TOEPLITZ ALGEBRAS OVER FOCK AND BERGMAN SPACES

SHENGKUN WU$^1$ AND XIANFENG ZHAO$^2$

Abstract. In this paper, we study Toeplitz algebras generated by certain class of Toeplitz operators on the $p$-Fock space and the $p$-Bergman space with $1 < p < \infty$. Let BUC($\mathbb{C}^n$) and BUC($\mathbb{B}_n$) denote the collections of bounded uniformly continuous functions on $\mathbb{C}^n$ and $\mathbb{B}_n$ (the unit ball in $\mathbb{C}^n$), respectively. On the $p$-Fock space, we show that the Toeplitz algebra which has a translation invariant closed subalgebra of BUC($\mathbb{C}^n$) as its set of symbols is linearly generated by Toeplitz operators with the same space of symbols. This answers a question recently posed by Fulsche [3]. On the $p$-Bergman space, we study Toeplitz algebras with symbols in some translation invariant closed subalgebras of BUC($\mathbb{B}_n$). In particular, we obtain that the Toeplitz algebra generated by all Toeplitz operators with symbols in BUC($\mathbb{B}_n$) is equal to the closed linear space generated by Toeplitz operators with such symbols. This generalizes the corresponding result for the case of $p = 2$ obtained by Xia [10].

1. Introduction

We begin with some basic notations and knowledge about Fock spaces, Bergman spaces and Toeplitz operators on such spaces. For a positive parameter $t$, let

\[ d\mu_t(z) = \frac{1}{(\pi t)^n} e^{-|z|^2/4} dV(z) \]

be the Gaussian measure on $\mathbb{C}^n$, where $dV(z)$ denotes the Lebesgue measure on $\mathbb{C}^n$. For $1 < p < \infty$, the $p$-Fock space $F_t^p$ is the space of entire functions $f$ on $\mathbb{C}^n$ which are $p$-integrable with respect to the Gaussian measure with a parameter \( \frac{2t}{p} \) > 0, i.e.,

\[ \|f\|_{F_t^p} = \left[ \int_{\mathbb{C}^n} |f(z)|^p d\mu_{2t/p}(z) \right]^{1/p} < \infty. \]

Let $q$ be the conjugate number of $p$, i.e., $\frac{1}{p} + \frac{1}{q} = 1$. Then the dual space of $F_t^p$ is $F_t^q$ and the duality pairing is given by

\[ \langle f, g \rangle_t = \int_{\mathbb{C}^n} f(z) \overline{g(z)} d\mu_t(z). \]

Key words and phrases. Toeplitz algebras; Fock spaces; Bergman spaces.
For $p = 2$, it is well-known that $F^2_t$ is a reproducing kernel Hilbert space with the reproducing kernel
\[ K^2_z(w) = \frac{w}{w - z}, \quad z, w \in \mathbb{C}^n, \]
where
\[ w \cdot \bar{z} = w_1\bar{z}_1 + \cdots + w_n\bar{z}_n \]
for $w = (w_1, \ldots, w_n)$ and $z = (z_1, \ldots, z_n)$. The normalized reproducing kernel is given by
\[ k^2_z(w) = \frac{K^2_z(w)}{\|K^2_z\|_{F^2_t}} = \frac{\bar{w} - \bar{z}|z|^2}{\|K^2_z\|_{F^2_t}}, \quad z, w \in \mathbb{C}^n. \]
Moreover, one can check easily that
\[ \|f\|_{F^p_t} = \left[ \frac{1}{(\pi t)^n} \int_{\mathbb{C}^n} |\langle f, k^j_z \rangle_t|^p dV(z) \right]^\frac{1}{p} \]
for $1 \leq p < \infty$.

With the normalized reproducing kernels on the Fock space $F^2_t$, the Berezin transform of an operator $T$ on $F^p_t$ is defined by
\[ \tilde{T}(z) = \langle Tk^j_z, k^j_z \rangle_t, \quad z \in \mathbb{C}^n. \]
For $\varphi \in L^\infty(\mathbb{C}^n, dV)$, the Toeplitz operator $T_\varphi$ with symbol $\varphi$ on $F^p_t$ is defined by
\[ T_\varphi f(z) = \int_{\mathbb{C}^n} \varphi(w)f(w)\overline{K^j_z(w)}d\mu_t(w). \]
Then $T_\varphi$ is bounded on $F^p_t$, i.e., $T_\varphi$ is bounded from $F^p_t$ to $F^p_t$.

Let $\mathbb{B}_n = \{z \in \mathbb{C}^n : |z| < 1\}$ denote the unit ball in $\mathbb{C}^n$. Let $dv$ denote the normalized Lebesgue measure on $\mathbb{B}_n$ with the normalization $v(\mathbb{B}_n) = 1$. For $1 < p < \infty$, the $p$-Bergman space $L^p_a$ is the collection of all holomorphic functions that are $p$-integrable with respect to $dv$. The norm on the Banach space $L^p_a$ is given by
\[ \|f\|_p = \left[ \int_{\mathbb{B}_n} |f(z)|^pdv(z) \right]^\frac{1}{p}. \]
Furthermore, the dual space of $L^p_a$ is $L^q_q$ under the standard duality pairing:
\[ \langle f, g \rangle = \int_{\mathbb{B}_n} f(z)\overline{g(z)}dv(z), \]
where $\frac{1}{p} + \frac{1}{q} = 1$. Recall that the reproducing kernel for the Bergman space $L^2_a$ is given by
\[ K_z(w) = \frac{1}{(1 - w \cdot \bar{z})^{n+1}}, \quad z, w \in \mathbb{B}_n. \]
Similar to the setting of $p$-Fock space, the Toeplitz operator $T_\varphi$ with symbol $\varphi \in L^\infty(\mathbb{B}_n, dv)$ on $L^p_a$ can also be defined via reproducing kernels:
\[ T_\varphi f(z) = \int_{\mathbb{B}_n} \varphi(w)f(w)\overline{K_z(w)}dv(w), \]
which is bounded on $L^p_a$.

Toeplitz algebras over Bergman spaces and Fock spaces have been investigated by many authors for a long time, see for example [2], [7], [8], [1], [9], [5], [10], [11], [12], [3] and [4]. Let us fix more notations before going to review the background about the investigation of Toeplitz algebras over these two function spaces.

By the full Toeplitz algebra, we mean that the Banach algebra generated by all Toeplitz operators with (essentially) bounded symbols. Let $\mathcal{J}$ be a subset of $L^\infty(\mathbb{C}^n, dv)$ and $\mathcal{T}(\mathcal{J})$ be the Banach algebra generated by $\{T_\varphi : \varphi \in \mathcal{J}\}$. In this paper, we shall call $\mathcal{T}(\mathcal{J})$ the Toeplitz algebra generated by all Toeplitz operators with symbols in $\mathcal{J}$. Moreover, we use $\mathcal{T}_{\text{fin}}(\mathcal{J})$ to denote the closed linear space generated by Toeplitz operators with symbols in $\mathcal{J}$. Let $\text{BUC}(\mathbb{C}^n)$ denote the set of bounded functions on $\mathbb{C}^n$ which are
uniformly continuous with respect to the Euclidean metric. For $f \in F^p_I$ and $z \in \mathbb{C}^n$, the translation $\alpha_z$ is defined by

$$(\alpha_z f)(w) := f(w + z), \quad w \in \mathbb{C}^n.$$  

We say that $\mathcal{J} \subset \text{BUC}(\mathbb{C}^n)$ is translation invariant on $\mathbb{C}^n$ if $\alpha_z f \in \mathcal{J}$ for all $f \in \mathcal{J}$ and $z \in \mathbb{C}^n$. Note that $\text{BUC}(\mathbb{C}^n)$ is translation invariant. In addition, the Berezin transform of any bounded linear operator on $F^p_I$ is also in $\text{BUC}(\mathbb{C}^n)$, see [3, Lemma 2.8] if necessary.

In the setting of the $p$-Bergman space, we let $\mathcal{I}$ be a subset of $L^\infty(\mathbb{B}_n, dv)$ and $T^b(\mathcal{I})$ be the Banach algebra generated by $\{T_\varphi : \varphi \in \mathcal{I}\}$. In the following, we shall call $T^b(\mathcal{I})$ the Toeplitz algebra generated by all Toeplitz operators with symbols in $\mathcal{I}$. We denote $T^b_{\text{loc}}(\mathcal{I})$ by the closed linear space generated Toeplitz operators with symbols in $\mathcal{I}$. We use $\text{BUC}(\mathbb{B}_n)$ to denote the set of bounded functions on $\mathbb{B}_n$ which are uniformly continuous with respect to the Bergman metric (which will be introduced in Section 3). For $f \in \text{BUC}(\mathbb{B}_n)$ and $z \in \mathbb{B}_n$, we define $\tau_z$ on $\text{BUC}(\mathbb{B}_n)$ as

$$(\tau_z f)(u) = f(\varphi_u(z)), \quad u \in \mathbb{B}_n,$$  

where $\varphi_u$ is the Möbius transform of $\mathbb{B}_n$ that interchanges 0 and $u$. For a subset $\mathcal{I}$ of $\text{BUC}(\mathbb{B}_n)$, we say that $\mathcal{I}$ is translation invariant on $\mathbb{B}_n$ if $\tau_z f \in \mathcal{I}$ for all $f \in \mathcal{I}$ and $z \in \mathbb{B}_n$.

In 2007, Suárez [8] obtained that the full Toeplitz algebra over the $p$-Bergman space $L^p_n$ equals the Toeplitz algebra with symbols in $\text{BUC}(\mathbb{B}_n)$ via the $n$-Berezin transform. Then Bauer and Isralowitz [1] established the same result for the full Toeplitz algebra over weighted Fock spaces. In [9], Xia and Zheng defined the sufficiently localized operator on $F^2_L$ and characterized the compactness of operators in the $C^*$-algebra generated by sufficiently localized operators. Furthermore, they obtained that the $C^*$-algebra generated by sufficiently localized operators contains the full Toeplitz algebra over the Fock space $F^2_L$.

Later, Isralowitz, Mitkovski and Wick [5] introduced the weakly localized operators on $L^p_n$ and showed that such class of operators forms an algebra and its closure also contains the full Toeplitz algebra over $L^p_n$ ($F^p_L$). Based on the study of the $C^*$-algebra generated by weakly localized operators, Xia [10] showed that the full Toeplitz algebra is equal to the norm closure of $\{T_\varphi : \varphi \in L^\infty(\mathbb{B}_n, dv)\}$. Indeed, in the setting of the Bergman space $L^2_n$ and the Fock space $F^2_L$, Xia [10] obtained that the full Toeplitz algebra coincides with the $C^*$-algebra generated by the class of weakly localized operators. In 2020, using a correspondence theory of translation invariant symbol on $\mathbb{C}^n$ and operator spaces, Fulsche [3] showed that the full Toeplitz algebra over the $p$-Fock space $F^p_L$ is the norm closure of all Toeplitz operators with symbols in $\text{BUC}(\mathbb{C}^n)$, which generalizes the result obtained by Xia [10] in the case of $p = 2$. Moreover, Fulsche [3] proved that every Toeplitz algebra which has a translation and $U$-invariant $C^*$-subalgebra of $\text{BUC}(\mathbb{C}^n)$ as its set of symbols is linearly generated by Toeplitz operators with the same space of symbols. Recently, by using a characterization of Toeplitz algebras over the $p$-Fock space $F^p_L$ [3], Hagger [4] established that the full Toeplitz algebra over $F^p_L$ coincides with each of the algebras generated by band-dominated, sufficiently localized and weakly localized operators, respectively.

In this paper, we will mainly consider the Toeplitz algebras generated by Toeplitz operators with symbols in some translation invariant closed subalgebras of $\text{BUC}(\mathbb{C}^n)$ and $\text{BUC}(\mathbb{B}_n)$ on the $p$-Fock space and the $p$-Bergman space, respectively. Recall that the orthonormal basis of $L^p_n$, and the integral representation in terms of certain sum of rank-one operators over a lattice for a class of Toeplitz operators are the crucial ingredients in Xia’s approach [10]. But the idea used there can not be applied to treat Toeplitz operators with translation invariant symbols on the Banach spaces $L^p_n$ and $F^p_L$. Noting that the automorphism group of $\mathbb{C}^n$ is commutative, thus the convolution of two functions (or two operators) has some nice properties on Fock spaces and which can be used to approximate an operator in the Toeplitz algebra by a sequence of Toeplitz operators [3]. However, the automorphism group of $\mathbb{B}_n$ is not commutative, so the technique used in [3] may not work for the case of Bergman spaces over the unit ball.

In order to characterize Toeplitz algebras with symbols in a subset of $\text{BUC}(\mathbb{C}^n)$ ($\text{BUC}(\mathbb{B}_n)$) over the $p$-Fock space ($p$-Bergman space), we will first establish an integral representation for weakly localized operators on the $p$-Fock space ($p$-Bergman space). Based on this integral representation, we are able to further study weakly localized operators on $F^p_L$ and $L^p_n$ via the Berezin transform. We now give a short
outline of the rest of the paper. In Section 2, we show that the Toeplitz algebra generated by Toeplitz operators on the $p$-Fock space $F_p^p$ with symbols in a translation invariant closed subalgebra of $\text{BUC}(\mathbb{C}^n)$ is linearly generated by Toeplitz operators with the same space of symbols, see Theorem 2.1. This answers an open question posed in [3] by using different methods. In Section 3, we obtain an integral representation for $s$-weakly localized operators (see Definition 3.1) on the $p$-Bergman space $L_p^p$, see Theorem 3.2. Then we apply this integral representation to study Toeplitz algebras with symbols in some translation invariant subalgebra $I \subset \text{BUC}(\mathbb{B}_n)$ in Section 4. In particular, we obtain in Theorem 4.9 that $T^b[I\text{BUC}(\mathbb{B}_n)]$ and $T^b[\text{BUC}(\mathbb{B}_n)]$ are both equal to the norm closure of the collection of $s$-weakly localized operators on $L_p^p$, $T^b[C_0(\mathbb{B}_n)]$ and $T^b[0\text{BUC}(\mathbb{B}_n)]$ are both equal to the ideal of compact operators on $L_p^p$, where $C_0(\mathbb{B}_n)$ is the (translation invariant) subalgebra of $\text{BUC}(\mathbb{B}_n)$ consisting of functions $f$ with $f(z) \to 0$ as $|z| \to 1$. This generalizes a result obtained by Xia in the case $p = 2$, see [10, Theorem 1.5].

In the following, $T^*$ denotes the Banach space adjoint of the bounded linear operator $T$ on $F_p^p$ or $L_p^p$. In addition, the notation $A \lesssim B$ for two nonnegative quantities $A$ and $B$ means that there is some inessential constant $C > 0$ such that $A \leq CB$.

2. TOEPLITZ ALGEBRAS OVER THE $p$-FOCK SPACE

This section is devoted to the study of the Toeplitz algebra $\mathcal{T}(\mathcal{J})$ over $F_t^p$ with $1 < p < \infty$, where $\mathcal{J}$ is a translation invariant closed subalgebra of $\text{BUC}(\mathbb{C}^n)$. The main result of this section is the following theorem, which shows that the assumption that the $U$-invariance and the self-adjointness of $\mathcal{J}$ is in fact unnecessary. This answers an open problem recently raised by Fulsche in [3, page 39].

**Theorem 2.1.** Let $\mathcal{J}$ be a translation invariant closed subalgebra of $\text{BUC}(\mathbb{C}^n)$, then

$$\mathcal{T}(\mathcal{J}) = \mathcal{T}_{\text{lin}}(\mathcal{J})$$

holds on $F_t^p$. Moreover, if $\mathcal{J}_1$ is a translation invariant closed ideal of $\mathcal{J}$, then $\mathcal{T}(\mathcal{J}_1)$ is a two-sided ideal in $\mathcal{T}(\mathcal{J})$.

The proof of the above theorem relies on the integral representation for weakly localized operators on $F_t^p$. Let us recall the definition of this class of operators on the p-Fock space $F_t^p$, which was first introduced by Isralowitz, Mitkovski and Wick [5, Definition 1.1].

**Definition 2.2.** Let $T$ be a bounded linear operator on $F_t^p$. Then $T$ is said to be weakly localized if it satisfies the following four conditions:

$$\sup_{z \in \mathbb{C}^n} \int_{\mathbb{C}^n} |\langle Tk_z^l, k_w^t \rangle| dV(w) < \infty,$$

$$\sup_{z \in \mathbb{C}^n} \int_{\mathbb{C}^n} |\langle T^* k_z^l, k_w^t \rangle| dV(w) < \infty,$$

$$\lim_{r \to \infty} \sup_{z \in \mathbb{C}^n} \int_{\mathbb{C}^n \setminus B(z, r)} |\langle Tk_z^l, k_w^t \rangle| dV(w) = 0,$$

$$\lim_{r \to \infty} \sup_{z \in \mathbb{C}^n} \int_{\mathbb{C}^n \setminus B(z, r)} |\langle T^* k_z^l, k_w^t \rangle| dV(w) = 0,$$

where $B(z, r)$ denotes the ball $\{w \in \mathbb{C}^n : |w - z| < r\}$ in $\mathbb{C}^n$ with center $z$ and radius $r$. We denote the collection of weakly localized operators on $F_t^p$ by $A_t^p$.

As the proof of Theorem 2.1 is long, we will divide the proof into several steps and complete the details in the end of this section. The main three steps of our approach are the following.

1. First, we establish an integral representation for weakly localized operators on $F_t^p$ (Theorem 2.5);

2. Based on the integral representation mentioned above, we show that a weakly localized operator belongs to the space $T_{\text{lin}}(\mathcal{J})$ if its Berezin transform is in $\mathcal{J}$ (Proposition 2.8);

3. For a finite product of Toeplitz operators with symbols in $\mathcal{J}$, we show that its Berezin transform belongs to $\mathcal{J}$ (Proposition 2.9).
Noting that the finite sum of finite products of Toeplitz operators with symbols in \( \mathcal{J} \) is weakly localized, and \( T_{lin}(\mathcal{J}) \subset T(\mathcal{J}) \), then Theorem 2.1 will follow immediately from (1)-(3).

In order to establish an integral representation for weakly localized operators on \( F^p_t \), first we need to recall some properties of Weyl operators on Fock spaces. For \( z \in \mathbb{C}^n \), the Weyl operator \( W_z \) is defined by

\[
W_z f(w) = k_z^f(w)f(w - z), \quad w \in \mathbb{C}^n,
\]

where \( f \in F^p_t \). It is easy to check that the following hold for all \( z, w \in \mathbb{C}^n \): \( W_z^* = W_{-z} \) and

\[
W_w W_z = e^{-i \ln(w \cdot z) \pi} W_{w+z}, \quad W_w k_z^f = e^{-i \ln(w \cdot z) \pi} k_{w+z}^f, \quad ||W_z f||_{F^p_t} = ||f||_{F^p_t}.
\]

(2.1)

For more information on Weyl operators, one can consult Chapter 2 of \cite{13}.

Let us begin with the following lemma.

**Lemma 2.3.** Let \( T \) be a bounded linear operator on \( F^p_t \). Suppose that \( h_0 \in L^\infty(\mathbb{C}^n, dV) \) and \( h_1, h_2 \in F^1_t \), then we have

\[
\sup_{u \in \mathbb{C}^n} |\langle TW_u h_1, W_u h_2 \rangle_t| \lesssim ||T|| \cdot ||h_1||_{F^1_t} ||h_2||_{F^1_t}
\]

and

\[
\left| \int_{\mathbb{C}^n} h_0(u) \langle f, W_u h_1 \rangle_t \langle W_u h_2, g \rangle_t dV(u) \right| \lesssim ||h_0||_{\mathcal{F}} ||h_1||_{F^1_t} ||h_2||_{F^1_t} ||f||_{F^p_t} ||g||_{F^p_t}
\]

for all \( f \in F^p_t \) and \( g \in F^p_t \).

**Proof.** First, we have

\[
|\langle TW_u h_1, W_u h_2 \rangle_t| \lesssim ||T|| \cdot ||W_u h_1||_{F^p_t} ||W_u h_2||_{F^p_t}
\]

\[
= ||T|| \cdot ||h_1||_{F^p_t} ||h_2||_{F^p_t}
\]

\[
\lesssim ||T|| \cdot ||h_1||_{F^1_t} ||h_2||_{F^1_t},
\]

where the last inequality follows from \cite[Theorem 2.10]{13}. Recall that the identity operator can be written as

\[
I = \frac{1}{(\pi t)^n} \int_{\mathbb{C}^n} (k_z^t \otimes k_z^t) dV(z)
\]

on \( F^p_t \), where

\[
(k_z^t \otimes k_z^t) f = \langle f, k_z^t \rangle_t k_z^t
\]

for \( f \in F^p_t \). Then we have

\[
\langle f, W_u h_1 \rangle_t = \frac{1}{(\pi t)^n} \int_{\mathbb{C}^n} \langle f, k_z^t \rangle_t \langle k_z^t, W_u h_1 \rangle_t dV(z).
\]

This gives us that

\[
\left| \int_{\mathbb{C}^n} h_0(u) \langle f, W_u h_1 \rangle_t \langle W_u h_2, g \rangle_t dV(u) \right|
\]

\[
\lesssim \int_{\mathbb{C}^n} |h_0(u)| \left| \int_{\mathbb{C}^n} \langle f, k_z^t \rangle_t \langle k_z^t, W_u h_1 \rangle_t dV(z) \right| \left| \int_{\mathbb{C}^n} \langle W_u h_2, k_z^t \rangle_t \langle k_z^t, g \rangle_t dV(w) dV(u) \right|
\]

\[
\lesssim ||h_0||_{\mathcal{F}} \int_{\mathbb{C}^n} \left\| \langle f, k_z^t \rangle_t \left( \int_{\mathbb{C}^n} \langle k_z^t, W_u h_1 \rangle_t \langle k_z^t, W_u h_2 \rangle_t dV(u) \right) \langle k_z^t, g \rangle_t dV(w) \right\| dV(z).
\]

Denoting

\[
F(z, w) := \int_{\mathbb{C}^n} \langle k_z^t, W_u h_1 \rangle_t \langle W_u h_2, k_z^t \rangle_t dV(u),
\]

...
then Hölder’s inequality gives
\[
\int_{C^n} \int_{C^n} |\langle f, k^t_x \rangle| \left( \int_{C^n} |\langle k^t_x, W_u h_1 \rangle| \ |\langle W_u h_2, k^t_w \rangle| dV(u) \right) |\langle k^t_w, g \rangle| dV(w) dV(z)
\]
\[
= \int_{C^n} \int_{C^n} |\langle f, k^t_x \rangle| F(z, w) |\langle k^t_w, g \rangle| dV(w) dV(z)
\]
\[
= \int_{C^n} \int_{C^n} |\langle f, k^t_x \rangle| F(z, w)^\frac{1}{p} F(z, w)^\frac{1}{q} dV(z) |\langle k^t_w, g \rangle| dV(w)
\]
\[
\leq \left[ \int_{C^n} \left( \int_{C^n} |\langle f, k^t_x \rangle| F(z, w)^\frac{1}{p} F(z, w)^\frac{1}{q} dV(z) \right)^p dV(w) \right]^\frac{1}{p} ||g||_{F^q_w}
\]
\[
\leq \|f\|_{F^p_t} \|g\|_{F^q_w} \left[ \sup_{z \in C^n} \int_{C^n} F(z, w) dV(w) \right]^\frac{1}{p} \left[ \sup_{w \in C^n} \int_{C^n} F(z, w) dV(z) \right]^\frac{1}{q}.
\]
Furthermore, we have that
\[
\sup_{z \in C^n} \int_{C^n} F(z, w) dV(w) \leq \sup_{z \in C^n} \int_{C^n} |\langle k^t_x, W_u h_1 \rangle| \ |\langle W_u h_2, k^t_w \rangle| dV(u) dV(w)
\]
\[
= \sup_{z \in C^n} \int_{C^n} \int_{C^n} |\langle k^t_x, h_1 \rangle| \ |\langle h_2, k^t_w \rangle| dV(u) dV(w)
\]
\[
= \sup_{z \in C^n} \int_{C^n} |\langle k^t_x, h_1 \rangle| \left( \int_{C^n} |\langle h_2, k^t_w \rangle| dV(w) dV(u) \right)
\]
\[
\lesssim ||h_1||_{F^1_t} ||h_2||_{F^1_t},
\]
where the last inequality follows from that
\[
\int_{C^n} |\langle \psi, k^t_x \rangle| dV(\lambda) = (\pi t)^n ||\psi||_{F^1_t}
\]
for \( \psi \in F^1_t \) and \( \lambda \in C^n \). This yields that
\[
\left| \int_{C^n} h_0(u) \langle f, W_u h_1 \rangle \langle W_u h_2, g \rangle dV(u) \right| \lesssim ||h_0||_{\infty} ||h_1||_{F^1_t} ||h_2||_{F^1_t} \|f\|_{F^p_t} ||g||_{F^q_w}.
\]
This completes the proof of the lemma.

For each \( h_0 \in L^\infty(C^n, dV) \) and \( h_1, h_2 \in F^1_t \), we define the operator
\[
\int_{C^n} h_0(u)(W_u h_1 \otimes W_u h_2) dV(u)
\]
on \( F^p_t \) by
\[
\left\langle \int_{C^n} h_0(u)(W_u h_1 \otimes W_u h_2) dV(u)f, \ g \right\rangle_t = \int_{C^n} h_0(u) \langle f, W_u h_2 \rangle \langle W_u h_1, g \rangle dV(u),
\]
where \( f \in F^p_t \) and \( g \in F^q_t \). Note that Lemma 2.3 guarantees that this operator is bounded.

The following lemma is elementary, but we include a proof here for the sake of completeness.

**Lemma 2.4.** For any \( r > 0 \) and \( w, w' \in B(0, r) \), we have that
\[
||k^t_w - k^t_w||_{F^1_t} \leq C_r |w - w'|
\]
for some positive constant \( C_r \) depending only on \( r \).
Proof. Using the definition of $W_w$ and (2.1), we have
\[
\|k^t_w - k^t_{w'}\|_{F^p_t} = \left\| W_w 1 - W_w e^{\frac{1}{t} \ln(w - w')} k^t_{w'-w} \right\|_{F^p_t}
\leq \left\| 1 - e^{\frac{1}{t} \ln(w - w')} k^t_{w'-w} \right\|_{F^p_t}
\leq \left\| 1 - e^{\frac{1}{t} \ln(w - w')} \right\| + \left\| 1 - k^t_{w'-w} \right\|_{F^p_t}
\leq 1 - e^{\frac{|w - w'|}{t}} + \left\| 1 - k^t_{w'-w} \right\|_{F^p_t}
\leq 1 - e^{\frac{|w - w'|}{t}} + \left\| 1 - k^t_{2w'-2w} e^{\frac{|w'-w|^2}{2t}} \right\|_{F^p_t}
\leq 1 - e^{\frac{|w - w'|}{t}} + \left\| 1 - k^t_{2w'-2w} e^{\frac{|w'-w|^2}{2t}} \right\|_{F^p_t}
\leq 1 - e^{\frac{|w - w'|}{t}} + 1 - e^{\frac{|w'-w|^2}{2t}} + e^{\frac{|w'-w|^2}{2t}} \left\| 1 - k^t_{2w'-2w} \right\|_{F^p_t}
\leq C_r |w - w'|,
\]
where the third inequality follows from that $k^t_{w'-w} = k^t_{2w'-2w} e^{\frac{|w'-w|^2}{2t}}$. \hfill \Box

Based on the previous two lemmas, we are able to establish an integral representation for weakly localized operators on $F^p_t$.

**Theorem 2.5.** Let $A$ be a bounded linear operator on $F^p_t$. Then for each $r > 0$, the mapping
\[
w \mapsto \int_{\mathbb{C}^n} \langle AW_z k^t_0, W_z k^t_w \rangle (W_z k^t_0) \otimes (W_z k^t_0) dV(z) = \int_{\mathbb{C}^n} \langle Ak^t_z, k^t_{z+w} \rangle (k^t_{z+w} \otimes k^t_z) dV(z)
\]
is uniformly continuous and uniformly bounded from $B(0, r)$ to the set of bounded linear operators on $F^p_t$. Moreover, the integral
\[
\int_{B(0, r)} \int_{\mathbb{C}^n} \langle Ak^t_z, k^t_{z+w} \rangle (k^t_{z+w} \otimes k^t_z) dV(z) dV(w)
\]
is convergent in the norm topology. Furthermore, if $A$ is weakly localized on $F^p_t$, then
\[
\frac{1}{(\pi t)^{2n}} \int_{B(0, r)} \int_{\mathbb{C}^n} \langle Ak^t_z, k^t_{z+w} \rangle (k^t_{z+w} \otimes k^t_z) dV(z) dV(w)
\]
converges to $A$ in norm as $r \to \infty$.

**Proof.** We obtain by (2.1) that
\[
\int_{\mathbb{C}^n} \langle AW_z k^t_0, W_z k^t_w \rangle (W_z k^t_0) \otimes (W_z k^t_0) dV(z) = \int_{\mathbb{C}^n} \langle Ak^t_z, k^t_{z+w} \rangle (k^t_{z+w} \otimes k^t_z) dV(z).
\]
Then the first conclusion follows from Lemmas 2.3 and 2.4. Thus the integral
\[
\int_{B(0, r)} \int_{\mathbb{C}^n} \langle Ak^t_z, k^t_{z+w} \rangle (k^t_{z+w} \otimes k^t_z) dV(z) dV(w)
\]
is convergent in the norm topology.
Let $A$ be weakly localized on $F^p_t$. For any $f \in F^p_t$ and $g \in F^q_t$, we have
\[
\langle Af, g \rangle_t = \frac{1}{(\pi t)^n} \int_{\mathbb{C}^n} \langle Af, k^t \rangle_t \langle k^t, g \rangle_t dV(w)
\]
\[
= \frac{1}{(\pi t)^n} \int_{\mathbb{C}^n} \langle f, A^* k^t \rangle_t \langle k^t, g \rangle_t dV(w)
\]
\[
= \frac{1}{(\pi t)^{2n}} \int_{\mathbb{C}^n} \int_{\mathbb{C}^n} \langle f, k^t \rangle_t \langle k^t, A^* k^t \rangle_t \langle k^t, g \rangle_t dV(z)dV(w)
\]
\[
= \frac{1}{(\pi t)^{2n}} \int_{\mathbb{C}^n} \int_{\mathbb{C}^n} \langle f, k^t \rangle_t \langle k^t, z, w \rangle \langle k^t, g \rangle_t dV(z)dV(w)
\]
Using the same method as in the proof of Lemma 2.3, we get
\[
\left| \langle Af, g \rangle_t - \frac{1}{(\pi t)^{2n}} \int_{B(0, r)} \int_{\mathbb{C}^n} \|Ak^t, k^t \rangle_t \langle k^t, k^t \rangle_t dV(z) dV(w) f, g \rangle_t \right|
\]
\[
= \frac{1}{(\pi t)^{2n}} \int_{\mathbb{C}^n \setminus B(0,r)} \int_{\mathbb{C}^n} |\langle f, k^t \rangle_t| |\langle Ak^t, k^t \rangle_t| |\langle k^t, g \rangle_t| dV(z) dV(w)
\]
\[
= \frac{1}{(\pi t)^{2n}} \int_{\mathbb{C}^n \setminus B(0,r)} \int_{\mathbb{C}^n} |\langle f, k^t \rangle_t| |\langle Ak^t, k^t \rangle_t| |\langle k^t, g \rangle_t| dV(w) dV(z)
\]
\[
\lesssim \|f\|_{F^p_t} \|g\|_{F^q_t} \left[ \sup_{z \in \mathbb{C}^n} \int_{\mathbb{C}^n \setminus B(0, r)} \|Ak^t, k^t \rangle_t |dV(w)\| \right]^{\frac{1}{p}} \left[ \sup_{w \in \mathbb{C}^n} \int_{\mathbb{C}^n} \|Ak^t, k^t \rangle_t |dV(z)\| \right]^{\frac{1}{q}}.
\]
Now the desired conclusion follows from the definition of a weakly localized operator. \(\square\)

Next, we will establish a sufficient condition for a weakly localized operator to be in the space $T_{\text{lin}}(\mathcal{J})$ via the Berezin transform. Before going further, we still need some preparations.

Let $L$ be a bilinear map from $F^1_t \times F^1_t$ to some Banach space $\mathcal{B}$. Suppose that $L(f, g)$ is linear with respect to $f$ and conjugate linear with respect to $g$. We say $L$ is bounded if
\[
L(f, g) \lesssim \|f\|_{F^1_t} \|g\|_{F^1_t}
\]
for all $f, g \in F^1_t$. For any multi-index $a = (a_1, \cdots, a_n)$ with $a_j \geq 0$ and $z \in \mathbb{C}^n$, we denote
\[
z^a = z_1^{a_1} \cdots z_n^{a_n}, \quad a! = a_1! \cdots a_n!
\]
and $|a| = a_1 + a_2 + \cdots + a_n$.

With the notations above, we have the following proposition.

**Proposition 2.6.** Let $L$ be a bounded bilinear map from $F^1_t \times F^1_t$ to a Banach space $\mathcal{B}$. Let $\mathcal{B}_1$ be a closed subspace of $\mathcal{B}$. If $L(k^t, k^t) \in \mathcal{B}_1$ for any $z \in \mathbb{C}^n$, then $L(k^t, k^t) \in \mathcal{B}_1$ for all $z, w \in \mathbb{C}^n$.

**Proof.** We only need to show that $L(K^t, K^t) \in \mathcal{B}_1$ if
\[
L(K^t, K^t) \in \mathcal{B}_1
\]
for all $z, w \in B(0, r)$ with $r > 0$.

For any multi-index $a = (a_1, \cdots, a_n)$, let $g_a(\xi) = \xi^a$ be in $F^1_t$. We know that $K^t(\xi)$ has a series expansion
\[
K^t(\xi) = \sum_a c_a z^a g_a(\xi)
\]
with $c_a > 0$. Noting that
\[
\lim_{m \to \infty} \sum_{|a| \leq m} c_a z^a g_a(\xi) = K^t(\xi)
\]
and
\[
|K^t(\xi) - \sum_{|a| \leq m} c_a z^a g_a(\xi)| \leq e \frac{\rho d_1}{1} + e \frac{\rho (|\xi_1| + \cdots + |\xi_n|)}{1},
\]
For each \( z \in \mathbb{C}^n \). Thus, it is enough to show that \( L(g_a, g_b) \in \mathcal{B}_1 \) for any multi-indices \( a \) and \( b \). Let

\[
K_{z,a}^t := \frac{\partial^a K_z^t}{\partial z^a}.
\]

Since

\[
\frac{\partial^a K_z^t}{\partial z^a} \bigg|_{z=0} = c_a a! g_a,
\]

it is sufficient to show that \( L(K_{z,a}^t, K_{z,b}^t) \in \mathcal{B}_1 \) for any two multi-indices \( a \) and \( b \). Let us prove this by induction.

First, when \( a = b = 0 \), we have

\[
L(K_{z,0}^t, K_{z,0}^t) = L(K_{z,z}^t, K_{z,z}^t) \in \mathcal{B}_1.
\]

Suppose that \( L(K_{z,a}^t, K_{z,b}^t) \in \mathcal{B}_1 \) if \( |a + b| \leq m \). Now we are going to show that \( L(K_{z,a}^t, K_{z,b}^t) \in \mathcal{B}_1 \) if \( |a + b| = m + 1 \). Without loss of generality, we may assume that \( a_1 \geq 1 \). Let \( e = (1, 0, \cdots, 0) \). Then there is a multi-index \( a' \) such that \( a' + e = a \). For any \( s > 0 \) such that \( z + se \in B(0, r) \), we have

\[
\frac{1}{s} \left[ L(K_{z+se,a',z+se,b}^t, K_{z+se,b}^t) - L(K_{z,a',z,b}^t, K_{z,b}^t) \right]
= L\left( K_{z+se,a',z+se,b} - K_{z,a',z,b}^t, s \right) + L\left( K_{z,a',z,b}^t, \frac{K_{z+se,b}^t - K_{z,b}^t}{s} \right).
\]

By the dominated convergence theorem again, we have

\[
\lim_{s \to 0} \left\| K_{z+se,a',z+se,b}^t - K_{z,a'}^t - K_{z,b}^t \right\|_{F_1^t} = 0 \quad \text{and} \quad \lim_{s \to 0} \left\| K_{z+se,b}^t - K_{z,b}^t \right\|_{F_1^t} = 0,
\]

to obtain

\[
L(K_{z,a',z+e+b}^t, K_{z,a'}^t) + L(K_{z,a'}^t, K_{z,b+e}^t) = \lim_{s \to 0} L\left( K_{z+se,a',z+se,b}^t - K_{z,a'}^t, s \right) + \lim_{s \to 0} L\left( K_{z,a'}^t, \frac{K_{z+se,b}^t - K_{z,b}^t}{s} \right)
= \lim_{s \to 0} \frac{1}{s} \left[ L(K_{z+se,a',z+se,b}^t, K_{z+se,b}^t) - L(K_{z,a',z,b}^t, K_{z,b}^t) \right] \in \mathcal{B}_1.
\]

On the other hand, we have

\[
\frac{1}{is} \left[ L(K_{z+ise,a',z+ise,b}^t, K_{z+ise,b}^t) - L(K_{z,a'}^t, K_{z,b}^t) \right]
= L\left( K_{z+ise,a',z+ise,b} - K_{z,a'}^t, \frac{K_{z+ise,b}^t - K_{z,b}^t}{is} \right) - L\left( K_{z,a'}^t, \frac{K_{z+ise,b}^t - K_{z,b}^t}{is} \right).
\]

Similarly, we have

\[
L(K_{z,a'}^t, K_{z,b}^t) - L(K_{z,a',z+e}^t, K_{z,b+e}) \in \mathcal{B}_1.
\]

Therefore, we obtain that

\[
2L(K_{z,a}^t, K_{z,b}^t) = L(K_{z,a}^t, K_{z,b}^t) - L(K_{z,a'}^t, K_{z,b+e}) + L(K_{z,a'}^t, K_{z,b}^t) + L(K_{z,a',z+e}^t, K_{z,b+e}^t)
\]
belongs to \( \mathcal{B}_1 \). This finishes the proof of Proposition 2.6.

In view of Proposition 2.6, we obtain that \( \langle AW(z)^t_1, W(z)^{t_1} \rangle \in \mathcal{J} \) when the Berezin transform of the operator \( A \) is in \( \mathcal{J} \), where \( W(z)^t \) is a Weyl operator.
Corollary 2.7. Let \( A \) be a bounded linear operator on \( F^p_t \), \( z, w \in \mathbb{C}^n \) and \( J \) be a translation invariant closed subalgebra of BUC(\( \mathbb{C}^n \)). If the Berezin transform of \( A \) is in \( J \), then
\[
\langle AW^k_z, W^k_w \rangle_t \in J.
\]
In addition, if \( h \in J \), then
\[
\int_{\mathbb{C}^n} h(u)(W^k_z \otimes W^k_w) dV(u) \in \mathcal{T}_{lin}(J).
\]

Proof. Since \( J \) is translation invariant and \( \tilde{A} \in J \), we have
\[
\langle AW^k_z, W^k_w \rangle_t = \langle Ak^+_{z}^t, k^+_{w}^t \rangle_t = \tilde{A}(\cdot + z) \in J.
\]

According to Lemma 2.3 and Proposition 2.6, we have
\[
\langle AW^k_z, W^k_w \rangle_t \in J.
\]
Let \( h \) be in \( J \). Then for any \( f \in F^p_t \) and \( g \in F^q_t \), we have
\[
\left\langle \int_{\mathbb{C}^n} h(u)(W^k_z \otimes W^k_w) dV(u)f, g \right\rangle_t = \int_{\mathbb{C}^n} h(u)\langle f, k_{z+u}^t \rangle_t \langle k_{w}^t, g \rangle_t dV(u)
\]
\[
= \int_{\mathbb{C}^n} h(u-z)\langle f, k_{u}^t \rangle_t \langle k_{w}^t, g \rangle_t dV(u)
\]
\[
= (\pi t)^n T_{\alpha_{-z}}h f, g \rangle_t,
\]
where the translation \( \alpha_{-z} \) is defined in Section 1. Since \( J \) is translation invariant, we have that \( \alpha_{-z}h \in J \) and
\[
\int_{\mathbb{C}^n} h(u)(W^k_z \otimes W^k_w) dV(u) = (\pi t)^n T_{\alpha_{-z}}h \in \mathcal{T}_{lin}(J).
\]

Using Lemma 2.3 and Proposition 2.6 again, we obtain
\[
\int_{\mathbb{C}^n} h(u)(W^k_z \otimes W^k_w) dV(u) \in \mathcal{T}_{lin}(J),
\]
to complete the proof of this corollary. \( \square \)

Combining Theorem 2.5 with Corollary 2.7 yields that a weakly localized operator on \( F^p_t \) belongs to \( \mathcal{T}_{lin}(J) \) if its Berezin transform is in \( J \).

Proposition 2.8. Let \( A \) be a weakly localized operator on \( F^p_t \) and \( J \) be a translation invariant closed subalgebra of BUC(\( \mathbb{C}^n \)). If the Berezin transform of \( A \) is in \( J \), then
\[
A \in \mathcal{T}_{lin}(J).
\]

Proof. Since \( A \) is weakly localized, we have by Theorem 2.5 that
\[
A = \lim_{r \to \infty} \frac{1}{(\pi t)^n} \int_{B(0,r)} \int_{\mathbb{C}^n} \langle AW_z k^t_0, W_z k^t_0 \rangle_t (W_z k^t_w) \otimes (W_z k^t_0) dV(z) dV(w).
\]
Now Corollary 2.7 gives us that
\[
\int_{\mathbb{C}^n} \langle AW_z k^t_0, W_z k^t_0 \rangle_t (W_z k^t_w) \otimes (W_z k^t_0) dV(z) \in \mathcal{T}_{lin}(J).
\]
This completes the proof. \( \square \)

Finally, we show in the following that the Berezin transform of the finite product of Toeplitz operators with symbols in \( J \) also belongs to \( J \).
Proposition 2.9. Let $\mathcal{J}$ be a translation invariant closed subalgebra of $\text{BUC}(\mathbb{C}^n)$. Suppose that $\varphi_1, \cdots, \varphi_m \in \mathcal{J}$ and $A = T_{\varphi_1} T_{\varphi_2} \cdots T_{\varphi_m}$. Then the Berezin transform $A$ is in $\mathcal{J}$. Moreover, if $\mathcal{J}_1$ is a translation invariant closed ideal of $\mathcal{J}$, $\psi_1, \cdots, \psi_k \in \mathcal{J}_1$ and $B = T_{\psi_1} T_{\psi_2} \cdots T_{\psi_k}$, then

$$AB \in \mathcal{J}_1 \quad \text{and} \quad BA \in \mathcal{J}_1.$$  

Proof. For a single Toeplitz operator $T_{\varphi_1}$, using $W_z T_{\varphi_1} W_z = T_{\alpha_z \varphi_1}$ we have

$$\langle T_{\varphi_1} k_z^t, k_z^t \rangle_t = \langle W_z T_{\varphi_1} W_z 1, 1 \rangle_t = \langle T_{\alpha_z \varphi_1} 1, 1 \rangle_t = \int_{\mathbb{C}^n} \alpha_z \varphi_1(\xi) d\mu_t(\xi).$$

Since $\varphi_1 \in \mathcal{J}$ and $\mathcal{J}$ is translation invariant, we have that $\alpha(\cdot) \varphi_1(\xi) \in \mathcal{J}$ for any $\xi \in \mathbb{C}^n$, and moreover, $\xi \mapsto \alpha(\cdot) \varphi_1(\xi)$ is uniformly continuous and uniformly bounded from $\mathbb{C}^n$ to $\mathcal{J}$ with respect to the $L^\infty$-norm. Thus we have

$$\langle T_{\varphi_1} k_z^t, k_z^t \rangle_t = \int_{\mathbb{C}^n} \alpha_1(\xi) d\mu_t(\xi) \in \mathcal{J}.$$  

To show that the Berezin transform of the product of $m$ Toeplitz operators belongs to $\mathcal{J}$, we suppose that the conclusion holds for $m \leq k - 1$. We are going to prove the conclusion holds for the case of $m = k$. Noting that $T_{\varphi_1}^* = T_{\overline{\varphi_1}}$, we have

$$\langle T_{\varphi_1} T_{\varphi_2} \cdots T_{\varphi_k} k_z^t, k_z^t \rangle_t = \langle T_{\varphi_1} k_z^t, k_z^t \rangle_t T_{\varphi_2} T_{\varphi_3} \cdots T_{\varphi_k}$$

$$= \frac{1}{(\pi t)^n} \int_{\mathbb{C}^n} \langle T_{\varphi_2} T_{\varphi_3} \cdots T_{\varphi_k} k_z^t, k_z^t \rangle_t T_{\varphi_2} T_{\varphi_3} \cdots T_{\varphi_k} dV(w)$$

$$= \frac{1}{(\pi t)^n} \int_{\mathbb{C}^n} \langle T_{\varphi_2} T_{\varphi_3} \cdots T_{\varphi_k} k_z^t, k_z^t \rangle_1 T_{\varphi_2} T_{\varphi_3} \cdots T_{\varphi_k} dV(w)$$

$$= \frac{1}{(\pi t)^n} \int_{\mathbb{C}^n} \langle T_{\varphi_2} T_{\varphi_3} \cdots T_{\varphi_k} W_z k_z^t, W_z k_z^t \rangle T_{\varphi_2} T_{\varphi_3} \cdots T_{\varphi_k} dV(w).$$

For $T_{\varphi_1}$ and the product $T_{\varphi_2} T_{\varphi_3} \cdots T_{\varphi_k}$, we have by the induction hypothesis that

$$\langle T_{\varphi_1} W(\cdot) k_z^t, W(\cdot) k_z^t \rangle_t \in \mathcal{J} \quad \text{and} \quad \langle T_{\varphi_2} T_{\varphi_3} \cdots T_{\varphi_k} W(\cdot) k_z^t, W(\cdot) k_z^t \rangle_t \in \mathcal{J}$$

for any $w \in \mathbb{C}^n$. Since $\mathcal{J}$ is a translation invariant subalgebra, we obtain by Corollary 2.7 that

$$\langle T_{\varphi_1} W(\cdot) k_z^t, W(\cdot) k_z^t \rangle_t \in \mathcal{J}.$$

Using that $W_z^* T_{\varphi_1} W_z = T_{\alpha_z \varphi_1}$ on $F^2_t$ for $\varphi \in L^\infty(\mathbb{C}^n, dV)$, we have

$$\| \langle T_{\varphi_1} W(\cdot) k_z^t, W(\cdot) k_z^t \rangle_t \|_\infty$$

$$\leq \sup_{a \in \mathbb{C}^n} \| T_{\varphi_2} T_{\varphi_3} \cdots T_{\varphi_k} W_z k_z^t, W_z k_z^t \rangle \| T_{\varphi_2} T_{\varphi_3} \cdots T_{\varphi_k} \|$$

$$\leq \int_{\mathbb{C}^n} \sup_{a \in \mathbb{C}^n} \| T_{\varphi_2} T_{\varphi_3} \cdots T_{\varphi_k} 1 \|_{F^2_t} \| k_z^t \|_{F^2_t} \| k_z^t \|_{F^2_t} dV(\xi)$$

$$\lesssim \| \varphi_1 \|_\infty \| \varphi_2 \|_\infty \cdots \| \varphi_k \|_\infty e^{-\frac{\| \xi \|^2}{4t^2}}.$$

where the last inequality comes from [13, Corollary 2.5]. By Lemmas 2.3 and 2.4, the mapping

$$w \mapsto \langle T_{\varphi_2} T_{\varphi_3} \cdots T_{\varphi_k} W(\cdot) k_z^t, W(\cdot) k_z^t \rangle_t \langle T_{\varphi_1} W(\cdot) k_z^t, W(\cdot) k_z^t \rangle_t$$

is uniformly continuous from each compact subset of $\mathbb{C}^n$ to $\mathcal{J}$. Thus (2.2) gives that

$$\langle T_{\varphi_1} T_{\varphi_2} T_{\varphi_3} \cdots T_{\varphi_k} \rangle_t \in \mathcal{J}.$$
This implies that $\tilde{A} \in \mathcal{J}$ when $A = T_{\varphi_1}T_{\varphi_2} \cdots T_{\varphi_m}$ with $m \geq 1$, as desired.

By the definition of the Berezin transform of $AB$, we have

$$\langle ABk_z^t,k_z^t \rangle = \frac{1}{(\pi t)^n} \int_{\mathbb{C}^n} \langle AW_zk_0^t, W_zk_w^t \rangle \langle BW_zk_0^t, W_zk_0^t \rangle dV(w).$$

From the arguments above, it follows that

$$\langle AW(\cdot)k_0^t, W(\cdot)k_w^t \rangle_t \in \mathcal{J} \quad \text{and} \quad \langle BW(\cdot)k_0^t, W(\cdot)k_w^t \rangle_t \in \mathcal{J}.$$ 

Since $\mathcal{J}_1$ is an ideal, we get that

$$\langle AW(\cdot)k_0^t, W(\cdot)k_w^t \rangle \langle BW(\cdot)k_0^t, W(\cdot)k_w^t \rangle_t \in \mathcal{J},$$

to obtain $\tilde{AB} \in \mathcal{J}_1$. Similarly, we can show that $\tilde{BA} \in \mathcal{J}_1$. This completes the proof of Proposition 2.9. \hfill \Box

Now we are ready to present the proof of Theorem 2.1.

\textbf{Proof of Theorem 2.1.} Let $\mathcal{J}$ be a translation invariant closed subalgebra of $\text{BUC}(\mathbb{C}^n)$. Let us first show that

$$\mathcal{T}(\mathcal{J}) = \mathcal{T}_{\text{lin}}(\mathcal{J}).$$

For $\varphi_1, \cdots, \varphi_m \in \mathcal{J}$, let $A = T_{\varphi_1}T_{\varphi_2} \cdots T_{\varphi_m}$. Proposition 2.9 implies that $\tilde{A} \in \mathcal{J}$. Using Theorem 2.8 and the fact that $A$ is weakly localized, we have

$$A \in \mathcal{T}_{\text{lin}}(\mathcal{J}).$$

Observing that $\mathcal{T}_{\text{lin}}(\mathcal{J}) \subset \mathcal{T}(\mathcal{J})$ is obvious, so we have $\mathcal{T}(\mathcal{J}) = \mathcal{T}_{\text{lin}}(\mathcal{J})$.

To complete the proof of Theorem 2.1, it remains to show that $\mathcal{T}(\mathcal{J}_1)$ is a two-sided ideal in $\mathcal{T}(\mathcal{J})$ if $\mathcal{J}_1$ is a translation invariant closed ideal of $\mathcal{J}$. To do so, we let $B = T_{\psi_1}T_{\psi_2} \cdots T_{\psi_k}$ with $\psi_1, \cdots, \psi_k \in \mathcal{J}_1$. Then we have by Proposition 2.9 that

$$\tilde{AB} \in \mathcal{J}_1 \quad \text{and} \quad \tilde{BA} \in \mathcal{J}_1.$$ 

Since $AB$ and $BA$ both are weakly localized operators, we deduce by Proposition 2.8 that

$$AB \in \mathcal{T}_{\text{lin}}(\mathcal{J}_1) = \mathcal{T}(\mathcal{J}_1) \quad \text{and} \quad BA \in \mathcal{T}_{\text{lin}}(\mathcal{J}_1) = \mathcal{T}(\mathcal{J}_1).$$ 

This completes the proof of Theorem 2.1. \hfill \Box

3. Integral representations on the $p$-Bergman space

The main purpose of this section is to establish an integral representation for $s$-weakly localized operators on the $p$-Bergman space $L^p_a$ with $1 < p < \infty$. First, let us review some basic knowledge about the reproducing kernel for the Bergman space $L^2_a$, the Möbius transform and the Bergman metric on the unit ball $\mathbb{B}_n$.

Recall that the reproducing kernel for the Bergman space $L^2_a$ is given by

$$K_z(w) = \frac{1}{(1 - w \cdot z)^{n+1}}, \quad z, w \in \mathbb{B}_n.$$ 

A simple calculation shows that

$$c_{p,q}'(1 - |z|^2)^{-\frac{n+1}{q}} \leq \|K_z\|_p \leq c_{p,q}(1 - |z|^2)^{-\frac{n+1}{q}}$$

for some positive constants $c_{p,q}$ and $c_{p,q}'$ depending only $p$ and $q$, where $\frac{1}{p} + \frac{1}{q} = 1$. Letting

$$k_z^{(p)} := (1 - |z|^2)^{\frac{n+1}{q}}K_z,$$

then we have that

$$c_p^{-1} \leq \|k_z^{(p)}\|_p \leq c_p$$

for all $1 < p < \infty$. For $p = 1$, we have

$$c_1^{-1} \leq \|k_z\|_1 \leq c_1.$$
for some constant \( c_p > 0 \) depending only on \( p \). Recall that the Berezin transform \( \tilde{T} \) of a bounded linear operator \( T \) on \( L^p_a \) is defined by
\[
\tilde{T}(z) = \langle Tk_z, k_z \rangle, \quad z \in \mathbb{B}_n,
\]
where \( k_z = k_z^{(2)} \) is the normalized reproducing kernel for \( L^p_a \).

Let \( \varphi_z \) be the Möbius transform of \( \mathbb{B}_n \) that interchanges 0 and \( z \). Then we have
\[
1 - |\varphi_a(z)|^2 = \frac{(1 - |a|^2)(1 - |z|^2)}{|1 - \overline{a} \cdot z|^2},
\]
see [6, pages 25-26] for the details. The Bergman metric on \( \mathbb{B}_n \) is defined by
\[
\beta(z, w) = \frac{1}{2} \log \frac{1 + |\varphi_z(w)|}{1 - |\varphi_z(w)|}, \quad z, w \in \mathbb{B}_n.
\]
For each \( z \in \mathbb{B}_n \) and \( 0 < r < \infty \), the corresponding \( \beta \)-ball is given by
\[
D(z, r) = \{ w \in \mathbb{B}_n : \beta(z, w) < r \},
\]
see pages 22-28 in [14]. Recall that the formula
\[
d\lambda(z) = \frac{dv(z)}{(1 - |z|^2)^{n+1}}
\]
gives us the standard Möbius-invariant measure on the unit ball. It is well-known that on \( L^p_a \) we have
\[
I = \int_{\mathbb{B}_n} (k_z \otimes k_z) d\lambda(z).
\]

Let \( z \in \mathbb{B}_n \), the operator \( U_z \) is defined by
\[
U_z f(w) = f(\varphi_z(w))k_z(w), \quad w \in \mathbb{B}_n, \quad f \in L^p_a. \tag{3.2}
\]
In particular, \( U_\varphi k_z = \eta(u, z)k_\varphi u(z) \), where \( u, z \in \mathbb{B}_n \) and \( \eta(u, z) = \frac{|1 - w \overline{z}|^{n+1}}{|1 - u \overline{z}|^{n+1}} \). Moreover, one can check readily that \( U_z^* U_z = U_z^* \) and
\[
U_z^* T \varphi U_z = T \varphi \varphi_z \tag{3.3}
\]
on \( L^p_a \) for \( \varphi \in L^\infty(\mathbb{B}_n, dv) \) and \( z \in \mathbb{B}_n \).

For a subset \( \mathcal{I} \) of BUC(\( \mathbb{B}_n \)), recall that \( \mathcal{I} \) is translation invariant if \( \tau_z f \in \mathcal{I} \) for all \( f \in \mathcal{I} \) and \( z \in \mathbb{B}_n \), where \( \tau_z \) is defined by (1.1):
\[
(\tau_z f)(u) = f(\varphi_u(z)), \quad u \in \mathbb{B}_n.
\]
Noting
\[
\beta(\varphi_u(z), \varphi_v(z)) \leq \frac{C}{1 - |z|^2} \beta(u, v) \tag{3.4}
\]
for some absolute constant \( C > 0 \), we see that BUC(\( \mathbb{B}_n \)) is translation invariant.

The following definition of the \( s \)-weakly localized operator was first introduced in [5, Definition 1.4], which plays an important role in the characterization of Toeplitz algebras over the Bergman space \( L^p_a \) [10, 11, 12].

**Definition 3.1.** For any real number \( s \) such that \( 0 < s < \min\{p, q\} \), we say that a bounded linear operator \( T \) on \( L^p_a \) is \( s \)-weakly localized if it satisfies
\[
\sup_{z \in \mathbb{B}_n} \int_{\mathbb{B}_n} \frac{\|Tk_z, k_w\|_2^{1 - \frac{2s}{q(n+1)}}}{\|K_z\|_2^{1 - \frac{2s}{q(n+1)}}} d\lambda(w) < \infty,
\]
and
\[
\sup_{z \in \mathbb{B}_n} \int_{\mathbb{B}_n} \frac{\|Tk_z, k_w\|_2^{1 - \frac{2s}{p(n+1)}}}{\|K_w\|_2^{1 - \frac{2s}{p(n+1)}}} d\lambda(w) < \infty,
\]
\[ \lim_{r \to \infty} \sup_{z \in B_n} \int_{B_n \setminus D(z,r)} |\langle Tk_z, k_w \rangle| \left\| K_z \right\|_2^{1 - \frac{2s}{p(q + 1)}} \left\| K_w \right\|_2^{-\frac{2s}{q(n+1)}} d\lambda(w) = 0, \]
\[ \lim_{r \to \infty} \sup_{z \in B_n} \int_{B_n \setminus D(z,r)} |\langle T^* k_z, k_w \rangle| \left\| K_z \right\|_2^{1 - \frac{2s}{p(q + 1)}} \left\| K_w \right\|_2^{-\frac{2s}{p(q + 1)}} d\lambda(w) = 0. \]

The collection of \( s \)-weakly localized operators on \( L^p_a \) is denoted by \( \mathcal{A}_s^p \).

In the rest of this paper, we fix an \( s \) such that \( 0 < s < \min\{p, q\} \). For an \( s \)-weakly localized operator \( T \) acting on \( L^p_a \), we define
\[ E_r(T, s) = \sup_{z \in \mathbb{B}_n} \int_{B_n \setminus D(z,r)} |\langle Tk_z, k_w \rangle| \left\| K_z \right\|_2^{1 - \frac{2s}{q(n+1)}} \left\| K_w \right\|_2^{-\frac{2s}{q(n+1)}} d\lambda(w) \]
and
\[ E'_r(T, s) = \sup_{z \in \mathbb{B}_n} \int_{B_n \setminus D(z,r)} |\langle T^* k_z, k_w \rangle| \left\| K_z \right\|_2^{1 - \frac{2s}{p(q + 1)}} \left\| K_w \right\|_2^{-\frac{2s}{p(q + 1)}} d\lambda(w). \]

Define \( D(z, 0) = \emptyset \) for \( z \in \mathbb{B}_n \), then we have that \( E_0(T, s) < \infty, E'_0(T, s) < \infty \) and
\[ \lim_{r \to \infty} E_r(T, s) = \lim_{r \to \infty} E'_r(T, s) = 0. \]

The main theorem of this section is the following integral representation for \( s \)-weakly localized operators on the \( p \)-Bergman space \( L^p_a \), which is parallel to Theorem 2.5 in the previous section.

**Theorem 3.2.** Let \( T \) be a bounded linear operator on \( L^p_a \) and \( r > 0 \). Then the mapping
\[ v \mapsto \int_{\mathbb{B}_n} \langle TU_uk_0, U_uk_v \rangle (U_uk_v) \otimes (U_uk_0) d\lambda(u) \]
is uniformly continuous (with respect to the Bergman metric) and uniformly bounded on \( D(0, r) \). Moreover, the integral
\[ \int_{D(0,r)} \int_{\mathbb{B}_n} \langle TU_uk_0, U_uk_v \rangle (U_uk_v) \otimes (U_uk_0) d\lambda(u) d\lambda(v) \]
is convergent in the norm topology. Furthermore, if \( T \in \mathcal{A}_s^p \), then
\[ \int_{D(0,r)} \int_{\mathbb{B}_n} \langle TU_uk_0, U_uk_v \rangle (U_uk_v) \otimes (U_uk_0) d\lambda(u) d\lambda(v) \]
converges to \( T \) in norm as \( r \to \infty \).

The following estimation related to the Bergman metric is useful for us to obtain the integral representation for \( s \)-weakly localized operators on \( L^p_a \), see [14, Lemma 2.20] and [14, Lemma 2.27] if needed.

**Lemma 3.3.** For any \( R > 0 \) and any \( b \in \mathbb{R} \), there exists a constant \( C > 0 \) such that
\[ \left| \frac{(1 - z \cdot \overline{v})^b}{(1 - z \cdot \overline{v})^b - 1} \right| \leq C \beta(u, v), \quad \left| \frac{(1 - |u|^2)^b}{(1 - |u|^2)^b - 1} \right| \leq C \beta(u, v), \]
\[ C^{-1} (1 - |u|^2) \leq 1 - |u|^2 \leq C (1 - |u|^2) \]
and
\[ C^{-1} |1 - z \cdot \overline{v}| \leq |1 - z \cdot \overline{v}| \leq C |1 - z \cdot \overline{v}| \]
for all \( z, u, v \in \mathbb{B}_n \) with \( \beta(u, v) \leq R \).

The next definition of separated set in the unit ball is quoted from [10, Definition 2.1].
Definition 3.4. Let $\Gamma$ be a nonempty subset of $\mathbb{B}_n$. We say that $\Gamma$ is $\delta$-separated (or separated), if there exists a $\delta > 0$ depending only on $\Gamma$ such that $\beta(u, v) \geq \delta$ for all $u \neq v$ in $\Gamma$.

Then the proof of Theorem 3.2 begins with the following lemma.

Lemma 3.5. Let $h$ be in $L^\infty(\mathbb{B}_n, dv)$ and $\Gamma$ be a $\delta$-separated set. Let $\{h_{1,u}\}$ and $\{h_{2,u}\}$ be two families of bounded analytic functions on $\mathbb{B}_n$. Then for each $f \in L^p_a$ and $g \in L^q_a$, we have

$$\sum_{u \in \Gamma} \left| h(u) \langle f, U_u h_{1,u} \rangle \langle U_u h_{2,u}, g \rangle \right| \leq C \|h\|_\infty \sup_{u \in \mathbb{B}_n} \|h_{1,u}\|_\infty \sup_{u \in \mathbb{B}_n} \|h_{2,u}\|_\infty \|f\|_p \|g\|_q$$

and

$$\int_{\mathbb{B}_n} \left| h(u) \langle f, U_u h_{1,u} \rangle \langle U_u h_{2,u}, g \rangle \right| d\lambda(u) \leq C' \|h\|_\infty \sup_{u \in \mathbb{B}_n} \|h_{1,u}\|_\infty \sup_{u \in \mathbb{B}_n} \|h_{2,u}\|_\infty \|f\|_p \|g\|_q,$$

where the constant $C$ depends only on $\delta$ and $C'$ is an absolute constant. Moreover, for any bounded linear operator $T$ on $L^p_a$, we have

$$\sup_{u \in \mathbb{B}_n} \|\langle TU_u h_{1,u}, U_u h_{2,u} \rangle\| \leq C'' \|T\| \sup_{u \in \mathbb{B}_n} \|h_{1,u}\|_\infty \sup_{u \in \mathbb{B}_n} \|h_{2,u}\|_\infty,$$

where $C''$ is an absolute constant.

Proof. Since $U_u h_{1,u} = (h_{1,u} \circ \varphi_u) k_u$ and $U_u h_{2,u} = (h_{2,u} \circ \varphi_u) k_u$ are bounded analytic functions, $\langle f, U_u h_{1,u} \rangle$ and $\langle U_u h_{2,u}, g \rangle$ are both well-defined. Then we have

$$\sum_{u \in \Gamma} \left| h(u) \langle f, U_u h_{1,u} \rangle \langle U_u h_{2,u}, g \rangle \right| = \sum_{u \in \Gamma} \left| h(u) \int_{\mathbb{B}_n} f(\xi) \langle K_\xi, U_u h_{1,u} \rangle \langle U_u h_{2,u}, K_\xi \rangle g(\zeta) d\nu(\zeta) \right|$$

$$\leq \|h\|_\infty \int_{\mathbb{B}_n} \int_{\mathbb{B}_n} |f(\xi)| \left| \sum_{u \in \Gamma} \langle K_\xi, U_u h_{1,u} \rangle \langle U_u h_{2,u}, K_\xi \rangle \rangle \|g(\zeta)\| d\nu(\zeta)$$

for each $f \in L^p_a$ and $g \in L^q_a$. Denote

$$F(\xi, \zeta) := \sum_{u \in \Gamma} \|\langle K_\xi, U_u h_{1,u} \rangle \langle U_u h_{2,u}, K_\xi \rangle\|.$$

Then for any $b \in \mathbb{R}$, we have by H"older's inequality that

$$\int_{\mathbb{B}_n} \int_{\mathbb{B}_n} |f(\xi)| F(\xi, \zeta) d\nu(\zeta) d\nu(\xi)$$

$$\leq \left( \int_{\mathbb{B}_n} \int_{\mathbb{B}_n} |f(\xi)| F(\xi, \zeta) d\nu(\zeta) d\nu(\xi) \right)^{\frac{1}{p'}} \|g\|_q$$

$$= \left( \int_{\mathbb{B}_n} \int_{\mathbb{B}_n} |f(\xi)| F(\xi, \zeta) \|K_\xi\|^{b_q} F(\xi, \zeta) \|K_\xi\|^{\frac{b_q}{2}} d\nu(\xi) \|K_\xi\|^{\frac{b_q}{2}} d\nu(\zeta) \right)^{\frac{1}{p'}} \|g\|_q.$$

Using H"older's inequality again yields that

$$\int_{\mathbb{B}_n} \int_{\mathbb{B}_n} |f(\xi)| F(\xi, \zeta) d\nu(\zeta) d\nu(\xi)$$

$$\leq \|g\|_q \left( \int_{\mathbb{B}_n} \int_{\mathbb{B}_n} |f(\xi)|^p F(\xi, \zeta) \|K_\xi\|^{\frac{b_q}{2}} F(\xi, \zeta) \|K_\xi\|^{\frac{b_q}{2}} d\nu(\xi) \right)^{\frac{1}{p'}} d\nu(\zeta)$$

$$\leq \|g\|_q \|f\|_p \left( \sup_{\zeta \in \mathbb{B}_n} \int_{\mathbb{B}_n} F(\xi, \zeta) \|K_\xi\|^{\frac{b_q}{2}} d\nu(\xi) \right)^{\frac{1}{p'}} \left( \sup_{\xi \in \mathbb{B}_n} \int_{\mathbb{B}_n} F(\xi, \zeta) \|K_\xi\|^{\frac{b_q}{2}} d\nu(\zeta) \right)^{\frac{1}{p'}}.$$
Next, we estimate the first term of the above inequality:

$$\sup_{\zeta \in \mathbb{B}_n} \int_{\mathbb{B}_n} F(\xi, \zeta) \frac{\|K_{\zeta}\|_{\ell^q}}{\|K_{\xi}\|_{\ell^q}} dv(\xi).$$

Using the definition of $U$, and changing of variables give us

$$|\langle K_{\xi}, U_{h_{1,u}} \rangle| = |\langle U_{h_{1,u}} K_{\xi}, h_{1,u} \rangle| = \left| \int_{\mathbb{B}_n} (U_{h_{1,u}} K_{\xi})(w) h_{1,u}(w) dv(w) \right|$$

$$= \left| \int_{\mathbb{B}_n} K_{\xi}(\varphi_u(w)) \frac{(1 - |u|^2)^{\frac{n+1}{2}}}{1 - w \cdot u} h_{1,u}(w) dv(w) \right|$$

$$\leq \int_{\mathbb{B}_n} |K_{\xi}(w)| \frac{|1 - w \cdot u|^{n+1}}{|1 - |u|^2|^{n+1}} \frac{|h_{1,u}(\varphi_u(w))|}{|1 - w \cdot u|^2} dv(w)$$

$$\leq \sup_{u \in \mathbb{B}_n} \|h_{1,u}\|_\infty \int_{\mathbb{B}_n} |K_{\xi}(w)| \frac{(1 - |u|^2)^{\frac{n+1}{2}}}{1 - w \cdot u} dv(w).$$

Similarly, we have

$$|\langle U_{h_{2,u}}, K_{\xi} \rangle| \leq \sup_{u \in \mathbb{B}_n} \|h_{2,u}\|_\infty \int_{\mathbb{B}_n} |K_{\xi}(z)| \frac{(1 - |u|^2)^{\frac{n+1}{2}}}{1 - z \cdot u} dv(z).$$

Thus we obtain by (3.5) that

$$F(\xi, \zeta) \leq \sup_{u \in \mathbb{B}_n} \|h_{1,u}\|_\infty \sup_{u \in \mathbb{B}_n} \|h_{2,u}\|_\infty \times I,$$

where

$$I := \int_{\mathbb{B}_n} \int_{\mathbb{B}_n} |K_{\xi}(w)| |K_{\xi}(z)| \sum_{u \in \Gamma} \frac{(1 - |u|^2)^{n+1}}{|1 - w \cdot u|^{n+1}|1 - z \cdot u|^{n+1}} dv(w)dv(z).$$

To estimate the above integral $I$, we need to deal with the summation first. For any $u \in \Gamma$ and $\xi \in D(u, \frac{\delta}{2})$, we have by Lemma 3.3 that

$$\frac{(1 - |u|^2)^{n+1}}{|1 - z \cdot u|^{n+1}|1 - w \cdot u|^{n+1}} \leq C_1 \frac{(1 - |\xi|^2)^{n+1}}{|1 - z \cdot \xi|^{n+1}|1 - w \cdot \xi|^{n+1}}$$

for some constant $C_1 > 0$ depending only on $\delta$. This gives that

$$\sum_{u \in \Gamma} \frac{(1 - |u|^2)^{n+1}}{|1 - z \cdot u|^{n+1}|1 - w \cdot u|^{n+1}} \leq \sum_{u \in \Gamma} \frac{C_1}{\lambda(D(u, \frac{\delta}{2}))} \int_{D(u, \frac{\delta}{2})} \frac{(1 - |\xi|^2)^{n+1}}{|1 - z \cdot \xi|^{n+1}|1 - w \cdot \xi|^{n+1}} d\lambda(\xi)$$

$$\leq C_2 \int_{\mathbb{B}_n} |K_{\xi}(w)| \int_{D(u, \frac{\delta}{2})} \frac{dv(u)}{|1 - z \cdot u|^{n+1}|1 - w \cdot u|^{n+1}}$$

$$= C_2 \int_{\mathbb{B}_n} |K_{\xi}(w)| \int_{\mathbb{B}_n} |K_{\xi}(z)| dv(u)dv(z).$$

where $C_2$ is a positive constant depending only on $\delta$. Therefore,

$$I \leq C_2 \int_{\mathbb{B}_n} \int_{\mathbb{B}_n} |K_{\xi}(w)| |K_{\xi}(z)| \int_{\mathbb{B}_n} |K_{\xi}(u)| dv(u)dv(z)dv(w).$$
Denoting the integral on the right hand side of the above inequality by $\Pi$, then we obtain
\[
F(\xi, \zeta) \leq C_2 \sup_{u \in \mathbb{B}_n} \|h_{1,u}\|_\infty \sup_{u \in \mathbb{B}_n} \|h_{2,u}\|_\infty \times \Pi.
\]
This gives us that
\[
\sup_{\xi \in \mathbb{B}_n} \int_{\mathbb{B}_n} F(\xi, \zeta) \frac{\|K_\xi\|_{2}^{bq}}{\|K_\zeta\|_{2}^{bq}} dv(\xi)
\leq C_2 \sup_{u \in \mathbb{B}_n} \|h_{1,u}\|_\infty \sup_{u \in \mathbb{B}_n} \|h_{2,u}\|_\infty \left( \sup_{\xi \in \mathbb{B}_n} \int_{\mathbb{B}_n} \frac{\|K_\xi\|_{2}^{bq}}{\|K_\zeta\|_{2}^{bq}} dv(\xi) \right),
\]
where
\[
\int_{\mathbb{B}_n} \frac{\|K_\xi\|_{2}^{bq}}{\|K_\zeta\|_{2}^{bq}} dv(\xi) = \int_{\mathbb{B}_n} \int_{\mathbb{B}_n} \int_{\mathbb{B}_n} \int_{\mathbb{B}_n} |K_\xi(w) K_\zeta(z) K_z(u) K_u(w)| \frac{\|K_\xi\|_{2}^{bq}}{\|K_\zeta\|_{2}^{bq}} dv(\xi) dv(u) dv(z) dv(w).
\]
Note that the integrand in (3.6) can be written as
\[
|K_\xi(w) K_\zeta(z) K_z(u) K_u(w)| \frac{\|K_\xi\|_{2}^{bq}}{\|K_\zeta\|_{2}^{bq}} = |K_\zeta(z)| \frac{\|K_\xi\|_{2}^{bq}}{\|K_\zeta\|_{2}^{bq}} K_u(w) \frac{\|K_u\|_{2}^{bq}}{\|K_\zeta\|_{2}^{bq}} \frac{\|K_w\|_{2}^{bq}}{\|K_w\|_{2}^{bq}} \frac{\|K_z\|_{2}^{bq}}{\|K_\zeta\|_{2}^{bq}}
\]
By [14, Theorem 1.12], we have
\[
\sup_{\zeta \in \mathbb{B}_n} \int_{\mathbb{B}_n} |K_\zeta(z)| \frac{\|K_\xi\|_{2}^{bq}}{\|K_\zeta\|_{2}^{bq}} dv(z) = \sup_{\zeta \in \mathbb{B}_n} \int_{\mathbb{B}_n} \frac{(1 - |z|^2)^{-\frac{bq(n+1)}{2}}}{|1 - \zeta \cdot \overline{z}|^{n+1}} dv(z)
\]
if $\frac{bq(n+1)}{2} < 1$. Now we choose $b > 0$ such that
\[
\frac{bq(n+1)}{2} < 1 \text{ and } \frac{bp(n+1)}{2} < 1.
\]
In this case, we obtain that the multiple integral in (3.6) is less than some positive constant $C_3'$. This leads to
\[
\sup_{\zeta \in \mathbb{B}_n} \int_{\mathbb{B}_n} F(\xi, \zeta) \frac{\|K_\xi\|_{2}^{bq}}{\|K_\zeta\|_{2}^{bq}} dv(\xi) \leq C_4 \sup_{u \in \mathbb{B}_n} \|h_{1,u}\|_\infty \sup_{u \in \mathbb{B}_n} \|h_{2,u}\|_\infty.
\]
Similarly, we have
\[
\sup_{\xi \in \mathbb{B}_n} \int_{\mathbb{B}_n} F(\xi, \zeta) \frac{\|K_\xi\|_{2}^{bq}}{\|K_\zeta\|_{2}^{bq}} dv(\xi) \leq C_5 \sup_{u \in \mathbb{B}_n} \|h_{1,u}\|_\infty \sup_{u \in \mathbb{B}_n} \|h_{2,u}\|_\infty.
\]
Combining the two inequalities above gives that
\[
\sum_{u \in \Gamma} |\langle h(u) f, U_u h_{1,u} \rangle \langle U_u h_{2,u}, g \rangle| \leq C \|h\|_\infty \sup_{u \in \mathbb{B}_n} \|h_{1,u}\|_\infty \sup_{u \in \mathbb{B}_n} \|h_{2,u}\|_\infty \|f\|_p \|g\|_q
\]
for some constant $C$ depending only on $\delta$, which is the first conclusion of this lemma.

Observe that the proof of the above inequality implies that
\[
\int_{\mathbb{B}_n} |\langle h(u) f, U_u h_{1,u} \rangle \langle U_u h_{2,u}, g \rangle| d\lambda(u) \leq C' \|h\|_\infty \sup_{u \in \mathbb{B}_n} \|h_{1,u}\|_\infty \sup_{u \in \mathbb{B}_n} \|h_{2,u}\|_\infty \|f\|_p \|g\|_q
\]
for some absolute constant $C' > 0$. This proves the second inequality in the lemma.

To obtain the last conclusion in our lemma, we first recall that
\[
\|k_u\|_p \lesssim (1 - |u|^2)^{\frac{n+1}{2} - \frac{n+1}{q}}, \quad u \in \mathbb{B}_n.
\]
Then we have by (3.2) that
\[
|\langle Tu_1, U_2 \rangle| \leq |\langle Th_1, \varphi h k, h_2 \rangle| \\
\leq \|T\| \sup_{u \in \mathbb{B}_n} \|h_1, \varphi h k\|_p \|h_2\|_q \\
\leq \|T\| \sup_{u \in \mathbb{B}_n} \|h_1, \varphi h k\|_p \|h_2, \varphi h k\|_q \\
\lesssim \|T\| \sup_{u \in \mathbb{B}_n} \|h_1, \varphi h k\|_p \|h_2, \varphi h k\|_q (1 - |u|^2)^{\frac{n+1}{2} - \frac{n+1}{q}} \\
= \|T\| \sup_{u \in \mathbb{B}_n} \|h_1, \varphi h k\|_p \|h_2, \varphi h k\|_q,
\]
as desired. This finishes the proof of Lemma 3.5. \qed

Using the same notation as in Lemma 3.5, $\Gamma$ denotes a separated set, $h$ is a bounded function on $\mathbb{B}_n$, \{h_1\} and \{h_2\} are two families of bounded analytic functions on $\mathbb{B}_n$ with the property that
\[
\sup_{u \in \mathbb{B}_n} \|h_1, \varphi h k\|_p \|h_2, \varphi h k\|_q < \infty.
\]

With the help of Lemma 3.5, now we can define two bounded linear operators
\[
\sum_{u \in \Gamma} h(u) (U_1 h_1, U_2 h_2) \quad \text{and} \quad \int_{\mathbb{B}_n} h(u) (U_1 h_1, U_2 h_2) d\lambda(u)
\]
as follows:
\[
\left\langle \sum_{u \in \Gamma} h(u) (U_1 h_1, U_2 h_2) \right, f, g \rangle = \sum_{u \in \Gamma} h(u) \langle f, U_1 h_1, U_2 h_2 \rangle \langle U_1 h_1, g \rangle
\]
and
\[
\left\langle \int_{\mathbb{B}_n} h(u) (U_1 h_1, U_2 h_2) d\lambda(u) \right, f, g \rangle = \int_{\mathbb{B}_n} h(u) \langle f, U_1 h_1, U_2 h_2 \rangle d\lambda(u),
\]
where $f \in \mathcal{L}^p_a$ and $g \in \mathcal{L}^q_a$. Noting that if $h_1 = h_2 = 1$, we have
\[
\int_{\mathbb{B}_n} h(u) (U_1 h_1, U_2 h_2) d\lambda(u) = \int_{\mathbb{B}_n} h(u) (k_u \otimes k_u) d\lambda(u),
\]
and hence
\[
\left\langle \int_{\mathbb{B}_n} h(u) (k_u \otimes k_u) d\lambda(u) \right, f, g \rangle = \int_{\mathbb{B}_n} h(u) \langle f, k_u \rangle \langle k_u, g \rangle d\lambda(u)
\]
\[
= \langle Th, g \rangle.
\]
This implies that the operator
\[
\int_{\mathbb{B}_n} h(u) (k_u \otimes k_u) d\lambda(u)
\]
is actually a Toeplitz operator with symbol $h$.

To establish Theorem 3.2, we need one more simple lemma.

**Lemma 3.6.** For each $u$ and $v$ in $D(0, r)$, we have
\[
\|k_u - k_v\|_r \leq C_r \beta(u, v),
\]
where $C_r$ is a positive constant depending only on $r$. 

Proof. Let \( r > 0, z \in \mathbb{B}_n \) and \( u, v \in D(0, r) \). We have by Lemma 3.3 that
\[
|k_u(z) - k_v(z)| = \frac{\left| (1 - |u|^2)^{\frac{n+1}{2}} - (1 - |v|^2)^{\frac{n+1}{2}} \right|}{(1 - z \cdot \overline{u})^{n+1}} - \frac{\left| (1 - |v|^2)^{\frac{n+1}{2}} \right|}{(1 - z \cdot \overline{v})^{n+1}} \leq \frac{\left| (1 - |u|^2)^{\frac{n+1}{2}} - (1 - |v|^2)^{\frac{n+1}{2}} \right|}{|1 - z \cdot \overline{u}|^{n+1}|1 - z \cdot \overline{v}|^{n+1}} \leq C_r^\prime [\beta(u, v)|k_v(z)| + \beta(u, v)|k_u(z)|] \leq C_r \beta(u, v),
\]
where the last inequality follows from that
\[
|k_u(z)| + |k_v(z)| \leq C_r^\prime \frac{1 - |u|^2}{1 - \overline{u}z} \frac{1 - |v|^2}{1 - \overline{v}z} < \frac{4C_r^\prime}{(1 + e^{2r})^2}
\]
for \( u, v \in D(0, r) \) and \( z \in \mathbb{B}_n \). This proves the lemma. \( \square \)

We are now in position to prove the main result of this section.

Proof of Theorem 3.2. First, combining Lemmas 3.5 and 3.6 gives us that the mapping
\[
v \mapsto \int_{\mathbb{B}_n} \langle TU_u k_0, U_u k_v \rangle (U_u k_v) \otimes (U_u k_0) d\lambda(u)
\]
is uniformly continuous and uniformly bounded on each \( D(0, r) \). This yields that the integral
\[
\int_{D(0, r)} \int_{\mathbb{B}_n} \langle TU_u k_0, U_u k_v \rangle (U_u k_v) \otimes (U_u k_0) d\lambda(u) d\lambda(v)
\]
is convergent in the norm topology.

Let \( T \) be in \( \mathcal{A}_r^p \). Then note that
\[
\langle Tf, g \rangle = \int_{\mathbb{B}_n} \langle Tf, k_v \rangle \langle k_v, g \rangle d\lambda(v)
= \int_{\mathbb{B}_n} \langle f, T^* k_v \rangle \langle k_v, g \rangle d\lambda(v)
= \int_{\mathbb{B}_n} \int_{\mathbb{B}_n} \langle f, k_u \rangle \langle k_u, T^* k_v \rangle d\lambda(u) \langle k_v, g \rangle d\lambda(v)
= \int_{\mathbb{B}_n} \int_{\mathbb{B}_n} \langle f, k_u \rangle \langle Tk_u, k_v \rangle d\lambda(u) \langle k_v, g \rangle d\lambda(v)
= \int_{\mathbb{B}_n} \int_{\mathbb{B}_n} \langle f, k_u \rangle \langle Tk_u, k_{\varphi_u(v)} \rangle \langle k_{\varphi_u(v)}, g \rangle d\lambda(u) d\lambda(v)
= \int_{\mathbb{B}_n} \int_{\mathbb{B}_n} \langle f, U_u k_0 \rangle \langle TU_u k_0, U_u k_v \rangle \langle U_u k_v, g \rangle d\lambda(u) d\lambda(v)
\]
for each \( f \in L^p_B \) and \( g \in L^q_B \). This gives that
\[
\langle Tf, g \rangle = \left\langle \int_{B(n, r)} \langle TU_k, U_k \rangle (U_k) \otimes (U_k) d\lambda(u) d\lambda(v) f, g \right\rangle
\]
\[
= \left\langle \int_{B(n, r)} \langle f, U_k \rangle \langle TU_k, U_k \rangle \langle U_k, g \rangle d\lambda(u) d\lambda(v) \right\rangle
\]
\[
= \int_{B(n, r)} \langle f, k \rangle \langle TK, k \varphi \rangle \langle k \varphi, g \rangle d\lambda(u) d\lambda(v)
\]
\[
= \int_{B(n, r)} \langle f, k \rangle \langle TK, k \varphi \rangle \langle k \varphi, g \rangle d\lambda(u) d\lambda(v)
\]
where the last equality follows from (3.1):
\[
k^{(p)}_z(w) = \frac{(1 - |z|^2)^{a+1}}{(1 - w \cdot z)^{a+1}} \quad \text{and} \quad k^{(q)}_z(w) = \frac{(1 - |z|^2)^{a+1}}{(1 - w \cdot z)^{a+1}}
\]
for \( z, w \in B_n \). Therefore,
\[
\left\langle \int_{B(n, r)} \langle f, k \rangle \langle TU_k, U_k \rangle (U_k) \otimes (U_k) d\lambda(u) d\lambda(v) f, g \right\rangle
\]
\[
\leq \left\langle \int_{B(n, r)} \langle f, k \rangle \langle TU_k, U_k \rangle (U_k) \otimes (U_k) d\lambda(u) d\lambda(v) \right\rangle
\]
\[
\leq (\int_{B(n, r)} |\langle f, k \rangle|^p d\lambda(u))^{\frac{1}{p}} (\int_{B(n, r)} |\langle TU_k, U_k \rangle (U_k) \otimes (U_k) d\lambda(u) d\lambda(v)|^q d\lambda(u))^{\frac{1}{q}}
\]
where the last equality follows from that
\[
\int_{B(n, r)} |\langle f, k \rangle|^p d\lambda(u) = \int_{B(n, r)} (1 - |u|^2)^{a+1} |f(u)|^p d\lambda(u) = ||f||_p^p.
\]
Furthermore, we note that
\[
\int_{B(n, r)} |\langle TU_k, U_k \rangle (U_k) \otimes (U_k) d\lambda(u) d\lambda(v)|^q d\lambda(u)
\]
\[
= \int_{B(n, r)} |\langle TU_k, U_k \rangle (U_k) \otimes (U_k) d\lambda(u) d\lambda(v)|^q d\lambda(u)
\]
\[
= \left\langle \sup_u \int_{B(n, r)} |\langle TU_k, U_k \rangle (U_k) \otimes (U_k) d\lambda(u) d\lambda(v)|^q d\lambda(u) \right\rangle^{\frac{1}{q}}
\]
where
\[
b = \frac{2(n+1) - 2s}{pq(n+1)}.
\]
Using Hölder’s inequality, the above integral does not exceed \( I' \times II' \), where
\[
I' := \left( \sup_u \int_{B(n, r)} |\langle TU_k, U_k \rangle (U_k) \otimes (U_k) d\lambda(u) d\lambda(v)|^q d\lambda(u) \right)^{\frac{1}{q}}
\]
and
\[
II' := \left( \sup_u \int_{B(n, r)} |\langle TU_k, U_k \rangle (U_k) \otimes (U_k) d\lambda(u) d\lambda(v)|^q d\lambda(u) \right)^{\frac{1}{q}}
\]
Using (3.1) again, we observe that
\[
I' = \left( \sup_{u \in \mathbb{B}_n} \int_{\mathbb{B}_n \setminus D(u, r)} |\langle Tk_u, k_v \rangle| \frac{\|K_u\|_{bp+1-\frac{2}{q}}}{\|K_u\|_{bp+1-\frac{2}{q}}} d\lambda(v) \right)^{\frac{q}{p}}
\]
and
\[
II' = \int_{\mathbb{B}_n} \int_{\mathbb{B}_n} |\langle Tk_u, k_v \rangle| \frac{\|K_u\|_{bp+1-\frac{2}{q}}}{\|K_u\|_{bp+1-\frac{2}{q}}} |\langle k_v^{(p)}, g \rangle|^q d\lambda(v) d\lambda(u).
\]
Elementary calculations give us that
\[
bp + 1 - \frac{2}{q} = 1 - \frac{2s}{q(n+1)} \quad \text{and} \quad bq + 1 - \frac{2}{p} = 1 - \frac{2s}{p(n+1)}.
\]
Combining the above expressions for \(I'\) and \(II'\), we obtain that
\[
\int_{\mathbb{B}_n} \int_{\mathbb{B}_n \setminus D(u, r)} \left| \langle Tk_u^{(p)}, k_v^{(q)} \rangle \langle k_v^{(p)}, g \rangle \right| d\lambda(v) d\lambda(u)
\leq \left( E_r(T, s) \right)^{\frac{q}{2}} \sup_{v \in \mathbb{B}_n} \int_{\mathbb{B}_n} |\langle k_u, T^* k_v \rangle| \frac{\|K_u\|_{bp+1-\frac{2}{p}}}{\|K_u\|_{bp+1-\frac{2}{p}}} d\lambda(u) \int_{\mathbb{B}_n} |\langle k_v^{(p)}, g \rangle|^q d\lambda(v)
= \left( E_r(T, s) \right)^{\frac{q}{2}} E_0'(T, s) \|g\|_q^q.
\]
This yields
\[
|\langle Tf, g \rangle - \left( \int_{D(0,r)} \int_{\mathbb{B}_n} \langle Tk_u k_0, U_u k_v \rangle (U_u k_0) \otimes (U_u k_0) d\lambda(u) d\lambda(v) f, g \rangle \right| 
\leq \|f\|_p \left( \int_{\mathbb{B}_n} \int_{\mathbb{B}_n \setminus D(u, r)} \left| \langle Tk_u^{(p)}, k_v^{(q)} \rangle \langle k_v^{(p)}, g \rangle \right| d\lambda(v) \right)^{\frac{1}{q}}
\leq \left( E_r(T, s) \right)^{\frac{1}{p}} \left( E_0'(T, s) \right)^{\frac{1}{q}} \|f\|_p \|g\|_q.
\]
According to our assumption that \(T \in A^p_0\), we have
\[
\lim_{r \to \infty} \left( E_r(T, s) \right)^{\frac{1}{p}} \left( E_0'(T, s) \right)^{\frac{1}{q}} = 0,
\]
to complete the proof of Theorem 3.2. \(\square\)

4. Toeplitz algebras over the \(p\)-Bergman space

In the final section, we will study Toeplitz algebras with symbols in a translation invariant subalgebra \(\mathcal{I} \subset \text{BUC}(\mathbb{B}_n)\) in terms of the integral representation obtained in the previous section. More specifically, the following will be established in Theorem 4.9 for the Toeplitz algebras \(T^b[\text{BUC}(\mathbb{B}_n)]\) and \(T^b[\text{C}_0(\mathbb{B}_n)]\) over the \(p\)-Bergman space \(L^p_{\mathbb{B}_n}\):

\[
T^b[\text{BUC}(\mathbb{B}_n)] = T^b_{\text{lin}}[\text{BUC}(\mathbb{B}_n)] = \text{clos}(A^p_0) \quad \text{and} \quad T^b[\text{C}_0(\mathbb{B}_n)] = T^b_{\text{lin}}[\text{C}_0(\mathbb{B}_n)] = \mathcal{K},
\]
where \(\text{clos}(A^p_0)\) denotes the closure of \(A^p_0\) with respect to the operator norm, and \(\mathcal{K}\) denotes the ideal of compact operators on \(L^p_{\mathbb{B}_n}\). The basic strategy used to prove the above conclusions is similar to the strategy used in Section 2 to prove the corresponding results for the case of \(F^p_{\mathbb{B}_n}\).

Let \(H(\mathbb{B}_n)\) be the set of functions which are holomorphic on the closure of the unit ball \(\mathbb{B}_n\). Let \(G\) be a bilinear map from \(H(\mathbb{B}_n) \times H(\mathbb{B}_n)\) to a Banach space \(\mathcal{B}\). We suppose that \(G(f, g)\) is linear with respect to \(f\) and conjugate linear with respect to \(g\). We say that \(G\) is bounded if
\[
\|G(f, g)\|_{\mathcal{B}} \lesssim \|f\|_{\infty} \|g\|_{\infty}
\]
for all $f, g \in H(\mathbb{E}_n)$. 

**Proposition 4.1.** Let $G$ be a bounded bilinear map from $H(\mathbb{E}_n) \times H(\mathbb{E}_n)$ to some Banach space $B$. Let $B_1$ be a closed subspace of $B$. If $G(k_z, k_z) \in B_1$ for each $z \in \mathbb{B}_n$, then $G(k_z, k_z) \in B_1$ for all $z, w \in \mathbb{B}_n$.

**Proof.** Note that $G(k_z, k_w) \in B_1$ is equivalent to $G(K_z, K_w) \in B_1$ for $z, w \in \mathbb{B}_n$. Thus, we only need to show that $G(K_z, K_z) \in B_1$ if $G(K_z, K_z) \in B_1$.

Fix a multi-index $a = (a_1, a_2, \ldots, a_n)$ with $a_j \geq 0$. Let $e_a$ be the function on $\mathbb{B}_n$ of the form:

$$e_a(v) = v^a = v_1^{a_1} \cdots v_n^{a_n}.$$ 

For any $r > 0$ and $z \in D(0, r)$, the reproducing kernel can be represented as:

$$K_z = \sum_a c_a z^a e_a,$$

where each $c_a$ is a nonzero constant, and the summation is uniformly convergent on each $D(0, r)$, i.e.,

$$\lim_{m \to \infty} \sup_{z \in D(0, r)} \left\| K_z - \sum_{|a| \leq m} c_a z^a e_a \right\|_\infty = 0,$$

where $|a| = a_1 + \cdots + a_n$ and $0 < r < \infty$.

As $G$ is bounded, we only need to show that $G(e_a, e_b) \in B_1$ for any two multi-indices $a$ and $b$. Denote

$$K_z^{(a)} := \frac{\partial^a K_z}{\partial z^a}.$$ 

It is sufficient to show that $G(K_z^{(a)}, K_z^{(b)}) \in B_1$ for any two multi-indices $a$ and $b$, since $K_z^{(a)}|_{z=0} = c_a a! e_a$.

To this end, we will use induction. First, we have by the assumption that

$$G(K_z^{(0)}, K_z^{(0)}) \in B_1.$$

For any positive integer $m$, we suppose that

$$G(K_z^{(a)}, K_z^{(b)}) \in B_1$$

for any $a$ and $b$ with $|a + b| \leq m$.

Let $a', b'$ be two indices such that

$$|a' + b'| = m + 1.$$ 

Without loss of generality, we may assume that there exist multi-indices $a$, $b$ and $d = (1, 0, \cdots, 0)$ such that

$$a' = a + d, \quad b' = b.$$ 

Since $|a + b| \leq m$, we have

$$G(K_z^{(a)}, K_z^{(b)}) \in B_1.$$

On one hand, we have

$$\frac{1}{t} \left( G(K_z^{(a)} + td, K_z^{(b)} + td) - G(K_z^{(a)}, K_z^{(b)}) \right)$$

$$= G\left( \frac{K_z^{(a)} + td}{t}, K_z^{(b)} + td \right) + G\left( K_z^{(a)}, \frac{K_z^{(b)} + td}{t} \right).$$

Since

$$\lim_{t \to 0} \left\| \frac{K_z^{(a)} + td}{t} - K_z^{(a+d)} \right\|_\infty = 0 \quad \text{and} \quad \lim_{t \to 0} \left\| K_z^{(b)} + td - K_z^{(b)} \right\|_\infty = 0,$$
we have by the boundedness of $G$ that
\[ G(K_z^{(a+d)}, K_z^{(b)}) + G(K_z^{(a)}, K_z^{(b+d)}) = \lim_{t \to 0} G \left( \frac{K_z^{(a)}}{t}, K_z^{(b)} + \frac{K_z^{(a)}}{t} \right) + \lim_{t \to 0} G \left( K_z^{(a)}, \frac{K_z^{(b)}}{t} + \frac{K_z^{(a+d)}}{t} \right) \]
\[ = \lim_{t \to 0} \frac{1}{t} [G(K_z^{(a)}, K_z^{(b)}) - G(K_z^{(a)}, K_z^{(b+d)})] \in B_1. \]

On the other hand,
\[ G(K_z^{(a+d)}, K_z^{(b)}) - G(K_z^{(a)}, K_z^{(b+d)}) = \lim_{t \to 0} G \left( \frac{K_z^{(a)}}{t}, K_z^{(b)} + \frac{K_z^{(a+d)}}{t} \right) - \lim_{t \to 0} G \left( K_z^{(a)}, \frac{K_z^{(b)} + K_z^{(a)}}{t} \right) \]
\[ = \lim_{t \to 0} \frac{1}{t} \left[ G \left( K_z^{(a)}, K_z^{(b)} + \frac{K_z^{(a)}}{t} \right) - G \left( K_z^{(a)}, K_z^{(b)} + \frac{K_z^{(a+d)}}{t} \right) \right] \]
\[ = \lim_{t \to 0} \frac{1}{t} \left[ G(K_z^{(a)}, K_z^{(b)}) + G(K_z^{(a)}, K_z^{(b+d)}) \right] \in B_1. \]

Thus we conclude that
\[ 2G(K_z^{(a+d)}, K_z^{(b)}) = G(K_z^{(a+d)}, K_z^{(b)}) + G(K_z^{(a)}, K_z^{(b+d)}) + G(K_z^{(a+d)}, K_z^{(b)}) - G(K_z^{(a)}, K_z^{(b+d)}) \]
belongs to $B_1$. This completes the proof of Proposition 4.1. $\square$

Applying Proposition 4.1 to the bilinear form $G(f, g) = \langle TU_{(\cdot)} f, U_{(\cdot)} g \rangle$, we deduce that $\langle TU_{(\cdot)} k_z, U_{(\cdot)} k_w \rangle$ belongs to a translation invariant closed subalgebra of $BUC(\mathbb{B}_n)$ if the Berezin transform of $T$ does.

**Corollary 4.2.** Let $T$ be a bounded linear operator on $L_p^n$ and $\mathcal{I}$ be a translation invariant closed subalgebra of $BUC(\mathbb{B}_n)$. If the Berezin transform of $T$ is in $\mathcal{I}$, then
\[ \langle TU_{(\cdot)} k_z, U_{(\cdot)} k_w \rangle \in \mathcal{I} \]
for all $z, w \in \mathbb{B}_n$.

**Proof.** Since $\mathcal{I}$ is translation invariant and $\overline{T} \in \mathcal{I}$, we have
\[ \langle TU_{(\cdot)} k_z, U_{(\cdot)} k_z \rangle = \langle Tk_{\varphi_{(\cdot)}(z)}, k_{\varphi_{(\cdot)}(z)} \rangle = \overline{T}(\varphi_{(\cdot)}(z)) = \tau_{z}(\overline{T}) \in \mathcal{I} \]
for any $z \in \mathbb{B}_n$. By Lemma 3.5 and Proposition 4.1, we get that
\[ \langle TU_{(\cdot)} k_z, U_{(\cdot)} k_w \rangle \in \mathcal{I} \]
for all $z, w \in \mathbb{B}_n$. This completes the proof. $\square$

Since the Bergman metric is Möbius invariant, $\{ \varphi_{u}(z) : u \in \Gamma \}$ is separated for any $z$ when $\Gamma$ is separated. Although the set $\{ \varphi_{u}(z) : u \in \Gamma \}$ may not be separated, we have the following lemma in the case that $\Gamma$ is $c$-separated.

**Lemma 4.3 ([10, Lemma 2.2]).** Let $r > 0$ and $0 < \rho < 1$. Suppose that $\Gamma$ is $c$-separated, then there exist a positive integer $m$ and a finite partition $\Gamma = \Gamma_1 \cup \cdots \cup \Gamma_m$ such that for any $|z| \leq \rho$ and $j \in \{1, 2, \ldots, m\}$, we have that $\{ \varphi_{u}(z) : u \in \Gamma_j \}$ is $r$-separated. Moreover, $m$ depends only on $r$, $\rho$ and $c$. 

In view of the above lemma, we will construct a partition of the unity on the unit ball. Let \( c > 0, l > 0 \) and \( \Gamma \) be a \( c \)-separated set. Without loss of generality, we may assume that \( 0 \in \Gamma \). Let \( \Phi_0^l \) be a radial positive smooth function such that

\[
\Phi_0^l(\xi) = \begin{cases} 
1, & \text{if } \xi \in D(0, l), \\
0, & \text{if } \xi \notin D(0, 2l).
\end{cases}
\] (4.1)

For \( \zeta \in \Gamma \), we define \( \Phi_\zeta^l \) such that

\[
\Phi_\zeta^l(\xi) = \Phi_0^l(\varphi_\zeta(\xi)), \quad \xi \in \mathbb{B}_n.
\] (4.2)

If \( \Gamma \) is a subset of the unit ball \( \mathbb{B}_n \) such that \( \{D(\zeta, \frac{c}{2}) : \zeta \in \Gamma\} \) are mutually disjoint and \( \{D(\zeta, c) : \zeta \in \Gamma\} \) covers \( \mathbb{B}_n \), we define

\[
\Psi_\zeta(\xi) := \frac{\Phi_\zeta^c(\xi)}{\sum_{\zeta \in \Gamma} \Phi_\zeta^c(\xi)}, \quad \xi \in \mathbb{B}_n.
\] (4.3)

Clearly, \( \Psi_\zeta(\varphi_\zeta(\xi)) = \Psi_0(\xi) \), \( \sum_{\zeta \in \Gamma} \Psi_\zeta(\xi) = 1 \) and \( \text{supp}(\Psi_\zeta) \subset D(\zeta, 2c) \).

Let \( \mathcal{I} \) be a translation invariant closed subalgebra of \( \text{BUC}(\mathbb{B}_n) \). Then we define \( \mathcal{I}' \) to be the subspace of \( L^\infty(\mathbb{B}_n, dv) \) generated by

\[
\left\{ \sum_{u \in \Gamma} f(u)\Phi_{\varphi_u(z)}^l : l > 0, \Gamma \text{ is a separated set, } z \in \mathbb{B}_n \text{ and } f \in \mathcal{I} \right\}.
\] (4.4)

Since \( \Phi_0^l \) is radial, we have

\[
\Phi_{\varphi_u(z)}^l(\zeta) = \Phi_0^l(\varphi_u(z)(\zeta)) = \Phi_0^l(\varphi_z(\varphi_u(\zeta))) = \Phi_z^l(\varphi_u(\zeta)).
\] (4.5)

Observe that \( \mathcal{I}' \) can be regarded as such a space which has the same growth as \( \mathcal{I} \). Let

\[
C_0(\mathbb{B}_n) = \left\{ f \in \text{BUC}(\mathbb{B}_n) : \lim_{|z| \to 1} f(z) = 0 \right\}.
\]

With the discussion above, we have the following result.

**Lemma 4.4.** Let \( \mathcal{I} \) be a translation invariant closed subalgebra of \( \text{BUC}(\mathbb{B}_n) \). Then the space \( \mathcal{I}' \) defined by (4.4) is contained in \( \text{BUC}(\mathbb{B}_n) \). Moreover, \( \mathcal{I}' \subset C_0(\mathbb{B}_n) \) if \( \mathcal{I} = C_0(\mathbb{B}_n) \).

**Proof.** Let \( l > 0, z \in \mathbb{B}_n \) and \( \Gamma \) be a \( c \)-separated set. By Lemma 4.3, for any \( r > 0 \) there is a finite partition \( \Gamma = \Gamma_1 \cup \cdots \cup \Gamma_m \) such that each \( \{\varphi_u(z) : u \in \Gamma_j\} \) is \( r \)-separated. Thus,

\[
\sum_{u \in \Gamma} f(u)\Phi_{\varphi_u(z)}^l = \sum_{j=1}^m \sum_{u \in \Gamma_j} f(u)\Phi_{\varphi_u(z)}^l
\]

for any \( f \in \text{BUC}(\mathbb{B}_n) \). Now we choose \( r \) big enough such that the support sets of \( \Phi_{\varphi_u(z)}^l \) are \( c \)-separated, i.e.,

\[
\beta\left(\text{supp}(\Phi_{\varphi_u(z)}^l), \text{supp}(\Phi_{\varphi_v(z)}^l)\right) \geq c
\]

for \( u, v \in \Gamma_j \). Since \( f \) is bounded, we have \( \sum_{u \in \Gamma_j} f(u)\Phi_{\varphi_u(z)}^l \in \text{BUC}(\mathbb{B}_n) \). Thus

\[
\sum_{u \in \Gamma_j} f(u)\Phi_{\varphi_u(z)}^l \in \text{BUC}(\mathbb{B}_n).
\]

For the case that \( \mathcal{I} = C_0(\mathbb{B}_n) \), let \( f \in C_0(\mathbb{B}_n) \), then \( \sum_{u \in \Gamma_j} f(u)\Phi_{\varphi_u(z)}^l \in C_0(\mathbb{B}_n) \) for \( j = 1, 2, \cdots, m \). This gives us

\[
\sum_{u \in \Gamma} f(u)\Phi_{\varphi_u(z)}^l \in C_0(\mathbb{B}_n),
\]

and we are done.
to obtain $\mathcal{I}' \subset C_0(\mathbb{B}_n)$. This completes the proof.

Let $\mathcal{I}$ be a translation invariant closed subalgebra of $\text{BUC}(\mathbb{B}_n)$ and $\mathcal{I}'$ be defined in (4.4). Before showing that an $s$-weakly localized operator belongs to $\mathcal{T}_{\text{lin}}^b(\mathcal{I}')$ when its Berezin transform is in $\mathcal{I}$, the following key proposition is required.

**Proposition 4.5.** Let $\mathcal{I}$ be a translation invariant closed subalgebra of $\text{BUC}(\mathbb{B}_n)$ and $\Gamma$ be $c$-separated. For each $f \in \mathcal{I}$ and $z, w \in \Gamma$, we have

$$\sum_{u \in \Gamma} f(u)(U_uk_z) \otimes (U_uk_w) \in \mathcal{T}_{\text{lin}}^b(\mathcal{I}')$$

and

$$\int_{\mathbb{B}_n} f(u)(U_uk_z) \otimes (U_uk_w) d\lambda(u) \in \mathcal{T}_{\text{lin}}^b(\mathcal{I}).$$

**Proof.** Based on Lemma 3.5 and Proposition 4.1, we need only to show that

$$\sum_{u \in \Gamma} f(u)(U_uk_z) \otimes (U_uk_z) \in \mathcal{T}_{\text{lin}}^b(\mathcal{I}')$$

and

$$\int_{\mathbb{B}_n} f(u)(U_uk_z) \otimes (U_uk_z) d\lambda(u) \in \mathcal{T}_{\text{lin}}^b(\mathcal{I}')$$

for every $z \in \mathbb{B}_n$.

Using

$$U_uk_z = \frac{|1 - u \cdot z|^{n+1}}{(1 - u \cdot z)^{n+1}} k_{\varphi_u(z)},$$

we have

$$\sum_{u \in \Gamma} f(u)(U_uk_z) \otimes (U_uk_z) = \sum_{u \in \Gamma} f(u)k_{\varphi_u(z)} \otimes k_{\varphi_u(z)}$$

and

$$\int_{\mathbb{B}_n} f(u)(U_uk_z) \otimes (U_uk_z) d\lambda(u) = \int_{\mathbb{B}_n} f(u)k_{\varphi_u(z)} \otimes k_{\varphi_u(z)} d\lambda(u).$$

By Lemmas 3.5 and 3.6, we obtain that the following two mappings:

$$z \mapsto \sum_{u \in \Gamma} f(u)(U_uk_z) \otimes (U_uk_z)$$

and

$$z \mapsto \int_{\mathbb{B}_n} f(u)(U_uk_z) \otimes (U_uk_z) d\lambda(u)$$

are both uniformly continuous and uniformly bounded from each $D(0, r)$ to the set of bounded linear operators on $L^p_\alpha$ in the norm topology, where $r > 0$.

Let us first show that

$$\sum_{u \in \Gamma} f(u)k_{\varphi_u(z)} \otimes k_{\varphi_u(z)} \in \mathcal{T}_{\text{lin}}^b(\mathcal{I}')$$

where $f \in \mathcal{I}$ and $\Gamma$ is $c$-separated. To do this, we let

$$a_l = \int_{\mathbb{B}_n} \Phi^l_z(\xi) d\lambda(\xi) \quad \text{and} \quad A_l = \int_{\mathbb{B}_n} \sum_{u \in \Gamma} f(u) \frac{\Phi^l_{\varphi_u(z)}(\xi)}{a_l} k_\zeta \otimes k_\zeta d\lambda(\zeta),$$
where the functions of the form $\Phi^l_{\zeta}$ are defined by (4.1) and (4.2). Since $A_l$ is the Toeplitz operator with symbol $\sum_{u \in \Gamma} f(u) \frac{\phi^l_{\varphi_u(z)}(\zeta)}{a_l}$, we have that $A_l \in T_{lin}(I')$. Furthermore, we have by (4.1) and (4.5) that

$$\int_{B_n} \sum_{u \in \Gamma} f(u) \frac{\phi^l_{\varphi_u(z)}(\zeta)}{a_l} k_\zeta k_\zeta d\lambda(\zeta) = \int_{B_n} \sum_{u \in \Gamma} f(u) \frac{\phi^l_{\varphi_u(z)}}{a_l} k_\zeta k_\zeta d\lambda(\zeta) = \int_{B_n} \sum_{u \in \Gamma} f(u) \frac{\phi^l_{\varphi_u(z)}}{a_l} k_\zeta k_\zeta d\lambda(\zeta) = \int_{D(z,2l)} \frac{\phi^l_{\varphi_u(z)}}{a_l} \sum_{u \in \Gamma} f(u) k_{\varphi_u(z)} \otimes k_{\varphi_u(z)} d\lambda(\zeta).$$

We may assume that $0 < \eta < 1$, then $z, \zeta \in D(0, 2 + |z|)$ if $\zeta \in D(z, 2l)$. Using Lemmas 3.5 and 3.6 again, we obtain

$$\left\| \sum_{u \in \Gamma} f(u) k_{\varphi_u(z)} \otimes k_{\varphi_u(z)} - \sum_{u \in \Gamma} f(u) k_{\varphi_u(z)} \otimes k_{\varphi_u(z)} \right\| \leq C|z| \eta,$$

where $C|z|$ is a constant depending only on $|z|$. This implies that

$$\left\| A_l - \sum_{u \in \Gamma} f(u) k_{\varphi_u(z)} \otimes k_{\varphi_u(z)} \right\| \leq C|z| \eta,$$

$$\left\| \int_{D(z,2l)} \frac{\phi^l_{\varphi_u(z)}}{a_l} \left( \sum_{u \in \Gamma} f(u) k_{\varphi_u(z)} \otimes k_{\varphi_u(z)} - \sum_{u \in \Gamma} f(u) k_{\varphi_u(z)} \otimes k_{\varphi_u(z)} \right) d\lambda(\zeta) \right\| \leq C|z| \eta,$$

to obtain

$$\sum_{u \in \Gamma} f(u) k_{\varphi_u(z)} \otimes k_{\varphi_u(z)} \in T_{lin}(I').$$

Next, we are going to show that

$$\int_{B_n} f(u) k_{\varphi_u(z)} \otimes k_{\varphi_u(z)} d\lambda(u) \in T_{lin}^b(I').$$

Let $\Gamma'$ be a subset of $B_n$ such that $\{D(\zeta, 2l) : \zeta \in \Gamma'\}$ are mutually disjoint and $\{D(\zeta, c) : \zeta \in \Gamma'\}$ covers $B_n$. Recalling that $\Psi_{\zeta}(\xi)$ is the function constructed in (4.3), then we have that

$$\left\langle \int_{B_n} f(u) k_{\varphi_u(z)} \otimes k_{\varphi_u(z)} d\lambda(u), h, g \right\rangle = \int_{B_n} f(u) \langle h, k_{\varphi_u(z)} \rangle \langle k_{\varphi_u(z)}, g \rangle d\lambda(u)$$

$$= \int_{B_n} \sum_{\zeta \in \Gamma'} \Psi_{\zeta}(u) f(u) \langle h, k_{\varphi_u(z)} \rangle \langle k_{\varphi_u(z)}, g \rangle d\lambda(u)$$

$$= \int \Psi_0(u) \sum_{\zeta \in \Gamma'} f(\varphi_{\zeta}(u)) \langle h, k_{\varphi_{\varphi_{\zeta}(u)}} \rangle \langle k_{\varphi_{\varphi_{\zeta}(u)}}, g \rangle d\lambda(u)$$

for any $h \in L^p_a$ and $g \in L^q_b$. By Lemma 4.3, there is a partition $\Gamma' = \Gamma'_{\eta} \cup \cdots \cup \Gamma_m$ such that $\{\varphi_{\zeta}(u) : \zeta \in \Gamma'_{\eta} \}$ is $c$-separated for any $j \in \{1, 2, \ldots, m\}$. From the proof of Lemma 4.3, we may suppose that
\{\varphi_{\varphi}(u) \mid \zeta \in \Gamma_j\} is also \(c\)-separated for each \(j\). Thus, we have
\[
\langle \int_{\mathbb{B}_n} f(u)k_{\varphi_{\varphi}(u)} \otimes k_{\varphi_{\varphi}(u)} d\lambda(u), g \rangle
= \sum_{j=1}^{m} \int_{\mathbb{B}_n} \Psi_0(u) \sum_{\zeta \in \Gamma_j} f(\varphi_{\varphi}(u)) \langle h, k_{\varphi_{\varphi}(u)}(z) \rangle \langle k_{\varphi_{\varphi}(u)}(z), g \rangle d\lambda(u)
= \sum_{j=1}^{m} \int_{D(0,2c)} \Psi_0(u) \langle \sum_{\zeta \in \Gamma_j} f(\varphi_{\varphi}(u)) k_{\varphi_{\varphi}(u)}(z) \otimes k_{\varphi_{\varphi}(u)}(z), h, g \rangle d\lambda(u),
\]
where the last equality follows from that \(\text{supp}(\Psi_0) \subset D(0,2c)\).

Now we need to show that the mapping
\[
u \mapsto \sum_{\zeta \in \Gamma_j} f(\varphi_{\varphi}(u)) k_{\varphi_{\varphi}(u)}(z) \otimes k_{\varphi_{\varphi}(u)}(z)
(4.7)
\]
is uniformly continuous and uniformly bounded from \(D(0,2c)\) to the set of bounded linear operators on \(L^p_n\) in the norm topology. In fact, we have by (3.4) that
\[
\beta(\varphi_{\varphi}(u)(z), \varphi_{\varphi}(w)(z)) \leq \frac{C}{1 - |z|^2} \beta(\varphi_{\varphi}(u), \varphi_{\varphi}(w))
= \frac{C}{1 - |z|^2} \beta(u, w)
\]
for all \(u, w \in D(0,2c)\). Recall that the absolute constant \(C\) comes from (3.4). Let
\[
a(u, u', \zeta, z) = \varphi_{\varphi}(u)(\varphi_{\varphi}(w)(z)).
\]
Then we have
\[
a(u, u', \zeta, z) \in D\left(0, \frac{C}{1 - |z|^2} \beta(u, w)\right)
\]
and
\[
\varphi_{\varphi}(u)(z) \bigl( a(u, u', \zeta, z) \bigr) = \varphi_{\varphi}(w)(z).
\]

It follows that
\[
\left\| \sum_{\zeta \in \Gamma_j} f(\varphi_{\varphi}(u)) k_{\varphi_{\varphi}(w)(z)} \otimes k_{\varphi_{\varphi}(w)(z)} - \sum_{\zeta \in \Gamma_j} f(\varphi_{\varphi}(u)) k_{\varphi_{\varphi}(w)(z)} \otimes k_{\varphi_{\varphi}(w)(z)} \right\|
= \left\| \sum_{\zeta \in \Gamma_j} \left[ f(\varphi_{\varphi}(u)) U_{\varphi_{\varphi}(w)}(z) k_{\varphi_{\varphi}(w)(z)} \otimes U_{\varphi_{\varphi}(w)}(z) k_{\varphi_{\varphi}(w)(z)} - f(\varphi_{\varphi}(u)) U_{\varphi_{\varphi}(w)}(z) k_0 \otimes U_{\varphi_{\varphi}(w)}(z) k_0 \right] \right\|
\leq C_1 \left[ \sup_{\zeta \in \mathbb{B}_n} |f(\varphi_{\varphi}(u)) - f(\varphi_{\varphi}(u'))| + \|f\|_{\infty} \beta(a(u, u', \zeta, z), 0) \right]
\leq C_1 \left[ \sup_{\zeta \in \mathbb{B}_n} |f(\varphi_{\varphi}(u)) - f(\varphi_{\varphi}(u'))| + \|f\|_{\infty} \frac{C}{1 - |z|^2} \beta(u, w') \right],
\]
where the first inequality follows from Lemmas 3.5 and 3.6. Since \(f \in \text{BUC}(\mathbb{B}_n)\), we obtain that the mapping defined in (4.7) is uniformly continuous. Similarly, we can show that this mapping is also uniformly bounded.

Recalling that
\[
\int_{\mathbb{B}_n} f(u)k_{\varphi_{\varphi}(u)} \otimes k_{\varphi_{\varphi}(u)} d\lambda(u) = \sum_{j=1}^{m} \int_{D(0,2c)} \Psi_0(u) \sum_{\zeta \in \Gamma_j} f(\varphi_{\varphi}(u)) k_{\varphi_{\varphi}(w)(z)} \otimes k_{\varphi_{\varphi}(w)(z)} d\lambda(u),
\]
we conclude that the above integral is convergent in the norm topology. Recalling that \( \{ \varphi_{\zeta}(u) : \zeta \in \Gamma_j \} \) is \( c \)-separated for any \( j \in \{1, 2, \cdots, m\} \), it follows from (4.6) that

\[
\int_{\mathbb{B}_n} f(u)k_{\varphi_u(z)} \otimes k_{\varphi_u(z)}d\lambda(u) \in \mathcal{T}^{b}_{\text{lin}}(\mathcal{I}'),
\]

completing the proof of Proposition 4.5. \( \square \)

**Theorem 4.6.** Let \( \mathcal{I} \) be a translation invariant closed subalgebra of \( \text{BUC}(\mathbb{B}_n) \) and \( \mathcal{I}' \) be defined in (4.4). Let \( T \) be a bounded linear operator on \( L^p_\mathcal{A} \). If \( T \in \mathcal{A}_\mathcal{S}^p \) and \( \tilde{T} \in \mathcal{I} \), then \( T \in \mathcal{T}^{b}_{\text{lin}}(\mathcal{I}') \).

**Proof.** From our assumption and Corollary 4.2, we have that \( \langle TU_{(\cdot)}k_w, U_{(\cdot)}k_z \rangle \in \mathcal{I} \) for all \( z, w \in \mathbb{B}_n \). By Proposition 4.5, we obtain

\[
\int_{\mathbb{B}_n} \langle TU_{u}k_0, U_{u}k_0 \rangle(U_{u}k_w) \otimes (U_{u}k_0)d\lambda(u) \in \mathcal{T}^{b}_{\text{lin}}(\mathcal{I}').
\]

Therefore, we conclude by Theorem 3.2 that

\[
T = \lim_{r \to \infty} \int_{D(0,r)} \int_{\mathbb{B}_n} \langle TU_{u}k_0, U_{u}k_n \rangle(U_{u}k_v) \otimes (U_{u}k_0)d\lambda(u)d\lambda(v) \in \mathcal{T}^{b}_{\text{lin}}(\mathcal{I}').
\]

This completes the proof of Theorem 4.6. \( \square \)

We next show that the Berezin transform of the finite product of Toeplitz operators with translation invariant symbols is also translation invariant on \( \mathbb{B}_n \).

**Proposition 4.7.** Let \( \mathcal{I} \) be a translation invariant closed subalgebra of \( \text{BUC}(\mathbb{B}_n) \). For \( \varphi_{1, \cdots, m} \in \mathcal{I} \), let \( A = T_{\varphi_{1}}T_{\varphi_{2}} \cdots T_{\varphi_{m}} \). Then we have

\[
\tilde{T}_{\varphi_{1}}(\cdot) = \int_{\mathbb{B}_n} \varphi_{1} \circ \varphi_{z}(w)d\nu(w)
\]

and \( \mathcal{I} \) is translation invariant, we have that \( \varphi_{1} \circ \varphi_{(\cdot)} \in \mathcal{I} \). Since \( \varphi_{1} \in \text{BUC}(\mathbb{B}_n) \) and

\[
\beta(\varphi_{z}(w), \varphi_{z}(w')) = \beta(w, w'),
\]

we obtain that the mapping

\[
w \mapsto \varphi_{1} \circ \varphi_{(\cdot)}(w)
\]

is uniformly continuous on \( \mathbb{B}_n \). Moreover, since

\[
\| \varphi_{1} \circ \varphi_{(\cdot)}(w) \|_{\mathcal{I}} = \sup_{z \in \mathbb{B}_n} | \varphi_{1} \circ \varphi_{z}(w) | = \| \varphi_{1} \|_{\infty} < \infty,
\]

we have that \( \varphi_{1} \circ \varphi_{(\cdot)}(w) \in \mathcal{I} \) and the integral

\[
\int_{\mathbb{B}_n} \varphi_{1} \circ \varphi_{(\cdot)}(w)d\nu(w)
\]

is convergent in the norm topology of \( \mathcal{I} \). It follows that

\[
\tilde{T}_{\varphi_{1}}(\cdot) = \int_{\mathbb{B}_n} \varphi_{1} \circ \varphi_{(\cdot)}(w)d\nu(w) \in \mathcal{I}.
\]

This shows that our conclusion holds for \( m = 1 \).
Now we suppose that the conclusion holds for \( m = k - 1 \). Let us consider the case of \( m = k \).

\[
(T_{\varphi_1} T_{\varphi_2} \cdots T_{\varphi_k} k_z, k_z) = \langle T_{\varphi_1} \cdots T_{\varphi_k} k_z, T_{\varphi^*_z} k_z \rangle \\
= \int_{\mathbb{B}_n} \langle T_{\varphi_2} \cdots T_{\varphi_k} k_z, k_w \rangle \langle k_w, T_{\varphi^*_z} k_z \rangle d\lambda(w) \\
= \int_{\mathbb{B}_n} \langle T_{\varphi_2} \cdots T_{\varphi_k} k_z, k_{\varphi_z(w)} \rangle \langle k_{\varphi_z(w)}, T_{\varphi^*_z} k_z \rangle d\lambda(w) \\
= \int_{\mathbb{B}_n} \langle T_{\varphi_2} \cdots T_{\varphi_k} U_z k_0, U_z k_w \rangle \langle T_{\varphi_1} U_z k_w, U_z k_0 \rangle d\lambda(w).
\]

By our hypothesis, \( \langle T_{\varphi_2} \cdots T_{\varphi_k} k_z, k_z \rangle \in \mathcal{I} \). It follows that

\[
\langle T_{\varphi_2} \cdots T_{\varphi_k} U_z k_w, U_z k_w \rangle = \langle T_{\varphi_2} \cdots T_{\varphi_k} k_{\varphi_z(w)}, k_{\varphi_z(w)} \rangle \in \mathcal{I},
\]

since \( \mathcal{I} \) is translation invariant. Using Corollary 4.2, we obtain

\[
\langle T_{\varphi_2} \cdots T_{\varphi_k} U_z k_0, U_z k_w \rangle \in \mathcal{I}.
\]

Similarly, we have

\[
\langle T_{\varphi_1} U_z k_w, U_z k_0 \rangle \in \mathcal{I},
\]

to obtain

\[
\langle T_{\varphi_2} \cdots T_{\varphi_k} U_z k_0, U_z k_w \rangle \langle T_{\varphi_1} U_z k_w, U_z k_0 \rangle \in \mathcal{I}.
\]

It follows from Lemmas 3.5 and 3.6 that the mapping

\[
w \mapsto \langle T_{\varphi_2} \cdots T_{\varphi_k} U_z k_0, U_z k_w \rangle \langle T_{\varphi_1} U_z k_w, U_z k_0 \rangle
\]

is uniformly continuous from each \( D(0, r) \) to \( \mathcal{I} \).

Choosing \( t > 2 > t' > 1 \) such that \( \frac{1}{t} + \frac{1}{t'} = 1 \), then we have by (3.3) that

\[
\left\| (T_{\varphi_2} \cdots T_{\varphi_k} U_z k_0, U_z k_w) \langle T_{\varphi_1} U_z k_w, U_z k_0 \rangle \right\| \\
= \sup_{z \in \mathbb{B}_n} \left\| (T_{\varphi_2} \cdots T_{\varphi_k} U_z k_0, U_z k_w) \langle T_{\varphi_1} U_z k_w, U_z k_0 \rangle \right\| \\
= \sup_{z \in \mathbb{B}_n} \langle T_{\varphi_2 \circ \varphi_z} \cdots T_{\varphi_k \circ \varphi_z} k_0, k_w \rangle \langle k_w, T_{\varphi^*_z \circ \varphi_z} k_0 \rangle \\
\leq \|T_{\varphi_2 \circ \varphi_z} \cdots T_{\varphi_k \circ \varphi_z} 1\|_{\ell'} \|k_w\|_1 \|k_w\|_1 \|T_{\varphi^*_z \circ \varphi_z} 1\|_{\ell'} \\
\lesssim (1 - |w|^2)^{(1-\frac{1}{t})/(n+1)},
\]

where the function \( (1 - |w|^2)^{(1-\frac{1}{t})/(n+1)} \) is integrable with respect to the measure \( d\lambda \) on \( \mathbb{B}_n \). Therefore,

\[
\langle T_{\varphi_1} T_{\varphi_2} \cdots T_{\varphi_k} k_z, k_z \rangle = \int_{\mathbb{B}_n} \langle T_{\varphi_2} \cdots T_{\varphi_k} U_z k_0, U_z k_w \rangle \langle T_{\varphi_1} U_z k_w, U_z k_0 \rangle d\lambda(w)
\]

is also in \( \mathcal{I} \), as desired. This completes the proof of Proposition 4.7.

Given a translation invariant closed subalgebra \( \mathcal{I} \subset \text{BUC}(\mathbb{B}_n) \), we recall that \( \mathcal{I}' \) is defined by (4.4). Then combining Theorem 4.6 with Proposition 4.7 gives that the Toeplitz algebra \( \mathcal{T}^b(\mathcal{I}) \) is contained in the closed linear space \( \mathcal{T}^b_{lin}(\mathcal{I}') \).

**Proposition 4.8.** Suppose that \( \mathcal{I} \) is a translation invariant closed subalgebra of \( \text{BUC}(\mathbb{B}_n) \). Then

\[
\mathcal{T}^b(\mathcal{I}) \subset \mathcal{T}^b_{lin}(\mathcal{I}')
\]

holds on the \( p \)-Bergman space \( L^p_{p} \).

**Proof.** Let \( A = T_{\varphi_1} T_{\varphi_2} \cdots T_{\varphi_m} \in \mathcal{T}^b(\mathcal{I}) \) with \( \varphi_1, \ldots, \varphi_m \in \mathcal{I} \). It follows from Proposition 4.7 that \( \widetilde{A} \in \mathcal{I} \). By Propositions 2.2 and 2.3 in [5], we deduce that \( A \in \mathcal{A}_{lin}^p \). Now we conclude by Theorem 4.6 that \( A \in \mathcal{T}^b_{lin}(\mathcal{I}') \). This finishes the proof of Proposition 4.8. □
The next theorem generalizes the corresponding result obtained by Xia [10, Theorem 1.5] for the case of $p = 2$.

**Theorem 4.9.** On the $p$-Bergman space $L_p^b$, we have

$$\mathcal{T}_{lin}^b[BUC(\mathbb{B}_n)] = \mathcal{T}^b[BUC(\mathbb{B}_n)] = \text{clos}(\mathcal{A}_p^b)$$

and

$$\mathcal{T}_{lin}^b[C_0(\mathbb{B}_n)] = \mathcal{T}^b[C_0(\mathbb{B}_n)] = \mathcal{K},$$

where $\text{clos}(\mathcal{A}_p^b)$ denotes the norm closure of $\mathcal{A}_p^b$ and $\mathcal{K}$ denotes the set of compact operators on $L_p^b$.

**Proof.** First, note that

$$\mathcal{T}_{lin}^b[BUC(\mathbb{B}_n)] \subset \mathcal{T}^b[BUC(\mathbb{B}_n)] \quad \text{and} \quad \mathcal{T}_{lin}^b[C_0(\mathbb{B}_n)] \subset \mathcal{T}^b[C_0(\mathbb{B}_n)].$$

On the other hand, it follows from Lemma 4.4 and Proposition 4.8 that

$$\mathcal{T}^b[BUC(\mathbb{B}_n)] \subset \mathcal{T}_{lin}^b[BUC(\mathbb{B}_n)]' \subset \mathcal{T}_{lin}^b[BUC(\mathbb{B}_n)]$$

and

$$\mathcal{T}^b[C_0(\mathbb{B}_n)] \subset \mathcal{T}_{lin}^b[C_0(\mathbb{B}_n)]' \subset \mathcal{T}_{lin}^b[C_0(\mathbb{B}_n)].$$

Thus we obtain that

$$\mathcal{T}_{lin}^b[BUC(\mathbb{B}_n)] = \mathcal{T}^b[BUC(\mathbb{B}_n)] \quad \text{and} \quad \mathcal{T}_{lin}^b[C_0(\mathbb{B}_n)] = \mathcal{T}^b[C_0(\mathbb{B}_n)].$$

By [8, Proposition 8.3], we have $\tilde{T} \in BUC(\mathbb{B}_n)$ for any $T \in \mathcal{A}_p^b$. Moreover, it follows from [5, Propositions 2.2 and 2.3] that $\mathcal{T}^b[BUC(\mathbb{B}_n)] \subset \text{clos}(\mathcal{A}_p^b)$. Therefore, we deduce by Theorem 4.6 that

$$\mathcal{T}^b[BUC(\mathbb{B}_n)] = \text{clos}(\mathcal{A}_p^b).$$

To finish the proof of this theorem, it remains to show that

$$\mathcal{K} = \mathcal{T}_{lin}^b[C_0(\mathbb{B}_n)].$$

Let

$$\mathcal{F} = \text{span}\{k_x \otimes k_y : x, y \in \mathbb{B}_n\}.$$ 

Since the linear span of the normalized reproducing kernels is dense in $L^p_n$ and $L^2_n$, we have that $\mathcal{F}$ is dense in $\mathcal{K}$. Now we are going to show $\mathcal{F} \subset \mathcal{A}_p^b$. To do this, we need only to show that $k_x \otimes k_y$ is $s$-weakly localized for all $x, y \in \mathbb{B}_n$.

In fact, for every $k_x \otimes k_y$ we have

$$|\langle (k_x \otimes k_y)k_z, k_w \rangle| = |\langle k_z, k_y \rangle| |\langle k_x, k_w \rangle|.$$ 

Suppose that $x, y \in D(0, a)$ for some $a > 0$, then we have by Lemma 3.3 that

$$|\langle k_z, k_y \rangle| |\langle k_x, k_w \rangle| \leq C_a |\langle k_z, k_\xi \rangle| |\langle k_x, k_w \rangle|$$

for all $\xi \in D(0, a)$, where $C_a$ is a positive constant depending only on $a$. This gives that

$$|\langle k_z, k_y \rangle| |\langle k_x, k_w \rangle| \leq \frac{C_a}{\lambda(D(0, a))} \int_{D(0, a)} |\langle k_z, k_\xi \rangle| |\langle k_x, k_w \rangle| d\lambda(\xi)$$

$$\leq \frac{C_a}{\lambda(D(0, a))} \int_{\mathbb{B}_n} |\langle k_z, k_\xi \rangle| |\langle k_x, k_w \rangle| d\lambda(\xi),$$
where $\lambda(D(0, a)) = \int_{D(0, a)} d\lambda$. Thus we have

\[
\sup_{z \in \mathbb{B}_n} \int_{\mathbb{B}_n \setminus D(z, r)} |\langle k_z, k_{\xi} \rangle| \cdot |\langle k_\xi, k_w \rangle| d\lambda(\xi) \leq \sup_{z \in \mathbb{B}_n} \int_{\mathbb{B}_n \setminus D(z, r)} |\langle k_z, k_{\xi} \rangle| \cdot |\langle k_\xi, k_w \rangle| d\lambda(w) \leq \sup_{z \in \mathbb{B}_n} \int_{\mathbb{B}_n \setminus D(z, r)} |\langle k_z, k_{\xi} \rangle| \cdot |\langle k_\xi, k_w \rangle| d\lambda(w)
\]

\[
= \sup_{z \in \mathbb{B}_n} \int_{\mathbb{B}_n \setminus D(z, r)} |\langle k_z, k_{\xi} \rangle| \cdot |\langle k_\xi, k_w \rangle| \cdot \left( \frac{1}{\|K_\xi\|_2^2} \frac{1}{\|K_w\|_2^2} \right) d\lambda(\xi) d\lambda(w)
\]

\[
= \sup_{z \in \mathbb{B}_n} \int_{\mathbb{B}_n \setminus D(z, r)} |\langle k_z, k_{\xi} \rangle| \cdot |\langle k_\xi, k_w \rangle| \cdot \left( \frac{1}{\|K_\xi\|_2^2} \frac{1}{\|K_w\|_2^2} \right) d\lambda(\xi) d\lambda(w)
\]

\[
+ \sup_{z \in \mathbb{B}_n} \int_{\mathbb{B}_n \setminus D(z, r)} \int_{\mathbb{B}_n \setminus D(z, r')} |\langle k_z, k_{\xi} \rangle| \cdot |\langle k_\xi, k_w \rangle| \cdot \left( \frac{1}{\|K_\xi\|_2^2} \frac{1}{\|K_w\|_2^2} \right) d\lambda(\xi) d\lambda(w)
\]

\[
:= I_1(r) + I_2(r).
\]

For $I_1(r)$, Fubini's theorem gives us

\[
I_1(r) = \sup_{z \in \mathbb{B}_n} \int_{\mathbb{B}_n \setminus D(z, r)} \int_{D(z', \frac{r}{2})} |\langle k_z, k_{\xi} \rangle| \cdot |\langle k_\xi, k_w \rangle| \cdot \left( \frac{1}{\|K_\xi\|_2^2} \frac{1}{\|K_w\|_2^2} \right) d\lambda(\xi) d\lambda(w)
\]

\[
= \sup_{z \in \mathbb{B}_n} \int_{D(z', \frac{r}{2})} \int_{\mathbb{B}_n \setminus D(z, r)} |\langle k_z, k_{\xi} \rangle| \cdot |\langle k_\xi, k_w \rangle| \cdot \left( \frac{1}{\|K_\xi\|_2^2} \frac{1}{\|K_w\|_2^2} \right) d\lambda(w) d\lambda(\xi)
\]

\[
\leq \left[ \sup_{\xi \in \mathbb{B}_n} \int_{\mathbb{B}_n \setminus D(\xi', \frac{r}{2})} |\langle k_\xi, k_w \rangle| \cdot \left( \frac{1}{\|K_w\|_2^2} \right) d\lambda(w) \right] \left[ \sup_{\xi \in \mathbb{B}_n} \int_{\mathbb{B}_n \setminus D(\xi', \frac{r}{2})} |\langle k_\xi, k_w \rangle| \cdot \left( \frac{1}{\|K_\xi\|_2^2} \right) d\lambda(\xi) \right],
\]

where the first inequality follows from that $D(\xi', \frac{r}{2}) \subset D(z, r)$ for $\xi \in D(z, \frac{r}{2})$.

To estimate $I_2(r)$, we note that

\[
I_2(r) = \sup_{z \in \mathbb{B}_n} \int_{\mathbb{B}_n \setminus D(z, r)} \int_{\mathbb{B}_n \setminus D(z, r')} |\langle k_z, k_{\xi} \rangle| \cdot |\langle k_\xi, k_w \rangle| \cdot \left( \frac{1}{\|K_\xi\|_2^2} \frac{1}{\|K_w\|_2^2} \right) d\lambda(\xi) d\lambda(w)
\]

\[
\leq \sup_{z \in \mathbb{B}_n} \int_{\mathbb{B}_n \setminus D(z, r')} \int_{\mathbb{B}_n \setminus D(z, r')} |\langle k_z, k_{\xi} \rangle| \cdot |\langle k_\xi, k_w \rangle| \cdot \left( \frac{1}{\|K_\xi\|_2^2} \frac{1}{\|K_w\|_2^2} \right) d\lambda(\xi) d\lambda(w)
\]

\[
\leq \left[ \sup_{z \in \mathbb{B}_n} \int_{\mathbb{B}_n \setminus D(z, r')} |\langle k_z, k_{\xi} \rangle| \cdot \left( \frac{1}{\|K_\xi\|_2^2} \right) d\lambda(\xi) \right] \left[ \sup_{\xi \in \mathbb{B}_n} \int_{\mathbb{B}_n \setminus D(\xi', \frac{r}{2})} |\langle k_\xi, k_w \rangle| \cdot \left( \frac{1}{\|K_w\|_2^2} \right) d\lambda(w) \right],
\]
Since the identity operator $I \in \mathcal{A}_b^p$, we have by [5, Lemma 2.1] that
\[
\lim_{r \to \infty} \sup_{z \in \mathbb{B}_n} \int_{B_n \setminus D(z,r)} |(k_x \otimes k_y)k_z, k_w)| \frac{1}{\|K_z\|_2^{1-\frac{2s}{q(n+1)}}\|K_w\|_2^{1-\frac{2s}{q(n+1)}}} d\lambda(w) 
\lesssim \lim_{r \to \infty} I_1(r) + \lim_{r \to \infty} I_2(r) = 0.
\]
Using the same arguments as above, one can verify that $k_x \otimes k_y$ satisfies the other three conditions in Definition 3.1. Thus we obtain that
\[
k_x \otimes k_y \in \mathcal{A}_s^p,
\]
and hence $\mathcal{F} \subset \mathcal{A}_s^p$.

For any $T \in \mathcal{F} \subset \mathcal{K}$, we have that $\tilde{T} \in \mathcal{C}_b^0(\mathbb{B}_n)$. Since $T \in \mathcal{F} \subset \mathcal{A}_s^p$, Lemma 4.4 and Theorem 4.6 imply that
\[T \in \mathcal{T}_{lin}^b[C_0(\mathbb{B}_n)],\]
to get $\mathcal{F} \subset \mathcal{T}_{lin}^b[C_0(\mathbb{B}_n)]$. This gives that
\[\mathcal{K} = \text{clos}(\mathcal{F}) \subset \mathcal{T}_{lin}^b[C_0(\mathbb{B}_n)].\]
Since $\mathcal{T}_{lin}^b[C_0(\mathbb{B}_n)] \subset \mathcal{K}$, we finally obtain that
\[\mathcal{K} = \mathcal{T}_{lin}^b[C_0(\mathbb{B}_n)].\]
This completes the proof of Theorem 4.9. \hfill \qed

Let us make a remark for the above theorem.

**Remark.** As mentioned in Section 1, it was proved by Xia [10, Theorem 1.5] that
\[
\mathcal{T}^b[L^\infty(\mathbb{B}_n, d\nu)] = \text{clos}(\mathcal{A}_s^2) = \mathcal{T}_{lin}^b[L^\infty(\mathbb{B}_n, d\nu)] \quad \text{(4.8)}
\]
and $\text{clos}(\mathcal{A}_s^2)$ equals the $C^*$-algebra generated by $\mathcal{A}_s^2$ for the case of $L_a^2$. But Suárez obtained in [8, Theorem 7.3] that
\[
\mathcal{T}_{lin}^b[\text{BUC}(\mathbb{B}_n)] = \mathcal{T}_{lin}^b[L^\infty(\mathbb{B}_n, d\nu)] \quad \text{and} \quad \mathcal{T}^b[\text{BUC}(\mathbb{B}_n)] = \mathcal{T}^b[L^\infty(\mathbb{B}_n, d\nu)]
\]
hold on the $p$-Bergman space $L_a^p$. Therefore, (4.8) can be rewritten as:
\[
\mathcal{T}^b[\text{BUC}(\mathbb{B}_n)] = \text{clos}(\mathcal{A}_s^2) = \mathcal{T}_{lin}^b[\text{BUC}(\mathbb{B}_n)] \quad \text{on the Bergman space } L_a^2.
\]
This means that Theorem 4.9 extends Xia’s result to case of the $p$-Bergman space with $p \neq 2$.

Let $\text{VMO}(\mathbb{B}_n)$ denote the set of vanishing mean oscillation functions on the unit ball. Let $\text{VMO}_\infty(\mathbb{B}_n) = \text{VMO}(\mathbb{B}_n) \cap L^\infty(\mathbb{B}_n, d\nu)$. It is well-known that $T_{\varphi_1}T_{\varphi_2} - T_{\varphi_1 \varphi_2}$ is compact when $\varphi_1, \varphi_2 \in \text{VMO}_\infty(\mathbb{B}_n)$. We end this section by the following corollary, which gives a characterization on the Toeplitz algebra with symbols in an algebra lying between $C_0(\mathbb{B}_n)$ and $\text{VMO}_\infty(\mathbb{B}_n)$.

**Corollary 4.10.** Let $\mathcal{I}$ be an algebra such that
\[C_0(\mathbb{B}_n) \subset \mathcal{I} \subset \text{VMO}_\infty(\mathbb{B}_n).\]
Then we have
\[\mathcal{T}^b(\mathcal{I}) = \text{clos}\{T_{\varphi} + K : \varphi \in \mathcal{I} \text{ and } K \in \mathcal{K}\} = \mathcal{T}_{lin}^b(\mathcal{I}),\]
where $\text{clos}\{T_{\varphi} + K : \varphi \in \mathcal{I} \text{ and } K \in \mathcal{K}\}$ denotes the norm closure of $\{T_{\varphi} + K : \varphi \in \mathcal{I} \text{ and } K \in \mathcal{K}\}$.

**Proof.** First, we claim that
\[\mathcal{T}^b(\mathcal{I}) \subset \text{clos}\{T_{\varphi} + K : \varphi \in \mathcal{I} \text{ and } K \in \mathcal{K}\}.
\]
Let us assume this for the moment and we will give its proof later. As $\mathcal{T}_{lin}^b(\mathcal{I}) \subset \mathcal{T}^b(\mathcal{I})$, it is enough to show that
\[\text{clos}\{T_{\varphi} + K : \varphi \in \mathcal{I} \text{ and } K \in \mathcal{K}\} \subset \mathcal{T}_{lin}^b(\mathcal{I}).\]
According to Theorem 4.9, we have
\[ \mathcal{K} = \mathcal{I}^b_{\text{lin}}[C_0(\mathbb{B}_n)], \]
to obtain
\[ \text{clos}\{T_\varphi + K : \varphi \in \mathcal{I} \text{ and } K \in \mathcal{K}\} = \text{clos}\{T_\varphi + T_\psi : \varphi \in \mathcal{I} \text{ and } \psi \in C_0(\mathbb{B}_n)\} \]
\[ \subset \text{clos}\{T_\varphi : \varphi \in \mathcal{I}\} \quad (\text{since } C_0(\mathbb{B}_n) \subset \mathcal{I}) \]
\[ = \mathcal{I}^b_{\text{lin}}(\mathcal{I}). \]

In order to complete the proof, we shall prove the above claim by induction. First, we have
\[ T_{\varphi_1} \in \text{clos}\{T_\varphi + K : \varphi \in \mathcal{I} \text{ and } K \in \mathcal{K}\} \]
if \( \varphi_1 \in \mathcal{I} \). Then we suppose that
\[ T_{\varphi_1} \cdots T_{\varphi_{m-1}} \in \text{clos}\{T_\varphi + K : \varphi \in \mathcal{I} \text{ and } K \in \mathcal{K}\} \]
for any functions \( \varphi_1, \ldots, \varphi_{m-1} \in \mathcal{I} \). Let \( \varphi_m \) be in \( \mathcal{I} \), then we have
\[ T_{\varphi_1} \cdots T_{\varphi_{m-1}} T_{\varphi_m} = T_{\varphi_1} \cdots T_{\varphi_{m-2}} T_{\varphi_{m-1} \varphi_m} + T_{\varphi_1} \cdots T_{\varphi_{m-2}} (T_{\varphi_{m-1}} T_{\varphi_m} - T_{\varphi_{m-1} \varphi_m}). \]
Note that \( T_{\varphi_{m-1}} T_{\varphi_m} - T_{\varphi_{m-1} \varphi_m} \) is compact, since \( \varphi_{m-1} \) and \( \varphi_m \) are in \( \mathcal{I} \subset \text{VMO}_\infty(\mathbb{B}_n) \). By the induction hypothesis, we have
\[ T_{\varphi_1} \cdots T_{\varphi_{m-1} \varphi_m} \in \text{clos}\{T_\varphi + K : \varphi \in \mathcal{I} \text{ and } K \in \mathcal{K}\}. \]
This implies that
\[ T_{\varphi_1} \cdots T_{\varphi_{m-1}} T_{\varphi_m} \in \text{clos}\{T_\varphi + K : \varphi \in \mathcal{I} \text{ and } K \in \mathcal{K}\}, \]
to get
\[ \mathcal{I}^b(\mathcal{I}) \subset \text{clos}\{T_\varphi + K : \varphi \in \mathcal{I} \text{ and } K \in \mathcal{K}\}. \]
This proves the claim and so the proof of Corollary 4.10 is finished. \( \square \)
