# On Graded 1-Absorbing Prime Submodules 

Ahmad Ka'abnef and Rashid Abu-Dawwas

#### Abstract

Let $G$ be a group with identity $e, R$ be a commutative $G$-graded ring with unity 1 and $M$ be a $G$-graded unital $R$-module. In this article, we introduce the concept of graded 1 -absorbing prime submodule. A proper graded $R$-submodule $N$ of $M$ is said to be a graded 1 -absorbing prime $R$-submodule of $M$ if for all non-unit homogeneous elements $x, y$ of $R$ and homogeneous element $m$ of $M$ with $x y m \in N$, either $x y \in\left(N:_{R} M\right)$ or $m \in N$. We show that the new concept is a generalization of graded prime submodules at the same time it is a special graded 2-absorbing submodule. Several properties of a graded 1-absorbing prime submodule have been obtained. We investigate graded 1 -absorbing prime submodules when the components $\left\{M_{g}: g \in G\right\}$ are multiplication $R_{e}$-modules.

## 1. Introduction

Throughout this article, $G$ will be a group with identity $e$ and $R$ a commutative ring with nonzero unity 1 . Then $R$ is said to be $G$-graded if $R=\bigoplus_{g \in G} R_{g}$ with $R_{g} R_{h} \subseteq R_{g h}$ for all $g, h \in G$ where $R_{g}$ is an additive subgroup of $R$ for all $g \in G$. The elements of $R_{g}$ are called homogeneous of degree $g$. If $x \in R$, then $x$ can be written uniquely as $\sum_{g \in G} x_{g}$, where $x_{g}$ is the component of $x$ in $R_{g}$. Moreover, $R_{e}$ is a subring of $R$ and $1 \in R_{e}$ and $h(R)=\bigcup_{g \in G} R_{g}$. Let $I$ be an ideal of a graded ring $R$. Then $I$ is said to be graded ideal if $I=\bigoplus_{g \in G}\left(I \cap R_{g}\right)$, i.e., for $x \in I, x=\sum_{g \in G} x_{g}$ where $x_{g} \in I$ for all $g \in G$. An ideal of a graded ring need not be graded.

Assume that $M$ is a left unital $R$-module. Then $M$ is said to be $G$-graded if $M=\bigoplus_{g \in G} M_{g}$ with $R_{g} M_{h} \subseteq M_{g h}$ for all $g, h \in G$ where $M_{g}$ is an additive subgroup of $M$ for all $g \in G$. The elements of $M_{g}$ are called homogeneous of degree $g$. It is clear that $M_{g}$ is an $R_{e}$-submodule of $M$ for all $g \in G$. If $x \in M$, then $x$ can be written uniquely as $\sum_{g \in G} x_{g}$, where $x_{g}$ is the component of $x$ in $M_{g}$. Moreover, $h(M)=\bigcup_{g \in G} M_{g}$. Let $N$ be an $R$-submodule of a graded $R$-module $M$. Then $N$ is

[^0]said to be graded $R$-submodule if $N=\bigoplus_{g \in G}\left(N \cap M_{g}\right.$ ), i.e., for $x \in N, x=\sum_{g \in G} x_{g}$ where $x_{g} \in N$ for all $g \in G$. An $R$-submodule of a graded $R$-module need not be graded.

For more details and terminology, see [12] and [14].
Lemma 1.1. (10], Lemma 2.1) Let $R$ be a $G$-graded ring and $M$ be a $G$-graded $R$-module.
(1) If $I$ and $J$ are graded ideals of $R$, then $I+J$ and $I \bigcap J$ are graded ideals of $R$.
(2) If $N$ and $K$ are graded $R$-submodules of $M$, then $N+K$ and $N \cap K$ are graded $R$-submodules of $M$.
(3) If $N$ is a graded $R$-submodule of $M, r \in h(R), x \in h(M)$ and $I$ is a graded ideal of $R$, then $R x, I N$ and $r N$ are graded $R$-submodules of $M$. Moreover, $\left(N:_{R} M\right)=\{r \in R: r M \subseteq N\}$ is a graded ideal of $R$.
Similarly, if $M$ is a graded $R$-module, $N$ a graded $R$-submodule of $M$ and $m \in$ $h(M)$, then $\left(N:_{R} m\right)$ is a graded ideal of $R$. Also, in particular, $A n n_{R}(M)=\left(0_{M}:_{R}\right.$ $M)$ is a graded ideal of $R$.

The concept of graded prime ideals and its generalizations have a significant place in graded commutative algebra since they are used in understanding the structure of graded rings. Recall that a proper graded ideal $P$ of $R$ is said to be graded prime ideal if $x, y \in h(R)$ such that $x y \in P$ implies $x \in P$ or $y \in P$ ([16]). Graded prime ideals have been extended to graded modules in [6]. A proper graded $R$ submodule $N$ of $M$ is said to be a graded prime submodule if whenever $x \in h(R)$ and $m \in h(M)$ with $x m \in N$, then $m \in N$ or $x \in\left(N:_{R} M\right)$. The notion of graded 2 -absorbing ideal, which is a generalization of graded prime ideal, was introduced in [4] as the following: a proper graded ideal $P$ of $R$ is said to be graded 2-absorbing if whenever $x, y, z \in h(R)$ such that $x y z \in P$, then either $x y \in P$ or $x z \in P$ or $y z \in P$. Also, Graded 2-absorbing ideals have been deeply studied in [13. Graded 2-absorbing submodules have been introduced and studied in [3]. A proper graded $R$-submodule $N$ of a graded $R$-module $M$ is said to be graded 2absorbing if whenever $x, y \in h(R)$ and $m \in h(M)$ such that $x y m \in N$, then either $x m \in N$ or $y m \in N$ or $x y \in\left(N:_{R} M\right)$. Graded 2-absorbing submodules have been generalized into graded $n$-absorbing submodules in [11]. Actually, the concept of graded 2-absorbing submodule is a generalization of graded prime submodules.

Recently, in [2], a new class of graded ideals has been introduced, which is an intermediate class of graded ideals between graded prime ideals and graded 2absorbing ideals. A proper graded ideal $P$ of $R$ is said to be a graded 1 -absorbing prime ideal if for each non-units $x, y, z \in h(R)$ with $x y z \in P$, then either $x y \in P$ or $z \in P$. Clearly, every graded prime ideal of $R$ is graded 1 -absorbing prime and every graded 1 -absorbing prime ideal of $R$ is graded 2 -absorbing. The next example shows that not every graded 2 -absorbing ideal of $R$ is graded 1 -absorbing prime.

Example 1.2. [2] Consider $R=\mathbb{Z}+3 x \mathbb{Z}[x]$ and $G=\mathbb{Z}$. Then $R$ is $G$-graded by $R_{0}=\mathbb{Z}, R_{j}=3 \mathbb{Z} x^{j}$ for $j \geq 1$ and $R_{j}=\{0\}$ otherwise. Now, $P=3 x \mathbb{Z}[x]$ is a graded ideal of $R$, so by Lemma 1.1, $P^{2}$ is a graded ideal of $R$. By (18], Example 2.2), $P^{2}$ is a 2-absorbing ideal of $R$, and then it is graded 2-absorbing. On the other hand, $P^{2}$ is not graded 1-absorbing prime as $3,9,3 x^{2} \in h(R)$ such that $(3)(9)\left(3 x^{2}\right) \in P^{2}$ while (3)(9) $\notin P^{2}$ and $3 x^{2} \notin P^{2}$.

Thus we have the following chain:
graded prime ideals $\Rightarrow$ graded 1-absorbing prime ideals $\Rightarrow$ graded 2-absorbing ideals.
On the other hand, we have another chain:
graded prime submodules $\Rightarrow$ graded 2 -absorbing submodules.
Thus we realize that there is a missing part in the second chain, which is between graded prime submodules and graded 2-absorbing submodules. Then we define the missing part of the chain as graded 1 -absorbing prime submodules. In this article, we are motivated by [17] to introduce and study the concept of graded 1-absorbing prime submodule. A proper graded $R$-submodule $N$ of $M$ is said to be a graded 1-absorbing prime $R$-submodule of $M$ if for all non-unit elements $x, y \in h(R)$ and $m \in h(M)$ with $x y m \in N$, either $x y \in\left(N:_{R} M\right)$ or $m \in N$. We show that the new concept is a generalization of graded prime submodules at the same time it is a special graded 2-absorbing submodule. Several properties of a graded 1-absorbing prime submodule have been obtained. We investigate graded 1-absorbing prime submodules when the components $\left\{M_{g}: g \in G\right\}$ are multiplication $R_{e}$-modules.

## 2. Graded 1-Absorbing Prime Submodules

In this section, we introduce and study the concept of graded 1-absorbing prime submodules.

Definition 2.1. Let $M$ be a graded $R$-module and $N$ be a proper graded $R$ submodule of $M$. Then $N$ is said to be a graded 1-absorbing prime $R$-submodule of $M$ if for all non-unit elements $x, y \in h(R)$ and $m \in h(M)$ with xym $\in N$, either $x y \in\left(N:_{R} M\right)$ or $m \in N$.

Example 2.2. Let $R$ be a graded local ring with graded maximal ideal $X$ satisfies $X^{2}=\{0\}$. If $M$ is a graded $R$-module, then every proper graded $R$-submodule of $M$ is graded 1-absorbing prime. To prove that, let $N$ be a proper graded $R$ submodule of $M, x, y \in h(R)$ be non-units and $m \in h(M)$ such that xym $\in N$. Since $x y \in X^{2}=\{0\}$, $x y \in\left(N:_{R} M\right)$, and hence $N$ is a graded 1-absorbing prime $R$-submodule of $M$.

Proposition 2.3. Let $M$ be a graded $R$-module and $N$ be a graded $R$-submodule of $M$.
(1) If $N$ is a graded prime $R$-submodule of $M$, then $N$ is a graded 1-absorbing prime $R$-submodule of $M$.
(2) If $N$ is a graded 1-absorbing prime $R$-submodule of $M$, then $N$ is a graded 2 -absorbing $R$-submodule of $M$.
Proof. (1) Let $x, y \in h(R)$ be non-units and $m \in h(M)$ such that $x y m \in$ $N$. Then $z=x y \in h(R)$ with $z m \in N$. Since $N$ is graded prime, either $z=x y \in\left(N:_{R} M\right)$ or $m \in N$. Hence, $N$ is a graded 1-absorbing prime $R$-submodule of $M$.
(2) Let $x, y \in h(R)$ and $m \in h(M)$ such that $x y m \in N$. If $x$ is unit, then $y m \in N$. If $y$ is unit, then $x m \in N$. Suppose that $x$ and $y$ are non-units. Since $N$ is graded 1-absorbing prime, either $x y \in\left(N:_{R} M\right)$ or $m \in N$, as needed. Hence, $N$ is a graded 2-absorbing $R$-submodule of $M$.

The next example shows that the converse of Proposition 2.3 (1) is not true in general.

Example 2.4. Consider $R=\mathbb{Z}_{4}, M=\mathbb{Z}_{4}[x]$ and $G=\mathbb{Z}$. Then $R$ is $G$-graded by $R_{0}=\mathbb{Z}_{4}$ and $R_{j}=\{0\}$ otherwise. Also, $M$ is $G$-graded by $M_{j}=\mathbb{Z}_{4} x^{j}$ for $j \geq 0$ and $M_{j}=\{0\}$ otherwise. As $x \in h(M), N=\langle x\rangle$ is a graded $R$-submodule of $M$. By Example 2.2, $N$ is a graded 1-absorbing prime $R$-submodule of $M$. On the other hand, $N$ is not graded prime $R$-submodule of $M$.

The next example shows that the converse of Proposition 2.3 (2) is not true in general.

Example 2.5. Consider $R=\mathbb{Z}, M=\mathbb{Z}_{30}[i]$ and $G=\mathbb{Z}_{2}$. Then $R$ is $G$-graded by $R_{0}=\mathbb{Z}$ and $R_{1}=\{0\}$. Also, $M$ is $G$ graded by $M_{0}=\mathbb{Z}_{30}$ and $M_{1}=i \mathbb{Z}_{30}$. Then $N=\langle\overline{6}\rangle$ is a graded 2-absorbing $R$-submodule of $M$. On the other hand, $2 \in h(R)$ is non-unit and $\overline{3} \in h(M)$ with $(2)(2)(\overline{3}) \in N$, but $(2)(2) \notin\left(N:_{R} M\right)$ and $\overline{3} \notin N$. Hence, $N$ is not graded 1-absorbing prime $R$-submodule of $M$.

So, we have the following chain:
graded prime submodules $\Rightarrow$ graded 1 -absorbing prime submodules $\Rightarrow$ graded 2 -absorbing submodules.
And the converse of each implication is not true in general.
Proposition 2.6. Let $M$ be a graded $R$-module and $N$ be a graded $R$-submodule of $M$. If $N$ is a graded 1-absorbing prime $R$-submodule of $M$, then $\left(N:_{R} M\right)$ is a graded 1-absorbing prime ideal of $R$.

Proof. Let $x, y, z \in h(R)$ be non-units such that $x y z \in\left(N:_{R} M\right)$. Assume that $m \in M$. Then $x y z m_{g} \in N$ for all $g \in G$. Since $N$ is graded 1-absorbing prime, either $x y \in\left(N:_{R} M\right)$ or $z m_{g} \in N$ for all $g \in G$. If $z m_{g} \in N$ for all $g \in G$, then $z m=z\left(\sum_{g \in G} m_{g}\right)=\sum_{g \in G} z m_{g} \in N$, which implies that $z \in\left(N:_{R} M\right)$. Hence, $\left(N:_{R} M\right)$ is a graded 1-absorbing prime ideal of $R$.

Similarly, one can prove the following:
Proposition 2.7. Let $M$ be a graded $R$-module and $N$ be a graded $R$-submodule of $M$. If $N$ is a graded 1-absorbing prime $R$-submodule of $M$, then $\left(N:_{R} m\right)$ is a graded 1-absorbing prime ideal of $R$ for all $m \in h(M)-N$.

The next example shows that the converse of Proposition 2.6 is not true in general.

Example 2.8. Consider $R=\mathbb{Z}, M=\mathbb{Z} \times \mathbb{Z}$ and $G=\mathbb{Z}_{2}$. Then $R$ is $G$ graded by $R_{0}=\mathbb{Z}$ and $R_{1}=\{0\}$. Also, $M$ is $G$-graded by $M_{0}=\mathbb{Z} \times\{0\}$ and $M_{1}=\{0\} \times \mathbb{Z}$. As $(3,0) \in h(M), N=\langle(3,0)\rangle$ is a graded $R$-submodule of $M$ such that $\left(N:_{R} M\right)=\{0\}$ is a graded prime ideal of $R$, so $\left(N:_{R} M\right)$ is a graded 1 -absorbing prime ideal of $R$. On the other hand, $3,2 \in h(R)$ are non-units and $(1,0) \in h(M)$ with $(3)(2)(1,0) \in N$, but $(3)(2) \notin\left(N:_{R} M\right)$ and $(1,0) \notin N$. Hence, $N$ is not graded 1-absorbing prime $R$-submodule of $M$.

Lemma 2.9. Let $M$ be a graded $R$-module and $N$ be a graded 1-absorbing prime $R$-submodule of $M$. For a graded $R$-submodule $L$ of $M$ and for non-unit elements $x, y \in h(R)$, if $x y L \subseteq N$, then either $x y \in\left(N:_{R} M\right)$ or $L \subseteq N$.

Proof. Assume that $L \nsubseteq N$. Then there is an element $0 \neq m \in L-N$, and then there exists $g \in G$ such that $m_{g} \notin N$. Note that, $m_{g} \in L$ as $L$ is a graded
$R$-submodule. By assumption, we have $x y m_{g} \in N$. Since $N$ is a graded 1-absorbing prime $R$-submodule, either $x y \in\left(N:_{R} M\right)$ or $m_{g} \in N$. The second choice implies a contradiction, we conclude that $x y \in\left(N:_{R} M\right)$, as desired.

Theorem 2.10. Let $M$ be a graded $R$-module and $N$ be a proper graded $R$ submodule of $M$. Then $N$ is a graded 1-absorbing prime $R$-submodule of $M$ if and only if whenever $I, J$ are proper graded ideals of $R$ and $L$ is a graded $R$-submodule of $M$ such that $I J L \subseteq N$, then either $I J \subseteq\left(N:_{R} M\right)$ or $L \subseteq N$.

Proof. Suppose that $N$ is a graded 1 -absorbing prime $R$-submodule of $M$. Assume that $I, J$ are proper graded ideals of $R$ and $L$ is a graded $R$-submodule of $M$ such that $I J L \subseteq N$. Suppose that $I J \nsubseteq\left(N:_{R} M\right)$. Then there exist $x \in I$ and $y \in J$ such that $x y \notin\left(N:_{R} M\right)$, and then there exist $g, h \in G$ such that $x_{g} y_{h} \notin\left(N:_{R} M\right)$. Note that, $x_{g} \in I$ and $y_{h} \in J$ as $I$ and $J$ are graded ideals. Since $I$ and $J$ are proper, $x_{g}$ and $y_{h}$ are non-units. Now, $x_{g} y_{h} L \subseteq N$, so by Lemma [2.9, $L \subseteq N$, as needed. Conversely, let $x, y \in h(R)$ be non-units and $m \in h(M)$ such that $x y m \in N$. Then $I=\langle x\rangle, J=\langle y\rangle$ are proper graded ideals of $R$ and $L=\langle m\rangle$ is a graded $R$-submodule of $M$ such that $I J L \subseteq N$. By assumption, either $I J \subseteq\left(N:_{R} M\right)$ or $L \subseteq N$. If $I J \subseteq\left(N:_{R} M\right)$, then $x y \in\left(N:_{R} M\right)$. Hence, $N$ is a graded 1-absorbing prime $R$-submodule of $M$.

Let $M$ be a $G$-graded $R$-module, $N$ be a graded $R$-submodule of $M$ and $g \in G$ such that $N_{g} \neq M_{g}$. In [6], $N$ is said to be a $g$-prime $R$-submodule of $M$ if whenever $r \in R_{e}$ and $m \in M_{g}$ such that $r m \in N$, then either $r \in\left(N:_{R} M\right)$ or $m \in N$. Also, in [2], A graded ideal $P$ of $R$ is said to be a $g$-1-absorbing prime ideal of $R$ if $P_{g} \neq R_{g}$ and whenever non-unit elements $x, y, z$ in $R_{g}$ such that $x y z \in P$, then $x y \in P$ or $z \in P$. We introduce the following definition:

Definition 2.11. Let $M$ be a $G$-graded $R$-module, $N$ be a graded $R$-submodule of $M$ and $g \in G$ such that $N_{g} \neq M_{g}$. Then $N$ is said to be a $g$-1-absorbing prime $R$ submodule of $M$ if for all non-unit elements $x, y \in R_{e}$ and $m \in M_{g}$ with xym $\in N$, either $x y \in\left(N:_{R} M\right)$ or $m \in N$.

Remark 2.12. Clearly, every $g$-prime $R$-submodule is $g$-1-absorbing prime. However, the converse is not true in general; $N=\langle x\rangle$ in Example 2.4 is a graded 1absorbing prime $R$-submodule, so it is a $g$-1-absorbing prime $R$-submodule for all $g \in G=\mathbb{Z}$, but if we choose $g=1$, then $N$ will be not graded $g$-prime $R$-submodule. Now, we are going to prove that if $R_{e}$ is not local ring, then a graded $R$-submodule will be an e-1-absorbing prime if and only if it is an e-prime $R$-submodule.

Lemma 2.13. Let $M$ be a graded $R$-module. If $M$ has an e-1-absorbing prime $R$-submodule that is not an e-prime $R$-submodule, then the sum of every non-unit element of $R_{e}$ and every unit element of $R_{e}$ is a unit element of $R_{e}$.

Proof. Let $N$ be an $e$-1-absorbing prime $R$-submodule of $M$ that is not an $e$-prime $R$-submodule. Then there exist a non-unit $r \in R_{e}$ and $m \in M_{g}$ such that $r m \in N$ but $r \notin\left(N:_{R} M\right)$ and $m \notin N$. Choose a non-unit element $a \in R_{e}$. Then we have that $r a m \in N$ and $m \notin N$. Since $N$ is $e$-1-absorbing prime, $r a \in\left(N:_{R} M\right)$. Let $u \in R_{e}$ be a unit element. Assume that $a+u$ is non-unit. Then $r(a+u) m \in N$. As $N$ is $e$-1-absorbing prime, $r(a+u) \in\left(N:_{R} M\right)$. This means that $r u \in\left(N:_{R} M\right)$, i.e., $r \in\left(N:_{R} M\right)$, which is a contradiction. Thus, we have $a+u$ is a unit element.

Theorem 2.14. Let $M$ be a graded $R$-module. If $M$ has an e-1-absorbing prime $R$-submodule that is not an e-prime $R$-submodule, then $R_{e}$ is a local ring.

Proof. By Lemma [2.13, the sum of every non-unit element of $R_{e}$ and every unit element of $R_{e}$ is a unit element of $R_{e}$, and then by ([8], Lemma 1 ), $R_{e}$ is a local ring.

Corollary 2.15. Let $R$ be a graded ring such that $R_{e}$ is not local ring. Suppose that $M$ is a graded $R$-module. Then a graded $R$-submodule $N$ of $M$ is an e-1absorbing prime $R$-submodule if and only if $N$ is an e-prime $R$-submodule of $M$.

Proposition 2.16. Let $\left\{N_{k}\right\}_{k \in \Delta}$ be a chain of graded 1-absorbing prime $R$ submodules of $M$. Then $\bigcap_{k \in \Delta} N_{k}$ is a graded 1-absorbing prime $R$-submodule of $M$.

Proof. Let $x, y \in h(R)$ be non-units and $m \in h(M)$ such that $x y m \in \bigcap_{k \in \Delta} N_{k}$. Suppose that $m \notin \bigcap_{k \in \Delta} N_{k}$. Then $m \notin N_{i}$ for some $i \in \Delta$. Since $x y m \in N_{i}$ and $N_{i}$ is graded 1-absorbing prime, $x y \in\left(N_{i}:_{R} M\right)$. For any $k \in \Delta$, if $N_{i} \subseteq N_{k}$, then $x y \in\left(N_{k}:_{R} M\right)$, and then $x y \in\left(\bigcap_{k \in \Delta} N_{k}:_{R} M\right)$. If $N_{k} \subseteq N_{i}$, then $m \notin N_{k}$. Since xym $\in N_{k}$ and $N_{k}$ is graded 1-absorbing prime, $x y \in\left(N_{k}:_{R} M\right)$, and then $x y \in\left(\bigcap_{k \in \Delta} N_{k}:_{R} M\right)$. Hence, $\bigcap_{k \in \Delta} N_{k}$ is a graded 1-absorbing prime $R$-submodule of $M$.

Lemma 2.17. Let $M$ be a graded $R$-module. If $M$ is finitely generated, then the union of every chain of proper graded $R$-submodules of $M$ is a proper graded $R$-submodule of $M$.

Proof. Suppose that $M=\left\langle x_{1}, x_{2}, \ldots, x_{n}\right\rangle$ for some $x_{1}, \ldots, x_{n} \in M$. Let $\left\{N_{k}\right\}_{k \in \Delta}$ be a chain of proper graded $R$-submodules of $M$. If $\bigcup_{k \in \Delta} N_{k}=M$, then $x_{1}, x_{2} \in$ $\bigcup_{k \in \Delta} N_{k}$, and then $x_{1} \in N_{j}$ and $x_{2} \in N_{r}$ for some $j, r \in \Delta$. If $N_{j} \subseteq N_{r}$, then $x_{1}, x_{2} \in N_{r}$. If $N_{r} \subseteq N_{j}$, then $x_{1}, x_{2} \in N_{j}$. In fact, this works for all $x_{i}$ 's. So, there exists $i \in \Delta$ such that $N_{i}$ contains all the generators $x_{1}, \ldots, x_{n}$ of $M$, and then $N_{i}=M$, which is a contradiction.

Proposition 2.18. Let $\left\{N_{k}\right\}_{k \in \Delta}$ be a chain of graded 1-absorbing prime $R$ submodules of $M$. If $M$ is finitely generated, then $\bigcup_{k \in \Delta} N_{k}$ is a graded 1-absorbing prime $R$-submodule of $M$.

Proof. By Lemma 2.17, $\bigcup_{k \in \Delta} N_{k}$ is a proper graded $R$-submodule of $M$. Let $x, y \in h(R)$ be non-units and $m \in h(M)$ such that $x y m \in \bigcup_{k \in \Delta} N_{k}$. Suppose that $m \notin \bigcup_{k \in \Delta} N_{k}$. Then $m \notin N_{k}$ for all $k \in \Delta$. Now, since $x y m \in \bigcup_{k \in \Delta} N_{k}, x y m \in N_{i}$ for some $i \in \Delta$, and since $N_{i}$ is graded 1-absorbing prime, $x y \in\left(N_{i}:_{R} M\right) \subseteq$

$$
\left(\bigcup_{k \in \Delta} N_{k}:_{R} M\right) \text {. Hence, } \bigcup_{k \in \Delta} N_{k} \text { is a graded 1-absorbing prime } R \text {-submodule of }
$$

$M$.
Let $M$ and $S$ be two $G$-graded $R$-modules. An $R$-homomorphism $f: M \rightarrow S$ is said to be a graded $R$-homomorphism if $f\left(M_{g}\right) \subseteq S_{g}$ for all $g \in G$ ([14]).

Lemma 2.19. ([1], Lemma 2.16) Suppose that $f: M \rightarrow S$ is a graded $R$ homomorphism of graded $R$-modules. If $K$ is a graded $R$-submodule of $S$, then $f^{-1}(K)$ is a graded $R$-submodule of $M$.

Lemma 2.20. (7], Lemma 4.8) Suppose that $f: M \rightarrow S$ is a graded $R$ homomorphism of graded $R$-modules. If $L$ is a graded $R$-submodule of $M$, then $f(L)$ is a graded $R$-submodule of $f(M)$.

Proposition 2.21. Suppose that $f: M \rightarrow S$ is a graded $R$-homomorphism of graded $R$-modules.
(1) If $K$ is a graded 1 -absorbing prime $R$-submodule of $S$ and $f^{-1}(K) \neq M$, then $f^{-1}(K)$ is a graded 1-absorbing prime $R$-submodule of $M$.
(2) Assume that $f$ is a graded epimorphism. If $L$ is a graded 1-absorbing prime $R$-submodule of $M$ containing $\operatorname{Ker}(f)$, then $f(L)$ is a graded 1-absorbing prime $R$-submodule of $S$.
Proof. (1) By Lemma 2.19, $f^{-1}(K)$ is a graded $R$-submodule of $M$. Let $x, y \in h(R)$ be non-units and $m \in h(M)$ such that $x y m \in f^{-1}(K)$. Then $f(m) \in h(S)$ such that $x y f(m)=f(x y m) \in K$. Since $K$ is graded 1 absorbing prime, either $x y \in\left(K:_{R} S\right)$ or $f(m) \in K$, and then either $x y \in\left(f^{-1}(K):_{R} M\right)$ or $m \in f^{-1}(K)$. Hence, $f^{-1}(K)$ is a graded 1 absorbing prime $R$-submodule of $M$.
(2) By Lemma 2.20, $f(L)$ is a graded $R$-submodule of $S$. Let $x, y \in h(R)$ be non-units and $s \in h(S)$ such that xys $\in f(L)$. Since $f$ is graded epimorphism, there exists $m \in h(M)$ such that $s=f(m)$, and then $f(x y m)=x y f(m)=x y s \in f(L)$, which implies that $f(x y m)=f(t)$ for some $t \in L$, and then xym $-t \in \operatorname{Ker}(f) \subseteq L$, which gives that xym $\in L$. Since $L$ is graded 1-absorbing prime, either $x y \in\left(L:_{R} M\right)$ or $m \in L$, and then either $x y \in\left(f(L):_{R} S\right)$ or $s=f(m) \in f(L)$. Hence, $f(L)$ is a graded 1 -absorbing prime $R$-submodule of $S$.

If $M$ is a $G$-graded $R$-module and $L$ is a graded $R$-submodule of $M$, then $M / L$ is a $G$-graded $R$-module by $(M / L)_{g}=\left(M_{g}+L\right) / L$ for all $g \in G([\mathbf{1 4}])$.

Corollary 2.22. Let $M$ be a graded $R$-module and $L \subseteq N$ be graded $R$ submodules of $M$. If $N$ is a graded 1-absorbing prime $R$-submodule of $M$, then $N / L$ is a graded 1-absorbing prime $R$-submodule of $M / L$.

Proof. Define $f: M \rightarrow M / L$ by $f(x)=x+L$. Then $f$ is a graded epimorphism with $\operatorname{Ker}(f)=L \subseteq N$. So, by Proposition 2.21, $f(N)=N / L$ is a graded 1absorbing prime $R$-submodule of $M / L$.

Definition 2.23. Let $M$ be a graded $R$-module, $L$ be a proper graded $R$-submodule of $M$ and $N$ be a graded 1-absorbing prime $R$-submodule of $M$ with $L \subseteq N$. Then $N$ is said to a minimal graded 1-absorbing prime $R$-submodule with respect to $L$ if there is no a graded 1-absorbing prime $R$-submodule $P$ of $M$ such that $L \subseteq P \subset N$.

Theorem 2.24. Let $M$ be a graded $R$-module and $L$ be a proper graded $R$ submodule of $M$. If $N$ is a graded 1-absorbing prime $R$-submodule of $M$ such that $L \subseteq N$, then there exists a minimal graded 1-absorbing prime $R$-submodule with respect to $L$ that it is contained in $N$.

Proof. Let $X$ be the set of all graded 1-absorbing prime $R$-submodules $N_{i}$ of $M$ such that $L \subseteq N_{i} \subseteq N$. Then $X$ is non-empty as it contains $N$. Consider ( $X, \supseteq$ ). Let $\left\{N_{k}\right\}_{k \in \Delta}$ be a chain in $X$. Then by Proposition 2.16, $\bigcap_{k \in \Delta} N_{k}$ is a graded 1absorbing prime $R$-submodule of $M$, and then by Zorn's Lemma, $X$ has a maximal element $K$. So, $K$ is a graded 1-absorbing prime $R$-submodule of $M$ such that $L \subseteq K \subseteq N$. If $K$ is not minimal graded 1-absorbing prime $R$-submodule with respect to $L$, then there exists a graded 1-absorbing prime $R$-submodule $P$ of $M$ such that $L \subseteq P \subseteq K$, and then $P \in X$, which implies that $K \subseteq P$, and hence $P=K$. Thus, $K$ is a minimal graded 1 -absorbing prime $R$-submodule with respect to $L$.

Let $I$ be a graded ideal of $R$. Then $\operatorname{Grad}(I)$ is the intersection of all graded prime ideals of $R$ containing $I$ ([5]). Similarly, if $N$ is a graded $R$-submodule of $M$, then the graded radical of $N$ is $\operatorname{Grad}(N)$ which is the intersection of all graded prime $R$-submodules of $M$ containing $N$. Motivated by this, we have the following definition.

Definition 2.25. (1) Let I be a graded ideal of $R$. Then the 1-graded radical of $I$ is the intersection of all graded 1-absorbing prime ideals of $R$ containing $I$, and is denoted by $\operatorname{Grad}_{1}(I)$. If $I=R$ or $R$ has no graded 1 -absorbing prime ideals, we define $\operatorname{Grad}_{1}(I)=R$.
(2) Let $N$ be a graded $R$-submodule of $M$. Then the 1-graded radical of $N$ is the intersection of all graded 1 -absorbing prime $R$-submodules of $M$ containing $N$, and is denoted by $\operatorname{Grad}_{1}(N)$. If $N=M$ or $M$ has no graded 1 -absorbing prime $R$-submodules, we define $\operatorname{Grad}_{1}(N)=M$.

Remark 2.26. Since every graded prime ideal is graded 1-absorbing prime, then $\operatorname{Grad}_{1}(I) \subseteq \operatorname{Grad}(I)$ for all graded ideal I of $R$. Similarly, $\operatorname{Grad}_{1}(N) \subseteq \operatorname{Grad}(N)$ for all graded $R$-submodule $N$ of $M$.

Motivated by ([15], Proposition 1.2), we state the following proposition, and the proof is elementary.

Proposition 2.27. Let $M$ be a graded $R$-module and $N$, $K$ be two graded $R$ submodules of $M$. Then the following statements hold:
(1) $N \subseteq \operatorname{Grad}_{1}(N)$.
(2) $\operatorname{Grad}_{1}\left(\operatorname{Grad}_{1}(N)\right) \subseteq \operatorname{Grad}_{1}(N)$.
(3) $\operatorname{Grad}_{1}(N \bigcap K) \subseteq \operatorname{Grad}_{1}(N) \bigcap \operatorname{Grad}_{1}(K)$.

Proposition 2.28. Let $M$ be a graded $R$-module and $N$ be a graded $R$-submodule of $M$. Then $\operatorname{Grad}_{1}\left(\left(N:_{R} M\right)\right) \subseteq\left(\operatorname{Grad}_{1}(N):_{R} M\right)$.

Proof. If $\operatorname{Grad}_{1}(N)=M$, then it is done. Suppose that $\operatorname{Grad}_{1}(N) \neq M$. Then there exists a graded 1 -absorbing prime $R$-submodule $L$ of $M$ such that $N \subseteq L$, and then by Proposition 2.6, $\left(L:_{R} M\right)$ is a graded 1-absorbing prime ideal of $R$ such that $\left(N:_{R} M\right) \subseteq\left(L:_{R} M\right)$, which implies that $\operatorname{Grad}_{1}\left(\left(N:_{R} M\right)\right) \subseteq\left(L:_{R} M\right)$, and hence $\operatorname{Grad}_{1}\left(\left(N:_{R} M\right)\right) M \subseteq L$. In fact, in similar way, $\operatorname{Grad}_{1}\left(\left(N:_{R} M\right)\right) M \subseteq L_{i}$ for every
graded 1-absorbing prime $R$-submodule $L_{i}$ of $M$ such that $N \subseteq L_{i}$. So, $\operatorname{Grad}_{1}\left(\left(N:_{R}\right.\right.$ $M)) M \subseteq \operatorname{Grad}_{1}(N)$, which means that $\operatorname{Grad}_{1}\left(\left(N:_{R} M\right)\right) \subseteq\left(\operatorname{Grad}_{1}(N):_{R} M\right)$.

Proposition 2.29. Let $R$ be a graded ring and $I$ be a graded ideal of $R$. If $I$ is a graded 1-absorbing prime ideal of $R$, then $I_{e}$ is a 1-absorbing prime ideal of $R_{e}$.

Proof. Let $x, y, z \in R_{e}$ be non-units such that $x y z \in I_{e}$. Then $x, y, z \in h(R)$ such that $x y z \in I$. Since $I$ is graded 1 -absorbing prime, either $x y \in I$ or $z \in I$. If $x y \in I$, then $x y \in R_{e} R_{e} \bigcap I \subseteq R_{e} \bigcap I=I_{e}$. If $z \in I$, then $z \in R_{e} \bigcap I=I_{e}$. Hence, $I_{e}$ is a 1-absorbing prime ideal of $R_{e}$.

Proposition 2.30. Let $M$ be a $G$-graded $R$-module and $N$ be a graded $R$ submodule of $M$. If $N$ is a graded 1-absorbing prime $R$-submodule of $M$, then $N_{g}$ is a 1-absorbing prime $R_{e}$-submodule of $M_{g}$ for al $g \in G$.

Proof. Let $g \in G$. Suppose that $x, y \in R_{e}$ be non-units and $m \in M_{g}$ such that $x y m \in N_{g}$. Then $x, y \in h(R)$ and $m \in h(M)$ such that $x y m \in N$. Since $N$ is graded 1-absorbing prime, either $x y \in\left(N:_{R} M\right)$ or $m \in N$. If $x y \in\left(N:_{R} M\right)$, then $x y \in R_{e}$ such that $x y M_{g} \subseteq x y M \subseteq N$, also, $x y M_{g} \subseteq R_{e} M_{g} \subseteq M_{g}$, and hence $x y M_{g} \subseteq N \bigcap M_{g}=N_{g}$, which implies that $x y \in\left(N_{g}:_{R_{e}} M_{g}\right)$. If $m \in N$, then $m \in N \bigcap M_{g}=N_{g}$. Hence, $N_{g}$ is a 1-absorbing prime $R_{e}$-submodule of $M_{g}$.

Let $M$ be a $G$-graded $R$-module and $g \in G$. In the sense of [9], $M_{g}$ is said to be a multiplication $R_{e}$-module if whenever $N$ is an $R_{e}$-submodule of $M_{g}$, then $N=I M_{g}$ for some ideal $I$ of $R_{e}$. Note that, since $I \subseteq\left(N:_{R_{e}} M_{g}\right), N=I M_{g} \subseteq\left(N:_{R_{e}}\right.$ $\left.M_{g}\right) M_{g} \subseteq N$. So, if $M_{g}$ is a multiplication $R_{e}$-module, then $N=\left(N:_{R_{e}} M_{g}\right) M_{g}$ for every $R_{e}$-submodule $N$ of $M_{g}$.

Proposition 2.31. Let $M$ be a $G$-graded $R$-module and $g \in G$ such that $M_{g}$ is a faithful multiplication $R_{e}$-module. Suppose that $I$ is a 1-absorbing prime ideal of $R_{e}$. Then whenever $x, y \in R_{e}$ are non-units and $m \in M_{g}$ such xym $\in I M_{g}$, then either $x y \in I$ or $m \in I M_{g}$.

Proof. Apply ( $\mathbf{1 7}$, Theorem 5) on the $R_{e}$-module $M_{g}$.
Theorem 2.32. Let $M$ be a $G$-graded $R$-module and $g \in G$ such that $M_{g}$ is a faithful multiplication $R_{e}$-module. If $I$ is a graded 1-absorbing prime ideal of $R$ and $(I M)_{g} \neq M_{g}$, then IM is a $g$-1-absorbing prime $R$-submodule of $M$.

Proof. By Lemma 1.1 (3), $I M$ is a graded $R$-submodule of $M$. Since $I$ is a graded 1-absorbing prime ideal of $R$, by Proposition 2.29, $I_{e}$ is a 1-absorbing prime ideal of $R_{e}$. Let $x, y \in R_{e}$ be non-units and $m \in M_{g}$ such that $x y m \in I M$. Then $x y m=x_{e} y_{e} m_{g}=(x y m)_{g} \in(I M)_{g}=I_{e} M_{g}$. By Proposition [2.31, either $x y \in I_{e}$ or $m \in I_{e} M_{g} \subseteq I M$. If $x y \in I_{e}$, then $x y \in I$ and then $x y M \subseteq I M$, which implies that $x y \in\left(I M:_{R} M\right)$. Hence, $I M$ is a $g$-1-absorbing prime $R$-submodule of $M$.

Proposition 2.33. Let $M$ be a graded $R$-module and $N$ be a graded 1-absorbing prime $R / A n n_{R}(M)$-submodule of $M$ as $M$ is a graded $R / A n n_{R}(M)$-module. If $U\left(R / A n n_{R}(M)\right)=\left\{r+A n n_{R}(M): r \in U(R)\right\}$, then $N$ is a graded 1-absorbing prime $R$-submodule of $M$ as $M$ is a graded $R$-module.

Proof. Let $x, y \in h(R)$ be non-units and $m \in h(M)$ such that $x y m \in N$. Then $x+A n n_{R}(M), y+A n n_{R}(M) \in h\left(R / A n n_{R}(M)\right)$ are non-units such that $\left(x+A n n_{R}(M)\right)\left(y+A n n_{R}(M)\right) m=x y m+A n n_{R}(M) m \in N$. Since $N$ is a graded 1-absorbing prime $R / A n n_{R}(M)$-submodule of $M$, either $x y+A n n_{R}(M) \in$
$\left(N:_{R / A n n_{R}(M)} M\right)$ or $m \in N$. If $x y+A n n_{R}(M) \in\left(N:_{R / A n n_{R}(M)} M\right)$, then $x y M \subseteq N$, which implies that $x y \in\left(N:_{R} M\right)$. Hence, $N$ is a graded 1-absorbing prime $R$-submodule of $M$ as $M$ is a graded $R$-module.

Theorem 2.34. Let $M$ be a $G$-graded $R$-module and $g \in G$ such that $M_{g}$ is a multiplication $R_{e}$-module and $U\left(R_{e} / A n n_{R_{e}}\left(M_{g}\right)\right)=\left\{r+A n n_{R_{e}}\left(M_{g}\right): r \in U\left(R_{e}\right)\right\}$. Assume that I is a graded 1-absorbing prime ideal of $R$ containing Ann $_{R}(M)$. Then $\left(I_{e} / A n n_{R_{e}}\left(M_{g}\right)\right) M_{g}$ is a $g$-1-absorbing prime $R$-submodule of $M$.

Proof. Since $M_{g}$ is a multiplication $R_{e}$-module, $M_{g}$ is a faithful multiplication $R_{e} / A n n_{R_{e}}\left(M_{g}\right)$-module (see [9], page 759). Also, since $I$ is a graded 1-absorbing prime ideal of $R, I_{e}$ is a 1-absorbing prime ideal of $R_{e}$ by Proposition 2.29, and then $I_{e} / A n n_{R_{e}}\left(M_{g}\right)$ is a 1-absorbing prime ideal of $R_{e} / A n n_{R_{e}}\left(M_{g}\right)$ by (17], Proposition 7). So, $\left(I_{e} / A n n_{R_{e}}\left(M_{g}\right)\right) M_{g}$ is a $g$-1-absorbing prime $R_{e} / A n n_{R_{e}}\left(M_{g}\right)$-submodule of $M$ by Theorem 2.32, which implies that $\left(I_{e} / \operatorname{Ann}_{R_{e}}\left(M_{g}\right)\right) M_{g}$ is a $g$-1-absorbing prime $R$-submodule of $M$ by ([17], Proposition 8).
