Abstract

We present a cyclic symmetric space-time, admitting closed timelike curves (CTCs) which appear after a certain instant of time, *i. e.*, a time-machine space-time. These closed time-like curves evolve from an initial spacelike hypersurface on the plane z = constant in a causally well-behaved manner. The space-time discussed here is freefrom curvature singularities and a 4D generalization of the Misner space in curved space-time. The matter field is of pure radiation with a negative Cosmological constant.

1 Introduction

One of the most intriguing aspects of Einstein's theory of gravitation is that solutions of Field Equations admit closed time-like curves (CTC). Presence of CTC in a space-time lead to time-travel which violate the causality condition. The first one being the Gödel's space-time [1] which admit closed time-like curves (CTC) everywhere and an eternal time-machine space-time. There are a considerable number of space-times in literature that admitting closed time-like curves have been constructed. A small sample would be [1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21]. One way of classifying such causality violating space-times would be to categorize the metrics as either eternal time-machine in which CTC always exist (in this class would be [1, 2]), or as time-machine space-times in which CTC appear after a

 $^{^{1}}$ faizuddinahmed 15@gmail.com ; faiz 4U.enter@rediffmil.com

certain instant of time. In the latter category would be the one discussed in [18, 19, 20]. Many of the models, however, suffer from one or more severe drawbacks. For instance, in some of these solutions, for example [13, 14, 20] the weak energy condition (WEC) is violated indicating unrealistic matterenergy content and some other solutions have singularities.

Among the time-machine space-times, we mention two: the first being Ori's compact core [17] which is represented by a vacuum metric locally isometric to pp waves and second, which is more relevant to the present work, the Misner space [22] in 2D. This is essentially a two dimensional metric (hence flat) with peculiar identifications. The Misner space is interesting in the context of CTC as it is a prime example of a space-time where CTC evolve from causally well-behaved initial conditions.

The metric for the Misner space [22]

$$ds_{Misn}^2 = -2 dt dx - t dx^2 \quad . \tag{1}$$

where $-\infty < t < \infty$ but the co-ordinate x periodic. The metric (1) is regular everywhere as detg = -1 including at t = 0. The curves $t = t_0$, where t_0 is a constant, are closed since x is periodic. The curves t < 0 are spacelike, but t > 0 are time-like and the null curves $t = t_0 = 0$ form the chronology horizon. The second type of curves, namely, $t = t_0 > 0$ are closed timelike curves (CTC). This metric has been the subject of intense study and quite recently, D. Levanony *et al* [23] have studied the motion of extended bodies in the 2D Misner space and its flat 4D generalizations. A non-flat 4D space-time, satisfying all the energy conditions, but with causality violating properties of the Misner space, primarily that CTC evolve smoothly from a initially causally well-behaved stage, would be physically more acceptable as a time-machine space-time.

In this paper, we shall attempt to show that causality violating curves appear in non-vacuum space-time with comparatively simple structure. In section 2, we analyze the space-time, in section 3, the matter distribution and the energy condition, in *section* 4, the space-time is classified and discussed its kinematical properties and concluding one in *section* 5.

2 Analysis of the space-time

Consider the following metric

$$ds^{2} = 4r^{2} dr^{2} + e^{2\alpha r^{2}} \left(dz^{2} - t d\phi^{2} - 2 dt d\phi \right) + 4\beta z r e^{-\alpha r^{2}} dr d\phi, \qquad (2)$$

where ϕ coordinate is assumed periodic $0 \leq \phi \leq \phi_0$, with α is an integer and $\beta > 0$ is real number. We have used co-ordinates $x^1 = r$, $x^2 = \phi$, $x^3 = z$ and $x^4 = t$. The ranges of the other co-ordinates are $t, z \in (-\infty, \infty)$ and $0 \leq r < \infty$. The metric has signature (+, +, +, -) and the determinant of the corresponding metric tensor $g_{\mu\nu}$, $det g = -4r^2 e^{6\alpha r^2}$. The non-zero components of the Einstein tensor are

$$G^{\mu}_{\mu} = 3 \alpha^{2}$$

$$G^{t}_{\phi} = -\frac{1}{2} e^{-6 \alpha r^{2}} \beta^{2}$$
(3)

Consider an azimuthal curves γ defined by $r = r_0$, $z = z_0$ and $t = t_0$, where r_0, z_0, t_0 are constants, then we have from the metric (2)

$$ds^2 = -t \, e^{2\,\alpha\,r^2} \, d\phi^2 \tag{4}$$

These curves are null for t = 0, spacelike throughout for $t = t_0 < 0$, but become time-like for $t = t_0 > 0$, which indicates the presence of closed timelike curves (CTC). Hence CTC form at a definite instant of time satisfy $t = t_0 > 0$.

It is crucial to have analysis that the above CTC evolve from an spacelike t = constant hypersurface (and thus t is a time coordinate)[17]. This can be ascertained by calculating the norm of the vector $\nabla_{\mu} t$ (or by determining the sign of the component g^{tt} in the inverse metric tensor $g^{\mu\nu}[17]$). We find from (2) that

$$g^{tt} = t \, e^{-2\,\alpha\,r^2} + \beta^2 \, z^2 \, e^{-6\,\alpha\,r^2} \tag{5}$$

A hypersurface t = constant is spacelike provided $g^{tt} < 0$ for $t = t_0 < 0$, but become time-like provided $g^{tt} > 0$ for $t = t_0 > 0$. Here we choose the z - planes defined by $z = z_0$, $(z_0, a \text{ constant equal to zero})$ such that the above condition is satisfied. Thus the spacelike t = constant < 0 hypersurface can be chosen as initial conditions over which the initial may be specified. There is a Cauchy horizon for $t = t_0 = 0$ called Chronology horizon which separates the causal and non-causal of the space-time. Hence the space-time evolves from a partial Cauchy hypersurface (initial spacelike hypersurface) in a causally well-behaved manner, upto a moment, i.e., a null hypersurface t = 0 and CTC form at a definite instant of time on z = constant plane.

Consider the Killing vector $\eta = \partial_{\phi}$ for metric (2) which has the normal form

$$\eta^{\mu} = (0, 1, 0, 0) \tag{6}$$

Its co-vector is

$$\eta_{\mu} = \left(2\beta z \, r \, e^{-\alpha r^2}, -t \, e^{2\,\alpha r^2}, 0, -e^{2\,\alpha r^2}\right) \tag{7}$$

(6) satisfies the Killing equation $\eta_{\mu;\nu} + \eta_{\nu;\mu} = 0$. For cyclicly symmetric metric, the norm $\eta_{\mu} \eta^{\mu}$ of the Killing vector is spacelike, closed orbits [24, 25, 26, 27, 28]. We note that

$$\eta^{\mu}\eta_{\mu} = -t \, e^{2\,\alpha\,r^2} \tag{8}$$

which is spacelike for t < 0, closed orbits (ϕ co-ordinate being periodic).

An important note is that the Riemann tensor $R_{\mu\nu\rho\sigma}$ can be expressed in terms of metric tensor $g_{\mu\nu}$ as

$$R_{\mu\nu\rho\sigma} = k \left(g_{\mu\rho} \, g_{\nu\sigma} - g_{\mu\sigma} \, g_{\nu\rho} \right) \tag{9}$$

where $k = -\alpha^2$ for the space-time (2).

Another important note is that if we take $\beta = 0$, then the space-time represented by (2) is maximally symmetric vacuum space-time and locally isometric anti-de Sitter space in four-dimension. One can easily show by a number of transformations the standard form of locally isometric AdS_4 metric [29]

$$ds^{2} = \frac{3}{(-\Lambda)x^{2}} \left(-dt^{2} + dx^{2} + d\phi^{2} + dz^{2} \right)$$
(10)

where one of the co-ordinate ϕ being periodic.

3 Matter distribution of the space-time and the energy condition

The Einstein's Field Equations taking into account the cosmological constant

$$G^{\mu\nu} + \Lambda g^{\mu\nu} = T^{\mu\nu} \quad , \quad \mu, \nu = 1, 2, 3, 4 \tag{11}$$

Consider the energy-momentum tensor that of pure radiation field [30]

$$T^{\mu\nu} = \rho \, n^{\mu} \, n^{\nu} \tag{12}$$

where n^{μ} is the null vector defined by

$$n^{\mu} = (0, 0, 0, 1) \tag{13}$$

The non-zero component of the energy-momentum tensor

$$T^t_{\phi} = -\rho \, e^{2\,\alpha\,r^2} \tag{14}$$

Equating Field Equations (11) using (3) and (14) we get

$$\Lambda = -3 \alpha^2 \tag{15}$$

$$\rho = \frac{1}{2}\beta^2 e^{-8\alpha r^2} , \quad 0 \le r < \infty$$
 (16)

The energy-density of pure radiation or null dust decreases exponentially with r and vanish at $r \to \pm \infty$. The matter field pure radiation satisfy the energy condition and the energy density ρ is always positive.

4 Classification and kinematical properties of the space-time

For classification of the spacetime (2), we can construct the following set of null tetrads (k, l, m, \bar{m}) as

$$k_{\mu} = (0, 1, 0, 0) \quad , \tag{17}$$

$$l_{\mu} = \left(-2\beta z \, r \, e^{-\alpha r^2}, \frac{t}{2} \, e^{2\alpha r^2}, 0, e^{2\alpha r^2}\right) \quad , \tag{18}$$

$$m_{\mu} = \frac{1}{\sqrt{2}} (2r, 0, i e^{\alpha r}, 0) \quad , \tag{19}$$

$$\bar{m}_{\mu} = \frac{1}{\sqrt{2}} \left(2r, 0, -i e^{\alpha r^2}, 0 \right) \quad , \tag{20}$$

where $i = \sqrt{-1}$. The set of null tetrads above are such that the metric tensor for the line element (2) can be expressed as

$$g_{\mu\nu} = -k_{\mu} \, l_{\nu} - l_{\mu} \, k_{\nu} + m_{\mu} \, \bar{m}_{\nu} + \bar{m}_{\mu} \, m_{\nu} \quad . \tag{21}$$

The vectors (17)—(20) are null vectors and are orthogonal except for $k_{\mu} l^{\mu} = -1$ and $m_{\mu} \bar{m}^{\mu} = 1$. Using this null tetrad above we have calculated the five Weyl scalars

$$\Psi_{3} = -\frac{i \alpha \beta e^{-2 \alpha r^{2}}}{2 \sqrt{2}}$$

$$\Psi_{4} = -\frac{1}{4} \beta e^{-2 \alpha r^{2}} \left(i + 2 \alpha z e^{\alpha r^{2}}\right)$$
(22)

are non-vanishing, while $\Psi_0 = \Psi_1 = \Psi_3 = 0$. The spacetime represented by (2) is of type III in the Petrov classification scheme. Note that the nonzero Weyl scalars Ψ_3 and Ψ_4 are finite at $r \to 0$ and vanish as $r \to \pm \infty$ indicating asymptotic flatness of the spacetime (2). The metric (2) is freefrom curvature singularities. The curvature invariant known as Kretchsmann scalar is given by

$$R^{\mu\nu\rho\sigma} R_{\mu\nu\rho\sigma} = 24 \,\alpha^4 \tag{23}$$

and the curvature scalar

$$R = -12 \alpha^2 \tag{24}$$

are constant being non-zero.

Using the null tetrad (17) we have calculated the *Optical* scalars [30] the *expnasion*, the *twist* and the *shear* and they are

$$\Theta = \frac{1}{2} k^{\mu}_{;\mu} = 0 ,$$

$$\omega^{2} = \frac{1}{2} k_{[\mu;\nu]} k^{\mu;\nu} = 0 ,$$

$$\sigma \bar{\sigma} = \frac{1}{2} k_{(\mu;\nu)} k^{\mu;\nu} - \Theta^{2} = 0$$
(25)

and the null vector (17) satisfy the geodesics equation

$$k_{\mu;\nu} k^{\nu} = 0 \quad . \tag{26}$$

Thus the spacetime represented by (2) is non-diverging, have shear-free null geodesics congruence. One can easily show that for constant r and z, the metric (2) reduces to conformal Misner space in 2D

$$ds_{confo}^2 = \Omega \, ds_{Misn}^2 \tag{27}$$

where $\Omega = e^{-2 \alpha r^2}$ is a constant.

5 Conclusion

Our primary motivation in this paper is to write down a metric for a spacetime that incorporates the Misner space and its causality violating properties and to classify it. The solution presented here is non-vacuum, cyclicly symmetric metric (2) and serves as a model of time-machine spacetime in the sense that CTC appear at a definite instant of time on the z - plane. Most of the CTC spacetimes violate one or more energy conditions or unrealistic matter souce and are unphysical. The model discussed here is free-from all these problems and matter distribution is of pure radiation field with negative cosmological constant satisfying the energy condition.

Appendix

The above metric (2) can be transform to a simple form as follows. Let us perform the following transformation

$$r \to \sqrt{r'},$$
 (28)

into the metric (2), one will get

$$ds^{2} = dr'^{2} + e^{2\alpha r'} (dz^{2} - t d\phi^{2} - 2 dt d\phi) + 2\beta z e^{-\alpha r'} dr' d\phi.$$
(29)

Finally doing another transformation

$$r' \to \frac{1}{\alpha} \ln \varrho$$
 (30)

into the metric (29), we get the following line element

$$ds^{2} = \frac{d\varrho^{2}}{\alpha^{2} \,\varrho^{2}} + \varrho^{2} \, dz^{2} + \varrho^{2} \left(-t \, d\phi^{2} - 2 \, dt \, d\phi \right) + \frac{2 \,\beta \, z}{\alpha \, \varrho^{2}} \, d\varrho \, d\phi. \tag{31}$$

Or if one does the following transformation

$$r' \to \frac{1}{\alpha} \ln(\alpha \, \varrho)$$
 (32)

into the metric (29), we get the following line element

$$ds^{2} = \frac{d\varrho^{2}}{\alpha^{2} \, \varrho^{2}} + \alpha^{2} \, \varrho^{2} \, dz^{2} + \alpha^{2} \, \varrho^{2} \left(-t \, d\phi^{2} - 2 \, dt \, d\phi \right) + \frac{2 \, \beta \, z}{\alpha^{2} \, \varrho^{2}} \, d\varrho \, d\phi. \tag{33}$$

Or if one does the following transformation

$$r' \to -\frac{1}{\alpha} \ln(\alpha \, \varrho)$$
 (34)

into the metric (29), we get the following line element

$$ds^{2} = \frac{1}{\alpha^{2} \, \varrho^{2}} \left(d\varrho^{2} - t \, d\phi^{2} - 2 \, dt \, d\phi + dz^{2} \right) - 2 \, \beta \, z \, d\varrho \, d\phi. \tag{35}$$
