# TWISTED PRE-LIE ALGEBRAS OF FINITE TOPOLOGICAL SPACES 

MOHAMED AYADI

#### Abstract

In this paper, we first study the species of finite topological spaces recently considered by F. Fauvet, L. Foissy, and D. Manchon. Then, we construct a twisted pre-Lie structure on the species of connected finite topological spaces. The underlying pre-Lie structure defines a coproduct on the species of finite topological spaces different from those already defined by the Authors above. In the end, we illustrate the link between the Grossman-Larson product and the proposed coproduct.

## 1. Introduction

A finite topological space is a finite set E endowed with a preorder $\leq$. The study of finite topological spaces was initiated by Alexandroff in 1937 [2], and revived at several periods since then, using the following well-known bijection [7,10]. Any topology $\mathcal{T}$ on $X$ defines a quasi-order (i.e. a reflexive transitive relation) denoted by $\leq_{\mathcal{T}}$ on $X$ :

$$
\begin{equation*}
x \leq_{\mathcal{T}} y \Longleftrightarrow \text { any open subset containing } x \text { also contains } y . \tag{1.1}
\end{equation*}
$$

Conversely, any quasi-order $\leq$ on $X$ defines a topology $\mathcal{T}_{\leq}$given by its upper ideals, i.e. subsets $Y \subset X$ such that $(y \in Y$ and $y \leq z) \Longrightarrow z \in Y$. Both operations are inverse to each other:

$$
\begin{equation*}
\leq_{\mathcal{T}_{\leq}}=\leq, \quad \mathcal{T}_{\leq \mathcal{T}}=\mathcal{T} \tag{1.2}
\end{equation*}
$$

Hence there is a natural bijection between topologies and quasi-orders on a finite set $X$. Any quasi-order (hence any topology $\mathcal{T}$ ) on $X$ gives rise to an equivalence relation:

$$
\begin{equation*}
x \sim_{\mathcal{T}} y \Longleftrightarrow\left(x \leq_{\mathcal{T}} y \text { and } y \leq_{\mathcal{T}} x\right) \tag{1.3}
\end{equation*}
$$

[^0]Let $\mathfrak{T}$ and $\mathfrak{T}^{\prime}$ be two topologies on a finite set $X$. We say that $\mathcal{T}^{\prime}$ is finer than $\mathfrak{T}$, and we write $\mathcal{T}^{\prime}<\mathcal{T}$, when any open subset for $\mathfrak{T}$ is an open subset for $\mathfrak{T}^{\prime}$. This is equivalent to the fact that for any $x, y \in X, x \leq_{\mathcal{T}} y \Rightarrow x \leq_{\mathcal{T}} y$.

The quotient $\mathcal{T} / \mathcal{T}^{\prime}$ of two topologies $\mathcal{T}$ and $\mathcal{T}^{\prime}$ with $\mathcal{T}^{\prime}<\mathcal{T}$ is defined as follows ( [8, Paragraph 2.2]): The associated quasi-order $\leq_{\mathcal{T} / \mathcal{T}}$, is the transitive closure of the relation $\mathcal{R}$ defined by:

$$
\begin{equation*}
x \mathcal{R} y \Longleftrightarrow\left(x \leq_{\mathcal{T}} y \text { or } y \leq_{\mathcal{J}^{\prime}} x\right) . \tag{1.4}
\end{equation*}
$$

More on finite topological spaces can be found in [1, 3, 5, 15, 20].
Recall that a linear (tensor) species is a contravariant functor from the category of finite sets Fin with bijections into the category Vect of vector spaces (on some field $\mathbf{k}$ ). The tensor product of two species $\mathbb{E}$ and $\mathbb{F}$ is given by

$$
\begin{equation*}
(\mathbb{E} \otimes \mathbb{F})_{X}=\bigoplus_{Y \sqcup Z=X} \mathbb{E}_{Y} \otimes \mathbb{F}_{Z}, \tag{1.5}
\end{equation*}
$$

where the notation $\sqcup$ stands for disjoint union. The unit of the tensor product denoted by $\mathbf{1}$ is defined by $\mathbf{1}_{\varnothing}=\mathbf{k}$ and $\mathbf{1}_{X}=\{0\}$, if $X \neq \varnothing$.
We write $x \in \mathbb{E}$ if there exists a finite set $X$ such that $x \in \mathbb{E}_{X}$.
A twisted algebra [12] is an algebra in the linear symmetric monoidal category of linear species. See $[4,18,19]$ for further details on and references to Joyal's theory of twisted algebras. Concretely, a twisted algebra is a linear species $\mathbb{E}$ provided with a product map (which is a map of linear species: $\mathbb{E} \otimes \mathbb{E} \rightarrow \mathbb{E}$ ). Associative algebras, commutative algebras, Lie algebras, pre-Lie algebras and so on, are defined accordingly.

The species $\mathbb{T}$ of finite topological spaces is defined as follows: For any finite set $X, \mathbb{T}_{X}$ is the vector space freely generated by the topologies on $X$. For any bijection $\varphi: X \longrightarrow X^{\prime}$, the isomorphism $\mathbb{T}_{\varphi}: \mathbb{T}_{X^{\prime}} \longrightarrow \mathbb{T}_{X}$ is defined by the obvious relabelling:

$$
\mathbb{T}_{\varphi}(\mathcal{T})=\left\{\varphi^{-1}(Y), Y \in \mathcal{T}\right\}
$$

for any topology $\mathfrak{T}$ on $X^{\prime}$.
A unital associative algebra ( [8, Paragraph 2.3]) on the species of finite topologies is defined as follows: for any pair $X_{1}, X_{2}$ of finite sets we introduce

$$
\begin{aligned}
m: \mathbb{T}_{X_{1}} \otimes \mathbb{T}_{X_{2}} & \longrightarrow \mathbb{T}_{X_{1} \sqcup X_{2}} \\
\mathcal{T}_{1} \otimes \mathcal{T}_{2} & \longmapsto \mathcal{T}_{1} \mathcal{T}_{2},
\end{aligned}
$$

where $\mathcal{T}_{1} \mathcal{T}_{2}$ is the disjoint union topology characterised by $Y \in \mathcal{T}_{1} \mathcal{I}_{2}$ if and only if $Y \cap X_{1} \in \mathcal{T}_{1}$ and $Y \cap X_{2} \in \mathcal{T}_{2}$. The unit is given by the unique topology on the empty set.

For any topology $\mathcal{T}$ on a finite set $X$ and for any subset $Y \subset X$, we denote by $\mathcal{T}_{\mid Y}$ the restriction of $\mathcal{T}$ to $Y$. It is defined by:

$$
\mathcal{T}_{\mid Y}=\{Z \cap Y, Z \in \mathcal{T}\}
$$

The external coproduct $\Delta$ on $\mathbb{T}$ is defined as follows:

$$
\begin{aligned}
\Delta: \mathbb{T}_{X} & \longrightarrow(\mathbb{T} \otimes \mathbb{T})_{X}=\bigoplus_{Y \sqcup Z=X} \mathbb{T}_{Y} \otimes \mathbb{T}_{Z} \\
\mathcal{T} & \longmapsto \sum_{Y \in \mathcal{T}} \mathcal{T}_{\mid X \backslash Y} \otimes \mathcal{T}_{\mid Y}
\end{aligned}
$$

The species $\mathbb{T}$ is this way endowed with a twisted bialgebra structure in [8].
Now consider the graded vector space:

$$
\begin{equation*}
\mathcal{H}=\overline{\mathcal{K}}(\mathbb{T})=\bigoplus_{n \geq 0} \mathcal{H}_{n} \tag{1.6}
\end{equation*}
$$

where $\mathcal{H}_{0}=\mathbf{k} .1$, and where $\mathcal{H}_{n}$ is the linear span of topologies on $\{1, \ldots, n\}$ when $n \geq 1$, modulo the action of the symmetric group $S_{n}$. The vector space $\mathcal{H}$ can be seen as the quotient of the species $\mathbb{T}$ by the "forget the labels" equivalence relation: $\mathcal{T} \sim \mathcal{T}^{\prime}$ if $\mathcal{T}$ (resp. $\mathcal{T}^{\prime}$ ) is a topology on a finite set $X$ (resp. $X^{\prime}$ ), such that there is a bijection from $X$ onto $X^{\prime}$ which is a homeomorphism with respect to both topologies. The functor $\overline{\mathcal{K}}$ from linear species to graded vector spaces thus obtained is intensively studied in ( [1, chapter 15]) under the name "bosonic Fock functor". The twisted Hopf algebra structure on $\mathbb{T}$ [8] naturally leads to the following:
$(\mathcal{H}, m, \Delta)$ is a commutative connected Hopf algebra, graded by the number of elements.
L. Foissy, C. Malvenuto and F. Patras in [9, section 6] were the first to prove that the finite topological spaces can be organized in a graded commutative Hopf algebra. The latter can be recovered by applying the $\overline{\mathcal{K}}$ functor to the twisted Hopf algebra structure on $\mathbb{T}$ described in [8]. The coproduct $\Delta$ defined therein is however not built from a pre-Lie structure. We define in the present work two twisted pre-Lie structures $\searrow$ and $\nearrow$ on the species of connected finite topological spaces, giving rise to two more coproducts $\Delta_{\searrow}$ and $\Delta_{\nearrow}$, hence two more twisted Hopf algebra structures. We expect that this will contribute to a better understanding of the finite topological spaces considered as a whole.

In section 2, we recall the method of D. Guin and J.-M. Oudom [16] to describe the enveloping algebra of a pre-Lie algebra, and we adapt it to the twisted context, following indications in [22].

In Section 3 of this paper, we define the enveloping algebra of the grafting twisted pre-Lie algebra of connected finite topological spaces, as well as its enveloping algebra using the GuinOudom method. Denoting by $\mathbb{V}$ the species of connected finite topological spaces, we consider the Hopf symmetric algebra $\mathcal{H}^{\prime}=S(\mathbb{V})$ of the pre-Lie twisted algebra $(\mathbb{V}, \searrow)$, equipped with its usual unshuffling coproduct $\Delta_{u n s h}$ and a product $\star$ defined on $\mathbb{T}$ by: For any pair $X_{1}, X_{2}$ of finite sets

$$
\begin{aligned}
\star: \mathbb{T}_{X_{1}} \otimes \mathbb{T}_{X_{2}} & \longrightarrow \mathbb{T}_{X_{1} \cup X_{2}} \\
\left(\mathcal{T}_{1}, \mathcal{T}_{2}\right) & \longmapsto \sum_{\left(\mathcal{T}_{1}\right)} \mathcal{T}_{1}^{(1)}\left(\mathcal{T}_{1}^{(2)} \searrow \mathcal{T}_{2}\right) .
\end{aligned}
$$

In section 4 we prove that there exists a twisted bialgebra structure on $\mathbb{T}$, where the external coproduct is defined by

$$
\begin{aligned}
\Delta_{\searrow}: \mathbb{T}_{X} & \longrightarrow(\mathbb{T} \otimes \mathbb{T})_{X}=\bigoplus_{Y \cup Z=X} \mathbb{T}_{Y} \otimes \mathbb{T}_{Z} \\
\mathcal{T} & \longmapsto \sum_{Y \in \mathcal{T}} \mathcal{T}_{\mid Y} \otimes \mathcal{T}_{\mid X \backslash Y}
\end{aligned}
$$

where $Y \bar{\epsilon} \mathcal{T}$ stands for

- $Y \in \mathcal{T}$,
- $\mathcal{T}_{\mid Y}=\mathcal{T}_{1} \ldots \mathcal{T}_{n}$, such that for all $i \in\{1, \ldots, n\}, \mathcal{T}_{i}$ connected and $\left(\min \mathcal{T}_{i}=(\min \mathcal{T}) \cap \mathcal{T}_{i}\right.$, or there is a single common ancestor $x_{i} \in \overline{X \backslash Y}$ to $\left.\min \mathcal{J}_{i}\right)$, where $\overline{X \backslash Y}=(X \backslash Y) / \sim_{\mathcal{T}_{X X Y}}$.
We moreover give a relation between the two structures $\Delta_{\searrow}$ and $\star$.
Finally we define in section 5 a new pre-Lie law $\nearrow$ on the species of connected finite topological spaces by: For all $\mathcal{T}=\left(X, \leq_{\mathcal{T}}\right)$ and $\mathcal{S}=\left(Y, \leq_{\delta}\right)$ be two finite topological spaces,

$$
\mathcal{T} \nearrow \mathcal{S}:=j(j(\mathcal{T}) \searrow j(\mathcal{S})),
$$

where $j$ is the involution which transforms $\leq$ into $\geq$. This law $\nearrow$ gives rise to a coproduct denoted $\Delta_{\nearrow}$ defined by $\Delta_{\nearrow}=(j \otimes j) \Delta_{\searrow} \circ j$.
For any finite set $A$ and for any pair of parts $A_{1}, A_{2}$ of $A$ with $A_{1} \cap A_{2}=\varnothing$, we define

$$
\Psi_{A_{1}, A_{2}}: \mathbb{T}_{A} \rightarrow \mathbb{T}_{A},
$$

as follows: for any topology $\mathcal{T} \in \mathbb{T}_{A}$, the topology $\Psi_{A_{1}, A_{2}}(\mathcal{T})$ is associated with the following pre-order $\leq$ defined by:

- If $a \in A_{1}$, and $b \in A_{2}$ then $a$ and $b$ are incomparable,
- If not, we have: $a \leq b$ if and only if $a \leq_{\mathcal{T}} b$.

In this section, we provide a relation between both pre-Lie structures, by proving that the following diagram commutes.

2. The enveloping algebra of pre-Lie algebras and twisted pre-Lie algebras

In this section, we recall the method of D. Guin and J.-M. Oudom [16] to describe the enveloping algebra of a pre-Lie algebra. We also recall how T. Schedler in [22] generalizes this method to twisted pre-Lie algebras.

Definition 2.1. A Lie algebra over a field $\mathbf{k}$ is a vector space $V$ endowed with a bilinear bracket [.,.] satisfying:
(1) The antisymmetry:

$$
[x, y]=-[y, x], \forall x, y \in V .
$$

(2) The Jacobi identity:

$$
[x,[y, z]]+[y,[z, x]]+[z,[x, y]]=0, \forall x, y, z \in V .
$$

Definition 2.2. [5, 14] A left pre-Lie algebra over a field $\mathbf{k}$ is a $\mathbf{k}$-vector space $A$ with a binary composition $\triangleright$ that satisfies the left pre-Lie identity:

$$
(x \triangleright y) \triangleright z-x \triangleright(y \triangleright z)=(y \triangleright x) \triangleright z-y \triangleright(x \triangleright z),
$$

for all $x, y, z \in A$. The left pre-Lie identity rewrites as:

$$
\begin{equation*}
L_{[x, y]}=\left[L_{x}, L_{y}\right], \tag{2.1}
\end{equation*}
$$

where $L_{x}: A \longrightarrow A$ is defined by $L_{x} y=x \triangleright y$, and where the bracket on the left-hand side is defined by $[x, y]=x \triangleright y-y \triangleright x$. As a consequence this bracket satisfies the Jacobi identity.

The pre-Lie product is extended to the symmetric algebra as follows [17]. Let $(A, \triangleright)$ be a pre-Lie algebra. We consider the Hopf symmetric algebra $S(A)$ equipped with its usual unshuffle coproduct denoted $\Delta_{\text {unsh }}$. We will use without restraint the classical Sweedler notation: $\Delta_{\text {unsh }}(a)=$ $\sum_{a} a^{(1)} \otimes a^{(2)}$.

We extend the product $\triangleright$ to $S(A)$. Let $a, b$ and $c \in S(A)$, and $x \in A$. We put:

- $1 \triangleright a=a$
- $a \triangleright 1=\varepsilon(a) 1$
- $(x a) \triangleright b=x \triangleright(a \triangleright b)-(x \triangleright a) \triangleright b$
- $a \triangleright(b c)=\sum_{a}\left(a^{(1)} \triangleright b\right)\left(a^{(2)} \triangleright c\right)$.

Definition 2.3. We define the following $\star$ product on $S(A)$ by:

$$
\begin{equation*}
a \star b=\sum_{a} a^{(1)}\left(a^{(2)} \triangleright b\right) . \tag{2.2}
\end{equation*}
$$

Theorem 2.1. [13, 16] The triple $\left(S(A), \star, \Delta_{\text {unsh }}\right)$ is a Hopf algebra which is isomorphic to the enveloping Hopf algebra $\mathcal{U}\left(A_{\text {Lie }}\right)$ of the Lie algebra $A_{\text {Lie }}$.
Proof. This theorem was proved by D. Guin and J.-M. Oudom in [16] (Lemma 2.10 and Theorem 2.12).

Definition 2.4. [4] A twisted Lie algebra over a field $\mathbf{k}$, is a species $\mathbb{E}$ endowed with a bilinear bracket $[]:, \mathbb{E} \otimes \mathbb{E} \rightarrow \mathbb{E}$, satisfying:
(i) $[]+,[,] \tau=0$,
(ii) $[,[]]+,[,[],] \Sigma+[,[],] \Sigma^{2}=0$,
where $\tau: \mathbb{E} \otimes \mathbb{E} \rightarrow \mathbb{E} \otimes \mathbb{E}$ is the flip, and $\Sigma: \mathbb{E} \otimes \mathbb{E} \otimes \mathbb{E} \rightarrow \mathbb{E} \otimes \mathbb{E} \otimes \mathbb{E}$ is the cyclic permutation of factors.

Definition 2.5. A left twisted pre-Lie algebra over a field $\mathbf{k}$, is a species $\mathbb{E}$ with a binary composition $\circ: \mathbb{E} \otimes \mathbb{E} \rightarrow \mathbb{E}$, satisfing the left twisted pre-Lie algebra identity

$$
\circ(\circ \otimes I d)-\circ(I d \otimes \circ)=(\circ(\circ \otimes I d)-\circ(I d \otimes \circ))(\tau \otimes I d) .
$$

T. Schedler in [22] shows that the properties of D. Guin and J.-M. Oudom above also work for the linear species, i.e:
Let $(\mathbb{E}, \circ$ ) be a twisted pre-Lie algebra. We consider the twisted Hopf symmetric algebra $S(\mathbb{E})$ equipped with its usual unshuffle coproduct denoted $\Delta_{\text {unsh }}$. We extend the product $\circ$ to $S(\mathbb{E})$ as follows. Let $a, b$ and $c \in S(\mathbb{E})$, and $x \in \mathbb{E}$. We put:

- $1 \circ a=a$
- $(x a) \circ b=x \circ(a \circ b)-(x \circ a) \circ b$
- $a \circ(b c)=\sum_{a}\left(a^{(1)} \circ b\right)\left(a^{(2)} \circ c\right)$,
and if we define the product $\star$ on $S(\mathbb{E})$ by:

$$
\begin{equation*}
a \star b=\sum_{a} a^{(1)}\left(a^{(2)} \circ b\right), \tag{2.3}
\end{equation*}
$$

then $\left(S(\mathbb{E}), \star, \Delta_{\text {unsh }}\right)$ is isomorphic to the enveloping Hopf algebra $\mathcal{U}\left(\mathbb{E}_{\text {Lie }}\right)$ of the twisted Lie algebra $\mathbb{E}_{\text {Lie }}$.
3. The enveloping algebra of the twisted pre-Lie algebra of fintite topological spaces
3.1. The pre-Lie algebra of rooted trees. Let $T$ the vector space spanned by the set of isomorphism classes of rooted trees and $\mathcal{H}=S(T)$. Grafting pre-Lie algebras of rooted trees were studied for the first time by F. Chapoton and M. Livernet [6], see also D. Manchon and A. Saidi [15]. The grafting product is given, for all $t, s \in T$, by:

$$
\begin{equation*}
t \rightarrow s=\sum_{s^{\prime} \text { vertex of } s} t \rightarrow_{s^{\prime}} s \tag{3.1}
\end{equation*}
$$

where $t \rightarrow_{s^{\prime}} s$ is the tree obtained by grafting the root of $t$ on the vertex $s^{\prime}$ of $s$. More explicitly, the operation $t \rightarrow s$ consists of grafting the root of $t$ on every vertex of $s$ and summing up.

Theorem 3.1. [6] Equipped by $\rightarrow$, the space $T$ is the free pre-Lie algebra with one generator.
Now, we can use the method of D. Guin and J.-M. Oudom [16] to find the enveloping algebra of the grafting pre-Lie algebra of rooted trees. We consider the Hopf symmetric algebra $\mathcal{H}=S(T)$ of the pre-Lie algebra ( $T, \rightarrow$ ), equipped with its usual unshuffling coproduct $\Delta_{\text {unsh }}$. We extend the product $\rightarrow$ to $\mathcal{H}$ by the same method used in (3.1), and we define the Grossman-Larson product [11] $\star$ on $\mathcal{H}$ by:

$$
t \star t^{\prime}=\sum_{t} t^{(1)}\left(t^{(2)} \rightarrow t^{\prime}\right) .
$$

By construction, the space $\left(\mathcal{H}, \star, \Delta_{\text {unsh }}\right)$ is a Hopf algebra.
3.2. Twisted pre-Lie algebra of the finite topological spaces. Let $\mathcal{T}_{1}=\left(X_{1}, \leq \mathcal{T}_{1}\right)$ and $\mathcal{T}_{2}=$ ( $X_{2}, \leq_{\tau_{2}}$ ) be two finite topological spaces, and let $v \in X_{2}$. We define:

$$
\mathcal{T}_{1} \searrow v \mathcal{T}_{2}:=\left(X_{1} \sqcup X_{2}, \leq\right),
$$

where $\leq$ is obtained from $\leq_{\mathcal{I}_{1}}$ and $\leq_{\mathcal{I}_{2}}$ as follows: compare any pair in $X_{2}$ (resp. $X_{1}$ ) by using $\leq_{\mathcal{J}_{2}}$ (resp. $\leq_{\tau_{1}}$ ), and compare any element $y \in X_{2}$ with any element $x \in X_{1}$.

To sum up, for any $x, y \in X_{1} \sqcup X_{2}, x \leq y$ if and only if:

- Either $x, y \in X_{1}$ and $x \leq_{\tau_{1}} y$,
- or $x, y \in X_{2}$ and $x \leq_{\mathcal{J}_{2}} y$,
- or $x \in X_{2}, y \in X_{1}$ and $x \leq_{J_{2}} v$.

Example 3.1.
$\int_{s_{1}}^{s_{4}} \int_{t_{1}}^{t_{2}}=$

Proposition 3.1. Let $\mathcal{T}_{1}=\left(X_{1}, \leq_{\mathcal{T}_{1}}\right)$ and $\mathcal{T}_{2}=\left(X_{2}, \leq_{\mathcal{T}_{2}}\right)$ be two connected finite topological spaces, and let $v \in X_{2}$. Then $\mathcal{T}_{1} \searrow_{v} \mathcal{T}_{2}:=\left(X_{1} \sqcup X_{2}, \leq\right)$, is a connected finite topological space.
Proof. Let $\mathcal{T}_{1}=\left(X_{1}, \leq_{\mathcal{T}_{1}}\right)$ and $\mathcal{T}_{2}=\left(X_{2}, \leq_{\mathcal{T}_{2}}\right)$ be two connected finite topological spaces, and let $v \in X_{2}$.
We must show that $\leq$ is a preorder relation on $X_{1} \sqcup X_{2}$ :
Reflexivity; Let $x \in X_{1} \sqcup X_{2}$, then $x \in X_{1}$ or $x \in X_{2}$.
If $x \in X_{1}$, we have $x \leq_{\mathcal{T}_{1}} x$, then $x \leq x$.
If $x \in X_{2}$, we have $x \leq_{\mathcal{I}_{2}} x$, then $x \leq x$.
Transitivity; Let $x, y, z \in X_{1} \sqcup X_{2}$ such that $x \leq y$ and $y \leq z$. So we have four possible cases:

- First case; $x, y, z \in X_{1}$, and ( $x \leq_{\mathcal{T}_{1}} y$ and $y \leq_{\mathcal{T}_{1}} z$ ).

Since $\leq_{\mathcal{I}_{1}}$ is transitive, then $x \leq_{\mathcal{J}_{1}} z$, then $x \leq z$.

- Second case; $x, y, z \in X_{2}$, and ( $x \leq_{\mathcal{J}_{2}} y$ and $y \leq_{\mathcal{J}_{2}} z$ ).

Since $\leq_{\mathcal{J}_{2}}$ is transitive, then $x \leq_{\mathcal{J}_{2}} z$, then $x \leq z$.

- Third case; $x, y \in X_{2}, z \in X_{1}$, and ( $x \leq_{\tau_{2}} y$ and $y \leq_{\tau_{2}} v$ ).

Since $\leq_{\tau_{2}}$ is transitive, then $x \leq_{\tau_{2}} v$, and since $x \in X_{2}$ and $z \in X_{1}$ therefore $x \leq z$.

- Fourth case; $x \in X_{2}, y, z \in X_{1}$, and ( $x \leq_{\mathcal{T}_{2}} v$ and $y \leq_{\mathcal{T}_{1}} z$ ).

In this case we have $x \in X_{2}, z \in X_{1}$, and $x \leq_{\mathcal{I}_{2}} v$, then $x \leq z$.

Proposition 3.2. Let $\mathcal{T}_{1}=\left(X_{1}, \leq_{\mathcal{T}_{1}}\right), \mathcal{T}_{2}=\left(X_{2}, \leq_{\mathcal{T}_{2}}\right)$ and $\mathcal{T}_{3}=\left(X_{3}, \leq_{\mathcal{T}_{3}}\right)$ be three finite connected topological spaces, and let $u \in X_{2}, v, w \in X_{3}$. Then

1) $\left(\mathcal{T}_{1} \searrow_{u} \mathcal{T}_{2}\right) \searrow_{w} \mathcal{T}_{3}=\mathcal{T}_{1} \searrow_{u}\left(\mathcal{T}_{2} \searrow_{w} \mathcal{T}_{3}\right)$.
2) $\mathcal{T}_{1} \searrow_{v}\left(\mathcal{T}_{2} \searrow_{w} \mathcal{T}_{3}\right)=\mathcal{T}_{2} \searrow_{w}\left(\mathcal{T}_{1} \searrow_{v} \mathcal{T}_{3}\right)$.

Proof. 1) Let $\mathcal{T}_{1}=\left(X_{1}, \leq_{\mathcal{T}_{1}}\right), \mathcal{T}_{2}=\left(X_{2}, \leq_{\mathcal{J}_{2}}\right)$ and $\mathcal{T}_{3}=\left(X_{3}, \leq_{\mathcal{J}_{3}}\right)$ be three finite connected topologies, and let $u \in X_{2}, w \in X_{3}$. We denote $\mathcal{T}_{3}^{\prime}=\left(\mathcal{T}_{1} \searrow u \mathcal{T}_{2}\right)=\left(X_{1} \sqcup X_{2}, \leq_{3}\right)$, with $\leq_{3}$ defined on $X_{1} \sqcup X_{2}$ by:
$x, y \in X_{1} \sqcup X_{2}$ et $x \leq_{3} y$ if and only if:

- Either $x, y \in X_{1}$ and $x \leq_{\tau_{1}} y$,
- or $x, y \in X_{2}$ and $x \leq_{\mathcal{T}_{2}} y$,
- or $x \in X_{2}, y \in X_{1}$ and $x \leq_{\mathcal{T}_{2}} u$,
and we denote $\mathcal{T}=\left(\mathcal{T}_{1} \searrow_{u} \mathcal{T}_{2}\right) \searrow_{w} \mathcal{T}_{3}=\left(X_{1} \sqcup X_{2} \sqcup X_{3}\right.$, $\leq$ ), with $\leq$ defined on $X_{1} \sqcup X_{2} \sqcup X_{3}$ by: $x, y \in X_{1} \sqcup X_{2} \sqcup X_{3}$ et $x \leq y$ if and only if:
- Either $x, y \in X_{1} \sqcup X_{2}$ and $x \leq_{3} y$,
- or $x, y \in X_{3}$ and $x \leq_{\mathcal{J}_{3}} y$,
- or $x \in X_{3}, y \in X_{1} \sqcup X_{2}$ and $x \leq_{\mathfrak{I}_{3}} w$,
then
$x, y \in X_{1} \sqcup X_{2} \sqcup X_{3}$ et $x \leq y$ if and only if:
- Either $x, y \in X_{1}$ and $x \leq_{\mathfrak{I}_{1}} y$,
- or $x, y \in X_{2}$ and $x \leq_{\mathcal{T}_{2}} y$,
- or $x \in X_{2}, y \in X_{1}$ and $x \leq_{\mathcal{J}_{2}} u$,
- or $x, y \in X_{3}$ and $x \leq_{\mathcal{J}_{3}} y$,
- or $x \in X_{3}, y \in X_{1} \sqcup X_{2}$ and $x \leq_{\tau_{3}} w$.

On the other hand,
we denote $\mathcal{T}_{1}^{\prime}=\mathcal{T}_{2} \searrow_{w} \mathcal{T}_{3}=\left(X_{2} \sqcup X_{3}, \leq_{1}\right)$, with $\leq_{1}$ defined on $X_{2} \sqcup X_{3}$ by:
$x, y \in X_{2} \sqcup X_{3}$ et $x \leq_{1} y$ if and only if:

- Either $x, y \in X_{2}$ and $x \leq_{\mathfrak{I}_{2}} y$,
- or $x, y \in X_{3}$ and $x \leq_{\mathcal{J}_{3}} y$,
- or $x \in X_{3}, y \in X_{2}$ and $x \leq_{\mathcal{T}_{3}} w$,
and we denote $\mathcal{T}^{\prime}=\mathcal{T}_{1} \searrow_{u}\left(\mathcal{T}_{2} \searrow_{w} \mathcal{T}_{3}\right)=\left(X_{1} \sqcup X_{2} \sqcup X_{3}\right.$, $\left.\leq^{\prime}\right)$, with $\leq^{\prime}$ defined on $X_{1} \sqcup X_{2} \sqcup X_{3}$ by: $x, y \in X_{1} \sqcup X_{2} \sqcup X_{3}$ et $x \leq^{\prime} y$ if and only if:
- Either $x, y \in X_{1}$ and $x \leq_{\mathcal{I}_{1}} y$,
- or $x, y \in X_{2} \sqcup X_{3}$ and $x \leq_{1} y$,
- or $x \in X_{2} \sqcup X_{3}, y \in X_{1}$ and $x \leq_{1} u$,
then
$x, y \in X_{1} \sqcup X_{2} \sqcup X_{3}$ et $x \leq^{\prime} y$ if and only if:
- Either $x, y \in X_{1}$ and $x \leq_{\mathcal{I}_{1}} y$,
- or $x, y \in X_{2}$ and $x \leq_{\mathcal{J}_{2}} y$,
- or $x, y \in X_{3}$ and $x \leq_{\mathcal{T}_{3}} y$,
- or $x \in X_{3}, y \in X_{2}$ and $x \leq_{\mathcal{I}_{3}} w$,
- or $x \in X_{2}, y \in X_{1}$ and $x \leq_{\mathcal{T}_{2}} u$,
- or $x \in X_{3}, y \in X_{1}$ and $x \leq_{\mathcal{J}_{3}} w$,
then $\leq=\leq^{\prime}$ on $X_{1} \sqcup X_{2} \sqcup X_{3}$.
Then

$$
\left(\mathcal{T}_{1} \searrow_{u} \mathcal{T}_{2}\right) \searrow_{w} \mathcal{T}_{3}=\mathcal{T}_{1} \searrow_{u}\left(\mathcal{T}_{2} \searrow_{w} \mathcal{T}_{3}\right)
$$

2) Let $v, w \in X_{3}$, we denote $\mathcal{T}_{2}^{\prime}=\left(\mathcal{T}_{1} \searrow_{v} \mathcal{T}_{3}\right)=\left(X_{1} \sqcup X_{3}, \leq_{2}\right)$, with $\leq_{2}$ defined on $X_{1} \sqcup X_{3}$ by: $x, y \in X_{1} \sqcup X_{3}$ et $x \leq_{2} y$ if and only if:

- Either $x, y \in X_{1}$ and $x \leq_{\mathcal{I}_{1}} y$,
- or $x, y \in X_{3}$ and $x \leq_{\mathcal{T}_{3}} y$,
- or $x \in X_{3}, y \in X_{1}$ and $x \leq_{\mathcal{T}_{3}} v$,
and we denote
$\mathcal{T}=\mathcal{T}_{2} \searrow_{w}\left(\mathcal{T}_{1} \searrow_{v} \mathcal{T}_{3}\right)=\left(X_{1} \sqcup X_{2} \sqcup X_{3}, \leq\right)$, with $\leq$ defined on $X_{1} \sqcup X_{2} \sqcup X_{3}$ by:
$x, y \in X_{1} \sqcup X_{2} \sqcup X_{3}$ et $x \leq y$ if and only if:
- Either $x, y \in X_{2}$ and $x \leq_{\tau_{2}} y$,
- or $x, y \in X_{1} \sqcup X_{3}$ and $x \leq_{2} y$,
- or $x \in X_{1} \sqcup X_{3}, y \in X_{2}$ and $x \leq_{2} w$,
then
$x, y \in X_{1} \sqcup X_{2} \sqcup X_{3}$ et $x \leq y$ if and only if:
- Either $x, y \in X_{2}$ and $x \leq_{\mathfrak{I}_{2}} y$,
- or $x, y \in X_{1}$ and $x \leq_{\mathcal{I}_{1}} y$,
- or $x, y \in X_{3}$ and $x \leq_{\mathcal{T}_{3}} y$,
- or $x \in X_{3}, y \in X_{1}$ and $x \leq_{\mathcal{T}_{3}} v$,
- or $x \in X_{3}, y \in X_{2}$ and $x \leq_{\mathcal{I}_{3}} w$.

On the other hand,
we denote $\mathcal{T}_{1}^{\prime}=\left(\mathcal{T}_{2} \searrow_{w} \mathcal{T}_{3}\right)=\left(X_{2} \sqcup X_{3}, \leq_{1}\right)$, with $\leq_{1}$ defined on $X_{2} \sqcup X_{3}$ by:
$x, y \in X_{2} \sqcup X_{3}$ et $x \leq_{1} y$ if and only if:

- Either $x, y \in X_{2}$ and $x \leq_{\tau_{2}} y$,
- or $x, y \in X_{3}$ and $x \leq_{\mathcal{T}_{3}} y$,
- or $x \in X_{3}, y \in X_{2}$ and $x \leq_{\mathcal{I}_{3}} w$,
and we denote
$\mathcal{T}^{\prime}=\mathcal{T}_{1} \searrow_{v}\left(\mathcal{T}_{2} \searrow_{w} \mathcal{T}_{3}\right)=\left(X_{1} \sqcup X_{2} \sqcup X_{3}, \leq^{\prime}\right)$, with $\leq^{\prime}$ defined on $X_{1} \sqcup X_{2} \sqcup X_{3}$ by:
$x, y \in X_{1} \sqcup X_{2} \sqcup X_{3}$ et $x \leq^{\prime} y$ if and only if:
- Either $x, y \in X_{1}$ and $x \leq_{\mathfrak{I}_{1}} y$,
- or $x, y \in X_{2} \sqcup X_{3}$ and $x \leq_{1} y$,
- or $x \in X_{2} \sqcup X_{3}, y \in X_{1}$ and $x \leq_{1} v$,
then
$x, y \in X_{1} \sqcup X_{2} \sqcup X_{3}$ et $x \leq^{\prime} y$ if and only if:
- Either $x, y \in X_{1}$ and $x \leq_{\mathcal{I}_{1}} y$,
- or $x, y \in X_{2}$ and $x \leq_{\mathcal{J}_{2}} y$,
- or $x, y \in X_{3}$ and $x \leq_{\mathcal{J}_{3}} y$,
- or $x \in X_{3}, y \in X_{2}$ and $x \leq_{\mathcal{J}_{3}} w$,
- or $x \in X_{3}, y \in X_{1}$ and $x \leq_{\mathcal{J}_{3}} v$,
then $\leq=\leq^{\prime}$ on $X_{1} \sqcup X_{2} \sqcup X_{3}$.
Then

$$
\mathcal{T}_{1} \searrow_{v}\left(\mathcal{T}_{2} \searrow_{w} \mathcal{T}_{3}\right)=\mathcal{T}_{2} \searrow_{w}\left(\mathcal{T}_{1} \searrow_{v} \mathcal{T}_{3}\right)
$$

We then define the grafting law in the species of connected finite topological spaces by:
For all $\mathcal{T}_{1} \in \mathbb{T}_{X_{1}}, \mathcal{T}_{2} \in \mathbb{T}_{X_{2}}$

$$
\mathcal{T}_{1} \searrow \mathcal{T}_{2}=\sum_{v \in X_{2}} \mathcal{T}_{1} \searrow_{v} \mathcal{T}_{2} \in \mathbb{T}_{X_{1} \sqcup X_{2}} .
$$

Theorem 3.2. $(\mathbb{V}, \searrow)$ is a twisted pre-Lie algebra.
Proof. Let $\mathcal{T}_{1}=\left(X_{1}, \leq \mathcal{T}_{1}\right), \mathcal{T}_{2}=\left(X_{2}, \leq \mathcal{T}_{2}\right)$ and $\mathcal{T}_{3}=\left(X_{3}, \leq \mathcal{T}_{3}\right)$ three finite topological spaces, we have:

$$
\begin{aligned}
\mathcal{T}_{1} \searrow\left(\mathcal{T}_{2} \searrow \mathcal{T}_{3}\right)= & \sum_{v \in X_{3}} \mathcal{T}_{1} \searrow\left(\mathcal{T}_{2} \searrow_{v} \mathcal{T}_{3}\right) \\
= & \sum_{u \in X_{2} \sqcup X_{3}} \sum_{v \in X_{3}} \mathcal{T}_{1} \searrow_{u}\left(\mathcal{T}_{2} \searrow_{v} \mathcal{T}_{3}\right) \\
= & \sum_{u \in X_{2}} \sum_{v \in X_{3}} \mathcal{T}_{1} \searrow_{u}\left(\mathcal{T}_{2} \searrow_{v} \mathcal{T}_{3}\right) \\
& +\sum_{u \in X_{3}} \sum_{v \in X_{3}} \mathcal{T}_{1} \searrow_{u}\left(\mathcal{T}_{2} \searrow_{v} \mathcal{T}_{3}\right) .
\end{aligned}
$$

On the other hand we have:

$$
\begin{aligned}
\left(\mathcal{T}_{1} \searrow \mathcal{T}_{2}\right) \searrow \mathcal{T}_{3} & =\sum_{r \in X_{2}}\left(\mathcal{T}_{1} \searrow r \mathcal{T}_{2}\right) \searrow \mathcal{T}_{3} \\
& =\sum_{s \in X_{3}} \sum_{r \in X_{2}}\left(\mathcal{T}_{1} \searrow_{r} \mathcal{T}_{2}\right) \searrow_{s} \mathcal{T}_{3} .
\end{aligned}
$$

Then

$$
\mathcal{T}_{1} \searrow\left(\mathcal{T}_{2} \searrow \mathcal{T}_{3}\right)-\left(\mathcal{T}_{1} \searrow \mathcal{T}_{2}\right) \searrow \mathcal{T}_{3}=\sum_{u, v \in X_{3}} \mathcal{T}_{1} \searrow u\left(\mathcal{T}_{2} \searrow v \mathcal{T}_{3}\right)
$$

Which is symmetric on $\mathfrak{T}_{1}$ and $\mathfrak{T}_{2}$. Then we obtain:

$$
\mathcal{T}_{1} \searrow\left(\mathcal{T}_{2} \searrow \mathcal{T}_{3}\right)-\left(\mathcal{T}_{1} \searrow \mathcal{T}_{2}\right) \searrow \mathcal{T}_{3}=\mathcal{T}_{2} \searrow\left(\mathcal{T}_{1} \searrow \mathcal{T}_{3}\right)-\left(\mathcal{T}_{2} \searrow \mathcal{T}_{1}\right) \searrow \mathcal{T}_{3}
$$

Consequently, $(\mathbb{V}, \searrow)$ is a twisted pre-Lie algebra, thus yielding a pre-Lie algebra structure on $\overline{\mathcal{K}}(\mathbb{T})$.

We showed that $(\mathbb{V}, \searrow)$ is a twisted pre-Lie algebra, so we consider the Hope symmetric algebra $\mathcal{H}^{\prime}=S(\mathbb{V})$ equipped with its usual unshuffling coproduct $\Delta_{\text {unsh }}$. We extend the product $\searrow$ to $\mathbb{T}$ by using Definition 2.3 and we define a product $\star$ on $\mathbb{T}$ by: For any pair $X_{1}, X_{2}$ of finite sets

$$
\begin{aligned}
\star: \mathbb{T}_{X_{1}} \otimes \mathbb{T}_{X_{2}} & \longrightarrow \mathbb{T}_{X_{1} \sqcup X_{2}} \\
\left(\mathcal{T}_{1}, \mathcal{T}_{2}\right) & \longmapsto \sum_{\mathcal{T}_{1}} \mathcal{T}_{1}^{(1)}\left(\mathcal{T}_{1}^{(2)} \searrow \mathcal{T}_{2}\right) .
\end{aligned}
$$

By construction, the space $\left(\mathcal{H}^{\prime}, \star, \Delta_{\text {unsh }}\right)$ is a cocommutative twisted Hopf algebra.

Remark 3.1. The species of finite connected posts (ie. finite connected $T_{0}$ topological spaces) is a twisted pre-Lie subalgebra of $(\mathbb{V}, \searrow)$, and the species of finite posts is a Hops subalgebra of $\mathcal{H}^{\prime}$.

## Example 3.2.

$$
\begin{aligned}
& (\aleph \cdot) \searrow!=\aleph \searrow(\cdot \searrow!)-(\curvearrowright \searrow \cdot) \searrow! \\
& =\Omega \searrow(!+\boldsymbol{\sigma})-\diamond \searrow! \\
& =\dot{\zeta}+\boldsymbol{Q}+\boldsymbol{\Delta}+\boldsymbol{\Delta}+2 \boldsymbol{\zeta} \\
& \xi-\xi
\end{aligned}
$$

$$
\begin{aligned}
& \left(\aleph_{0}\right) \star!=\left(\aleph_{0}\right) \searrow!+\aleph .!+\aleph(\cdot \searrow!)+\cdot(\Omega \searrow!)
\end{aligned}
$$

$$
\begin{aligned}
& +\cdot(\nabla+\zeta)
\end{aligned}
$$

$$
\begin{aligned}
& +. \boldsymbol{V}+. \boldsymbol{\gamma}
\end{aligned}
$$

## 4. Bialgebras of finite topological spaces

4.1. A twisted bialgebra of finite topological spaces. Let $X$ be any finite set, we define the coproduct $\Delta_{\searrow}$ by:

$$
\begin{aligned}
\Delta_{\searrow}: \mathbb{T}_{X} & \longrightarrow(\mathbb{T} \otimes \mathbb{T})_{X}=\bigoplus_{Y \sqcup Z=X} \mathbb{T}_{Y} \otimes \mathbb{T}_{Z} \\
\mathcal{T} & \longmapsto \sum_{Y \in \mathcal{T}} \mathcal{T}_{\mid Y} \otimes \mathcal{T}_{\mid X \backslash Y}
\end{aligned}
$$

Where $Y \bar{\epsilon} \mathcal{T}$, stands for

- $Y \in \mathcal{T}$,
- $\mathcal{T}_{\mid Y}=\mathcal{T}_{1} \ldots \mathcal{T}_{n}$, such that for all $i \in\{1, \ldots, n\}, \mathcal{T}_{i}$ connected and $\left(\min \mathcal{T}_{i}=(\min \mathcal{T}) \cap \mathcal{T}_{i}\right.$, or there is a single common ancestor $x_{i} \in \overline{X \backslash Y}$ to $\left.\min \mathcal{T}_{i}\right)$, where $\overline{X \backslash Y}=(X \backslash Y) / \sim_{\mathcal{J}_{|X| Y}}$.

Example 4.1. $\Delta_{\searrow}(\aleph)=\Lambda \otimes 1+1 \otimes \Omega$

$$
\Delta_{\searrow}(V)=\cdots \otimes \cdot+V \otimes 1+1 \otimes V
$$

Theorem 4.1. $\left(\mathbb{T}, m, \Delta_{\searrow}\right)$ is a commutative connected twisted bialgebra, and $\mathcal{H}=\overline{\mathcal{K}}(\mathbb{T})$ is a commutative graded bialgebra.

Proof. To show that $\mathbb{T}$ is a twisted bialgebra [1], it is necessary to show that $\Delta_{\searrow}$ is coassociative, and that the species coproduct $\Delta_{\searrow}$ and the product defined by:

$$
\begin{aligned}
m: \mathbb{T}_{X_{1}} \otimes \mathbb{T}_{X_{2}} & \longrightarrow \mathbb{T}_{X_{1} \sqcup X_{2}} \\
\mathcal{T}_{1} \otimes \mathcal{T}_{2} & \longmapsto \mathcal{T}_{1} \mathcal{T}_{2},
\end{aligned}
$$

are compatible. The unit $\mathbf{1}$ is identified to the empty topology. Coassociativity is checked by a careful, but straighforward computation. We have

$$
\begin{aligned}
\left(\Delta_{\searrow} \otimes i d\right) \Delta_{\searrow}(\mathcal{T}) & =\left(\Delta_{\searrow} \otimes i d\right)\left(\sum_{Y \in \mathcal{T}} \mathcal{T}_{\mid Y} \otimes \mathcal{T}_{\mid X \backslash Y}\right) \\
& =\sum_{Z \in \mathcal{T}_{\mid Y}, Y \in \mathcal{T}} \mathcal{T}_{\mid Z} \otimes \mathcal{T}_{\mid Y \backslash Z} \otimes \mathcal{T}_{|X| Y} .
\end{aligned}
$$

On the other hand

$$
\begin{aligned}
\left(i d \otimes \Delta_{\searrow}\right) \Delta_{\searrow}(\mathcal{T}) & =\left(i d \otimes \Delta_{\searrow}\right)\left(\sum_{U \mathcal{\epsilon} \mathcal{T}} \mathcal{T}_{\mid U} \otimes \mathcal{T}_{\mid X \backslash U}\right) \\
& =\sum_{W \in \mathcal{T}_{X \mid U}, U \in \mathcal{T}} \mathcal{T}_{\mid U} \otimes \mathcal{T}_{\mid W} \otimes \mathcal{T}_{|X|(U \sqcup W)} .
\end{aligned}
$$

Coassociativity will come from the fact that $(Z, Y) \longmapsto(Z, Y \backslash Z)$ is a bijection from the set of pairs $(Z, Y)$ with $Y \bar{\epsilon} \mathcal{T}$ and $Z \bar{\epsilon} \mathcal{T}_{\mid Y}$ and, onto the set of pairs $(U, W)$ with $U \bar{\epsilon} \mathcal{T}$ and $W \bar{\epsilon} \mathcal{T}_{\mid X \backslash U}$. The inverse map is given by $(U, W) \longmapsto(U, U \sqcup W)$.

Let $A=\left\{(Z, Y), Y \bar{\in} \mathcal{T}\right.$ and $\left.Z \bar{\in} \mathcal{T}_{\mid Y}\right\}$, and $B=\left\{(U, W), U \bar{\epsilon} \mathcal{T}\right.$ and $\left.W \overline{\mathcal{E}} \mathcal{T}_{\mid X \backslash U}\right\}$.
We define

$$
\begin{array}{rlrl}
f: A & \longrightarrow B & g: B & \longrightarrow A \\
(Z, Y) & \longmapsto(Z, Y \backslash Z) & (U, W) & \longmapsto(U, U \sqcup W)
\end{array}
$$

Let us prove that $f$ and $g$ are well defined.
Let $(Z, Y) \in A$, i.e
$-Y \in \mathcal{T}$ and $\mathcal{T}_{\mid Y}=\mathcal{T}_{1} \ldots \mathcal{T}_{n}$, such that for all $i \in\{1, \ldots, n\}, \mathcal{T}_{i}$ connected component and $\left(\min \mathcal{T}_{i}=(\min \mathcal{T}) \cap \mathcal{T}_{i}\right.$ or there is a unique common ancestor $x_{i} \in \overline{X \backslash Y}$ to $\left.\min \mathcal{T}_{i}\right)$,
and
$-Z \in \mathcal{T}_{\mid Y}$ and $\mathcal{T}_{\mid Z}=\mathcal{T}_{1 \mid Z} \ldots \mathcal{T}_{n \mid Z}=\mathcal{T}_{1,1} \mathcal{T}_{1,2} \ldots \mathcal{T}_{1, i_{1}} \mathcal{T}_{2,1} \mathcal{T}_{2,2} \ldots \mathcal{T}_{2, i_{2}} \ldots \mathcal{T}_{n, 1} \mathcal{T}_{n, 2} \ldots \mathcal{T}_{n, i_{n}}$, such that for all $i \in\{1, \ldots, n\}, j \in\left\{i_{1}, \ldots, i_{n}\right\}, \mathcal{T}_{i, j}$ connected component and $\left(\min \mathcal{T}_{i, j}=\min \mathcal{T}_{\mid Y} \cap \mathcal{T}_{i, j}\right.$ or there is a unique common ancestor $x_{i, j} \in \overline{Y \backslash Z}$ to $\min \mathcal{T}_{i, j}$ ).
Then we can visualise $\mathcal{T}$ by the graph illustrated below in figure 1:
Graphically it is clear that $Z \in \mathcal{T}$ and $Y \backslash Z \in \mathcal{T}_{\mid X \backslash Z}$. Then $(Z, Y \backslash Z) \in B$.
Then $f$ is well defined.
Let $(U, W) \in B$, i.e
$-U \in \mathcal{T}$ and $\mathcal{T}_{\mid U}=\mathcal{T}_{\mid U_{1}} \ldots \mathcal{T}_{\mid U_{p}}$, such that for all $i \in\{1, \ldots, p\}, \mathcal{T}_{\mid U_{i}}$ connected component and $\left(\min \mathcal{J}_{\mid U_{i}}=(\min \mathcal{T}) \cap \mathcal{T}_{\mid U_{i}}\right.$ or there is a unique $x_{i} \in \overline{X \backslash U}$ common ancestor to $\left.\min \mathcal{T}_{\mid U_{i}}\right)$. and
$-W \in \mathcal{T}_{\mid X \backslash U}$ and $\mathcal{T}_{\mid W}=\mathcal{T}^{1} \ldots \mathcal{T}^{q}$, such that for all $j \in\{1, \ldots, q\}, \mathcal{T}^{j}$ connected component and $\left(\min \mathcal{T}^{j}=\min \mathcal{T}_{\mid X \backslash U} \cap \mathcal{T}^{j}\right.$ or there is a unique $x_{j} \in \overline{X \backslash(U \sqcup W)}$ common ancestor to min $\mathcal{T}^{j}$ ).
For all $k \in\{1, \ldots, q\}$, we notice $U^{k}=\bigsqcup_{0 \leq n \leq p} U_{i}$, where $U_{i}$ verifies the existence of $x_{i} \in \overline{W_{k}}=\overline{\mathcal{V}\left(\mathcal{T}^{k}\right)}$ common ancestor to $\min \mathcal{I}_{\mid U_{i}}$, where $v \in \mathcal{V}\left(\mathcal{T}^{k}\right)$ denotes that $v$ is a element of the topological space $\mathcal{T}^{k}$.

Figure 1
We notice $U^{0}=\underset{0 \leq n \leq p}{ } U_{i}$, where $U_{i}$ verifies the existence of a unique $x_{i} \in \overline{X \backslash(U \sqcup W)}$ common ancestor to $\min \mathcal{T}_{\mid U_{i}}$.
We notice $W_{0} \subset W$, where $W_{0}$ verifie thet for all $x \in W_{0}$, there is no $y \in U$ such that $x \leq_{\mathcal{T}} y$.
Then we can visualise $\mathcal{T}$ by the graph illustrated below in figure 2 below:
Graphically it is clear that $U \in \mathcal{T}_{\mid W \sqcup U}$ and $W \sqcup U \in \mathcal{T}$. Then $(U, U \sqcup W) \in A$.

Figure 2
Then $g$ is well defined.
We have for all $(Z, Y) \in A$ then $(Z, Y \backslash Z) \in B$, and for all $(U, W) \in B$ then $(U, U \sqcup W) \in A$. Then
$|A|=|B|$.
Let $\left(Z_{1}, Y_{1}\right),\left(Z_{2}, Y_{2}\right) \in A$ such that $f\left(Z_{1}, Y_{1}\right)=f\left(Z_{2}, Y_{2}\right)$, then $Z_{1}=Z_{2}$, then $Y_{1} \backslash Z_{1}=Y_{2} \backslash Z_{1}$, then $f$ is injective, then $f$ is bijective.
In the same way we show that $g$ is bijective, and $g \circ f=f \circ g=I d$.
Then $\Delta$ is coassociative.
Finally, we show immediately that

$$
\Delta_{\searrow}\left(\mathcal{T}_{1} \mathcal{T}_{2}\right)=\Delta_{\searrow}\left(\mathcal{T}_{1}\right) \Delta_{\searrow}\left(\mathcal{T}_{2}\right)
$$

Remark 4.1. For any finite set $X$, let us recall from [8] the internal coproduct $\Gamma$ on $\mathbb{T}_{X}$ :

$$
\begin{equation*}
\Gamma(\mathcal{T})=\sum_{\mathcal{T}^{\prime} \otimes \mathcal{T}} \mathcal{T}^{\prime} \otimes \mathcal{T} / \mathcal{T}^{\prime} \tag{4.1}
\end{equation*}
$$

The sum runs over topologies $\mathfrak{T}^{\prime}$ which are $\mathfrak{T}$-admissible, i.e

- finer than $\mathcal{T}$,
- such that $\mathcal{T}_{\mid Y}^{\prime}=\mathcal{T}_{\mid Y}$ for any subset $Y \subset X$ connected for the topology $\mathcal{T}^{\prime}$,
- such that for any $x, y \in X$,

$$
\begin{equation*}
x \sim_{\mathcal{J}^{\prime} \mathcal{T}^{\prime}} y \Longleftrightarrow x \sim_{\mathcal{J}^{\prime} / \mathcal{T}^{\prime}} y . \tag{4.2}
\end{equation*}
$$

F. Fauvet, L. Foissy, and D. Manchon in [8] show that $\Gamma$ and $\Delta$ are compatible.

On the other hand, we notice that $\Gamma$ and $\Delta_{\searrow}$ are not compatible. In fact:

then

$$
\begin{aligned}
& \left(I d \otimes \Delta_{\searrow}\right) \Gamma(\widehat{\nabla})=\gamma \cdot \otimes[\cdot \otimes \odot+1 \otimes \dot{( }+\dot{\circ}+1] \\
& + \text {. } \otimes[\because \otimes \cdot+1 \otimes!+\odot \otimes 1] \\
& +2 \boldsymbol{I I} \otimes[\odot \otimes \odot+\mathbf{1} \otimes \stackrel{\ominus}{\odot}+\stackrel{\ominus}{\bullet} \otimes \mathbf{1}] \\
& +\ldots \otimes[\wedge \otimes \cdot+1 \otimes \diamond+\diamond \otimes 1] \\
& +\forall \otimes[: \% \otimes 1+1 \otimes: \%]
\end{aligned}
$$

On the other hand

$$
\begin{aligned}
& m^{13}(\Gamma \otimes \Gamma) \Delta_{\searrow}(\dot{\gamma})=\dot{\gamma} \cdot \otimes[1 \otimes \dot{\ominus}+\dot{\circ}, \otimes 1] \\
& +ふ \cdot \otimes[\because \otimes \cdot+1 \otimes!+!() \otimes 1] \\
& +2!\dot{i} \otimes[1 \otimes \stackrel{\oplus}{\oplus}+\odot \otimes 1] \\
& +\ldots \otimes[\Omega \otimes \cdot+1 \otimes \zeta+\gamma \otimes 1] \\
& +\delta \otimes[:: \otimes 1+1 \otimes: \% \\
& +\dot{C} \cdot \otimes[\stackrel{\dot{\circ}}{\odot} \otimes+\odot \otimes \cdot]
\end{aligned}
$$

then $\left(I d \otimes \Delta_{\searrow}\right) \Gamma\left(\bigotimes^{\prime} \neq m^{13}(\Gamma \otimes \Gamma) \Delta_{\searrow}\left(\diamond^{\prime}\right)\right.$. Then $\Gamma$ and $\Delta_{\searrow}$ are not compatible.
4.2. Relation between $\star$ and $\Delta_{\searrow}$. In this subsection, we prove that there exist relations between the Grossman-Larson product $\star$ and the coproduct $\Delta_{\searrow}$.
Let $G$ be a group acting on $X$. For every $x \in X$, we denote by $G \cdot x$ the orbit of $x$ and we denote by $G_{x}$ the stabilizer subgroup of $G$ with respect to $x$. The group action is transitive if and only if it has exactly one orbit, that is if there exists $x$ in $X$ with $G \cdot x=X$ (i.e. $X$ is non-empty and if for each pair $x, y \in X$ there exists $g \in G$ such that $g \cdot x=y$ ). This is the case if and only if $G \cdot x=X$, for all $x$ in $X$.
If $G$ and $X$ is finite, then the orbit-stabilizer theorem, together with Lagrange's theorem [21](theorem 3.9), gives

$$
\begin{equation*}
|G \cdot x|=\left[G_{X}: G\right]=\frac{|G|}{\left|G_{x}\right|}, \tag{4.3}
\end{equation*}
$$

that implies that the cardinal of the orbit is a divisor of the group order.
Definition 4.1. For any topology $\mathcal{T}$ on a finite set $X$, we denote by $\operatorname{Aut}(\mathcal{T})$ the subgroup of permutations of $X$ which are homeomorphisms with respect to $\mathfrak{T}$. The symmetry factor is defined by $\sigma(\mathcal{T})=|\operatorname{Aut}(\mathcal{T})|$. We define the linear map $e_{\mathcal{T}}: \mathbb{T}_{X} \longrightarrow \mathbb{K}$ by:

$$
e_{\mathcal{T}}\left(\mathcal{T}^{\prime}\right)=\sigma(\mathcal{T}) \text {, if } \mathcal{T}=\mathcal{T}^{\prime}, \text { and } 0 \text { if not. }
$$

Definition 4.2. We define the graft operator $\mathcal{B}: \mathbb{T} \rightarrow \mathbb{T}$ by, $\mathcal{B}(\mathcal{T})=\mathcal{T} \searrow\{*\}$, for any topology $\mathcal{T}$ on $X$, this is the topology on $X \sqcup\{*\}$ obtained by keeping the preorder and $X$ and by putting * $<x$ for any $x \in X$.

Theorem 4.2. Let $\mathcal{T}_{1} \in \mathbb{T}_{X_{1}}, \mathcal{T}_{2} \in \mathbb{T}_{X_{2}}$ and $\mathcal{T}^{\prime} \in \mathbb{T}_{X}$, then

$$
\left\langle e_{\mathcal{J}_{1}} \star e_{\mathcal{T}_{2}}, \mathcal{T}^{\prime}\right\rangle=\left\langle e_{\mathcal{J}_{1}} \otimes e_{\mathcal{T}_{2}}, \Delta \searrow\left(\mathcal{T}^{\prime}\right)\right\rangle
$$

Proof. Let $\mathcal{T}_{1} \in \mathbb{T}_{X_{1}}, \mathcal{T}_{2} \in \mathbb{T}_{X_{2}}$ and $\mathcal{T}^{\prime} \in \mathbb{T}_{X}$.
Case 1; $\mathfrak{T}_{1}$ is connected, we have

$$
\begin{aligned}
& \left\langle e_{\mathcal{T}_{1}} \star e_{\mathcal{T}_{2}}, \mathcal{T}^{\prime}\right\rangle=\left\langle e_{\mathcal{T}_{1} \backslash \mathcal{B \mathcal { T } _ { 2 }}}, \mathcal{B T}^{\prime}\right\rangle \\
& =\sum_{v \in X_{2} \sqcup(*)}\left\langle e_{\mathcal{T}_{1} \backslash \mathcal{B J}^{2}}, \mathcal{B T}^{\prime}>\right. \\
& =\sum_{\substack{v \in X_{2} \leq(*) \\
\mathcal{B} \mathcal{J}^{\prime}=\mathcal{T}_{1} \backslash \mathcal{V N}_{2} \mathcal{B}}} \sigma\left(\mathcal{B T}^{\prime}\right) \text {. }
\end{aligned}
$$

Let us consider the set $B=\left\{v \in X_{2} \sqcup\{*\}, \mathcal{B T}^{\prime}=\mathcal{T}_{1} \searrow v \mathcal{B I}_{2}\right\}$, we show that $\operatorname{Aut}\left(\mathcal{B I}_{2}\right)$ acts transitively on $B$. We define the map

$$
\begin{aligned}
\Phi_{1}: \operatorname{Aut}\left(\mathcal{B J}_{2}\right) \times B & \longrightarrow B \\
(\varphi, v) & \longmapsto \varphi(v) .
\end{aligned}
$$

Let $v \in B$, if $v=*$, then $\varphi(v)=v$. If not then $\mathcal{T}_{1} \searrow_{\varphi(v)} \mathcal{B J}_{2}=\mathcal{T}_{1} \searrow_{\varphi(v)} \varphi\left(\mathcal{B T}_{2}\right)=h\left(\mathcal{T}_{1} \searrow_{v} \mathcal{B} \mathcal{T}_{2}\right)$, where $h_{\mid X_{1}}=I d$ and if $v \in X_{2} \sqcup\{*\}, h(v)=\varphi(v)$, where $\varphi \in \operatorname{Aut}\left(\mathcal{B I}_{2}\right)$. It is clear that $h \in \operatorname{Aut}\left(\mathcal{B J}^{\prime}\right)$, then $\mathcal{T}_{1} \searrow_{\varphi(v)} \mathcal{B T}_{2}=h\left(\mathcal{B T}^{\prime}\right)=\mathcal{B \mathcal { T } ^ { \prime }}$. Then $\Phi_{1}$ is well defined.
Moreover for all $v \in B, I d(v)=v$, and for all $\varphi, \varphi^{\prime} \in \operatorname{Aut}\left(\mathcal{B I}_{2}\right), \Phi_{1}\left(\varphi, \varphi^{\prime}(v)\right)=\varphi\left(\varphi^{\prime}(v)\right)=\left(\varphi \varphi^{\prime}\right)(v)$. Then $\Phi_{1}$ is an action.
Now to show that $\Phi_{1}$ is transitive, let $u, v \in B$, and let us define $f: X \sqcup\{*\} \longrightarrow X \sqcup\{*\}$ by $f(u)=v, f(v)=u$, and for all $w \in X \sqcup\{*\} \backslash\{u, v\}, f(w)=w$, it is clear that $f \in \operatorname{Aut}\left(\mathcal{B J}^{\prime}\right)$.
If we take $\varphi: X_{2} \sqcup\{*\} \longrightarrow X_{2} \sqcup\{*\}$, defined by $\varphi=f_{\mid X_{2} \sqcup * * *}$, so we have, $\varphi \in \operatorname{Aut}\left(\mathcal{B T}_{2}\right)$, and $\varphi(u)=v$, then $\Phi_{1}$ is transitive. Then $B=\operatorname{Aut}\left(\mathcal{B I}_{2}\right) \cdot v$, for all $v \in B$.
For all $v \in B$, we call the stabilizer of $v$ the set:

$$
\operatorname{Aut}\left(\mathcal{B I}_{2}\right)_{v}=\left\{\varphi \in \operatorname{Aut}\left(\mathcal{B I}_{2}\right), \varphi(v)=v\right\}
$$

And since $\left\lvert\,\left(\operatorname{Aut}\left(\mathcal{B I}_{2}\right) \mid\right.$ is finite, then $|B|=\left|\operatorname{Aut}\left(\mathcal{B I}_{2}\right) \cdot v\right|=\frac{\left|\operatorname{Aut}\left(\mathcal{B I}_{2}\right)\right|}{\left|\operatorname{Aut}\left(\mathcal{B I}_{2}\right)_{v}\right|}$, for all $v \in B$. \right. Then

$$
|B|=\frac{\left|\sigma\left(\mathcal{T}_{2}\right)\right|}{\left|\operatorname{Aut}\left(\mathcal{T}_{2}\right)_{v}\right|}, \text { for all } v \in B \backslash\{*\}
$$

On the other hand

$$
\begin{aligned}
\left\langle e_{\mathcal{T}_{1}} \otimes e_{\mathcal{T}_{2}}, \Delta \backslash\left(\mathcal{T}^{\prime}\right)>\right. & \left.=\sum_{Y \in \mathcal{T}^{\prime}}<e_{\mathcal{T}_{1}}, \mathcal{T}_{\mid Y}^{\prime}\right\rangle\left\langle e_{\mathcal{J}_{2}}, \mathcal{T}_{\mid X \backslash Y}^{\prime}\right\rangle \\
& =\sum_{\substack{Y \in \mathcal{J}^{\prime} \\
\mathcal{T}_{1}=\mathcal{T}_{\mid Y}}} \sigma\left(\mathcal{T}_{1}\right) \sigma\left(\mathcal{T}_{2}\right) .
\end{aligned}
$$

Let us consider the set
$A=\left\{v \in X\right.$, the cut above $v$ give the term of $\Delta_{\searrow}\left(\mathcal{T}^{\prime}\right)$ isomorphic to $\left.\mathcal{T}_{1} \otimes \mathcal{T}_{2}\right\}$,
we notice that $A \cap B \backslash\{*\} \neq \varnothing$.
We show that $\operatorname{Aut}\left(\mathcal{T}^{\prime}\right)$ acts transitively on $A$. We define the map

$$
\begin{aligned}
\Phi_{2}: \operatorname{Aut}\left(\mathcal{T}^{\prime}\right) \times A & \longrightarrow A \\
(\varphi, v) & \longmapsto \varphi(v)
\end{aligned}
$$

Let $v \in A$ then $\mathcal{T}_{\mid X_{1}}^{\prime}$ isomorphic to $\mathcal{T}_{1}$ and $\mathcal{T}_{\mid X_{2}}^{\prime}$ isomorphic to $\mathcal{T}_{2}$, then for all $\varphi \in \operatorname{Aut}\left(\mathcal{T}^{\prime}\right), \varphi\left(\mathcal{T}_{\mid X_{i}}^{\prime}\right)$ isomorph to $\mathcal{T}_{i}, i \in\{1,2\}$, and $\Delta \backslash\left(\varphi\left(\mathcal{T}^{\prime}\right)\right)$ isomorphic to $\Delta \backslash\left(\mathcal{T}^{\prime}\right)$,
then for all $\varphi \in \operatorname{Aut}\left(\mathcal{T}^{\prime}\right)$, the cut above $\varphi(\nu)$ give the term of $\Delta_{\searrow}\left(\mathcal{T}^{\prime}\right)$ isomorphic to $\mathcal{T}_{1} \otimes \mathcal{T}_{2}$, then $\varphi(v) \in A$. Then $\Phi_{2}$ is well defined.
Let $v \in A$, and $\varphi, \varphi^{\prime} \in \operatorname{Aut}\left(\mathcal{T}^{\prime}\right)$, then $\operatorname{Id}(v)=v$ and $\Phi_{2}\left(\varphi, \varphi^{\prime}(v)\right)=\varphi\left(\varphi^{\prime}(v)\right)=\left(\varphi \varphi^{\prime}\right)(v)$. Then $\Phi_{2}$ is an action.
Let $u, v \in A$, we defined $f: X \longrightarrow X$ by: $f(u)=v, f(v)=u$, and for all $w \notin\{u, v\}, f(w)=w$, it is clear that $f \in \operatorname{Aut}\left(\mathcal{T}^{\prime}\right)$, then $\Phi_{2}$ is transitive. And since $\left|\operatorname{Aut}\left(\mathcal{T}^{\prime}\right)\right|$ is finite, then

$$
|A|=\frac{\left|\operatorname{Aut}\left(\mathcal{T}^{\prime}\right)\right|}{\left|\operatorname{Aut}\left(\mathcal{T}^{\prime}\right)_{v}\right|}, \text { for all } v \in A \text {. }
$$

Let $v \in A$, then $\left|\operatorname{Aut}\left(\mathcal{T}^{\prime}\right)_{v}\right|=\left|\operatorname{Aut}\left(\mathcal{T}_{1}\right) \operatorname{Aut}\left(\mathcal{T}_{2}\right)_{v}\right|=\left|\operatorname{Aut}\left(\mathcal{T}_{1}\right)\right|\left|\operatorname{Aut}\left(\mathcal{T}_{2}\right)_{v}\right|$. Then

$$
\left|\operatorname{Aut}\left(\mathcal{T}_{2}\right)_{v}\right|=\frac{\left|\operatorname{Aut}\left(\mathcal{T}^{\prime}\right)\right|}{|A|\left|\operatorname{Aut}\left(\mathcal{T}_{1}\right)\right|}, \text { for all } v \in A
$$

that since $A \cap B \backslash\{*\} \neq \varnothing$, there exists $v \in A \cap B \backslash\{*\}$ such that

$$
\left|\operatorname{Aut}\left(\mathcal{T}_{2}\right)_{v}\right|=\frac{\left|\operatorname{Aut}\left(\mathcal{T}^{\prime}\right)\right|}{|A|\left|\operatorname{Aut}\left(\mathcal{T}_{1}\right)\right|}=\frac{\left|\operatorname{Aut}\left(\mathcal{T}_{2}\right)\right|}{|B|}
$$

then

$$
\frac{\sigma\left(\mathcal{T}^{\prime}\right)}{|A| \sigma\left(\mathcal{T}_{1}\right)}=\frac{\sigma\left(\mathcal{T}_{2}\right)}{|B|},
$$

then

$$
|B| \sigma\left(\mathcal{T}^{\prime}\right)=|A| \sigma\left(\mathcal{T}_{1}\right) \sigma\left(\mathcal{T}_{2}\right)
$$

We define $A^{\prime}=\left\{Y, Y \bar{\epsilon} \mathcal{T}^{\prime}, \mathcal{T}_{1}=\mathcal{T}_{Y}^{\prime}, \mathcal{T}_{2}=\mathcal{T}_{|X| Y}^{\prime}\right\}$, we notice that $|A|=\left|A^{\prime}\right|$. Then

$$
\begin{aligned}
& =|B| \sigma\left(\mathcal{B T}^{\prime}\right) \\
& =|B| \sigma\left(\mathcal{T}^{\prime}\right) \\
& =\left|A^{\prime}\right| \sigma\left(\mathcal{T}_{1}\right) \sigma\left(\mathcal{T}_{2}\right) \\
& =\sum_{\substack{\mathcal{T}_{1}=\mathcal{T}_{\mid Y}^{Y \in \mathcal{T}_{2}^{\prime}}=\mathcal{T}_{|X| Y}^{\prime}}} \sigma\left(\mathcal{T}_{1}\right) \sigma\left(\mathcal{T}_{2}\right) \\
& =\left\langle e_{\mathcal{J}_{1}} \otimes e_{\mathcal{J}_{2}}, \Delta_{\searrow}\left(\mathcal{T}^{\prime}\right)\right\rangle .
\end{aligned}
$$

Case2; $\mathcal{T}_{1}$ not connected.
Let $\mathcal{T}_{1}=\mathcal{T}_{1,1} \ldots \mathcal{T}_{1, n} \in \mathbb{T}_{X_{1}}$, where $\mathcal{T}_{1, i}$ is connected for all $i \in[n]$. And let $\mathcal{T}_{2} \in \mathbb{T}_{X_{2}}, \mathcal{T}^{\prime} \in \mathbb{T}_{X}$, we
have

$$
\begin{aligned}
& \left\langle e_{\mathcal{T}_{1}} \star e_{\mathcal{T}_{2}}, \mathcal{T}^{\prime}\right\rangle=\left\langle e_{\mathcal{T}_{1} \backslash \mathcal{B} \mathcal{T}_{2}}, \mathcal{B T}^{\prime}\right\rangle \\
& =\sum_{\underline{v}=\left(v_{1}, \ldots, v_{n}\right) \in X_{2}}<e_{\mathcal{T}_{1} \backslash \underline{\underline{B}}} \mathcal{B J}_{2}, \mathcal{B T}^{\prime}>
\end{aligned}
$$

Let us consider the set $\underline{B}=\left\{\underline{\underline{v}}=\left(v_{1}, \ldots, v_{n}\right) \in X_{2} \sqcup\{*\}, \mathcal{B T}^{\prime}=\mathcal{T}_{1} \searrow_{\underline{\underline{1}}} \mathcal{B T}_{2}\right\}$.
$\operatorname{Aut}\left(\mathcal{T}_{2}\right)$ acts transitively on $\underline{B}$ by the action. (In the same way that we used to show that $\Phi_{1}$ is a transitive action.)

$$
\begin{aligned}
\Phi_{3}: \operatorname{Aut}\left(\mathcal{T}_{2}\right) \times \underline{B} & \longrightarrow \underline{B} \\
(\varphi, \underline{v}) & \longmapsto \varphi(\underline{v}) .
\end{aligned}
$$

And since $\left|\operatorname{Aut}\left(\mathcal{T}_{2}\right)\right|$ is finite, then $|\underline{B}|=\frac{\sigma\left(\mathcal{T}_{2}\right)}{\left|\operatorname{Aut}\left(\mathcal{T}_{2}\right)_{\underline{\underline{b}}}\right|}$, where $\underline{v} \in \underline{B}$.
On the other hand

$$
\begin{aligned}
\left\langle e_{\mathcal{T}_{1}} \otimes e_{\mathcal{T}_{2}}, \Delta \backslash\left(\mathcal{T}^{\prime}\right)>\right. & =\sum_{Y \in \mathcal{T}^{\prime}}\left\langle e_{\mathcal{T}_{1}}, \mathcal{T}_{\mid Y}^{\prime}\right\rangle\left\langle e_{\mathcal{T}_{2}}, \mathcal{T}_{\mid X \backslash Y}^{\prime}\right\rangle \\
& =\sum_{\substack{\mathcal{T}_{1}=\mathcal{T}_{\mid Y}^{Y \in \mathcal{T}_{2}^{\prime}}=\mathcal{T}_{X \mid Y}^{\prime}}} \sigma\left(\mathcal{T}_{1}\right) \sigma\left(\mathcal{T}_{2}\right) .
\end{aligned}
$$

Let us consider the set
$\underline{A}=\left\{\underline{v}=\left(v_{1}, \ldots, v_{n}\right) \in X\right.$, the cut above $\underline{v}$ give the term of $\Delta_{\searrow}\left(\mathcal{T}^{\prime}\right)$ isomorphic to $\left.\mathcal{T}_{1} \otimes \mathcal{T}_{2}\right\}$.
We notice that $\underline{A} \cap \underline{B}_{X_{2}} \neq \varnothing$.
$\operatorname{Aut}\left(\mathcal{T}^{\prime}\right)$ acts transitively on $\underline{A}$ by the action. (In the same way that we used to show that $\Phi_{2}$ is a transitive action.)

$$
\begin{aligned}
\Phi_{4}: \operatorname{Aut}\left(\mathcal{T}^{\prime}\right) \times \underline{A} & \longrightarrow \underline{A} \\
(\varphi, \underline{v}) & \longmapsto \varphi(\underline{v}) .
\end{aligned}
$$

And since $\left|\operatorname{Aut}\left(\mathcal{T}^{\prime}\right)\right|$ is finite, then $|\underline{A}|=\frac{\sigma\left(\mathcal{T}^{\prime}\right)}{\left|\operatorname{Aut}\left(\mathcal{T}^{\prime}\right)_{\underline{v}}\right|}$, where $\underline{v} \in \underline{A}$.
If $\underline{v} \in \underline{A}$, then $\left|\operatorname{Aut}\left(\mathcal{T}^{\prime}\right)_{\underline{\underline{v}}}\right|=\left|\operatorname{Aut}\left(\mathcal{T}_{1}\right) \operatorname{Aut}\left(\mathcal{T}_{2}\right)_{\underline{v}}\right|=\left|\overline{\operatorname{Aut}}\left(\mathcal{T}_{1}\right)\right|\left|\operatorname{Aut}\left(\mathcal{T}_{2}\right)_{\underline{v}}\right|$,
then $\left|\operatorname{Aut}\left(\mathcal{T}_{2}\right)_{\underline{v}}\right|=\frac{\left|\operatorname{Aut}\left(\mathcal{T}^{\prime}\right)\right|}{|\underline{A}|\left|\operatorname{Aut}\left(\mathcal{T}_{1}\right)\right|}$ for all $v \in \underline{A}$,
then

$$
\left|\operatorname{Aut}\left(\mathcal{T}_{2}\right)_{\underline{v}}\right|=\frac{\left|\operatorname{Aut}\left(\mathcal{T}^{\prime}\right)\right|}{|\underline{A}|\left|\operatorname{Aut}\left(\mathcal{T}_{1}\right)\right|}=\frac{\left|\operatorname{Aut}\left(\mathcal{T}_{2}\right)\right|}{|\underline{B}|} \text {, for all } v \in \underline{A} \cap \underline{B} \cap X_{2},
$$

then $\frac{\sigma\left(\mathcal{T}^{\prime}\right)}{|\underline{A}| \sigma\left(\mathcal{T}_{1}\right)}=\frac{\sigma\left(\mathcal{T}_{2}\right)}{|\underline{B}|}$. Then $\underline{\underline{B}}\left|\sigma\left(\mathcal{T}^{\prime}\right)=\underline{\mid}\right| \underline{\mid} \sigma\left(\mathcal{T}_{1}\right) \sigma\left(\mathcal{T}_{2}\right)$.

We define $\underline{A}^{\prime}=\left\{Y, Y \overline{\overline{\mathcal{T}}} \mathcal{T}^{\prime}, \mathcal{T}_{1}=\mathcal{T}_{\mid Y}^{\prime}\right.$ and $\left.\mathcal{T}_{2}=\mathcal{T}_{\mid X \backslash Y}^{\prime}\right\}$, we notice that $|\underline{A}|=\left|\underline{A^{\prime}}\right|$. Then

$$
\begin{aligned}
& \left\langle e_{\mathcal{T}_{1}} \star e_{\mathcal{T}_{2}}, \mathcal{T}^{\prime}\right\rangle=\left\langle e_{\mathcal{T}_{1} \backslash \mathcal{B} \mathcal{T}_{2}}, \mathcal{B T}^{\prime}\right\rangle \\
& =\sum_{\underline{v}=\left(v_{1}, \ldots, v_{n}\right) \in X_{2}}<e_{\mathcal{T}_{1} \backslash_{\underline{-}} \mathcal{B} \mathcal{I}_{2}}, \mathcal{B T ^ { \prime }}> \\
& =\sum_{\substack{\left.\mathcal{M} \mathcal{T}^{\prime}=\mathcal{T}_{1,1} \backslash v_{1}\left(\mathcal{V}_{1,2}, \ldots, v_{n}\right) \in X_{2} \\
\mathcal{V}_{2} \ldots\left(\mathcal{T}_{1, n} \backslash v_{n} \mathcal{B} \mathcal{T}_{2}\right) \ldots\right)}} \sigma\left(\mathcal{B J}^{\prime}\right) \\
& =|\underline{B}| \sigma\left(\mathcal{T}^{\prime}\right) \\
& =\left|\underline{A^{\prime}}\right| \sigma\left(\mathcal{T}_{1}\right) \sigma\left(\mathcal{T}_{2}\right) \\
& =\sum_{\substack{\gamma \in \mathcal{T}^{\prime} \\
\mathcal{T}_{1}=\mathcal{T}_{\mid Y}^{\prime}, \mathcal{T}_{2}=\mathcal{T}_{|X| Y}^{\prime}}} \sigma\left(\mathcal{T}_{1}\right) \sigma\left(\mathcal{T}_{2}\right) \\
& =\sum_{Y \in \mathcal{T}^{\prime}}<e_{\mathcal{T}_{1}}, \mathcal{T}_{\mid Y}^{\prime}><e_{\mathcal{J}_{2}}, \mathcal{T}_{\mid X \backslash Y}^{\prime}> \\
& =\left\langle e_{\mathcal{J}_{1}} \otimes e_{\mathcal{J}_{2}}, \Delta_{\succ}\left(\mathcal{T}^{\prime}\right)\right\rangle .
\end{aligned}
$$

## 5. Relation between 】and $\nearrow$

In this part we define the law $\nearrow$ on $\mathbb{V}$ by: For all $\mathcal{T}=\left(X, \leq_{\mathcal{T}}\right)$ and $\mathcal{S}=\left(Y, \leq_{\delta}\right)$ be two finite connected topological spaces,

$$
\mathcal{T} \nearrow \mathcal{S}:=j(j(\mathcal{T}) \searrow j(\mathcal{S})),
$$

where $j$ is the involution which transforms $\leq$ into $\geq$. In other words, open subsets in $\mathcal{T}$ are closed subsets in $j(\mathcal{T})$ and vice-versa. In particular, it is obvious that $(\mathbb{V}, \nearrow)$ is a twisted pre-Lie algebra due to the fact that $(\mathbb{V}, \searrow)$ is a twisted pre-Lie algebra.
Definition 5.1. For any finite set $A$ and for any pair of parts $A_{1}, A_{2}$ of $A$ with $A_{1} \cap A_{2}=\varnothing$, we define $\Psi_{A_{1}, A_{2}}: \mathbb{T}_{A} \rightarrow \mathbb{T}_{A}$, as follows: for any topology $\mathcal{T} \in \mathbb{T}_{A}, \Psi_{A_{1}, A_{2}}(\mathcal{T})=(A, \leq)$, where $\leq$ defined by

- If $a \in A_{1}$, and $b \in A_{2}$ then $a$ and $b$ are uncomparable,
- otherwise, we have $a \leq b$ if and only if $a \leq_{\mathcal{T}} b$.

Proposition 5.1. For any finite set $A$ and for any pair of parts $A_{1}, A_{2}$ of $A$ with $A_{1} \cap A_{2}=\varnothing$, and let $\mathcal{T} \in \mathbb{T}_{A}$ then

1) $\Psi_{A_{1}, A_{2}}(\mathcal{T})=(A, \leq)$ is a finite topological space.
2) $\Psi_{A_{1}, A_{2}}$ is a projector.

Proof. 1) Let $A=A_{1} \sqcup A_{2}$, with $A_{1} \cap A_{2}=\varnothing$, and let $\mathcal{T} \in \mathbb{T}_{A}$, we must show that $\leq$ is a preorder relation on $A$ :
Reflexivity; Let $x \in A$, then $x \in A_{1}$ or $x \in A_{2}$.
If $x \in A_{1}$, we have $x \leq_{\mathcal{T}} x$ then $x \leq x$, same thing if $x \in A_{2}$.
Transitivity; Let $x, y, z \in A$ such that $x \leq y$ and $y \leq z$. So we have two possible cases:

- First case; $x, y, z \in A_{1}$, and ( $x \leq y$ and $y \leq z$ ), then ( $x \leq_{\mathcal{T}} y$ and $y \leq_{\mathcal{T}} z$ ).

Since $\leq_{\mathcal{T}}$ is transitive, then $x \leq_{\mathcal{T}} z$, then $x \leq z$.

- Second case; $x, y, z \in A_{2}$, likewise the first case.

2) Let $\mathcal{T} \in \mathbb{T}_{A}$, we must show that $\Psi_{A_{1}, A_{2}}(\mathcal{T})=\Psi_{A_{1}, A_{2}}^{2}(\mathcal{T})$.

If not $\mathcal{T}^{\prime}=\left(A, \leq^{\prime}\right)=\Psi_{A_{1}, A_{2}}(\mathcal{T})$, then $\Psi_{A_{1}, A_{2}}^{2}(\mathcal{T})=\Psi_{A_{1}, A_{2}}\left(\mathcal{T}^{\prime}\right)=(A, \leq)$, where $\leq$ defined by

- If $a \in A_{1}$, and $b \in A_{2}$ then $a$ and $b$ are uncomparable,
- otherwise, we have $a \leq b$ if and only if $a \leq^{\prime} b$.

And since we have, $a \leq^{\prime} b$ if and only if $a \leq_{\mathcal{T}} b$, then $\leq$ defined by

- If $a \in A_{1}$, and $b \in A_{2}$ then $a$ and $b$ are uncomparable,
- otherwise, we have $a \leq b$ if and only if $a \leq_{\mathcal{J}} b$.

Then $\Psi_{A_{1}, A_{2}}=\Psi_{A_{1}, A_{2}}^{2}$.
Theorem 5.1. Let $\mathcal{T}=\left(X, \leq_{\mathcal{J}}\right), \mathcal{S}=\left(Y, \leq_{\S}\right)$ and $\mathcal{U}=\left(Z, \leq_{\mathcal{U}}\right)$ be three finite connected topological spaces, and let $s \in Y, u \in Z$. The following diagram is commutative:

Proof. Let $\mathcal{T}=\left(X, \leq_{\mathcal{T}}\right), \mathcal{S}=\left(Y, \leq_{\mathcal{S}}\right)$ and $\mathcal{U}=\left(Z, \leq_{\mathcal{U}}\right)$ be three finite connected topological spaces, and let $s \in Y, u \in Z$, then for $\mathcal{W}=(X \sqcup Y \sqcup Z, \leq \mathcal{W})=\left(\mathcal{T} \nearrow^{s} \mathcal{S}\right) \searrow u \mathcal{U}$, we have

- for all $x \in X, x \leq_{\mathcal{W}} s$,
- and for all $y \in X \sqcup Y, u \leq w y$,
then
- for all $x \in X, x \leq_{\Psi_{x, z}(\mathcal{W})} s$,
- and for all $y \in Y, u \leq \Psi_{X, Z}(\mathcal{W}) y$,
then $\Psi_{X, Z}(\mathcal{W})$ is connected.
moreover we have $\mathcal{T} \nearrow^{s} \mathcal{S}=\left(X \sqcup Y\right.$, $\left.\leq_{1}^{\prime}\right)$, with $\leq_{1}^{\prime}$ defined on $X \sqcup Y$ by:
$x, y \in X \sqcup Y$ et $x \leq_{1}^{\prime} y$ if and only if:
- Either $x, y \in X$ and $x \leq_{\mathcal{T}} y$,
- or $x, y \in Y$ and $x \leq_{s} y$,
- or $x \in X, y \in Y$ and $s \leq s y$,
then $\left(\mathcal{T} \nearrow^{s} \mathcal{S}\right) \searrow_{u} \mathcal{U}=\left(X \sqcup Y \sqcup Z, \leq_{\mathcal{W}}\right)$, with $\leq_{\mathcal{W}}$ defined on $X \sqcup Y \sqcup Z$ by:
$x, y \in X \sqcup Y \sqcup Z$ et $x \leq_{\mathcal{W}} y$ if and only if:
- Either $x, y \in X \sqcup Y$ and $x \leq_{1}^{\prime} y$,
- or $x, y \in Z$ and $x \leq u y$,
- or $x \in Z, y \in X \sqcup Y$ and $x \leq_{u} u$,
then $x, y \in X \sqcup Y \sqcup Z$ et $x \leq_{\mathcal{W}} y$ if and only if:
- Either $x, y \in X$ and $x \leq_{\mathcal{T}} y$,
- or $x, y \in Y$ and $x \leq_{s} y$,
- or $x \in X, y \in Y$ and $s \leq_{s} y$,
- or $x, y \in Z$ and $x \leq u y$,
- or $x \in Z, y \in Y$ and $x \leq_{u} u$,
- or $x \in Z, y \in X$ and $x \leq u u$,
if we apply $\Psi_{X, Z}$ to $\left(\mathcal{T} \nearrow^{s} \mathcal{S}\right) \searrow_{u} \mathcal{U}$, we can eliminate the cases: $x \in Z, y \in X$ and $x \leq_{u} u$. On the other hond
$\mathcal{S} \searrow_{u} \mathcal{U}=\left(Y \sqcup U, \leq_{1}\right)$, with $\leq_{1}$ defined on $Y \sqcup Z$ by:
$x, y \in Y \sqcup Z$ et $x \leq_{1} y$ if and only if:
- Either $x, y \in Y$ and $x \leq_{s} y$,
- or $x, y \in Z$ and $x \leq_{u} y$,
- or $x \in Z, y \in Y$ and $x \leq u u$,
then $\mathcal{T} \nearrow^{s}\left(\mathcal{S} \searrow_{u} \mathcal{U}\right)=(X \sqcup Y \sqcup Z, \leq)$, with $\leq$ defined on $X \sqcup Y \sqcup Z$ by:
$x, y \in X \sqcup Y \sqcup Z$ et $x \leq y$ if and only if:
- Either $x, y \in X$ and $x \leq_{\mathcal{T}} y$,
- or $x, y \in Y \sqcup Z$ and $x \leq_{1} y$,
- or $x \in X, y \in Y \sqcup Z$ and $s \leq_{1} y$,
then $x, y \in X \sqcup Y \sqcup Z$ et $x \leq y$ if and only if:
- Either $x, y \in X$ and $x \leq_{\mathcal{T}} y$,
- or $x, y \in Y$ and $x \leq_{\delta} y$,
- or $x, y \in Z$ and $x \leq u y$,
- or $x \in Z, y \in Y$ and $x \leq u u$,
- or $x \in X, y \in Y$ and $s \leq_{s} y$.

Then the equality between

$$
\mathcal{T} \nearrow^{s}\left(\mathcal{S} \searrow_{u} \mathcal{U}\right)=\Psi_{X, Z}\left(\left(\mathcal{T} \nearrow^{s} \mathcal{S}\right) \searrow_{u} \mathcal{U}\right) .
$$

Corollary 5.1. Let $\mathcal{T}=\left(X, \leq_{\mathcal{T}}\right), \mathcal{S}=\left(Y, \leq_{s}\right)$ and $\mathcal{U}=\left(Z, \leq_{\mathcal{U}}\right)$ be three finite connected topological spaces, and let $s \in Y, u \in Z$. Then

$$
\mathcal{T} \searrow_{s}\left(\mathcal{S} \nearrow^{u} \mathcal{U}\right)=\Psi_{X, Z}\left(\left(\mathcal{T} \searrow_{s} \mathcal{S}\right) \nearrow^{u} \mathcal{U}\right)
$$

i.e, the following diagram is commutative:

Proof. Let $\mathcal{T}=\left(X, \leq_{\mathcal{T}}\right), \mathcal{S}=\left(Y, \leq_{\mathcal{S}}\right)$ and $\mathcal{U}=\left(Z, \leq_{\mathcal{U}}\right)$ be three finite connected topological spaces, and let $s \in Y, u \in Z$.
We notice $\mathcal{T}^{\prime}=j(\mathcal{T}), \mathcal{S}^{\prime}=j(\mathcal{S})$ and $\mathcal{U}^{\prime}=j(\mathcal{U})$, according to theorem 5.1, we have:

$$
\mathcal{T}^{\prime} \nearrow^{s}\left(\mathcal{S}^{\prime} \searrow_{u} \mathcal{U}^{\prime}\right)=\Psi_{X, Z}\left(\left(\mathcal{T}^{\prime} \nearrow^{s} \mathcal{S}^{\prime}\right) \searrow_{u} \mathcal{U}^{\prime}\right),
$$

then

$$
j\left(\mathcal{T}^{\prime} \nearrow^{s}\left(\mathcal{S}^{\prime} \searrow u \mathcal{U}^{\prime}\right)\right)=j\left[\Psi_{X, Z}\left(\left(\mathcal{T}^{\prime} \nearrow^{s} \mathcal{S}^{\prime}\right) \searrow u \mathcal{U}^{\prime}\right)\right]
$$

then $\quad j\left(\mathcal{T}^{\prime}\right) \searrow_{s} j\left(\left(\mathcal{S}^{\prime} \searrow_{u} \mathcal{U}^{\prime}\right)\right)=\Psi_{X, Z}\left[j\left(\left(\mathcal{T}^{\prime} \nearrow^{s} \mathcal{S}^{\prime}\right)\right) \nearrow^{u} j\left(\mathcal{U}^{\prime}\right)\right]$,
then $\quad j\left(\mathcal{T}^{\prime}\right) \searrow_{s}\left(j\left(\mathcal{S}^{\prime}\right) \nearrow^{u} j\left(\mathcal{U}^{\prime}\right)\right)=\Psi_{X, Z}\left[\left(j\left(\mathcal{T}^{\prime}\right) \searrow_{s} j\left(\mathcal{S}^{\prime}\right)\right) \nearrow^{u} j\left(\mathcal{U}^{\prime}\right)\right]$.
Then

$$
\mathcal{T} \searrow_{s}\left(\mathcal{S} \nearrow^{u} \mathcal{U}\right)=\Psi_{X, Z}\left(\left(\mathcal{T} \searrow_{s} \mathcal{S}\right) \nearrow^{u} \mathcal{U}\right)
$$

Proposition 5.2. Let $\mathcal{T}=\left(X, \leq_{\mathcal{T}}\right), \mathcal{S}=\left(Y, \leq_{\S}\right)$ and $\mathcal{U}=\left(Z, \leq_{\mathcal{U}}\right)$ be three finite connected topological spaces, then

$$
\mathcal{T} \nearrow(\mathcal{S} \searrow \mathcal{U})-\Psi_{X, Z}((\mathcal{T} \nearrow \mathcal{S}) \searrow \mathcal{U})=\mathcal{S} \searrow(\mathcal{T} \nearrow \mathcal{U})-\Psi_{Y, Z}((\mathcal{S} \searrow \mathcal{T}) \nearrow \mathcal{U})
$$

Proof. Let $\mathcal{T}=\left(X, \leq_{\mathcal{T}}\right), \mathcal{S}=\left(Y, \leq_{\mathcal{S}}\right)$ and $\mathcal{U}=\left(Z, \leq_{\mathcal{U}}\right)$ be three finite connected topological spaces, then

$$
\begin{aligned}
\mathcal{T} \nearrow(\mathcal{S} \searrow \mathcal{U})-\Psi_{X, Z}((\mathcal{T} \nearrow \mathcal{S}) \searrow \mathcal{U}) & =\sum_{u \in Z, s \in Y \cup Z} \mathcal{T} \nearrow^{s}\left(\mathcal{S} \searrow_{u} \mathcal{U}\right)-\sum_{u \in Z, s \in Y} \Psi_{X, Z}\left(\left(\mathcal{T} \nearrow^{s} \mathcal{S}\right) \searrow_{u} \mathcal{U}\right) \\
& =\sum_{u, s \in Z} \mathcal{T} \nearrow^{s}\left(\mathcal{S} \searrow_{u} \mathcal{U}\right)+\sum_{u \in Z, s \in Y}\left[\mathcal{T} \nearrow^{s}\left(\mathcal{S} \searrow_{u} \mathcal{U}\right)\right. \\
& =\sum_{u, s \in \mathcal{Z}} \mathcal{T} \nearrow^{s}\left(\mathcal{S} \Psi_{X, Z} \mathcal{U}\left(\left(\mathcal{T} \nearrow^{s} \mathcal{S}\right) \searrow_{u} \mathcal{U}\right)\right] \\
& =\sum_{u, s \in Z} \mathcal{S} \searrow_{u}\left(\mathcal{T} \nearrow^{s} \mathcal{U}\right) \\
& =\sum_{u, s \in \mathcal{Z}} \mathcal{S} \searrow_{u}\left(\mathcal{T} \nearrow^{s} \mathcal{U}\right)+\sum_{s \in Z, u \in X}\left[\mathcal{S} \searrow_{u}\left(\mathcal{T} \nearrow^{s} \mathcal{U}\right)\right. \\
& =\sum_{s \in Z, u \in X \cup Z} \mathcal{S} \searrow_{Y u}\left(\mathcal{T} \nearrow^{s} \mathcal{U}\right)-\sum_{u \in X, s \in Z} \Psi_{Y, Z}\left(\left(\mathcal{S} \searrow_{u} \mathcal{T}\right) \nearrow^{s} \mathcal{U}\right) \\
& =\mathcal{S} \searrow(\mathcal{T} \nearrow \mathcal{U})-\Psi_{Y, Z}\left((\mathcal{S} \searrow \mathcal{T}) \nearrow^{s} \mathcal{U}\right) .
\end{aligned}
$$

Acknowledgements: I would like to thank my Ph.D. thesis supervisors: Professor Dominique Manchon and Professor Ali Baklouti for their advice, guidance and constant support.

Funding: This work was supported by the University of Sfax, Tunisia.
