a $C^{*}$-algebra $\mathscr{A}$. It is well known that for every $a \in \mathscr{A}$, we have $r(a) \leq\|a\|$ and that equality holds in this inequality if $a$ is normal. The following lemma gives us a spectral radius inequality for sums of elements in $C^{*}$-algebras.
Lemma 2.12. [21, Lemma 3.5] Let $\mathscr{A}$ be a $C^{*}$-algebra and let $a, b \in \mathscr{A}$. Then

$$
r(a+b) \leq\left\|\left[\begin{array}{cc}
\|a\| & \|a b\|^{1 / 2} \\
\|a b\|^{1 / 2} & \|b\|
\end{array}\right]\right\|
$$

Now, we present a refinement of the triangle inequality for the numerical radius in Hilbert $C^{*}$-modules. We use some ideas of [1, Theorem 3.4]. We refer the reader to $[4,7,14,18]$ for more information on the triangle inequality.
Theorem 2.13. Let $\mathscr{V}$ be a Hilbert $\mathscr{A}$-module and let $\mathbb{L}(\mathscr{V})$ be the linking algebra of $\mathscr{V}$. Let $x, y \in \mathscr{V}$. Then

$$
\Omega(x+y) \leq\left\|\left[\begin{array}{cc}
\Omega(x) & \frac{1}{2}\left\|\left[\begin{array}{cc}
T_{\langle x, y\rangle} & 0 \\
0 & \theta_{x, y}
\end{array}\right]\right\|^{1 / 2} \\
\frac{1}{2}\left\|\left[\begin{array}{cc}
T_{\langle x, y\rangle} & 0 \\
0 & \theta_{x, y}
\end{array}\right]\right\|^{1 / 2} & \Omega(y)
\end{array}\right]\right\| \leq \Omega(x)+\Omega(y)
$$

Proof. Let $\lambda \in \mathbb{T}$. Put $a=\left[\begin{array}{cc}0 & \bar{\lambda} l_{x} \\ \lambda r_{x} & 0\end{array}\right]$ and $b=\left[\begin{array}{cc}0 & \bar{\lambda} l_{y} \\ \lambda r_{y} & 0\end{array}\right]$. Then

$$
\|a\| \leq 2 \Omega(x) \quad \text { and } \quad\|b\| \leq 2 \Omega(y)
$$

Also, for every $c \in \mathscr{A}$ and $z \in \mathscr{V}$, we have

$$
l_{x} r_{y}(c)=l_{x}(y c)=\langle x, y c\rangle=\langle x, y\rangle c=T_{\langle x, y\rangle}(c)
$$

and

$$
r_{x} l_{y}(z)=r_{x}(\langle y, z\rangle)=x\langle y, z\rangle=\theta_{x, y}(z)
$$

Thus $l_{x} r_{y}=T_{\langle x, y\rangle}$ and $r_{x} l_{y}=\theta_{x, y}$. Therefore, $a b=\left[\begin{array}{cc}T_{\langle x, y\rangle} & 0 \\ 0 & \theta_{x, y}\end{array}\right]$ and hence,

$$
\left\|\left[\begin{array}{cc}
T_{\langle x, y\rangle} & 0  \tag{2.9}\\
0 & \theta_{x, y}
\end{array}\right]\right\|=\|a b\| \leq\|a\|\|b\| \leq 4 \Omega(x) \Omega(y)
$$

Since $\left[\begin{array}{cc}0 & \bar{\lambda} l_{(x+y)} \\ \lambda r_{(x+y)} & 0\end{array}\right]$ is a self adjoint element of $C^{*}$-algebra $\mathbb{L}(\mathscr{V})$, we have

$$
\left\|\left[\begin{array}{cc}
0 & \bar{\lambda} l_{(x+y)} \\
\lambda r_{(x+y)} & 0
\end{array}\right]\right\|=r\left(\left[\begin{array}{cc}
0 & \bar{\lambda} l_{(x+y)} \\
\lambda r_{(x+y)} & 0
\end{array}\right]\right) .
$$

Therefore, by Lemma 2.12, we obtain

$$
\begin{aligned}
\left\|\left[\begin{array}{cc}
0 & \bar{\lambda} l_{(x+y)} \\
\lambda r_{(x+y)} & 0
\end{array}\right]\right\| & =r\left(\left[\begin{array}{cc}
0 & \bar{\lambda} l_{(x+y)} \\
\lambda r_{(x+y)} & 0
\end{array}\right]\right) \\
& =r(a+b) \\
& \leq\left\|\left[\begin{array}{cc}
\|a\| & \|a b\|^{1 / 2} \\
\|a b\|^{1 / 2} & \|b\|
\end{array}\right]\right\| .
\end{aligned}
$$

So, by the norm monotonicity of matrices with nonnegative entries (see, e.g., [9, p. 491]), we get

$$
\begin{aligned}
\left\|\left[\begin{array}{cc}
0 & \bar{\lambda} l_{(x+y)} \\
\lambda r_{(x+y)} & 0
\end{array}\right]\right\| & \leq\left\|\left[\begin{array}{cc}
\sup _{\lambda \in \mathbb{T}}\|a\| & \sup _{\lambda \in \mathbb{T}}\|a b\|^{1 / 2} \\
\sup _{\lambda \in \mathbb{T}}\|a b\|^{1 / 2} & \sup _{\lambda \in \mathbb{T}}\|b\|
\end{array}\right]\right\| \\
& =\left\|\left[\begin{array}{cc}
2 \Omega(x) & \left\|\left[\begin{array}{cc}
T_{\langle x, y\rangle} & 0 \\
0 & \theta_{x, y}
\end{array}\right]\right\|^{1 / 2} \\
\left\|\left[\begin{array}{cc}
T_{\langle x, y\rangle} & 0 \\
0 & \theta_{x, y}
\end{array}\right]\right\|^{1 / 2} & 2 \Omega(y)
\end{array}\right]\right\| .
\end{aligned}
$$

Therefore, for every $\lambda \in \mathbb{T}$ we have

$$
\frac{1}{2}\left\|\left[\begin{array}{cc}
0 & \bar{\lambda} l_{(x+y)} \\
\lambda r_{(x+y)} & 0
\end{array}\right]\right\| \leq \|\left[\begin{array}{cc}
\Omega(x) & \frac{1}{2}\left\|\left[\begin{array}{cc}
T_{\langle x, y\rangle} & 0 \\
0 & \theta_{x, y}
\end{array}\right]\right\|^{1 / 2} \\
\frac{1}{2}\left\|\left[\begin{array}{cc}
T_{\langle x, y\rangle} & 0 \\
0 & \theta_{x, y}
\end{array}\right]\right\|^{1 / 2} & \Omega(y)
\end{array}\right]
$$

whence

$$
\Omega(x+y) \leq\left\|\left[\begin{array}{cc}
\Omega(x) & \frac{1}{2}\left\|\left[\begin{array}{cc}
T_{\langle x, y\rangle} & 0 \\
0 & \theta_{x, y}
\end{array}\right]\right\|^{1 / 2}  \tag{2.10}\\
\frac{1}{2}\left\|\left[\begin{array}{cc}
T_{\langle x, y\rangle} & 0 \\
0 & \theta_{x, y}
\end{array}\right]\right\|^{1 / 2} & \Omega(y)
\end{array}\right]\right\| .
$$

On the other hand, by (2.9), we have

$$
\begin{align*}
& \|\left[\begin{array}{cc}
\Omega(x) & \frac{1}{2}\left\|\left[\begin{array}{cc}
T_{\langle x, y\rangle} & 0 \\
0 & \theta_{x, y}
\end{array}\right]\right\|^{1 / 2} \\
\frac{1}{2}\left\|\left[\begin{array}{cc}
T_{\langle x, y\rangle} & 0 \\
0 & \theta_{x, y}
\end{array}\right]\right\|^{1 / 2} & \Omega(y) \\
\quad=\frac{1}{2}\left(\Omega(x)+\Omega(y)+\sqrt{(\Omega(x)-\Omega(y))^{2}+\left\|\left[\begin{array}{cc}
T_{\langle x, y\rangle} & 0 \\
0 & \theta_{x, y}
\end{array}\right]\right\|}\right) \\
\quad \leq \frac{1}{2}\left(\Omega(x)+\Omega(y)+\sqrt{(\Omega(x)-\Omega(y))^{2}+4 \Omega(x) \Omega(y)}\right)=\Omega(x)+\Omega(y) .
\end{array} . .\right.
\end{align*}
$$

Thus

$$
\left\|\left[\begin{array}{cc}
\Omega(x) & \frac{1}{2}\left\|\left[\begin{array}{cc}
T_{\langle x, y\rangle} & 0 \\
0 & \theta_{x, y}
\end{array}\right]\right\|^{1 / 2} \\
\frac{1}{2}\left\|\left[\begin{array}{cc}
T_{\langle x, y\rangle} & 0 \\
0 & \theta_{x, y}
\end{array}\right]\right\| \|^{1 / 2} & \Omega(y)
\end{array}\right]\right\| \Omega(x)+\Omega(y)
$$

and the proof is completed.
As a consequence of Theorem 2.13, we have the following result.
Corollary 2.14. Let $\mathscr{V}$ be a Hilbert $\mathscr{A}$-module, and $x, y \in \mathscr{V}$. If $\Omega(x+y)=$ $\Omega(x)+\Omega(y)$, then

$$
\begin{gathered}
\Omega(x) \Omega(y)=\frac{1}{4}\left\|\left[\begin{array}{cc}
T_{\langle x, y\rangle} & 0 \\
0 & \theta_{x, y}
\end{array}\right]\right\| . \\
\text { In particular, } \Omega(x)=\frac{1}{2}\left\|\left[\begin{array}{cc}
T_{\langle x, x\rangle} & 0 \\
0 & \theta_{x, x}
\end{array}\right]\right\|^{1 / 2} .
\end{gathered}
$$

The following lemma must be known to specialists. For the sake of completeness we include the proof.
Lemma 2.15. Let $\mathscr{V}$ be a Hilbert $\mathscr{A}$-module, and $x, y \in \mathscr{V}$. Then

$$
\left\|\theta_{x, y}\right\|=\left\|\langle x, x\rangle^{1 / 2}\langle y, y\rangle^{1 / 2}\right\|
$$

Proof. We may assume that $x, y \neq 0$ otherwise the identity trivially holds. We have

$$
\begin{aligned}
\left\|\theta_{x, y}\left(\frac{y\langle x, x\rangle^{1 / 2}}{\left\|y\langle x, x\rangle^{1 / 2}\right\|}\right)\right\|^{2} & =\frac{\left\|x\langle y, y\rangle\langle x, x\rangle^{1 / 2}\right\|^{2}}{\left\|y\langle x, x\rangle^{1 / 2}\right\|^{2}} \\
& =\frac{\left\|\langle x, x\rangle^{1 / 2}\langle y, y\rangle\langle x, x\rangle\langle y, y\rangle\langle x, x\rangle^{1 / 2}\right\|}{\left\|\langle x, x\rangle^{1 / 2}\langle y, y\rangle\langle x, x\rangle^{1 / 2}\right\|} \\
& =\left\|\langle x, x\rangle^{1 / 2}\langle y, y\rangle\langle x, x\rangle^{1 / 2}\right\|=\left\|\langle x, x\rangle^{1 / 2}\langle y, y\rangle^{1 / 2}\right\|^{2}
\end{aligned}
$$

and so

$$
\left\|\theta_{x, y}\left(\frac{y\langle x, x\rangle^{1 / 2}}{\left\|y\langle x, x\rangle^{1 / 2}\right\|}\right)\right\|=\left\|\langle x, x\rangle^{1 / 2}\langle y, y\rangle^{1 / 2}\right\|
$$

Hence

$$
\begin{equation*}
\left\|\theta_{x, y}\right\| \geq\left\|\langle x, x\rangle^{1 / 2}\langle y, y\rangle^{1 / 2}\right\| \tag{2.12}
\end{equation*}
$$

On the other hand, let $z \in \mathscr{V}$ with $\|z\|=1$. By (1.1) we have $\langle y, z\rangle\langle z, y\rangle \leq\langle y, y\rangle$ and hence by Theorem 2.2.5(2) of [13] it follows that

$$
\langle x, x\rangle^{1 / 2}\langle y, z\rangle\langle z, y\rangle\langle x, x\rangle^{1 / 2} \leq\langle x, x\rangle^{1 / 2}\langle y, y\rangle\langle x, x\rangle^{1 / 2} .
$$

So, [13, Theorem 2.2.5(3)] implies

$$
\begin{equation*}
\left\|\langle x, x\rangle^{1 / 2}\langle y, z\rangle\langle z, y\rangle\langle x, x\rangle^{1 / 2}\right\| \leq\left\|\langle x, x\rangle^{1 / 2}\langle y, y\rangle\langle x, x\rangle^{1 / 2}\right\| . \tag{2.13}
\end{equation*}
$$

Therefore,

$$
\begin{aligned}
\left\|\theta_{x, y}(z)\right\| & =\|x\langle y, z\rangle\| \\
& =\|\langle z, y\rangle\langle x, x\rangle\langle y, z\rangle\|^{1 / 2} \\
& =\left\|\langle x, x\rangle^{1 / 2}\langle y, z\rangle\langle z, y\rangle\langle x, x\rangle^{1 / 2}\right\|^{1 / 2} \\
& \stackrel{(2.13)}{\leq}\left\|\langle x, x\rangle^{1 / 2}\langle y, y\rangle\langle x, x\rangle^{1 / 2}\right\|^{1 / 2}=\left\|\langle x, x\rangle^{1 / 2}\langle y, y\rangle^{1 / 2}\right\|,
\end{aligned}
$$

whence

$$
\begin{equation*}
\left\|\theta_{x, y}\right\| \leq\left\|\langle x, x\rangle^{1 / 2}\langle y, y\rangle^{1 / 2}\right\| . \tag{2.14}
\end{equation*}
$$

Utilizing (2.12) and (2.14), we conclude that $\left\|\theta_{x, y}\right\|=\left\|\langle x, x\rangle^{1 / 2}\langle y, y\rangle^{1 / 2}\right\|$.
We close this paper with the following result.
Corollary 2.16. Let $\mathscr{V}$ be a Hilbert $\mathscr{A}$-module, and $x, y \in \mathscr{V}$. If $\langle x, y\rangle=0$, then

$$
\Omega(x+y) \leq \frac{1}{2}\left(\Omega(x)+\Omega(y)+\sqrt{(\Omega(x)-\Omega(y))^{2}+\left\|\langle x, x\rangle^{1 / 2}\langle y, y\rangle^{1 / 2}\right\|}\right) \leq \Omega(x)+\Omega(y) .
$$

Proof. Since $\langle x, y\rangle=0$, we have $T_{\langle x, y\rangle}=0$. Hence from (2.10), (2.11) and Lemma 2.15, we deduce the desired result.
