# PARTIALLY DISSIPATIVE ONE-DIMENSIONAL HYPERBOLIC SYSTEMS IN THE CRITICAL REGULARITY SETTING, AND APPLICATIONS 

TIMOTHÉE CRIN-BARAT AND RAPHAËL DANCHIN

#### Abstract

Here we develop a method for investigating global strong solutions of partially dissipative hyperbolic systems in the critical regularity setting. Compared to the recent works by Kawashima and Xu , we use hybrid Besov spaces with different regularity exponent in low and high frequency. This allows to consider more general data and to track the exact dependency on the dissipation parameter for the solution. Our approach enables us to go beyond the $L^{2}$ framework in the treatment of the low frequencies of the solution, which is totally new, to the best of our knowledge.

Focus is on the one-dimensional setting (the multi-dimensional case will be considered in a forthcoming paper) and, for expository purpose, the first part of the paper is devoted to a toy model that may be seen as a simplification of the compressible Euler system with damping. More elaborated systems (including the compressible Euler system with general increasing pressure law) are considered at the end of the paper.

## Introduction

The study of the global existence issue for so-called partially dissipative hyperbolic systems of balance laws goes back to the seminal work of Kawashima [20]. Recall that a general $n$ component systems of balance laws in $\mathbb{R}^{d}$ reads:

$$
\begin{equation*}
\frac{\partial w}{\partial t}+\sum_{j=1}^{d} \frac{\partial F_{j}(w)}{\partial x_{j}}=Q(w) . \tag{1}
\end{equation*}
$$

Here the unknown $w=w(t, x)$ with $t \in \mathbb{R}^{+}$and $x \in \mathbb{R}^{d}$ is valued in an open convex subset $\mathcal{O}_{w}$ of $\mathbb{R}^{n}$ and $Q, F_{j}: \mathbb{R}^{n} \rightarrow \mathcal{O}_{w}$ are given $n$-vector valued smooth functions on $\mathcal{O}_{w}$.

It is well known that classical systems of conservation laws (that is with $Q(w)=0$ ) supplemented with smooth data admit local-in-time strong solutions that may develop singularities (shock waves) in finite time even if the initial data are small perturbations of a constant solution (see for instance the works by Majda in [23] and Serre in [27]). A sufficient condition for global existence for small perturbations of a constant solution $\bar{w}$ of (11) is the total dissipation hypothesis, namely the damping (or dissipation) term $Q(w)$ acts directly on each component of the system, making the whole solution to tend to $\bar{w}$ exponentially fast. However, in most evolutionary systems coming from physics, that condition is not verified, and even though global-in-time strong solutions do exist, exponential decay is very unlikely. A more reasonable assumption is that dissipation acts only on some components of the system. After suitable change of coordinates, we may write:

$$
\begin{equation*}
Q(w)=\binom{0}{q(w)} \tag{2}
\end{equation*}
$$

where $0 \in \mathbb{R}^{n_{1}}, q(w) \in \mathbb{R}^{n_{2}}, n_{1}, n_{2} \in \mathbb{N}$ and $n_{1}+n_{2}=n$. This so-called partial dissipation hypothesis arises in many applications such as gas dynamics or numerical simulation of conservation laws by relaxation scheme. A well known example is the damped compressible Euler system for isentropic flows that we will be investigated at the end of the paper. For this system,

2010 Mathematics Subject Classification. 35Q35; 76N10.
Key words and phrases. Hyperbolic systems, critical regularity, time decay, partially dissipative.
the works by Wang and Yang [31] and Sideris, Thomases and Wang [29] pointed out that the dissipative mechanism, albeit only present in the velocity equation, can prevent the formation of singularities that would occur if $Q \equiv 0$.

Looking for conditions on the systems of the form (11)-(2) guaranteeing global existence of strong solutions for small perturbations of a constant solution $\bar{w}$ goes back to the paper of Shizuta and Kawashima [28], the thesis of Kawashima [20] and, more recently, to the paper of Yong [37]. Their researches reveal the importance of a rather explicit linear stability criterion, that is nowadays called the (SK) (for Shizuta-Kawashima) condition and of the existence of an entropy that provides a suitable symmetrisation of the system. Roughly speaking, (SK) condition ensures that the partial damping provided by (2) acts on all the components of the solution, although indirectly, so that all the solutions of (1) emanating from small perturbations of $\bar{w}$ eventually tend to $\bar{w}$, while the paper by Yong provides tools to get quantitative estimates on the solutions when $Q(\bar{w})=0$. As observed by Bianchini, Hanouzet and Natalini [4], in many situations, a careful analysis of the Green kernel of the linearized system about $\bar{w}$ allows to get explicit (and optimal) algebraic rates of convergence in $L^{p}$ of smooth global solutions to $\bar{w}$. Let us finally mention that a more general approach has been proposed by Beauchard and Zuazua in [2], that allows to handle partially dissipative systems that need not satisfy the (SK) condition.

Recently, Kawashima and Xu in [34] and [35] extended all the prior works on partially dissipative hyperbolic systems satisfying the (SK) and entropy conditions (including the compressible Euler system with a damping term) to 'critical' non-homogeneous Besov spaces of $L^{2}$ type. To obtain their results, they symmetrized the system thanks to the entropy hypothesis, applied a frequency localization argument relying on the Littlewood-Paley decomposition and used new properties concerning Chemin-Lerner's spaces. They took advantage of the equivalence between the condition (SK) and the existence of a compensating function so as to to exhibit global-in-time $L^{2}$ integrability properties of all the components of the system.

The present paper focuses on the particular situation where the space dimension is $d=1$ and the number of components is $n=2$ (the multi-dimensional case will be investigated in a forthcoming paper [8] for the whole class of partially dissipative systems verifying the (SK) condition). Our goal is to propose a method and a functional framework with different regularities for low and high frequencies. For the high frequencies, we do not really have the choice as it is known that the optimal regularity for local well-posedness in the context of general quasilinear hyperbolic systems, is given by the 'critical' Besov space $\mathbb{B}_{2,1}^{\frac{3}{2}}$. The novelty here is that we propose to look at the low frequencies of the solution in another space, not necessarily related to $L^{2}$. The advantage is not only that we will be able to consider a larger class of initial data that may be less decaying at infinity, but also that one can easily keep track of the dependency of the solution with respect to the dissipation coefficient, and thus have some informations on the large dissipation asymptotics. Various considerations lead us to think that a suitable space for low frequencies is the homogeneous Besov space $\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}}$ (with, possibly, $p>2$ ) that corresponds to the critical embedding in $L^{\infty}$.

For expository purpose, we spend most of the paper implementing our method on a simple 'toy model' that may be seen as a simplification of the one-dimensional compressible Euler system with damping, and pressure law $P(\rho)=\frac{1}{2} \rho^{2}$, namely

$$
\left\{\begin{array}{lll}
\partial_{t} u+v \partial_{x} u+\partial_{x} v=0 & \text { in } & \mathbb{R}^{+} \times \mathbb{R}, \\
\partial_{t} v+v \partial_{x} v+\partial_{x} u+\lambda v=0 & \text { in } & \mathbb{R}^{+} \times \mathbb{R}, \\
\left.(u, v)\right|_{t=0}=\left(u_{0}, v_{0}\right) . & \text { on } & \mathbb{R}
\end{array}\right.
$$

Above, the unknown $u$ may be seen as the discrepancy to the reference density normalized to 1 , (then, the first equation is a simplification of the mass balance), while the unknown $v$ stands for
the velocity of the fluid, and the second equation corresponds to the evolution of velocity with a friction term of magnitude $\lambda>0$ (which could also be interpreted as a relaxation parameter).

In order to have a robust method that can be adapted to more involved systems, we shall not compute explicitly the solution of the linearized system $\left(T M_{\lambda}\right)$ about $(0,0)$, but rather use modified energy arguments (different from those of S. Kawashima in his thesis [20]) and suitable change of unknowns. More specifically, we will introduce a 'modified' velocity that plays the same role as the 'viscous effective flux' in the works of Hoff [18] and, more recently, of Haspot [17] dedicated to the compressible Navier-Stokes equations.

Our approach will enable us to obtain more accurate estimates and a weaker smallness condition than in prior works (in particular [20, 37, 2, 36]). We will see that it is enough to assume that the low frequencies of the data have Besov regularity for some Lebesgue index that may be greater than 2 . Also, we will improve the decay that was obtained for the compressible Euler system with damping in [36] and, adapting an idea from Xu and Xin in [32] for the compressible Navier-Stokes system will enable us to discard the additional smallness assumption on the low frequencies that is usually required to obtain the decay estimates.

The rest of the paper unfolds as follow. In Section we present our main results for $\left(T M_{\lambda}\right)$, namely the global existence of a solution corresponding to small data with optimal estimates with respect to the dissipation coefficient, and time decay estimates. In the next section, we focus on the particular case of data with regularity in Besov spaces built on $L^{2}$, and prove global existence in this case, as well as the time decay estimates. The method we here propose is different than the one for the general case, and is more easily extendable to the multi-dimensional setting. In Section 3, we propose another method that allows to get our global existence result for a larger class of data, not necessarily in $L^{2}$ type spaces. The next two sections are devoted to adapting our results, first for the isentropic Euler system with damping, and next for a general class of one-dimensional systems of two conservations laws, with partial damping. Some technical lemmas are proved in Appendix.

Acknowledgments. The second author is partially supported by the ANR project INFAMIE (ANR-15-CE40-0011).

## 1. Main results

Before stating the main results, we need to introduce a few notations. First, throughout the paper, we fix a homogeneous Littlewood-Paley decomposition $\left(\dot{\Delta}_{j}\right)_{j \in \mathbb{Z}}$ that is defined by

$$
\dot{\Delta}_{j} \triangleq \varphi\left(2^{-j} D\right) \quad \text { with } \quad \varphi(\xi) \triangleq \chi(\xi / 2)-\chi(\xi)
$$

where $\chi$ stands for a smooth function with range in $[0,1]$, supported in ] $-4 / 3,4 / 3[$ and such that $\chi \equiv 1$ on $[-3 / 4,3 / 4]$. We further set

$$
\dot{S}_{j} \triangleq \chi\left(2^{-j} D\right) \quad \text { for all } j \in \mathbb{Z}
$$

and define $\mathcal{S}_{h}^{\prime}$ to be the set of tempered distributions $z$ such that $\dot{S}_{j} z \rightarrow 0$ uniformly when $j \rightarrow-\infty$.

Following [1] we introduce the homogeneous Besov semi-norms:

$$
\|z\|_{\dot{\mathbb{B}}_{p, r}^{s}} \triangleq\left\|2^{j s}\right\| \dot{\Delta}_{j} z\left\|_{L^{p}(\mathbb{R})}\right\|_{\ell^{r}(\mathbb{Z})}
$$

then define the homogeneous Besov spaces $\dot{\mathbb{B}}_{p, r}^{s}\left(\right.$ for any $s \in \mathbb{R}$ and $\left.(p, r) \in[1, \infty]^{2}\right)$ to be the subset of $z$ in $\mathcal{S}_{h}^{\prime}$ such that $\|z\|_{\dot{\mathbb{B}}_{p, r}^{s}}$ is finite.

To any element $z$ of $\mathcal{S}_{h}^{\prime}$, we associate its low and high frequency parts with respect to some fixed threshold $J_{0} \in \mathbb{Z}$, through

$$
z^{\ell} \triangleq \sum_{j \leq J_{0}} \dot{\Delta}_{j} z=\dot{S}_{J_{0}+1} z \quad \text { and } \quad z^{h} \triangleq \sum_{j>J_{0}} \dot{\Delta}_{j} z=\left(\operatorname{Id}-\dot{S}_{J_{0}+1}\right) z .
$$

In order to emphasize the dependency of the notation with respect to the threshold parameter $J_{0}$, we use sometimes the notation $z^{\ell, J_{0}}$ and $z^{h, J_{0}}$. Likewise, we set ${ }^{1}$ if $r<\infty$

$$
\|z\|_{\mathbb{P}_{p, r}^{s}}^{\ell, J_{0}} \triangleq\left(\sum_{j \leq J_{0}}\left(2^{j s}\left\|\dot{\Delta}_{j} z\right\|_{L^{p}}\right)^{r}\right)^{\frac{1}{r}} \quad \text { and } \quad\|z\|_{\mathbb{B}_{p, r}^{s}}^{h, J_{0}} \triangleq\left(\sum_{j \geq J_{0}}\left(2^{j s}\left\|\dot{\Delta}_{j} z\right\|_{L^{p}}\right)^{r}\right)^{\frac{1}{r}}
$$

Whenever the value of $J_{0}$ is clear from the context, we shall only write $\|z\|_{\mathbb{M}_{p, r}^{s}}^{\ell}$
For any Banach space $X$, index $\rho$ in $[1, \infty]$ and time $T \in[0, \infty]$, we use the notation $\|z\|_{L_{T}^{\rho}(X)} \triangleq\| \| z\left\|_{X}\right\|_{L^{\rho}(0, T)}$. If $T=+\infty$, then we just write $\|z\|_{L^{\rho}(X)}$. In the case where $z$ has $n$ components $z_{j}$ in $X$, we slightly abusively keep the notation $\|z\|$ to mean $\sum_{j \in\{1, \cdots, n\}}\left\|z_{j}\right\|_{X}$.

Throughout the paper, $C>0$ designates a generic harmless constant, the value of which depends on the context. We use the notation $p^{\prime}$ for the conjugate Lebesgue exponent of $p$. Finally, we denote by $\left(c_{j}\right)_{j \in \mathbb{Z}}$ nonnegative sequences such that $\sum_{j \in \mathbb{Z}} c_{j}=1$.

We can now state our main global existence result for $\left(T M_{\lambda}\right)$.
Theorem 1.1. Let $2 \leq p \leq 4$. There exist $k=k(p) \in \mathbb{Z}$ and $c_{0}=c_{0}(p)>0$ such that for $J_{\lambda} \triangleq\left\lfloor\log _{2} \lambda\right\rfloor+k$, if we assume that $u_{0}^{\ell, J_{\lambda}}, v_{0}^{\ell, J_{\lambda}} \in \dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}}$ and $u_{0}^{h, J_{\lambda}}, v_{0}^{h, J_{\lambda}} \in \dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}$ with

$$
\left\|\left(u_{0}, v_{0}\right)\right\|_{\dot{B}_{p, 1}^{\prime}}^{l} \hat{L}^{\frac{1}{p}}+\lambda^{-1}\left\|\left(u_{0}, v_{0}\right)\right\|_{\mathbb{B}_{2,1}^{3}}^{h, J_{\lambda}} \leq c_{0},
$$

then System $\left(T M_{\lambda}\right)$ admits a unique global solution $(u, v)$ in the space $E_{p}^{J_{\lambda}}$ defined by

$$
\begin{aligned}
& u^{\ell, J_{\lambda}} \in \mathcal{C}_{b}\left(\mathbb{R}^{+} ; \dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}}\right) \cap L^{1}\left(\mathbb{R}^{+}, \dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}+2}\right), \quad u^{h, J_{\lambda}} \in \mathcal{C}_{b}\left(\mathbb{R}^{+} ; \dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}\right) \cap L^{1}\left(\mathbb{R}^{+}, \dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}\right), \\
& v^{\ell, J_{\lambda}} \in \mathcal{C}_{b}\left(\mathbb{R}^{+} ; \dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}}\right) \cap L^{1}\left(\mathbb{R}^{+}, \dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}+1}\right), \quad v^{h, J_{\lambda}} \in \mathcal{C}_{b}\left(\mathbb{R}^{+} ; \dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}\right) \cap L^{1}\left(\mathbb{R}^{+}, \dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}\right) \\
& \lambda v+\partial_{x} u \in L^{1}\left(\mathbb{R}^{+}, \dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}}\right) \quad \text { and } \quad v \in L^{2}\left(\mathbb{R}^{+}, \dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}}\right) .
\end{aligned}
$$

Moreover we have the following a priori estimate:

$$
X_{p, \lambda}(t) \lesssim\left\|\left(u_{0}, v_{0}\right)\right\|_{\substack{\mathbb{B}_{p, 1}^{\prime}}}^{\ell, J_{\lambda}}+\lambda^{-1}\left\|\left(u_{0}, v_{0}\right)\right\|_{\dot{B}_{2,1}^{3}}^{h, J_{\lambda}} \quad \text { for all } t \geq 0,
$$

where

$$
\begin{aligned}
& X_{p, \lambda}(t) \triangleq\|(u, v)\|_{L_{t}^{\infty}\left(\dot{B}_{p, 1}^{\frac{1}{p}}\right)}^{\ell, J_{\lambda}}+\lambda^{-1}\|(u, v)\|_{L_{t}^{\infty}\left(\mathbb{B}_{2,1}^{\frac{3}{2}}\right)}^{h, J_{\lambda}}+\lambda^{-1}\|u\|_{L_{t}^{1}\left(\dot{B}_{p, 1}^{\frac{1}{p}+2}\right)}^{\ell, J_{\lambda}}+\|(u, v)\|_{L_{t}^{1}\left(\mathbb{B}_{2,1}^{\frac{3}{2}}\right)}^{h, J_{\lambda}} \\
& +\left\|\lambda v+\partial_{x} u\right\|_{L_{t}^{1}\left(\dot{B}_{p, 1}^{\frac{1}{p}}\right)}+\lambda^{\frac{1}{2}}\|v\|_{L_{t}^{2}\left(\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}}\right)} .
\end{aligned}
$$

Remark 1.1. Somehow, the function $\lambda v+\partial_{x} u$ may be seen as a damped mode of the system, which explains its better time integrability. This is actually the key to closing the estimates globally in time, and this enables us to prove similar results for more general systems (see Sections 4 and (5).

Remark 1.2. Kawashima and $X u$ in [34] obtained a result in critical nonhomogeneous Besov spaces built on $L^{2}$ for a class of system containing $\left(T M_{\lambda}\right)$. In their functional setting however, it seems difficult to track the exact dependency of the smallness condition and of the estimates with respect to the damping parameter $\lambda$. Furthermore, whether a $L^{p}$ approach may be performed for the whole classe of systems that is considered therein, is unclear.

Remark 1.3. In the $L^{2}$ case, the method we here propose is robust enough to be adapted to higher dimension and to systems with more components, see [5] and 8 .

[^0]Remark 1.4. In Section 4 a statement similar to the above one is obtained for the isentropic compressible Euler system with a damping term in the velocity equation. To our knowledge, it is the first result (partially) in the $L^{p}$ setting for this system. Obtaining a similar result in higher dimension is a work in progress.

The above theorem gives us for free some insight on the diffusive relaxation limit of $\left(T M_{\lambda}\right)$ in the case of fixed initial data ${ }^{2}$.

Corollary 1.1. Under the hypotheses of Theorem 1.1, we have $u \rightarrow u_{0}$ and $v \rightarrow 0$ when $\lambda$ goes to infinity. More precisely,

$$
\|v\|_{L^{2}\left(\dot{\mathbb{B}}_{p, 1}^{\left.\frac{1}{p}\right)}\right.} \leq C c_{0} \lambda^{-1 / 2} \quad \text { and } \quad\left\|u(t)-u_{0}\right\|_{\dot{\mathbb{B}}_{p, 1}^{0}} \leq C c_{0}\left(\frac{t}{\lambda}\right)^{\frac{1}{2 p}}
$$

Proof. The first inequality follows from the estimate for $X_{p, \lambda}$ in Theorem 1.1. For the second inequality, we observe that by interpolation in Besov spaces and Hölder inequality,

$$
\left\|\partial_{x} v\right\|_{L^{r}\left(\dot{\mathbb{B}}_{p, 1}^{0}\right)} \lesssim\left\|\partial_{x} v\right\|_{L^{1}\left(\dot{\mathbb{B}}_{p, 1}^{p}\right)}^{1-\frac{1}{p}}\left\|\partial_{x} v\right\|_{L^{2}\left(\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}-1}\right)}^{\frac{1}{p}} \quad \text { with } \quad \frac{1}{r} \triangleq 1-\frac{1}{2 p}
$$

Since

$$
\left\|\partial_{x} v\right\|_{L^{1}\left(\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}}\right)} \lesssim\|v\|_{L^{1}\left(\mathbb{B}_{p, 1}^{\frac{1}{p}+1}\right)}^{\ell}+\|v\|_{L^{1}\left(\dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}\right)}^{h}
$$

Theorem 1.1 gives us

$$
\left\|\partial_{x} v\right\|_{L^{r}\left(\dot{\mathbb{B}}_{p, 1}^{0}\right)} \leq C c_{0} \lambda^{-\frac{1}{2 p}}
$$

Similarly, we have

$$
\left\|\partial_{x} u\right\|_{L^{\widetilde{r}}\left(\dot{\mathbb{B}}_{p, 1}^{0}\right)} \lesssim\left\|\partial_{x} u\right\|_{L^{1}\left(\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}+1}\right)}^{\frac{1}{2}-\frac{1}{2 p}}\left\|\partial_{x} u\right\|_{L^{\infty}\left(\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}-1}\right)}^{\frac{1}{2}+\frac{1}{2 p}} \quad \text { with } \quad \frac{1}{\widetilde{r}} \triangleq \frac{1}{2}-\frac{1}{2 p}
$$

Hence, using that the product maps $\dot{\mathbb{B}}_{p, 1}^{0} \times \dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}}$ to $\dot{\mathbb{B}}_{p, 1}^{0}$ and Theorem 1.1, we deduce that

$$
\left\|v \partial_{x} u\right\|_{L^{r}\left(\dot{\mathbb{B}}_{p, 1}^{0}\right)} \lesssim\|v\|_{L^{2}\left(\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}}\right)}\left\|\partial_{x} u\right\|_{L^{\widetilde{r}}\left(\dot{\mathbb{B}}_{p, 1}^{0}\right)} \leq C c_{0} \lambda^{-\frac{1}{2 p}}
$$

Since $\partial_{t} u=-\partial_{x} v-v \partial_{x} u$, we get the desired inequality for $u(t)-u_{0}$, by time integration and Hölder inequality.

Our second main result concerns the optimal decay estimates of the solution constructed in the first theorem. For now, we only consider the case $p=2$.

Theorem 1.2. Under the hypotheses of Theorem 1.1 with $p=2$, there exists a Lyapunov functional associated to the solution $(u, v)$ constructed there, which is equivalent to $\|(u, v)\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}} \cap \dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}}$.

If, additionally, $\left(u_{0}, v_{0}\right) \in \dot{\mathbb{B}}_{2, \infty}^{-\sigma_{1}}$ for some $\sigma_{1} \in\left(-\frac{1}{2}, \frac{1}{2}\right]$ then, there exists a constant $C$ depending only on $\sigma_{1}$ and such that

$$
\|(u, v)(t)\|_{\dot{\mathbb{B}}_{2, \infty}^{-\sigma_{1}}} \leq C\left\|\left(u_{0}, v_{0}\right)\right\|_{\dot{\mathbb{B}}_{2, \infty}^{-\sigma_{1}}}, \quad \forall t \geq 0
$$

Furthermore, there exists a constant $\kappa_{0}$ depending only on $\sigma_{1}, \lambda$ and on the norm of the data (and that may be taken equal to one in certain regimes, see the remark below) such that, if

$$
\langle t\rangle \triangleq 1+\kappa_{0} t, \quad \alpha_{2} \triangleq \sigma_{1}+\frac{1}{2} \quad \text { and } \quad C_{0, \lambda} \triangleq \lambda^{1+\alpha_{2}}\left\|\left(u_{0}, v_{0}\right)\right\|_{\mathbb{B}_{2, \infty}^{-\sigma_{1}}}^{\ell, J_{\lambda}}+\left\|\left(u_{0}, v_{0}\right)\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}}^{h, J_{\lambda}}
$$

[^1]then we have the following decay estimates:
\[

$$
\begin{aligned}
\lambda^{\frac{3}{2}-\sigma}\left\|\langle\lambda t\rangle^{\alpha}(u, v)(t)\right\|_{\mathbb{B}_{2,1}}^{\ell J_{\lambda}} & \leq C C_{0, \lambda}, \quad \sigma \in\left[-\sigma_{1}, 1 / 2\right], \quad \alpha \triangleq \frac{\sigma+\sigma_{1}}{2}, \\
\left\|\langle\lambda t\rangle^{\alpha_{2}}(u, v)(t)\right\|_{\mathbb{B}_{2, \infty}}^{h J_{\lambda}} & \leq C C_{0, \lambda}, \\
\lambda^{\sigma_{1}+\frac{3}{2}}\left\|\langle\lambda t\rangle^{\alpha_{1}} v\right\|_{\mathbb{B}_{2, \infty}^{-\sigma_{1}}}^{\ell, J_{\lambda}} & \leq C C_{0, \lambda}, \quad \alpha_{1} \triangleq \frac{1}{2}\left(\frac{1}{2}+\sigma_{1}\right) .
\end{aligned}
$$
\]

Remark 1.5. Our proof reveals than $\kappa_{0} \approx 1$ whenever the first term of $C_{0, \lambda}$ is controlled by the second one (which amounts to saying that the low frequencies of the data are dominated by the high frequencies).
Remark 1.6. The fact that $v$ undergoes direct dissipation and not $u$ explains why the decay of the low frequencies of $v$ is stronger than that of $u$.
Remark 1.7. In light of the embedding $L^{1} \hookrightarrow \dot{\mathbb{B}}_{2, \infty}^{-\frac{1}{2}}$, the above statement with $\sigma_{1}=1 / 2$ encompasses the classical $L^{1}$ condition of [24]. Actually, choosing suitable exponents allows to recover all the conditions used in (4) for getting decay estimates.

## 2. The case $p=2$

The present section is dedicated to the case $p=2$ in Theorem 1.1 and to the proof of Theorem 1.2. The reason for looking first at $p=2$ is that one can exhibit a Lyapunov functional for $\left(T M_{\lambda}\right)$ that allows to treat the low and high frequencies of the solution together. Throughout this section, we focus on the proof of a priori estimates for smooth solutions to $\left(T M_{\lambda}\right)$, the reader being referred to the next section for the rigorous proof of existence and uniqueness, in the general case.

Before starting, let us observe that $(u, v)$ is a solution to $\left(T M_{\lambda}\right)$ if and only if the couple ( $\tilde{u}, \tilde{v}$ ) defined by

$$
\begin{equation*}
(u, v)(t, x) \triangleq(\tilde{u}, \tilde{v})(\lambda t, \lambda x) \tag{3}
\end{equation*}
$$

satisfies $\left(T M_{1}\right)$. Therefore, it suffices to establish Theorems 1.1 and 1.2 for $\lambda=1$, scaling back giving the desired inequalities, owing to the use of homogeneous Besov norms.

In the rest of this section, and in the following one, we shall use the short notation (TM) to designate $\left(T M_{1}\right)$.
2.1. Global a priori estimates for the linearized toy model. Here we are concerned with the proof of a priori estimates for the following linearization of $(T M)$ :

$$
\left\{\begin{array}{lll}
\partial_{t} u+w \partial_{x} u+\partial_{x} v=0 & \text { in } & \mathbb{R}^{+} \times \mathbb{R}  \tag{LTM}\\
\partial_{t} v+w \partial_{x} v+\partial_{x} u+v=0 & \text { in } & \mathbb{R}^{+} \times \mathbb{R} \\
\left.(u, v)\right|_{t=0}=\left(u_{0}, v_{0}\right) & \text { on } & \mathbb{R},
\end{array}\right.
$$

where the given function $w: \mathbb{R} \times \mathbb{R} \rightarrow \mathbb{R}$ is smooth.
In the following computations, we assume that we are given a smooth solution $(u, v)$ of $(L T M)$ on $[0, T] \times \mathbb{R}$, and denote, for all $j \in \mathbb{Z}$,

$$
\begin{equation*}
u_{j} \triangleq \dot{\Delta}_{j} u \quad \text { and } \quad v_{j} \triangleq \dot{\Delta}_{j} v \tag{4}
\end{equation*}
$$

Inspired by the work of the second author in [9, 13], we consider the following functional:

$$
\begin{equation*}
\mathcal{L}_{j} \triangleq \sqrt{\left\|u_{j}\right\|_{L^{2}}^{2}+\left\|v_{j}\right\|_{L^{2}}^{2}+\left\|\partial_{x} u_{j}\right\|_{L^{2}}^{2}+\left\|\partial_{x} v_{j}\right\|_{L^{2}}^{2}+\int_{\mathbb{R}} v_{j} \partial_{x} u_{j}} \tag{5}
\end{equation*}
$$

Applying operator $\dot{\Delta}_{j}$ to ( $L T M$ ), simple computations lead to

$$
\begin{gathered}
\frac{1}{2} \frac{d}{d t}\left\|\left(u_{j}, v_{j}\right)\right\|_{L^{2}}^{2}+\left\|v_{j}\right\|_{L^{2}}^{2}+\int_{\mathbb{R}}\left(\dot{\Delta}_{j}\left(w \partial_{x} u\right) \dot{\Delta}_{j} u+\dot{\Delta}_{j}\left(w \partial_{x} v\right) \dot{\Delta}_{j} v\right)=0 \\
\left.\frac{1}{2} \frac{d}{d t}\left\|\left(\partial_{x} u_{j}, \partial_{x} v_{j}\right)\right\|_{L^{2}}^{2}+\left\|\partial_{x} v_{j}\right\|_{L^{2}}^{2}+\int_{\mathbb{R}}\left(\dot{\Delta}_{j} \partial_{x}\left(w \partial_{x} u\right)\right) \dot{\Delta}_{j} \partial_{x} u+\dot{\Delta}_{j}\left(\partial_{x}\left(w \partial_{x} v\right)\right) \dot{\Delta}_{j} \partial_{x} v\right)=0 \\
\frac{d}{d t} \int_{\mathbb{R}} v_{j} \partial_{x} u_{j}+\int_{\mathbb{R}} v_{j} \partial_{x} u_{j}+\left\|\partial_{x} u_{j}\right\|_{L^{2}}^{2}-\left\|\partial_{x} v_{j}\right\|_{L^{2}}^{2}+\int_{\mathbb{R}}\left(\dot{\Delta}_{j} \partial_{x}\left(w \partial_{x} u\right) \dot{\Delta}_{j} v+\dot{\Delta}_{j}\left(w \partial_{x} v\right) \partial_{x} \dot{\Delta}_{j} u\right)=0
\end{gathered}
$$

Using the fact that

$$
\begin{equation*}
\dot{\Delta}_{j}\left(w \partial_{x} z\right)=w \partial_{x} z_{j}+\left[\dot{\Delta}_{j}, w\right] \partial_{x} z \quad \text { for } \quad z=u, v \tag{6}
\end{equation*}
$$

and integrating by parts, we see that

$$
\int_{\mathbb{R}} \dot{\Delta}_{j}\left(w \partial_{x} z\right) \dot{\Delta}_{j} z=-\frac{1}{2} \int_{\mathbb{R}} \partial_{x} w\left|z_{j}\right|^{2}+\int_{\mathbb{R}}\left[\dot{\Delta}_{j}, w\right] \partial_{x} z z_{j}
$$

Hence, using the classical commutator estimate (79) recalled in the Appendix and the embed$\operatorname{ding} \dot{\mathbb{B}}_{2,1}^{\frac{1}{2}} \hookrightarrow L^{\infty}$, we get an absolute constant $C>0$ such that for all $j \in \mathbb{Z}$,

$$
\left|\int_{\mathbb{R}} \dot{\Delta}_{j}\left(w \partial_{x} z\right) \dot{\Delta}_{j} z\right| \leq C c_{j} 2^{-\frac{j}{2}}\left\|\partial_{x} w\right\|_{\dot{B}_{2,1}^{\frac{1}{2}}}\|z\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}\left\|\dot{\Delta}_{j} z\right\|_{L^{2}} \quad \text { with } \quad \sum_{j \in \mathbb{Z}} c_{j}=1
$$

Likewise, we have, thanks to an integration by parts,

$$
\int_{\mathbb{R}} \dot{\Delta}_{j} \partial_{x}\left(w \partial_{x} z\right) \dot{\Delta}_{j} \partial_{x} z=\frac{1}{2} \int_{\mathbb{R}} \partial_{x} w\left(\partial_{x} z_{j}\right)^{2}+\int_{\mathbb{R}} \partial_{x}\left[\dot{\Delta}_{j}, w\right] \partial_{x} z \partial_{x} z_{j}
$$

Hence, using (81) and $\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}} \hookrightarrow L^{\infty}$,

$$
\left|\int_{\mathbb{R}} \dot{\Delta}_{j} \partial_{x}\left(w \partial_{x} z\right) \dot{\Delta}_{j} \partial_{x} z\right| \leq C c_{j} 2^{-\frac{j}{2}}\left\|\partial_{x} w\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}\|z\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}\left\|\partial_{x} z_{j}\right\|_{L^{2}}
$$

Finally, integrating by parts reveals that

$$
\int_{\mathbb{R}}\left(\dot{\Delta}_{j} \partial_{x}\left(w \partial_{x} u\right) \dot{\Delta}_{j} v+\dot{\Delta}_{j}\left(w \partial_{x} v\right) \partial_{x} \dot{\Delta}_{j} u\right)=\int_{\mathbb{R}}\left[\dot{\Delta}_{j}, w\right] \partial_{x} v \partial_{x} u_{j}-\int_{\mathbb{R}}\left[\dot{\Delta}_{j}, w\right] \partial_{x} u \partial_{x} v_{j}
$$

Hence, using (79),

$$
\begin{aligned}
\mid \int_{\mathbb{R}}\left(\dot{\Delta}_{j} \partial_{x}\left(w \partial_{x} u\right) \dot{\Delta}_{j} v+\dot{\Delta}_{j}\left(w \partial_{x} v\right)\right. & \left.\partial_{x} \dot{\Delta}_{j} u\right) \mid \\
& \left.\leq C c_{j} 2^{-\frac{j}{2}}\left(\|u\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}\left\|\partial_{x} v_{j}\right\|_{L^{2}}+\|v\|_{\dot{B}_{2,1}^{1}}\left\|\partial_{x} u_{j}\right\|_{L^{2}}\right)\left\|\partial_{x} w\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}\right)
\end{aligned}
$$

In order to conclude the proof of estimates for $\mathcal{L}_{j}$, one can observe that there exist two absolute constants $C$ and $c$ such that

$$
\begin{gather*}
C^{-1}\left\|\left(u_{j}, v_{j}, \partial_{x} u_{j}, \partial_{x} v_{j}\right)\right\|_{L^{2}}^{2} \leq \mathcal{L}_{j}^{2} \leq C\left\|\left(u_{j}, v_{j}, \partial_{x} u_{j}, \partial_{x} v_{j}\right)\right\|_{L^{2}}^{2}  \tag{7}\\
\text { and }\left\|v_{j}\right\|_{L^{2}}^{2}+\frac{1}{2}\left(\left\|\partial_{x} u_{j}\right\|_{L^{2}}^{2}+\left\|\partial_{x} v_{j}\right\|_{L^{2}}^{2}+\int_{\mathbb{R}} v_{j} \partial_{x} u_{j} d x\right) \geq c \min \left(1,2^{2 j}\right) \mathcal{L}_{j}^{2}
\end{gather*}
$$

Consequently, putting together with the above inequalities, we obtain

$$
\begin{equation*}
\frac{1}{2} \frac{d}{d t} \mathcal{L}_{j}^{2}+c \min \left(1,2^{2 j}\right) \mathcal{L}_{j}^{2} \leq C c_{j} 2^{-\frac{j}{2}}\left\|\partial_{x} w\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}\left\|\left(u, v, \partial_{x} u, \partial_{x} v\right)\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}} \mathcal{L}_{j} \tag{8}
\end{equation*}
$$

Then, integrating on $[0, t]$ for $t \in[0, T]$ and using Lemma A. 1 yields

$$
\begin{align*}
& 2^{\frac{j}{2}}\left\|\left(u_{j}, v_{j}, \partial_{x} u_{j}, \partial_{x} v_{j}\right)(t)\right\|_{L^{2}}+\min \left(1,2^{2 j}\right) 2^{\frac{j}{2}} \int_{0}^{t}\left\|\left(u_{j}, v_{j}, \partial_{x} u_{j}, \partial_{x} v_{j}\right)\right\|_{L^{2}}  \tag{9}\\
& \leq C\left(2^{\frac{j}{2}}\left\|\left(u_{j}, v_{j}, \partial_{x} u_{j}, \partial_{x} v_{j}\right)(0)\right\|_{L^{2}}+\int_{0}^{t} c_{j}\left\|\left(u, v, \partial_{x} u, \partial_{x} v\right)\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}\left\|\partial_{x} w\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}\right) .
\end{align*}
$$

Since (direct) damping is present in the equation for $v$, one can expect $v$ to have better decay and time integrability properties than $u$. In fact, as explained at the beginning of Section 3, it is even better to consider the function $z \triangleq v+\partial_{x} u$ that satisfies:

$$
\partial_{t} z+z+w \partial_{x} z=-\partial_{x x}^{2} v-\partial_{x} w \partial_{x} u
$$

Now, applying Operator $\dot{\Delta}_{j}$ to the above equation, then using the basic energy method gives:

$$
\frac{1}{2} \frac{d}{d t}\left\|z_{j}\right\|_{L^{2}}^{2}+\left\|z_{j}\right\|_{L^{2}}^{2}=-\int_{\mathbb{R}} z_{j} \partial_{x x}^{2} v_{j}-\int_{\mathbb{R}} \dot{\Delta}_{j}\left(w \partial_{x} z\right) z_{j}-\int_{\mathbb{R}} \dot{\Delta}_{j}\left(\partial_{x} w \partial_{x} u\right) z_{j} .
$$

The last term may be handled thanks to the decomposition (6), integration by parts (as above) and Inequality (79) with $s=1 / 2$. This gives

$$
\frac{1}{2} \frac{d}{d t}\left\|z_{j}\right\|_{L^{2}}^{2}+\left\|z_{j}\right\|_{L^{2}}^{2} \leq\left\|z_{j}\right\|_{L^{2}}\left(\left\|\partial_{x x}^{2} v_{j}\right\|_{L^{2}}+C 2^{-\frac{j}{2}} c_{j}\left\|\partial_{x} w\right\|_{\dot{B}_{2,1}^{\frac{1}{2}}}\|z\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}+\left\|\dot{\Delta}_{j}\left(\partial_{x} w \partial_{x} u\right)\right\|_{L^{2}}\right)
$$

After time integration (use Lemma A.1), we end up for all $t \in[0, T]$ with

$$
\begin{aligned}
2^{\frac{j}{2}}\left\|z_{j}(t)\right\|_{L^{2}}+2^{\frac{j}{2}} \int_{0}^{t}\left\|z_{j}\right\|_{L^{2}} \leq & 2^{\frac{j}{2}}\left\|z_{j}(0)\right\|_{L^{2}} \\
& +2^{\frac{j}{2}} \int_{0}^{t}\left\|\partial_{x x}^{2} v_{j}\right\|_{L^{2}}+C \int_{0}^{t} c_{j}\left(\left\|\partial_{x} w\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}\|z\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}+\left\|\partial_{x} w \partial_{x} u\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}\right)
\end{aligned}
$$

Hence, summing up on $j \leq 0$ and using the stability of the space $\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}$ by product yields

$$
\begin{equation*}
\|z(t)\|_{\dot{\mathbb{B}}_{2,1}^{\ell}}^{\ell}+\int_{0}^{t}\|z\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}^{\ell} \leq\left\|z_{0}\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}^{\ell}+C \int_{0}^{t}\|v\|_{\dot{\mathbb{B}}_{2,1}^{\ell}}^{\ell}+C \int_{0}^{t}\left\|\partial_{x} w\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}\left(\|z\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}+\left\|\partial_{x} u\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}\right) . \tag{10}
\end{equation*}
$$

Let us sum (9) on $j \in \mathbb{Z}$, then add (10) multiplied by a small enough constant. Using (7) and denoting $X(t) \triangleq\left\|\left(u, v, \partial_{x} u, \partial_{x} v\right)(t)\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}$, we eventually get

$$
\begin{equation*}
X(t)+\int_{0}^{t}\left(\|(u, v)\|_{\dot{\mathbb{B}}_{2,1}^{\frac{5}{2}}}^{\ell}+\|(u, v)\|_{\dot{\mathbb{B}}_{2,1}^{3}}^{h}+\left\|v+\partial_{x} u\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}^{\ell}\right) \leq C\left(X(0)+\int_{0}^{t}\left\|\partial_{x} w\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}} X\right) . \tag{11}
\end{equation*}
$$

Let us revert to our toy model, assuming that $w=v$. Then, denoting by $Y(t)$ the left-hand side of (11), we get

$$
Y(t) \leq C\left(X(0)+Y^{2}(t)\right)
$$

As $Y(0)=X(0)$, a continuity argument ensures that there exists $c_{0}>0$ such that if

$$
\begin{equation*}
X(0) \approx\left\|\left(u_{0}, v_{0}\right)\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}} \cap \dot{\dot{B}}_{2,1}^{\frac{3}{2}}} \leq c_{0} \tag{12}
\end{equation*}
$$

then we have

$$
Y(t) \leq 2 C X(0) \quad \text { for all } t \in[0, T]
$$

2.2. Proof of Theorem 1.2, For getting decay estimates without any additional smallness condition, the first step is to prove that the extra negative regularity for low frequencies is preserved through the time evolution. This is stated in the following lemma which is an adaptation to our setting of a result first proved by J. Xu and Z. Xin in [32] for the compressible Navier-Stokes system.

Lemma 2.1. Let $\left.\left.\sigma_{1} \in\right]-\frac{3}{2}, \frac{1}{2}\right]$. If, in addition to the hypotheses of Theorem $1.1,\left\|\left(u_{0}, v_{0}\right)\right\|_{\mathbb{B}_{2, \infty}^{-\sigma_{1}}}$ is bounded then, for all $t \geq 0$, we have

$$
\|(u, v)(t)\|_{\dot{\mathbb{B}}_{2, \infty}^{-\sigma_{1}}} \leq C\left\|\left(u_{0}, v_{0}\right)\right\|_{\dot{\mathbb{B}}_{2, \infty}^{-\sigma_{1}}}
$$

Proof. Applying $\dot{\Delta}_{j}$ to $(T M)$ yields

$$
\left\{\begin{array}{l}
\partial_{t} u_{j}+\partial_{x} v_{j}=-v \partial_{x} u_{j}+\left[v, \dot{\Delta}_{j}\right] \partial_{x} u \\
\partial_{t} v_{j}+\partial_{x} u_{j}+v_{j}=-v \partial_{x} v_{j}+\left[v, \dot{\Delta}_{j}\right] \partial_{x} v
\end{array}\right.
$$

Hence, an energy method, followed by time integration (use Lemma A.1) gives

$$
\begin{aligned}
\left\|\left(u_{j}, v_{j}\right)(t)\right\|_{L^{2}}+\int_{0}^{t}\left\|v_{j}\right\|_{L^{2}} & \leq\left\|\left(u_{j}, v_{j}\right)(0)\right\|_{L^{2}} \\
& +\frac{1}{2} \int_{0}^{t}\left\|\partial_{x} v\right\|_{L^{\infty}}\left\|\left(u_{j}, v_{j}\right)\right\|_{L^{2}}+\int_{0}^{t}\left\|\left[v, \dot{\Delta}_{j}\right] \partial_{x} u\right\|_{L^{2}}+\int_{0}^{t}\left\|\left[v, \dot{\Delta}_{j}\right] \partial_{x} v\right\|_{L^{2}}
\end{aligned}
$$

Omitting the second term in the left-hand side, and using the commutator estimate (80) that is valid provided $-1 / 2 \leq-\sigma_{1}<3 / 2$, we get

$$
\|(u, v)(t)\|_{\dot{\mathbb{B}}_{2, \infty}^{-\sigma_{1}}} \leq\left\|\left(u_{0}, v_{0}\right)\right\|_{\dot{\mathbb{B}}_{2, \infty}^{-\sigma_{1}}}+C \int_{0}^{t}\left\|\partial_{x} v\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}\|(u, v)\|_{\dot{\mathbb{B}}_{2, \infty}^{-\sigma_{1}}}
$$

Hence, by Gronwall lemma,

$$
\|(u, v)(t)\|_{\dot{\mathbb{B}}_{2, \infty}^{-\sigma_{1}}} \leq\left\|\left(u_{0}, v_{0}\right)\right\|_{\dot{\mathbb{B}}_{2, \infty}^{-\sigma_{1}}} \exp \left(C \int_{0}^{t}\left\|\partial_{x} v\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}\right)
$$

Since the term in the exponential is small (as $X(0)$ is small), we get the lemma.
The second ingredient is that one can work out from the computations we did in the previous paragraph, a Lyapunov functional that is equivalent to the norm of $(u, v)$ in $\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}} \cap \dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}$. To proceed, observe that, on the one hand, Inequality (8) implies that for all $t \geq 0$,

$$
\begin{aligned}
\mathcal{L}(t)+c \int_{0}^{t} \mathcal{H} \leq \mathcal{L}(0)+C \int_{0}^{t}\left\|\partial_{x} v\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}} \mathcal{L} \\
\quad \text { with } \quad \mathcal{L} \triangleq \sum_{j \in \mathbb{Z}} 2^{\frac{j}{2}} \mathcal{L}_{j} \quad \text { and } \quad \mathcal{H} \triangleq \sum_{j \in \mathbb{Z}} 2^{\frac{j}{2}} \min \left(1,2^{2 j}\right) \mathcal{L}_{j}
\end{aligned}
$$

and that, on the other hand, (10) gives us

$$
\left\|\left(v+\partial_{x} u\right)(t)\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}^{\ell}+\int_{0}^{t}\left\|v+\partial_{x} u\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}^{\ell} \leq\left\|v_{0}+\partial_{x} u_{0}\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}^{\ell}+C \int_{0}^{t}\|v\|_{\dot{\mathbb{B}}_{2,1}^{\frac{5}{2}}}^{\ell}+C \int_{0}^{t}\left\|\partial_{x} v\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}} \mathcal{L} .
$$

Hence, there exist $\eta>0$ and $c^{\prime}>0$ such that, denoting $\widetilde{\mathcal{L}} \triangleq \mathcal{L}+\eta\left\|v+\partial_{x} u\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}^{\ell}$, we have

$$
\widetilde{\mathcal{L}}(t)+c^{\prime} \int_{0}^{t} \widetilde{\mathcal{H}} \leq \widetilde{\mathcal{L}}(0)+C \int_{0}^{t}\left\|\partial_{x} v\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}} \mathcal{L} \quad \text { with } \quad \widetilde{\mathcal{H}} \triangleq \mathcal{H}+\eta\left\|v+\partial_{x} u\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}^{\ell}
$$

Observe that $\widetilde{\mathcal{H}} \gtrsim\left\|\partial_{x} v\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}$. Since the previous step ensures that $\mathcal{L} \lesssim X(0)$, one can conclude that the last term of the above inequality may be absorbed by the second term of the left-hand side provided $X(0)$ is small enough. So finally, taking $c^{\prime}$ smaller if need be, we discover that

$$
\widetilde{\mathcal{L}}(t)+c^{\prime} \int_{0}^{t} \widetilde{\mathcal{H}} \leq \widetilde{\mathcal{L}}(0)
$$

Clearly, one can start the proof from any time $t_{0} \geq 0$ and get in a similar way:

$$
\widetilde{\mathcal{L}}\left(t_{0}+h\right)+c^{\prime} \int_{t_{0}}^{t_{0}+h} \widetilde{\mathcal{H}} \leq \widetilde{\mathcal{L}}\left(t_{0}\right), \quad h \geq 0
$$

This of course ensures that $\widetilde{\mathcal{L}}$ is nonincreasing on $\mathbb{R}^{+}$(hence differentiable almost everywhere) and that for all $t_{0} \geq 0$ and $h>0$,

$$
\frac{\widetilde{\mathcal{L}}\left(t_{0}+h\right)-\widetilde{\mathcal{L}}\left(t_{0}\right)}{h}+c^{\prime} \frac{1}{h} \int_{t_{0}}^{t_{0}+h} \widetilde{\mathcal{H}} \leq 0 .
$$

Consequently, passing to the limit $h \rightarrow 0$ gives

$$
\begin{equation*}
\frac{d}{d t} \widetilde{\mathcal{L}}+c^{\prime} \widetilde{\mathcal{H}} \leq 0 \quad \text { a. e. on } \mathbb{R}^{+} \tag{13}
\end{equation*}
$$

We thus come to the conclusion that:
Lemma 2.2. There exist two functionals $\widetilde{\mathcal{L}}$ and $\widetilde{\mathcal{D}}$ satisfying

$$
\widetilde{\mathcal{L}} \simeq\|(u, v)\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}} \cap \dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}} \quad \text { and } \quad \widetilde{\mathcal{D}} \simeq\|u\|_{\dot{\mathbb{B}}_{2,1}^{\frac{5}{2}}}^{\ell}+\|u\|_{\dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}}^{h}+\|v\|_{\dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}},
$$

and such that if $\left\|\left(u_{0}, v_{0}\right)\right\|_{\dot{B}_{2,1}^{\frac{1}{2}} \cap \dot{B}_{2,1}^{\frac{3}{2}}}$ is small enough then (13) is satisfied.
One can now tackle the proof of decay estimates. Let us denote

$$
C_{0} \triangleq\left\|\left(u_{0}, v_{0}\right)\right\|_{\dot{\mathbb{B}}_{2, \infty}^{-\sigma_{1}}}^{\ell}+\left\|\left(u_{0}, v_{0}\right)\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}}^{h} .
$$

As a first, observe that interpolation for homogeneous Besov norms gives us:

$$
\|(u, v)\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}^{\ell} \lesssim\left(\|(u, v)\|_{\dot{\mathbb{B}}_{2, \infty}^{-\sigma_{1}}}^{\ell}\right)^{\theta_{0}}\left(\|(u, v)\|_{\dot{\mathbb{B}}_{2,1}^{\frac{5}{2}}}^{\ell}\right)^{1-\theta_{0}} \quad \text { with } \quad \theta_{0} \triangleq \frac{2}{5 / 2+\sigma_{1}} .
$$

Therefore, owing to Lemma 2.1, there exists $c>0$ such that

$$
\|(u, v)\|_{\dot{\mathbb{B}}_{2,1}^{\frac{5}{2}}}^{\ell} \geq c C_{0}^{-\frac{\theta_{0}}{1-\theta_{0}}}\left(\|(u, v)\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}^{\ell}\right)^{\frac{1}{1-\theta_{0}}} .
$$

Note that our definition of $C_{0}$ and the estimates we proved for $(u, v)$ in the previous paragraph also ensure that

$$
\|(u, v)\|_{\dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}}^{h} \gtrsim C_{0}^{-\frac{\theta_{0}}{1-\theta_{0}}}\left(\|(u, v)\|_{\dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}}^{h}\right)^{\frac{1}{1-\theta_{0}}} .
$$

Hence, thanks to the above lemma, we have,

$$
\frac{d}{d t} \widetilde{\mathcal{L}}+c C_{0}^{-\frac{\theta_{0}}{1-\theta_{0}}} \widetilde{\mathcal{L}}^{\frac{1}{1-\theta_{0}}} \leq 0 \quad \text { with } \quad \widetilde{\mathcal{L}} \simeq\|(u, v)\|_{\dot{B}_{2,1}^{\frac{1}{2}} \cap \dot{\dot{B}}_{2,1}^{\frac{3}{2}}}
$$

Integrating, this gives us

$$
\widetilde{\mathcal{L}}(t) \leq\left(1+\kappa_{0} t\right)^{1-\frac{1}{\theta_{0}}} \widetilde{\mathcal{L}}(0) \quad \text { with } \quad \kappa_{0} \triangleq c \frac{\theta_{0}}{1-\theta_{0}}\left(\frac{\widetilde{\mathcal{L}}(0)}{C_{0}}\right)^{\frac{\theta_{0}}{1-\theta_{0}}}
$$

Rewriting $\theta_{0}$ in terms of $\sigma_{1}$ and using that $\left\|\left(u_{0}, v_{0}\right)\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}} \cap \dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}} \lesssim C_{0}$, we get

$$
\begin{equation*}
\|(u, v)(t)\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}} \cap \dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}} \leq C(1+t)^{-\alpha_{1}}\left\|\left(u_{0}, v_{0}\right)\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}} \dot{\dot{B}_{2,1}^{2}}} \quad \text { with } \quad \alpha_{1} \triangleq \frac{1}{2}\left(\sigma_{1}+\frac{1}{2}\right) \tag{14}
\end{equation*}
$$

In order to get the decay rate in $\dot{\mathbb{B}}_{2,1}^{\sigma}$ for all $\sigma \in\left(-\sigma_{1}, 1 / 2\right)$, we just need the interpolation inequality

$$
\|(u, v)\|_{\dot{\mathbb{B}}_{2,1}^{\sigma}} \leq\|(u, v)\|_{\dot{\mathbb{R}}_{2, \infty}^{-\sigma_{1}}}^{\theta_{1}}\|(u, v)\|_{\dot{\mathbb{B}}_{2,1}^{2}}^{1-\theta_{1}} \quad \text { with } \quad \theta_{1} \triangleq \frac{1 / 2-\sigma}{1 / 2+\sigma_{1}} \in(0,1) .
$$

In the end, we get (since $\kappa_{0} \lesssim 1$ ):

$$
\|(u, v)(t)\|_{\dot{\mathbb{B}}_{2,1}^{\sigma}} \leq C\left(1+\kappa_{0} t\right)^{-\frac{\sigma+\sigma_{1}}{2}}\left\|\left(u_{0}, v_{0}\right)\right\|_{\mathbb{B}_{2, \infty}}^{\theta_{1}} \theta_{1}\left\|\left(u_{0}, v_{0}\right)\right\|_{\dot{B}_{2,1}^{2} \cap \dot{B}_{2,1}^{\frac{1}{2}}}^{1-\theta_{1}} .
$$

In order to improve the decay for the damped component $v$, let us start from

$$
\partial_{t} v+v=-\frac{1}{2} \partial_{x}\left(v^{2}\right)-\partial_{x} u .
$$

As $v_{0}^{\ell}$ is in $\dot{\mathbb{B}}_{2, \infty}^{-\sigma_{1}}$ for some $\left.\left.\sigma_{1} \in\right]-\frac{1}{2}, \frac{1}{2}\right]$, we get

$$
\begin{equation*}
\|v(t)\|_{\dot{\mathbb{B}}_{2, \infty}^{-\sigma_{1}}}^{\ell} \leq e^{-t}\left\|v_{0}\right\|_{\dot{\mathbb{B}}_{2, \infty}^{-\sigma_{1}}}^{\ell}+\int_{0}^{t} e^{-(t-\tau)}\left\|\left(\partial_{x} v^{2}, \partial_{x} u\right)\right\|_{\dot{\mathbb{B}}_{2, \infty}^{-\sigma_{1}}}^{\ell} d \tau . \tag{15}
\end{equation*}
$$

It is important to observe that, as $1-\sigma_{1} \geq 1 / 2$,

$$
\begin{equation*}
\left\|\partial_{x} z\right\|_{\dot{\mathbb{B}}_{2, \infty}^{-\sigma_{1}}}^{\ell} \lesssim\|z\|_{\dot{B}_{2,1}^{1}}^{\ell} . \tag{16}
\end{equation*}
$$

Hence, multiplying (15) by $\langle t\rangle^{\alpha_{1}}$ and using the product laws in Besov spaces recalled in Proposition A. 3 yields:

$$
\left\|\langle t\rangle^{\alpha_{1}} v(t)\right\|_{\dot{\mathbb{R}}_{2, \infty}^{-\sigma_{1}}}^{\ell} \leq\left\|v_{0}\right\|_{\mathbb{B}_{2, \infty}^{-\sigma_{1}}}^{\ell}+\int_{0}^{t}\langle t\rangle^{\alpha_{1}} e^{-(t-\tau)}\|u\|_{\dot{\mathbb{B}}_{2, \infty}^{1-\sigma_{1}}}^{\ell} d \tau+\int_{0}^{t}\langle t\rangle^{\alpha_{1}} e^{-(t-\tau)}\|v\|_{\mathbb{B}_{2,1}^{\frac{1}{2}}}^{2} d \tau,
$$

and one can conclude as above that

$$
\langle t\rangle^{\alpha_{1}}\|v(t)\|_{\dot{\mathbb{B}}_{2, \infty}^{-\sigma_{1}}} \lesssim\left\|\left(u_{0}, v_{0}\right)\right\|_{\dot{\mathbb{B}}_{2, \infty}^{-\sigma_{1}}}+\left\|\left(u_{0}, v_{0}\right)\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2} \cap \dot{B}_{2,1}^{3}}}
$$

Let us finally exhibit the (optimal) decay rate of the high frequencies for the norm in $\dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}$. Recall that for $j \geq 0$, we have

$$
\frac{d}{d t} \mathcal{L}_{j}^{2}+c \mathcal{L}_{j}^{2} \lesssim \mathcal{L}_{j}^{2}\left\|\partial_{x} v\right\|_{L^{\infty}}+c_{j} 2^{-\frac{j}{2}} X\left\|\partial_{x} v\right\|_{\dot{B}_{2,1}^{\frac{1}{2}}} \mathcal{L}_{j} .
$$

Hence, using Lemma A.1 multiplying by $2^{\frac{j}{2}}$, summing up on $j \geq 0$ and remembering that

$$
\sum_{j \geq 0} 2^{\frac{j}{2}} \mathcal{L}_{j} \simeq\|(u, v)\|_{\dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}}^{h},
$$

we get

$$
\begin{equation*}
\|(u, v)(t)\|_{\dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}}^{h} \lesssim e^{-c t}\left\|\left(u_{0}, v_{0}\right)\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}}^{h}+\int_{0}^{t} e^{-c(t-\tau)}\|v\|_{\dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}}\|(u, v)\|_{\dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}} \tag{17}
\end{equation*}
$$

Multiplying both sides by $\langle t\rangle^{2 \alpha_{1}}$, we get

$$
\begin{aligned}
&\left\|\langle t\rangle^{2 \alpha_{1}}(u, v)(t)\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}}^{h} \lesssim\langle t\rangle^{2 \alpha_{1}} e^{-c t}\left\|\left(u_{0}, v_{0}\right)\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}}^{h} \\
&+\int_{0}^{t}\left(\frac{\langle t\rangle}{\langle\tau\rangle}\right)^{2 \alpha_{1}} e^{-c(t-\tau)}\left(\langle\tau\rangle^{\alpha_{1}}\|v\|_{\dot{\mathbb{B}}_{2,1}^{3}}\right)\left(\langle\tau\rangle^{\alpha_{1}}\|(u, v)\|_{\dot{\mathbb{B}}_{2,1}^{3}}\right)
\end{aligned}
$$

Taking advantage of (14) for bounding the norms in the time integral, one ends up with the desired decay estimate for $\|(u, v)(t)\|_{\dot{B}_{2,1}^{2}}^{h}$. This completes the proof of Theorem 1.2,

Remark 2.1. In the same way, making the slightly stronger assumption that $v_{0}^{\ell} \in \dot{\mathbb{B}}_{2,1}^{-\frac{1}{2}}$, we get

$$
\langle t\rangle^{\alpha_{1}}\|v(t)\|_{\dot{\mathbb{B}}_{2,1}^{-\frac{1}{2}}} \lesssim\left\|v_{0}\right\|_{\dot{\mathbb{B}}_{2,1}^{-\frac{1}{2}}}+\left\|\left(u_{0}, v_{0}\right)\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}} \cap \dot{B}_{2,1}^{\frac{3}{2}}} .
$$

## 3. Proof of Theorem 1.1

An explicit computation in the Fourier space of the solution to (LTM) with $w=0$ reveals that:

- In low frequencies, the matrix of the system corresponding to frequency $\xi$ has two real eigenvalues that tend to be equal to 1 and to $\xi^{2}$, for $\xi$ going to 0 ;
- In high frequencies, two complex conjugated eigenvalues coexist, that are, asymptotically, equal to $\frac{1}{2}\left(\xi^{2} \pm i \xi\right)$.
Consequently, one can expect that the low frequency part of System (TM) is solvable in some $L^{p}$ type functional framework with, possibly, $p \neq 2$, whereas going beyond the $L^{2}$ framework in high frequency is bound to fail. A similar dichotomy has been observed for the compressible Navier-Stokes equations (see in particular [6, 7, 17]) but the behavior of the low and high frequencies in our situation is exchanged.

In order to extend the results of the previous section to the $L^{p}$ framework for low frequencies, we shall adapt [17] to our setting, introducing an 'effective velocity' that reads $z=v+\partial_{x} u$ and may be seen as an approximate dissipative eigenmode of the system, in the low frequency regime.

The bulk of the proof consists in establishing estimates in the functional framework of Theorem 1.1 for $(L T M)$. This will be carried out in the first two subsections of this part. Then, we will prove the existence part of the theorem and, finally, the uniqueness of a solution.
3.1. Low frequencies estimates in $L^{p}$. The main result of this section reads as follows.

Proposition 3.1. Let $(u, v)$ be a smooth solution of $(L T M)$ on $[0, T]$. Then, for all $1 \leq p<\infty$, we have

$$
\begin{align*}
\|(u, v)(t)\|_{\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}}}^{\ell}+\int_{0}^{t}\|u\|_{\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}+2}}^{\ell}+ & \int_{0}^{t}\left\|v+\partial_{x} u\right\|_{\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}}}^{\ell}  \tag{18}\\
& \leq C\left(\left\|\left(u_{0}, v_{0}\right)\right\|_{\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}}}^{\ell}+\int_{0}^{t}\left\|\left(u, v, \partial_{x} u\right)\right\|_{\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}}}\|w\|_{\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}+1}}\right) .
\end{align*}
$$

Proof. Let us set $z \triangleq v+\partial_{x} u$. We observe that the couple $(u, z)$ satisfies

$$
\left\{\begin{array}{l}
\partial_{t} u-\partial_{x x}^{2} u+w \partial_{x} u=-\partial_{x} z  \tag{19}\\
\partial_{t} z+z+w \partial_{x} z=\partial_{x x x}^{3} u-\partial_{x x}^{2} z-\partial_{x} w \partial_{x} u
\end{array}\right.
$$

In low frequencies, we expect the linear terms of the right-hand side to be negligible, so that we will look at the first equation as a heat equation with a convection term, and at the second one as a damped transport equation.

Now, applying $\dot{\Delta}_{j}$ to the first equation of (19) yields

$$
\begin{aligned}
\partial_{t} u_{j}-\partial_{x x}^{2} u_{j} & =-\dot{\Delta}_{j}\left(w \partial_{x} u\right)-\partial_{x} z_{j} \\
& =-w \partial_{x} u_{j}-\partial_{x} z_{j}+\left[w, \dot{\Delta}_{j}\right] \partial_{x} u .
\end{aligned}
$$

Multiplying by $\left|u_{j}\right|^{p-2} u_{j}$ and integrating in space, we get

$$
\begin{aligned}
& \frac{1}{p} \frac{d}{d t}\left\|u_{j}\right\|_{L^{p}}^{p}-\int_{\mathbb{R}} \partial_{x x}^{2} u_{j}\left|u_{j}\right|^{p-2} u_{j} \\
&=-\int_{\mathbb{R}} \partial_{x} z_{j}\left|u_{j}\right|^{p-2} u_{j}-\int_{\mathbb{R}} w \partial_{x} u_{j}\left|u_{j}\right|^{p-2} u_{j}+\int_{\mathbb{R}}\left[w, \dot{\Delta}_{j}\right] \partial_{x} u\left|u_{j}\right|^{p-2} u_{j} .
\end{aligned}
$$

Hence, integrating by parts, using Cauchy-Schwarz inequality and Proposition A. 1 gives

$$
\frac{1}{p} \frac{d}{d t}\left\|u_{j}\right\|_{L^{p}}^{p}+c_{p} 2^{2 j}\left\|u_{j}\right\|_{L^{p}}^{p} \leq \frac{1}{p}\left\|\partial_{x} w\right\|_{L^{\infty}}\left\|u_{j}\right\|_{L^{p}}^{p}+\left(\left\|\partial_{x} z_{j}\right\|_{L^{p}}+\left\|\left[w, \dot{\Delta}_{j}\right] \partial_{x} u\right\|_{L^{p}}\right)\left\|u_{j}\right\|_{L^{p}}^{p-1}
$$

Multiplying by $2^{\frac{j}{p}}$, summing up on $j \leq J_{0}$ and using Lemma A. 1 we obtain

$$
\begin{aligned}
\|u(t)\|_{\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}}}^{\ell}+c_{p} & \int_{0}^{t}\|u\|_{\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}+2}}^{\ell} \\
& \leq\left\|u_{0}\right\|_{\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}}}^{\ell}+\int_{0}^{t}\|z\|_{\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}+1}}^{\ell}+\frac{1}{p} \int_{0}^{t}\left\|\partial_{x} w\right\|_{L^{\infty}}\|u\|_{\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}}}^{\ell}+\sum_{j \leq J_{0}} 2^{\frac{j}{p}} \int_{0}^{t}\left\|\left[w, \dot{\Delta}_{j}\right] \partial_{x} u\right\|_{L^{p}} .
\end{aligned}
$$

The commutator term may be bounded according to Inequality (79) with $s=1 / p$. Hence, remembering that $\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}} \hookrightarrow L^{\infty}$, we end up with

$$
\begin{equation*}
\|u(t)\|_{\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}}}^{\ell}+c_{p} \int_{0}^{t}\|u\|_{\dot{\mathbb{B}}_{p, 1}^{p}}^{\ell} \leq\left\|u_{0}\right\|_{\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}}}^{\ell}+\int_{0}^{t}\|z\|_{\dot{\mathbb{B}}_{p, 1}^{p}}^{\ell}{ }^{\frac{1}{p}+1}+C \int_{0}^{t}\|w\|_{\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}+1}}\|u\|_{\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}}} . \tag{20}
\end{equation*}
$$

Let us next look at the second equation of (19). We have for all $j \in \mathbb{Z}$,

$$
\partial_{t} z_{j}+z_{j}+w \partial_{x} z_{j}=\partial_{x x x}^{3} u_{j}-\partial_{x x}^{2} z_{j}-\dot{\Delta}_{j}\left(\partial_{x} w \partial_{x} u\right)+\left[w, \dot{\Delta}_{j}\right] \partial_{x} z
$$

Multiplying by $z_{j}\left|z_{j}\right|^{p-2}$ and adapting what we did for the for the first equation of (LTM) , we obtain

$$
\begin{aligned}
&\|z(t)\|_{\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}}}^{\ell}+\int_{0}^{t}\|z\|_{\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}}}^{\ell} \leq\left\|z_{0}\right\|_{\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}}}^{\ell}+\int_{0}^{t}\|z\|_{\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}+2}}^{\ell}+\int_{0}^{t}\|u\|_{\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}+3}}^{\ell}+\frac{1}{p} \int_{0}^{t}\left\|\partial_{x} w\right\|_{L^{\infty}}\|z\|_{\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}}}^{\ell} \\
&+\int_{0}^{t} \sum_{j \leq J_{0}} 2^{\frac{j}{p}}\left\|\left[w, \dot{\Delta}_{j}\right] \partial_{x} z\right\|_{L^{p}}+\int_{0}^{t}\left\|\partial_{x} w \partial_{x} u\right\|_{\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}}}^{\ell}
\end{aligned}
$$

Combining Proposition A.2, the commutator estimate (79), the embedding $\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}} \hookrightarrow L^{\infty}$ and Proposition A.3, we discover that

$$
\begin{align*}
\|z(t)\|_{\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}}}^{\ell}+\int_{0}^{t}\|z\|_{\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}}}^{\ell} \leq\left\|z_{0}\right\|_{\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}}}^{\ell}+ & \int_{0}^{t}\|z\|_{\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}+2}}^{\ell}+\int_{0}^{t}\|u\|_{\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}+3}}^{\ell}  \tag{21}\\
& +\int_{0}^{t}\|w\|_{\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}+1}}\|z\|_{\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}}}+\int_{0}^{t}\left\|\partial_{x} w\right\|_{\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}}}\left\|\partial_{x} u\right\|_{\dot{\mathbb{B}}_{p, 1}^{p}} .
\end{align*}
$$

At this stage, the key observation is that, owing to Bernstein inequality, there exists an absolute constant $C$ such that for any couple $\left(\sigma, \sigma^{\prime}\right) \in \mathbb{R}^{2}$ with $\sigma \leq \sigma^{\prime}$, we have

$$
\begin{equation*}
\|f\|_{\mathbb{B}_{p, 1}^{\sigma^{\prime}}}^{\ell} \leq C 2^{J_{0}\left(\sigma^{\prime}-\sigma\right)}\|f\|_{\stackrel{\mathbb{B}}{p, 1}_{\prime}^{\ell}}^{\ell} \tag{22}
\end{equation*}
$$

Consequently, if $J_{0}$ is chosen small enough, then after adding up (20) and (21), we just get

$$
\begin{aligned}
&\|(u, z)(t)\|_{\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}}}^{\ell}+\int_{0}^{t}\left(\|u\|_{\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}+2}}^{\ell}+\|z\|_{\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}}}^{\ell}\right) \lesssim\left\|\left(u_{0}, z_{0}\right)\right\|_{\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}}}^{\ell} \\
&+\int_{0}^{t}\|w\|_{\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}+1}}\left(\|u\|_{\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}+1}}+\|u\|_{\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}}}+\|z\|_{\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}}}\right) .
\end{aligned}
$$

Because

$$
\|z\|_{\dot{B}_{p, 1}^{\frac{1}{p}}} \lesssim\|u\|_{\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}+1}}+\|v\|_{\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}}} \quad \text { and } \quad\|v\|_{\dot{B}_{p, 1}^{1}}^{\ell} \underset{\dot{B}_{\dot{p}}^{p}}{ } \lesssim\|z\|_{\dot{B}_{p, 1}^{\frac{1}{p}}}^{\ell}+\|u\|_{\dot{B}_{p, 1}^{1}}^{\ell},
$$

we conclude to the desired inequality.
3.2. High frequencies estimates in $L^{2}$. Our second task is to bound the high frequencies of the solution of $(L T M)$. Although the functional framework for high frequencies is the same as before, one cannot repeat exactly the computations therein since the terms $\left(w \partial_{x} u\right)^{h}$ and $\left(w \partial_{x} v\right)^{h}$ contain a little amount of low frequencies of $w, u$ and $v$, that are only in spaces of the type $\dot{\mathbb{B}}_{p, 1}^{s}$ with $p>2$ (and thus not in some $\dot{\mathbb{B}}_{2,1}^{s^{\prime}}$ ). To overcome the difficulty, we have to study more carefully the commutators coming into play in the proof (see Lemma A.3).

Proposition 3.2. Let $(u, v)$ be of solution of $(L T M)$ with $u_{0}^{\ell}, v_{0}^{\ell} \in \dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}}$ and $u_{0}^{h}, v_{0}^{h} \in \dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}$ for some $2 \leq p \leq 4$. Define $p^{*}$ by the relation $1 / p+1 / p^{*}=1 / 2$. Then, the following a priori estimate holds for some constant $C$ depending only on $J_{0}$ :

$$
\begin{aligned}
& \|(u, v)(t)\|_{\dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}}^{h}+\int_{0}^{t}\|(u, v)\|_{\dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}}^{h} \lesssim\left\|\left(u_{0}, v_{0}\right)\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}}^{h}+\int_{0}^{t}\left(\left\|\partial_{x} w\right\|_{L^{\infty}}\|(u, v)\|_{\dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}}^{h}\right. \\
& \left.\quad+\|w\|_{\dot{\mathbb{B}}_{p^{*}, 1}^{\ell}+\frac{1}{p^{*}}}^{l}\left\|\left(\partial_{x} u, \partial_{x} v\right)\right\|_{\dot{\mathbb{B}}_{p, 1}^{1}}^{\frac{1}{p-1}}+\left\|\left(\partial_{x} u, \partial_{x} v\right)\right\|_{L^{\infty}}\|w\|_{\dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}}^{h}+\left\|\left(\partial_{x} u, \partial_{x} v\right)\right\|_{\dot{\mathbb{B}}_{p, 1}^{1-\frac{1}{p}}}^{\ell}\left\|\partial_{x} w\right\|_{\dot{\mathbb{B}}_{p^{*}, 1}^{\ell}-\frac{1}{p^{*}}}^{\ell}\right) .
\end{aligned}
$$

Proof. We localize System ( $L T M$ ) by means of $\dot{\Delta}_{j}$, getting

$$
\left\{\begin{array}{c}
\partial_{t} u_{j}+\partial_{x} v_{j}+\dot{S}_{j-1} w \partial_{x} u_{j}=R_{j}^{1} \\
\partial_{t} v_{j}+\partial_{x} u_{j}+v_{j}+\dot{S}_{j-1} w \partial_{x} v_{j}=R_{j}^{2}
\end{array}\right.
$$

with

$$
R_{j}^{1} \triangleq \dot{S}_{j-1} w \partial_{x} u_{j}-\dot{\Delta}_{j}\left(w \partial_{x} u\right) \quad \text { and } \quad R_{j}^{2} \triangleq \dot{S}_{j-1} w \partial_{x} v_{j}-\dot{\Delta}_{j}\left(w \partial_{x} v\right)
$$

The remainder terms $R_{j}^{1}$ and $R_{j}^{2}$ will be bounded according to Lemma A.3. To handle the left-hand side of the above localized system, we introduce the following functional, designed for high frequencies:

$$
\widetilde{\mathcal{L}}_{j}^{2} \triangleq\left\|\left(\partial_{x} u_{j}, \partial_{x} v_{j}\right)\right\|_{L^{2}}^{2}+\int_{\mathbb{R}} v_{j} \partial_{x} u_{j},
$$

and get

$$
\begin{aligned}
& \frac{1}{2}\left(\frac{d}{d t} \widetilde{\mathcal{L}}_{j}^{2}+\widetilde{\mathcal{L}}_{j}^{2}\right)+\int_{\mathbb{R}} \partial_{x}\left(\left(\dot{S}_{j-1} w \partial_{x} u_{j}\right) \partial_{x} u_{j}+\partial_{x}\left(\dot{S}_{j-1} w \partial_{x} v_{j}\right) \partial_{x} v_{j}\right) \\
& +\int_{\mathbb{R}}\left(\dot{S}_{j-1} w \partial_{x} v_{j} \partial_{x} u_{j}+\partial_{x}\left(\dot{S}_{j-1} w \partial_{x} u_{j}\right) v_{j}\right)=\int_{\mathbb{R}}\left(\partial_{x} R_{j}^{1} \partial_{x} u_{j}+\partial_{x} R_{j}^{2} \partial_{x} v_{j}+\frac{1}{2}\left(\partial_{x} R_{j}^{1} v_{j}+R_{j}^{2} \partial_{x} u_{j}\right)\right) .
\end{aligned}
$$

Using integration by parts and multiplying by 2 then yields

$$
\frac{d}{d t} \widetilde{\mathcal{L}}_{j}^{2}+\widetilde{\mathcal{L}}_{j}^{2}+\int_{\mathbb{R}} \partial_{x} \dot{S}_{j-1} w\left(\left(\partial_{x} u_{j}\right)^{2}+\left(\partial_{x} v_{j}\right)^{2}\right)=\int_{\mathbb{R}}\left(R_{j}^{2} \partial_{x} u_{j}-R_{j}^{1} \partial_{x} v_{j}-2 R_{j}^{1} \partial_{x}^{2} u_{j}-2 R_{j}^{2} \partial_{x}^{2} v_{j}\right)
$$

From this, using Cauchy-Schwarz inequality, that $\widetilde{\mathcal{L}}_{j} \simeq\left\|\left(\partial_{x} u_{j}, \partial_{x} v_{j}\right)\right\|_{L^{2}}$ and Lemma A.1 we get for all $t \geq 0$ and $j \geq J_{0}$,

$$
\widetilde{\mathcal{L}}_{j}(t)+\int_{0}^{t} \widetilde{\mathcal{L}}_{j} \leq C\left(\int_{0}^{t}\left\|\partial_{x} w\right\|_{L^{\infty}} \widetilde{\mathcal{L}}_{j}+2^{j} \int_{0}^{t}\left\|R_{j}^{1}, R_{j}^{2}\right\|_{L^{2}}\right)
$$

with $C$ depending only on $J_{0}$. Hence, multiplying by $2^{\frac{j}{2}}$ and summing up on $j \geq J_{0}$,

$$
\begin{align*}
\|(u, v)(t)\|_{\dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}}^{h}+\int_{0}^{t}\|(u, v)\|_{\dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}}^{h} & \lesssim\left\|\left(u_{0}, v_{0}\right)\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}}^{h}  \tag{23}\\
& +\int_{0}^{t}\left\|\partial_{x} w\right\|_{L^{\infty}}\|(u, v)\|_{\dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}}^{h}+\int_{0}^{t} \sum_{j \geq J_{0}} 2^{\frac{3}{2} j}\left\|\left(R_{j}^{1}, R_{j}^{2}\right)\right\|_{L^{2}} .
\end{align*}
$$

At this stage, taking advantage of Lemma A. 3 with $s=3 / 2$ to bound the sum, we conclude to the desired inequality.
3.3. Global a priori estimates for the toy model. We are now ready to establish the following proposition which is the key to the proof of the existence part of the theorem.
Proposition 3.3. Let $(u, v)$ be a smooth solution of $(T M)$ on $[0, T]$. Then, still assuming that $2 \leq p \leq 4$, there exists a constant $C$ and an integer $J_{0}$ (corresponding to the threshold between low and high frequencies) such that for all $t \in[0, T]$, we have

$$
X_{p}(t) \leq C\left(X_{p, 0}+X_{p}^{2}(t)\right)
$$

with $X_{p, 0} \triangleq\left\|\left(u_{0}, v_{0}\right)\right\|_{\dot{\mathbb{B}}_{p, 1}^{p}}^{\ell}+\left\|\left(u_{0}, v_{0}\right)\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}}^{h}$ and
$X_{p}(t) \triangleq\|(u, v)\|_{L_{t}^{\infty}\left(\dot{B}_{p, 1}^{\frac{1}{p}}\right)}^{\ell}+\|(u, v)\|_{L_{t}^{\infty}\left(\dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}\right)}^{h}$

$$
+\|u\|_{L_{t}^{1}\left(\dot{\mathbb{P}}_{p, 1}^{\frac{1}{p}+2}\right)}^{\ell}+\left\|v+\partial_{x} u\right\|_{L_{t}^{1}\left(\mathbb{(}_{p, 1}^{\frac{1}{p}}\right)}+\|v\|_{L_{t}^{2}\left(\dot{B}_{p, 1}^{\frac{1}{p}}\right)}+\|(u, v)\|_{L_{t}^{1}\left(\mathbb{B}_{2}^{\frac{3}{2}}\right)}^{h} .
$$

Proof. As a first, let us observe that $\|v\|_{L_{t}^{2}\left(\mathbb{B}_{p, 1}^{\frac{1}{p}}\right)}$ is dominated by the other terms of $X_{p}(t)$ (let us denote them by $\left.\widetilde{X}_{p}(t)\right)$. This is clearly the case of the high frequency part since, by Bernstein inequality, Hölder inequality and the embedding $\dot{\mathbb{B}}_{2,1}^{s} \hookrightarrow \dot{\mathbb{B}}_{p, 1}^{s+\frac{1}{p}-\frac{1}{2}}$ with $s=3 / 2$,

$$
\|v\|_{L_{t}^{2}\left(\dot{\mathbb{B}}_{p, 1}^{\left(\frac{1}{p}\right)}\right.}^{h} \lesssim\|v\|_{L_{t}^{2}\left(\dot{\mathbb{B}}_{p, 1}^{1+\frac{1}{p}}\right)}^{h} \lesssim\|v\|_{L_{t}^{2}\left(\dot{( }_{2,1}^{\frac{3}{2}}\right)}^{h} \lesssim \sqrt{\|v\|_{L_{t}^{1}\left(\mathbb{B}_{2,1}^{2}\right)}^{h}\|v\|_{L_{t}^{\infty}\left(\dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}\right)}^{h}} .
$$

For the low frequency part, we write that

$$
\|v\|_{L_{t}^{2}\left(\dot{\mathbb{P}}_{p, 1}^{\frac{1}{p}}\right)}^{\ell} \leq\left\|\partial_{x} u\right\|_{L_{t}^{2}\left(\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}}\right)}^{\ell}+\|z\|_{L_{t}^{2}\left(\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}}\right)} \quad \text { with } \quad z \triangleq v+\partial_{x} u \text {. }
$$

By Hölder inequality and interpolation, we have

$$
\left\|\partial_{x} u\right\|_{L_{t}^{2}\left(\dot{\mathbb{B}}_{p, 1}\right)}^{\ell} \lesssim\left(\|u\|_{L_{t}^{\infty}\left(\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}}\right)}^{\ell}\|u\|_{L_{t}^{1}\left(\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}+2}\right)}^{\ell}\right)^{\frac{1}{2}} \quad \text { and }\|z\|_{L_{t}^{2}\left(\dot{\mathbb{B}}_{p, 1}^{p}\right)}^{\ell} \lesssim\left(\|z\|_{L_{t}^{\infty}\left(\dot{B}_{p, 1}^{\frac{1}{p}}\right)}^{\ell}\|z\|_{L_{t}^{1}\left(\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}}\right)}^{\ell}\right)^{\frac{1}{2}} .
$$

As the low frequencies of $z$ in $L_{t}^{\infty}\left(\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}}\right)$ may be bounded by $\widetilde{X}_{p}(t)$, we proved that

$$
\begin{equation*}
\|v\|_{L_{t}^{2}\left(\dot{B}_{p, 1}^{\frac{1}{p}}\right)} \lesssim \widetilde{X}_{p}(t) \quad \text { for all } t \in \mathbb{R}^{+} \tag{24}
\end{equation*}
$$

Let us also notice that by Sobolev embedding and Bernstein inequality,

$$
\left\|v+\partial_{x} u\right\|_{L_{t}^{1}\left(\dot{B}_{p, 1}^{p}\right)}^{h} \lesssim\|v\|_{L_{t}^{1}\left(\mathbb{B}_{2,1}^{\frac{3}{2}}\right)}^{h}+\left\|\partial_{x} u\right\|_{L_{t}^{1}\left(\mathbb{B}_{2,1}^{2}\right)}^{h} .
$$

Therefore, adding up the inequalities from Propositions 3.1 and 3.2 for $w=v$ and observing that $2 \leq p \leq p^{*}$, we get
$X_{p}(t) \lesssim X_{p, 0}+\int_{0}^{t}\left(\|(u, v)\|_{\dot{\dot{B}_{p, 1}^{p}}}^{\ell}+\|(u, v)\|_{\dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}}^{h}\right)\left(\|v\|_{\dot{\dot{B}_{p, 1}^{p}}}^{\ell}+\|v\|_{\dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}}^{h}\right)+\int_{0}^{t}\|v\|_{\dot{B}_{p, 1}^{p}}^{\ell}\left\|\left(\partial_{x} u, \partial_{x} v\right)\right\|_{\dot{B}_{p, 1}^{\frac{1}{p}}}$.

Since
we conclude that the inequality of Proposition 3.3 is satisfied.
3.4. Proof of the existence part of Theorem 1.1. The proof relies on the following classical result about the local existence of strong solutions for hyperbolic symmetric systems of type

$$
\left\{\begin{array}{l}
\partial_{t} U+\sum_{k=1}^{d} A_{k}(U) \partial_{k} U+A_{0}(U)=0  \tag{QS}\\
\left.U\right|_{t=0}=U_{0}
\end{array}\right.
$$

where $A_{k}, k=0, \ldots, d$ are smooth functions from $\mathbb{R}^{n}$ to the space of $n \times n$ matrices, that are symmetric if $k \neq 0$.

Theorem 3.1. [1, Chap. 4] Let $U_{0}$ be in the nonhomogeneous Besov space $\mathbb{B}_{2,1}^{\frac{d}{2}+1}\left(\mathbb{R}^{d} ; \mathbb{R}^{n}\right)$. Then, $(Q S)$ admits a unique maximal solution $U$ in $\mathcal{C}\left(\left[0, T^{*}\left[; \mathbb{B}_{2,1}^{\frac{d}{2}+1}\right) \cap \mathcal{C}^{1}\left(\left[0, T^{*}\left[; \mathbb{B}_{2,1}^{\frac{d}{2}}\right)\right.\right.\right.\right.$, and there exists a positive constant $c$ such that

$$
T^{*} \geq \frac{c}{\left\|U_{0}\right\|_{\mathbb{B}_{2,1}^{d}+1}}
$$

## Furthermore,

$$
T^{*}<\infty \Longrightarrow \int_{0}^{T^{*}}\|\nabla U\|_{L^{\infty}}=\infty
$$

The proof of the existence part of Theorem 1.1 is structured as follows. First, we multiply the low frequencies of the data by a cut-off function in order to have data in $\mathbb{B}_{2,1}^{\frac{3}{2}}$. One can then use the above theorem to construct a sequence of approximate solutions, that are shown to be global. We prove uniform estimates in the space $E_{p}$ for those solutions, pass to the limit up to subsequence by means of compactness arguments, and finally check that the limit is a solution of (TM) with the required properties.

First step. Construction of approximate solutions. Let $\left(u_{0}, v_{0}\right)$ be such that $u_{0}^{\ell}, v_{0}^{\ell} \in \dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}}$ and $u_{0}^{h}, v_{0}^{h} \in \dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}$. Since $\left(u_{0}, v_{0}\right)$ need not be in $\mathbb{B}_{2,1}^{\frac{3}{2}}$, we set for all $n \geq 1$,

$$
u_{0}^{n} \triangleq \chi_{n} \dot{S}_{J_{0}-5} u_{0}+\left(\operatorname{Id}-\dot{S}_{J_{0}-5}\right) u_{0} \quad \text { and } \quad v_{0}^{n} \triangleq \chi_{n} \dot{S}_{J_{0}-5} v_{0}+\left(\operatorname{Id}-\dot{S}_{J_{0}-5}\right) v_{0}
$$

with $\chi_{n} \triangleq \chi\left(n^{-1}\right.$.), where $\chi$ stands (for instance) for the bump function of Section 1.
It is obvious that the sequences $\left(u_{0}^{n}\right)_{n \in \mathbb{N}}$ and $\left(v_{0}^{n}\right)_{n \in \mathbb{N}}$ tend to $u_{0}$ and $v_{0}$ in the sense of distributions, when $n$ tends to infinity. Moreover, as $u_{0}^{\ell}$ and $v_{0}^{\ell}$ are in $\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}}$, the low frequencies of the data are in $L^{\infty}$, and the spatial truncation thus guarantees that $u_{0}^{n}, v_{0}^{n} \in \mathbb{B}_{2,1}^{\frac{3}{2}}$. Hence, Theorem 3.1 provides us with a unique maximal solution $\left(u^{n}, v^{n}\right) \in \mathcal{C}\left(\left[0, T_{n}\left[; \mathbb{B}_{2,1}^{\frac{3}{2}}\right) \cap \mathcal{C}^{1}\left(\left[0, T_{n}\left[; \mathbb{B}_{2,1}^{\frac{1}{2}}\right)\right.\right.\right.\right.$.

We claim that we have for $z_{0}=u_{0}, v_{0}$,

$$
\begin{equation*}
\left\|z_{0}^{n}\right\|_{\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}}}^{\ell}+\left\|z_{0}^{n}\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}}^{h} \lesssim\left\|z_{0}\right\|_{\dot{\mathbb{B}}_{p, 1}^{p}}^{\ell}+\left\|z_{0}\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}}^{h} . \tag{25}
\end{equation*}
$$

Indeed, since $\left\|\chi_{n}\right\|_{\dot{\mathbb{B}}_{p, 1}^{p}}^{\ell} \simeq\|\chi\|_{\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}}}^{\ell}<\infty$, owing to the invariance of the norm in $\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}}$ by spatial dilation (see e.g. [1], Rem. 2.19]), we may write

$$
\begin{aligned}
\left\|z_{0}^{n}\right\|_{\dot{\mathbb{B}}_{p, 1}^{1}}^{\ell} & \leq\left\|\chi_{n} \dot{S}_{J_{0}-5} z_{0}\right\|_{\dot{B}_{p, 1}^{p}}^{\ell}+\left\|\left(\operatorname{Id}-\dot{S}_{J_{0}-5}\right) z_{0}\right\|_{\dot{B}_{p, 1}^{p}}^{\ell} \\
& \lesssim\left\|z_{0}\right\|_{\dot{\mathbb{B}}_{p, 1}^{p}}^{\ell} \frac{1}{p} \\
& \lesssim\left\|\chi_{n}\right\|_{\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}}}+\left\|z_{0}\right\|_{\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}}} \\
& \lesssim z_{0}\left\|_{\dot{\mathbb{B}}_{p, 1}^{p}}^{\ell}+\right\| z_{0} \|_{\dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}}^{h}
\end{aligned}
$$

Next, we see that

$$
\left\|z_{0}^{n}\right\|_{\dot{B}_{2,1}^{\frac{3}{2}}}^{h} \leq\left\|\chi_{n} \dot{S}_{J_{0}-5} z_{0}\right\|_{\dot{B}_{2,1}}^{h}+\left\|\left(\operatorname{Id}-\dot{S}_{J_{0}-5}\right) z_{0}^{h}\right\|_{\dot{B}_{2,1}^{2}} .
$$

It is obvious that the last term may be bounded by $\left\|z_{0}\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}}^{h}$. For the other term, the important observation is that for $j \geq J_{0}$, we have

$$
\dot{\Delta}_{j}\left(\chi_{n} \dot{S}_{J_{0}-5} z_{0}\right)=\sum_{j^{\prime} \geq j-3} \dot{\Delta}_{j}\left(\dot{S}_{j^{\prime}+2} \dot{S}_{J_{0}-5} z_{0} \dot{\Delta}_{j^{\prime}} \chi_{n}\right)
$$

Hence, owing to the scaling properties of the space $\dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}$,

$$
\left\|\chi_{n} \dot{S}_{J_{0}-5} z_{0}\right\|_{\dot{B}_{2,1}^{\frac{3}{2}}}^{h} \lesssim\left\|\dot{S}_{J_{0}-5} z_{0}\right\|_{L^{\infty}}\left\|\chi_{n}\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}} \lesssim n^{-1}\left\|z_{0}\right\|_{\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}}}
$$

which eventually yields (25).
Second step. Uniform estimates. Since, for all $T>0$, the space $\mathcal{C}\left([0, T] ; \mathbb{B}_{2,1}^{\frac{3}{2}}\right) \cap \mathcal{C}^{1}\left([0, T] ; \mathbb{B}_{2,1}^{\frac{1}{2}}\right)$ is included in our 'solution space' $E_{p}(T)$ (that is, $E_{p}$ restricted to $[0, T]$ ), one can take advantage of Proposition 3.3 for bounding our sequence. From it and (25), we get, denoting $X_{p}^{n}$ the function $X_{p}$ pertaining to $\left(u^{n}, v^{n}\right)$,

$$
\begin{equation*}
X_{p}^{n} \leq C\left(X_{p, 0}+\left(X_{p}^{n}\right)^{2}\right) \tag{26}
\end{equation*}
$$

It is clear that if

$$
\begin{equation*}
2 C X_{p}^{n}(t) \leq 1 \tag{27}
\end{equation*}
$$

then Inequality (26) implies that

$$
X_{p}^{n}(t) \leq 2 C X_{p, 0}
$$

Then, thanks to a classical bootstrap argument, we can conclude that if $X_{p, 0}$ is small enough then (27) is true as long as the solution exists. Hence, there exists a constant $C$ such that

$$
\begin{equation*}
X_{p}^{n}(t) \leq C X_{p, 0} \quad \text { for all } n \geq 1 \text { and } t \in\left[0, T_{n}[.\right. \tag{28}
\end{equation*}
$$

In order to show that the above inequality implies that the solution is global (namely that $T_{n}=\infty$ ), one can argue by contradiction, assuming that $T_{n}<\infty$, and use the blow-up criterion of Theorem 3.1. However, we first have to justify that the nonhomogeneous Besov norm $\mathbb{B}_{2,1}^{\frac{3}{2}}$ of the solution is under control up to time $T_{n}$. Now, applying the standard energy method to (TM) yields for all $t<T_{n}$,

$$
\left\|\left(u^{n}, v^{n}\right)(t)\right\|_{L^{2}}^{2} \leq\left\|\left(u_{0}^{n}, v_{0}^{n}\right)\right\|_{L^{2}}^{2}+\int_{0}^{t}\left\|\partial_{x} v^{n}\right\|_{L^{\infty}}\left\|\left(u^{n}, v^{n}\right)\right\|_{L^{2}}^{2}
$$

Since (28) and the embedding of $\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}}$ and $\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}$ in $L^{\infty}$ ensure that $\partial_{x} v^{n}$ is in $L_{T_{n}}^{1}\left(L^{\infty}\right)$, using Gronwall lemma gives that $\left(u^{n}, v^{n}\right)$ is in $L_{T_{n}}^{\infty}\left(L^{2}\right)$, and thus in $L_{T_{n}}^{\infty}\left(\mathbb{B}_{2,1}^{\frac{3}{2}}\right)$ owing, again, to (28).

It is now easy to conclude : for all $t_{0, n} \in\left[0, T_{n}[\right.$, Theorem 3.1 $]$ provides us with a solution of (TM) with the initial data $\left(u\left(t_{0, n}\right), v\left(t_{0, n}\right)\right.$ ), on $\left[t_{0, n}, T+t_{0, n}\right]$ for some $T$ that may be bounded from below independently of $t_{0, n}$. Consequently, choosing $t_{0, n}$ such that $t_{0, n}>T_{n}-T$, we see that the solution $\left(u^{n}, v^{n}\right)$ can be extended beyond $T_{n}$, which contradicts the maximality of $T_{n}$. Hence $T_{n}=+\infty$ and the solution corresponding to the initial data ( $u_{0}^{n}, v_{0}^{n}$ ) is global in time and satisfies (28) for all time.

Third step. Convergence. We have to show that $\left(u^{n}, v^{n}\right)_{n \in \mathbb{N}}$ tends, up to subsequence, to some $(u, v) \in E_{p}$ in the sense of distribution, that satisfies (TM).

The proof that we here propose rests on Ascoli Theorem and suitable compact embeddings. Let us explain how it goes for $\left(u^{n}\right)_{n \in \mathbb{N}}$, the convergence of $\left(v^{n}\right)_{n \in \mathbb{N}}$ being similar. From (28) and elementary embedding, we know that :

- $\left(\partial_{x} u^{n}\right)_{n \in \mathbb{N}}$ and $\left(\partial_{x} v^{n}\right)_{n \in \mathbb{N}}$ are bounded in $L^{2}\left(\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}}\right)$,
- $\left(v^{n}\right)_{n \in \mathbb{N}}$ is bounded in $L^{\infty}\left(\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}}\right)$.

Hence, both $\left(v^{n} \partial_{x} u^{n}\right)_{n \in \mathbb{N}}$ and $\left(\partial_{x} v^{n}\right)_{n \in \mathbb{N}}$ are bounded in $L^{2}\left(\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}}\right)$, which implies that $\left(\partial_{t} u^{n}\right)_{n \in \mathbb{N}}$ is bounded in $L^{2}\left(\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}}\right)$. This means that $\left(u^{n}\right)_{n \in \mathbb{N}}$ viewed as a sequence of functions valued in $\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}}$ is locally equicontinuous on $\mathbb{R}^{+}$.

Moreover $\left(u^{n, h}\right)_{n \in \mathbb{N}}$ is bounded in $\mathcal{C}\left(\mathbb{R}^{+}, \dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}\right),\left(u^{n, \ell}\right)_{n \in \mathbb{N}}$ is bounded in $\mathcal{C}\left(\mathbb{R}^{+}, \dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}}\right)$ and we know, thanks to a result of [1, Chap. 2], that the embedding from $F=\left\{u \in \mathcal{S}^{\prime}, u^{\ell} \in\right.$ $\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}}$ and $\left.u^{h} \in \dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}\right\}$ to $\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}}$ is locally compact. Therefore, one can combine Ascoli Theorem and the Cantor diagonal extraction process to deduce that there exists a distribution $u$ such that, up to subsequence $\left(\phi u^{n}\right)_{n \in \mathbb{N}}$ converges to $\phi u$ in $\mathcal{C}\left(\mathbb{R}^{+} ; \dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}}\right)$ for all function $\phi$ compactly supported in $\mathbb{R}^{+} \times \mathbb{R}^{n}$. Then, using the Fatou property (cf. [1], chapter 2) we obtain that $u^{\ell} \in L^{\infty}\left(\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}}\right) \cap L^{1}\left(\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}+2}\right)$ and $u^{h} \in L^{\infty}\left(\dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}\right) \cap L^{1}\left(\dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}\right)$, with norms bounded by the righthand side of (28). One can argue similarly for establishing the weak convergence of $\left(v^{n}\right)_{n \in \mathbb{N}}$ to some distribution $v$ fulfilling the desired properties of regularity up to time continuity.

Finally, passing to the limit in $(T M)$ is not an issue, since we have strong convergence (after localization) in norms with positive indices of regularity.

Last step. Proving that $(u, v) \in E_{p}$. The only property that misses is the time continuity. It may be obtained by looking at $u$ and $v$ as solutions of transport equations. Indeed, by construction, we have

$$
\partial_{t} u+v \partial_{x} u=-\partial_{x} v \quad \text { and } \quad \partial_{t} v+v \partial_{x} v+v=-\partial_{x} u
$$

The properties we proved so far for $u$ and $v$ ensure that $\partial_{x} u$ and $\partial_{x} v$ belong to $L^{2}\left(\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}}\right)$. Hence, the standard properties for the transport equation (see e.g. [1, Chap. 3]) give us that $(u, v) \in \mathcal{C}\left(\mathbb{R}^{+} ; \dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}}\right)$.

To show that $(u, v)^{h} \in \mathcal{C}\left(\mathbb{R}^{+} ; \dot{B}_{2,1}^{\frac{3}{2}}\right)$, one can mimic the proof for general symmetric hyperbolic systems, summing up only on high frequencies, as presented at [1, p.196] for instance.

In the end, we thus have proved that $(u, v)$ is a global solution of (TM), that verifies the desired properties of regularity and $X_{p}(t) \leq C X_{p, 0}$ for all $t \in \mathbb{R}^{+}$.
3.5. Proof of uniqueness. Consider two solutions $\left(u_{1}, v_{1}\right)$ and $\left(u_{2}, v_{2}\right)$ of (TM) (not necessarily small) in the space $E_{p}$, that correspond to the same initial data ( $u_{0}, v_{0}$ ). The proof of uniqueness will follow from stability estimates involving suitable norms. The difficulty is that our functional framework is not the standard one for the low frequency of the solution, so that
one cannot follow the classical proof for hyperbolic symmetric systems. Here we shall estimate $(\delta u, \delta v):=\left(u_{2}-u_{1}, v_{2}-v_{1}\right)$ in the space

$$
\begin{equation*}
F_{p}(T) \triangleq\left\{z \in \mathcal{C}\left([0, T] ; \dot{\mathbb{B}}_{p, 1}^{\frac{2}{p}-\frac{1}{2}}\right): z^{h} \in \mathcal{C}\left([0, T] ; \dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}\right)\right\} \tag{29}
\end{equation*}
$$

The reason for this choice is the usual loss of one derivative when proving stability estimates for quasilinear hyperbolic systems (hence the exponent $1 / 2$ for high frequencies). The exponent for low frequencies looks to be the best one for controlling the nonlinearities. Before starting the proof, we introduce the notation

$$
\delta U(t) \triangleq\|(\delta u, \delta v)(t)\|_{\dot{B}_{p, 1}^{2} \frac{2}{p}}^{\ell}+\|(\delta u, \delta v)(t)\|_{\dot{B}_{2,1}^{\frac{1}{2}}}^{h} .
$$

Step 1. Proving that $(\delta u, \delta v) \in F_{p}(T)$. Remember that $\partial_{t} u_{i}=-\partial_{x} v_{i}-v_{i} \partial_{x} u_{i}$ for $i=1,2$. By interpolation in Besov spaces and Hölder inequality with respect to the time variable, since $\partial_{x} u_{i}^{\ell}$ and $\partial_{x} v_{i}^{\ell}$ are in $L^{\infty}\left(\mathbb{R}^{+} ; \dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}-1}\right) \cap L^{1}\left(\mathbb{R}^{+} ; \dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}+1}\right)$, we get

$$
\begin{equation*}
\partial_{x} u_{i}^{\ell}, \partial_{x} v_{i}^{\ell} \in L^{r}\left(\mathbb{R}^{+} ; \mathbb{B}_{p, 1}^{\frac{2}{p}-\frac{1}{2}}\right) \quad \text { with } \quad \frac{1}{r} \triangleq \frac{1}{4}+\frac{1}{2 p} . \tag{30}
\end{equation*}
$$

It is clear that the same property holds for the high frequencies of $\partial_{x} u_{i}$ and $\partial_{x} v_{i}$, since they belong to $L^{1}\left(\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}}\right) \cap L^{\infty}\left(\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}}\right)$. We also know that $v_{i}$ belongs to $L^{\infty}\left(\mathbb{R}^{+} ; \dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}}\right)$. Therefore, from the product laws in Besov spaces that have been recalled in Proposition A.3, we gather that $\partial_{x} v_{i}$ and $v_{i} \partial_{x} u_{i}$ are in $L^{r}\left(\mathbb{R}^{+} ; \dot{\mathbb{B}}_{p, 1}^{\frac{2}{p}-\frac{1}{2}}\right)$. Hence, $\partial_{t} u_{i}$ is in $L^{r}\left(\mathbb{R}^{+} ; \dot{\mathbb{B}}_{p, 1}^{\frac{2}{p}-\frac{1}{2}}\right)$, and thus

$$
\begin{equation*}
\left(u_{i}-u_{0}\right) \in \mathcal{C}_{l o c}^{\frac{1}{r}}\left(\mathbb{R}^{+} ; \dot{\mathbb{B}}_{p, 1}^{\frac{2}{p}-\frac{1}{2}}\right) . \tag{31}
\end{equation*}
$$

Proving the result for $v_{i}$ is almost the same, except that we have to handle the damping term. To overcome it, we notice that

$$
\partial_{t}\left(e^{t} v_{i}\right)=-e^{t} v_{i} \partial_{x} v_{i}-e^{t} \partial_{x} u_{i}
$$

Arguing as above, we get that $\partial_{t}\left(e^{t} v_{i}\right) \in L_{l o c}^{r}\left(\mathbb{R}^{+} ; \dot{\mathbb{B}}_{p, 1}^{\frac{2}{p}-\frac{1}{2}}\right)$, whence

$$
\begin{equation*}
\left(e^{t} v_{i}-v_{0}\right) \in \mathcal{C}_{l o c}^{\frac{1}{r}}\left(\mathbb{R}^{+} ; \dot{B}_{p, 1}^{\frac{2}{p}-\frac{1}{2}}\right) \tag{32}
\end{equation*}
$$

From (31) and (32), we conclude that $(\delta u, \delta v) \in F_{p}(T)$ for all finite $T$.
Step 2. Estimates for the low frequencies. The system satisfied by ( $\delta u, \delta v$ ) reads:

$$
\left\{\begin{array}{l}
\partial_{t} \delta u+\partial_{x} \delta v=-\delta v \partial_{x} u_{1}-v_{2} \partial_{x} \delta u,  \tag{33}\\
\partial_{t} \delta v+\delta v+\partial_{x} \delta u=-\delta v \partial_{x} v_{1}-v_{2} \partial_{x} \delta v .
\end{array}\right.
$$

Then, we follow the computations leading to Proposition 3.1 with $w=0$, looking at $-\delta v \partial_{x} u_{1}-$ $v_{2} \partial_{x} \delta u$ and $-\delta v \partial_{x} v_{1}-v_{2} \partial_{x} \delta v$ as source terms, and working at the level of regularity $2 / p-1 / 2$ instead of $1 / p$ (since the left-hand side of (33) is linear with constant coefficients, this shift of regularity does not change the proof). Omitting the time integral in the left-hand side of the Inequality given by Proposition [3.1, we find that

In order to bound the right-hand side, we may use that Proposition A. 4 yields

$$
\begin{equation*}
\|a b\|_{\dot{\mathbb{B}}_{p, 1}^{\frac{2}{p}-\frac{1}{2}}} \lesssim\|a\|_{\dot{\mathbb{B}}_{p, 1}^{p}}\|b\|_{\dot{\mathbb{S}}_{p, 1}^{\frac{2}{p}-\frac{1}{2}}} \tag{34}
\end{equation*}
$$

as well as the following inequality that is a consequence of (84) in the appendix (take $s=\frac{2}{p}-\frac{1}{2}$ therein):

$$
\begin{equation*}
\|a b\|_{\dot{B}_{p, 1}^{p} \frac{2}{p}-\frac{1}{2}}^{\ell} \lesssim\|a\|_{\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}} \cap \mathbb{B}_{p, 1}^{\frac{1}{p}+1}}\|b\|_{\dot{\mathbb{B}}_{p, 1}^{\frac{2}{p}-\frac{3}{2}}} . \tag{35}
\end{equation*}
$$

In the end, choosing $a=v_{2}$ and $b=\partial_{x} \delta u$ or $\partial_{x} \delta v$, we get

Step 3. Estimates for the high frequencies. We look at the system satisfied by ( $\delta u, \delta v$ ) under the form:

$$
\left\{\begin{array}{l}
\partial_{t} \delta u+v_{2} \partial_{x} \delta u+\partial_{x} \delta v=-\delta v \partial_{x} u_{1}, \\
\partial_{t} \delta v+\delta v+v_{2} \partial_{x} \delta v+\partial_{x} \delta u=-\delta v \partial_{x} v_{1} .
\end{array}\right.
$$

This is System (LTM) except for the source terms in the right-hand side. Clearly, following the computations leading to (23), but using the index $1 / 2$ instead of $3 / 2$ gives

$$
\begin{align*}
& \|(\delta u, \delta v)(t)\|_{\dot{B}_{2,1}^{\frac{1}{2}}}^{h} \lesssim \int_{0}^{t}\left\|\partial_{x} v_{2}\right\|_{L^{\infty}}\|(\delta u, \delta v)\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}^{h}  \tag{37}\\
& +\int_{0}^{t} \sum_{j \geq J_{0}} 2^{\frac{j}{2}}\left(\left\|\left[v_{2}, \dot{\Delta}_{j}\right] \partial_{x} \delta u\right\|_{L^{2}}+\left\|\left[v_{2}, \dot{\Delta}_{j}\right] \partial_{x} \delta v\right\|_{L^{2}}\right)+\int_{0}^{t}\left(\left\|\delta v \partial_{x} u_{1}\right\|_{\dot{B}_{2,1}^{\frac{1}{2}}}^{h}+\left\|\delta v \partial_{x} v_{1}\right\|_{\dot{B}_{2,1}^{\frac{1}{2}}}^{h}\right) .
\end{align*}
$$

Let $p^{*} \triangleq 2 p /(p-2)$. Lemma A. 3 tells us that, for $z=\delta u, \delta v$,

$$
\begin{aligned}
\sum_{j \geq J_{0}} 2^{\frac{j}{2}}\left\|\left[v_{2}, \dot{\Delta}_{j}\right] \partial_{x} z\right\|_{L^{2}} \lesssim\left\|\partial_{x} v_{2}\right\|_{L^{\infty}}\|z\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}^{h}+ & \left\|\partial_{x} z\right\|_{\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}-1}}\left\|v_{2}\right\|_{\dot{\mathbb{B}}_{p^{*}, 1}^{1+\frac{1}{p^{*}}}}^{\ell} \\
& +\left\|\partial_{x} z\right\|_{\dot{\mathbb{B}}_{\infty}^{-1}, \infty}\left\|v_{2}\right\|_{\dot{\mathbb{B}}_{2,1}^{2}}^{h}+\left\|\partial_{x} z\right\|_{\dot{\mathbb{B}}_{p, 1}^{2}}^{\ell}-\frac{1}{p}
\end{aligned}\left\|\partial_{x} v_{2}\right\|_{\dot{\mathbb{B}}_{p^{*}, 1}^{\ell}-\frac{1}{p^{*}}}^{\ell} .
$$

Hence, using obvious embedding and the fact that
yields for $z=\delta u, \delta v$,

$$
\begin{equation*}
\sum_{j \geq J_{0}} 2^{\frac{j}{2}}\left\|\left[v_{2}, \dot{\Delta}_{j}\right] \partial_{x} z\right\|_{L^{2}} \lesssim\left(\left\|v_{2}\right\|_{\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}}}^{\ell}+\left\|v_{2}\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}}^{h}\right)\left(\|z\|_{\dot{\mathbb{B}}_{p, 1}^{\frac{2}{p}-\frac{1}{2}}}^{\ell}+\|z\|_{\dot{B}_{2,1}^{\frac{1}{2}}}^{h}\right) . \tag{38}
\end{equation*}
$$

The last two terms of (37) may be bounded thanks to Inequality (85): we get for $z=u_{1}, v_{1}$,

$$
\begin{equation*}
\left\|\delta v \partial_{x} z\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}^{h} \lesssim\left(\|\delta v\|_{\dot{B}_{p, 1}^{2}-\frac{1}{2}}^{\ell}+\|\delta v\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}^{h}\right)\left(\left\|\partial_{x} z\right\|_{\dot{B}_{p, 1}^{\frac{1}{p}-1}}^{\ell}+\left\|\partial_{x} z\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}^{h}\right) . \tag{39}
\end{equation*}
$$

Plugging (38) and (39) in (37), and using also the fact that

$$
\left\|\partial_{x} v_{2}\right\|_{L^{\infty}} \lesssim\left\|v_{2}\right\|_{\dot{\mathbb{D}}_{p, 1}^{\frac{1}{p}}}^{\ell}+\left\|v_{2}\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}}^{h}
$$

we end up with

$$
\begin{equation*}
\|(\delta u, \delta v)(t)\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}^{h} \lesssim \int_{0}^{t}\left(\left\|\left(u_{1}, v_{1}, v_{2}\right)\right\|_{\dot{\mathbb{B}}_{p, 1}^{p}}^{\ell}+\left\|\left(u_{1}, v_{1}, v_{2}\right)\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}}^{h}\right) \delta U . \tag{40}
\end{equation*}
$$

Step 4. Conclusion. Putting (36) and (40) together yields

$$
\delta U(t) \leq C \int_{0}^{t}\left(\left\|\left(u_{1}, v_{1}, v_{2}\right)\right\|_{\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}}}^{\ell}+\left\|\left(u_{1}, v_{1}, v_{2}\right)\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}}^{h}+\left\|\left(\partial_{x} u_{1}, \partial_{x} v_{1}\right)\right\|_{\dot{\mathbb{B}}_{p, 1}^{p}} \frac{2}{p}-\frac{1}{2}\right) d U d \tau .
$$

Knowing that $\left(u_{1}, v_{1}\right)$ and $\left(u_{2}, v_{2}\right)$ are in $E_{p}(T)$ and remembering (30), we get,

$$
\int_{0}^{T}\left(\left\|\left(u_{1}, v_{1}, v_{2}\right)\right\|_{\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}}}^{\ell}+\left\|\left(u_{1}, v_{1}, v_{2}\right)\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}}^{h}\right)<\infty .
$$

Hence, applying Gronwall lemma allows to conclude that $\delta U \equiv 0$ on $[0, T]$. In other words, $\left(u_{1}, v_{1}\right)$ and $\left(u_{2}, v_{2}\right)$ coincide on $[0, T] \times \mathbb{R}$. Since $T$ is arbitrary, uniqueness is proved.

## 4. Compressible Euler system with Damping

As pointed out in the introduction, System (TM) may be seen as an approximation of the damped isentropic compressible Euler system with pressure law $P(\rho)=\frac{\rho^{2}}{2}$. Here we want to adapt the method of the previous sections to the true damped compressible Euler system :

$$
\left\{\begin{array}{l}
\partial_{t} \rho+\partial_{x}(V \rho)=0,  \tag{E}\\
\partial_{t}(\rho V)+\partial_{x}\left(\rho V^{2}\right)+\partial_{x}(P(\rho))+\lambda \rho V=0,
\end{array}\right.
$$

supplemented with initial data $\left(\rho_{0}, V_{0}\right)$ that is a perturbation of some constant state $(\bar{\rho}, 0)$ with $\bar{\rho}>0$. The (given) pressure function $P$ is assumed to be smooth and such that:

$$
\left\{\begin{array}{l}
\text { Case } 2<p \leq 4: P(\rho)=a \rho^{\gamma} \text { for some positive } a \text { and } \gamma \text { in a neighborhood of } \bar{\rho} .  \tag{41}\\
\text { Case } p=2: \text { just } P^{\prime}(\bar{\rho})>0 .
\end{array}\right.
$$

Note that, performing a suitable normalization reduces the study to the case $\bar{\rho}=P^{\prime}(\bar{\rho})=1$ (hence $a=1 / \gamma$ in the first case), which will be assumed from now on.

Consider the new unknown

$$
n(\rho) \triangleq \int_{1}^{\rho} \frac{P^{\prime}(s)}{s} d s
$$

Since our assumptions on the pressure guarantee that $\rho \mapsto n(\rho)$ is a smooth diffeomorphism from a neighborhood of 1 to a neighborhood of 0 , one can rewrite $(E)$ under the form

$$
\left\{\begin{array}{l}
\partial_{t} n+V \partial_{x} n+\partial_{x} V+G(n) \partial_{x} V=0,  \tag{42}\\
\partial_{t} V+V \partial_{x} V+\partial_{x} n+\lambda V=0,
\end{array}\right.
$$

where $G(n)$ is defined by the relation $G(n(\rho)) \triangleq P^{\prime}(\rho)-1$.
Theorem 4.1. Under hypothesis (41), there exist $k=k(p) \in \mathbb{Z}$ and $c_{0}=c_{0}(p)>0$ such that for $J_{\lambda} \triangleq\left\lfloor\log _{2} \lambda\right\rfloor+k$, if we assume that $\left(n_{0}, V_{0}\right)$ fulfills the same conditions as in Theorem 1.1, then System (42) admits a unique global solution ( $n, V$ ) verifying the same properties as the solution therein. Furthermore, Corollary 1.1 and Theorem 1.2 hold true (with the same decay rate).

Proof. Performing the rescaling (3) reduces the proof to the case $\lambda=1$, and we are thus left with bounding for all $t \geq 0$, the functional

$$
\begin{aligned}
X_{p}(t) \triangleq\|(n, V)\|_{L_{t}^{\infty}\left(\dot{\mathbb{B}}_{p, 1}^{p}\right)}^{\ell} & +\|(n, V)\|_{L_{t}^{\infty}\left(\dot{B}_{2,1}^{\frac{3}{2}}\right)}^{h} \\
& +\|n\|_{L_{t}^{1}\left(\dot{B}_{p, 1}^{\frac{1}{p}+2}\right)}^{\ell}+\|(n, V)\|_{L_{t}^{1}\left(\mathbb{B}_{2,1}^{\frac{3}{2}}\right)}^{h}+\left\|V+\partial_{x} n\right\|_{L_{t}^{1}\left(\dot{B}_{p, 1}^{\prime}\right)}+\|V\|_{L_{t}^{2}\left(\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}}\right)}
\end{aligned}
$$

[^2]in terms of
$$
X_{p, 0} \triangleq\left\|\left(n_{0}, V_{0}\right)\right\|_{\dot{\mathbb{P}}_{p, 1}^{1}}^{\ell}+\left\|\left(n_{0}, V_{0}\right)\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}}^{h} .
$$

Remember that $\|V\|_{L_{t}^{2}\left(\mathbb{B}_{p, 1}^{\frac{1}{p}}\right)}$ and $\left\|V+\partial_{x} n\right\|_{L_{t}^{1}\left(\dot{B}_{p, 1}^{\frac{1}{p}}\right)}^{h}$ are bounded by the first four terms of $X_{p}$ (see (24)).

Low frequencies estimates. We follow the method we used for $(T M)$, looking at $G(n) \partial_{x} V$ as a source term. Owing to Propositions A. 3 and A.4 we have

$$
\left\|G(n) \partial_{x} V\right\|_{\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}}} \lesssim\|n\|_{\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}}}\left\|\partial_{x} V\right\|_{\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}}}
$$

Therefore, mimicking the proof of Proposition 3.1, we end up again for all $t \geq 0$ with

$$
\begin{align*}
\|(n, V)(t)\|_{\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}}}^{\ell}+\int_{0}^{t}\|n\|_{\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}+2}}^{\ell}+ & \int_{0}^{t}\left\|V+\partial_{x} n\right\|_{\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}}}^{\ell}  \tag{43}\\
& \leq C\left(\left\|\left(n_{0}, V_{0}\right)\right\|_{\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}}}^{\ell}+\int_{0}^{t}\left\|\left(n, V, \partial_{x} n\right)\right\|_{\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}}}\|V\|_{\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}+1}}\right) .
\end{align*}
$$

High frequencies estimates. One has the following proposition:
Proposition 4.1. Let $(n, V)$ be a smooth solution of (42) on the interval $[0, T]$, under assumption (41). Define $p^{*}$ by the relation $1 / p+1 / p^{*}=1 / 2$. There exists a constant $C$ depending only on the threshold $J_{0}$ between the low and high frequencies such that for all $t \in[0, T]$,

$$
\left.\begin{array}{rl}
\|(n, V)(t)\|_{\dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}}^{h} & +\int_{0}^{t}\|(n, V)\|_{\dot{B}_{2,1}^{\frac{3}{2}}}^{h} \lesssim\left\|\left(n_{0}, V_{0}\right)\right\|_{\dot{B}_{2,1}^{3}}^{h}+\int_{0}^{t}\left\|\left(\partial_{x} n, \partial_{x} V\right)\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}\|(n, V)\|_{\mathbb{B}_{2,1}^{\frac{3}{2}}}^{h} \\
& \quad+\int_{0}^{t}\left(\|V\|_{\dot{\mathbb{B}}_{p^{*}, 1}^{1}}^{\ell} \frac{1}{p^{*}}\right.
\end{array}\left\|\left(\partial_{x} n, \partial_{x} V\right)\right\|_{\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}-1}}+\left\|\left(\partial_{x} n, \partial_{x} V\right)\right\|_{\dot{\mathbb{B}}_{p, 1}^{1-\frac{1}{p}}}^{\ell}\left\|\partial_{x} V\right\|_{\dot{\mathbb{B}}_{p^{*}, 1}^{\ell}-\frac{1}{p^{*}}}^{\ell}\right) .
$$

Proof. We localize System (42) by means of $\dot{\Delta}_{j}$, getting

$$
\left\{\begin{array}{c}
\partial_{t} n_{j}+\dot{S}_{j-1} V \partial_{x} n_{j}+\partial_{x} V_{j}+\dot{S}_{j-1} G(n) \partial_{x} V_{j}=R_{j}^{1}+R_{j}^{\prime 1}  \tag{44}\\
\partial_{t} V_{j}+\dot{S}_{j-1} V \partial_{x} V_{j}+\partial_{x} n_{j}+V_{j}=R_{j}^{2}
\end{array}\right.
$$

where

$$
\begin{array}{rlr} 
& R_{j}^{1} \triangleq \dot{S}_{j-1} V \partial_{x} n_{j}-\dot{\Delta}_{j}\left(V \partial_{x} n\right), \quad R_{j}^{\prime 1} \triangleq \dot{S}_{j-1} G(n) \partial_{x} V_{j}-\dot{\Delta}_{j}\left(G(n) \partial_{x} V\right) \\
\text { and } & R_{j}^{2} \triangleq \dot{S}_{j-1} V \partial_{x} V_{j}-\dot{\Delta}_{j}\left(V \partial_{x} V\right) .
\end{array}
$$

The only difference with $(T M)$ is the appearance of $\dot{S}_{j-1} G(n) \partial_{x} V_{j}$ in the first equation and of the commutator $R_{j}^{\prime 1}$. To handle the former term, one has to add a suitable weight in the definition of the functional we used for $(T M)$ : for $j \geq J_{0}$ and $\eta=\eta\left(J_{0}\right)>0$ (to be chosen small enough), we set

$$
\widetilde{\mathcal{L}}_{j}^{2} \triangleq \int_{\mathbb{R}}\left(\partial_{x} n_{j}\right)^{2}+\left(1+\dot{S}_{j-1} G(n)\right)\left(\partial_{x} V_{j}\right)^{2}+\eta \int_{\mathbb{R}} V_{j} \partial_{x} n_{j}
$$

Differentiating in time this quantity and performing several integration by parts yields:

$$
\begin{align*}
& \text { (45) } \frac{d}{d t} \widetilde{\mathcal{L}}_{j}^{2}+\widetilde{\mathcal{H}}_{j}^{2}+\int_{\mathbb{R}} \partial_{x} \dot{S}_{j-1} V\left(\left(\partial_{x} n_{j}\right)^{2}+\left(1+\dot{S}_{j-1} G(n)\right)\left(\partial_{x} V_{j}\right)^{2}\right)  \tag{45}\\
& \quad-\int_{\mathbb{R}} \partial_{x} \dot{S}_{j-1} G(n) S_{j-1} V\left(\partial_{x} V_{j}\right)^{2}=\int_{\mathbb{R}}\left(\partial_{x} V_{j}\right)^{2} \partial_{t} \dot{S}_{j-1} G(n) \\
& +2 \int_{\mathbb{R}}\left(\partial_{x}\left(R_{j}^{1}+R_{j}^{\prime 1}\right) \partial_{x} n_{j}+\left(1+S_{j-1} G(n)\right) \partial_{x} R_{j}^{2} \partial_{x} V_{j}\right)+\eta \int_{\mathbb{R}}\left(\partial_{x}\left(R_{j}^{1}+R_{j}^{\prime 1}\right) V_{j}+R_{j}^{2} \partial_{x} n_{j}\right) \\
& \text { with } \widetilde{\mathcal{H}}_{j}^{2} \triangleq \eta\left\|\partial_{x} n_{j}\right\|_{L^{2}}^{2}+(2-\eta) \int_{\mathbb{R}}\left(1+\dot{S}_{j-1} G(n)\right)\left(\partial_{x} V_{j}\right)^{2}+\eta \int_{\mathbb{R}} V_{j} \partial_{x} n_{j} .
\end{align*}
$$

To continue, let us assume that

$$
\begin{equation*}
\|n\|_{L^{\infty}}+\|V\|_{L^{\infty}} \ll 1 \quad \text { on } \quad[0, T] \tag{46}
\end{equation*}
$$

Then, since $G(0)=0$, we have, using the mean value theorem and the uniform boundedness of operator $\dot{S}_{j-1}$ in all Lebesgue spaces:

$$
\left\|\dot{S}_{j-1} G(n)\right\|_{L^{\infty}} \lesssim\|n\|_{L^{\infty}} \ll 1
$$

and thus, if $\eta$ is small enough,

$$
\begin{equation*}
\widetilde{\mathcal{L}}_{j}^{2} \simeq\left\|\left(\partial_{x} n_{j}, \partial_{x} V_{j}\right)\right\|_{L^{2}}^{2} \quad \text { and } \quad \widetilde{\mathcal{H}}_{j}^{2} \simeq\left\|\left(\partial_{x} n_{j}, \partial_{x} V_{j}\right)\right\|_{L^{2}}^{2} \quad \text { for all } j \geq J_{0} \tag{47}
\end{equation*}
$$

Let us also observe that

$$
\begin{aligned}
\partial_{t} G(n) & =G^{\prime}(n) \partial_{t} n \\
& =-G^{\prime}(n)\left(V \partial_{x} n+(1+G(n)) \partial_{x} V\right) .
\end{aligned}
$$

Owing to assumption (46) and to the mean value theorem, we thus get

$$
\begin{equation*}
\left\|\partial_{t} G(n)\right\|_{L^{\infty}} \lesssim\left\|\partial_{x} V\right\|_{L^{\infty}}+\|V\|_{L^{\infty}}\left\|\partial_{x} n\right\|_{L^{\infty}} . \tag{48}
\end{equation*}
$$

Proceeding analogously, we obtain

$$
\begin{equation*}
\left\|\partial_{x} G(n)\right\|_{L^{\infty}} \lesssim\left\|\partial_{x} n\right\|_{L^{\infty}} \tag{49}
\end{equation*}
$$

Hence, from inequality (45) and (47), we get for some small enough $c$ and large enough $C$,

$$
\begin{equation*}
\frac{d}{d t} \widetilde{\mathcal{L}}_{j}^{2}+c \widetilde{\mathcal{L}}_{j}^{2} \leq C\left(\left\|\left(\partial_{x} V, \partial_{x} n\right)\right\|_{L^{\infty}} \widetilde{\mathcal{L}}_{j}+2^{j}\left\|\left(R_{j}^{1}, R_{j}^{\prime 1}, R_{j}^{2}\right)\right\|_{L^{2}}\right) \widetilde{\mathcal{L}}_{j} \quad \text { for all } j \geq J_{0} \tag{50}
\end{equation*}
$$

At this point, taking advantage of Lemma A. 1 yields

$$
\begin{equation*}
\widetilde{\mathcal{L}}_{j}(t)+c \int_{0}^{t} \widetilde{\mathcal{L}}_{j} \leq \widetilde{\mathcal{L}}_{j}(0)+C \int_{0}^{t}\left\|\left(\partial_{x} V, \partial_{x} n\right)\right\|_{L^{\infty}} \mathcal{L}_{j}+C 2^{j} \int_{0}^{t}\left\|\left(R_{j}^{1}, R_{j}^{\prime 1}, R_{j}^{2}\right)\right\|_{L^{2}} \tag{51}
\end{equation*}
$$

Now, multiplying (51) by $2^{\frac{j}{2}}$, using (47) and summing up on $j \geq J_{0}$ gives us

$$
\begin{align*}
\|(n, V)(t)\|_{\dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}}^{h}+ & \int_{0}^{t}\|(n, V)\|_{\dot{\mathbb{B}}_{2,1}^{\frac{3}{3}}}^{h} \lesssim\left\|\left(n_{0}, V_{0}\right)\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}}^{h}  \tag{52}\\
& +\int_{0}^{t}\left\|\left(\partial_{x} V, \partial_{x} n\right)\right\|_{L^{\infty}}\|(n, V)\|_{\dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}}^{h}+\int_{0}^{t} \sum_{j \geq J_{0}} 2^{\frac{3 j}{2}}\left\|\left(R_{j}^{1}, R_{j}^{\prime 1}, R_{j}^{2}\right)\right\|_{L^{2}} .
\end{align*}
$$

The terms $R_{j}^{1}$ and $R_{j}^{2}$ may be bounded exactly as in the proof Proposition 3.2. As regards $R_{j}^{\prime 1}$, Lemma A. 3 gives us

$$
\begin{aligned}
& \sum_{j \geq J_{0}} 2^{\frac{3}{2} j}\left\|R_{j}^{\prime 1}\right\|_{L^{2}} \lesssim\left\|\partial_{x} G(n)\right\|_{L^{\infty}}\left\|\partial_{x} V\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}^{h}+\left\|\partial_{x} V\right\|_{\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}-1}}\|G(n)\|_{\dot{\mathbb{B}}_{p^{*}, 1}^{1+\frac{1}{p^{*}}}}^{\ell} \\
& +\left\|\partial_{x} V\right\|_{L^{\infty}}\|G(n)\|_{\dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}}^{h}+\left\|\partial_{x} V\right\|_{\dot{\mathbb{B}}_{p, 1}^{1-\frac{1}{p}}}^{\ell}\left\|\partial_{x} G(n)\right\|_{\dot{\mathbb{B}}_{p^{*}, 1}^{\ell}-\frac{1}{p^{*}}}^{\ell} .
\end{aligned}
$$

Using (49) completes the proof of the proposition.

Global-in-time a priori estimate. We claim that granted with Inequalities (43) and the above proposition, we have, whenever Condition (46) is satisfied on $[0, T]$,

$$
\begin{equation*}
X_{p}(t) \lesssim X_{p, 0}+X_{p}^{2}(t) \quad \text { for all } t \in[0, T] . \tag{53}
\end{equation*}
$$

Inequality (43) is exactly the same as for ( $T M$ ). Hence, the terms in $X_{p}(t)$ corresponding to the low frequencies of $(n, V)$ are bounded by $X_{p}^{2}(t)$. Note also that $\|v\|_{L_{t}^{2}\left(\mathbb{B}_{p, 1}^{\frac{1}{p}}\right)}$ may be bounded according to (24), and thus eventually by $X_{p}^{2}(t)$.

In order to handle the high frequencies, we shall proceed differently depending on whether $P(\rho)=\rho^{\gamma} / \gamma$ or $P$ is a general pressure law with $P^{\prime}(1)=1$. In fact, to handle the latter case, we need to assume that $p=2$.

1. Case $P(\rho)=\rho^{\gamma} / \gamma$ with $\gamma>0$. Then, $G(n)=(\gamma-1) n$ and the inequality of Proposition 4.1 reduces to

$$
\left.\begin{array}{rl}
\|(n, V)(t)\|_{\dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}}^{h} & +\int_{0}^{t}\|(n, V)\|_{\dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}}^{h} \lesssim\left\|\left(n_{0}, V_{0}\right)\right\|_{\dot{B}_{2,1}^{3}}^{h}+\int_{0}^{t}\left\|\left(\partial_{x} n, \partial_{x} V\right)\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}\|(n, V)\|_{\dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}}^{h} \\
\quad+\int_{0}^{t}\left(\|V\|_{\dot{\mathbb{B}}_{p^{*}, 1}^{1}}^{\ell} \frac{1}{p^{*}}\right.
\end{array}\left\|\left(\partial_{x} n, \partial_{x} V\right)\right\|_{\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}-1}}+\left\|\left(\partial_{x} n, \partial_{x} V\right)\right\|_{\dot{\mathbb{B}}_{p, 1}^{1-\frac{1}{p}}}^{\ell}\left\|\partial_{x} V\right\|_{\dot{\mathbb{B}}_{p^{*}, 1}^{\ell}-\frac{1}{p^{*}}}^{l}\right) .
$$

Compared to our study of $(T M)$, only the last line is new. However, one can use the fact that

$$
\begin{aligned}
& \int_{0}^{t}\|n\|_{\dot{\mathbb{B}}_{p^{*}, 1}^{1+\frac{1}{p^{*}}}}^{\ell}\left\|\partial_{x} V\right\|_{\dot{\mathbb{B}}_{p, 1}^{1}}^{\frac{1}{p}-1} \\
& \int_{0}^{t}\left\|\partial_{x} V\right\|_{\dot{\mathbb{B}}_{p, 1}^{1-\frac{1}{p}}}^{\ell}\left\|\partial_{x} n\right\|_{\dot{\mathbb{B}}_{p^{*}, 1}^{-\frac{1}{p^{*}}}}^{\ell} \lesssim\|V\|_{L_{t}^{2}\left(\dot{\mathbb{B}}_{p, 1}^{1+\frac{1}{p}}\right)}^{\ell}\|V\|_{L_{t}^{2}\left(\dot{\mathbb{B}}_{p, 1}^{p}\right)}^{\ell} \\
& L_{t}^{1}\left(\dot{\mathbb{B}}_{p, 1}^{1+\frac{1}{p}}\right)
\end{aligned}\|n\|_{L_{t}^{\infty}\left(\dot{\mathbb{B}}_{p, 1}^{p}\right)}^{\ell} \quad \text { as } 1-\frac{1}{p^{*}} \geq \frac{1}{p} .
$$

The terms on the right may be bounded by $X_{p}^{2}(t)$. Hence we have (53).
2. Case of a general pressure law with $P^{\prime}(1)=1$. For $p=2$, Proposition 4.1 together with the embeddings $\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}} \hookrightarrow \dot{\mathbb{B}}_{\infty, 1}^{0} \hookrightarrow L^{\infty}$ and $\dot{\mathbb{B}}_{2,1}^{\frac{3}{2}} \hookrightarrow \dot{\mathbb{B}}_{\infty, 1}^{1}$ give us

$$
\begin{aligned}
\|(n, V)(t)\|_{\dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}}^{h} & +\int_{0}^{t}\|(n, V)\|_{\dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}}^{h} \lesssim\left\|\left(n_{0}, V_{0}\right)\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}}^{h}+\int_{0}^{t}\left\|\left(\partial_{x} n, \partial_{x} V\right)\right\|_{\dot{B}_{2,1}^{\frac{1}{2}}}\|(n, V)\|_{\dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}}^{h} \\
& +\int_{0}^{t}\|V\|_{\dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}}^{\ell}\|(n, V)\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}+\int_{0}^{t}\left\|\partial_{x} V\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}\|G(n)\|_{\dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}}+\int_{0}^{t}\|(n, G(n))\|_{\dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}}^{\ell}\|V\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}} .
\end{aligned}
$$

Since, by Proposition A. 4 and Cauchy-Schwarz inequality, we have

$$
\begin{aligned}
& \int_{0}^{t}\left\|\partial_{x} V\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}\|G(n)\|_{\dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}} \\
& \lesssim \int_{0}^{t}\left\|\partial_{x} V\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}\|n\|_{\dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}} \lesssim\left\|\partial_{x} V\right\|_{L_{t}^{2}\left(\dot{\mathbb{B}}_{2,1}^{2}\right)}\|n\|_{L_{t}^{2}\left(\dot{B}_{2,1}^{2}\right)}, \\
& \int_{0}^{t}\|(n, G(n))\|_{\dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}}^{\ell}\|V\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}} \lesssim\|n\|_{L_{t}^{2}\left(\dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}\right)}\|V\|_{L_{t}^{2}\left(\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}\right)},
\end{aligned}
$$

one can conclude that (53) is satisfied.

Uniqueness. As for (TM), we look at the system satisfied by the difference $(\delta n, \delta V):=\left(n_{2}-\right.$ $n_{1}, V_{2}-V_{1}$ ) between two solutions, namely:

$$
\left\{\begin{array}{l}
\partial_{t} \delta n+\partial_{x} \delta V+V_{2} \partial_{x} \delta n+G\left(n_{2}\right) \partial_{x} \delta V=-\delta V \partial_{x} n_{1}-\left(G\left(n_{2}\right)-G\left(n_{1}\right)\right) \partial_{x} V_{1},  \tag{54}\\
\partial_{t} \delta V+\delta V+\partial_{x} \delta n+V_{2} \partial_{x} \delta V=-\delta V \partial_{x} V_{1}
\end{array}\right.
$$

and estimate ( $\delta n, \delta V$ ) for all $T>0$ in the space $F_{p}(T)$ defined in (29). Compared to the proof of uniqueness for ( $T M$ ) we have to handle the two terms containing the function $G$.

Let us first explain how to estimate the low frequencies. We have to bound the additional terms $G\left(n_{2}\right) \partial_{x} \delta V$ and $\left(G\left(n_{2}\right)-G\left(n_{1}\right)\right) \partial_{x} V_{1}$ in $\dot{\mathbb{B}}_{p, 1}^{\frac{2}{p}}{ }^{\frac{1}{2}}$. Now, according to (34) and (35), we have

$$
\begin{aligned}
\left\|\left(G\left(n_{2}\right)-G\left(n_{1}\right)\right) \partial_{x} V_{1}\right\|_{\dot{\mathbb{B}}_{p, 1}^{p}-\frac{1}{p}}^{\ell} & \lesssim\left\|G\left(n_{2}\right)-G\left(n_{1}\right)\right\|_{\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}}}\left\|\partial_{x} V_{1}\right\|_{\dot{B}_{p, 1}^{p}} \frac{2}{p}-\frac{1}{2} \\
\left\|G\left(n_{2}\right) \partial_{x} \delta V\right\|_{\dot{\mathbb{B}}_{p, 1}^{\frac{2}{p}-\frac{1}{2}}}^{\ell} & \left\|n_{2}\right\|_{\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}} \cap \dot{\dot{B}}_{p, 1}^{\frac{1}{p}+1}}\left\|\partial_{x} \delta V\right\|_{\dot{\mathbb{B}}_{p, 1}^{\frac{2}{p}}-\frac{3}{2}} .
\end{aligned}
$$

From the relation

$$
\begin{equation*}
G\left(n_{2}\right)-G\left(n_{1}\right)=\delta n \int_{0}^{1} G^{\prime}\left(n_{1}+\tau \delta n\right) d \tau \tag{55}
\end{equation*}
$$

and Propositions A. 3 and A.4, we find out:

$$
\left\|G\left(n_{2}\right)-G\left(n_{1}\right)\right\|_{\dot{\mathbb{B}}_{p, 1}^{1}} \lesssim\|\delta n\|_{\dot{\mathbb{B}}_{p, 1}^{p}}
$$

Therefore, we eventually have

$$
\begin{align*}
& +\int_{0}^{t}\left(\left\|\partial_{x} V_{1}\right\|_{\dot{B}_{p, 1}^{\frac{2}{p}}}\left\|\frac{1}{2}\right\| \delta\left\|_{\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}}}+\right\| n_{2}\left\|_{\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}} \cap \dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}+1}}\right\| \delta V \|_{\dot{\mathbb{B}}_{p, 1}^{\frac{2}{p}-\frac{1}{2}}}\right) . \tag{56}
\end{align*}
$$

Let us next estimate the high frequencies of $(\delta n, \delta V)$ in $\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}$. Applying operator $\dot{\Delta}_{j}$ to (54), we get for all $j \geq J_{0}$,

$$
\left\{\begin{array}{c}
\partial_{t} \delta n_{j}+\partial_{x} \delta V_{j}+\dot{S}_{j-1} V_{2} \partial_{x} \delta n_{j}+\dot{S}_{j-1} G\left(n_{2}\right) \partial_{x} \delta V_{j} \\
\quad=-\dot{\Delta}_{j}\left(\delta V \partial_{x} n_{1}+\left(G\left(n_{2}\right)-G\left(n_{1}\right)\right) \partial_{x} V_{1}\right)+\delta R_{j}^{1}+\delta R_{j}^{\prime 1} \\
\partial_{t} \delta V_{j}+\delta V_{j}+\partial_{x} \delta n_{j}+\dot{S}_{j-1} V_{2} \partial_{x} \delta V_{j}=-\dot{\Delta}_{j}\left(\delta V \partial_{x} V_{1}\right)+\delta R_{j}^{2}
\end{array}\right.
$$

with $\delta R_{j}^{1} \triangleq \dot{S}_{j-1} V_{2} \partial_{x} \delta n_{j}-\dot{\Delta}_{j}\left(V_{2} \partial_{x} \delta n\right), \delta R_{j}^{\prime 1} \triangleq \dot{S}_{j-1} G\left(n_{2}\right) \partial_{x} \delta V_{j}-\dot{\Delta}_{j}\left(G\left(n_{2}\right) \partial_{x} \delta V\right)$ and $\delta R_{j}^{2} \triangleq$ $\dot{S}_{j-1} V_{2} \partial_{x} \delta V_{j}-\dot{\Delta}_{j}\left(V_{2} \partial_{x} \delta V\right)$.

Arguing as in the proof of Proposition 4.1, we consider the functional

$$
\int_{\mathbb{R}}\left(\partial_{x} \delta n_{j}\right)^{2}+\left(1+\dot{S}_{j-1} G\left(n_{2}\right)\right)\left(\partial_{x} \delta V_{j}\right)^{2}+\eta \int_{\mathbb{R}} \delta V_{j} \partial_{x} \delta n_{j}
$$

and follow the computations therein, with regularity exponent $1 / 2$ instead of $3 / 2$. We get

$$
\begin{array}{r}
\|(\delta n, \delta V)(t)\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}^{h} \lesssim \int_{0}^{t}\left\|\left(\partial_{x} n_{2}, \partial_{x} V_{2}\right)\right\|_{L^{\infty}}\|(\delta n, \delta V)\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}^{h}+\int_{0}^{t} \sum_{j \geq J_{0}} 2^{\frac{j}{2}}\left(\left\|\delta R_{j}^{1}\right\|_{L^{2}}+\left\|\delta R_{j}^{\prime 1}\right\|_{L^{2}}+\left\|\delta R_{j}^{2}\right\|_{L^{2}}\right) \\
+\int_{0}^{t}\left(\left\|\delta V \partial_{x} n_{1}\right\|_{\dot{B}_{2,1}^{2}}^{h}+\left\|\delta V \partial_{x} V_{1}\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}^{h}+\left\|\left(G\left(n_{2}\right)-G\left(n_{1}\right)\right) \partial_{x} V_{1}\right\|_{\dot{B}_{2,1}^{\frac{1}{2}}}^{h}\right) .
\end{array}
$$

The terms with $\delta R_{j}^{1}$ and $\delta R_{j}^{2}$ may be bounded as in the proof of uniqueness for ( $T M$ ). Regarding $\delta R_{j}^{\prime 1}$, we use Lemma A. 3 with $s=1 / 2$, and get

$$
\begin{aligned}
\sum_{j \geq J_{0}} 2^{\frac{j}{2}}\left\|\delta R_{j}^{\prime 1}\right\|_{L^{2}} \lesssim\left\|\partial_{x} G\left(n_{2}\right)\right\|_{L^{\infty}}\|\delta V\|_{\dot{B}_{2,1}^{\frac{1}{2}}}^{h} & +\left\|\partial_{x} \delta V\right\|_{\dot{B}_{p, 1}^{\dot{p}^{p}-1}}\left\|G\left(n_{2}\right)\right\|_{\dot{\mathbb{B}}_{p^{*}, 1}^{1+\frac{1}{p^{*}}}}^{\ell} \\
& +\left\|\partial_{x} \delta V\right\|_{L^{\infty}}\left\|G\left(n_{2}\right)\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}^{h}+\left\|\partial_{x} \delta V\right\|_{\dot{\mathbb{B}}_{p, 1}^{1-\frac{1}{p}}}^{\ell}\left\|\partial_{x} G\left(n_{2}\right)\right\|_{\dot{\mathbb{B}}_{p^{*}, 1}^{\ell}-\frac{1}{p^{*}}}^{\ell}
\end{aligned}
$$

To continue the proof, we have two distinguish two cases depending on whether $P(\rho)=\rho^{\gamma} / \gamma$ and $2 \leq p \leq 4$, or $P$ is a general pressure law with $P^{\prime}(1)=1$, and $p=2$. In the first case, we have $G(n)=(\gamma-1) n$, so that $G\left(n_{2}\right)-G\left(n_{1}\right)=(\gamma-1) \delta n$. Now, in light of (85), we have

$$
\left\|\delta n \partial_{x} V_{1}\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}^{h} \lesssim\left(\|\delta n\|_{\dot{\mathbb{B}}_{p, 1}^{2}-\frac{2}{2}}^{\ell}+\|\delta n\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}^{h}\right)\left(\left\|\partial_{x} V_{1}\right\|_{\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}-1}}^{\ell}+\left\|\partial_{x} V_{1}\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}^{h}\right) .
$$

As all the terms with $G\left(n_{2}\right)$ in the estimate for $R_{j}^{\prime 1}$ are proportional to $n_{2}$, we arrive at

$$
\begin{align*}
& \|(\delta n, \delta V)(t)\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}^{h}  \tag{57}\\
& \lesssim \int_{0}^{t}\left(\left\|\left(n_{1}, n_{2}, V_{1}, V_{2}\right)\right\|_{\dot{\mathbb{B}}_{p, 1}^{p}}^{\ell}+\left\|\left(n_{1}, n_{1}, V_{1}, V_{2}\right)\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}}^{h}+\left\|\left(\partial_{x} n_{1}, \partial_{x} V_{1}\right)\right\|_{\dot{\mathbb{B}}_{p, 1}^{p}}^{2-\frac{1}{2}}\right)\|(\delta n, \delta V)\|_{F_{p}} .
\end{align*}
$$

In the case $p=2$ with $P^{\prime}(1)=1$, then one may proceed essentially as in the proof of Proposition 4.1 to bound the terms with $G\left(n_{2}\right)$ in the estimate for $R_{j}^{\prime 1}$, and one can use Proposition A.4 combined with product laws and Relation (55) to eventually arrive at

$$
\left\|\left(G\left(n_{2}\right)-G\left(n_{1}\right)\right) \partial_{x} V_{1}\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}} \lesssim\|\delta n\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}\left\|\partial_{x} V_{1}\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}} .
$$

Consequently, (57) still holds true.
In all cases, putting (56) and (57) together yields

$$
\begin{aligned}
& \|(\delta n, \delta V)\|_{F_{p}(t)} \\
& \quad \leq C \int_{0}^{t}\left(\left\|\left(n_{1}, n_{2}, V_{1}, V_{2}\right)\right\|_{\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}}}^{\ell}+\left\|\left(n_{1}, n_{2}, V_{1}, V_{2}\right)\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}}^{h}+\left\|\left(\partial_{x} n_{1}, \partial_{x} V_{1}\right)\right\|_{\dot{\mathbb{B}}_{p, 1}^{p} \frac{2}{p}-\frac{1}{2}}\right)\|(\delta n, \delta V)\|_{F_{p}},
\end{aligned}
$$

and using Gronwall lemma completes the proof of uniqueness.
Decay estimates. Here, we assume that $p=2$ and follow the same approach as for (TM).
Step 1: estimating the solution in $\dot{\mathbb{B}}_{2, \infty}^{-\sigma_{1}}$. This is only a matter of handling the additional term $G(n) \partial_{x} v$. Applying $\dot{\Delta}_{j}$ to the system satisfied by $(n, V)$ yields

$$
\left\{\begin{array}{l}
\partial_{t} n_{j}+\partial_{x} V_{j}=-v \partial_{x} n_{j}-G(n) \partial_{x} V+\left[V, \dot{\Delta}_{j}\right] \partial_{x} n, \\
\partial_{t} V_{j}+\partial_{x} n_{j}+V_{j}=-V \partial_{x} V_{j}+\left[v, \dot{\Delta}_{j}\right] \partial_{x} V
\end{array}\right.
$$

So, considering $G(n) \partial_{x} V$ as a source term, we get

$$
\begin{aligned}
\left\|\left(n_{j}, V_{j}\right)(t)\right\|_{L^{2}}+\int_{0}^{t} & \left\|V_{j}\right\|_{L^{2}} \leq\left\|\left(n_{j}, V_{j}\right)(0)\right\|_{L^{2}}+\int_{0}^{t}\left\|\partial_{x} V\right\|_{L^{\infty}}\left\|\left(n_{j}, V_{j}\right)\right\|_{L^{2}} \\
& \quad+\int_{0}^{t}\left\|\left[V, \dot{\Delta}_{j}\right] \partial_{x} n\right\|_{L^{2}}+\int_{0}^{t}\left\|\left[V, \dot{\Delta}_{j}\right] \partial_{x} V\right\|_{L^{2}}+\left\|\dot{\Delta}_{j}\left(G(n) \partial_{x} V\right)\right\|_{L^{2}}\left\|n_{j}\right\|_{L^{2}}
\end{aligned}
$$

We have

$$
\left\|G(n) \partial_{x} V\right\|_{\dot{\mathbb{B}}_{2, \infty}^{-\sigma_{1}}} \leq\|G(n)\|_{\dot{\mathbb{B}}_{2, \infty}^{-\sigma_{\infty}}}\left\|\partial_{x} V\right\|_{\dot{B}_{2,1}^{\frac{1}{2}}} .
$$

In order to bound $G(n)$ in $\dot{\mathbb{B}}_{2, \infty}^{-\sigma_{1}}$, one cannot readily use Proposition A.4 since $-\sigma_{1}$ may be negative. However, from Taylor formula, we know that there exists a smooth function $H$ vanishing at 0 such that

$$
G(n)=G^{\prime}(0) n+H(n) n
$$

Hence, combining product and composition estimates gives

$$
\|G(n)\|_{\dot{\mathbb{B}}_{2, \infty}^{-\sigma_{1}}} \lesssim\|n\|_{\dot{\mathbb{B}}_{2, \infty}^{-\sigma_{1}}}\left(1+\|n\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}\right) .
$$

In the regime we consider, $\|n\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}$ is small. Hence we conclude that

$$
\|(n, V)(t)\|_{\dot{\mathbb{d}}_{2, \infty}^{-\sigma_{1}}} \leq\left\|\left(n_{0}, V_{0}\right)\right\|_{\dot{\mathbb{S}}_{2, \infty}^{-\sigma_{1}}}+C \int_{0}^{t}\left\|\partial_{x} V\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}\|(n, V)\|_{\dot{\mathbb{B}}_{2, \infty}^{-\sigma_{1}}},
$$

which ensures after using Gronwall lemma and the bound of $\left\|\partial_{x} V\right\|_{L^{1}\left(\dot{B}_{2,1}^{\frac{1}{2}}\right)}$ in terms of $X_{2,0}$, that

$$
\forall t \in \mathbb{R}^{+},\|(n, V)(t)\|_{\dot{\mathbb{B}}_{2, \infty}^{-\sigma_{1}}} \leq C\left\|\left(n_{0}, V_{0}\right)\right\|_{\dot{\mathbb{B}}_{2, \infty}^{-\sigma_{1}}} .
$$

Step 2: Lyapunov functional. We aim at exhibiting a Lyapunov functional that is equivalent to $\|(n, V)\|_{\dot{B}_{2,1}^{\frac{1}{2} \cap} \dot{B}_{2,1}^{\frac{3}{2}}}$. The high frequency part of the solution has already been treated efficiently with $\widetilde{\mathcal{L}}_{j}$. To bound the low frequency part, consider the evolution equation for $z \triangleq V+\partial_{x} n$ :

$$
\partial_{t} z+V \partial_{x} z+z=-\partial_{x x}^{2} V-\partial_{x} V \partial_{x} n-\partial_{x}\left(G(n) \partial_{x} V\right)
$$

Following the computations we did for ( $T M$ ) leads to

$$
\begin{aligned}
&\|z(t)\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}^{\ell}+\int_{0}^{t}\|z\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}^{\ell} \leq\left\|z_{0}\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}^{\ell}+\int_{0}^{t}\left\|\partial_{x x}^{2} V\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}^{\ell} \\
& \quad+C \int_{0}^{t}\left\|\partial_{x} V\right\|_{\dot{B}_{2,1}^{\frac{1}{2}}}\|z\|_{\dot{B}_{2,1}^{\frac{1}{2}}}+C \int_{0}^{t}\left\|\partial_{x} V\right\|_{\dot{B}_{2,1}^{\frac{1}{2}}}\left\|\partial_{x} n\right\|_{\dot{B}_{2,1}^{\frac{1}{2}}}+\int_{0}^{t}\left\|\partial_{x}\left(G(n) \partial_{x} V\right)\right\|_{\dot{B}_{2,1}^{2}}^{\ell} \\
& .
\end{aligned}
$$

The last term may be bounded. by $\left\|G(n) \partial_{x} V\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}$. Then, using Propositions A.3 and A.4 one ends up with

$$
\begin{equation*}
\|z(t)\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}^{\ell}+\int_{0}^{t}\|z\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}^{\ell} \leq\left\|z_{0}\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}^{\ell}+\int_{0}^{t}\left\|\partial_{x x}^{2} V\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}^{\ell}+C \int_{0}^{t}\left\|\partial_{x} V\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}\left\|\left(z, n, \partial_{x} n\right)\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}} . \tag{58}
\end{equation*}
$$

Next, using the fact that

$$
\partial_{t} n+V \partial_{x} n-\partial_{x x}^{2} n=-G(n) \partial_{x} V-\partial_{x} z,
$$

we get

$$
\begin{equation*}
\|n(t)\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}^{\ell}+\int_{0}^{t}\|n\|_{\dot{\mathbb{B}}_{2,1}^{\frac{5}{2}}}^{\ell} \leq\left\|n_{0}\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}^{\ell}+\int_{0}^{t}\left\|\partial_{x} z\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}^{\ell}+C \int_{0}^{t}\left\|\partial_{x} V\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}\|n\|_{\dot{B}_{2,1}^{\frac{1}{2}}} . \tag{59}
\end{equation*}
$$

The high frequency part of the solution may be bounded according to (51). Hence, setting
$\widetilde{\mathcal{L}} \triangleq \sum_{j \leq J_{0}} 2^{\frac{j}{2}}\left\|\left(\dot{\Delta}_{j} n, \dot{\Delta}_{j} z\right)\right\|_{L^{2}}+\sum_{j \geq J_{0}} 2^{\frac{j}{2}} \widetilde{\mathcal{L}}_{j} \quad$ and $\quad \widetilde{\mathcal{H}} \triangleq\left\|V+\partial_{x} n\right\|_{\dot{B}_{2,1}^{\frac{1}{2}}}^{\ell}+\|V\|_{\dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}}^{h}+\|n\|_{\dot{\mathbb{B}}_{2,1}^{\frac{5}{2}}}^{\ell}+\|n\|_{\dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}}^{h}$ and bounding $R_{j}^{1}, R_{j}^{\prime 1}$ and $R_{j}^{2}$ as in the proof of Proposition 4.1, we discover that if taking $J_{0}$ negative enough, then all the linear terms in (58) and (59) may be absorbed by $\widetilde{\mathcal{H}}$, so that we have for some suitably small positive $c$,

$$
\begin{equation*}
\widetilde{\mathcal{L}}(t)+c \int_{0}^{t} \widetilde{\mathcal{H}} \leq \widetilde{\mathcal{L}}(0)+C \int_{0}^{t}\left\|\partial_{x} V\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}} \mathcal{L}+C \int_{0}^{t}\|n\|_{\dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}}\|V\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}} \tag{60}
\end{equation*}
$$

Above, we used that $\widetilde{\mathcal{L}} \simeq\|(n, V)\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}} \cap \dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}}$ and that $\widetilde{\mathcal{H}} \gtrsim\left\|\partial_{x} V\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}$. Now, since furthermore $\widetilde{\mathcal{H}} \gtrsim\|z\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}$ and $\widetilde{\mathcal{L}} \gtrsim\|z\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}$, one may write

$$
\begin{aligned}
\|n\|_{\dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}}\|V\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}} & \leq\|n\|_{\dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}}^{2}+\|n\|_{\dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}}\|z\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}} \\
& \lesssim\|n\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}^{\ell}\|n\|_{\dot{\mathbb{B}}_{2,1}^{\frac{5}{2}}}+\left(\|n\|_{\dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}}^{h}+\|n\|_{\dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}}^{\ell}\|z\|_{\dot{B}_{2,1}^{\frac{1}{2}}}+\|n\|_{\dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}}^{h}\|z\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}\right. \\
& \lesssim \widetilde{\mathcal{L}} \widetilde{\mathcal{H}}+\widetilde{\mathcal{L}} \widetilde{\mathcal{H}}+\widetilde{\mathcal{H} \mathcal{H}}+\widetilde{\mathcal{H}} \widetilde{ }
\end{aligned}
$$

Hence, if $\widetilde{\mathcal{L}}(0)$ is small enough then, combining (60) with a bootstrap argument yields

$$
\widetilde{\mathcal{L}}(t)+\frac{c}{2} \int_{0}^{t} \widetilde{\mathcal{H}} \leq \widetilde{\mathcal{L}}(0) \quad \text { for all } t \geq 0
$$

Step 3: Proof of decay estimates. From this point, one can repeat word for word the proof of decay estimates for the low frequencies of the solutions to (TM).

For the high frequencies, starting from (50), using Lemma A. 3 and integrating gives

$$
\|(n, V)(t)\|_{\dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}}^{h} \lesssim e^{-c t}\left\|\left(n_{0}, V_{0}\right)\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}}^{h}+\int_{0}^{t} e^{-c(t-\tau)}\left(\|V\|_{\dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}}\|(n, V)\|_{\dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}}+\|V\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}\|n\|_{\dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}}\right) .
$$

Compared to (17), there is one more term. However, as for (TM), Steps 1 and 2 together imply that

$$
\|(n, V)(t)\|_{\dot{B}_{2,1}^{\frac{1}{2}} \cap \dot{B}_{2,1}^{\frac{3}{2}}} \lesssim\langle t\rangle^{-\alpha_{1}} .
$$

Hence, one may easily conclude that

$$
\|(n, V)(t)\|_{\dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}}^{h} \lesssim\langle t\rangle^{-2 \alpha_{1}} .
$$

This completes the proof of the theorem (up to the proof of existence, which is totally analogous as for (TM)).

## 5. A more general 1D model

In this section, we consider a more general class of one dimensional systems, namely

$$
\left\{\begin{array}{c}
\partial_{t} u+\alpha \partial_{x} v+V^{1} \partial_{x} u+W^{1} \partial_{x} v=0,  \tag{61}\\
\partial_{t} v+\beta \partial_{x} u+V^{2} \partial_{x} u+W^{2} \partial_{x} v+\lambda v+\kappa \lambda v^{q}=0
\end{array}\right.
$$

wher $\kappa$ is a real parameter, $q \geq 2$, an integer, $V^{1}=V^{1}(v)$ and $V^{2}=V^{2}(v)$ are smooth functions vanishing at $0, W^{1}=W^{1}(u, v)$ and $W^{2}=W^{2}(u, v)$ are smooth functions vanishing at $(0,0)$, and $\alpha, \beta, \lambda$ are strictly positive constants.

Theorem 5.1. Let the data $\left(u_{0}, v_{0}\right)$ satisfy the assumptions of Theorem 1.1 with $J_{\lambda} \triangleq\left\lfloor\log _{2} \lambda\right\rfloor$ and $p=2$. Then, System (61) admits a unique global solution ( $u, v$ ) verifying the same properties as the solution therein. Furthermore, Corollary 1.1 and Theorem 1.2 hold true.

Remark 5.1. If $V^{1}, V^{2}, W^{1}$ and $W^{2}$ are 'general' smooth functions, then it is unlikely that a $L^{p}$ theory may be worked out. We need a very specific structure of the nonlinear terms in order that the $L^{p}$ estimates of the low frequencies fit with the $L^{2}$ regularity of the high frequencies.
Remark 5.2. We do not know how to handle terms like $u \partial_{x} u$ in any equations of the system (this is the reason why we assumed that $V^{1}$ and $V^{2}$ only depend on $v$ ). In fact, although the system is locally well-posed if $V^{1}$ and $V^{2}$ also depend on $u$, the time integrability of $u$ is not good enough for global estimates.

[^3]Elements of proof. We just explain how to find a Lyapunov function and to control the norm in $\dot{\mathbb{B}}_{2, \infty}^{-\sigma_{1}}$ of a smooth solution $(u, v)$ of (61) on $[0, T]$, in terms of the data. Proving existence and uniqueness is essentially the same as for the systems we treated before (uniqueness is easier somehow since we assumed $p=2$ ). Although the system under consideration is no longer symmetric if $\alpha+W^{1} \neq \beta+V^{2}$, it is symmetrizable (see [3, Chap. 10]).

Note that performing a suitable rescaling reduces our problem to the case

$$
\begin{equation*}
\alpha=\beta=\lambda=1 \tag{62}
\end{equation*}
$$

Indeed, if we set

$$
(u, v)(t, x)=(\sqrt{\alpha} \tilde{u}, \sqrt{\beta} \tilde{v})\left(\lambda t, \frac{\lambda}{\sqrt{\alpha \beta}} x\right)
$$

then $(u, v)$ satisfies (61) if and only if $(\tilde{u}, \tilde{v})$ satisfies a similar system with (62), parameter $\kappa \beta^{\frac{q-1}{2}}$ and slightly modified functions $V_{1}, V_{2}, W_{1}$ and $W_{2}$ (the modification depending only on $\alpha$ and $\beta$ ). So we will assume (62) in the rest of this section.

A priori estimates. We adapt the method we used for $(T M)$ in the case $p=2$. The terms $V^{1} \partial_{x} u$ and $W^{2} \partial_{x} v$ are a slight generalization of $v \partial_{x} u$ and $v \partial_{x} v$ and may be treated similarly. To handle $W^{1} \partial_{x} v$ and $V^{2} \partial_{x} u$, we need to introduce suitable weights in the definition of the Lyapunov. Finally, $v^{q}$ may be seen as a harmless nonlinear source term.

Let us start the computations : we assume that we are given a smooth function $(u, v)$ of (61) on some time interval $[0, T]$ such that for some suitably small $\eta>0$,

$$
\begin{equation*}
\sup _{t \in[0, T]}\|(u, v)(t)\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}} \leq \eta \tag{63}
\end{equation*}
$$

and, still denoting $u_{j}=\dot{\Delta}_{j} u$ and $v_{j}=\dot{\Delta}_{j} v$, we set for all $j \in \mathbb{Z}$,

$$
\mathcal{L}_{j} \triangleq\left(\left\|\left(u_{j}, v_{j}\right)\right\|_{L^{2}}^{2}+\int_{\mathbb{R}} v_{j} \partial_{x} u_{j}+\int_{\mathbb{R}}\left(1+V^{2}\right)\left(\partial_{x} u_{j}\right)^{2}+\int_{\mathbb{R}}\left(1+W^{1}\right)\left(\partial_{x} v_{j}\right)^{2}\right)^{1 / 2}
$$

We shall use repeatedly that (63) implies that

$$
\begin{equation*}
\sup _{t \in[0, T]} \max \left(\|u(t)\|_{L^{\infty}},\|v(t)\|_{L^{\infty}},\left\|V^{1}(t)\right\|_{L^{\infty}},\left\|V^{2}(t)\right\|_{L^{\infty}},\left\|W^{1}(t)\right\|_{L^{\infty}},\left\|W^{2}(t)\right\|_{L^{\infty}}\right) \ll 1 \tag{64}
\end{equation*}
$$

which in particular entails that

$$
\begin{equation*}
\mathcal{L}_{j} \simeq\left\|\left(u_{j}, v_{j}, \partial_{x} u_{j}, \partial_{x} v_{j}\right)\right\|_{L^{2}} \tag{65}
\end{equation*}
$$

Now, applying $\dot{\Delta}_{j}$ to (61)-(62) yields for all $j \in \mathbb{Z}$,

$$
\left\{\begin{array}{l}
\partial_{t} u_{j}+\left(1+W^{1}\right) \partial_{x} v_{j}+V^{1} \partial_{x} u_{j}=R_{j}^{1}  \tag{66}\\
\partial_{t} v_{j}+\left(1+V^{2}\right) \partial_{x} u_{j}+W^{2} \partial_{x} v_{j}+v_{j}=R_{j}^{2}-\kappa \dot{\Delta}_{j}\left(v^{q}\right)
\end{array}\right.
$$

with

$$
R_{j}^{1} \triangleq\left[V^{1}, \dot{\Delta}_{j}\right] \partial_{x} u+\left[W^{1}, \dot{\Delta}_{j}\right] \partial_{x} v \quad \text { and } \quad R_{j}^{2} \triangleq\left[V^{2}, \dot{\Delta}_{j}\right] \partial_{x} u+\left[W^{2}, \dot{\Delta}_{j}\right] \partial_{x} v
$$

In order to compute the time derivative of $\mathcal{L}_{j}^{2}$, we need the following obvious identities:

$$
\begin{aligned}
& \frac{1}{2} \frac{d}{d t}\left\|\left(u_{j}, v_{j}\right)\right\|_{L^{2}}^{2}+\left\|v_{j}\right\|_{L^{2}}^{2}-\frac{1}{2} \int_{\mathbb{R}}\left(\left(u_{j}\right)^{2} \partial_{x} V^{1}+\left(v_{j}\right)^{2} \partial_{x} W^{2}\right)+\int_{\mathbb{R}}\left(W^{1} u_{j} \partial_{x} v_{j}+V^{2} v_{j} \partial_{x} u_{j}\right) \\
& =\int_{\mathbb{R}}\left(R_{j}^{1} u_{j}+R_{j}^{2} v_{j}-\kappa\left(\dot{\Delta}_{j} v^{q}\right) v_{j}\right) \\
& \frac{d}{d t} \int_{\mathbb{R}} v_{j} \partial_{x} u_{j}+\left\|\partial_{x} u_{j}\right\|_{L^{2}}^{2}-\left\|\partial_{x} v_{j}\right\|_{L^{2}}^{2}+\int_{\mathbb{R}} v_{j} \partial_{x} u_{j} \\
& +\int_{\mathbb{R}}\left(\left(W^{2}-V^{1}\right) \partial_{x} u_{j} \partial_{x} v_{j}+V^{2}\left(\partial_{x} u_{j}\right)^{2}-W^{1}\left(\partial_{x} v_{j}\right)^{2}\right)=\int_{\mathbb{R}}\left(R_{j}^{2} \partial_{x} u_{j}-R_{j}^{1} \partial_{x} v_{j}-\kappa\left(\dot{\Delta}_{j} v^{q}\right) \partial_{x} u_{j}\right)
\end{aligned}
$$

$$
\begin{array}{r}
\frac{1}{2} \frac{d}{d t} \int_{\mathbb{R}}\left(1+V^{2}\right)\left(\partial_{x} u_{j}\right)^{2}+\int_{\mathbb{R}}\left(1+V^{2}\right) \partial_{x} u_{j} \partial_{x}\left(V^{1} \partial_{x} u_{j}\right)+\int_{\mathbb{R}}\left(1+V^{2}\right) \partial_{x} u_{j} \partial_{x}\left(\left(1+W^{1}\right) \partial_{x} v_{j}\right) \\
=\int_{\mathbb{R}}\left(1+V^{2}\right) \partial_{x} u_{j} \partial_{x} R_{j}^{1}+\frac{1}{2} \int_{\mathbb{R}} \partial_{t} V^{2}\left(\partial_{x} u_{j}\right)^{2} \\
\frac{1}{2} \frac{d}{d t} \int_{\mathbb{R}}\left(1+W^{1}\right)\left(\partial_{x} v_{j}\right)^{2}+\int_{\mathbb{R}}\left(1+W^{1}\right) \partial_{x} v_{j} \partial_{x}\left(W^{2} \partial_{x} v_{j}\right)+\int_{\mathbb{R}}\left(1+W^{1}\right) \partial_{x} v_{j} \partial_{x}\left(\left(1+V^{2}\right) \partial_{x} u_{j}\right) \\
+\int_{\mathbb{R}}\left(1+W^{1}\right)\left(\partial_{x} v_{j}\right)^{2}=\int_{\mathbb{R}}\left(1+W^{1}\right) \partial_{x} v_{j}\left(\partial_{x} R_{j}^{2}-\kappa \partial_{x} \dot{\Delta}_{j} v^{q}\right)+\frac{1}{2} \int_{\mathbb{R}} \partial_{t} W^{1}\left(\partial_{x} v_{j}\right)^{2}
\end{array}
$$

The fundamental observation that justifies our using those very weights in the definition of $\mathcal{L}_{j}$ is that the third integrals in the last two relations compensate. Consequently, denoting

$$
\mathcal{H}_{j}^{2} \triangleq\left\|v_{j}\right\|_{L^{2}}^{2}+\frac{1}{2} \int_{\mathbb{R}} v_{j} \partial_{x} u_{j}+\frac{1}{2}\left\|\partial_{x} u_{j}\right\|_{L^{2}}^{2}+\int_{\mathbb{R}}\left(W^{1}+\frac{1}{2}\right)\left(\partial_{x} v_{j}\right)^{2}
$$

and using the fact that

$$
\int_{\mathbb{R}} V^{2} v_{j} \partial_{x} u_{j}=-\int_{\mathbb{R}} V^{2} u_{j} \partial_{x} v_{j}-\int_{\mathbb{R}} u_{j} v_{j} \partial_{x} V^{2}
$$

we arrive at

$$
\begin{aligned}
& \frac{1}{2} \frac{d}{d t} \mathcal{L}_{j}^{2}+\mathcal{H}_{j}^{2}=\frac{1}{2} \int\left(\left(v_{j}\right)^{2} \partial_{x} W^{2}+\left(u_{j}\right)^{2} \partial_{x} V^{1}\right)+\int_{\mathbb{R}} u_{j} v_{j} \partial_{x} V^{2}+\int_{\mathbb{R}}\left(V^{2}-W^{1}\right) u_{j} \partial_{x} v_{j} \\
& +\frac{1}{2} \int_{\mathbb{R}}\left(\left(V^{1}-W^{2}\right) \partial_{x} u_{j} \partial_{x} v_{j}-V^{2}\left(\partial_{x} u_{j}\right)^{2}+W^{1}\left(\partial_{x} v_{j}\right)^{2}\right)+\frac{1}{2} \int_{\mathbb{R}}\left(\partial_{x} u_{j}\right)^{2}\left(V^{1} \partial_{x} V^{2}-\left(1+V^{2}\right) \partial_{x} V^{1}\right) \\
& \quad+\frac{1}{2} \int_{\mathbb{R}}\left(\partial_{x} v_{j}\right)^{2}\left(W^{2} \partial_{x} W^{1}-\left(1+W^{1}\right) \partial_{x} W^{2}\right)+\frac{1}{2} \int_{\mathbb{R}}\left(\left(\partial_{x} u_{j}\right)^{2} \partial_{t} V^{2}+\left(\partial_{x} v_{j}\right)^{2} \partial_{t} W^{1}\right) \\
& +\int_{\mathbb{R}}\left(u_{j}-\frac{1}{2} \partial_{x} v_{j}\right) R_{j}^{1}+\int_{\mathbb{R}}\left(v_{j}+\frac{1}{2} \partial_{x} u_{j}\right) R_{j}^{2}+\int_{\mathbb{R}}\left(\left(1+V^{2}\right) \partial_{x} u_{j} \partial_{x} R_{j}^{1}+\left(1+W^{1}\right) \partial_{x} v_{j} \partial_{x} R_{j}^{2}\right) \\
& -\kappa \int_{\mathbb{R}}\left(\left(v_{j}+\frac{1}{2} \partial_{x} u_{j}\right) \dot{\Delta}_{j} v^{q}+\left(1+W^{1}\right) \partial_{x} \dot{\Delta}_{j} v^{q} \partial_{x} v_{j}\right)
\end{aligned}
$$

Since

$$
\partial_{t} V^{2}=-\left(V^{2}\right)^{\prime}\left(\left(1+V^{2}\right) \partial_{x} u+W^{2} \partial_{x} v+v+\kappa v^{q}\right)
$$

remembering (64), we have

$$
\left\|\partial_{t} V^{2}\right\|_{L^{\infty}} \lesssim\left\|\partial_{x} u\right\|_{L^{\infty}}+\|(u, v)\|_{L^{\infty}}\left\|\partial_{x} v\right\|_{L^{\infty}}+\|v\|_{L^{\infty}}
$$

and, similarly,

$$
\left\|\partial_{t} W^{1}\right\|_{L^{\infty}} \lesssim\left\|\partial_{x} u\right\|_{L^{\infty}}+\left\|\partial_{x} v\right\|_{L^{\infty}}+\|v\|_{L^{\infty}}
$$

Observe also that

$$
\left\|\partial_{x} V^{i}\right\|_{L^{\infty}} \lesssim\left\|\partial_{x} v\right\|_{L^{\infty}} \quad \text { and } \quad\left\|\partial_{x} W^{i}\right\|_{L^{\infty}} \lesssim\left\|\left(\partial_{x} u, \partial_{x} v\right)\right\|_{L^{\infty}} \quad \text { for } \quad i=1,2
$$

whence, in particular

$$
\int_{\mathbb{R}} u_{j} v_{j} \partial_{x} V^{2} \lesssim\left\|\partial_{x} v\right\|_{L^{\infty}}\left\|u_{j}\right\|_{L^{2}}\left\|v_{j}\right\|_{L^{2}}
$$

Therefore,

$$
\begin{aligned}
& \frac{1}{2} \frac{d}{d t} \mathcal{L}_{j}^{2}+\mathcal{H}_{j}^{2} \lesssim\|(u, v)\|_{L^{\infty}}\left\|\partial_{x} v_{j}\right\|_{L^{2}}\left\|\left(u_{j}, \partial_{x} u_{j}, \partial_{x} v_{j}\right)\right\|_{L^{2}}+\|v\|_{L^{\infty}}\left\|\partial_{x} u_{j}\right\|_{L^{2}}^{2} \\
& \quad+\left\|\partial_{x} u\right\|_{L^{\infty}}\left\|\left(v_{j}, \partial_{x} u_{j}, \partial_{x} v_{j}\right)\right\|_{L^{2}}^{2}+\left\|\partial_{x} v\right\|_{L^{\infty}}\left\|\left(u_{j}, v_{j}, \partial_{x} u_{j}, \partial_{x} v_{j}\right)\right\|_{L^{2}}^{2} \\
& +\left\|\left(R_{j}^{1}, R_{j}^{2}\right)\right\|_{L^{2}}\left\|\left(u_{j}, v_{j}, \partial_{x} u_{j}, \partial_{x} v_{j}\right)\right\|_{L^{2}}+\left\|\left(\partial_{x} R_{j}^{1}, \partial_{x} R_{j}^{2}\right)\right\|_{L^{2}}\left\|\left(\partial_{x} u_{j}, \partial_{x} v_{j}\right)\right\|_{L^{2}} \\
& \quad+\left\|\left(v_{j}, \partial_{x} u_{j}\right)\right\|_{L^{2}}\left\|\dot{\Delta}_{j} v^{q}\right\|_{L^{2}}+\left\|\partial_{x} v_{j}\right\|_{L^{2}}\left\|\partial_{x} \dot{\Delta}_{j} v^{q}\right\|_{L^{2}}
\end{aligned}
$$

Then, remembering (65) and using lemma A.1 we discover that for all $j \in \mathbb{Z}$ and $t \in[0, T]$,

$$
\begin{align*}
& 67) \quad \begin{aligned}
\mathcal{L}_{j}(t)+c \min \left(1,2^{2 j}\right) \int_{0}^{t} \mathcal{L}_{j} & \leq \mathcal{L}_{j}(0) \\
+C \int_{0}^{t}\left(\left\|\partial_{x} v\right\|_{L^{\infty}} \mathcal{L}_{j}+\left\|\partial_{x} u\right\|_{L^{\infty}}\right. & \left.\left\|v_{j}\right\|_{L^{2}}+\left\|\left(v, \partial_{x} u\right)\right\|_{L^{\infty}}\left\|\partial_{x} u_{j}\right\|_{L^{2}}+\left\|\left(u, v, \partial_{x} u\right)\right\|_{L^{\infty}}\left\|\partial_{x} v_{j}\right\|_{L^{2}}\right) \\
& +\int_{0}^{t}\left\|\left(\dot{\Delta}_{j} v^{q}, \partial_{x} \dot{\Delta}_{j} v^{q}\right)\right\|_{L^{2}}+C \int_{0}^{t}\left\|\left(R_{j}^{1}, R_{j}^{2}, \partial_{x} R_{j}^{1}, \partial_{x} R_{j}^{2}\right)\right\|_{L^{2}} .
\end{aligned} \tag{67}
\end{align*}
$$

To bound the commutator terms, let us use (79) that yields

$$
\left\|R_{j}^{1}\right\|_{L^{2}} \lesssim c_{j} 2^{-\frac{j}{2}}\left(\left\|\partial_{x} V^{1}\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}\|u\|_{\dot{B}_{2,1}^{\frac{1}{2}}}+\left\|\partial_{x} W^{1}\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}\|v\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}\right) \text { for all } j \in \mathbb{Z} .
$$

Clearly, since $v$ is small in $\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}, V^{1}=V^{1}(v)$ and $V^{1}(0)=0$, Proposition A.4 entails that

$$
\begin{equation*}
\left\|\partial_{x} V^{1}\right\|_{\dot{B}_{2,1}^{1}} \lesssim\left\|\partial_{x} v\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}} . \tag{68}
\end{equation*}
$$

In order to bound the term with $W^{1}$, we use the fact that there exist two smooth functions $G=G(u, v)$ and $H=H(u, v)$ vanishing at $(0,0)$ and such that

$$
\partial_{x} W^{1}=\partial_{u} W^{1}(0,0) \partial_{x} u+\partial_{v} W^{1}(0,0) \partial_{x} v+G(u, v) \partial_{x} u+H(u, v) \partial_{x} v
$$

Consequently, using the stability of the space $\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}$ by product and results in [26, Section 5.5] for bounding $G(u, v)$ and $H(u, v)$, we get

$$
\begin{equation*}
\left\|\partial_{x} W^{1}\right\|_{\dot{B}_{2,1}^{1}} \lesssim\left\|\left(\partial_{x} u, \partial_{x} v\right)\right\|_{\dot{B}_{2,1}^{\frac{1}{2}}}\left(1+\|(u, v)\|_{\dot{B}_{2,1}^{\frac{1}{2}}}\right) . \tag{69}
\end{equation*}
$$

So finally, remembering (63), we have

$$
\begin{equation*}
\left\|R_{j}^{1}\right\|_{L^{2}} \lesssim c_{j} 2^{-\frac{j}{2}}\left(\|u\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}\left\|\partial_{x} v\right\|_{\dot{B}_{2,1}^{\frac{1}{2}}}+\|v\|_{\dot{\mathbb{R}}_{2,1}^{\frac{1}{2}}}\left\|\left(\partial_{x} u, \partial_{x} v\right)\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}\right) . \tag{70}
\end{equation*}
$$

Bounding $R_{j}^{2}$ works exactly the same. Next, in light of (81), we have

$$
\left\|\partial_{x} R_{j}^{1}\right\|_{L^{2}} \lesssim c_{j} 2^{-\frac{j}{2}}\left(\left\|\partial_{x} V^{1}\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}\left\|\partial_{x} u\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}+\left\|\partial_{x} W^{1}\right\|_{\dot{B}_{2,1}^{\frac{1}{2}}}\left\|\partial_{x} v\right\|_{\dot{B}_{2,1}^{\frac{1}{2}}}\right),
$$

and a similar inequality for $\partial_{x} R_{j}^{2}$. Hence repeating the above arguments for bounding $\partial_{x} V^{1}$, $\partial_{x} V^{2}, \partial_{x} W^{1}$ and $\partial_{x} W^{2}$, we end up with

$$
\begin{equation*}
\left\|\partial_{x} R_{j}^{i}\right\|_{L^{2}} \lesssim c_{j} 2^{-\frac{j}{2}}\left\|\partial_{x} v\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}\left\|\left(\partial_{x} u, \partial_{x} v\right)\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}, \quad i=1,2 . \tag{71}
\end{equation*}
$$

Now, reverting to (67), using the embedding $\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}} \hookrightarrow L^{\infty}$ and that

$$
\begin{equation*}
\mathcal{H}_{j} \simeq\left\|\left(v_{j}, \partial_{x} u_{j}, \partial_{x} v_{j}\right)\right\|_{L^{2}} \tag{72}
\end{equation*}
$$

we get, denoting

$$
\mathcal{L} \triangleq \sum_{j \in \mathbb{Z}} 2^{\frac{j}{2}} \mathcal{L}_{j},
$$

two positive constants $c$ and $C$ such that

$$
\begin{align*}
& \mathcal{L}(t)+c \sum_{j} \min \left(1,2^{2 j}\right) 2^{\frac{j}{2}} \int_{0}^{t} \mathcal{L}_{j} \leq \mathcal{L}(0)+C \int_{0}^{t}\left\|\partial_{x} v\right\|_{\dot{B}_{2,1}^{\frac{1}{2}}} \mathcal{L}  \tag{73}\\
&+C \int_{0}^{t}\|v\|_{\dot{B}_{2,1}^{\frac{1}{2}}}\left\|\partial_{x} u\right\|_{\dot{B}_{2,1}^{\frac{1}{2}}}+C \int_{0}^{t}\left\|\partial_{x} u\right\|_{\dot{B}_{2,1}^{\frac{1}{2}}}^{2}+C \int_{0}^{t}\left\|\left(v^{q}, \partial_{x} v^{q}\right)\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}
\end{align*}
$$

As for (TM), we need better properties of integrability for $v$ in order to close the above estimate. The situation is a bit more complex since the second line above was not present. Nevertheless, it is still possible to exhibit a control of $z \triangleq v+\partial_{x} u$ in $L^{1}\left(\mathbb{R}_{+} ; \dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}\right)$ (which, as we saw in (24) yields a bound for $v$ in $\left.L^{2}\left(\mathbb{R}_{+} ; \dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}\right)\right)$. Indeed, we have

$$
\begin{equation*}
\partial_{t} z+z+V^{1} \partial_{x} z=\left(V^{1}-W^{2}\right) \partial_{x} v-V^{2} \partial_{x} u-\partial_{x x}^{2} v-\partial_{x} V^{1} \partial_{x} u-\partial_{x}\left(W^{1} \partial_{x} v\right)-\kappa v^{q} \tag{74}
\end{equation*}
$$

which, as in the proof of (10) leads to

$$
\begin{aligned}
& \|z(t)\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}^{\ell}+\int_{0}^{t}\|z\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}^{\ell} \leq\left\|z_{0}\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}^{\ell}+\int_{0}^{t}\left\|\partial_{x x}^{2} v\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}^{\ell}+C \int_{0}^{t}\left\|\partial_{x} V^{1}\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}\|z\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}} \\
& \quad+\int_{0}^{t}\left\|\left(V^{1}-W^{2}\right) \partial_{x} v+V^{2} \partial_{x} u+\partial_{x} V^{1} \partial_{x} u\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}^{\ell}+\int_{0}^{t} \| \partial_{x}\left(W^{1} \partial_{x} v\left\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}^{\ell}+\kappa \int_{0}^{t}\right\| v^{q} \|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}^{\ell} .\right.
\end{aligned}
$$

Using product and composition estimates and remembering (63), we get

$$
\begin{aligned}
\left\|\left(V^{1}-W^{2}\right) \partial_{x} v\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}} & \lesssim\|(u, v)\|_{\dot{B}_{2,1}^{\frac{1}{2}}}\left\|\partial_{x} v\right\|_{\dot{B}_{2,1}^{\frac{1}{2}}}, \\
\left\|V^{2} \partial_{x} u\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}} & \lesssim\|v\|_{\dot{B}_{2,1}^{\frac{1}{2}}}\left\|\partial_{x} u\right\|_{\dot{B}_{2,1}^{\frac{1}{2}}}, \\
\left\|\partial_{x} V^{1} \partial_{x} u\right\|_{\dot{\mathbb{B}}_{2,1}^{2}}^{\frac{1}{2}} & \lesssim\left\|\partial_{x} v\right\|_{\dot{B}_{2,1}^{\frac{1}{2}}}\left\|\partial_{x} u\right\|_{\dot{B}_{2,1}^{\frac{1}{2}}} .
\end{aligned}
$$

Since only low frequencies are involved, we have

$$
\left\|\partial_{x}\left(W^{1} \partial_{x} v\right)\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}^{\ell} \lesssim\left\|W^{1} \partial_{x} v\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}} \lesssim\|(u, v)\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}\left\|\partial_{x} v\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}} .
$$

Hence, using also (68), we get

$$
\begin{align*}
\|z(t)\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}} & +\int_{0}^{t}\|z\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}} \leq\left\|z_{0}\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}+\int_{0}^{t}\left\|\partial_{x x}^{2} v\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}^{\ell}  \tag{75}\\
& +C \int_{0}^{t}\left\|\partial_{x} v\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}\left\|\left(u, v, z, \partial_{x} u\right)\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}+C \int_{0}^{t}\|v\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}\left\|\partial_{x} u\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}+\int_{0}^{t}\left\|v^{q}\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}} .
\end{align*}
$$

In order to close the estimates for the solution, it suffices to add up (73) to $\varepsilon \cdot(75)$ with suitably small $\varepsilon$. More precisely, setting

$$
\widetilde{\mathcal{L}} \triangleq \mathcal{L}+\varepsilon\|z\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}^{\ell} \quad \text { and } \quad \widetilde{\mathcal{H}} \triangleq c \sum_{j \in \mathbb{Z}} \min \left(1,2^{2 j}\right) 2^{\frac{j}{2}} \mathcal{L}_{j}+\varepsilon\|z\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}^{\ell},
$$

we get for all $t \in[0, T]$ if $\varepsilon$ has been chosen small enough,

$$
\begin{align*}
& \widetilde{\mathcal{L}}(t)+\frac{1}{2} \int_{0}^{t} \widetilde{\mathcal{H}} \leq \widetilde{\mathcal{L}}(0)+C \int_{0}^{t}\left(\left\|\partial_{x} v\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}} \widetilde{\mathcal{L}}+\left\|\partial_{x} u\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}^{2}+\|v\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}\left\|\partial_{x} u\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}\right)  \tag{76}\\
&+C \int_{0}^{t}\left\|\left(v^{q}, \partial_{x} v^{q}\right)\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}}
\end{align*}
$$

Let us emphasize that

$$
\widetilde{\mathcal{L}} \simeq\left\|\left(u, v, \partial_{x} u, \partial_{x} v\right)\right\|_{\dot{B}_{2,1}^{1}} \quad \text { and } \quad \widetilde{\mathcal{H}} \simeq\|u\|_{\dot{B}_{2,1}^{\frac{5}{2}}}^{\ell}+\|u\|_{\dot{B}_{2,1}^{3}}^{h}+\left\|v+\partial_{x} u\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}^{\ell}+\|v\|_{\dot{B}_{2,1}^{\frac{3}{2}}}^{h} .
$$

Hence in particular, we have $\left\|\partial_{x} v\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}} \lesssim \widetilde{\mathcal{H}}$ and, as explained in the previous section (just replace $n$ by $u$ and $V$ by $v$ ),

$$
\begin{equation*}
\|v\|_{\dot{\mathbb{B}_{2,1}^{1}}}\left\|\partial_{x} u\right\|_{\dot{\mathbb{B}_{2,1}}} \lesssim \widetilde{\mathcal{L}} \widetilde{\mathcal{H}} . \tag{77}
\end{equation*}
$$

Furthermore,

$$
\begin{aligned}
\left\|\partial_{x} u\right\|_{\dot{B}_{2,1}^{2}}^{2} & \lesssim\left(\left\|\partial_{x} u\right\|_{\dot{B}_{2,1}^{\frac{1}{2}}}^{\ell}\right)^{2}+\left(\left\|\partial_{x} u\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}^{h}\right)^{2} \\
& \lesssim\|u\|_{\dot{\mathbb{B}}_{2,1}^{\ell}}^{\ell}\|u\|_{\dot{\mathbb{B}}_{2,1}^{2}}^{\ell}+\left(\|u\|_{\dot{\mathbb{B}}_{2,1}^{2}}^{\frac{3}{2}}\right)^{2} \lesssim \widetilde{\mathcal{L}} \widetilde{\mathcal{H}}
\end{aligned}
$$

Finally, Lemma A.3 and (77) together ensure that

$$
\begin{aligned}
\left\|v^{q}\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}} & \lesssim\|v\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}^{q} \\
& \lesssim\|v\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}^{q-1}\left(\|z\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}+\left\|\partial_{x} u\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}\right) \\
& \lesssim \widetilde{\mathcal{L}}^{q-1} \widetilde{\mathcal{H}}+\widetilde{\mathcal{L}}^{q-2}\|v\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}\left\|\partial_{x} u\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}} \\
& \lesssim \widetilde{\mathcal{L}}^{q-1} \widetilde{\mathcal{H}}
\end{aligned}
$$

and

$$
\left\|\partial_{x} v^{q}\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}} \lesssim\left\|\partial_{x} v\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}\|v\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}^{q-1} \lesssim \widetilde{\mathcal{L}}^{q-1} \widetilde{\mathcal{H}}
$$

Consequently, Inequality (76) reduces to

$$
\widetilde{\mathcal{L}}(t)+\frac{1}{2} \int_{0}^{t} \widetilde{\mathcal{H}} \leq \widetilde{\mathcal{L}}(0)+C \int_{0}^{t}\left(\widetilde{\mathcal{L}}+\widetilde{\mathcal{L}}^{q-1}\right) \widetilde{\mathcal{H}}
$$

Now, applying a bootstrap argument, one may conclude that there exists a small constant $\eta$ such that if $\widetilde{\mathcal{L}}(0) \leq \eta$, then

$$
\begin{equation*}
\forall t \in[0, T], \quad \widetilde{\mathcal{L}}(t)+\frac{1}{4} \int_{0}^{t} \widetilde{\mathcal{H}} \leq \widetilde{\mathcal{L}}(0) \tag{78}
\end{equation*}
$$

This gives the desired control on the norm of the solution and, in addition, that $\widetilde{\mathcal{L}}$ is a Lyapunov functional.

Decay estimates. Granted with a Lyapunov functional that has the same properties as in the previous sections, in order to get the whole family of decay estimates, it suffices to establish a uniform in time bound in $\dot{\mathbb{B}}_{2, \infty}^{-\sigma_{1}}$ for the solution. The starting point is that, for all $j \in \mathbb{Z}$,

$$
\left\{\begin{array}{l}
\partial_{t} u_{j}+\partial_{x} v_{j}+V^{1} \partial_{x} u_{j}=\left[V^{1}, \dot{\Delta}_{j}\right] \partial_{x}-\dot{\Delta}_{j}\left(W^{1} \partial_{x} v\right) \\
\partial_{t} v_{j}+\partial_{x} u_{j}+v_{j}=-\dot{\Delta}_{j}\left(W^{2} \partial_{x} v\right)-\dot{\Delta}_{j}\left(V^{2} \partial_{x} u\right)-\kappa \dot{\Delta}_{j} v^{q}
\end{array}\right.
$$

Applying an energy method, using Lemma A. 1 and Inequality (80) eventually delivers:

$$
\begin{aligned}
\|(u, v)(t)\|_{\dot{\mathbb{B}}_{2, \infty}^{-\sigma_{1}}} \leq \|\left(u_{0}, v_{0}\right) & \left\|_{\dot{\mathbb{B}}_{2, \infty}^{-\sigma_{1}}}+C \int_{0}^{t}\right\| \partial_{x} V^{1}\left\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}\right\|(u, v) \|_{\dot{\mathbb{B}}_{2, \infty}^{-\sigma_{1}}} \\
& +\int_{0}^{t}\left(\left\|W^{1} \partial_{x} v\right\|_{\dot{\mathbb{B}}_{2, \infty}^{-\sigma_{1}}}+\left\|W^{2} \partial_{x} v\right\|_{\dot{\mathbb{B}}_{2, \infty}^{-\sigma_{1}}}+\left\|V^{2} \partial_{x} u\right\|_{\dot{\mathbb{B}}_{2, \infty}^{-\sigma_{1}}}+\kappa\left\|v^{q}\right\|_{\dot{\mathbb{B}}_{2, \infty}^{--\sigma_{1}}}\right)
\end{aligned}
$$

Using for $i=1,2$, the decomposition

$$
W^{i}(u, v)=\left(\partial_{u} W^{i}(0,0)+G^{i}(u, v)\right) u+\left(\partial_{v} W^{i}(0,0)+H^{i}(u, v)\right) v
$$

where $G^{i}$ and $H^{i}$ are smooth functions vanishing at $(0,0)$, we get thanks to results in [26, Section 5.5] and Proposition A. 3

$$
\left\|W^{i} \partial_{x} v\right\|_{\dot{\mathbb{B}}_{2, \infty}^{-\sigma_{1}}} \lesssim\|(u, v)\|_{\dot{\mathbb{B}}_{2, \infty}^{-\sigma_{1}}}\left\|\partial_{x} v\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}
$$

Proposition A. 3 also implies that

$$
\left\|v^{q}\right\|_{\dot{\mathbb{B}}_{2, \infty}^{-\sigma_{1}}} \lesssim\left\|v^{2}\right\|_{\dot{\mathbb{B}}_{2, \infty}^{-\sigma_{1}}}\|v\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}^{q-2}
$$

In order to estimate the term with $v^{2}$, we use that $v=z-\partial_{x} u$ and get the decomposition:

$$
v^{2}=v^{h}\left(v+v^{\ell}\right)+z^{\ell}\left(v^{\ell}-\partial_{x} u^{\ell}\right)+\left(\partial_{x} u^{\ell}\right)^{2} .
$$

By Proposition $\mathbf{A . 3}$ and interpolation, we thus have

$$
\begin{aligned}
& \left\|v^{2}\right\|_{\dot{\mathbb{B}}_{2, \infty}^{-\sigma_{1}}} \lesssim\left\|v^{h}\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}\left\|v+v^{\ell}\right\|_{\dot{\mathbb{B}}_{2, \infty}^{-\sigma_{1}}}+\left(\left\|v^{\ell}\right\|_{\dot{\mathbb{B}}_{2, \infty}^{-\sigma_{1}}}+\left\|\partial_{x} u^{\ell}\right\|_{\dot{\mathbb{B}}_{2, \infty}^{-\sigma_{1}}}\right)\left\|z^{\ell}\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}+\left\|\partial_{x} u^{\ell}\right\|_{\dot{\mathbb{B}}_{2,1}^{2}\left(\frac{1}{2}-\sigma_{1}\right)}^{2} \\
& \lesssim\|v\|_{\dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}}^{h}\|v\|_{\dot{\mathbb{B}}_{2, \infty}^{-\sigma_{1}}}+\|(u, v)\|_{\dot{\mathbb{B}}_{2, \infty}^{-\sigma_{1}}}\|z\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}^{\ell}+\|u\|_{\dot{\mathbb{B}}_{2, \infty}^{-\sigma_{1}}}^{\ell}\|u\|_{\dot{B}_{2,1}^{\frac{5}{2}}}^{\ell} .
\end{aligned}
$$

Hence we have

$$
\left\|v^{q}\right\|_{\dot{\mathbb{B}}_{2, \infty}^{-\sigma_{1}}} \lesssim\|v\|_{\dot{B}_{2,1}^{1}}^{q-2}\|(u, v)\|_{\dot{\mathbb{B}}_{2, \infty}^{-\sigma_{1}}} \widetilde{\mathcal{H}} .
$$

Finally, using the decomposition

$$
V^{2}(v) \partial_{x} u=V^{2}(v) \partial_{x} u^{h}+V^{2}(z) \partial_{x} u^{\ell}-\left(\int_{0}^{1} V^{2}\left(z-\tau \partial_{x} u\right)\right)\left(\partial_{x} u^{\ell} \partial_{x} u^{\ell}+\partial_{x} u^{\ell} \partial_{x} u^{h}\right)
$$

we get by similar computations that

$$
\left\|V^{2} \partial_{x} u\right\|_{\dot{\mathbb{B}}_{2, \infty}^{-\sigma_{1}}} \lesssim\|(u, v)\|_{\dot{\mathbb{B}}_{2, \infty}^{-\sigma_{1}}} \widetilde{\mathcal{H}}
$$

Therefore, in the end, we get

$$
\|(u, v)(t)\|_{\dot{\mathbb{B}}_{2, \infty}^{-\sigma_{1}}} \leq\left\|\left(u_{0}, v_{0}\right)\right\|_{\dot{\mathbb{B}}_{2, \infty}^{-\sigma_{1}}}+C \int_{0}^{t} \tilde{\mathcal{H}}\left(1+\|v\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}^{q-2}\right)\|(u, v)\|_{\dot{\mathbb{B}}_{2, \infty}^{-\sigma_{1}}},
$$

which, combined with (78) and Gronwall lemma implies that

$$
\sup _{t \in[0, T]}\|(u, v)(t)\|_{\dot{\mathbb{B}}_{2, \infty}^{-\sigma_{1}}} \lesssim\left\|\left(u_{0}, v_{0}\right)\right\|_{\dot{\mathbb{B}}_{2, \infty}^{-\sigma_{1}}} .
$$

At this stage, completing the proof of decay estimates is left to the reader.

## Appendix A.

Here we gather a few technical results that have been used repeatedly in the paper. The first one is a rather standard lemma pertaining to some differential inequality.

Lemma A.1. Let $p \geq 1$ and $X:[0, T] \rightarrow \mathbb{R}^{+}$be a continuous function such that $X^{p}$ is differentiable almost everywhere. We assume that there exists a constant $B \geq 0$ and a measurable function $A:[0, T] \rightarrow \mathbb{R}^{+}$such that

$$
\frac{1}{p} \frac{d}{d t} X^{p}+B X^{p} \leq A X^{p-1} \quad \text { a.e. on }[0, T] .
$$

Then, for all $t \in[0, T]$, we have

$$
X(t)+B \int_{0}^{t} X \leq X_{0}+\int_{0}^{t} A .
$$

Proof. The case $p=1$ being obvious, assume that $1<p<\infty$. Then, we set $X_{\varepsilon} \triangleq\left(X^{p}+\varepsilon^{p}\right)^{1 / p}$ for $\varepsilon>0$, and observe that

$$
\frac{1}{p} \frac{d}{d t} X_{\varepsilon}^{p}+B X_{\varepsilon}^{p} \leq A X_{\varepsilon}^{p-1}+B \varepsilon^{p} \quad \text { a.e. on }[0, T] .
$$

Dividing both sides by the positive function $X_{\varepsilon}^{p-1}$, we get

$$
\frac{d}{d t} X_{\varepsilon}+B X_{\varepsilon} \leq A+B \varepsilon\left(\frac{\varepsilon}{X_{\varepsilon}}\right)^{p-1}
$$

whence, as $\varepsilon / X_{\varepsilon} \leq 1$,

$$
\frac{d}{d t} X_{\varepsilon}+B X_{\varepsilon} \leq A+B \varepsilon
$$

Then, integrating in time and taking the limit as $\varepsilon$ tends to 0 yields the desired inequality.
The following result from [10] has been used in the proof of Proposition 3.1.
Proposition A.1. If $\operatorname{Supp}(\mathcal{F} f) \subset\left\{\xi \in \mathbb{R}^{d}: R_{1} \lambda \leq|\xi| \leq R_{2} \lambda\right\}$ for some $0<R_{1}<R_{2}$ then, there exists $c=c\left(d, R_{1}, R_{2}\right)>0$ such that for all $p \in[2, \infty[$, we have

$$
c \lambda^{2}\left(\frac{p-1}{p}\right) \int_{\mathbb{R}^{d}}|f|^{p} \leq(p-1) \int_{\mathbb{R}^{d}}|\nabla f|^{2}|f|^{p-2}=-\int_{\mathbb{R}^{d}} f \Delta f|f|^{p-2} .
$$

The proof of the following inequality may be found in e.g. [1, Chap. 2].
Lemma A.2. Let $1 \leq p, q, r \leq \infty$ be such that $\frac{1}{p}+\frac{1}{q}=\frac{1}{r}$. Let a be a function with gradient in $L^{p}$ and $b$, a function in $L^{q}$. There exists a constant $C$ such that

$$
\left\|\left[\dot{\Delta}_{j}, a\right] b\right\|_{L^{r}} \leq C 2^{-j}\|\nabla a\|_{L^{q}}\|b\|_{L^{p}} \quad \text { for all } j \in \mathbb{Z}
$$

The following estimates are proved in [1, Chap. 2] and [12], respectively.
Proposition A.2. Assume that $d=1$ and that $1 \leq p \leq \infty$. The following inequalities hold:

- If $\left.s \in]-\min \left(\frac{1}{p}, \frac{1}{p^{\prime}}\right), \frac{1}{p}+1\right]$, then

$$
\begin{equation*}
2^{j s}\left\|\left[w, \dot{\Delta}_{j}\right] \partial_{x} v\right\|_{L^{p}} \leq C c_{j}\left\|\partial_{x} w\right\|_{\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}}}\|v\|_{\dot{\mathbb{B}}_{p, 1}^{s}} \quad \text { with } \quad \sum_{j \in \mathbb{Z}} c_{j}=1 . \tag{79}
\end{equation*}
$$

- If $s \in\left[-\min \left(\frac{1}{p}, \frac{1}{p^{\prime}}\right), \frac{1}{p}+1[\right.$, then

$$
\begin{equation*}
\sup _{j \in \mathbb{Z}} 2^{j s}\left\|\left[w, \dot{\Delta}_{j}\right] \partial_{x} v\right\|_{L^{p}} \leq C\left\|\partial_{x} w\right\|_{\dot{B}_{p, 1}^{\frac{1}{p}}}\|v\|_{\dot{\mathbb{B}}_{p, \infty}^{s}} \tag{80}
\end{equation*}
$$

- If $\left.s \in]-1-\min \left(\frac{1}{p}, \frac{1}{p^{\prime}}\right), \frac{1}{p}\right]$, then we have

$$
\begin{equation*}
\left\|\partial_{x}\left(\left[w, \dot{\Delta}_{j}\right] v\right)\right\|_{L^{p}} \leq C c_{j} 2^{-j s}\left\|\partial_{x} w\right\|_{\dot{\mathbb{B}}_{p, 1}^{1}}\|v\|_{\dot{\mathbb{B}}_{p, 1}^{s}} \quad \text { with } \quad \sum_{j \in \mathbb{Z}} c_{j}=1 \text {. } \tag{81}
\end{equation*}
$$

The following product laws in Besov spaces have been used several times.
Proposition A.3. Let $(s, p, r) \in] 0, \infty\left[\times[1, \infty]^{2}\right.$. Then, $\dot{\mathbb{B}}_{p, r}^{s} \cap L^{\infty}$ is an algebra and we have

$$
\begin{equation*}
\|a b\|_{\dot{\mathbb{B}}_{p, r}^{s}} \leq C\left(\|a\|_{L^{\infty}}\|b\|_{\dot{\mathbb{B}}_{p, r}^{s}}+\|a\|_{\dot{\mathbb{B}}_{p, r}^{s},}\|b\|_{L^{\infty}}\right) \tag{82}
\end{equation*}
$$

If, furthermore, $-\min \left(d / p, d / p^{\prime}\right)<s \leq d / p$, then the following inequality holds:

$$
\begin{equation*}
\|a b\|_{\dot{\mathbb{B}}_{p, 1}^{s}} \leq C\|a\|_{\dot{\dot{d}}_{p, 1}^{d}}\|b\|_{\dot{\mathbb{P}}_{p, 1}^{s}} \tag{83}
\end{equation*}
$$

We have, if $-\min \left(d / p, d / p^{\prime}\right)<s \leq d / p+1$,

$$
\begin{equation*}
\|a b\|_{\dot{\mathbb{B}}_{p, 1}^{s}}^{\ell} \lesssim\|a\|_{L^{\infty} \cap \dot{B}_{p, 1}^{\frac{1}{p}+1}}\|b\|_{\dot{\mathbb{B}}_{p, 1}^{s-1}} \tag{84}
\end{equation*}
$$

In the case $d=1$ and $2 \leq p \leq 4$, we have

$$
\begin{equation*}
\|a b\|_{\dot{B}_{2,1}^{1}} \lesssim\left(\|a\|_{\dot{\mathbb{B}}_{p, 1}^{p}-1}^{\ell}+\|a\|_{\dot{B}_{2,1}^{\frac{1}{2}}}^{h}\right)\left(\|b\|_{\dot{B}_{p, 1}^{2}-\frac{1}{2}}^{\ell}+\|b\|_{\dot{B}_{2,1}^{\frac{1}{2}}}^{h}\right) \tag{85}
\end{equation*}
$$

Proof. The first two inequalities are direct consequences of the results stated in [1, Chap. 2]. To prove the third one, we need the following so-called Bony decomposition for the product of two tempered distributions $a$ and $b$ (whenever it is defined):

$$
a b=T_{a} b+T_{b}^{\prime} a \quad \text { with } \quad T_{a} b \triangleq \sum_{j \in \mathbb{Z}} \dot{S}_{j-1} a \dot{\Delta}_{j} b \quad \text { and } \quad T_{b}^{\prime} a \triangleq \sum_{j \in \mathbb{Z}} \dot{S}_{j+2} b \dot{\Delta}_{j} a
$$

Now, using Bernstein inequality and the results of continuity for $T$ and $T^{\prime}$ stated in [1, Chap. 2], we may write:

$$
\left\|T_{a} b\right\|_{\dot{\mathbb{P}}_{p, 1}^{s}}^{\ell} \lesssim\left\|T_{a} b\right\|_{\dot{\mathbb{B}}_{p, 1}^{s-1}} \lesssim\|a\|_{L^{\infty}}\|b\|_{\dot{\mathbb{R}}_{p, 1}^{s-1}}
$$

and, provided, $s-1 \leq d / p$ and $s>-\min \left(d / p, d / p^{\prime}\right)$,

$$
\left\|T_{b}^{\prime} a\right\|_{\dot{\mathbb{B}}_{p, 1}^{s}} \lesssim\|a\|_{\dot{\mathbb{i}}_{p, 1}^{\frac{d}{p}+1}}\|b\|_{\dot{\dot{P}}_{p, 1}^{s-1}}
$$

This gives (84).
For proving (85), we combine Bony's decomposition and decomposition of $a$ and $b$ in low and high frequencies, writing

$$
a b=T_{a}^{\prime} b^{\ell}+T_{a}^{\prime} b^{h}+T_{b^{e}} a^{\ell}+T_{b} a^{h}+T_{b^{h}} a^{\ell} .
$$

All the terms in the right-hand side, except for the last one, may be bounded by means of the standard results of continuity for operators $T$ and $T^{\prime}$ (see again [1, Chap. 2]). Setting $p^{*}=2 p /(p-2)$, we get:

$$
\begin{aligned}
\left\|T_{a}^{\prime} b^{\ell}\right\|_{\dot{B}_{2,1}^{\frac{1}{2}}} & \lesssim\|a\|_{\dot{B}_{p, 1}^{1}}\left\|b^{\frac{1}{p}-1}\right\| \|_{\dot{\mathbb{B}}_{p^{*}, 1}^{\frac{1}{p}+1}} \\
\left\|T_{a}^{\prime} b^{h}\right\|_{\dot{B}_{2,1}^{\frac{1}{2}}} & \lesssim\|a\|_{L^{\infty}}\|b\|_{\dot{B}_{p, 1}^{\frac{1}{p}-1}}^{h}\|b\|_{\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}}}^{\ell}, \\
\left\|T_{b^{e}} a^{\ell}\right\|_{\dot{B}_{2,1}^{2}}^{1} & \lesssim\left\|b^{\ell}\right\|_{L^{p^{*}}}\left\|a^{\ell}\right\|_{\dot{\mathbb{B}}_{p, 1}^{\frac{1}{2}}}, \\
\left\|T_{b} a^{h}\right\|_{\dot{B}_{2,1}^{\frac{1}{2}}} & \lesssim\|b\|_{L^{\infty}}\left\|a^{h}\right\|_{\dot{B}_{2,1}^{\frac{1}{2}}}
\end{aligned}
$$

Finally, since $a^{\ell}=\dot{S}_{J_{0}+1} a$ and $b^{h}=\left(\operatorname{Id}-\dot{S}_{J_{0}+1}\right) b$, we see that

$$
T_{b^{h}} a^{\ell}=\dot{S}_{J_{0}} b^{h} \dot{\Delta}_{J_{0}+1} a^{\ell}
$$

Consequently,

$$
\left\|T_{b^{h}} a^{\ell}\right\|_{\dot{B}_{2,1}^{\frac{1}{2}}} \lesssim\left\|\dot{\Delta}_{J_{0}+1} a^{\ell}\right\|_{L^{\infty}}\left\|\dot{S}_{J_{0}} b^{h}\right\|_{L^{2}} \lesssim\|a\|_{L^{\infty}}\|b\|_{\dot{B}_{2,1}^{\frac{1}{2}}}^{h}
$$

Adding up this latter inequality to the previous ones gives

$$
\|a b\|_{\dot{B}_{2,1}^{\frac{1}{2}}} \lesssim\|a\|_{L^{\infty}}\|b\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}^{h}+\|a\|_{\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}-1}}\|b\|_{\dot{B}_{p, 1}^{1}+1}^{\ell}+\|b\|_{L^{\infty}}\left\|a^{h}\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}}+\left\|b^{\ell}\right\|_{L^{p^{*}}}\left\|a^{\ell}\right\|_{\dot{B}_{p, 1}^{\frac{1}{2}}}
$$

Then, using Bernstein inequality, $2 / p-1 / 2 \leq 1 / p$ and the embeddings $\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}} \hookrightarrow L^{\infty}$ and $\dot{\mathbb{B}}_{p, 1}^{\frac{2}{p}-\frac{1}{2}} \hookrightarrow L^{p^{*}}$ completes the proof of (85).

The following result for composition in Besov spaces may be found in [1].
Proposition A.4. Let $f$ be a function in $\mathcal{C}^{\infty}(\mathbb{R})$ such that $f(0)=0$. Let $\left.\left(s_{1}, s_{2}\right) \in\right] 0, \infty\left[{ }^{2}\right.$ and $\left(p_{1}, p_{2}, r_{1}, r_{2}\right) \in[1, \infty]^{4}$. We assume that $s_{1}<\frac{d}{p_{1}}$ or that $s_{1}=\frac{d}{p_{1}}$ and $r_{1}=1$.

Then, for every real-valued function $u$ in $\dot{\mathbb{B}}_{p_{1}, r_{1}}^{s_{1}} \cap \dot{\mathbb{B}}_{p_{2}, r_{2}}^{s_{2}} \cap L^{\infty}$, the function $f \circ u$ belongs to $\dot{\mathbb{B}}_{p_{1}, r_{1}}^{s_{1}} \cap \dot{\mathbb{B}}_{p_{2}, r_{2}}^{s_{2}} \cap L^{\infty}$, and we have in particular

$$
\|f \circ u\|_{\dot{\mathbb{B}}_{p_{k}, r_{k}}^{s k}} \leq C\left(f^{\prime},\|u\|_{L^{\infty}}\right)\|u\|_{\dot{\mathbb{R}}_{p_{k}, r_{k}}^{s_{k}}} \quad \text { for } k \in\{1,2\}
$$

The following result is the key to Theorem 1.1 in the general case.
Lemma A.3. Assume that $d=1$. Let $p \in[2,4]$ and $s \in\left[1 / 2,3 / 2\left[\right.\right.$. Define $p^{*} \triangleq 2 p /(p-2)$. For all $j \in \mathbb{Z}$, denote $\mathcal{R}_{j} \triangleq \dot{S}_{j-1} w \partial_{x} \dot{\Delta}_{j} z-\dot{\Delta}_{j}\left(w \partial_{x} z\right)$.

There exists a constant $C$ depending only on the threshold number $J_{0}$ between low and high frequencies and on s, such that

$$
\left.\begin{array}{rl}
\sum_{j \geq J_{0}}\left(2^{j s}\left\|\mathcal{R}_{j}\right\|_{L^{2}}\right) \leq C\left(\left\|\partial_{x} w\right\|_{L^{\infty}}\left\|\partial_{x} z\right\|_{\mathbb{\mathbb { B }}_{2,1}^{s-1}}^{h}\right. & +\left\|\partial_{x} z\right\|_{\dot{\mathbb{B}}_{p, 1}^{1}} \frac{1}{p-1}\|w\|_{\dot{\mathbb{B}}_{p^{*}, 1}^{1+\frac{1}{p^{*}}}}^{\ell} \\
& +\left\|\partial_{x} z\right\|_{\dot{\mathbb{B}}_{\infty}^{s, \frac{3}{\infty}}}\|w\|_{\mathbb{\mathbb { B }}_{2,1}^{s}}^{h}+\left\|\partial_{x} z\right\|_{\dot{\mathbb{B}}_{p, 1}^{s-\frac{1}{2}}}^{\ell}-\frac{1}{p}
\end{array}\left\|\partial_{x} w\right\|_{\dot{\mathbb{B}}_{p^{*}, 1}^{\ell}-\frac{1}{p^{*}}}^{\ell}\right) .
$$

In the case $s=3 / 2$, we have

$$
\begin{aligned}
\sum_{j \geq J_{0}}\left(2^{j \frac{3}{2}}\left\|\mathcal{R}_{j}\right\|_{L^{2}}\right) \leq C\left(\left\|\partial_{x} w\right\|_{L^{\infty}}\left\|\partial_{x} z\right\|_{\dot{\mathbb{B}}_{2,1}^{2}}^{h}+\right. & \left\|\partial_{x} z\right\|_{\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}-1}}\|w\|_{\dot{\mathbb{B}}_{p^{*}, 1}^{1+1}}^{\ell+\frac{1}{p^{*}}} \\
& \left.+\left\|\partial_{x} z\right\|_{L^{\infty}}\|w\|_{\dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}}^{h}+\left\|\partial_{x} z\right\|_{\dot{\mathbb{B}}_{p, 1}^{1-\frac{1}{p}}}^{\ell}\left\|\partial_{x} w\right\|_{\dot{\mathbb{B}}_{p^{*}, 1}^{\ell}-\frac{1}{p^{*}}}^{\ell}\right) .
\end{aligned}
$$

Proof. From Bony decomposition recalled above, we deduce that

$$
\begin{aligned}
\mathcal{R}_{j} & =-\dot{\Delta}_{j}\left(T_{\partial_{x} z}^{\prime} w\right)-\sum_{\left|j^{\prime}-j\right| \leq 4}\left[\dot{\Delta}_{j}, \dot{S}_{j^{\prime}-1} w\right] \partial_{x} \dot{\Delta}_{j^{\prime}} z-\sum_{\left|j^{\prime}-j\right| \leq 1}\left(\dot{S}_{j^{\prime}-1} w-\dot{S}_{j-1} w\right) \dot{\Delta}_{j} \dot{\Delta}_{j^{\prime}} \partial_{x} z \\
& =\mathcal{R}_{j}^{1}+\mathcal{R}_{j}^{2}+\mathcal{R}_{j}^{3}
\end{aligned}
$$

To estimate $\mathcal{R}_{j}^{1}$, we decompose $w$ into low and high frequencies, getting

$$
T_{\partial_{x} z}^{\prime} w=T_{\partial_{x} z}^{\prime} w^{\ell}+T_{\partial_{x} z}^{\prime} w^{h} .
$$

Because $1 / p+1 / p^{*}=1 / 2$, the classical results of continuity for paraproduct and remainder operators (see e.g. [1, Chap. 2]) ensure that

$$
\left\|T_{\partial_{x} z}^{\prime} w^{\ell}\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}} \lesssim\left\|\partial_{x} z\right\|_{\dot{\mathbb{B}}_{p, 1}^{\frac{1}{p}-1}}\left\|w^{\ell}\right\|_{\dot{\mathbb{B}}_{p^{*}, 1}} \frac{1}{p^{*}+1},
$$

and we have

$$
\left\|T_{\partial_{x} z}^{\prime} w^{h}\right\|_{\dot{\mathbb{B}}_{2,1}^{s}} \lesssim\left\|\partial_{x} z\right\|_{\dot{B}_{\infty, \infty}^{s-\frac{3}{2}}}\left\|w^{h}\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}} \text { if } 0<s<3 / 2, \quad \text { and }\left\|T_{\partial_{x} z}^{\prime} w^{h}\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}} \lesssim\left\|\partial_{x} z\right\|_{L^{\infty}}\left\|w^{h}\right\|_{\dot{B}_{2,1}^{\frac{3}{2}}} .
$$

Observing that $T_{\partial_{x} z}^{\prime} w^{\ell}$ contains only low frequencies so that its norm in $\dot{\mathbb{B}}_{2,1}^{s}$ is controlled by its norm in $\dot{\mathbb{B}}_{2,1}^{\frac{1}{2}}$ if $s \geq 1 / 2$, we deduce that
(86) $\sum_{j \in \mathbb{Z}}\left(2^{j s}\left\|\mathcal{R}_{j}^{1}\right\|_{L^{2}}\right) \leq C\left(\left\|\partial_{x} z\right\|_{\dot{B}_{p, 1}^{\frac{1}{p}-1}}\left\|w^{\ell}\right\|_{\dot{\mathbb{B}}_{p^{*}, 1}^{1+\frac{1}{p^{*}}}}+\left\|\partial_{x} z\right\|_{\dot{\mathbb{B}}_{\infty, \infty}^{s-\frac{3}{2}}}\left\|w^{h}\right\|_{\dot{\mathbb{B}}_{2,1}^{\frac{3}{2}}}\right)$ if $1 / 2 \leq s<3 / 2$,

$$
\begin{equation*}
\sum_{j \in \mathbb{Z}}\left(2^{\frac{3}{2} j}\left\|\mathcal{R}_{j}^{1}\right\|_{L^{2}}\right) \leq C\left(\left\|\partial_{x} z\right\|_{\dot{B}_{p, 1}^{\frac{1}{p}-1}}\left\|w^{\ell}\right\|_{\dot{\mathbb{B}}_{p^{*}, 1}^{1+\frac{1}{p^{*}}}}+\left\|\partial_{x} z\right\|_{L^{\infty}}\left\|w^{h}\right\|_{\dot{B}_{2,1}^{\frac{3}{2}}}\right) . \tag{87}
\end{equation*}
$$

Next, taking advantage of Lemma A.2, we see that if $j^{\prime} \geq J_{0}$ and $\left|j-j^{\prime}\right| \leq 4$, then we have

$$
2^{j s}\left\|\left[\dot{\Delta}_{j}, \dot{S}_{j^{\prime}-1} w\right] \partial_{x} \dot{\Delta}_{j^{\prime}} z\right\|_{L^{2}} \lesssim\left\|\partial_{x} \dot{S}_{j^{\prime}-1} w\right\|_{L^{\infty}} 2^{j^{\prime}(s-1)}\left\|\partial_{x} \dot{\Delta}_{j^{\prime}} z\right\|_{L^{2}}
$$

while, if $j^{\prime}<J_{0}, j \geq J_{0}$ and $\left|j-j^{\prime}\right| \leq 4$,

$$
2^{j s}\left\|\left[\dot{\Delta}_{j}, \dot{S}_{j^{\prime}-1} w\right] \partial_{x} \dot{\Delta}_{j^{\prime}} z\right\|_{L^{2}} \lesssim 2^{-\frac{j^{\prime}}{p^{*}}}\left\|\partial_{x} \dot{S}_{j^{\prime}-1} w\right\|_{L^{p^{*}}} 2^{j^{\prime}\left(s-\frac{1}{2}-\frac{1}{p}\right)}\left\|\partial_{x} \dot{\Delta}_{j^{\prime}} z\right\|_{L^{p}}
$$

Therefore,

$$
\begin{equation*}
\sum_{j \geq J_{0}}\left(2^{j s}\left\|\mathcal{R}_{j}^{2}\right\|_{L^{2}}\right) \leq C\left(\left\|\partial_{x} w\right\|_{L^{\infty}}\left\|\partial_{x} z\right\|_{\dot{\mathbb{B}}_{2,1}^{s-1}}^{h}+\left\|\partial_{x} z\right\|_{\dot{\mathbb{B}}_{p, 1}^{s-\frac{1}{2}-\frac{1}{p}}}^{\ell}\left\|\partial_{x} w\right\|_{\dot{\mathbb{B}}_{p^{*}, 1}^{-\frac{1}{p^{*}}}}^{\ell}\right) \tag{88}
\end{equation*}
$$

Finally, for all $j \geq J_{0}$ and $\left|j^{\prime}-j\right| \leq 1$, we have

$$
\begin{aligned}
2^{j s}\left\|\left(\dot{S}_{j^{\prime}-1} w-\dot{S}_{j-1} w\right) \dot{\Delta}_{j} \dot{\Delta}_{j^{\prime}} \partial_{x} z\right\|_{L^{2}} & \leq 2^{j}\left\|\dot{\Delta}_{j \pm 1} w\right\|_{L^{\infty}} 2^{j(s-1)}\left\|\partial_{x} \dot{\Delta}_{j^{\prime}} \dot{\Delta}_{j} z\right\|_{L^{2}} \\
& \leq C\left\|\dot{\Delta}_{j \pm 1} \partial_{x} w\right\|_{L^{\infty}} 2^{j(s-1)}\left\|\partial_{x} \dot{\Delta}_{j} z\right\|_{L^{2}}
\end{aligned}
$$

Hence

$$
\begin{equation*}
\sum_{j \geq J_{0}}\left(2^{j s}\left\|\mathcal{R}_{j}^{3}\right\|_{L^{2}}\right) \leq C\left\|\partial_{x} w\right\|_{L^{\infty}}\left\|\partial_{x} z\right\|_{\mathbb{B}_{2,1}^{s-1}}^{h} . \tag{89}
\end{equation*}
$$

Putting (86), (87), (88) and (89) together completes the proof.

[^0]:    ${ }^{1}$ For technical reasons, we need a small overlap between low and high frequencies.

[^1]:    ${ }^{2}$ We actually expect our method to be appropriate for investigating the connections between the compressible Euler system and the porous media equation, in the spirit of [19, 22, 33]. This is a work in progress.

[^2]:    ${ }^{4}$ In what follows, we shall only use that $G$ is a smooth function vanishing at 0.

[^3]:    ${ }^{5}$ In the case $q=3$ and $\kappa>0, \kappa v^{q}$ is a classical representation of a drag term.
