# Interpolation inequality and some applications 

Abdellaziz Harrabi ${ }^{1}$<br>Department of Mathematics, Collage of science. Northern Border University, Arar, Saudi Arabia Institut Supérieur des Mathématiques Appliquées et de l'Informatique, Universitè de Kairouan, Tunisia

#### Abstract

We investigate explicit universal estimate of finite Morse index solutions to polyharmonic equations. Differently to previous works [3, 7, 8, 14], propose here a direct proof using a new interpolation inequality and a delicate boot-strap argument under large superlinear and subcritical growth conditions to show that the universal constant grows as a power function of the Morse index. Also, our interpolation inequality allows us to provide local $L^{p}-W^{2 r, p}$ estimate.

Keywords: Interpolation inequality, Universal estimate, Morse index, Pohozaev identity, Boot strap argument. PACS: Primary 35G20, 35G30, Secondary 35B05, 35B09, 35B53.

## 1. Introduction

### 1.1. Interpolation inequalities.

Let $n, r \geq 2$ be two integer numbers and $p \geq 2$ a real number. We designate by $\Omega$ an open subset of $\mathbb{R}^{n}$ and $B_{R}$ the ball of radius $R>0$ centered at the origin. Let $j=\left(j_{1}, j_{2}, \ldots j_{n}\right)$ be a multi index, the weak $j^{\text {th }}$ partial derivative and the magnitude of the $q^{t h}$ gradient of $u \in W_{l o c}^{r, p}(\Omega)$ are respectively defined $a$.e in $\Omega$ by

$$
\begin{equation*}
D^{j} u=\frac{\partial^{j} u}{\partial x_{1}^{j_{1}} \ldots \partial x_{n}^{j_{n}}}, 1 \leq|j| \leq r \text { and }\left|\nabla^{q} u\right|=\left(\sum_{|j|=q}\left|D^{j} u\right|^{p}\right)^{\frac{1}{p}}, 1 \leq q \leq r . \tag{1.1}
\end{equation*}
$$

Let $\varepsilon \in(0,1)$ and $1 \leq q \leq r-1$. From an obvious dilation argument, the standard interpolation inequality [1] implies

$$
\begin{equation*}
R^{p(q-r)} \int_{B_{R}}\left|\nabla^{q} v\right|^{p} \leq \varepsilon \int_{B_{R}}\left|\nabla^{r} v\right|^{p}+C \varepsilon^{\frac{-q}{--q}} R^{-p r} \int_{B_{R}}|v|^{p}, \quad v \in W^{r, p}\left(B_{R}\right) . \tag{1.2}
\end{equation*}
$$

where $C=C(n, p, r)$ is a positive constant. According to (1.2), one can establish the following weighted interpolation inequality (see [14, 15, 20])

$$
\begin{equation*}
R^{p(q-r)} \Phi_{q}^{p}(v) \leq \varepsilon \Phi_{r}^{p}(v)+C \varepsilon^{\frac{-q}{r-q}} R^{-p r} \int_{B_{R}}|v|^{p}, \tag{1.3}
\end{equation*}
$$

where $\Phi_{q}$ is a family of weighted semi-norms defined by

$$
\Phi_{q}(v)=\left(\sup _{0<\alpha<1}(1-\alpha)^{q} \int_{B_{a R}}\left|\nabla^{q} v\right|^{p}\right)^{\frac{1}{p}}, 0 \leq q \leq r
$$

[^0]Inequality (1.3) together with the following cut-off function $\psi=\psi_{\alpha, R} \in C_{c}^{r}\left(\mathbb{R}^{n}\right), \alpha \in(0,1)$

$$
\psi(x)=\exp \left(\left(\frac{\frac{|x|}{R}-\alpha}{\frac{|x|}{R}-\alpha^{\prime}}\right)^{2 r+1}\right) \text { if } \alpha R<|x|<\alpha^{\prime} R, \psi \equiv 1 \text { if }|x| \leq \alpha R \text { and } \psi \equiv 0 \text { if }|x| \geq \alpha^{\prime} R \text { where } \alpha^{\prime}=\frac{1+\alpha}{2}
$$

are quite useful to provide the energy estimate which is essential to classify stable at infinity weak solution of the $p$ polyharmonic equations [15] (see also [14, 20] for $p=2$ ). The reader may consults [1, 11, 10] for further applications of (1.3). When $p \geq 2$ we introduce a new interpolation inequality which will be more relevant in providing integral estimates in various contexts. In particular it will be helpful to establish explicit universal estimate and local $L^{p}$ $W^{2 r, p}$-estimate (see Appendix C). Moreover, our inequality relies on a more general cut-off function related to two bounded open subset $\omega$ and $\omega^{\prime}$ such that $\bar{\omega} \subset \omega^{\prime} \subset \overline{\omega^{\prime}} \subset \Omega$. Precisely, denote $d=\operatorname{dist}\left(\omega, \Omega \backslash \omega^{\prime}\right)$, we have
Lemma 1.1. There exist $\psi \in C_{c}^{\infty}\left(\omega^{\prime}\right)$ and a positive constant $C$ depending only on ( $n, p, k, m$ ) such that

$$
\left\{\begin{array}{l}
0 \leq \psi \leq 1 \text { and } \psi \equiv 1 \text { if } x \in \omega  \tag{1.4}\\
\left|\nabla^{k} \psi(x)\right|^{p} \leq C d^{-k p}, \forall x \in \omega^{\prime} \text { and } k \in \mathbb{N} .
\end{array}\right.
$$

Moreover, we have

$$
\begin{equation*}
\left|\nabla^{k} \psi^{m}\right| \leq C d^{-k} \psi^{(m-k)}, \quad \forall x \in \omega^{\prime} \text { and } m>k \tag{1.5}
\end{equation*}
$$

As usual, we used the power function $\psi^{m}, m>r$ as a cut-off function (see [6, 8, 21, 14, 15]). Let $(q, k) \in \mathbb{N}^{*} \times \mathbb{N}^{*}, q+$ $k=r$., our main first result reads as follows.
Lemma 1.2. For every $0<\varepsilon<1$, there exists a positive constant $C=C(n, r, p, m)$ such that for any $u \in W_{l o c}^{r, p}(\Omega)$, we have

$$
\begin{equation*}
\int_{\omega^{\prime}}\left|\nabla^{q} u\right|^{p}\left|\nabla^{k}\left(\psi^{m}\right)\right|^{p} \leq C d^{-p k} \int_{\omega^{\prime}}\left|\nabla^{q} u\right|^{p} \psi^{p(m-k)} \leq \varepsilon \int_{\omega^{\prime}}\left|\nabla^{r} u\right|^{p} \psi^{p m}+C \varepsilon^{1-p^{r}} d^{-p r} \int_{\omega^{\prime}}|u|^{p} \psi^{p(m-r)} \tag{1.6}
\end{equation*}
$$

Consequently,

$$
\begin{equation*}
\int_{\omega^{\prime}}\left|\nabla^{r} u\right|^{p} \psi^{p m} \leq 2 \int_{\omega^{\prime}}\left|\nabla^{r}\left(u \psi^{m}\right)\right|^{p}+C d^{-p r} \int_{\omega^{\prime}}|u|^{p} \psi^{p(m-r)}, \tag{1.7}
\end{equation*}
$$

and

$$
\begin{equation*}
\int_{\omega^{\prime}}\left|\nabla^{q} u\right|^{p}\left|\nabla^{k} \psi^{m}\right|^{p} \leq C d^{-p k} \int_{\omega^{\prime}}\left|\nabla^{q} u\right|^{p} \psi^{p(m-k)} \leq \varepsilon \int_{\omega^{\prime}}\left|\nabla^{r}\left(u \psi^{m}\right)\right|^{p}+C \varepsilon^{1-p^{r}} d^{-p r} \int_{\omega^{\prime}}|u|^{p} \psi^{p(m-r)} \tag{1.8}
\end{equation*}
$$

### 1.2. Explicit universal estimate.

Consider the following polyharmonic problem:

$$
\begin{equation*}
(-\Delta)^{r} u=f(x, u), \text { in } \Omega \tag{1.9}
\end{equation*}
$$

Here, $\Omega$ is a proper domain of $\mathbb{R}^{n}, u \in C^{2 r}(\Omega), f$ and $f^{\prime}=\frac{\partial f}{\partial s}$ belong to $C(\Omega \times \mathbb{R})$. The associated quadratic form of (1.9) is defined by

$$
\begin{equation*}
Q_{u}(h)=\int_{\Omega}\left|D_{r} h\right|^{2}-\int_{\Omega} f^{\prime}(x, u) h^{2}, h \in C_{c}^{r}(\Omega) \tag{1.10}
\end{equation*}
$$

where $D_{r} h=\nabla \Delta^{j-1} h,\left|D_{r} h\right|^{2}=\left|\nabla \Delta^{j-1} h\right|^{2}$ if $r=2 j-1$ and $D_{r} h=\Delta^{j} h,\left|D_{r} h\right|^{2}=\left(\Delta^{j} h\right)^{2}$ if $r=2 j, j \in \mathbb{N}^{*}$. The Morse index of $u$, denoted by $i(u)$ is defined as the maximal dimension of all subspaces $V$ of $C_{c}^{r}(\Omega)$ such that $Q_{u}(h)<0, \forall h \in V \backslash\{0\}$. In previous works [7, 8, 14], universal estimate has been established from blow-up technique and some available Liouville-type theorems classifying finite Morse index solutions (see also the case of positive solutions in [9, 19, 20, 21]. However, this procedure fails to derive explicit estimate and requires a restrictive asymptotic
behaviour condition:
$\left(h_{0}\right)$ : There exists $q>1$ such that $\lim _{|s| \rightarrow \infty} \frac{f^{\prime}(x, s)}{|s|^{q-1}}=1$, uniformly with respect to $x \in \Omega$.
Thanks to Lemma 1.2 , we establish explicit universal estimate under the following large superlinear and subcritical growth conditions:
There exist $s_{0}>0, c_{1}>1$ and $1<p_{1} \leq p_{2}<\frac{n+2 r}{n-2 r}$ such that for all $(x, s) \in \Omega \times \mathbb{R} \backslash\left[-s_{0}, s_{0}\right]$,
$\left(h_{1}\right)$ (Super-linearity) $f^{\prime}(x, s) s^{2} \geq p_{1} f(x, s) s ;$
( $h_{2}$ ) (Subcritical growth) $\left(p_{2}+1\right) F(x, s) \geq f(x, s) s$, where $F(x, s)=\int_{0}^{s} f(x, t) d t$;
$\left(h_{3}\right)\left|\left(\nabla_{y} F\right)(x, s)\right| \leq c_{1}(F(x, s)+1)$, for all $(x, s) \in \Omega \times \mathbb{R}$;
( $h_{4}$ ) $\left|f^{\prime}(x, s)\right| \leq c_{1}$, for all $(x, s) \in \Omega \times\left[-s_{0}, s_{0}\right],|f(x, 0)| \leq c_{1}$ and $\pm f\left(x, \pm s_{0}\right) \geq \frac{1}{c_{1}}$, for all $x \in \Omega$.
When $f(x, s)=f(s)$ the above assumptions are reduced to $\left(h_{1}\right)-\left(h_{2}\right)$ (with $\pm f\left( \pm s_{0}\right)>0$ ) and obviously are weaker than $\left(h_{0}\right)$. Let $K \in C^{1}(\Omega)$ be a positive function such that $K,|\nabla K| \in L^{\infty}(\Omega)$, and $1<p_{1}<p_{2}<\frac{n+2 r}{n-2 r}$ and denote $s_{+}=\max (s, 0), s_{-}=\max (-s, 0)$ 1. The nonlinearity $f(x, s)=K(x)\left(s_{+}^{p_{2}}-s_{-}^{p_{1}}\right)$ satisfies $\left(h_{1}\right)-\left(h_{4}\right)$ but violates $\left(h_{0}\right)$. Let $\alpha \in(0,1), y \in \Omega$. Denote $\delta_{y}=\operatorname{dist}(y, \partial \Omega), d_{y}=\inf \left(\alpha, \delta_{y}\right)^{2}$. We have

Theorem 1.1. Assume that $f$ satisfies $\left(h_{1}\right)$ - $\left(h_{4}\right)$. Then, there exist $\alpha_{0} \in(0,1), \gamma_{1}>0, \gamma_{2}>0$ and a positive constant $C=C\left(\alpha_{0}, n, r, p_{1}, p_{2}, s_{0}, c_{1}\right)$ independent of $\Omega$ such that for any finite Morse index solution $u$ of (1.9) and for every $\alpha \in\left(0, \alpha_{0}\right)$, we have

$$
\begin{equation*}
\sum_{j=0}^{2 r-1} d_{y}^{j}\left|\nabla^{j} u(y)\right| \leq C(1+i(u))^{\gamma_{2}} d_{y}^{-\gamma_{1}}, \forall y \in \Omega \tag{1.11}
\end{equation*}
$$

Precisely, if $\frac{p_{2}+1}{p_{2}}<\frac{n}{2 r}$ then $\gamma_{1}=\frac{4 r^{2}\left(p_{1}+1\right) p_{2}}{\left(p_{1}-1\right)\left(2 r\left(p_{2}+1\right)-n\left(p_{2}-1\right)\right)}$ and $\gamma_{2}=\gamma_{1}+\frac{2 r\left(p_{2}+1\right)}{2 r\left(p_{2}+1\right)-n\left(p_{2}-1\right)}$.
Remark 1.1. Denote $\Omega_{\alpha}=\left\{y \in \Omega, \delta_{y} \geq \alpha\right\}, \alpha \in\left(0, \alpha_{0}\right)$. As a direct consequence of (1.11), we have

$$
\|u\|_{C^{2 r-1}\left(\Omega_{\alpha}\right)} \leq C \alpha^{1-2 r-\gamma_{1}}(1+i(u))^{\gamma_{2}} \text { and if } y \in \Omega \backslash \Omega_{\alpha} \text {, then } \sum_{j=0}^{2 r-1}\left|\nabla^{j} u(y)\right| \leq C(1+i(u))^{\gamma_{2}} \delta_{y}^{1-2 r-\gamma_{1}} .
$$

To prove Theorem 1.1 we make use of Lemmas 1.1 and 1.2 to obtain a first integral estimate on a ring around $y$ (see (3.16) in Section 3). By virtue of a variant of the Pohozaev identity [18], we extend this estimate to a bull centered at $y$ as follows

$$
\begin{equation*}
d_{y}^{-n} \int_{B\left(y, \frac{d y}{2}\right)}|f(x, u)|^{\frac{p_{2}+1}{p_{2}}} \leq C\left(\frac{1+i(u)}{d_{y}}\right)^{\frac{2\left(p_{1}+1\right) r}{p_{1}-1}+1}, \forall y \in \Omega \tag{1.12}
\end{equation*}
$$

As $p_{2}$ is subcritical, we used a delicate boot strap argument to end the proof of Theorem 1.1. Note that estimate (1.12) holds when $\frac{n+2 r}{n-2 r}<p_{1} \leq p_{2}$, but it is not clear which procedure would be helpful to derive (1.11). Also, inequality (1.12) could be extended to solutions of the $p$-polyharmonic equation. However, we do not dispose to any $L^{q}$-regularity result to star the boot strap procedure. Regarding the case of bounded domain, explicit $L^{\infty}$-bounds of

[^1]finite Morse index solutions of the second order Dirichlet boundary-value problem has been obtained in [12, 13, 22] under similar assumptions of $\left(h_{1}\right)-\left(h_{4}\right)$ which improve the a priori $L^{\infty}$-estimates stated in [3, 17]. Also, in [16] the authors examined the influence of the type boundary conditions involving the biharmonic and triharmonic problems to provide similar explicit $L^{\infty}$-bounds. The general higher order case $r \geq 4$, is more difficult since some needed local interior estimates near the boundary are so hard to achieve.
This paper is organized as follows: Section 2 is devoted to the proofs of Lemmas 1.1 and 1.2 In section 3, we give the proof of Theorem 1.1 In appendix C, we provide the proof of local $L^{p}-W^{2 r, p}$ estimate.
In the following, $C$ (respectively $C_{\varepsilon}$ ) denotes always generic positive constants depending only on ( $n, p, r, k, m$ ) (respectively on ( $\varepsilon, n, p, r, m)$ ) which could be changed from one line to another.

## 2. Proofs of Lemmas 1.1 and 1.2 ,

Proof of Lemma 1.1. Set $\omega_{d}=\left\{x \in \Omega\right.$, $\left.\operatorname{dist}(x, \omega)<\frac{d}{4}\right\}$, where $d=\operatorname{dist}\left(\omega, \Omega \backslash \omega^{\prime}\right)$, we have $\omega \subset \omega_{d} \subset$ $\omega^{\prime}$. Let $h=\chi \omega_{d}$ be the indicator function of $\omega_{d}$ and $g \in C_{c}^{\infty}\left(\mathbb{R}^{n}\right)$ a nonnegative function such that $\operatorname{supp}(g) \subset$ $B_{1}$ and $\int_{\mathbb{R}^{n}} g(x) d x=1$. Set

$$
g_{d}(x)=\left(\frac{8}{d}\right)^{n} g\left(\frac{8 x}{d}\right) \text { and } \psi(x)=\int_{\mathbb{R}^{n}} g_{d}(y) h(x-y) d y=\int_{B_{\frac{d}{8}}} g_{d}(y) h(x-y) d y
$$

We have $0 \leq \psi \leq 1$ and $\operatorname{supp}(\psi) \subset \omega_{d}+B_{\frac{d}{8}} \subset \omega^{\prime}$ (see proposition 4.18 in [4]). Since $\omega+B_{\frac{d}{8}} \subset \omega_{d}$, then $\psi(x)=1$ if $x \in \omega$. Also, $\psi \in C_{c}^{\infty}\left(\mathbb{R}^{n}\right)$ with $D^{j} \psi(x)=\int_{B_{\frac{d}{8}}} D^{j} g_{d}(y) h(x-y) d y$ (see proposition 4.20 in [4]). Therefore,

$$
\left|D^{j} \psi(x)\right| \leq \int_{B_{\lambda}}\left|D^{j} g_{d}\right| d y \leq\left(\frac{8}{d}\right)^{-|j|} \int_{B_{1}}\left|D^{j} g(y)\right| d y \leq C d^{-|j|}
$$

Now, from (1.1) one can see that $\left|\nabla^{k} \psi(x)\right|^{p} \leq C d^{-k p}, \forall x \in \omega^{\prime} \backslash \omega$ and $k \in \mathbb{N}$, where is $C=C(n, k, p)>0$.
Proof of (1.5). The proof will be done by working inductively with respect $k \geq 1$. Observe that (1.5) is an immediate consequence of (1.4) if $k=1$. Assume now that the following inequality holds for all $1 \leq l \leq k$ and $m>l$

$$
\begin{equation*}
\left|\nabla^{l} \psi^{m}\right| \leq C d^{-l} \psi^{(m-l)}, \quad \forall x \in \omega^{\prime} \tag{2.1}
\end{equation*}
$$

Let $m>k+1$, fix $j=\left(j_{1}, j_{2}, \ldots, j_{n}\right)$ such that $2 \leq|j| \leq k+1$ and $i_{0} \in\{1,2, \ldots, n\}$ such that $j_{i_{0}} \neq 0$ and denote $j_{-}=\left(j_{1}, . ., j_{i_{0}}-1, . . j_{n}\right)$. According to Leibnitz's formula, we have

$$
\mathcal{D}^{j} \psi^{m}=m \mathcal{D}^{j-}\left(\psi^{m-1} \frac{\partial \psi}{\partial x_{i_{0}}}\right)=m \psi^{m-1} \mathcal{D}^{j} \psi+m \sum_{\substack{s+t=j_{0} \\ t \neq j_{0}}} a_{s, t} \mathcal{D}^{s} \psi^{m-1} \mathcal{D}^{t} \frac{\partial \psi}{\partial x_{i_{0}}}, \text { where }|s|+|t|=k, a_{s, t} \in \mathbb{R}
$$

From (1.4), we derive

$$
\left|\nabla^{k} \psi^{m}\right| \leq C\left(d^{-k} \psi^{m-l}+\sum_{1 \leq l \leq k} d^{l-k-1}\left|\nabla^{l} \psi^{m-1}\right|\right), \forall x \in \omega^{\prime}
$$

According to our assumption (2.1), $m-1>k$ and the above inequality, we derive that (1.5) holds for $k+1$. This achieves the proof of Lemma 1.1 .

### 2.1. Proof of Lemma 1.2

We will use the following elementary inequalities. For $p \geq 2, \varepsilon \in(0,1), a, b$ and $c$ positive real numbers, we have

$$
\begin{equation*}
b^{p} \leq 2 a^{p}+C|a-b|^{p}, \quad a b^{p-2} c \leq \frac{1}{p} \varepsilon^{1-p} a^{p}+\frac{p-2}{p} \varepsilon b^{p}+\frac{1}{p} \varepsilon c^{p} . \tag{2.2}
\end{equation*}
$$

Let $\psi$ the cut-off function defined in Lemma 1.1 and $m>r$. Inequality (1.8) is an immediate consequence of (1.6) and (1.7). Also, inequality (1.7) follows from (1.6). In fact, from (1.1), we have $\left|\nabla^{r} u\right|^{p} \psi^{p m}=\sum_{|j|=r}\left|D^{j} u\right|^{p} \psi^{p m}$. Thus, the first inequality of (2.2) (with $a=\left|D^{j}\left(u \psi^{m}\right)\right|$ and $b=\left|D^{j}(u) \psi^{m}\right|$ ) and Leibnitz's formula [1] imply

$$
\begin{aligned}
\left|\nabla^{r} u\right|^{p} \psi^{p m} & \leq 2\left|\nabla^{r}\left(u \psi^{m}\right)\right|^{p}+C \sum_{|\mathrm{j}|=r}\left|D^{j}\left(u \psi^{m}\right)-D^{j}(u) \psi^{m}\right|^{p} \\
& \leq 2\left|\nabla^{r}\left(u \psi^{m}\right)\right|^{p}+C \sum_{q+k=r, q \neq r}\left|\nabla^{q} u\right|^{p}\left|\nabla^{k} \psi^{m}\right|^{p} .
\end{aligned}
$$

In view of (1.5), we get $\int_{\omega^{\prime}}\left|\nabla^{r} u\right|^{p} \psi^{p m} \leq 2 \int_{\Omega}\left|\nabla^{r}\left(u \psi^{m}\right)\right|^{p}+C \sum_{q+k=r, q \neq r} d^{-p k} \int_{\omega^{\prime}}\left|\nabla^{q} u\right|^{p} \psi^{p(m-k)}$. Hence, inequality (1.7) follows from (1.6).

Proof of (1.6). Set $I_{q}=d^{-p k} \int_{\omega^{\prime}}\left|\nabla^{q} u\right|_{p}^{p} \psi^{p(m-k)}$. From (1.5), we have $\int_{\omega^{\prime}}\left|\nabla^{q} u\right|^{p}\left|\nabla^{k}\left(\psi^{m}\right)\right|^{p} \leq C I_{q}$. Thus, to provide (1.6), we have only to prove the following inequality:

$$
\begin{equation*}
I_{q} \leq \varepsilon I_{r}+C \varepsilon^{1-p^{r}} I_{0}, \forall 1 \leq q \leq r-1 \tag{2.3}
\end{equation*}
$$

We divide the proof of (2.3) into two steps.
Step 1. We establish the following first-order interpolation inequality:

$$
\begin{equation*}
I_{q} \leq \varepsilon I_{q+1}+C \varepsilon^{1-p} I_{q-1}, 1 \leq q \leq r-1 . \tag{2.4}
\end{equation*}
$$

Recall that $\psi \in C_{c}^{\infty}\left(\omega^{\prime}\right)$ and denote $u_{\mid \omega^{\prime}}$ the restriction of $u$ on $\omega^{\prime}$. Observe that by virtue of Meyers-Serrin's density theorem [1] and using Lebesgue's dominated convergence theorem [4], one can reduce the proof of (2.4) to $u_{\mid \omega^{\prime}}$ belonging to $\in C^{r}\left(\omega^{\prime}\right) \cap W^{r, p}\left(\omega^{\prime}\right)$. Let $j=\left(j_{1}, j_{2}, \ldots, j_{n}\right)$ be a multi index with $|j|=q \leq r-1$ and $i_{0} \in\{1,2, \ldots, n\}$ such that $j_{i_{0}} \neq 0$. Set $j_{-}=\left(j_{1}, . ., j_{i_{0}}-1, . . j_{n}\right),\left|j_{-}\right|=q-1$ and $j_{+}=\left(j_{1}, . ., j_{i_{0}}+1, . . j_{n}\right),\left|j_{+}\right|=q+1$. As $p \geq 2$ and $|j| \leq r-1$, we have

$$
\begin{equation*}
\left|D^{j} u\right|^{p-2} D^{j} u \in C^{1}\left(\omega^{\prime}\right) \text { and } \frac{\partial\left(\left|D^{j} u\right|^{p-2} D^{j} u\right)}{\partial x_{i_{0}}}=(p-1)\left|D^{j} u\right|^{p-2} D^{j_{+}} u . \tag{2.5}
\end{equation*}
$$

From (1.5) on has $|\nabla \psi| \leq C d^{-1}$, then integration by parts yields

$$
\begin{align*}
d^{-p k} \int_{\omega^{\prime}}\left|D^{j} u\right|^{p} \psi^{p(m-k)}= & d^{-p k} \int_{\omega^{\prime}}\left|D^{j} u\right|^{p-2} D^{j} u \frac{\partial D^{j_{-}} u}{\partial x_{i_{0}}} \psi^{p(m-k)} \\
= & -(p-1) d^{-p k} \int_{\omega^{\prime}}\left|D^{j} u\right|^{p-2} D^{j_{+}} u D^{j_{-}} u \psi^{p(m-k)} \\
& -p(m-k) d^{-p k} \int_{\omega^{\prime}}\left|D^{j} u\right|^{p-2} D^{j} u D^{j_{-}} u \psi^{p(m-k)-1} \frac{\partial \psi}{\partial x_{i_{0}}} \\
\leq & C d^{-p k} \int_{\omega^{\prime}}\left|\nabla^{q-1} u \| \nabla^{q} u\right|^{p-2}\left|\nabla^{q+1} u\right| \psi^{p(m-k)} \\
& +C d^{-(p k+1)} \int_{\omega^{\prime}}\left|\nabla^{q-1} u \| \nabla^{q} u\right|^{p-1} \psi^{p(m-k)-1} . \tag{2.6}
\end{align*}
$$

Taking into account that $I_{q}=\sum_{|\mathrm{j}|=q} d^{-p k} \int_{\omega^{\prime}}\left|D^{j} u\right|^{p} \psi^{p(m-k)}$ with $k=r-q$, so inequality (2.6) implies $I_{q} \leq C\left(J_{1}+J_{2}\right)$ where $J_{1}=d^{-p k} \int_{\omega^{\prime}}\left|\nabla^{q-1} u \| \nabla^{q} u\right|^{p-2}\left|\nabla^{q+1} u\right| \psi^{p(m-k)}$ and $J_{2}=d^{-(p k+1)} \int_{\omega^{\prime}}\left|\nabla^{q-1} u \| \nabla^{q} u\right|^{p-1} \psi^{p(m-k)-1}$.

Observe that $p k=(k+1)+k(p-2)+(k-1), p(m-k)=(m-(k+1))+(p-2)(m-k)+(m-(k-1))$ (respectively $p k+1=(k+1)+(p-2) k+k$ and $p(m-k)-1=(m-(k+1))+(p-2)(m-k)+(m-k)$. Thus, inequality (2.2)
with $a=d^{-(k+1)}\left|\nabla^{q-1} u\right| \psi^{m-(k+1)}, \quad b=d^{-k}\left|\nabla^{q} u\right| \psi^{(r-k)}$ and $c=d^{-(k-1)}\left|\nabla^{q+1} u\right| \psi^{m-(k-1)}\left(\right.$ respectively $\left.c=d^{-k}\left|\nabla^{q} u\right| \psi^{(r-k)}\right)$, implies

$$
J_{1} \leq \frac{1}{p} \varepsilon^{1-p} I_{q-1}+\frac{(p-2)}{p} \varepsilon I_{q}+\frac{1}{p} \varepsilon I_{q+1} \text { and } J_{2} \leq \frac{1}{p} \varepsilon^{1-p} I_{q-1}+\frac{p-1}{p} \varepsilon I_{q} .
$$

Combining the above inequalities with (2.7) we deduce (1-2Ce) $I_{q} \leq C \varepsilon^{1-p} I_{q-1}+C \varepsilon I_{q+1}$. Hence, the inequality (2.4) follows by replacing $\varepsilon$ by $\frac{\varepsilon}{4(1+C)}$.
Step 2. End of the proof of (2.3). The case $r=2$, or $r \geq 3$ and $q=1$ are an immediate consequence of (2.4). Let $r \geq 3,2 \leq q \leq r-1$ and $2 \leq t \leq q$ and set $S_{t}=\sum_{i=2}^{t} I_{i}$. We apply (2.4) where one substitutes $q$ by $t-i$ and $\varepsilon$ by $\varepsilon^{p^{i}}$, we derive $C^{i} \varepsilon^{-p^{i}} I_{t-i} \leq C^{i+1} \varepsilon^{-p^{i+1}} I_{t-i-1}+C^{i} I_{t-i+1}$. Since $S_{t} \leq S_{q}$ and $0<\varepsilon<1$, the summation of the above inequalities from $i=0$ to $i=t-1$ yields

$$
\begin{equation*}
I_{t} \leq C \varepsilon^{1-p^{r}} I_{0}+\varepsilon I_{t+1}+C \varepsilon S_{q} \text { if } 2 \leq t \leq q . \tag{2.8}
\end{equation*}
$$

Summing now (2.8) from $t=2$ to $t=q$ and substituting $\varepsilon$ by $\frac{\varepsilon}{2(C+1)}$, we arrive at $S_{q} \leq C \varepsilon^{1-p^{r}} I_{0}+\varepsilon I_{q+1}$, for all $1 \leq$ $q \leq r-1$. Combining (2.8) with $t=q$ and the last inequality, we obtain

$$
\begin{equation*}
I_{q} \leq C \varepsilon^{1-p^{r}} I_{0}+\varepsilon I_{q+1}, 1 \leq q \leq r-1 \tag{2.9}
\end{equation*}
$$

To end the proof of (2.3), we iterate (2.9) as follows

$$
\left\{\begin{array}{l}
I_{q} \leq C \varepsilon^{1-p^{r}} I_{0}+I_{q+1}  \tag{2.10}\\
I_{q+1} \leq+C \varepsilon^{1-p^{r}} I_{0, r}+I_{q+2} \\
\vdots \\
I_{r-1} \leq C \varepsilon^{1-p^{r}} I_{0}+\varepsilon I_{r}
\end{array}\right.
$$

Hence, the summation of the above inequalities yields $I_{q} \leq C \varepsilon^{1-p^{r}} I_{0}+\varepsilon I_{r}$, which is the desired inequality (2.3). The proof of Lemma 1.2 is completed.

## 3. Proof of Theorem 1.1

### 3.1. Preliminary results.

$B(y, \lambda)$ stands for the ball of radius $\lambda>0$ centered at $y \in \mathbb{R}^{n}$. Let $\psi$ be the cut-off function defined in Lemma 1.1 related to two open subset $\omega$ and $\omega^{\prime}$ of $B(y, \lambda)$. Thanks to Lemma 1.2 with $p=2$, we establish the following technical lemma:

Lemma 3.1. For every $0<\varepsilon<1$, there exists a positive constant $C_{\varepsilon}=C(n, m, r, \varepsilon)$ such that, for all $u \in H^{r}(B(y, \lambda))$, we have

$$
\begin{gather*}
\left.\int_{B(y, \lambda)}| | D_{r}\left(u \psi^{m}\right)\right|^{2}-\left.D_{r} u D_{r}\left(u \psi^{2 m}\right)\left|\leq \varepsilon \int_{B(y, \lambda)}\right| \nabla^{r}\left(u \psi^{m}\right)\right|^{2}+C_{\varepsilon} d^{-2 r} \int_{B(y, \lambda)}|u|^{2} \psi^{2(m-r)} ;  \tag{3.1}\\
\left.\int_{B(y, \lambda)}| | D_{r} u\right|^{2} \psi^{2 m}-\left.D_{r} u D_{r}\left(u \psi^{2 m}\right)\left|\leq \varepsilon \int_{B(y, \lambda)}\right| \nabla^{r}\left(u \psi^{m}\right)\right|^{2}+C_{\varepsilon} d^{-2 r} \int_{B(y, \lambda)}|u|^{2} \psi^{2(m-r)}  \tag{3.2}\\
\quad \int_{B(y, \lambda)}\left|\nabla^{r}\left(u \psi^{m}\right)\right|^{2} \leq C\left(\int_{B(y, \lambda)}\left|D_{r} u\right|^{2} \psi^{2 m}+d^{-2 r} \int_{B(y, \lambda)}|u|^{2} \psi^{2(m-r)}\right) \tag{3.3}
\end{gather*}
$$

where $d=\operatorname{dist}\left(\omega, B(y, \lambda) \backslash \omega^{\prime}\right)$. Moreover, if $u \in H^{r+1}(B(y, \lambda))$, we have

$$
\begin{equation*}
\int_{B(y, \lambda)}\left|D_{r} u \cdot D_{r}(\nabla u \cdot(x-y)) \psi^{2 m}-D_{r} u \cdot D_{r}\left(\nabla u \cdot(x-y) \psi^{2 m}\right)\right| \leq C\left(1+\left(\frac{\lambda}{d}\right)^{2}\right)\left(\sum_{1 \leq q \leq r} d^{-2(r-q)} \int_{\omega^{\prime} \backslash \omega}\left|\nabla^{q} u\right|^{2}+d^{-2 r} \int_{\omega^{\prime} \backslash \omega}|u|^{2}\right) \tag{3.4}
\end{equation*}
$$

## Proofs of Lemma 3.1 ,

For $v \in H^{r}(B(y, \lambda))$ and $\eta \in C_{c}^{r}(B(y, \lambda))$, set $A(\eta, v):=D_{r}(v \eta)-\eta D_{r} v$. A simple computations yield

$$
\left|D_{r}(u \eta)\right|^{2}-\eta^{2}\left|D_{r} u\right|^{2}=2 \eta D_{r} u \cdot A(\eta, u)+|A(\eta, u)|^{2}, \eta^{2} D_{r} u \cdot D_{r} v-D_{r} u \cdot D_{r}\left(v \eta^{2}\right)=-D_{r} u \cdot A\left(\eta^{2}, v\right),
$$

and $|A(\eta, v)| \leq C \sum_{q+k=r, q \neq r}\left|\nabla^{q} v \| \nabla^{k} \eta\right|$. Therefore,

$$
\left.\left|\left|D_{r}(u \eta)\right|^{2}-\eta^{2}\right| D_{r} u\right|^{2} \mid \leq C \sum_{q+k=r, q \neq r}\left(\left|D_{r} u\right| \|\left.\nabla^{q} u\left|\left(\eta\left|\nabla^{k} \eta\right|+\left|\nabla^{k}\left(\eta^{2}\right)\right|\right)+\left|\nabla^{q} u\right|^{2}\right| \nabla^{k} \eta\right|^{2}\right)
$$

and

$$
\left|\left|\eta^{2} D_{r} u \cdot D_{r} v-D_{r} u \cdot D_{r}\left(v \eta^{2}\right)\right| \leq C\right| D_{r} u\left|\sum_{q+k=r, q \neq r}\right| \nabla^{q} v \| \nabla^{k}\left(\eta^{2}\right) \mid .
$$

Choosing now $\eta=\psi^{m}$ and using (1.5), we obtain ${ }^{5}$

$$
\begin{align*}
& \int_{B(y, \lambda)}\left|\left(\psi^{2 m} D_{r} u \cdot D_{r} v-D_{r} u \cdot D_{r}\left(v \psi^{2 m}\right)\right)\right| \leq C S_{1}(u, v)  \tag{3.5}\\
& \left.\left.\int_{B(y, \lambda)}| | D_{r}\left(u \psi^{m}\right)\right|^{2}-\psi^{2 m}\left|D_{r}\right|\right) \mid \leq C\left(S_{1}(u, u)+S_{2}(u)\right) \tag{3.6}
\end{align*}
$$

$$
\text { where } S_{1}(u, v)=\int_{\omega^{\prime} \backslash \omega}\left|\nabla^{r} u\right|\left(\sum_{0 \leq q \leq r-1} d^{r-q}\left|\nabla^{q} v\right| \psi^{2 m+q-r}\right) \text { and } S_{2}(u)=\int_{\omega^{\prime} \backslash \omega}\left(\sum_{0 \leq q \leq r-1} d^{-2(r-q)}\left|\nabla^{q} u\right|^{2} \psi^{2 m-2(r-q))}\right) \text {. }
$$

We invoke Cauchy-Schwarz's inequality:

$$
\left|a_{r} \sum_{q=0}^{r-1} a_{q}\right| \leq \epsilon\left|a_{r}\right|^{2}+C_{\epsilon} \sum_{q=0}^{r-1}\left|a_{q}\right|^{2},\left(a_{0}, a_{1}, \ldots a_{r}\right) \in \mathbb{R}^{r+1}
$$

with $a_{r}=\left|\nabla^{r} u\right| \psi^{m}$ and $a_{q}=d^{q-r}\left|\nabla^{q} u\right| \psi^{(m+q-r)}$ if $q=0,1 \ldots r-1$. As $p m-(r-q)=(p-1) m+(m-(r-q))$, we arrive at

$$
\begin{equation*}
S_{1}(u, u)+S_{2}(u) \leq+\varepsilon \int_{B(y, \lambda)}\left|\nabla^{r} u\right|^{2} \psi^{2 m}+C_{\varepsilon} \sum_{q+k=r, q \neq r} d^{-2 k} \int_{B(y, \lambda)}\left|\nabla^{q} u\right|^{2} \mid \psi^{2(m-k)} . \tag{3.7}
\end{equation*}
$$

Hence, inequality (3.1) follows from (3.5) (with $v=u$ ), (3.7) and inequalities (1.7), (1.8) of Lemma 1.2 Collecting now , inequalities (3.6), (3.7), (1.7) and (1.8), we obtain

$$
\begin{equation*}
\left.\int_{B(y, \lambda)}| | D_{r} u\right|^{2} \psi^{2 m}\left|D_{r}\left(u \psi^{m}\right)\right|^{2}-\left.\left|\leq \varepsilon \int_{B(y, \lambda)}\right| \nabla^{r}\left(u \psi^{m}\right)\right|^{2}+C_{\varepsilon} d^{-2 r} \int_{B(y, \lambda)}|u|^{2} \psi^{2(m-r)} . \tag{3.8}
\end{equation*}
$$

[^2]So, inequality (3.2) is an immediate consequence of (3.1) and (3.8).
Proof of (3.3). We appeal to the following higher order Calderon-Zygmund's inequality ( see the proof in the appendix of [5], see also [11]):

$$
\begin{equation*}
\int_{B(y, \lambda)}\left|\nabla^{r} v\right|^{2} \leq C \int_{B(y, \lambda)}\left|D_{r} v\right|^{2}, \forall v \in H_{0}^{r}((B(y, \lambda)), \tag{3.9}
\end{equation*}
$$

where $C$ is a positive constant depending only on ( $n, r, p$ ). Therefore, combining (3.9) (with $v=u \psi^{m}$ ) and (3.8), we provide (3.3).
Proof of (3.4). As

$$
S_{1}(u, v)=\int_{\omega^{\prime} \backslash \omega}\left(\left|\nabla^{r} u\right| \sum_{0 \leq q \leq r-1} d^{r-q}\left|\nabla^{q} v\right| \psi^{2 m+q-r}\right)
$$

the above Cauchy-Schwarz's inequality, yields

$$
\begin{equation*}
S_{1}(u, v) \leq \int_{\omega^{\prime} \backslash \omega}\left|\nabla^{r} u\right|^{2}+C \sum_{0 \leq q \leq r-1} d^{-2(r-q)} \int_{\omega^{\prime} \backslash \omega}\left|\nabla^{q} v\right|^{2} \tag{3.10}
\end{equation*}
$$

Fix now $v=\nabla u \cdot(x-y)$ and taking into account that
$\left.\left|\nabla^{q}(\nabla u \cdot(x-y))\right|^{2} \leq C\left(\lambda^{2}\left|\nabla^{q+1} u\right|^{2}+\left|\nabla^{q} u\right|^{2}\right) \leq C\left(\frac{\lambda}{d}\right)^{2} d^{2}\left|\nabla^{q+1} u\right|^{2}+\left|\nabla^{q} u\right|^{2}\right)$, we deduce that

$$
\begin{equation*}
S_{1}(u, v) \leq C\left(1+\left(\frac{\lambda}{d}\right)^{2}\right)\left(\sum_{1 \leq q \leq r} d^{-2(r-q)} \int_{\omega^{\prime} \backslash \omega}\left|\nabla^{q} u\right|^{2}\right)+d^{-2 r} \int_{\omega^{\prime} \backslash \omega}|u|^{2} \tag{3.11}
\end{equation*}
$$

Thus, the proof of (3.4) follows by collecting (3.5), 3.11). This ends the proofs of Lemma $3.1 \quad \square$ At last, in view of assumptions $\left(h_{1}\right)-\left(h_{4}\right)$, we have (see the proof in Appendix A):
Lemma 3.2. Let $t>1$ and set $q_{1}=\frac{p_{2}+1}{p_{2}}$. There exists a positive constant $C=C\left(s_{0}, p_{1}, p_{2}, c_{1}\right)$ such that for all $(x, s) \in \Omega \times \mathbb{R}$, we have

- [1] $f^{\prime}(x, s) s^{2} \geq p_{1} f(x, s)-C$;
- [2] $\left(p_{2}+1\right) F(x, s) \geq f(x, s) s-C$;
- [3] |s| ${ }^{p_{1}+1} \leq C(|f(x, s) s|+1),|f(x, s) s| \leq f(x, s) s+C$ and $|F(x, s)| \leq C(f(x, s) s+1)$;
- $[4]|f(x, s)|^{q_{1}} \leq C(|f(x, s) s|+1)$ and $|f(x, s)|^{\frac{t}{p_{2}}} \leq C\left(|s|^{t}+1\right)$;
- [5] For all $\varepsilon \in(0,1), 0 \leq a \leq 1$ and $b>0$ we have $a s^{2} b \leq C+\varepsilon|f(x, s) s| a^{\frac{p_{1}+1}{2}}+\varepsilon^{\frac{-2}{p_{1}-1}} b^{\frac{p_{1}+1}{p_{1}-1}}$.

### 3.2. End of the proof of Theorem 1.1

Recall that $d_{y}=\inf \left(\alpha, \delta_{y}\right)$, where $\delta_{y}=\operatorname{dist}(y, \partial \Omega), y \in \Omega$ and $\alpha \in(0,1)$. For $j=1,2, \cdots, i(u)+1$, set

$$
\begin{aligned}
& A_{j}:=\left\{x \in \mathbb{R}^{n} ; a_{j}<|x-y|<b_{j}\right\}, a_{j}=\frac{2(j+i(u))}{4(i(u)+1)} d_{y} ; \quad b_{j}=\frac{2(j+i(u))+1}{4(i(u)+1)} d_{y} \text { and } \\
& A_{j}^{\prime}:=\left\{x \in \mathbb{R}^{n} ; a_{j}^{\prime}<|x-y|<b_{j}^{\prime}\right\}, a_{j}^{\prime}=\frac{2(j+i(u))-\frac{1}{2}}{4(i(u)+1)} d_{y} . \quad b_{j}^{\prime}=\frac{2(j+i(u))+\frac{3}{2}}{4(i(u)+1)} d_{y} .
\end{aligned}
$$

Observe that $\subset \overline{A_{j}} \subset A_{j}^{\prime} \subset \overline{A_{j}} \subset B\left(y, d_{y}\right)$ and let $\psi_{j} \in C_{c}^{r}\left(B\left(y, d_{y}\right)\right.$ be the cut-off function defined in Lemme1.1 with $\omega=A_{j}$ and $\omega^{\prime}=A_{j}^{\prime}$ and satisfying $\operatorname{supp}\left(\psi_{j}\right) \subset A_{j}^{\prime}, 0 \leq \psi_{j} \leq 1$ if $x \in A_{j}^{\prime}$ and $\psi_{j}=1$ if $x \in A_{j}$. Moreover, we have

$$
\left\{\begin{array}{l}
\operatorname{dist}\left(A_{j}, B\left(y, d_{y}\right) \backslash A_{j}^{\prime}\right)=\frac{d_{y}}{2(i(u)+1)} \text { and (1.5) implies },  \tag{3.12}\\
\left|\nabla^{k}\left(\psi_{j}^{m}\right)(x)\right|^{2} \leq C \psi_{j}^{2(m-k)}\left(\frac{1+i(u)}{d_{y}}\right)^{2 k}, \forall x \in B\left(y, d_{y}\right) .
\end{array}\right.
$$

From inequality (1.8) we derive

$$
\begin{equation*}
\left.\sum_{1 \leq q \leq r-1} d^{-p(r-q)} \int_{A_{j}}\left|\nabla^{q} u\right|^{p}\left|\leq \varepsilon \int_{B\left(y, d_{y}\right)}\right| \nabla^{r}\left(u \psi_{j}^{m}\right)\right|^{2}+C_{\varepsilon}\left(\frac{1+i(u)}{d_{y}}\right)^{2 r} \int_{B\left(y, d_{y}\right)} u^{2} \psi_{j}^{2(m-r)} . \tag{3.13}
\end{equation*}
$$

In the sequel we choose $m=\frac{\left(p_{1}+1\right) r}{2}$ so that $m>r$ and $\frac{\left(p_{1}+1\right)(m-r)}{p_{1}-1}=m$. Thus, point 5 of Lemma 3.2 with $s=u, a=\psi_{j_{0}}^{2(m-r)}$ and $b=\left(\frac{1+i(u)}{d_{y}}\right)^{-2 r}$, yields

$$
\begin{equation*}
\left(\frac{1+i(u)}{d_{y}}\right)^{-2 r} \int_{B\left(y, d_{y}\right)} u^{2} \psi_{j_{0}}^{2(m-r)} \leq C d_{y}^{n}+\varepsilon \int_{B\left(y, d_{y}\right)}|f(x, u) u| \psi_{j_{0}}^{2 m}+C_{\varepsilon} d_{y}^{n}\left(\frac{1+i(u)}{d_{y}}\right)^{\frac{2\left(p_{p}+1\right) r}{p_{1}-1}} \tag{3.14}
\end{equation*}
$$

Next observe that $\operatorname{supp}\left(u \psi_{j}^{m}\right) \cap \operatorname{supp}\left(u \psi_{l}^{m}\right)=\emptyset, \forall 1 \leq l \neq j \leq 1+i(u)$, then according to the definition of the quadratic form (3.15) we derive

$$
Q_{u}\left(\sum_{1}^{1+i(u)} \lambda_{j} u \psi_{j}^{m}\right)=\sum_{1}^{1+i(u)} \lambda_{j}^{2} Q_{u}\left(u \psi_{j}^{m}\right)
$$

in view of the definition of $i(u)$, there exists $j_{0} \in\{1,2, \ldots, 1+i(u)\}$ such that $Q_{u}\left(u \psi_{j_{0}}^{m}\right) \geq 0$. Therefore, point 1 of Lemma 3.2 implies

$$
\begin{equation*}
p_{1} \int_{B\left(y, d_{y}\right)} f(x, u) u \psi_{j_{0}}^{2 m}-C d_{y}^{n} \leq \int_{B\left(y, d_{y}\right)} f^{\prime}(x, u) u^{2} \psi_{j_{0}}^{2 m} \leq \int_{B\left(y, d_{y}\right)}\left|D_{r}\left(u \psi_{j_{0}}^{m}\right)\right|^{2} \tag{3.15}
\end{equation*}
$$

We divide the proof into three steps.
Step 1. We shall prove the following estimate

$$
\begin{equation*}
\sum_{1 \leq q \leq r} d^{-2(r-q)} \int_{A_{j_{0}}}\left|\nabla^{q} u\right|^{2}+\int_{A_{j_{0}}}|f(x, u) u| \leq C d_{y}^{n}\left(\frac{1+i(u)}{d_{y}}\right)^{\frac{2\left(p_{p}+1\right) r}{p_{1}-1}} . \tag{3.16}
\end{equation*}
$$

Multiplying equation (1.9) by $-\frac{1+p_{1}}{2} u \psi_{j_{0}}^{2 m}$, integrating by parts, we obtain

$$
-\frac{1+p_{1}}{2} \int_{B\left(y, d_{y}\right)} f(x, u) u \psi_{j_{0}}^{2 m}=-\frac{1+p_{1}}{2} \int_{B\left(y, d_{y}\right)} D_{r} u D_{r}\left(u \psi_{j_{0}}^{2 m}\right) .
$$

We combine the last equality with (3.15) and point 3 of Lemma3.2, yields

$$
\frac{p_{1}-1}{2}\left(\int_{B\left(y, d_{y}\right)}|f(x, u) u| \psi_{j_{0}}^{2 m}+\int_{B\left(y, d_{y}\right)}\left|D_{r}\left(u \psi_{j_{0}}^{m}\right)\right|^{2}\right) \leq C d_{y}^{n}+\frac{p_{1}+1}{2} \int_{B\left(y, d_{y}\right)}\left(\left|D_{r}\left(u \psi_{j_{0}}^{m}\right)\right|^{2}-D_{r} u D_{r}\left(u \psi_{j_{0}}^{2 m}\right)\right) .
$$

It follows from (3.1) and (3.9) that

$$
\int_{B\left(y, d_{y}\right)}\left|\nabla^{r}\left(u \psi_{j_{0}}^{m}\right)\right|^{2}+\int_{B\left(y, d_{y}\right)}|f(x, u) u| \psi_{j_{0}}^{2 m} \leq C d_{y}^{n}+\varepsilon \int_{B\left(y, d_{y}\right)} \left\lvert\, \nabla^{r}\left(\left.u \psi_{j_{0}}^{m}\right|^{2}+C_{\varepsilon}\left(\frac{1+i(u)}{d_{y}}\right)^{2 r} \int_{B\left(y, d_{y}\right.} u^{2} \psi_{j_{0}}^{2(m-r)} .\right.\right.
$$

Collecting the last inequalities with $(3.13)$ and 3 (3.14), we get 6

$$
\sum_{1 \leq q \leq r} d^{-p(r-q)} \int_{A_{j_{0}}}\left|\nabla^{q} u\right|^{p}\left|+\int_{B\left(y, d_{y}\right)}\right| f(x, u) u \left\lvert\, \psi_{j_{0}}^{2 m} \leq C d_{y}^{n}\left(\frac{1+i(u)}{d_{y}}\right)^{\frac{2\left(p_{p}+1\right) r}{p_{1}-1}}\right.
$$

${ }^{6}$ Observe that $d_{y}^{n} \leq d_{y}^{n}\left(\frac{1+i(u)}{d_{y}}\right)^{\frac{2\left(p_{1}+1\right) r}{p_{1}-1}}$ as $d_{y}=\inf \left(\alpha, \delta_{y}\right)<1$.

Therefore, inequality (3.16) follows as $\psi_{j_{0}}(x)=1$ if $x \in A_{j_{0}}$.
Step 2. We shall use the following identity (see the proof in appendix B):

$$
\begin{equation*}
D_{r} u D_{r}(\nabla u \cdot(x-y))=\frac{1}{2} \nabla\left(\left|D_{r} u\right|^{2}\right) \cdot(x-y)+r\left|D_{r} u\right|^{2}, \tag{3.17}
\end{equation*}
$$

to establish a variant of the Pohozaev identity and we exploit (3.16) to prove that:

$$
\begin{equation*}
d_{y}^{-n} \int_{B\left(y, \frac{d,}{2}\right)}|f(x, u)|^{q_{1}} \leq C\left(\frac{1+i(u)}{d_{y}}\right)^{\frac{2\left(p_{1}+1\right) r}{p_{1}-1}+1} . \tag{3.18}
\end{equation*}
$$

Recall that $A_{j_{0}}=\left\{x \in \mathbb{R}^{n} ; a_{j_{0}}<|x-y|<b_{j_{0}}\right\}$. We invoke again Lemma 1.1 with $\omega=B\left(y, a_{j_{0}}\right), \omega^{\prime}=B\left(y, b_{j_{0}}\right)$ and let $\psi \in C_{c}^{r}\left(B\left(y, b_{j_{0}}\right)\right)$ such that

$$
\begin{equation*}
\psi \equiv 1 \text { for all } x \in B\left(y, a_{j_{0}}\right) \text { and }\left|\nabla^{k} \psi^{2 m}\right| \leq C\left(\frac{1+i(u)}{d_{y}}\right)^{k} \psi^{2 m-k} \forall x \in A_{j_{0}} \text { and } k=1,2, . ., r . \tag{3.19}
\end{equation*}
$$

Multiplying equation (1.9) by $u \psi^{2 m}$ (respectively by $(\nabla u \cdot(x-y)) \psi^{2 m}$ ) and integrating by parts, we get
$\int_{B\left(y, d_{y}\right)} D_{r} u D_{r}\left(u \psi^{2 m}\right)=\int_{B\left(y, d_{y}\right)} f(x, u) u \psi^{2 m}$ respectively $\left.\int_{B\left(y, d_{y}\right)} D_{r} u D_{r}\left(\nabla u \cdot(x-y) \psi^{2 m}\right)=\int_{B\left(y, d_{y}\right)} f(x, u) \nabla u \cdot(x-y)\right) \psi^{2 m}$.
According to inequality (3.2) (respectively (3.4), (3.19) and (3.16)), we derive

$$
\begin{gather*}
\int_{B\left(y, d_{y}\right)}\left|D_{r} u\right|^{2} \psi^{2 m}-\int_{B\left(y, d_{y}\right)} f(x, u) u \phi^{2 m} \leq \varepsilon \int_{B\left(y, d_{y}\right)}\left|\nabla^{r}\left(u \psi^{m}\right)\right|^{2}+C_{\varepsilon}\left(\frac{1+i(u)}{d_{y}}\right)^{2 r} \int_{B(y, d)} u^{2} \psi^{2(m-r)}  \tag{3.20}\\
\int_{B\left(y, d_{y}\right)} \psi^{2 m} D_{r} u D_{r}(\nabla u \cdot(x-y)) \leq \int_{B\left(y, d_{y}\right)} f(x, u) \nabla u \cdot(x-y) \psi^{2 m}+C d_{y}^{n}\left(\frac{1+i(u)}{d_{y}}\right)^{\frac{2\left(p_{1}+1\right) r}{p_{1}-1}}+C\left(\frac{1+i(u)}{d_{y}}\right)^{-2 r} \int_{A_{j_{0}}} u^{2} \psi^{2(m-r)}
\end{gather*}
$$

As above, using point 5 of Lemma 3.2 and (3.16), there holds that

$$
\begin{equation*}
C\left(\frac{1+i(u)}{d_{y}}\right)^{-2 r} \int_{A_{j_{0}}} u^{2} \psi_{j_{0}}^{2(m-r)} \leq C d_{y}^{n}+\frac{1}{2} \int_{A_{j_{0}}}|f(x, u) u| \psi_{j_{0}}^{2 m}+C d_{y}^{n}\left(\frac{1+i(u)}{d_{y}}\right)^{\frac{2\left(p_{1}+1\right) r}{p_{1}-1}} \leq C d_{y}^{n}\left(\frac{1+i(u)}{d_{y}}\right)^{\frac{2\left(p_{p}+1\right) r}{p_{1}-1}} \tag{3.21}
\end{equation*}
$$

Combining these inequalities we get

$$
\begin{equation*}
\int_{B\left(y, d_{y}\right)} \psi^{2 m} D_{r} u D_{r}(\nabla u \cdot(x-y)) \leq \int_{B\left(y, d_{y}\right)} f(x, u) \nabla u \cdot(x-y) \psi^{2 m}+C d_{y}^{n}\left(\frac{1+i(u)}{d_{y}}\right)^{\frac{2\left(p_{1}+1\right) r}{p_{1}-1}} \tag{3.22}
\end{equation*}
$$

In one hand, integration by parts of the first term of the right hand-side, gives

$$
\int_{B\left(y, d_{y}\right)} f(x, u) \nabla u \cdot(x-y) \psi^{2 m}=-n \int_{B\left(y, d_{y}\right)} F(x, u) \psi^{2 m}-\int_{A_{j_{0}}} F(x, u)\left(\nabla \psi^{2 m} \cdot(x-y)\right)+\int_{B\left(y, d_{y}\right)}\left(\nabla_{x} F\right)(x, u) \cdot(x-y) \psi^{2 m},
$$

Invoking now assumption $\left(h_{3}\right)$ with points 2-3 of Lemma3.2, (3.19) and using again (3.16), it follows that ${ }^{7}$ imply

$$
\begin{equation*}
\int_{B\left(y, d_{y}\right)} f(x, u)\left(\nabla u \cdot(x-y) \psi^{2 m}=\left(C \alpha+-\frac{n}{p_{2}+1}\right) \int_{B\left(y, d_{y}\right)} f(x, u) u \psi^{2 m}+C d_{y}^{n}(1+i(u))\left(\frac{1+i(u)}{d_{y}}\right)^{\frac{2\left(p_{1}+1\right) r}{p_{1}-1}} .\right. \tag{3.23}
\end{equation*}
$$

[^3]On the other hand, using (3.17) and integrating by parts we derive

$$
\int_{B\left(y, d_{y}\right)} \psi^{2 m} D_{r} u D_{r}(\nabla u \cdot(x-y))=\frac{2 r-n}{2} \int_{B\left(y, d_{y}\right)}\left|D_{r} u\right|^{2} \psi^{2 m}-\frac{1}{2} \int_{A_{j_{0}}}\left|D_{r} u\right|^{2}\left(\nabla \psi^{2 m} \cdot(x-y)\right)
$$

As $\left|D_{r} u\right|^{2} \leq\left|\nabla^{r} u\right|^{2}$ and $|x-y| \leq 1$, it follows from (3.19) and (3.16) that

$$
\int_{B\left(y, d_{y}\right)} \psi^{2 m} D_{r} u D_{r}(\nabla u \cdot(x-y))=\frac{2 r-n}{2} \int_{B\left(y, d_{y}\right)}\left|D_{r} u\right|^{2} \psi^{2 m}+C d_{y}^{n}\left(\frac{1+i(u)}{d_{y}}\right)^{\frac{2\left(p_{1}+1\right) r}{p_{1}-1}+1}
$$

Collecting inequalities (3.22), (3.23) and the last equality we arrive at

$$
\begin{equation*}
\left(\frac{2 n}{\left(p_{2}+1\right)(n-2 r)}-\frac{C \alpha}{(n-2 r}\right) \int_{B\left(y, d_{y}\right)} f(x, u) u \psi^{2 m}-\int_{B\left(y, d_{y}\right)}\left|D_{r} u\right|^{2} \psi^{2 m} \leq C d_{y}^{n}\left(\frac{1+i(u)}{d_{y}}\right)^{\frac{2\left(p_{1}+1\right) r}{p_{1}-1}+1} \tag{3.24}
\end{equation*}
$$

We choose $\alpha=\alpha_{0} \in(0,1)$ small enough so that $\frac{2 n}{\left(p_{2}+1\right)(n-2 r)}-\frac{C \alpha_{0}}{(n-2 r}>1$ and we combine the above inequality with $(3.20)$ and (3.3), we deduce that 8

$$
\begin{aligned}
\int_{B\left(y, d_{y}\right)}\left|\nabla^{r} u\right|^{2} \psi^{2 m}+\int_{B\left(y, d_{y}\right)} f(x, u) u \psi^{2 m} \leq & \varepsilon \int_{B\left(y, d_{y}\right)}\left|\nabla^{r}\left(u \psi^{m}\right)\right|^{2}+C_{\varepsilon} \frac{(1+i(u))^{2 r}}{d_{y}^{2 r}} \int_{B(y, d)} u^{2} \psi^{2(m-r)} \\
& +C d_{y}^{n}\left(\frac{1+i(u)}{d_{y}}\right)^{\frac{2\left(p_{y}+1\right) r}{p_{1}-1}+1}
\end{aligned}
$$

Inequality (3.21) and points 3 of Lemma 3.2 imply

$$
\int_{B\left(y, d_{y}\right)}\left|\nabla^{r}\left(u \psi^{m}\right)\right|^{2}+\int_{B\left(y, d_{y}\right)}|f(x, u) u| \psi^{2 m} \leq C d_{y}^{n}\left(\frac{1+i(u)}{d_{y}}\right)^{\frac{2\left(p_{1}+1\right) r}{p_{1}-1}+1}
$$

Observe now that $\psi \equiv 1$ for all $x \in B\left(y, \frac{d_{y}}{2}\right) \subset B\left(y, a_{j_{0}}\right)$, so estimate (3.18) follows from the above inequality and point 4 of Lemma 3.2.

Step 3. Boot-strap procedure. Set $\lambda=\frac{d_{y}}{2}<1, u_{\lambda}(x)=u(y+\lambda x)$ and $g_{\lambda}(x)=f(y+\lambda x, u(y+\lambda x)), x \in B_{1}$, then $u_{\lambda}$ satisfies

$$
\begin{equation*}
\left(-\Delta u_{\lambda}\right)^{r}=\lambda^{2 r} g_{\lambda} \text { in } B_{1} \tag{3.25}
\end{equation*}
$$

By virtue of (3.18), we have

$$
\begin{equation*}
\int_{B_{1}}\left|g_{\lambda}\right|^{q_{1}}=2^{n} d_{y}^{-n} \int_{B\left(y, \frac{\left.d_{y}\right)}{2}\right.}|f(x, u)|^{q_{1}} \leq C\left(\frac{1+i(u)}{d_{y}}\right)^{\frac{2\left(p_{1}+1\right) r}{p_{1}-1}+1} \tag{3.26}
\end{equation*}
$$

We invoke local $L^{p}-W^{2 r, p}$ estimate (see Corollary 3.1 in the Appendix C) and Rellich-Kondrachov's theorem [11]. Let $q>1$, then point 3 of Lemma 3.2 implies

$$
\begin{array}{r}
\left\|u_{\lambda}\right\|_{L^{q^{*}\left(B_{\frac{1}{2}}\right)}} \leq C\left\|u_{\lambda}\right\|_{\left.W^{2 r q}\left(B_{\frac{1}{2}}\right)\right)} \leq C\left(\left\|g_{\lambda}\right\|_{L^{q}\left(B_{1}\right)}+\left\|u_{\lambda}\right\|_{L^{q}\left(B_{1}\right)}\right) \leq C\left(\left\|g_{\lambda}\right\|_{L^{q}\left(B_{1}\right)}+1\right) \\
\text { where } q^{*}=\frac{q n}{n-2 r q} \text { if } 2 r q<n \text { and for all } q^{*}>1 \text { if } q=\frac{n}{2 r} \tag{3.27}
\end{array}
$$

[^4]and
\[

$$
\begin{equation*}
\left\|u_{\lambda}\right\|_{C^{2 r-1}\left(B_{\frac{1}{2}}\right)} \leq C\left\|u_{\lambda}\right\|_{W^{2 r, q\left(B_{\frac{1}{2}}\right)}} \leq C\left(\left\|g_{\lambda}\right\|_{L^{q}\left(B_{1}\right)}+\left\|u_{\lambda}\right\|_{L^{q}\left(B_{1}\right)}\right) \leq C\left(\left\|g_{\lambda}\right\|_{L^{q}\left(B_{1}\right)}+1\right), \text { if } 2 r q>n . \tag{3.28}
\end{equation*}
$$

\]

So, inequality (3.27) and point 4 of Lemma 3.2 give

$$
\begin{equation*}
\left\|g_{\lambda}\right\|_{L^{q^{*}}\left(B_{\frac{1}{2}}\right)} \leq C\left(\left\|g_{\lambda}\right\|_{L^{q}\left(B_{1}\right)}+1\right)^{p_{2}}, \text { if } 2 r q \leq n \tag{3.29}
\end{equation*}
$$

If $2 r q_{1} \geq n$ (respectively $2 r q_{1}=n$ ) the desired estimate (1.11) follows from (3.26) and (3.28) (with $q=q_{1}$ ) (respectively (3.26), (3.27) (with $q=q_{1}$ ) and (3.28), (3.29) (with $q=p_{2} \frac{n+1}{2 r}$ ). The case $2 r q_{1}<n$ needs more involving analysis. As $q_{1}=\frac{p_{2}+1}{p_{2}}$ and $1<p_{2}<\frac{n+2 r}{n-2 r}$, we have

$$
q_{1}^{*}=\frac{q_{1} n}{n-2 r q_{1}}=\frac{\left(p_{2}+1\right) n}{p_{2}(n-2 r)-2 r}>\frac{\left(p_{2}+1\right) n}{n}>p_{2} \text { and } \frac{1}{q_{1}}-\frac{2 r p_{2}}{n\left(p_{2}-1\right)}<0 .
$$

Set $q_{2}=\frac{q_{1}^{*}}{p_{2}}$ and $q_{k+1}=\frac{q_{k}^{*}}{p_{2}}$. We claim that there exists $k_{0} \in \mathbb{N}^{*}$ such that

$$
\begin{equation*}
2 r q_{k_{0}+1}>n \text { and } 2 r q_{k_{0}}<n . \tag{3.30}
\end{equation*}
$$

Suppose by contradiction that $2 r q_{k}<n$ for all $k \in \mathbb{N}^{*}$. Then, $\frac{1}{q_{k+1}}=\frac{p_{2}}{q_{k}}-\frac{2 r p_{2}}{n}$ and therefore

$$
\begin{equation*}
\frac{1}{q_{k+1}}=\frac{p_{2}^{k}}{q_{1}}-\frac{2 r p_{2}}{n} \sum_{j=0}^{k-1} p_{2}^{j}=p_{2}^{k}\left(\frac{1}{q_{1}}-\frac{2 r p_{2}}{n\left(p_{2}-1\right)}\right)+\frac{2 r p_{2}}{n\left(p_{2}-1\right)} \tag{3.31}
\end{equation*}
$$

We reach a contradiction since $\frac{1}{q_{k}} \rightarrow-\infty$. Set now

$$
\beta=\frac{2 r p_{2}}{n\left(p_{2}-1\right)}\left(\frac{2 r p_{2}}{n\left(p_{2}-1\right)}-\frac{1}{q_{1}}\right)^{-1}=\frac{2 r\left(p_{2}+1\right)}{2 r\left(p_{2}+1\right)-n\left(p_{2}-1\right)} .
$$

From (3.31), we have $p_{2}^{k_{0}}<\beta$ and $p_{2}^{k_{0}+1}>\beta$. Hence, iterating (3.29), we obtain

$$
\left\|g_{\lambda}\right\|_{L^{\mu_{0}+1}\left(B_{2}^{\frac{1}{2}+1}\right)} \leq C\left(\left\|g_{2}\right\|_{L^{q_{1}}\left(B_{1}\right)}+1\right)^{p_{R_{2}}^{k_{0}}} \leq C\left(\left\|g_{\lambda}\right\|_{L^{q^{4}}\left(B_{1}\right)}+1\right)^{\beta} .
$$

Set $\gamma_{1}=\frac{\left(p_{1}+1\right) \beta}{q_{1}}=\frac{2 r\left(p_{1}+1\right) p_{2}}{2 r\left(p_{2}+1\right)-n\left(p_{2}-1\right)}$ and $\gamma_{2}=\beta+\frac{2 r}{p_{1}-1} \gamma_{1}$. As $r q_{k_{0}+1}>n$, the last inequality with (3.28) and (3.26) imply

$$
\left.\left\|u_{\lambda}\right\|_{C^{2 r-1}(B}^{2^{\frac{1}{0}+1}}\right) \leq C(1+i(u))^{\gamma_{2}} d_{y}^{\frac{-2 r}{p_{1}^{-1}} \gamma_{1}}
$$

According to the definition of $u_{\lambda}$, we get $\sum_{j=0}^{2 r-1} d_{y}^{j}\left|\left(\nabla^{j} u\right)(y)\right| \leq C(1+i(u))^{\gamma_{2}} d_{y}^{\frac{-2 r}{p_{1}-1} \gamma_{1}}$. This achieves the proof of Theorem
Appendix A: Proof of Lemma 3.2, In the following, $C$ denotes generic positive constant depending only on the parameters $\left(s_{0}, p_{1}, p_{2}\right)$ and the constant $c_{1}$ of assumptions $\left(h_{1}\right)-\left(h_{4}\right)$. The following inequalities are an immediate consequence of $\left(h_{4}\right)$ :

$$
\begin{equation*}
|F(x, s)|,|f(x, s) s| \leq C, \forall(x, s) \in \Omega \times\left[-s_{0}, s_{0}\right] . \tag{3.32}
\end{equation*}
$$

Hence, points 1 and 2 follow from $\left(h_{1}\right)-\left(h_{2}\right)$. Also, in view of (3.32) and the fact that the nonlinearity $-f(x,-s)$ satisfies $\left(h_{1}\right)-\left(h_{4}\right)$, we need only to prove points 3 and 4 for all $(x, s) \in \Omega \times\left[s_{0}, \infty\right)$.
Proof of point 3. According to $\left(h_{1}\right)$, we have

$$
\begin{equation*}
f^{\prime}(x, s) s \geq p_{1} f(x, s), \forall(x, s) \in \Omega \times\left[s_{0}, \infty\right) \tag{3.33}
\end{equation*}
$$

which implies $\left(\frac{f(x, s)}{s^{p_{1}}}\right)^{\prime} \geq 0$. As $f\left(x, s_{0}\right) \geq \frac{1}{c_{1}}$ for all $x \in \Omega$ (see $\left(h_{4}\right)$ ), we derive

$$
\begin{equation*}
f(x, s) \geq \frac{s^{p_{1}}}{c_{1} s_{0}^{p_{1}}} \text { and } f(x, s) s \geq \frac{s^{p_{1}+1}}{c_{1} s_{0}^{p_{1}}}, \forall(x, s) \in \Omega \times\left[s_{0}, \infty\right), \tag{3.34}
\end{equation*}
$$

which imply the first inequality of point 3. Integrating now (3.33) over $\left[s_{0}, s\right]$ and using ( $h_{2}$ ), we derive $\frac{f(x, s) s}{p_{2}+1} \leq$ $F(x, s) \leq \frac{f(x, s) s}{p_{1}+1}+C, \forall(x, s) \in \Omega \times\left[s_{0}, \infty\right)$ which pmlies the second and third inequalities of point 3.
Proof of point 4. According to ( $h_{2}$ ), we have $\left(\frac{F(x, s)}{s^{p_{2}+1}}\right)^{\prime} \leq 0 \forall(x, s) \in \Omega \times\left[s_{0}, \infty\right)$ which with (3.32) imply $F(x, s) \leq C s^{p_{2}+1} \forall(x, s) \in \Omega \times\left[s_{0}, \infty\left(\right.\right.$. Hence, from $\left(h_{2}\right)$ and point 2 , we get $|f(x, s)|^{\frac{1}{p_{2}}} \leq C|s|, \forall(x, s) \in \Omega \times\left[s_{0}, \infty\right)$. Consequently, for $t>0$ and $q_{1}=\frac{p_{2}+1}{p_{2}}$, we derive

$$
|f(x, s)|^{q_{1}} \leq C|f(x, s) s| \text { and }|f(x, s)|^{\frac{t}{p_{2}}} \leq C|s|^{t},(x, s) \in \Omega \times\left[s_{0}, \infty\right) .
$$

Proof of point 5. In view of Young's inequality, we obtain $a s^{2} b \leq \varepsilon s^{p_{1}+1} a^{\frac{p_{1}+1}{2}}+\varepsilon^{\frac{-2}{p_{1}-1}} b^{\frac{p_{1}+1}{p_{1}-1}}$. Recall that $0 \leq a \leq 1$ and using point 3, we derive point 5. This end the proof of Lemma 3.2,

Appendix C: Proof of (3.17).
Noticing that (3.17) is trivial for $r=1$. Let $k \in \mathbb{N}^{*}$. If $r=2 k$, i.e. $D_{r}=\Delta^{k}$, apply Leibnitz's formula, we have

$$
\begin{equation*}
\Delta^{k}(\nabla u \cdot \cdot(x-y))=\nabla\left(\Delta^{k} u\right) \dot{(x-y)}+2 k \Delta^{k} u . \tag{3.35}
\end{equation*}
$$

Multiplying (3.35) by $\Delta^{k} u$ and taking into account that $\Delta^{k} u \nabla\left(\Delta^{k} u\right) \cdot(x-y)=\frac{1}{2} \nabla\left(\left(\Delta^{k} u\right)^{2}\right) \cdot(x-y)$, This achieves the proof of (3.17).
If $r=2 k+1$, that is $D_{r}=\nabla \Delta^{k}$. According to (3.35) we derive

$$
D_{r} u \cdot D_{r}(\nabla u \cdot(x-y))=\nabla \Delta^{k} \nabla\left(\nabla\left(\Delta^{k} u\right) \cdot(x-y)\right)+(r-1)\left|D_{r} u\right|^{2} .
$$

Therefore, (3.17) follows as $\nabla w \cdot \nabla(\nabla w \cdot(x-y))=\frac{1}{2} \nabla\left(|\nabla w|^{2}\right) \cdot(x-y)+|\nabla w|^{2}, \forall w \in C^{1}\left(\mathbb{R}^{n}\right)$.
Appendix C: Local $L^{p}-W^{2 t, p}$-estimate, $t \in \mathbb{N}^{*}, p \geq 2$. Consider the linear higher order elliptic problem of the form

$$
\begin{equation*}
L u=g \text { in } \Omega . \tag{3.36}
\end{equation*}
$$

Here $\Omega$ is a domain of $\mathbb{R}^{n}$ and

$$
L=\left(-\sum_{i, k=1}^{n} a_{i k}(x) \frac{\partial^{2}}{\partial x_{i} \partial x_{k}}\right)^{r}+\sum_{|j| \leq 2 t-1} b_{j}(x) D^{j}
$$

where $b_{j} \in L_{l o c}^{\infty}(\Omega), a_{i k} \in C^{2 t-2}(\Omega)$ and $L$ is a local uniformly elliptic operator, that is For all bounded open subset $O$ of $\Omega$ there exists a constant $\lambda_{O}>0$ with $\lambda_{O}^{-1}|\xi|^{2} \leq \sum_{i, k=1}^{n} a_{i k}(x) \xi_{i} \xi_{k} \leq \lambda_{O}|\xi|^{2}$ for all $\xi \in \mathbb{R}^{n}, x \in \bar{O}$. Let $A$ and $A^{\prime}$ be two bounded open subset of $\Omega$ such that $\bar{A} \subset A^{\prime} \subset \overline{A^{\prime}} \subset \Omega$ and $\omega^{\prime}$. When $p \geq 2$ by virtue of Lemma 1.2, we establish local analogue of the celebrated $L^{p}-W^{2 t, p}$ estimate of Agmon-Douglis-Nirenberg [2]. Set $d=\operatorname{dist}\left(A, \Omega \backslash A^{\prime}\right)$.

Corollary 3.1. Let $g \in L_{l o c}^{p}(\Omega)$ for some $p \geq 2$. Then, there exists a constant $C>0$ depending only on $\left\|a_{i k}\right\|_{C^{2 r-2}\left(A^{\prime}\right)}$, $\left\|b_{j}\right\|_{L^{\infty}\left(A^{\prime}\right)}$ and $\lambda_{A^{\prime}}, A, A^{\prime}, d, n, p, t$ such that for any $u \in W_{\text {loc }}^{2 t, p}(\Omega)$ a weak solution of (3.36), we have

$$
\|u\|_{W^{2 t, p}(A)} \leq C\left(\|g\|_{L^{p}\left(A^{\prime}\right)}+\|u\|_{L^{p}\left(A^{\prime}\right)}\right) .
$$

## Proof of Corollary 3.1,

In the following $C$ denotes a generic positive constant which depends on the parameters stated in Corollary 3.1 As $\bar{A}$ is a compact subset of $A^{\prime}$, we can find $x_{i} \in A, i=1,2 \ldots, i_{0}$ such that $\bar{A} \subset \bigcup_{1 \leq i \leq i_{0}} B\left(x_{i}, \frac{d}{4}\right) \subset A^{\prime}$ where $i_{0} \in \mathbb{N}^{*}$ depending only on $d$ and $\omega$. Let $m \geq 2 t$ and $\psi$ be the cut-off function defined in Lemma 1.1 relying on $\omega_{i}=B\left(x_{i}, \frac{d}{4}\right)$ and $\omega_{i}^{\prime}=B\left(x_{i}, \frac{d}{2}\right)$. A simple computations give

$$
L\left(u \psi^{m}\right)=g \psi^{m}+u L\left(\psi^{m}\right)+b_{0} u \psi^{m}+\sum_{1 \leq|i|+|j| \leq 2 t-1} c_{i, j} D^{j} u D^{i}\left(\psi^{m}\right), \text { where } c_{i, j} \in L^{\infty}\left(A^{\prime}\right) .
$$

As $u \psi^{m} \in W^{2 t, p}\left(\omega^{\prime}\right) \cap W_{0}^{t, p}\left(\omega_{i}^{\prime}\right)$ with $\omega_{i}^{\prime}$ is of class $C^{2 t}$, Agmon-Douglis-Nirenberg's global estimate [2] and (1.5) imply

$$
\begin{equation*}
\sum_{0 \leq s \leq 2 t} \int_{\omega^{\prime}}\left|\nabla^{s}\left(u \psi^{m}\right)\right|^{p} \leq C\left(\|g\|_{L^{p}\left(\omega^{\prime}\right)}^{p}+\|u\|_{L^{p}\left(\omega^{\prime}\right)}^{p}+\sum_{1 \leq s \leq 2 t-1} \sum_{1 \leq q \leq s} \int_{\omega^{\prime}}\left|\nabla^{q} u\right|^{p}\left|\nabla^{s-q} \psi^{m}\right|^{p}\right) \tag{3.37}
\end{equation*}
$$

Using now inequality (1.8) with $r=s$, we obtain

$$
\sum_{1 \leq q \leq s-1} \int_{\omega^{\prime}}\left|\nabla^{q} u\right|^{p}\left|\nabla^{s-q} \psi^{m}\right|^{p} \leq \varepsilon \int_{\omega^{\prime}}\left|\nabla^{s}\left(u \psi^{m}\right)\right|^{p}+C_{\varepsilon, d} \int_{\omega^{\prime}}|u|^{p} \psi^{p(m-s)} .
$$

Applying again (1.8) with $r=s+1$ and replacing $\varepsilon$ by $\frac{\varepsilon}{d}$, yields

$$
\left.\int_{\omega^{\prime}}\left|\nabla^{s} u\right|^{p}\left|\psi^{p m} \leq \int_{\omega^{\prime}}\right| \nabla^{s} u\right|^{p} \psi^{p(m-1)} \leq \varepsilon \int_{\omega^{\prime}}\left|\nabla^{s+1}\left(u \psi^{m}\right)\right|^{p}+C_{\varepsilon, d} \int_{\omega^{\prime}}|u|^{p} \psi^{p(m-s-1)} .
$$

Collecting the two last inequalities, we derive

$$
\sum_{1 \leq s \leq 2 t-1} \sum_{1 \leq q \leq s} \int_{\omega^{\prime}}\left|\nabla^{q} u\right|^{p}\left|\nabla^{s-q} \psi^{m}\right|^{p} \leq \varepsilon \sum_{0 \leq s \leq 2 t} \int_{\omega^{\prime}}\left|\nabla^{s}\left(u \psi^{m}\right)\right|^{p}+C_{\varepsilon, d} \int_{\omega^{\prime}}|u|^{p}
$$

We insert the above inequality in the right-hand side of (3.37) and we choose $\varepsilon=\frac{1}{2 C}$, it follows that

$$
\left\|u \psi^{m}\right\|_{W^{2 t, p}\left(\omega^{\prime}\right)}^{p} \leq C\left(\|g\|_{L^{p}\left(\omega^{\prime}\right)}^{p}+\|u\|_{L^{p}\left(\omega^{\prime}\right)}^{p}\right)
$$

Since $\psi(x)=1$ if $x \in \omega$, we obtain

$$
\|u\|_{W^{2 t, p}\left(B\left(x_{i}, \frac{d}{4}\right)\right)}^{p} \leq C\left(\|g\|_{L^{p}\left(\omega^{\prime}\right)}^{p}+\|u\|_{L^{p}\left(\omega^{\prime}\right)}^{p}\right) \leq C\left(\|g\|_{L^{p}\left(A^{\prime}\right)}^{p}+\|u\|_{L^{p}\left(A^{\prime}\right)}^{p}\right) .
$$

As $\bar{A} \subset \bigcup_{1 \leq i \leq i_{0}} B\left(x_{i}, \frac{d}{4}\right)$ and $i_{0}$ depends only on $A$ and $d$, we derive

$$
\|u\|_{W^{2 t, p}(A}^{p} \leq C i_{0}\left(\|g\|_{L^{p}\left(A^{\prime}\right)}^{p}+\|u\|_{L^{p}\left(A^{\prime}\right)}^{p}\right) .
$$

This achieves the proof of Corollary 3.1 .

[^1]:    ${ }^{1}$ If $\Omega$ is an unbounded domain we assume in addition that $K(x) \geq c_{0}>0$ for all $x \in \Omega$.
    ${ }^{2}$ In the statement of Theorem 1.1 we used (1.1 with $p=1$.
    ${ }^{3}$ Note that the boot strap argument requires a subcritical growth.

[^2]:    ${ }^{4}$ Both $D_{r}$ and $A(\eta, v)$ are respectively scalar operators if $r$ is even, and $n$-vectorial operators if $r$ is odd.
    ${ }^{5}$ Observe that $\left|D_{r} u\right| \leq C\left|\nabla^{r} u\right|$.

[^3]:    ${ }^{7}$ We also use that $|x-y| \leq d_{y} \leq \alpha$.

[^4]:    ${ }^{8}$ Recall that $\frac{2 n}{\left(p_{2}+1\right)(n-2 r)}>1$.
    ${ }^{9}$ Observe that $\lambda=\frac{d_{y}}{2}<1$.
