# Cohomology and deformations of associative superalgebras 

R. B. Yadav,*<br>Sikkim University, Gangtok, Sikkim, 737102, InDIA

#### Abstract

In this paper we generalize to associative superalgebras Gerstenhaber's work on cohomology structure of an associative algebra. We introduce two multiplications $\cup$ and $[-,-]$ on the cochain complex $C^{*}(A ; A)$ of an associative superalgebra $A$. We prove that these multiplications induce two multiplications on $H^{*}(A ; A)$ and make it graded commutative superalgebra and graded Lie superalgebra, respectively. Moreover, we introduce formal deformation theory of associative superalgebras.

## 1. Introduction

The cohomology theory of associative algebra was studied by G. Hochschild in [1], [2], [3]; and by Murray Gerstenhaber in [4]. Gerstenhaber proved that there exists a cup product multiplication $\cup$ in $H^{*}(A ; A)$ with respect to which it is a commutative graded associative algebra. It was shown that if $P$ is a two sided module over $A$, then $H^{*}(A ; P)$ is a two sided module over $H^{*}(A ; A)$. He introduced a bracket product $[-,-]$ with respect to which $H^{*}(A ; A)$ is a graded Lie algebra.

The deformation is a tool to study a mathematical object by deforming it into a family of the same kind of objects depending on a certain parameter. Deformation

[^0]theory of algebraic structures was introduced by Gerstenhaber for rings and algebras in a series of papers [4], [5], [6], [7]. Recently, deformation theory of superalgebraic structures has been studied by many authors [8], [9], [10], [11], [12], [12].

Graded algebras are of interest in physics in the context of 'supersymmetries' relating particles of differing statistics. In mathematics, graded algebras are known for some time in the context of deformation theory [13]. A superalgebra is a $\mathbb{Z}_{2}$-graded algebra $A=A_{0} \oplus A_{1}$ (that is, if $a \in A_{\alpha}, b \in A_{\beta}$, then $a b \in A_{\alpha+\beta}, \alpha, \beta \in \mathbb{Z}_{2}=\{0,1\}$ ). An associative superalgebra is a superalgebra $A=A_{0} \oplus A_{1}$ such that $(a b) c=a(b c)$, for all $a, b, c$ in $A$.

The goal of this paper is to study different algebraic structures on the cochain complex $C^{*}(A ; A)$, the cohomology $H^{*}(A ; A)$ of an associative superalgebra and application of this study in the formal deformation theory of $A$. Organization of the paper is as follows. In Section 2, we recall some basic definitions. In Section 3, we introduce $\mathbb{Z}$ graded Lie and pre-Lie superalgebras. In Section 4 we introduce supermodules over superalgebras. In Section 5, we introduce derivations of $\mathbb{Z}$-graded superalgebras. In Section 6, we discuss cohomology of associative superalgebras. In this section we establish a fundamental isomorphism between $H_{i}^{n}(A ; P)$ and $H_{i}^{n-1}\left(A ; C^{1}(A ; P)\right)$, for $n \geq 2, i=0,1$ as in [1] for associative algebras. In Section 7] we compute cohomology of associative superalgebras in dimensions 0,1 and 2. In Section 8 we introduce a cup product $\cup$ for the cohomology of an associative superalgebra $A$. In this section we prove that $\left\{C^{*}(A ; A), \cup\right\}$ is a $\mathbb{Z}$-graded associative superalgebra and coboundary map $\delta$ is a derivation on it. Also, we prove that $\left\{H^{*}(A ; A), \cup\right\}$ is a $\mathbb{Z}$-graded associative superalgebra. In section 9 we introduce $\mathbb{Z}$-graded right pre-Lie supersystem and discuss the $\mathbb{Z}$-graded right pre-Lie superalgebra given by it. We show the existence of a bracket product $[-,-]$ on $C^{*}(A ; A)$ with respect to which it is a $\mathbb{Z}$-graded Lie superalgebra and $\delta$ is a derivation on $\left\{C^{*}(A ; A),[-,-]\right\}$. We prove that $\left\{H^{*}(A ; A),[-,-]\right\}$ $\mathbb{Z}$-graded Lie superalgebra. If $P$ is a two sided module over an associative superalgebra $A$, then $H^{*}(A ; P)$ is a two sided module over $\left\{H^{*}(A ; A), \cup\right\}$. In section 10 , we introduce formal deformation theory of associative superalgebras. We prove that obstruction cochain to the deformations are 3-cocycles. We discuss equivalence of deformations and prove that cohomology class of the infinitesimal of a deformation
depends only on its equivalence class.

## 2. Associative superalgebra

In this section, we recall definitions of graded algebra, associative superalgebra, Lie superalgebra. We give some examples of associative superalgebras. Throughout the paper we denote a fixed field of characteristic 0 by $K$.

Definition 2.1. Let $\Delta$ be a commutative group and $K$ be a field. A $\Delta$-graded vector space is a vector space $V$ over $K$ together with a family of subspaces $\left\{V^{\alpha}\right\}_{\alpha \in \Delta}$, indexed by $\Delta$ such that $V=\bigoplus_{\alpha \in \Delta} V^{\alpha}$, the direct sum of $V^{\alpha}$ 's. An element a in $V^{\alpha}$ is called homogeneous of degree $\alpha$, we write $\operatorname{deg}(a)=\alpha$.

A $\Delta$-graded algebra over $K$ is a $\Delta$-graded vector space $E=\bigoplus_{\alpha \in \Delta} E^{\alpha}$ together with a bilinear map $m: E \times E \rightarrow E$ such that $m\left(E^{\alpha} \times E^{\beta}\right) \subset E^{\alpha+\beta}$ for all $\alpha, \beta \in \Delta$. An associative superalgebra is a $\mathbb{Z}_{2}$-graded algebra $A=A_{0} \oplus A_{1}$ such that $m(m(a, b), c)=m(a, m(b, c))$, for all $a, b, c \in A$. A Lie superalgebra is a $\mathbb{Z}_{2^{-}}$ graded algebra such that following conditions are satisfied:

1. $m(a, b)=-(-1)^{\alpha \beta} m(b, a)$,
2. $(-1)^{\alpha \gamma} m(m(a, b), c)+(-1)^{\beta \alpha} m(m(b, c), a)+(-1)^{\gamma \beta} m(m(c, a), b)=0$,
for all $a \in E_{\alpha}, b \in E_{\beta}, c \in E_{\gamma}, \alpha, \beta, \gamma \in \mathbb{Z}_{2}$.
In any $\mathbb{Z}_{2}$-graded vector space $V=V_{0} \oplus V_{1}$ we use a notation in which we replace degree deg $(a)$ of $a$ homogeneous element $a \in V$ by ' $a$ ' whenever deg $(a)$ appears in an exponent; thus, for example $(-1)^{a b}=(-1)^{\operatorname{deg}(a) \operatorname{deg}(b)}$. Let $V=V_{0} \oplus V_{1}$ and $W=W_{0} \oplus W_{1}$ be $\mathbb{Z}_{2}$-graded vector spaces over a field $K$. A linear map $f$ : $V \rightarrow W$ is said to be homogeneous of degree $\alpha$ if $f(a) \in W$ is homogeneous and $\operatorname{deg}(f(a))-\operatorname{deg}(a)=\alpha$, for all $a \in V_{\beta}, \beta \in\{0,1\}$. We denote degree of $f$ by $\operatorname{deg}(f)$.

Example 2.1. Let $V=V_{0} \oplus V_{1}$ be a $\mathbb{Z}_{2}$-graded vector space. Consider the vector space $A$ of all homogeneous endomorphisms of $V$. Then $A=\operatorname{End}_{0}(V) \oplus \operatorname{End}_{1}(V)$, where

$$
\operatorname{End}_{\alpha}(V)=\left\{f \in \operatorname{End}(V): f\left(V_{\beta}\right) \subset V_{\alpha+\beta}, \forall \beta \in \mathbb{Z}_{2}\right\}, \quad \alpha \in \mathbb{Z}_{2}
$$

$A$ is an associative superalgebra with respect to composition operation.

## 3. Graded Lie and pre-Lie superalgebras

Definition 3.1. We call a $\mathbb{Z} \times \mathbb{Z}_{2}$-graded algebra $E=\bigoplus_{(\alpha, \beta) \in \mathbb{Z} \times \mathbb{Z}_{2}} E_{\beta}^{\alpha}$ a $\mathbb{Z}$-graded superalgebra. An element a in $E_{\beta}^{\alpha}$ is said to be homogeneous of degree $(\alpha, \beta)$, for all $(\alpha, \beta) \in \mathbb{Z} \times \mathbb{Z}_{2}$. The anti-isomorph or opposite $A^{\prime}$ of a $\mathbb{Z}$-graded superalgebra is the superalgebra which as a $K$-vector space, is identical with $A$, but in which multiplication $m^{\prime}$ is given by $m^{\prime}(a, b)=m(b, a)$, where $m$ is the multiplication in $A$.

For all $\alpha \in \mathbb{Z}, \beta \in \mathbb{Z}_{2}$, from here onwards whenever $\alpha+\beta$ appears in an exponent we understand it as $\alpha+\beta \bmod 2$. We call a $\mathbb{Z}$-graded superalgebra $E$ a $\mathbb{Z}$-graded associative superalgebra if

$$
m(m(a, b), c)=m(m(b, c), a)
$$

for all homogeneous $a, b, c \in E$. Clearly every $\mathbb{Z}$-graded associative superalgebra is an associative algebra. We call a $\mathbb{Z}$-graded superalgebra $E$ a $\mathbb{Z}$-graded commutative superalgebra if

$$
m(a, b)=(-1)^{\alpha_{1} \alpha_{2}+\beta_{1} \beta_{2}} m(b, a)
$$

for all $a \in E_{\beta_{1}}^{\alpha_{1}}, b \in E_{\beta_{2}}^{\alpha_{2}}$. We call a $\mathbb{Z}$-graded superalgebra $E$ a $\mathbb{Z}$-graded Lie superalgebra if following conditions are satisfied

1. If $a \in E_{\beta_{1}}^{\alpha_{1}}$ and $b \in E_{\beta_{2}}^{\alpha_{2}}$ then

$$
m(a, b)=-(-1)^{\alpha_{1} \alpha_{2}+\beta_{1} \beta_{2}} m(b, a) .
$$

2. If $a \in E_{\beta_{1}}^{\alpha_{1}}, b \in E_{\beta_{2}}^{\alpha_{2}}$ and $c \in E_{\beta_{3}}^{\alpha_{3}}$, then

$$
\begin{align*}
(-1)^{\alpha_{1} \alpha_{3}+\beta_{1} \beta_{3}} m(m(a, b), c)+ & (-1)^{\alpha_{2} \alpha_{1}+\beta_{2} \beta_{1}} m(m(b, c), a) \\
& +(-1)^{\alpha_{3} \alpha_{2}+\beta_{3} \beta_{2}} m(m(c, a), b)=0 \tag{1}
\end{align*}
$$

Definition 3.2. We call a $\mathbb{Z}$-graded superalgebra $E$ a $\mathbb{Z}$-graded right pre-Lie superalgebra if

$$
\begin{align*}
& m(m(c, a), b)-(-1)^{\alpha_{1} \alpha_{2}+\beta_{1} \beta_{2}} m(m(c, b), a) \\
= & m(c, m(a, b))-(-1)^{\alpha_{1} \alpha_{2}+\beta_{1} \beta_{2}} m(c, m(b, a)), \tag{2}
\end{align*}
$$

for all $a \in E_{\beta_{1}}^{\alpha_{1}}, b \in E_{\beta_{2}}^{\alpha_{2}}$ and $c \in E_{\beta_{3}}^{\alpha_{3}}$. An antiisomorph $A^{\prime}$ of a $\mathbb{Z}$-graded right pre-Lie superalgebra is called $\mathbb{Z}$-graded left pre-Lie superalgebra.

Theorem 3.1. Let $A$ be a $\mathbb{Z}$-graded pre-Lie superalgebra. Define a multiplication $[-,-]: A \times A \rightarrow A b y$

$$
\begin{equation*}
[a, b]=m(a, b)-(-1)^{\alpha_{1} \alpha_{2}+\beta_{1} \beta_{2}} m(b, a) \tag{3}
\end{equation*}
$$

for all $a \in A_{\beta_{1}}^{\alpha_{1}}, b \in A_{\beta_{2}}^{\alpha_{2}}$. Then in the bracket product $[-,-] A$ is a $\mathbb{Z}$-graded Lie superalgebra.

Proof. Clearly the bracket product $[-,-]$ satisfies $[a, b]=-(-1)^{\alpha_{1} \alpha_{2}+\beta_{1} \beta_{2}}[b, a]$, for all $a \in A_{\beta_{1}}^{\alpha_{1}}, b \in A_{\beta_{2}}^{\alpha_{2}}$. For all $a \in A_{\beta_{1}}^{\alpha_{1}}, b \in A_{\beta_{2}}^{\alpha_{2}}$ and $c \in A_{\beta_{3}}^{\alpha_{3}}$, by using relations 2, 3, we have

$$
\begin{align*}
& (-1)^{\alpha_{1} \alpha_{3}+\beta_{1} \beta_{3}}[[a, b], c] \\
= & (-1)^{\alpha_{1} \alpha_{3}+\beta_{1} \beta_{3}}\left\{m(m(a, b), c)-(-1)^{\alpha_{1} \alpha_{2}+\beta_{1} \beta_{2}} m(m(b, a), c)\right\} \\
& (-1)^{\alpha_{3} \alpha_{2}+\beta_{3} \beta_{2}}\left\{-m(c, m(a, b))+(-1)^{\alpha_{1} \alpha_{2}+\beta_{1} \beta_{2}} m(c, m(b, a))\right\} \\
= & (-1)^{\alpha_{1} \alpha_{3}+\beta_{1} \beta_{3}}\left\{m(m(a, b), c)-(-1)^{\alpha_{1} \alpha_{2}+\beta_{1} \beta_{2}} m(m(b, a), c)\right\} \\
& (-1)^{\alpha_{3} \alpha_{2}+\beta_{3} \beta_{2}}\left\{-m(m(c, a), b)+(-1)^{\alpha_{1} \alpha_{2}+\beta_{1} \beta_{2}} m(m(c, b), a)\right\}  \tag{4}\\
& (-1)^{\alpha_{2} \alpha_{1}+\beta_{2} \beta_{1}}[[b, c], a] \\
= & (-1)^{\alpha_{2} \alpha_{1}+\beta_{2} \beta_{1}}\left\{m(m(b, c), a)-(-1)^{\alpha_{2} \alpha_{3}+\beta_{2} \beta_{3}} m(m(c, b), a)\right\} \\
= & (-1)^{\alpha_{1} \alpha_{3}+\beta_{1} \beta_{3}}\left\{-m(a, m(b, c))+(-1)^{\alpha_{2} \alpha_{3}+\beta_{2} \beta_{3}} m(a, m(c, b))\right\} \\
= & (-1)^{\alpha_{2} \alpha_{1}+\beta_{2} \beta_{1}}\left\{m(m(b, c), a)-(-1)^{\alpha_{2} \alpha_{3}+\beta_{2} \beta_{3}} m(m(c, b), a)\right\} \\
& (-1)^{\alpha_{1} \alpha_{3}+\beta_{1} \beta_{3}}\left\{-m(m(a, b), c)+(-1)^{\alpha_{2} \alpha_{3}+\beta_{2} \beta_{3}} m(m(a, c), b)\right\}  \tag{5}\\
= & (-1)^{\alpha_{3} \alpha_{2}+\beta_{3} \beta_{2}}[[c, a], b] \\
= & (-1)^{\alpha_{3} \alpha_{2}+\beta_{3} \beta_{2}}\left\{m(m(c, a), b)-(-1)^{\alpha_{2} \alpha_{1}+\beta_{2} \beta_{1}}\left\{-m(b, m(c, a))+(-1)^{\alpha_{3} \alpha_{1}+\beta_{3} \beta_{1}} m(b, m(a, c))\right\}\right. \\
= & (-1)^{\alpha_{3} \alpha_{2}+\beta_{3} \beta_{2}}\left\{m(m(c, a), b)-(-1)^{\alpha_{3} \alpha_{1}+\beta_{3} \beta_{1}} m(m(a, c), b)\right\} \\
& (-1)^{\alpha_{2} \alpha_{1}+\beta_{2} \beta_{1}}\left\{-m(m(b, c), a)+(-1)^{\alpha_{3} \alpha_{1}+\beta_{3} \beta_{1}} m(m(b, a), c)\right\}
\end{align*}
$$

From Equations 4, 5 and 6 we conclude that Equation 1 holds. Therefore $A$ is a $\mathbb{Z}$ graded Lie superalgebra.

## 4. Supermodules over $\mathbb{Z}$-graded superalgebras

Definition 4.1. Let $A$ be a $\mathbb{Z}$-graded superalgebra, $P=\bigoplus_{(\alpha, \beta) \in \mathbb{Z} \times \mathbb{Z}_{2}} P_{\beta}^{\alpha}$ be a $\mathbb{Z} \times$ $\mathbb{Z}_{2}$-graded $K$-vector space and $\rho: P \times A \rightarrow P$ be a $K$-bilinear map such that $\rho\left(P_{\beta_{1}}^{\alpha_{1}}, A_{\beta_{2}}^{\alpha_{2}}\right) \subset P_{\beta_{1}+\beta_{2}}^{\alpha_{1}+\alpha_{2}}$. If $A$ is a $\mathbb{Z}$-graded associative superalgebra, then we say that $P$ is a right supermodule over $A$, denoting $\rho(x, a)$ by xa and $m(a, b)$ by ab, provided $x(a b)=(x a) b$, for all $x \in P, a, b \in A$. Every $\mathbb{Z}$-graded associative superalgebra is a right supermodule over itself. If $A$ is a $\mathbb{Z}$-graded Lie superalgebra, then we say that $P$ is a right supermodule over $A$, denoting $\rho(x, a)$ by $[x, a]$ and $m(a, b)$ by $[a, b]$, provided $[[x, a], b]=[x,[a, b]]+(-1)^{\alpha_{3} \alpha_{2}+\beta_{3} \beta_{2}}[[x, b], a]$, for all $x \in P_{\beta_{1}}^{\alpha_{1}}, a \in A_{\beta_{2}}^{\alpha_{2}}$, $b \in A_{\beta_{3}}^{\alpha_{3}}$. Every $\mathbb{Z}$-graded Lie superalgebra is a right supermodule over itself. If $A$ is a $\mathbb{Z}$-graded right pre-Lie superalgebra, then we say that $P$ is a right supermodule over $A$, denoting $\rho(x, a)$ by $x \circ a$ and $m(a, b)$ by ab, provided

$$
(x \circ a) \circ b-(-1)^{\alpha_{3} \alpha_{2}+\beta_{3} \beta_{2}}(x \circ b) \circ a=x \circ(a b)-(-1)^{\alpha_{3} \alpha_{2}+\beta_{3} \beta_{2}}(x \circ(b a)),
$$

for all $x \in P_{\beta_{1}}^{\alpha_{1}}, a \in A_{\beta_{2}}^{\alpha_{2}}$ and $b \in A_{\beta_{3}}^{\alpha_{3}}$. Every $\mathbb{Z}$-graded right pre-Lie superalgebra is a right supermodule over itself.

We call a right supermodule $P$ over the anti-isomorph $A^{\prime}$ of $a \mathbb{Z}$-graded associative or Lie superalgebra $A$ as left supermodule over it. We say that $P$ is a (two sided) supermodule over a $\mathbb{Z}$-graded (associative or Lie) superalgebra $A$ if $A \oplus P$ is a $\mathbb{Z}$ graded (associative or Lie) superalgebra such that $A$ is subsuperalgebra of $A \oplus P$ and $m(x, y)=0$, for all $x, y \in P$. Clearly, if $P$ is a (two sided) supermodule over a $\mathbb{Z}$ graded (associative or Lie) superalgebra A then it is a right as well as left supermodule over $A$. If $P$ is a right supermodule over a $\mathbb{Z}$-graded commutative superalgebra $A$, then if we define a left action $A \times P \rightarrow P$ of $A$ on $P$ by $a x=(-1)^{\alpha_{1} \alpha_{2}+\beta_{1} \beta_{2}}$ xa, for all $x \in P_{\beta_{1}}^{\alpha_{1}}, a \in A_{\beta_{2}}^{\alpha_{2}}$, then $P$ becomes a (two sided) supermodule over $A$. If $P$ is a right supermodule over a $\mathbb{Z}$-graded Lie superalgebra $A$, then if we define a left action $A \times P \rightarrow P$ of $A$ on $P$ given by $[a, x]=-(-1)^{\alpha_{1} \alpha_{2}+\beta_{1} \beta_{2}}[x, a]$, for all $x \in P_{\beta_{1}}^{\alpha_{1}}$, $a \in A_{\beta_{2}}^{\alpha_{2}}, P$ becomes $a$ (two sided) supermodule over $A$.

## 5. Derivations of $\mathbb{Z}$-graded superalgebras

Definition 5.1. Let $A=\bigoplus_{(\alpha, \beta) \in \mathbb{Z} \times \mathbb{Z}_{2}} A_{\beta}^{\alpha}$ be a $\mathbb{Z}$-graded superalgebra. A $K$-linear map $D: A \rightarrow A$ is called left derivation of degree $(\alpha, \beta)$ of $A$ if $D$ is homogeneous of degree $(\alpha, \beta)$ and

$$
\begin{equation*}
D(a b)=(D a) b+(-1)^{\alpha \alpha_{1}+\beta \beta_{1}} a(D b) \tag{7}
\end{equation*}
$$

for all $a \in A_{\beta_{1}}^{\alpha_{1}}$ and $b \in A_{\beta_{2}}^{\alpha_{2}}$. A K-linear map $D: A \rightarrow A$ is called a right derivation of degree $(\alpha, \beta)$ of $A$ if $D$ is homogeneous of degree $(\alpha, \beta)$ and

$$
\begin{equation*}
D(a b)=(-1)^{\alpha \alpha_{2}+\beta \beta_{2}}(D a) b+a(D b) \tag{8}
\end{equation*}
$$

for all $a \in A_{\beta_{1}}^{\alpha_{1}}$ and $b \in A_{\beta_{2}}^{\alpha_{2}}$. Let $\mathcal{D}=\bigoplus_{(\alpha, \beta) \in \mathbb{Z} \times \mathbb{Z}_{2}} \mathcal{D}_{\beta}^{\alpha}$ be the vector space obtained by taking direct sum of the vector spaces $\mathcal{D}_{\beta}^{\alpha}$ of right derivations of $A$ of degree $(\alpha, \beta)$, $(\alpha, \beta) \in \mathbb{Z} \times \mathbb{Z}_{2}$. For $D_{1} \in \mathcal{D}_{\beta_{1}}^{\alpha_{1}}, D_{2} \in \mathcal{D}_{\beta_{2}}^{\alpha_{2}}$, if we define

$$
\left[D_{1}, D_{2}\right]=D_{1} D_{2}-(-1)^{\alpha_{1} \alpha_{2}+\beta_{1} \beta_{2}} D_{2} D_{1}
$$

then it can be easily verified that $\left[D_{1}, D_{2}\right]$ is a right derivation of $A$ of degree $\left(\alpha_{1}+\right.$ $\alpha_{2}, \beta_{1}+\beta_{2}$ ) and with this multiplication $\mathcal{D}$ is a $\mathbb{Z}$-graded Lie superalgebra. Similar statement can be given if $\mathcal{D}=\bigoplus_{(\alpha, \beta) \in \mathbb{Z} \times \mathbb{Z}_{2}} \mathcal{D}_{\beta}^{\alpha}$ is the vector space obtained by taking direct sum of the vector spaces $\mathcal{D}_{\beta}^{\alpha}$ of left derivations of $A$ of degree $(\alpha, \beta),(\alpha, \beta) \in$ $\mathbb{Z} \times \mathbb{Z}_{2}$. If $A=\bigoplus_{(\alpha, \beta) \in \mathbb{Z} \times \mathbb{Z}_{2}} A_{\beta}^{\alpha}$ is a $\mathbb{Z}$-graded associative superalgebra and $a \in A_{\beta}^{\alpha}$, then if we define two $K$-linear maps $D_{1}^{a}, D_{2}^{a}: A \rightarrow A$ by

$$
\begin{align*}
& D_{1}^{a} b=a b-(-1)^{\alpha \alpha^{\prime}+\beta \beta^{\prime}} b a  \tag{9}\\
& D_{2}^{a} b=b a-(-1)^{\alpha \alpha^{\prime}+\beta \beta^{\prime}} a b \tag{10}
\end{align*}
$$

for all $b \in A_{\beta^{\prime}}^{\alpha^{\prime}}$, then $D_{1}^{a}$ and $D_{2}^{a}$ are left and right derivations of $A$, respectively of degree $(\alpha, \beta)$. Similarly if $A=\bigoplus_{(\alpha, \beta) \in \mathbb{Z} \times \mathbb{Z}_{2}} A_{\beta}^{\alpha}$ is a $\mathbb{Z}$-graded Lie superalgebra and $a \in A_{\beta}^{\alpha}$, then if we define

$$
\begin{align*}
D_{1}^{a} b & =[a, b]  \tag{11}\\
D_{2}^{a} b & =[b, a] \tag{12}
\end{align*}
$$

for all $b \in A_{\beta^{\prime}}^{\alpha^{\prime}}$, then $D_{1}^{a}$ and $D_{2}^{a}$ are left and right derivations of $A$, respectively of degree $(\alpha, \beta) . D_{1}^{a}$ and $D_{2}^{a}$ are called inner derivations of $A$ induced by $a$.

Let $A$ be a $\mathbb{Z}$-graded superalgebra and $P$ be a (two sided) module over $A$. A $K$ linear map $D: A \rightarrow P$ is called a left derivation, respectively a right derivation, of degree $\alpha$ of $A$ into $P$ if 7 , respectively 8 holds, for all $a \in A_{\beta_{1}}^{\alpha_{1}}$ and $b \in A_{\beta_{2}}^{\alpha_{2}}$. If A is $\mathbb{Z}$-graded associative or Lie superalgebra, then we can define left and right inner derivations using relations 9 ,10]11, 12, In this case, we choose $a \in P_{\beta}^{\alpha}$.

Definition 5.2. We call a $\mathbb{Z}$-graded superalgebra $A$ as a differential graded superalgebra if it is equipped with a (right or left) derivation $D: A \rightarrow A$ of degree $(1,0)$ such that $d^{2}=0$.

## 6. Cohomology of associative superalgebras

Let $V=V_{0} \oplus V_{1}, W=W_{0} \oplus W_{1}$ be $\mathbb{Z}_{2}$-graded $K$-vector spaces. An n-linear map $f: V \underbrace{\times \cdots \times}_{n \text { times }} V \rightarrow W$ is said to be homogeneous of degree $\alpha$ if for all homogeneous $x_{i} \in V, 1 \leq i \leq n, f\left(x_{1}, \cdots, x_{n}\right)$ is a homogeneous element in $W$ and $\left.\operatorname{deg}\left(f\left(x_{1}, \cdots, x_{n}\right)\right)-\sum_{i=1}^{n} \operatorname{deg}\left(x_{i}\right)\right)=\alpha$. We denote the degree of a homogeneous $f$ by $\operatorname{deg}(f)$. We use a notation in which we replace degree $\operatorname{deg}(f)$ by ' $f$ ' whenever $\operatorname{deg}(f)$ appears in an exponent; thus, for example $(-1)^{\operatorname{deg}(f)}=(-1)^{f}$. For each $n \geq 0$, we define a $K$-vector space $C^{n}(V ; W)$ as follows: For $n \geq 1, C^{n}(V ; W)$ consists of homogeneous $n$-linear maps $f: V \underbrace{\times \cdots \times V}_{n \text { times }} \rightarrow W$, and $C^{0}(V ; W)=W$. Clearly, $C^{n}(V ; W)=C_{0}^{n}(V ; W) \oplus C_{1}^{n}(V ; W)$, where $C_{i}^{n}(V ; W)$ is the $K$-vector subspace of $C^{n}(A ; P)$ consisting of elements of degree $i$ with $i=0,1$.

Let $A=A_{0} \oplus A_{1}$ be an associative superalgebra and $P=P_{0} \oplus P_{1}$ be a (two sided) supermodule over $A$. We define two $K$-bilinear maps

$$
A \times C^{1}(A ; P) \rightarrow C^{1}(A ; P) \text { and } C^{1}(A ; P) \times A \rightarrow C^{1}(A ; P)
$$

(we use same symbol $*$ for both the maps and differentiate them from context) by

$$
\begin{gather*}
(a * f)\left(a_{1}\right)=a f\left(a_{1}\right)  \tag{13}\\
(f * a)\left(a_{1}\right)=f\left(a a_{1}\right)-f(a) a_{1} \tag{14}
\end{gather*}
$$

for all $a, a_{1} \in A, f \in C^{1}(A ; P)$. We have following proposition:

Proposition 6.1. $C^{1}(A ; P)$ is a (two sided) supermodule over $A$.
Proof. Proof is a direct consequence of the two actions of $A$ on $C^{1}(A ; P)$ given by relations 13,14 and the definition of supermodule.

We define a $K$-linear map $\delta^{n}: C^{n}(A ; P) \rightarrow C^{n+1}(A ; P)$ by

$$
\begin{align*}
\delta^{n} f\left(x_{1}, \cdots, x_{n+1}\right)= & (-1)^{x_{1} f} x_{1} \cdot f\left(x_{2}, \cdots, x_{n+1}\right) \\
& +\sum_{i=1}^{n}(-1)^{i} f\left(x_{1}, \cdots, x_{i} \cdot x_{i+1}, \cdots, x_{n+1}\right) \\
& +(-1)^{n+1} f\left(x_{1}, \cdots, \cdots, x_{n}\right) \cdot x_{n+1} \tag{15}
\end{align*}
$$

for all $f$ in $C^{n}(A ; P), n \geq 1$, and $\delta^{0} f\left(x_{1}\right)=(-1)^{x_{1} f} x_{1} . f-f . x_{1}$, for all $f$ in $C^{0}(A ; P)=P$. Clearly, for each $f \in C^{n}(A ; P), n \geq 0, \operatorname{deg}(\delta f)=\operatorname{deg}(f)$. For each $f \in C^{n}(A ; P), n>0$, we define $f_{n-1} \in C^{n-1}\left(A ; C^{1}(A ; P)\right)$, by

$$
f_{n-1}\left(a_{1}, \cdots, a_{n-1}\right)\left(a_{n}\right)=f\left(a_{1}, \cdots, a_{n}\right)
$$

Theorem 6.1. $\delta \delta=0$, that is, $\left(C^{*}(A ; P), \delta\right)$ is a cochain complex.
Proof. For $f \in C^{0}(A ; P)$, we have

$$
\begin{aligned}
\delta \delta f\left(x_{1}, x_{2}\right)= & (-1)^{x_{1} f} x_{1} \delta f\left(x_{2}\right)-\delta f\left(x_{1} \cdot x_{2}\right)+\delta f\left(x_{1}\right) \cdot x_{2} \\
= & (-1)^{x_{1} f} x_{1} \cdot\left((-1)^{x_{2} f} x_{2} \cdot f-f \cdot x_{2}\right)-(-1)^{x_{2} f+x_{1} f}\left(x_{1} \cdot x_{2}\right) \cdot f \\
& +f \cdot\left(x_{1} \cdot x_{2}\right)+(-1)^{x_{1} f}\left(x_{1} \cdot f\right) \cdot x_{2}-\left(f \cdot x_{1}\right) \cdot x_{2} \\
= & 0
\end{aligned}
$$

For $f \in C^{n}(A ; P), n \geq 1$, we have

$$
\begin{align*}
(\delta f)_{n}\left(x_{1}, \cdots, x_{n}\right)\left(x_{n+1}\right)= & \delta f\left(x_{1}, \cdots, x_{n+1}\right) \\
= & (-1)^{x_{1} f} x_{1} \cdot f\left(x_{2}, \cdots, x_{n+1}\right) \\
& +\sum_{i=1}^{n}(-1)^{i} f\left(x_{1}, \cdots, x_{i} \cdot x_{i+1}, \cdots, x_{n+1}\right) \\
& +(-1)^{n+1} f\left(x_{1}, \cdots, x_{n}\right) \cdot x_{n+1} \\
= & (-1)^{x_{1} f}\left(x_{1} * f_{n-1}\left(x_{2}, \cdots, x_{n}\right)\left(x_{n+1}\right)\right. \\
& +\sum_{i=1}^{n-1}(-1)^{i} f_{n-1}\left(x_{1}, \cdots, x_{i} \cdot x_{i+1}, \cdots, x_{n}\right)\left(x_{n+1}\right) \\
& +(-1)^{n}\left(f_{n-1}\left(x_{1}, \cdots, x_{n-1}\right) * x_{n}\right) x_{n+1} \\
= & \delta f_{n-1}\left(x_{1}, \cdots, x_{n}\right)\left(x_{n+1}\right) \tag{16}
\end{align*}
$$

Thus $(\delta f)_{n}=\delta\left(f_{n-1}\right)$. This implies that for all $f \in C^{n}(A ; P), n \geq 1$,

$$
\begin{equation*}
(\delta \delta f)_{n+1}=\delta\left((\delta f)_{n}\right)=\delta \delta\left(f_{n-1}\right) \tag{17}
\end{equation*}
$$

Assume that $\delta \delta f=0$ holds, for all $f \in C^{q}(A ; P)$, where $P$ is an arbitrary supermodule over $A, 0 \leq q \leq n$. Using Equation 17, for $f \in C^{n+1}(A ; P)$ we have $\delta \delta\left(f_{n}\right)=$ $(\delta \delta f)_{n+2}$. By induction hypothesis $\delta \delta\left(f_{n}\right)=0$. This implies that $(\delta \delta f)_{n+2}=0$. Since $f=0$ if and only if $f_{n-1}=0$, for all $f \in C^{n}(A ; P), n \geq 1$, we conclude that $\delta \delta f=0$. So, by using mathematical induction we conclude that $\delta \delta=0$.

We denote $\operatorname{ker}\left(\delta^{n}\right)$ by $Z^{n}(A ; P)$ and image of $\delta^{n-1}$ by $B^{n}(A ; P)$. We call the $n$-th cohomology $Z^{n}(A ; P) / B^{n}(A ; P)$ of the cochain complex $\left(C^{*}(A ; P), \delta\right)$ as the $n$-th cohomology of $A$ with coefficients in $P$ and denote it by $H^{n}(A ; P)$. Since $A$ is a supermodule over itself. So we can consider cohomology groups $H^{n}(A ; A)$. We call $H^{n}(A ; A)$ as the $n$-th cohomology group of $A$. We have

$$
Z^{n}(A ; P)=Z_{0}^{n}(A ; P) \oplus Z_{1}^{n}(A ; P), B^{n}(A ; P)=B_{0}^{n}(A ; P) \oplus B_{1}^{n}(A ; P)
$$

$Z_{i}^{n}(A ; P)=\left\{f \in Z^{n}(A ; P): \operatorname{deg}(f)=i\right\}, B_{i}^{n}(A ; P)=\left\{f \in B^{n}(A ; P):\right.$ $\operatorname{deg}(f)=i\}$ are vector subspaces of $Z^{n}(A ; P)$ and $B^{n}(A ; P)$, respectively, $i=0,1$. Since boundary map $\delta^{n}: C^{n}(A ; P) \rightarrow C^{n+1}(A ; P)$ is homogeneous of degree 0 , we
conclude that $H^{n}(A ; P)$ is $\mathbb{Z}_{2}$-graded and

$$
H^{n}(A ; P) \cong H_{0}^{n}(A ; P) \oplus H_{1}^{n}(A ; P)
$$

where $H_{i}^{n}(A ; P)=Z_{i}^{n}(A ; P) / B_{i}^{n}(A ; P), i=0,1$.
Theorem 6.2. For $n \geq 2, H_{i}^{n}(A ; P) \cong H_{i}^{n-1}\left(A ; C^{1}(A ; P)\right), i=0,1$.
Proof. Clearly, for $i=0,1$, the mapping $f \mapsto f_{n-1}$ is an isomorphism from $C_{i}^{n}(A ; P)$ onto $C_{i}^{n-1}\left(A ; C^{1}(A ; P)\right)$. Since $(\delta f)_{n}=\delta\left(f_{n-1}\right), Z_{i}^{n}(A ; P)$ and $B_{i}^{n}(A ; P)$ are mapped by the mapping $f \mapsto f_{n-1}$ onto $Z_{i}^{n-1}\left(A ; C^{1}(A ; P)\right)$ and $B_{i}^{n-1}\left(A ; C^{1}(A ; P)\right)$, respectively. Hence, for $i=0,1$, the mapping $f \mapsto f_{n-1}$ induces an isomorphism from $H_{i}^{n}(A ; P)$ onto $H_{i}^{n-1}\left(A ; C^{1}(A ; P)\right)$.

## 7. Cohomology of associative superalgebras in low dimensions

Let $A=A_{0} \oplus A_{1}$ be an associative superalgebra and $P=P_{0} \oplus P_{1}$ be a supermodule over $A$. For any $m \in C_{i}^{0}(A ; P)=P_{i}, f \in C_{i}^{1}(A ; P)$ and $g \in C_{i}^{2}(A ; P), i=0,1$

$$
\begin{gather*}
\delta^{0} m(x)=(-1)^{m x} x \cdot m-m \cdot x  \tag{18}\\
\delta^{1} f\left(x_{1}, x_{2}\right)=-f\left(x_{1} \cdot x_{2}\right)+(-1)^{x_{1} f} x_{1} \cdot f\left(x_{2}\right)+f\left(x_{1}\right) \cdot x_{2}  \tag{19}\\
\delta^{2} g\left(x_{1}, x_{2}, x_{3}\right)=\quad-g\left(x_{1} \cdot x_{2}, x_{3}\right)+g\left(x_{1}, x_{2} \cdot x_{3}\right) \\
\quad+(-1)^{x_{1} g} x_{1} \cdot g\left(x_{2}, x_{3}\right)-g\left(x_{1}, x_{2}\right) \cdot x_{3} . \tag{20}
\end{gather*}
$$

We denote the set $\left\{m \in P_{i} \mid m \cdot x=(-1)^{m x} x . m\right.$, for all homogeneous $\left.x \in A\right\}$ by $\operatorname{Com}_{P_{i}} A$. We have

$$
\begin{aligned}
H_{i}^{0}(A ; P) & =\left\{m \in P_{i} \mid(-1)^{m x} x \cdot m-m \cdot x=0, \text { for all homogeneous } x \in A\right\} \\
& =\operatorname{Com}_{P_{i}} A
\end{aligned}
$$

For every $m \in P_{i}$ the map $x \mapsto(-1)^{i x} x . m-m . x$ is a left inner derivation of $A$ into $P$ of degree $i$ and induced by $-m$. We denote the vector spaces of left derivations and left inner derivations of degree $i$ of $A$ into $P$ by $\operatorname{Der}_{i}(A ; P)$ and $\operatorname{Der}_{i}^{I n n}(A ; P)$ respectively. By using 18,19 we have

$$
H_{i}^{1}(A ; P)=\operatorname{Der}_{i}(A ; P) / \operatorname{Der}_{i}^{I n n}(A ; P)
$$

Let $A$ be an associative superalgebra and $P$ be a supermodule over $A$. We regard $P$ as an associative superalgebra with trivial product $x y=0$, for all $x, y \in P$. We define extension of $A$ by $P$ of degree 0 to be an exact sequence

$$
\begin{equation*}
0 \longrightarrow P \xrightarrow{i} \mathcal{E} \xrightarrow{\pi} A \longrightarrow 0 \tag{*}
\end{equation*}
$$

of associative superalgebras such that $\operatorname{deg}(i)=0=\operatorname{deg}(\pi)$ and

$$
\begin{equation*}
x \cdot i(m)=\pi(x) \cdot m, i(m) \cdot x=m \cdot \pi(x) \tag{21}
\end{equation*}
$$

for all homogeneous $x \in \mathcal{E}, m \in P$. The exact sequence $(*)$ regarded as a sequence of $K$-vector spaces splits. Therefore without any loss of generality we may assume that $\mathcal{E}$ as a $K$-vector space coincides with the direct sum $A \oplus P$ and that $i(m)=(0, m)$, $\pi(x, m)=x$. Hence relation 21 is meaningful. Thus we have $\mathcal{E}=\mathcal{E}_{0} \oplus \mathcal{E}_{1}$, where $\mathcal{E}_{0}=A_{0} \oplus P_{0}, \mathcal{E}_{1}=A_{1} \oplus P_{1}$. The multiplication in $\mathcal{E}=A \oplus P$ has then necessarily the form

$$
\begin{gathered}
\left(0, m_{1}\right) \cdot\left(0, m_{2}\right)=(0,0),\left(x_{1}, 0\right) \cdot\left(0, m_{1}\right)=\left(0, x_{1} \cdot m_{1}\right) \\
\left(0, m_{2}\right) \cdot\left(x_{2}, 0\right)=\left(0, m_{2} \cdot x_{2}\right),\left(x_{1}, 0\right) \cdot\left(x_{2}, 0\right)=\left(x_{1} \cdot x_{2}, h\left(x_{1}, x_{2}\right)\right)
\end{gathered}
$$

for some $h \in C_{0}^{2}(A ; P)$, for all homogeneous $x_{1}, x_{2} \in A, m_{1}, m_{2} \in P$. Thus, in general, we have

$$
\begin{equation*}
(x, m) \cdot(y, n)=(x \cdot y, x \cdot n+m \cdot y+h(x, y)) \tag{22}
\end{equation*}
$$

for all homogeneous $(x, m),(y, n)$ in $\mathcal{E}=A \oplus P$.
Conversely, let $h: A \times A \rightarrow P$ be a bilinear homogeneous map of degree 0 . For homogeneous $(x, m),(y, n)$ in $\mathcal{E}=A \oplus P$ we define multiplication by Equation 22 , For homogeneous $(x, m),(y, n)$ and $(z, p)$ in $\mathcal{E}$ we have

$$
\begin{align*}
((x, m) \cdot(y, n)) \cdot(z, p)= & ((x \cdot y) \cdot z,(x \cdot y) \cdot p+(x \cdot n) \cdot z+(m \cdot y) \cdot z \\
& +h(x, y) \cdot z+h(x \cdot y, z)  \tag{23}\\
(x, m) \cdot((y, n) \cdot(z, p))= & (x \cdot(y \cdot z), x \cdot(y \cdot p)+x \cdot(n \cdot z)+m \cdot(y \cdot z) \\
& +x \cdot h(y, z)+h(x, y \cdot z) \tag{24}
\end{align*}
$$

From Equations 23, 24, we conclude that $\mathcal{E}=A \oplus P$ is an associative superalgebra with product given by Equation 22 if and only if $\delta^{2} h=0$. We denote the associative superalgebra given by Equation 22 using notation $\mathcal{E}_{h}$. Thus for every cocycle $h$ in $C_{0}^{2}(A ; P)$ there exists an extension

$$
E_{h}: 0 \longrightarrow P \xrightarrow{i} \mathcal{E}_{h} \xrightarrow{\pi} A \longrightarrow 0
$$

of $A$ by $P$ of degree 0 , where $i$ and $\pi$ are inclusion and projection maps, that is, $i(m)=$ $(0, m), \pi(x, m)=x$. We say that two extensions

$$
0 \longrightarrow P \longrightarrow \mathcal{E}^{i} \longrightarrow A \longrightarrow 0(i=1,2)
$$

of $A$ by $P$ of degree 0 are equivalent if there is an associative superalgebra isomorphism $\psi: \mathcal{E}^{1} \rightarrow \mathcal{E}^{2}$ of degree 0 such that following diagram commutes:

We use $F(A, P)$ to denote the set of all equivalence classes of extensions of $A$ by $P$ of degree 0. Equation 22 defines a mapping of $Z_{0}^{2}(A ; P)$ onto $F(A, P)$. If for $h, h^{\prime} \in Z_{0}^{2}(A ; P) E_{h}$ is equivalent to $E_{h^{\prime}}$, then commutativity of diagram $(* *)$ is equivalent to

$$
\psi(x, m)=(x, m+f(x))
$$

for some $f \in C_{0}^{1}(A ; P)$. We have

$$
\begin{align*}
\psi\left(\left(x_{1}, m_{1}\right) \cdot\left(x_{2}, m_{2}\right)\right) & =\psi\left(x_{1} \cdot x_{2}, x_{1} \cdot m_{2}+m_{1} \cdot x_{2}+h\left(x_{1}, x_{2}\right)\right) \\
& =\left(x_{1} \cdot x_{2}, x_{1} \cdot m_{2}+m_{1} \cdot x_{2}+h\left(x_{1}, x_{2}\right)+f\left(x_{1} \cdot x_{2}\right)\right) \tag{25}
\end{align*}
$$

$$
\begin{align*}
\psi\left(x_{1}, m_{1}\right) \cdot \psi\left(x_{2}, m_{2}\right) & =\left(x_{1}, m_{1}+f\left(x_{1}\right)\right) \cdot\left(x_{2}, m_{2}+f\left(x_{2}\right)\right) \\
& =\left(x_{1} \cdot x_{2}, x_{1} \cdot\left(m_{2}+f\left(x_{2}\right)\right)+\left(m_{1}+f\left(x_{1}\right)\right) \cdot x_{2}+h^{\prime}\left(x_{1}, x_{2}\right)\right) \tag{26}
\end{align*}
$$

Since $\psi\left(\left(x_{1}, m_{1}\right) .\left(x_{2}, m_{2}\right)\right)=\psi\left(x_{1}, m_{1}\right) \cdot \psi\left(x_{2}, m_{2}\right)$, we have

$$
\begin{align*}
h\left(x_{1}, x_{2}\right)-h^{\prime}\left(x_{1}, x_{2}\right) & =-f\left(x_{1} \cdot x_{2}\right)+x_{1} \cdot f\left(x_{2}\right)+f\left(x_{1}\right) \cdot x_{2} \\
& =\delta^{1}(f)\left(x_{1}, x_{2}\right) \tag{27}
\end{align*}
$$

Thus two extensions $E_{h}$ and $E_{h^{\prime}}$ of degree 0 are equivalent if and only if there exists some $f \in C_{0}^{1}(A ; P)$ such that $\delta^{1} f=h-h^{\prime}$. We thus have following theorem:

Theorem 7.1. The set $F(A, P)$ of all equivalence classes of extensions of $A$ by $P$ of degree 0 is in one to one correspondence with the cohomology group $H_{0}^{2}(A ; P)$. This correspondence $\omega: H_{0}^{2}(A ; P) \rightarrow F(A, P)$ is obtained by assigning to each cocycle $h \in Z_{0}^{2}(A ; P)$, the extension given by multiplication 22

## 8. Cup product for $H^{*}(A ; A)$

Definition 8.1. Let $P$ be a (two sided) supermodule over an associative superalgebra A. Also, assume that $P$ has an structure associative superalgebra, in particular we may take $P=A$. We define a multiplication $\cup$ on $C^{*}(A ; P)=\bigoplus C^{n}(A ; P)$ by defining $\cup: C^{m}(A ; P) \times C^{n}(A ; P) \rightarrow C^{m+n}(A ; P)$ by

$$
\begin{align*}
& f \cup g\left(a_{1}, \cdots, a_{m}, b_{1}, \cdots, b_{n}\right) \\
= & (-1)^{\tilde{g}\left(a_{1}+\cdots+a_{m}\right)} f\left(a_{1}, \cdots, a_{m}\right) g\left(b_{1}, \cdots, b_{n}\right), \tag{28}
\end{align*}
$$

for all $f \in C_{\tilde{f}}^{m}(A ; P), g \in C_{\tilde{g}}^{n}(A ; P)$, for all $m, n \geq 0$. If we put $C^{n}(A ; P)=0$ for $n<0$, then $C^{*}(A ; P)$ is a $\mathbb{Z}$-graded associative superalgebra with respect to the multiplication $\cup$.

As a direct consequence of definitions of coboundary map $\delta 15$ and $\cup$ we have following proposition:

Proposition 8.1. For $f \in C_{\tilde{f}}^{m}(A ; P), g \in C_{\tilde{g}}^{n}(A ; P)$,

$$
\begin{equation*}
\delta(f \cup g)=\delta f \cup g+(-1)^{m} f \cup \delta g . \tag{29}
\end{equation*}
$$

From Proposition8.1, we conclude that $\delta$ is a derivation of $\left\{C^{*}(A ; P), \cup\right\}$ of degree $(1,0)$. Hence the cochain complex $C^{*}(A ; A)$ of an associative super algebra is a
differential graded associative superalgebra with respect to the multiplication $\cup$. Next, we have some observations as following theorem:

Theorem 8.1. (i) $\left\{Z^{*}(A ; P), \cup\right\}$ is a subsuperalgebra of $\left\{C^{*}(A ; P), \cup\right\}$, where $Z^{*}(A ; P)=\bigoplus Z^{n}(A ; P) ;$
(ii) If one of $f$ and $g$ is in $B^{m}(A ; P)$ and other in $Z^{n}(A ; P)$, then $f \cup g \in B^{m+n}(A ; P)$, that is, $B^{*}(A ; P)=\bigoplus B^{n}(A ; P)$ is a (two sided) ideal of $Z^{*}(A ; P) ;$
(iii) $H^{*}(A ; P)=\bigoplus H^{n}(A ; P)$ is a $\mathbb{Z}$-graded associative superalgebra with respect to multiplication $\cup$ (called as cup product) defined by

$$
\left(f+B^{m}(A ; P)\right) \cup\left(g+B^{n}(A ; P)\right)=(f \cup g)+B^{m+n}(A ; P)
$$

for all $f \in Z^{m}(A ; P), g \in Z^{n}(A ; P)$.
Let $A$ be an associative superalgebra and $P$ be a (two sided) supermodule over $A$. If we define two actions of $C^{*}(A ; A)=\oplus C^{n}(A ; A)$ on $C^{*}(A ; P)=\oplus C^{n}(A ; P)$ (we use same symbol $\cup$ for both the actions and differentiate them from context) by

$$
f \cup g\left(a_{1}, \cdots, a_{m}, b_{1}, \cdots, b_{n}\right)=(-1)^{\tilde{g}\left(a_{1}+\cdots+a_{m}\right)} f\left(a_{1}, \cdots, a_{m}\right) g\left(b_{1}, \cdots, b_{n}\right),
$$

for all $f \in C_{\tilde{f}}^{m}(A ; A), g \in C_{\tilde{g}}^{n}(A ; P)$ or $f \in C_{\tilde{f}}^{m}(A ; P), g \in C_{\tilde{g}}^{n}(A ; A)$. With these two actions $C^{*}(A ; P)$ is a (two sided) supermodule over $C^{*}(A ; A)$

It is clear that Equation 29 holds also when either $f \in C^{m}(A ; P), g \in C^{n}(A ; A)$ or $f \in C^{m}(A ; A), g \in C^{n}(A ; P)$. This implies that $Z^{m}(A ; A) \cup Z^{n}(A ; P)$ and $Z^{m}(A ; P) \cup Z^{n}(A ; A)$ are contained in $Z^{m+n}(A ; P)$, and $Z^{m}(A ; A) \cup B^{n}(A ; P)$ and $B^{m}(A ; A) \cup Z^{n}(A ; P)$ are contained in $B^{m+n}(A ; P)$. Hence we conclude that $H^{*}(A ; P)$ is a (two sided) supermodule over $\left\{H^{*}(A ; A), \cup\right\}$.

## 9. Bracket product for $\boldsymbol{H}^{*}(A ; A)$

Definition 9.1. A right pre-Lie super system $\left\{V_{m}, \circ_{i}\right\}$ is defined as a sequence

$$
\cdots, V_{-1}, V_{0}, V_{1}, V_{2} \cdots, V_{n}, \cdots
$$

of $\mathbb{Z}_{2}$-graded $K$-vector spaces $V_{m}=V_{0}^{m} \oplus V_{1}^{m}$ together with an assignment for every triple of integers $m, n, i \geq 0$ with $i \leq m$, of a homogeneous $K$-bilinear map $\circ_{i}=\circ_{i}(m, n)$ of $V_{m} \times V_{n}$ into $V_{m+n}$ of degree 0 such that following conditions are satisfied:

$$
\left(f \circ_{i} g\right) \circ_{j} h= \begin{cases}(-1)^{\tilde{g} \tilde{h}}\left(f \circ_{j} h\right) \circ_{i+p} g, & \text { if } 0 \leq j \leq i-1  \tag{30}\\ f \circ_{i}\left(g \circ_{j-i} h\right), & \text { if } i \leq j \leq n+i\end{cases}
$$

for all $f \in V_{\tilde{f}}^{m}, g \in V_{\tilde{g}}^{n}$ and $h \in V_{\tilde{h}}^{p}$. Here $\circ_{i}(f, g)=f \circ_{i} g$. From the first case of Equation 30 we have

$$
\begin{equation*}
\left(f \circ_{j} h\right) \circ_{i+p} g=(-1)^{\tilde{g} \tilde{h}}\left(f \circ_{i+p} g\right) \circ_{j+n} h, \text { if } 0 \leq i+p \leq j-1 \tag{31}
\end{equation*}
$$

In Equation 31 replacing $i+p$ by $i$ and $j+n$ by $j$ we have

$$
\begin{equation*}
\left(f \circ_{i} g\right) \circ_{j} h=(-1)^{\tilde{g} \tilde{h}}\left(f \circ_{j-n} h\right) \circ_{i} g, \text { if } n+i+1 \leq j \leq m+n \tag{32}
\end{equation*}
$$

Example 9.1. Let $A=A_{0} \oplus A_{1}$ be an associative superalgebra. Put $V_{0}=A$, and $V_{m}=0$, for all $m \in \mathbb{Z}$ with $m \neq 0$. We define $\circ_{i}=o_{i}(m, n): V_{m} \times V_{n} \rightarrow V_{m+n}$ by

$$
a \circ_{i} b= \begin{cases}a b, & \text { if } i=m=n=0 \\ 0, & \text { otherwise }\end{cases}
$$

Clearly, $\left\{V_{m}, \circ_{i}\right\}$ is a right pre-Lie supersystem.
Example 9.2. Let $U=U_{0} \oplus V_{1}, W=W_{0} \oplus W_{1} \mathbb{Z}_{2}$-graded $K$-vector spaces. Let $\phi: W \rightarrow U$ be a homogeneous $K$-linear map of degree 0 . Put

$$
V_{m}= \begin{cases}C^{m+1}(U ; W), & \text { if } m \in \mathbb{Z}, m \geq-1 \\ 0, & \text { otherwise } .\end{cases}
$$

For integers $m, n, i \geq 0, i \leq m$ we define $\circ_{i}: V_{m} \times V_{n} \rightarrow V_{m+n}$ by

$$
\begin{align*}
& f \circ_{i} g\left(x_{1}, \cdots, x_{i}, y_{1}, \cdots, y_{n+1}, x_{i+2}, \cdots, x_{m+1}\right) \\
= & (-1)^{\tilde{g}\left(x_{1}+\cdots+x_{i}\right)} f\left(x_{1}, \cdots, x_{i}, \phi g\left(y_{1}, \cdots, y_{n+1}\right), x_{i+2}, \cdots, x_{m+1}\right), \tag{33}
\end{align*}
$$

for all $f \in V_{\tilde{f}}^{m}=C_{\tilde{f}}^{m+1}(A ; P), g \in V_{\tilde{g}}^{n}=C_{\tilde{g}}^{n+1}(A ; P)$. The definition of $\circ_{i}$ can be extended to the case when $n=-1$ as follows

$$
\begin{align*}
& f \circ_{i} g\left(x_{1}, \cdots, x_{i}, x_{i+2}, \cdots, x_{m+1}\right) \\
= & (-1)^{\tilde{g}\left(x_{1}+\cdots+x_{i}\right)} f\left(x_{1}, \cdots, x_{i}, \phi g, x_{i+2}, \cdots, x_{m+1}\right) \tag{34}
\end{align*}
$$

One can readily verify that the condition 30 holds and $\left\{V_{m}, \circ_{i}\right\}$ is a right pre-Lie supersystem. .

Definition 9.2. Let $\left(V_{m}, \circ_{i}\right)$ be a pre-Lie supersystem. For every $m$ and $n$ we define a homogeneous $K$-bilinear map $\circ: V_{m} \times V_{n} \rightarrow V_{m+n}$ of degree $(0,0)$ by

$$
f \circ g= \begin{cases}\sum_{i=0}^{m}(-1)^{n i} f \circ_{i} g, & \text { if } m \geq 0  \tag{35}\\ 0, & \text { if } m<0\end{cases}
$$

for all $f \in V_{m}, g \in V_{n}$.

Theorem 9.1. Let $\left(V_{m}, \circ_{i}\right)$ be a right pre-Lie supersystem. Then for $f \in V_{\tilde{f}}^{m}, g \in V_{\tilde{g}}^{n}$, $h \in V_{\tilde{h}}^{p}$
(a)

$$
(f \circ g) \circ h-f \circ(g \circ h)=\sum_{\substack{0 \leq j \leq i-1 \\ n+i+1 \leq j \leq m+n}}(-1)^{n i+p j}\left(f \circ_{i} g\right) \circ_{j} h
$$

(b) $(f \circ g) \circ h-f \circ(g \circ h)=(-1)^{n p+\tilde{g} \tilde{h}}((f \circ h) \circ g-f \circ(h \circ g))$.

Proof. By using Definitions 35,30

$$
\begin{align*}
&=(f \circ g) \circ h-f \circ(g \circ h) \\
&= \sum_{\substack{0 \leq j \leq m+n \\
0 \leq i \leq m}}(-1)^{p j+n i}\left(f \circ_{i} g\right) \circ_{j} h-\sum_{\substack{0 \leq \lambda \leq m \\
0 \leq \mu \leq n}}(-1)^{\lambda(n+p)+\mu p} f \circ_{\lambda}\left(g \circ_{\mu} h\right) \\
&= \sum_{\substack{0 \leq i \leq m \\
0 \leq \leq j i-1 \\
n+i+1 \leq j \leq m+n}}(-1)^{p j+n i}\left(f \circ_{i} g\right) \circ_{j} h+\sum_{\substack{0 \leq i \leq m \\
i \leq j \leq n+i}}(-1)^{p j+n i}\left(f \circ_{i} g\right) \circ_{j} h \\
&-\sum_{\substack{0 \leq \lambda \leq m \\
0 \leq \mu \leq n}}(-1)^{\lambda(n+p)+\mu p} f \circ_{\lambda}\left(g \circ_{\mu} h\right) \\
&= \sum_{\substack{0 \leq i \leq m \\
0 \leq j \leq i \leq 1 \\
n+i+1 \leq j \leq m+n}}(-1)^{p j+n i}\left(f \circ_{i} g\right) \circ_{j} h+\sum_{\substack{0 \leq i \leq m \\
i \leq j \leq n+i}}(-1)^{p j+n i} f \circ_{i}\left(g \circ_{j-i} h\right) \\
& \quad-\sum_{\substack{0 \leq \lambda \leq m \\
0 \leq \mu \leq n}}(-1)^{\lambda(n+p)+\mu p} f \circ_{\lambda}\left(g \circ_{\mu} h\right) \\
&= \sum_{\substack{0 \leq i \leq m \\
0 \leq j \leq i-1 \\
n+i+1 \leq j \leq m+n}}(-1)^{p j+n i}\left(f \circ_{i} g\right) \circ_{j} h
\end{align*}
$$

From Equation 36

$$
\begin{aligned}
& (f \circ g) \circ h-f \circ(g \circ h) \\
= & \sum_{\substack{0 \leq i \leq m \\
0 \leq j \leq i-1 \\
n+i+1 \leq j \leq m+n}}(-1)^{p j+n i}\left(f \circ_{i} g\right) \circ_{j} h \\
= & (-1)^{p j+n i+\tilde{g} \tilde{h}}\left\{\sum_{\substack{0 \leq i \leq m \\
0 \leq j \leq i-1}}\left(f \circ_{j} h\right) \circ_{i+p} g+\sum_{\substack{0 \leq i \leq m \\
n+i+1 \leq j \leq m+n}}\left(f \circ_{j-n} h\right) \circ_{i} g\right\}
\end{aligned}
$$

Putting $j=\lambda, i+p=\mu$ in the first sum and $j-n=\lambda, i=\mu$ in the second sum of

Equation 37, we get

$$
\begin{align*}
& (f \circ g) \circ h-f \circ(g \circ h) \\
= & \sum_{\substack{0 \leq \lambda \leq m \\
\lambda+p+1 \leq \mu \leq m+p}}(-1)^{p \lambda+n \mu+n p+\tilde{g} \tilde{h}}\left(f \circ_{\lambda} h\right) \circ_{\mu} g \\
& +\sum_{\substack{0 \leq \lambda \leq m \\
0 \leq \mu \leq \lambda-1}}(-1)^{p \lambda+p n+n \mu+\tilde{g} \tilde{h}}\left(f \circ \circ_{\lambda} h\right) \circ_{\mu} g \\
= & (-1)^{n p+g h}((f \circ h) \circ g-f \circ(h \circ g)) \tag{37}
\end{align*}
$$

Corollary 9.1. Let $\left\{V_{m}, \circ_{i}\right\}$ be a right pre-Lie supersystem and let $V=\bigoplus V_{m}$ be the direct sum of the $\mathbb{Z}_{2}$-graded $K$-vector spaces $V_{m}=V_{0}^{m} \oplus V_{1}^{m}$. Then with respect to multiplication given by $\circ$ in Definition 9.2 V is a $\mathbb{Z}$-graded right pre-Lie superalgebra.

Definition 9.3. Let $\left\{V_{m}, \circ_{i}\right\}$ be a right pre-Lie supersystem and $W=\bigoplus_{(m, n)} W_{n}^{m}$ be a $\mathbb{Z} \times \mathbb{Z}_{2}$-graded $K$-vector space. We write $W_{m}=W_{0}^{m} \oplus W_{1}^{m}$ for all $m \in \mathbb{Z}$. We say that $W$ has the structure of a right supermodule over the right pre-Lie supersystem $\left\{V_{m}, \circ_{i}\right\}$ if there exist homogeneous linear maps (for which we use the same notation $\circ_{i}$ ) from $W_{m} \times V_{n}$ to $W_{m+n}$ such that Equation 30 holds for all $f \in W_{m}, g \in V_{n}$ and $h \in V_{p}$. Now define $\circ: W \times V \rightarrow W$ by

$$
f \circ g= \begin{cases}\sum_{i=0}^{m}(-1)^{n i} f \circ_{i} g, & \text { if } m \geq 0  \tag{38}\\ 0, & \text { if } m<0\end{cases}
$$

for all $f \in W_{m}, g \in V_{n}$. Let $V=\bigoplus V_{n}$ be the $\mathbb{Z}$-graded right pre-Lie superalgebra given by the right pre-Lie supersystem $\left\{V_{m}, \circ_{i}\right\}$. Using similar arguments as in the proof of Theorem 9.1 we conclude that $W$ is a right supermodule over the $\mathbb{Z}$-graded right pre-Lie superalgebra $V$ with respect to the action $\circ$ of $V$ on $W$ given by Equation 38 Consider the $\mathbb{Z}$-graded Lie superalgebra structure given by the $\mathbb{Z}$-graded right pre-Lie superalgebra using Theorem 3.1] If we define a right action of the $\mathbb{Z}$-graded Lie superalgebra $V$ on $W$ by $[X, f]=X \circ f, X \in W, f \in V$, then $W$ is a right supermodule over the $\mathbb{Z}$-graded Lie superalgebra $V$.

As in Example 9.2 , if we consider only $\mathbb{Z}_{2}$-graded $K$-vector space structure of $A$ and put $U=W=A, \phi=I d_{A}$, then $\left\{C^{m}(A ; A), \circ_{i}\right\}$ is a right pre-Lie supersystem where elements of $C^{m}(A ; A)$ has degree $m-1$ and dimension $m$. For $f \in C^{m}(A ; P)$, $g \in C^{n}(A ; A)$ we define $f \circ_{i} g \in C^{m+n-1}(A ; P)$ by

$$
\begin{align*}
& f \circ_{i} g\left(x_{1}, \cdots, x_{i}, y_{1}, \cdots, y_{n+1}, x_{i+2}, \cdots, x_{m+1}\right) \\
= & (-1)^{\tilde{g}\left(x_{1}+\cdots+x_{i}\right)} f\left(x_{1}, \cdots, x_{i}, g\left(y_{1}, \cdots, y_{n+1}\right), x_{i+2}, \cdots, x_{m+1}\right) \tag{39}
\end{align*}
$$

The definition of $\circ_{i}$ can be extended to the case when $n=-1$ as follows

$$
\begin{align*}
& f \circ_{i} g\left(x_{1}, \cdots, x_{i}, x_{i+2}, \cdots, x_{m+1}\right) \\
= & (-1)^{\tilde{g}\left(x_{1}+\cdots+x_{i}\right)} f\left(x_{1}, \cdots, x_{i}, g, x_{i+2}, \cdots, x_{m+1}\right) \tag{40}
\end{align*}
$$

We can easily verify that $C^{*}(A ; P)$ is a right supermodule over the right pre-Lie supersystem $\left\{C^{m}(A ; A), \circ_{i}\right\}$. From Corollary $9.1,\left\{C^{*}(A ; A), \circ\right\}$ is right pre-Lie superalgebra. By Theorem 3.1, $\left\{C^{*}(A ; A),[-,-]\right\}$ is a $\mathbb{Z}$-graded Lie superalgebra. Also, from Definition 9.3 , we can see that $C^{*}(A ; P)$ is a right supermodule over the right pre-Lie superalgebra $\left\{C^{*}(A ; A), \circ\right\}$. For $f \in C_{\tilde{f}}^{m}(A ; P), g \in C_{\tilde{g}}^{n}(A ; A)$, if we define $[f, g]=f \circ g$, and $[g, f]=-(-1)^{m n+\tilde{f} \tilde{g}}[f, g]$, then $C^{*}(A ; P)$ is (two-sided) supermodule over the $\mathbb{Z}$-graded Lie superalgebra $\left\{C^{*}(A ; A),[-,-]\right\}$.

We define $\pi \in C_{0}^{2}(A ; A)$ by $\pi(a, b)=a b$. We observe that $\delta \pi=0$ and $\delta I d_{A}=\pi$, that is, $\pi \in B_{0}^{2}(A ; A)$. By using direct definitions we have

$$
\begin{equation*}
f \cup g=\left(\pi \circ_{0} f\right) \circ_{m} g \tag{41}
\end{equation*}
$$

for all $f \in C^{m}(A ; A)$ and $g \in C^{n}(A ; A)$. Also, one can easily verify using definitions of $\pi, \delta$ and $\circ$ that

$$
\begin{align*}
\delta f & =-f \circ \pi+(-1)^{m-1} \pi \circ f \\
& =(-1)^{m-1}\left(\pi \circ f-(-1)^{m-1} f \circ \pi\right) \tag{42}
\end{align*}
$$

for all $f \in C_{\tilde{f}}^{m}(A ; A)$. By using Equation 3, we have

$$
\begin{align*}
\delta f & =[f,-\pi] \\
& =(-1)^{m-1}[\pi, f] \tag{43}
\end{align*}
$$

From Equation 42 it is clear that $\delta$ is a right inner derivation of degree $(1,0)$ of the $\mathbb{Z}$ graded Lie superalgebra $\left\{C^{*}(A ; A),[-,-]\right\}$ induced by $-\pi$. Hence $\left\{C^{*}(A ; A),[-,-]\right\}$ is a differential $\mathbb{Z}$-graded Lie superalgebra. Next, we have following result:

Theorem 9.2. Let $A$ be a associative superalgebra. Then

$$
\begin{equation*}
f \circ \delta g-\delta(f \circ g)+(-1)^{n-1} \delta f \circ g=(-1)^{n-1}\left\{(-1)^{\tilde{f} \tilde{g}} g \cup f-(-1)^{m n} f \cup g\right\} \tag{44}
\end{equation*}
$$

for all $f \in C_{\tilde{f}}^{m}(A ; A)$ and $g \in C_{\tilde{g}}^{n}(A ; A)$.
Proof. Using the Equation 42 and Definition 3.2, we have

$$
\begin{align*}
& f \circ \delta g-\delta(f \circ g)+(-1)^{n-1} \delta f \circ g \\
= & (-1)^{n-1} f \circ(\pi \circ g)-f \circ(g \circ \pi)-(-1)^{m+n-2} \pi \circ(f \circ g)+(f \circ g) \circ \pi \\
& +(-1)^{n-1+m-1}(\pi \circ f) \circ g-(-1)^{n-1}(f \circ \pi) \circ g \\
= & (-1)^{m+n}\{(\pi \circ f) \circ g-\pi \circ(f \circ g)\} \tag{45}
\end{align*}
$$

Using Theorem 9.1 (a) and Equations 4132 we have

$$
\begin{align*}
(\pi \circ f) \circ g-\pi \circ(f \circ g) & =\sum_{\substack{0 \leq j \leq i-1 \\
m+i \leq j \leq m}}(-1)^{(m-1) i+(n-1) j}\left(\pi \circ_{i} f\right) \circ_{j} g \\
& =(-1)^{(n-1) m}\left(\pi \circ_{0} f\right) \circ_{m} g+(-1)^{m-1}\left(\pi \circ_{1} f\right) \circ_{0} g \\
& =(-1)^{(n-1) m}\left(\pi \circ_{0} f\right) \circ_{m} g+(-1)^{m-1+\tilde{f} \tilde{g}}\left(\pi \circ_{0} g\right) \circ_{n} f \\
& =(-1)^{(n-1) m} f \cup g+(-1)^{m-1+\tilde{f} \tilde{g}} g \cup f \\
& =(-1)^{m-1}\left\{(-1)^{\tilde{f} \tilde{g}} g \cup f-(-1)^{m n} f \cup g\right\} \tag{46}
\end{align*}
$$

Using Equations 4546 we conclude Equation 44. This completes proof of the theorem.

Corollary 9.2. If $A$ is an associative superalgebra, then the $\mathbb{Z}$-graded associative superalgebra $\left\{H^{*}(A ; A), \cup\right\}$ is commutative, that is, if $u \in H_{\tilde{u}}^{m}(A ; A), v \in H_{\tilde{v}}^{n}(A ; A)$, then

$$
u \cup v=(-1)^{m n+\tilde{u} \tilde{v}} v \cup u
$$

Proof. By using Theorem 9.2, for $f \in Z_{\tilde{f}}^{m}(A ; A), g \in Z_{\tilde{g}}^{n}(A ; A)$ we have

$$
\left\{(-1)^{\tilde{f} \tilde{g}} g \cup f-(-1)^{m n} f \cup g=(-1)^{n} \delta(f \circ g) .\right.
$$

Hence we conclude that $u \cup v=(-1)^{m n+\tilde{u} \tilde{v}} v \cup u$, for all $u \in H_{\widetilde{u}}^{m}(A ; A), v \in$ $H_{\tilde{v}}^{n}(A ; A)$.

If $A$ is an associative superalgebra and $P$ is a (two sided ) supermodule over $A$, then $A \oplus P$ has the structure of an associative superalgebra with respect to the multiplication given by

$$
(a, x) \cdot(b, y)=(a . b, a \cdot y+x . b)
$$

for all $a, b \in A, x, y \in P$. Consider the natural inclusions $C^{n}(A ; A), C^{n}(A ; P) \subset$ $C^{n}(A \oplus P ; A \oplus P)$ defined by $f\left(a_{1}, \cdots, a_{n}\right)=0$, if some $a_{i}$ is in $P$, for all $f$ in $C^{n}(A ; A)$ or $C^{n}(A ; P)$. Now, Theorem 9.2 holds for the associative superalgebra $A \oplus P$. Observe that if $f \in C^{m}(A ; A), g \in C^{n}(A ; P)$ are cocyles, then $g \in C^{n}(A \oplus$ $P ; A \oplus P)$ is a cocycle but $f \in C^{n}(A \oplus P ; A \oplus P)$ need not be a cocycle. Also, observe that if $f \in Z^{m}(A ; A), g \in Z^{n}(A ; P)$, then in the Equation44 in the Theorem 9.2 for the associative superalgebra $A \oplus P,(\delta f) \circ g=0, f \circ(\delta g)=0$. This implies that if $f \in Z^{m}(A ; A), g \in Z^{n}(A ; P)$, then

$$
\delta(f \circ g)=-(-1)^{n-1}\left\{(-1)^{\tilde{f} \tilde{f}} g \cup f-(-1)^{m n} f \cup g\right\}
$$

Hence we have following result:
Corollary 9.3. Let $A$ be a $\mathbb{Z}$-graded associative superalgebra and $P$ be a supermodule over A. Then

$$
u \cup v=(-1)^{m n+\tilde{u} \tilde{v}} v \cup u
$$

if $u \in H_{\widetilde{u}}^{m}(A ; A), v \in H_{\widetilde{v}}^{n}(A ; P)$.
Theorem 9.3. Let $A$ be a associative superalgebra and $P$ be a (two sided) supermodule over $A$. Then $C^{*}(A ; P)$ is a (two sided) supermodule over the $\mathbb{Z}$-graded Lie superalgebra $\left\{C^{*}(A ; A),[-,-]\right\}$. Also, we have

$$
\left[Z_{n_{1}}^{m_{1}}(A ; P), Z_{n_{2}}^{m_{2}}(A ; A)\right] \subset Z_{n_{1}+n_{2}}^{m_{1}+m_{2}}(A ; P)
$$

$$
\left[B_{n_{1}}^{m_{1}}(A ; P), Z_{n_{2}}^{m_{2}}(A ; A)\right],\left[Z_{n_{1}}^{m_{1}}(A ; P), Z_{n_{2}}^{m_{2}}(A ; A)\right] \subset B_{n_{1}+n_{2}}^{m_{1}+m_{2}}(A ; P)
$$

$\left\{H^{*}(A ; A),[-,-]\right\}$ is a $\mathbb{Z}$-graded Lie superalgebra and $H^{*}(A ; P)$ is a (two sided) supermodule over $\left\{H^{*}(A ; A),[-,-]\right\}$.

Proof. From our previous discussion we already know that $C^{*}(A ; P)$ is a supermodule over the $\mathbb{Z}$-graded Lie superalgebra $\left\{C^{*}(A ; A),[-,-]\right\}$. Consider the associative superalgebra $A \oplus P$ and $\mathbb{Z}$-graded Lie superalgebra $\left\{C^{*}(A \oplus P ; A \oplus P),[-,-]\right\}$. Since coboundary map $\delta$ is an inner right derivation of $\left\{C^{*}(A \oplus P ; A \oplus P),[-,-]\right\}$ induced by $-\pi$, we have

$$
\begin{equation*}
\delta[f, g]=[f, \delta g]+(-1)^{n-1}[\delta f, g] \tag{47}
\end{equation*}
$$

for all $f \in C^{m}(A \oplus P ; A \oplus P), g \in C^{n}(A \oplus P ; A \oplus P)$. In particular, Equation 47 holds for $f$ in $C^{m}(A ; A)$ or $C^{m}(A ; P), g$ in $C^{n}(A ; P)$ or $C^{n}(A ; A)$; and for $\delta$ as a coboundary map on $C^{*}(A ; A)$ or $C^{*}(A ; P)$. From this we conclude the theorem.

## 10. Formal Deformation of Associative Superalgebras

Given an associative superalgebra $A=A_{0} \oplus A_{1}$, we denote the ring of all formal power series with coefficients in $A$ by $A[[t]]$. Thus $A[[t]]=A_{0}[[t]] \oplus A_{1}[[t]]$. If $a_{t} \in A[[t]]$, then $a_{t}=a_{t_{0}} \oplus a_{t_{1}}$, where $a_{t_{0}} \in A_{0}[[t]]$ and $a_{t_{1}} \in A_{1}[[t]] . K[[t]]$ denotes the ring of all formal power series with coefficients in $K$.

Definition 10.1. A formal one-parameter deformation of an associative superalgebra $A=A_{0} \oplus A_{1}$ is a $K[[t]]$-bilinear map

$$
\mu_{t}: A[[t]] \times A[[t]] \rightarrow A[[t]]
$$

satisfying the following properties:
(a) $\mu_{t}(a, b)=\sum_{i=0}^{\infty} \mu_{i}(a, b) t^{i}$, for all $a, b \in A$, where $\mu_{i}: A \times A \rightarrow A, i \geq 0$ are bilinear homogeneous mappings of degree zero and $\mu_{0}(a, b)=\mu(a, b)$ is the original product on $A$.
(b)

$$
\begin{equation*}
\mu_{t}\left(\mu_{t}(a, b), c\right)=\mu_{t}\left(a, \mu_{t}(b, c)\right) \tag{48}
\end{equation*}
$$

for all homogeneous $a, b, c \in A$.
The Equation 48 is equivalent to following equation:

$$
\begin{equation*}
\sum_{i+j=r} \mu_{i}\left(\mu_{j}(a, b), c\right)=\sum_{i+j=r}\left\{\mu_{i}\left(a, \mu_{j}(b, c)\right)\right. \tag{49}
\end{equation*}
$$

for all homogeneous $a, b, c \in A$.

Next we give definition of a formal deformation of finite order of an associative superalgebra $A$.

Definition 10.2. A formal one-parameter deformation of order $n$ of an associative superalgebra $A=A_{0} \oplus A_{1}$ is a $K[[t]]$-bilinear map

$$
\mu_{t}: A[[t]] \times A[[t]] \rightarrow A[[t]]
$$

satisfying the following properties:
(a) $\mu_{t}(a, b)=\sum_{i=0}^{n} \mu_{i}(a, b) t^{i}, \forall a, b, c \in A$, where $\mu_{i}: A \times A \rightarrow A, 0 \leq i \leq n$, are $K$-bilinear homogeneous maps of degree 0 , and $\mu_{0}$ is the original product on $A$.
(b)

$$
\begin{equation*}
\mu_{t}\left(\mu_{t}(a, b), c\right)=\mu_{t}\left(a, \mu_{t}(b, c)\right) \tag{50}
\end{equation*}
$$

for all homogeneous $a, b, c \in A$.
Remark 10.1. 1. For $r=0$, conditions 49 is equivalent to the fact that $A$ is an associative superalgebra.
2. For $r=1$, conditions 49 is equivalent to

$$
\begin{aligned}
0= & -\mu_{1}\left(\mu_{0}(a, b), c\right)-\mu_{0}\left(\mu_{1}(a, b), c\right) \\
& +\mu_{1}\left(a, \mu_{0}(b, c)\right)+\mu_{0}\left(a, \mu_{1}(b, c)\right) \\
= & \delta^{2} \mu_{1}(a, b, c) ; \text { for all homogeneous } a, b, c \in A .
\end{aligned}
$$

Thus for $r=1,49$ is equivalent to saying that $\mu_{1} \in C_{0}^{2}(A ; A)$ is a cocycle. In general, for $r \geq 0, \mu_{r}$ is just a 2-cochain, that is, $\mu_{r} \in C_{0}^{2}(A ; A)$.

Definition 10.3. We call the cochain $\mu_{1} \in C_{0}^{2}(A ; A)$ infinitesimal of the deformation $\mu_{t}$. In general, if $\mu_{i}=0$, for $1 \leq i \leq n-1$, and $\mu_{n}$ is a nonzero cochain in $C_{0}^{2}(A ; A)$, then we call $\mu_{n} n$-infinitesimal of the deformation $\mu_{t}$.

Proposition 10.1. The infinitesimal $\mu_{1} \in C_{0}^{2}(A ; A)$ of the deformation $\mu_{t}$ is a cocycle. In general, $n$-infinitesimal $\mu_{n}$ is a cocycle in $C_{0}^{2}(A ; A)$.

Proof. For $\mathrm{n}=1$, proof is obvious from the Remark 10.1. For $n>1$, proof is similar.

From Equation 49, we have

$$
\begin{align*}
& \sum_{\substack{i+j=r \\
i, j>0}} \mu_{i}\left(\mu_{j}(a, b), c\right)-\sum_{\substack{i+j=r \\
i, j>0}}\left\{\mu_{i}\left(a, \mu_{j}(b, c)\right)\right. \\
= & \mu_{r}\left(a, \mu_{0}(b, c)\right)+\mu_{0}\left(a, \mu_{r}(b, c)\right)-\mu_{0}\left(\mu_{r}(a, b), c\right)-\mu_{r}\left(\mu_{0}(a, b), c\right) \\
= & \delta^{2} \mu_{r}(a, b, c) \tag{51}
\end{align*}
$$

Definition 10.4. Given a formal deformation $\mu_{t}$ of order $n$ of an associative superalgebra $A=A_{0} \oplus A_{1}$, we define a 3-cochain $\mathrm{Ob}_{n+1}(A)$ by

$$
O b_{n+1}(A)=\sum_{\substack{i+j=r \\ i, j>0}} \mu_{i}\left(\mu_{j}(a, b), c\right)-\sum_{\substack{i+j=r \\ i, j>0}}\left\{\mu_{i}\left(a, \mu_{j}(b, c)\right) .\right.
$$

We call $\mathrm{Ob}_{n+1}(A)(n+1)$ th obstruction cochain for extending $\mu_{t}$ to a deformation of $A$ of order $n+1$.

As an application of Theorem 9.1 we conclude following Lemma:
Lemma 10.1. For all $\mu_{\alpha}, \mu_{\beta}, \mu_{\gamma} \in C_{0}^{n}(A ; A)$ with $\beta, \gamma$ an even integer, we have
(a) $\mu_{\alpha} \circ\left(\mu_{\beta} \circ \mu_{\beta}\right)=\left(\mu_{\alpha} \circ \mu_{\beta}\right) \circ \mu_{\beta}$,
(b) $\left(\mu_{\alpha} \circ \mu_{\beta}\right) \circ \mu_{\gamma}-\mu_{\alpha} \circ\left(\mu_{\beta} \circ \mu_{\gamma}\right)=-\left(\mu_{\alpha} \circ \mu_{\gamma}\right) \circ \mu_{\beta}+\mu_{\alpha} \circ\left(\mu_{\gamma} \circ \mu_{\beta}\right)$.

Theorem 10.1. The $(n+1)$ th obstruction cochain is a 3 -cocycle.
Proof. Consider the right pre-Lie superalgebra $\{c *(A, A), \circ\}$. By definition of $\circ$, we have

$$
\begin{equation*}
O b_{n+1}(A)(a, b, c)=\sum_{\substack{i+j=n+1 \\ i, j>0}} \mu_{i} \circ \mu_{j}(a, b, c) \tag{52}
\end{equation*}
$$

By using Theorem 9.2 we have

$$
\begin{equation*}
\mu_{i} \circ \delta \mu_{j}-\delta\left(\mu_{i} \circ \mu_{j}\right)-\delta \mu_{i} \circ \mu_{j}=-\mu_{j} \cup \mu_{i}+\mu_{i} \cup \mu_{j} \tag{53}
\end{equation*}
$$

for all $\mu_{i}, \mu_{j} \in C_{0}^{2}(A ; A)$. From relations 52 and 53 we have

$$
\begin{align*}
\delta O b_{n+1}(A) & =\sum_{\substack{i+j=n+1 \\
i, j>0}} \delta\left(\mu_{i} \circ \mu_{j}\right) \\
& =\sum_{\substack{i+j=n+1 \\
i, j>0}}\left\{\mu_{i} \circ \delta \mu_{j}-\delta \mu_{i} \circ \mu_{j}+\mu_{j} \cup \mu_{i}-\mu_{i} \cup \mu_{j}\right\} \\
& =\sum_{\substack{i+j=n+1 \\
i, j>0}}\left\{\mu_{i} \circ \delta \mu_{j}-\delta \mu_{i} \circ \mu_{j}\right\} \tag{54}
\end{align*}
$$

Observe that if $\mu_{t}=\sum_{i=0}^{n} \mu_{i} t^{i}$ is a deformation of $A$ of order $n$, then

$$
\begin{equation*}
\delta \mu_{\gamma}(a, b, c)=\sum_{\substack{\alpha+\beta=\gamma \\ \alpha, \beta>0}} \mu_{\alpha} \circ \mu_{\beta}(a, b, c) \tag{55}
\end{equation*}
$$

$\forall \gamma \leq n$. Using Equations 54 and 55 we have

$$
\begin{aligned}
\delta O b_{n+1}(A)= & \sum_{\substack{i+j+k=n+1 \\
i, j, k>0}}\left\{\mu_{i} \circ\left(\mu_{j} \circ \mu_{k}\right)-\left(\mu_{i} \circ m u_{j}\right) \circ \mu_{k}\right\} \\
= & \sum_{\substack{i+j+k=n+1 \\
i, j, k>0, j<k}}\left\{\mu_{i} \circ\left(\mu_{j} \circ \mu_{k}+\mu_{k} \circ \mu_{j}\right)\right. \\
& \left.-\left(\mu_{i} \circ \mu_{j}\right) \circ \mu_{k}+\left(\mu_{i} \circ \mu_{k}\right) \circ \mu_{j}\right\} \quad \text { (Using Lemma 10.1 Part (a)) } \\
= & 0 \quad(\text { Using Lemma 10.1 Part (b)) }
\end{aligned}
$$

As a consequence of above theorem we conclude following corollary
Corollary 10.1. If $H^{3}(A ; A)=0$, then every 2-cocycle in $C_{0}^{2}(A ; A)$ is an infinitesimal of some deformation of $A$.

Definition 10.5. Let $\mu_{t}$ and $\tilde{\mu}_{t}$ be two formal deformations of an associative superalgebra $A=A_{0} \oplus A_{1}$. A formal isomorphism from the deformation $\mu_{t}$ to $\tilde{\mu_{t}}$ is a $K[[t]]$-linear automorphism $\Psi_{t}: A[[t]] \rightarrow A[[t]]$ given by

$$
\Psi_{t}=\sum_{i=0}^{\infty} \psi_{i} t^{i}
$$

where each $\psi_{i}$ is a homogeneous $K$-linear map $A \rightarrow A$ of degree $0, \psi_{0}(a)=a$, for all $a \in A$ and

$$
\tilde{\mu_{t}}\left(\Psi_{t}(a), \Psi_{t}(b)\right)=\Psi_{t} \circ \mu_{t}(a, b)
$$

for all $a, b \in A$.
We call two deformations $\mu_{t}$ and $\tilde{\mu}_{t}$ of an associative superalgebra $A$ to be equivalent if there exists a formal isomorphism $\Psi_{t}$ from $\mu_{t}$ to $\tilde{\mu_{t}}$. Observe that Formal isomorphism on the collection of all formal deformations of an associative superalgebra $A$ is an equivalence relation. We call a formal deformation of $A$ that is equivalent to the deformation $\mu_{0}$ a trivial deformation.

Theorem 10.2. The cohomology class of the infinitesimal of a deformation $\mu_{t}$ of an associative superalgebra $A$ is same for each member of equivalence class of $\mu_{t}$.

Proof. If $\Psi_{t}$ is a formal isomorphism from $\mu_{t}$ to $\tilde{\mu_{t}}$, the we have, for all $a, b \in A$, $\tilde{\mu_{t}}\left(\Psi_{t} a, \Psi_{t} b\right)=\Psi_{t} \circ \mu_{t}(a, b)$. In particular, we have

$$
\begin{aligned}
\left(\mu_{1}-\tilde{\mu_{1}}\right)(a, b) & =\mu_{0}\left(\psi_{1} a, b\right)+\mu_{0}\left(a, \psi_{1} b\right)-\psi_{1}\left(\mu_{0}(a, b)\right) \\
& =\delta^{1} \psi_{1}(a, b)
\end{aligned}
$$

Thus we have $\mu_{1}-\tilde{\mu_{1}}=\delta^{1} \psi_{1}$. This completes the proof.
