Abstract

The construction of Miura and Bäcklund transformations for $A_n$ mKdV and KdV hierarchies are presented in terms of gauge transformations acting upon the zero curvature representation. As in the well known $sl(2)$ case, we derive and relate the equations of motion for the two hierarchies. Moreover, the Miura-gauge transformation is not unique, instead, it is shown to be connected to a set of generators labeled by the exponents of $A_n$. The construction of generalized gauge-Bäcklund transformation for the $A_n$-KdV hierarchy is obtained as a composition of Miura and Bäcklund-gauge transformations for $A_n$-mKdV hierarchy. The zero curvature representation provide a framework which is universal within all flows and generates systematically Bäcklund transformations for the entirely hierarchy.

1 Introduction

The recent studies of integrable models has revealed an increasing importance of its underlying algebraic structure which is intimately connected to a series of peculiar properties, as to the existence of an infinite number of conservation laws, soliton solutions, Bäcklund transformation, etc. Structural connection has been known for some time, see for instance, [1], [2]. Many of these properties can be derived from the zero curvature formulation in terms of two dimensional gauge potentials, $A_x$ and $A_t$ lying in an affine algebra, $\hat{G}$, i.e.,

$$\partial_x A_t - \partial_t A_x + [A_x, A_t] = 0. \quad (1.1)$$

A particular virtue of the zero curvature representation (1.1) is its gauge invariance. Conservation laws can be derived by abelianizing the two dimensional potentials by gauge transforming them into

$^2$francisco.gomes@unesp.br
$^3$gabriel.lobo@unesp.br
$^4$a.zimerman@unesp.br
the Cartan subalgebra of $\hat{\mathcal{G}}$ [3]. Soliton solutions in turn, can be constructed by gauge transforming a vacuum solution $A^\nu_a$ and $A^\rho_a$ into some nontrivial configuration (dressing) see for instance [4]. More recently, gauge transformation was shown to be a key ingredient in constructing Bäcklund transformations [5]-[8]. In all cases, gauge transformation is an essential ingredient.

Bäcklund transformation interpolates between two soliton solutions of an integrable model [9]. More recently, it was employed to describe integrable defects in the sense that two field configurations can be connected by a defect at certain space location [10]-[11]. Thus, the classification of integrable defects and the construction of the various types of Bäcklund transformations are intimately connected. The construction of Bäcklund transformations can be formulated in terms of gauge transforming the two dimensional potentials $A_{\mu}$ from one field configuration, say $\phi$ to another, $\psi$, i.e.,

$$U(\phi_i,\psi_i)A_{\mu}(\phi_i) = A_{\mu}(\psi_i)U(\phi_i,\psi_i) + \partial_\mu U(\phi_i,\psi_i)$$

A natural construction of Bäcklund-gauge transformations $U(\phi_i,\psi_i)$ in terms of a graded affine algebra was proposed in [6], [7] for the $A_2$ mKdV (sinh-Gordon) and in [8] for the generalized $A_n$ Toda Hierarchies. Moreover $U(\phi_i,\psi_i)$ was shown to be an universal object and provide a systematic construction of Bäcklund transformation extended to all evolution equations (flows) within the hierarchy.

Another application of gauge invariance of the zero curvature formulation is the construction of a Miura transformation connecting the mKdV and KdV hierarchies. Several aspects of KdV hierarchies have been developed in the past with regards to spherically symmetric reductions of self dual Yang-Mills theories in 4-D, the realization of $W$-algebras, etc (e.g. see for instance [12]-[16] and refs. therein). In particular, in ref. [7] a Miura-gauge transformation $S$ was proposed to map the the $A_2$ two dimensional potentials $A_{\mu}^{\text{mKdV}}$ into $A_{\mu}^{\text{KdV}}$, i.e.,

$$A_{\mu}^{\text{KdV}} = S A_{\mu}^{\text{mKdV}} S^{-1} + S \partial_\mu S^{-1}$$

In this paper we follow the same line of reasoning of ref. [7] to discuss the construction of Miura-gauge transformation from the $A_n$-mKdV to the $A_n$-KdV systems. In particular it allows us to derive the Bäcklund-gauge transformation of the $A_n$-KdV from the $A_n$-mKdV system.

This paper is organized as follows. In sections 2 and 3 we discuss the algebraic structure and construct the general $A_n$ equations of motion for the second flow of zero curvature representation for both mKdV and KdV systems. In section 4 we discuss the structure of the Miura-gauge transformation for $A_2, A_3$ systems (and for $A_4$ in the appendix B). In particular, we argue that there are more than one Miura transformation connecting both systems. In fact, for $A_n$ there are $n+1$ transformations labeled by the identity $I$ and by the discrete set of constant generators $E^{(k)} \in \hat{\mathcal{K}}$, of grade $k = 1, \ldots, n$. We construct explicitly the Miura transformations for $A_2, A_3$ and $A_4$ and propose a general construction for the $A_n$ case. Section 5 contains the general structure between equations of motion of the two integrable hierarchies. In section 6 we present the construction of Bäcklund transformation for the $A_n$-KdV system as a combination of Miura and Bäcklund transformations for the mKdV system. Section 7 contains our conclusions.

## 2 mKdV Equations

Here we shall consider generic time evolution equations for the $A_n$-mKdV hierarchy which are classified according to the grading structure developed in the Appendix A. Consider the decomposition of an affine Lie algebra $\hat{\mathcal{G}} = \sum_a \mathcal{G}_a$ according to a grading operator $Q$ such that $[Q, \mathcal{G}_a] = a \mathcal{G}_a$. 

Let \( E \equiv E^{(1)} \) be a constant grade one generator responsible for a second decomposition of \( \hat{\mathcal{G}} \) into \( \mathcal{K} = \{ x \in \hat{\mathcal{K}}, [x, E] = 0 \} \) and its complement, \( \mathcal{M} \) i.e.,

\[
\hat{\mathcal{G}} = \mathcal{K} \oplus \mathcal{M}. \tag{2.1}
\]

In particular, projecting into the zero grade subspace, \( \mathcal{G}_0 = \mathcal{K} \oplus \mathcal{M} \). Define now the Lax operator as

\[
L = \partial_x + E + A_0, \tag{2.2}
\]

where \( A_0 \in \mathcal{M} \) (and consequently \( A_0 \in \mathcal{G}_0 \)). In the case of \( \hat{\mathcal{G}} = \hat{sl}(n + 1) \) and principal gradation with subspaces given as in (A.5), \( E^{(1)} \) is given by

\[
E \equiv E^{(1)} = \sum_{k=1}^{n} E_{\alpha_k} + \lambda E_{-(\alpha_1 + \cdots + \alpha_n)}. \tag{2.3}
\]

and \( A_0 \) parametrized as

\[
A_0 = \sum_{k=1}^{n} v_k h_k = \begin{pmatrix} r_1 & 0 & \cdots & 0 \\ 0 & r_2 & \cdots & 0 \\ \vdots & \ddots & \ddots & \vdots \\ 0 & 0 & \cdots & r_{n+1} \end{pmatrix}, \tag{2.4}
\]

where \( r_i = v_i - v_{i-1}, \ i = 1, \ldots, n+1, \ v_0 = v_{n+1} = 0. \) The relation \( v_i = \sum_{j=1}^{i} r_j \) follows from trace condition.

We now propose the construction of time evolution equations in the zero curvature representation,

\[
[\partial_x + A_x, \partial_t + A_{tN}] = \partial_x A_{tN} - \partial_t N A_x + [A_x, A_{tN}] = 0 \tag{2.5}
\]

where \( A_x = E^{(1)} + A_0. \)

The so called positive grade time evolution is constructed for \( A_{tN} \) given by

\[
A_{tN} = D^{(N)} + D^{(N-1)} + \cdots + D^{(0)}, \quad D^{(j)} \in \mathcal{G}_j, \quad N \in \mathbb{Z}_+. \tag{2.6}
\]

The zero curvature representation (2.5) decomposes according to the graded structure into

\[
[E^{(1)}, D^{(N)}] = 0, \tag{2.7}
\]
\[
[E^{(1)}, D^{(N-1)}] + [A_0, D^{(N)}] + \partial_x D^{(N)} = 0, \tag{2.8}
\]
\[
:\ 
\]
\[
[A_0, D^{(0)}] + \partial_x D^{(0)} - \partial_t N A_0 = 0, \tag{2.9}
\]

and allows solving for \( D^{(j)} \) recursively starting from the highest grade eqn. (2.7). In particular, the last eqn. (2.9) is the only eqn. involving time derivatives acting on \( A_0 \) and can be regarded as the time evolution for the fields parametrizing \( A_0 \in \mathcal{M}. \)

Solving (2.7) for \( N = 2 \) and \( n > 1, \) according to the grading structure given in (A.5) we find

\[
D^{(2)} = a_2 \left( \sum_{k=1}^{n-1} E_{\alpha_k + \alpha_{k+1}} + \lambda E_{-(\alpha_1 + \cdots + \alpha_{n-1})} + \lambda E_{-(\alpha_2 + \cdots + \alpha_n)} \right) \in \hat{\mathcal{K}}. \tag{2.10}
\]
where \( a_2 \) is an arbitrary coefficient. The lower grade matrices \( D^{(i)}, i = 0, 1 \) can be solved recursively from the appropriate grade projections of the zero-curvature equation \( (2.5) \). For example when \( N = 2 \), the grade one element \( D^{(1)} \) is solved from \( (2.8) \) i.e.,

\[
[E^{(1)}, D^{(1)}] + [A_0, D^{(2)}] + \partial_x D^{(2)} = 0.
\]

(2.11)

leading to

\[
\partial_x a_2 = 0 \quad \text{and} \quad D^{(1)} = \sum_{k=1}^{n}(v_{k+1} - v_{k-1})E_{\alpha_k} + (v_1 - v_n)\lambda E_{-(\alpha_1+\cdots+\alpha_n)}
\]

(2.12)

where we shall set \( a_2 = 1 \).

The grade 1 projection of the zero-curvature equation \( (2.5) \) leads to

\[
[E^{(1)}, D^{(0)}] + [A_0, D^{(1)}] + \partial_x D^{(1)} = 0,
\]

(2.13)

with \( D^{(0)} = \sum_{a=1}^{n} d_a h_a \). It therefore follows,

\[
K_{j,a}d_a = K_{j,a}v_a(v_{j+1} - v_{j-1}) + \partial_x(v_{j+1} - v_{j-1}),
\]

(2.14)

where \( K_{ab} = 2^{\alpha_a/\alpha_b} = 2\delta_{a,b} - \delta_{a,b-1} - \delta_{a,b+1} \) is the Cartan matrix of \( sl(n+1) \).

Solving \( (2.14) \) for \( d_a, a = 1, \ldots, n \) and inserting it into the grade 0 projection of the zero-curvature equation \( (2.9) \) yields the eqn. of motion for \( t \equiv t_2 \),

\[
\partial_t v_a = \partial_x d_a.
\]

(2.15)

After multiplying both sides of relation \( (2.15) \) by the Cartan matrix \( K \) and making use of relation \( (2.14) \) we obtain, [19]

\[
\partial_t \sum_{a=1}^{n} K_{ba}v_a = \partial_t (2v_b - v_{b+1} - v_{b-1})
\]

(2.16)

\[
= \partial_x \left[ \partial_x (v_{b+1} - v_{b-1}) + (2v_b - v_{b+1} - v_{b-1})(v_{b+1} - v_{b-1}) \right], \quad b = 1, \ldots, n.
\]

Recalling equation \( (2.16) \) can be rewritten as,

\[
\partial_t (r_{b+1} - r_b) = -\partial_x \left[ \partial_x (r_b + r_{b+1}) - (r_{b+1} - r_b) (r_b + r_{b+1}) \right], \quad b = 1, \ldots, n,
\]

(2.17)

that defines \( t_2 \) flows of \( sl(n+1) \) mKdV hierarchy. Inverting the Cartan matrix explicitly for the cases where \( n = 2, 3 \) in \( (2.16) \) we find in terms of \( v_j \) variables, respectively,

\[
\partial_{t_2} v_1 = \frac{1}{3} \partial_x \left( -\partial_x v_1 + 2\partial_x v_2 + v_1^2 - 2v_2^2 + 2v_1 v_2 \right),
\]

\[
\partial_{t_2} v_2 = \frac{1}{3} \partial_x \left( -2\partial_x v_1 + \partial_x v_2 + 2v_1^2 - v_2^2 - 2v_1 v_2 \right),
\]

(2.18)

and

\[
\partial_{t_2} v_1 = \frac{1}{2} \partial_x \left( -\partial_x v_1 + \partial_x v_2 + \partial_x v_3 + v_1^2 - v_2^2 - v_3^2 + v_1 v_2 + v_2 v_3 \right),
\]

\[
\partial_{t_2} v_2 = \partial_x \left( -\partial_x v_1 + \partial_x v_3 + v_1^2 - v_2^2 - v_1 v_2 + v_2 v_3 \right),
\]

\[
\partial_{t_2} v_3 = \frac{1}{2} \partial_x \left( -\partial_x v_1 - \partial_x v_2 + \partial_x v_3 + v_1^2 + v_2^2 - v_3^2 - v_1 v_2 - v_2 v_3 \right),
\]

(2.19)
3 KdV Equations

For the $A_n$-KdV hierarchy we shall employ the same algebraic structure namely, principal gradation, $Q^{ppal}$ and constant grade one element, $E^{(1)}$ (2.3) and propose the following Lax operator

$$L = \partial_x + E^{(1)} + A^{(-1)} + \cdots + A^{(-n)}, \quad A^{(k-n-1)} = J_{n+1-k}E_{-(\alpha_k+\cdots+\alpha_n)} \in \mathcal{M} \subset \mathcal{G}_{k-n-1} \quad (3.1)$$

for $k = 1, \ldots, n$, or in matrix form

$$A_x = E^{(1)} + A^{(-1)} + \cdots + A^{(-n)} = \begin{pmatrix}
0 & 1 & 0 & \cdots & 0 & 0 \\
0 & 0 & 1 & \cdots & 0 & 0 \\
\ddots & \ddots & \ddots & \ddots & \ddots & \ddots \\
\ddots & \ddots & 1 & 0 \\
\vdots & \vdots & \vdots & \vdots & \vdots & 1 \\
\lambda + J_n & J_{n-1} & \cdots & 0 & J_1 & 0
\end{pmatrix} \quad (3.2)$$

The zero curvature representation

$$[\partial_x + E^{(1)} + A^{(-1)} + \cdots + A^{(-n)}, \ \partial_t + D^{(2)} + D^{(1)} + \cdots + D^{(-n)}] = 0 \quad (3.3)$$

leads to the following graded eqns.,

$$[E^{(1)}, D^{(2)}] = 0, \quad (3.4)$$
$$[E^{(1)}, D^{(1)}] + \partial_x D^{(2)} = 0, \quad (3.5)$$
$$[E^{(1)}, D^{(0)}] + [A^{(-1)}, D^{(2)}] + \partial_x D^{(1)} = 0, \quad (3.6)$$
$$[E^{(1)}, D^{(-1)}] + [A^{(-1)}, D^{(1)}] + [A^{(-2)}, D^{(2)}] + \partial_x D^{(0)} = 0, \quad (3.7)$$

which involves the unknowns $D^{(2)}, D^{(1)}$, and $D^{(-1)}$. Moreover, the lower graded eqns.,

$$[A^{(-1)}, D^{(-n)}] + [A^{(-2)}, D^{(-n+1)}] + \cdots + [A^{(-n)}, D^{(-1)}] = 0, \quad (3.8)$$
$$[A^{(-2)}, D^{(-n)}] + [A^{(-3)}, D^{(-n+1)}] + \cdots + [A^{(-n)}, D^{(-2)}] = 0, \quad (3.9)$$

$$\vdots$$

$$[A^{(-n)}, D^{(-n+1)}] + [A^{(-n+1)}, D^{(-n)}] = 0, \quad (3.10)$$
$$[A^{(-n)}, D^{(-n)}] = 0. \quad (3.11)$$

involves the unknowns $D^{(-1)}_K, \ldots, D^{(-n)}$. Together they lead to the time evolution eqns.

$$\partial_{t_2} A^{(-1)} = [E^{(1)}, D^{(-2)}] + [A^{(-1)}, D^{(0)}] + [A^{(-2)}, D^{(1)}] + [A^{(-3)}, D^{(2)}] + \partial_x D^{(-1)}, \quad (3.12)$$
$$\partial_{t_2} A^{(-2)} = [E^{(1)}, D^{(-3)}] + [A^{(-1)}, D^{(-1)}] + [A^{(-4)}, D^{(2)}] + \partial_x D^{(-2)}, \quad (3.13)$$
$$\vdots$$
$$\partial_{t_2} A^{(-n)} = [A^{(-1)}, D^{(-n+1)}] + [A^{(-2)}, D^{(-n+2)}] + \cdots + [A^{(-n)}, D^{(0)}] + \partial_x D^{(-n)}. \quad (3.14)$$

In order to obtain the time evolution eqns. (3.12)-(3.14) we need to solve eqns. (3.4)-(3.7) for $D^{(2)}, D^{(1)}, D^{(0)}, D^{(-1)}_M$ and (3.8)-(3.11) for $D^{(-1)}_K, D^{(-2)}, \ldots, D^{(-n)}$. Let us start from (3.4) which coincides with (2.7) for $N = 2$ and yields $D^{(2)} = D^{(2)}_K \in K$ given by (2.10).
Notice that since \(^5\) \([E^{(1)}, D^{(1)}] \in \mathcal{M}\), eqn. (3.5) imply that \(\partial_x(a_2) = 0\), \(D^{(1)}_\mathcal{M} = 0\) and henceforth \(D^{(1)} = D^{(1)}_\mathcal{K} \in \hat{\mathcal{K}}\), i.e.,

\[
D^{(1)} = a_1 \left( E^{(0)}_{\alpha_1} + E^{(0)}_{\alpha_2} + \cdots + E^{(0)}_{\alpha_n} + E^{(1)}_{-(\alpha_1 + \cdots + \alpha_n)} \right)
\]  

(3.15)

Eqn (3.6) imply that

\[
\partial_x a_1 = 0, \quad [E^{(1)}, D^{(0)}_\mathcal{M}] + [A^{(-1)}, D^{(2)}_\mathcal{K}] = 0
\]  

(3.16)

and we shall take \(a_1 = 0\) and \(a_2 = 1\). Inserting \(A^{(-1)} = J_1 E^{(0)}_{-\alpha_n}\) and \(D^{(0)} = \sum_{i=1}^n d_i (\mu_i \cdot H^{(0)})\) we find

\[
D^{(0)} = -J_1 \left( \mu_{n-1} \cdot H^{(0)} \right),
\]  

(3.17)

where \(\mu_{n-1}\) is the \((n - 1)\)-th fundamental weight of \(A_n\), i.e.,

\[
\mu_{n-1} = \sum_{i=1}^{n-1} \left( \frac{2i}{n+1} \right) \alpha_i + \left( \frac{n-1}{n+1} \right) \alpha_n,
\]  

(3.18)

where \(\alpha_j, j = 1, \cdots n\) are simple roots of \(A_n\). Following the same philosophy, we find from (3.7) that

\[
D^{(-1)}_{\mathcal{M}} = \sum_{i=1}^{n-2} \frac{2i}{n+1} \partial_x J_1 E^{(0)}_{-\alpha_i} + \left( \frac{n-1}{n+1} \partial_x J_1 + J_2 \right) E^{(0)}_{-\alpha_{n-1}} + \left( \frac{n-1}{n+1} \partial_x J_1 + J_2 \right) E^{(0)}_{-\alpha_n}
\]  

(3.19)

In order to solve eqns. (3.8)-(3.11) we propose a general solution for \(D^{(-i)}, i = 1, \ldots, n\) by assigning to them only negative step operators (lower diagonal) of grade \(-i\) as follows,

\[
D^{(-n)} = b^{(-n)}_1 E^{(0)}_{-(\alpha_1 + \cdots + \alpha_n)},
\]

\[
D^{(-n+1)} = b^{(-n+1)}_1 E^{(0)}_{-(\alpha_1 + \cdots + \alpha_{n-1})} + b^{(-n+1)}_2 E^{(0)}_{-(\alpha_2 + \cdots + \alpha_n)},
\]

\[
\vdots
\]

\[
D^{(-1)} = b^{(-1)}_1 E^{(0)}_{-\alpha_1} + b^{(-1)}_2 E^{(0)}_{-\alpha_2} + \cdots + b^{(-1)}_n E^{(0)}_{-\alpha_n}
\]  

(3.20)

where \(b^{(-i)}_k\) are coefficients to be determined by eqns. (3.12)-(3.14).

In order to illustrate our formulation consider the following explicit examples,
\( \mathcal{G} = sl(3), \quad n = 2 \)

\[
\begin{align*}
D^{(0)} &= -J_1 \left( \frac{2}{3} h_1^{(0)} + \frac{1}{3} h_2^{(0)} \right), \\
D^{(-1)} &= (J_2 + \frac{1}{3} \partial_x J_1) E_{-\alpha_1}^{(0)} + (J_2 + \frac{1}{3} \partial_x J_1) E_{-\alpha_2}^{(0)}. 
\end{align*}
\]

(3.21)

Eqns. (3.12) and (3.13) give rise to

\[
D^{(-2)} = -\left( \frac{2}{3} \partial_x^2 J_1 + \partial_x J_2 \right) E_{-\alpha_1 - \alpha_2}^{(0)} 
\]

(3.22)

and respectively to the following eqns. of motion

\[
\begin{align*}
\partial_{t_2} J_1 &= \partial_x^2 J_1 + 2 \partial_x J_2, \\
\partial_{t_2} J_2 &= -\frac{1}{3} \left( 2 \partial_x^2 J_1 + 3 \partial_x^2 J_2 - 2 J_1 \partial_x J_1 \right). 
\end{align*}
\]

(3.23)

Likewise, (3.12) and (3.13) yields,

\[
\begin{align*}
D^{(-2)} &= \left( \frac{1}{2} \partial_x^2 J_1 + J_3 \right) E_{-\alpha_1 - \alpha_2}^{(0)} + \left( \frac{3}{2} \partial_x^2 J_1 - \partial_x J_2 + J_3 \right) E_{-\alpha_2 - \alpha_3}^{(0)}, \\
D^{(-3)} &= \left( \frac{1}{2} \partial_x^3 J_1 - \partial_x J_3 \right) E_{-\alpha_1 - \alpha_2 - \alpha_3}^{(0)} 
\end{align*}
\]

(3.26)

and the eqns. of motion

\[
\begin{align*}
\partial_{t_2} J_1 &= 2 \left( \partial_x^2 J_1 + \partial_x J_2 \right), \\
\partial_{t_2} J_2 &= \left( -2 \partial_x^2 J_1 - \partial_x^2 J_2 + J_1 \partial_x J_1 + 2 \partial_x J_3 \right), \\
\partial_{t_2} J_3 &= \frac{1}{2} \left( \partial_x^3 J_1 - J_1 \partial_x^2 J_1 - 2 \partial_x^2 J_3 + J_2 \partial_x J_1 \right). 
\end{align*}
\]

(3.27)

\section{Miura Transformation}

In this section we propose a Miura-gauge transformation \( S \) to connect the two gauge potentials \( A_x^{mKdV} \) and \( A_x^{KdV} \) as,

\[
A_x^{KdV} = S A_x^{mKdV} S^{-1} + S \partial_x S^{-1} 
\]

(4.1)

where

\[
A_x^{mKdV} = E^{(1)} + \sum_{i=1}^{n} v_i h_i, \quad A_x^{KdV} = E^{(1)} + \sum_{j=1}^{n} J_{n+1-j} E_{-(\alpha_i+\alpha_{i+1}+\cdots+\alpha_n)}. 
\]

(4.2)
The first thing to notice is that both potentials in (4.2) are defined according to the same Lie algebraic structure, i.e., principal gradation, \(Q^{ppal}\) and share the same constant, grade one semi-simple element \(E^{(1)}\) given in (2.3) (see app. A). The desired Miura-gauge transformation \(S\) is then constructed to preserves such structure.

Let us recall the \(sl(2)\) case where the Miura transformation \(J = \epsilon \partial_x v - v^2\), \(\epsilon = \pm 1\) connects the KdV and mKdV equations, i.e.,

\[
4 \partial_t J - \partial_x^2 J - 6 \partial_x J = \mathcal{P}_\epsilon \left(4 \partial_t v - \partial_x(\partial_x^2 v - 2v^3)\right) = 0, \quad \mathcal{P}_\epsilon = (\epsilon \partial_x - 2v)
\]

(4.3)

In fact, in ref. [7] we have constructed two solutions for the Miura-gauge transformation (4.1), namely,

\[
\begin{align*}
S_{\epsilon = 1} &= I + s^{(-1)} = \begin{pmatrix} 1 & 0 \\ v & 1 \end{pmatrix} & S_{\epsilon = -1} &= E^{(-1)} + s^{(-2)} = \begin{pmatrix} 0 & \lambda^{-1} \\ 1 & -\lambda^{-1}v \end{pmatrix}
\end{align*}
\]

(4.4)

where \(s^{(-i)} \in \mathcal{G}_{-i}\) and \(E^{(-1)} = E_{-\alpha_1} + \lambda^{-1}E_{\alpha_1} = \begin{pmatrix} 0 & \lambda^{-1} \\ 1 & 0 \end{pmatrix}\) corresponding to \(\epsilon = +1\) and \(\epsilon = -1\) respectively.

Likewise the \(sl(2)\) case (4.4), we now consider \(\mathcal{G} = sl(3)\) where \(E \equiv E^{(1)} = E_{\alpha_1} + E_{\alpha_2} + \lambda E_{-\alpha_1 - \alpha_2} = \begin{pmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ \lambda & 0 & 0 \end{pmatrix}\), and propose three solutions for \(S\) satisfying (4.1),

\[
S_1 = I + s^{(-1)} + s^{(-2)} = \begin{pmatrix} 1 & 0 & 0 \\ v_1 & 1 & 0 \\ v_1^2 - \partial_x v_1 & v_2 & 1 \end{pmatrix}
\]

(4.5)

leading to the Miura transformation

\[
\begin{align*}
J_1^{(1)} &= -\partial_x(v_1 + v_2) + v_1^2 - v_1v_2 + v_2^2 \\
J_2^{(1)} &= v_1\partial_x(-2v_1 + v_2) + \partial_x^2 v_1 + v_1^2 v_2 - v_1v_2^2.
\end{align*}
\]

(4.6)

The second solution is given by

\[
S_2 = E^{(-1)} + s^{(-2)} + s^{(-3)} = \begin{pmatrix} 0 & 0 & \lambda^{-1} \\ 1 & 0 & -\lambda^{-1}v_2 \\ v_1 - v_2 & 1 & \lambda^{-1}(v_2^2 + \partial_x v_2) \end{pmatrix}
\]

(4.7)

for \(E^{(-1)} = E^1 = E_{-\alpha_1} + E_{-\alpha_2} + \lambda^{-1}E_{\alpha_1 + \alpha_2} = \begin{pmatrix} 0 & 0 & \lambda^{-1} \\ 1 & 0 & 0 \\ 0 & 1 & 0 \end{pmatrix}\), which leads to the Miura transformation

\[
\begin{align*}
J_1^{(2)} &= -\partial_x(v_1 - 2v_2) + v_2^2 - v_1v_2 + v_2^2 \\
J_2^{(2)} &= -v_2\partial_x(v_1 + v_2) - \partial_x^2 v_2 + v_1^2v_2 - v_1v_2^2.
\end{align*}
\]

(4.8)

A third solution is given by

\[
S_3 = E^{(-2)} + s^{(-3)} + s^{(-4)} = \begin{pmatrix} 0 & \lambda^{-1} \\ 0 & \lambda^{-1}(-v_1 + v_2) & \lambda^{-1} \\ 1 & \lambda^{-1}A & -\lambda^{-1}v_1 \end{pmatrix}
\]

(4.9)
where the matrix operator 

\[
\begin{pmatrix}
0 & \lambda^{-1} \\
0 & 0 \\
1 & 0
\end{pmatrix},
\]

and

\[A = \partial_x(v_1 - v_2) + (v_1 - v_2)^2\]

leading to the Miura transformation

\[
\begin{align*}
J_1^{(3)} &= 2\partial_xv_1 - \partial_xv_2 + v_1^2 - v_1v_2 + v_2^2, \\
J_2^{(3)} &= (-v_1 + v_2)\partial_xv_1 + 2(v_1 - v_2)\partial_xv_2 + \partial_x^2(-v_1 + v_2) + v_1^2v_2 - v_1v_2^2.
\end{align*}
\]

In the appendix B we develop the example for \(G = sl(4)\) by constructing 4 solutions for the Miura-gauge transformation (4.1) and notice a general pattern emerging that induces to the following general proposition for the sl\((n + 1)\) case,

- Given \(E^{(1)} = \sum_{j=1}^{n} E_{\alpha_j} + \lambda E_{-(\alpha_1 + \cdots + \alpha_n)}\), there are \(n\) generators of grade \(q = -1, -2, \ldots, -n\) commuting with \(E^{(1)}\), namely, \(\{E^{(-1)}, E^{(-2)}, \ldots, E^{(-n)}\} \in \hat{K}\) (see for instance appendix of ref.[3]).

- Propose solution \(S_i = E^{(-i)} + s^{(-i-1)} + s^{(-i-2)} + \cdots + s^{(-i-n)}\), \(i = 0, 1, \ldots, n\) where \(E^{(0)} = I\) and \(S_{i+n+1} = \lambda S_i\) such that the algebraic structure of gauge potentials (4.2) is preserved \(^6\).

- Each solution generates a Miura transformation \(J_a^{(i)}, a = 1, \ldots, n + 1\).

## 5 Equations of Motion

We now conjecture that the equations of motion of the two hierarchies are connected as in the well known case of the \(A_2\) KdV and mKdV equations (4.3). In fact, we argue that the equations of motion of the generalized \(A_n\) mKdV and KdV hierarchies are related by a matrix operator \(P\), as \([KdV(J_i)] = P [mKdv(v_i)]\), or in components,

\[
\begin{pmatrix}
\partial_t J_1 \\
\partial_t J_2 \\
\vdots \\
\partial_t J_n
\end{pmatrix} = P
\begin{pmatrix}
\partial_t v_1 \\
\partial_t v_2 \\
\vdots \\
\partial_t v_n
\end{pmatrix}
\]

(5.1)

where the matrix operator \(P\) is denoted \(P_{ij}\).

Explicitly we have considered the equations of motion (2.18) and (3.24) for \(sl(3)\) written in the form (5.1) as

\[
\begin{pmatrix}
\partial_t J_1 \\
\partial_t J_2
\end{pmatrix} = P
\begin{pmatrix}
\partial_t v_1 \\
\partial_t v_2
\end{pmatrix}
\]

(5.2)

It is clear that there is a different \(P\) operator associated to each solution of the Miura-Gauge transformation (4.1).

- For \(S_1\) (4.5) and Miura (4.6),

\[
\begin{align*}
P_{11}^{(1)} &= -\partial_x + 2v_1 - v_2, \\
P_{12}^{(1)} &= -\partial_x - v_1 + 2v_2, \\
P_{21}^{(1)} &= \partial_x^2 - 2v_1\partial_x - 2\partial_xv_1 + \partial_xv_2 + 2v_1v_2 - 2v_2^2, \\
P_{22}^{(1)} &= v_1\partial_x - 2v_1v_2 + v_2^2.
\end{align*}
\]

(5.3)

\(^6\)It is clear that \(S\) contains a highest grade component commuting with \(E^{(1)}\) in order to preserve the common graded structure the two gauge potentials \(A^{KdV}_x\) and \(A^{mKdV}_x\).
• Likewise for the Miura-gauge transformation $S_2$ (4.7) and Miura (4.8),

\[
\begin{align*}
F_{11}^{(2)} &= -\partial_x + 2v_1 - v_2, \\
F_{12}^{(2)} &= 2\partial_x - v_1 + 2v_2, \\
F_{21}^{(2)} &= -v_2\partial_x + 2v_1v_2 - v_2^2, \\
F_{22}^{(2)} &= -\partial_x^2 - v_2\partial_x - \partial_x v_1 - \partial_x v_2 - 2v_1v_2 + v_1^2. 
\end{align*} 
\tag{5.4}
\]

• For $S_3$ given in (4.9) and Miura (4.10),

\[
\begin{align*}
F_{11}^{(3)} &= 2\partial_x + 2v_1 - v_2, \\
F_{12}^{(3)} &= -\partial_x - v_1 + 2v_2, \\
F_{21}^{(3)} &= -\partial_x^2 - v_2\partial_x + v_2\partial_x - \partial_x v_1 + 2\partial_x v_2 + 2v_1v_2 - v_2^2, \\
F_{22}^{(3)} &= \partial_x^2 + 2v_1\partial_x - 2v_2\partial_x + \partial_x v_1 - 2\partial_x v_2 + v_1^2 - 2v_1v_2. 
\end{align*} 
\tag{5.5}
\]

For the $sl(4)$ case the same procedure can be employed for each associated Miura-gauge transformation given in appendix B.

6 Bäcklund Transformation

In this section we generalize the results of ref. [7] by constructing the Bäcklund transformation for the $A_n$-KdV hierarchy from the Miura and Bäcklund-gauge transformations constructed for the $A_n$-mKdV hierarchy. Consider the Bäcklund-gauge transformation for the $A_n$-mKdV hierarchy proposed in [8],

\[
U(\phi_i, \psi_i)A_\mu^{m\text{KdV}}(\phi_i) = A_\mu^{m\text{KdV}}(\psi_i)U(\phi_i, \psi_i) + \partial_\mu U(\phi_i, \psi_i) 
\tag{6.1}
\]

where $u_i = \partial_x \phi_i, \ v_i = \partial_x \psi_i$. Also, the Miura-gauge transformation can be written as,

\[
A_\mu^{\text{KdV}}(J_i) = SA_\mu^{m\text{KdV}}(v_i)S^{-1} + S\partial_\mu S^{-1}. 
\tag{6.2}
\]

Let $K(I, J)$ be the generator of the Bäcklund-gauge transformation for the $A_n$-KdV hierarchy, i.e.,

\[
K(I_i, J_i)A_\mu^{K\text{dV}}(I_i) = A_\mu^{K\text{dV}}(J_i)K(I_i, J_i) + \partial_\mu K(I_i, J_i) 
\tag{6.3}
\]

Inserting (6.2) into (6.1), we find

\[
K(I_i, J_i) = S(v_i)U(\phi_i, \psi_i)S^{-1}(u_i) 
\tag{6.4}
\]

Notice that $K(I_i, J_i)$ given in (6.4) depend upon mKdV variables $u_i$ and $v_i$. In ref. [7] we have shown that the gauge-Bäcklund transformation $K(I_i, J_i)$ was entirely written in terms of KdV variables $I$ and $J$ if we use two different Miura gauge transformations, for the right $S(u) = S_{+\epsilon}$ and for the left $S(v)^{-1} = S_{-\epsilon}^{-1}$ multiplications (see (4.4)). Here we will follow the same principle by choosing different $S$ solutions for right and left multiplication in (6.4).

Bäcklund transformation for the $A_n$ Toda theory was first proposed in [17] and in [8], it was generalized as a gauge transformation constructed and classified according to a graded affine Lie
We now show how to re-write the Bäcklund matrix $K$ elements, in the sense that it is same for all positive and negative flows.

Consider the type I Bäcklund-gauge transformation for $sl(3)$ mKdV hierarchy (see for instance [8]),

$$U(\phi_1, \psi_1) = \begin{pmatrix} 1 & 0 & e^{-\phi_2 - \psi_1} \\ \sigma e^{\phi_1 + \psi_1 - \psi_2} & 1 & 0 \\ 0 & \sigma e^{-\phi_1 + \phi_2 + \psi_2} & 1 \end{pmatrix}$$  \hspace{1cm} (6.5)

which yield the following equations corresponding to the mKdV Bäcklund transformation,

$$u_1 - v_1 = \sigma \left( e^{\phi_1 + \psi_1 - \psi_2} - e^{-\phi_2 - \psi_1} \right), \quad u_2 - v_2 = \sigma \left( e^{-\phi_1 + \phi_2 + \psi_2} - e^{-\phi_2 - \psi_1} \right)$$  \hspace{1cm} (6.6)

where $u_i = \partial_x \phi_i, \quad v_i = \partial_x \psi_i, \quad i = 1, 2$ and take the two solutions $S_1(u_i)$ and $S_3(v_i)$ given by (4.5) and (4.9) to be inserted as right and left multiplications in (6.4) yielding the following matrix elements,

$$K_{11} = (-u_1 + \sigma e^{\phi_1 + \psi_1 - \psi_2})\lambda^{-1}$$  \hspace{1cm} (6.7)

$$K_{22} = (-u_2 - v_1 + v_2 + \sigma e^{-\phi_1 + \phi_2 + \psi_2})\lambda^{-1}$$  \hspace{1cm} (6.8)

$$K_{33} = (-v_1 + \sigma e^{-\phi_2 - \psi_1})\lambda^{-1}$$  \hspace{1cm} (6.9)

$$K_{12} = K_{23} = \lambda^{-1}$$  \hspace{1cm} (6.10)

$$K_{31} = 1 + Y\lambda^{-1}$$  \hspace{1cm} (6.11)

$$K_{13} = 0$$  \hspace{1cm} (6.12)

$$K_{21} = \left( \partial_x u_1 - u_1^2 + u_1 u_2 + u_1 \sigma e^{-\phi_1 + \phi_2 + \psi_2} - (v_1 - v_2)(u_1 + \sigma e^{\phi_1 + \psi_1 - \psi_2}) \right)\lambda^{-1}$$  \hspace{1cm} (6.13)

$$K_{32} = \left( \partial_x v_1 - \partial_x v_2 + v_1^2 + v_2^2 - 2v_1 v_2 + u_2 v_1 - u_2 \sigma e^{-\phi_2 - \psi_1} - v_1 \sigma e^{-\phi_1 + \phi_2 + \psi_2} \right)\lambda^{-1}$$  \hspace{1cm} (6.14)

where

$$Y = u_1 v_1 \sigma e^{-\phi_1 + \phi_2 + \psi_2} + (\partial_x u_1 - u_1^2 + u_1 u_2)(-v_1 + \sigma e^{-\phi_2 - \psi_1}) + (\partial_x v_1 - \partial_x v_2 + v_1^2 + v_2^2 - 2v_1 v_2)(-u_1 + \sigma e^{\phi_1 + \psi_1 - \psi_2})$$  \hspace{1cm} (6.15)

We now show how to re-write the Bäcklund matrix $K(I_i, J_i)$ in KdV variables. Subtracting the diagonal terms and using (6.6),

$$K_{11} - K_{22} = (-u_1 + v_1 + u_2 - v_2 + \sigma e^{\phi_1 + \psi_1 - \psi_2} - \sigma e^{-\phi_1 + \phi_2 + \psi_2})\lambda^{-1} = 0$$  \hspace{1cm} (6.16)

$$K_{22} - K_{33} = (-u_2 + v_2 + \sigma e^{-\phi_1 + \phi_2 + \psi_2} - \sigma e^{-\phi_2 - \psi_1})\lambda^{-1} = 0$$  \hspace{1cm} (6.17)

and henceforth

$$K_{11} = K_{22} = K_{33} \equiv \frac{1}{3} Q\lambda^{-1}.$$  \hspace{1cm} (6.18)

Acting with $x$ derivative on $Q$ and re-arranging terms,

$$\partial_x Q = \lambda \partial_x (K_{11} + K_{22} + K_{33})$$

$$= \partial_x (-u_1 - u_2 - 2v_1 + v_2) + u_1 \sigma (e^{\phi_1 + \psi_1 - \psi_2} - e^{-\phi_1 + \phi_2 + \psi_2})$$

$$+ u_2 \sigma (e^{-\phi_1 + \phi_2 + \psi_2} - e^{-\phi_2 - \psi_1}) + v_1 \sigma (e^{\phi_1 + \psi_1 - \psi_2} - e^{-\phi_2 - \psi_1}) + v_2 \sigma (e^{-\phi_1 + \phi_2 + \psi_2} - e^{\phi_1 + \psi_1 - \psi_2}).$$

---

7Observe that the relativistic Toda model correspond to the first negative flow [18]
After eliminating the exponentials from the mKdV Bäcklund transformations (6.6) and subsequent use of Miura transformations (4.6) and (4.10), i.e.,

\[
I_1(u_i) = J_1^{(1)}(u_i) = -\partial_x u_1 - \partial_x u_2 + u_1^2 + u_2^2 - u_1 u_2 \quad (6.19)
\]

\[
J_1(v_i) = J_1^{(3)}(v_i) = 2\partial_x v_1 - \partial_x v_2 + v_1^2 + v_2^2 - v_1 v_2 \quad (6.20)
\]

we find,

\[
\partial_x Q = I_1 - J_1. \quad (6.21)
\]

The \( K_{21} \) matrix element also can be written interely in terms of KdV variables, e.g., replacing the \( \partial_x u_1 \) term using (6.7),

\[
\lambda K_{21} = -\frac{1}{3} \partial_x Q + u_1 \sigma (e^{\phi_1 + \psi_1 - \psi_2} - e^{-\phi_1 + \phi_2 + \psi_2}) - u_1 (u_1 - u_2 - v_1 + v_2)
\]

\[
= -\frac{1}{3} \partial_x Q
\]

where we have used (6.6). Likewise, using the Miura transformation (6.20) in (6.14) and then replacing the remaining \( \partial_x v_1 \) using (6.9) we find,

\[
\lambda K_{32} = J_1 - \partial_x v_1 - v_1 v_2 + u_2 v_1 - u_2 \sigma e^{-\phi_2 - \psi_1} - v_1 \sigma e^{-\phi_1 + \phi_2 + \psi_2}
\]

\[
= J_1 + \frac{1}{3} \partial_x Q + v_1 \sigma (e^{-\phi_2 - \psi_1} - e^{-\phi_1 + \phi_2 + \psi_2}) + v_2 (u_2 - v_2) = J_1 + \frac{1}{3} \partial_x Q
\]

where we have used (6.6) to eliminate the exponentials. Finally doing the same procedure for (6.11) we find

\[
K_{31} = 1 + \frac{Y}{\lambda} \quad (6.22)
\]

where \( Y = \sigma^3 - \frac{Q^3}{3} + \frac{1}{3} Q J_1 \) and

\[
K(I, J) = \left(\begin{array}{ccc}
\frac{1}{3} Q & \frac{1}{\lambda} & 0 \\
-\frac{1}{3} (I_1 - J_1) & \frac{1}{3} Q & \frac{1}{\lambda} \\
1 + \frac{Y}{\lambda} & \frac{1}{3} (J_1 + 2 J_1) & \frac{1}{3} Q
\end{array}\right). \quad (6.23)
\]

It can be verified that \( det K = \frac{1}{\lambda} + \frac{\sigma^3}{\lambda^2} \).

We have verified that the very same argument follows if we instead of the pair \( S_2(v_i) \) and \( S_1^{-1}(u_i) \), use in (6.4) \( S_1(v_i) \) and \( S_2^{-1}(u_i) \). The resulting Bäcklund-gauge transformation \( K \) for the KdV hierarchy has the same form as (6.23) but now written in terms of the corresponding Miura fields given in (4.6) and (4.8) and so is the resulting Bäcklund-gauge generator for the remaining pair \( S_2, S_3 \).

Let us now write down explicit Bäcklund transformation for the \( A_2 \)-mKdV system. Employing the gauge-Bäcklund transformation (6.23) in (6.3) where gauge potentials \( A_{u}^{KdV} \) are given by,

\[
A_{x}^{KdV} = \left(\begin{array}{ccc}
0 & 1 & 0 \\
0 & 0 & 1 \\
\lambda + J_2 & J_1 & 0
\end{array}\right), \quad A_{t}^{KdV} = \left(\begin{array}{ccc}
-\frac{2 J_1}{3} & 0 & 1 \\
\lambda + \frac{2}{3} \partial_x J_1 + J_2 & \frac{J_1}{3} & 0 \\
-\frac{2}{3} \partial_x^2 J_1 - \partial_x J_2 & \lambda + \frac{2}{3} \partial_x J_1 + J_2 & \frac{J_1}{3}
\end{array}\right). \quad (6.24)
\]
The nontrivial equations obtained from (6.3) for $A^K_{t\bar{d}V}$ are

\begin{align}
I_2 - J_2 &= \partial_x J_1 - \frac{1}{3}(I_1 - J_1)Q \\
\partial_x (I_1 - J_1) &= -3J_2 + J_1Q - \frac{1}{9}Q^3 + 3\sigma^3 \\
\partial_x (I_1 + 2J_1) &= -3J_2 + I_1Q - \frac{1}{9}Q^3 + 3\sigma^3
\end{align}

which are compatible in the sense that a linear combination of any two yields the third. Those correspond to matrix elements (3, 1), (2, 1) and (3, 2) respectively.

As for the $A^K_t$ potential, the nontrivial eqns. corresponding to matrix diagonal elements are,

\begin{align}
\partial_t Q &= 2\partial_x I_1 + 3I_2 - I_1Q + \frac{1}{3}Q(I_1 - J_1) + \frac{1}{9}Q^3 - 3\sigma^3, \\
\partial_t Q &= \partial_x (I_1 - 2J_1) + 3(I_2 - J_2) + \frac{1}{3}(I_1 - J_1)Q, \\
\partial_t Q &= -\partial_x J_1 - 3J_2 + J_1Q + \frac{1}{3}Q(I_1 - J_1) - \frac{1}{9}Q^3 + 3\sigma^3.
\end{align}

Other nontrivial eqns. are,

\begin{align}
3\partial_x (I_1 - J_1) &= 6\partial_x^2 I_1 + 9\partial_x I_2 - 2I_1^2 + J_1^2 + I_1J_1 - (2\partial_x (I_1 - J_1) + 3(I_2 - J_2))Q, \tag{6.31} \\
3\partial_x (I_1 + 2J_1) &= 6\partial_x^2 J_1 + 9\partial_x J_2 + I_1^2 - 2J_1^2 + I_1J_1 + (\partial_x (I_1 - J_1) + 3(I_2 - J_2))Q, \tag{6.32}
\end{align}

\begin{align}
\partial_t \left( -\frac{Q^3}{27} + \frac{1}{3}Q J_1 \right) &= \frac{1}{9} \left( J_1 \left( \partial_x (4I_1 - J_1) + 6I_2 - 3J_2 - 2I_1Q + \frac{Q^3}{9} - 3\sigma^3 \right) \\
&+ I_1 \left( \partial_x (2I_1 + J_1) + 3I_2 + 3J_2 + \frac{2Q^3}{9} - 6\sigma^3 \right) \right) \\
&+ Q \partial_x \left( -3I_2 + 3J_2 - 2\partial_x I_1 + 2\partial_x J_1 - J_1^2 Q \right)
\end{align}

and correspond to matrix elements (2, 1), (3, 2) and (3, 1) respectively.

Subtracting (6.28) - (6.29) and (6.29) - (6.30) we eliminate $\partial_t Q$ and recover (6.27) and (6.26) respectively. Moreover, substituting (6.25) in (6.29) we find

\begin{align}
\partial_t Q &= \partial_x (I_1 - J_1) + 2(I_2 - J_2), \tag{6.34}
\end{align}

which leads directly to the eqns. of motion (3.23) for $I_1$ and $J_1$ by acting with $\partial_x$ in (6.34), i.e.,

\begin{align}
\partial_t (I_1 - J_1) = \partial_x^2 (I_1 - J_1) + 2\partial_x (I_2 - J_2). \tag{6.35}
\end{align}

Subtracting (6.32) and (6.31) we find

\begin{align}
3\partial_x J_1 &= -2\partial_x^2 (I_1 - J_1) - 3\partial_x (I_2 - J_2) + (I_1^2 - J_1^2) + (\partial_x (I_1 - J_1) + 2(I_2 - J_2))Q \tag{6.36}
\end{align}

Acting with $\partial_t$ on eqn. (6.25) and using the fact that $\partial_x Q = I_1 - J_1$,

\begin{align}
3\partial_t (I_2 - J_2) &= \partial_x (3\partial_x J_1 - Q\partial_t Q) \\
&= \partial_x \left( Q(- (I_2 - J_2) + \partial_x J_1 - \frac{1}{3}(I_1 - J_1)Q) \right) \\
&+ \partial_x \left( -2\partial_x^2 (I_1 - J_1) - 3\partial_x (I_2 - J_2) + (I_1^2 - J_1^2) \right)
\end{align}

where we have used (6.36) and substituted $\partial_t Q$ using (6.29). After making use of (6.25) to eliminate the first term (proportional to $Q$) we end up with the equation of motion for $I_2$ and $J_2$ (3.24), i.e.,

\begin{align}
\partial_t (I_2 - J_2) &= -\frac{1}{3} \partial_x \left( 2\partial_x^2 (I_1 - J_1) + 3\partial_x (I_2 - J_2) - (I_1^2 - J_1^2) \right) \tag{6.37}
\end{align}

13
7 Discussion and Further Developments

The gauge invariance of zero curvature representation was exploited in order to map the $A_n$-mKdV hierarchy into its counterpart, the $A_n$-KdV hierarchy. Such map is known as generalized Miura-gauge transformation and is generated by a gauge transformation denoted by $S$. We have shown by developing explicit examples, that $S$ has the virtue of preserving the algebraic structure of the Lax operators (i.e., two dimensional gauge potentials $A^m_{\mu}K^{dV}$ and $A^K_{\mu}dV$). An interesting discovery is that $S$ is not unique, as it was already been suggested from the well known $sl(2)$ example (4.3) in which the Miura transformation is two-fold degenerated, parametrized by $\epsilon = \pm 1$. The $A_n$-Miura-gauge transformation present a $n+1$ degeneracy and was shown to be classified according to the elements of the Kernel of $E(1), \hat{K}$, supplemented with the identity element $I$. The role of the subgroup of transformations generated by such subset of generators is still not entirely clear and is currently under investigation.

The Bäcklund transformation for the KdV hierarchy, in turn was inherited from the gauge-Bäcklund transformation for the mKdV hierarchy by left-right multiplication by Miura-gauge generators as in (6.4), i.e., $K(J,I) = S(I)U(\phi,\psi)S^{-1}(J)$.

A surprising feature of the construction, is a nontrivial change of mKdV to KdV variables $(\phi,\psi) \rightarrow (J,I)$ which was shown to be possible if the left and right Miura transformations appearing in (6.4) correspond to different degenerate solutions associated to $\hat{K}$. Such fact was already realised for the $sl(2)$ case in [7] and was explicitly verified for several combinations of Miura solutions for $sl(3)$ example.

As a matter of fact, the resulting gauge Bäcklund transformation was entirely written in terms of KdV variables and appears as an universal object within the hierarchy, in the sense that it is the same for all flows. As a byproduct, it generates, in a systematic manner, the Bäcklund transformation for all flows. Moreover, this method provides a classification of integrable defects as proposed in [11] and may also be extended to other generalized type II Bäcklund transformations from mKdV to KdV hierarchies [8]. The framework employed in this paper may be also extended to Lie algebras other than $A_n$, whose Dynkin diagram may connect more than two nearest neighbours, e.g., $B_4, E_6, E_7, E_8$ in the line of ref. [20] or to non-simply laced algebras. Application to twisted algebras may also provide interesting examples in the lines of ref. [21].

A Affine Algebraic Structure

Consider an affine Kac-Moody algebra $\hat{G}$ defined by

$$\left[H^{(m)}_i, H^{(n)}_j\right] = \kappa m \delta_{m+n,0} \delta_{i,j}$$
$$\left[H^{(m)}_i, E^{(n)}_\alpha\right] = \alpha^i E^{(m+n)}_\alpha$$
$$\left[E^{(m)}_\beta, E^{(n)}_\alpha\right] = \begin{cases} \epsilon(\alpha, \beta) E^{(m+n)}_\alpha & \alpha + \beta = \text{root}, \\ \frac{2}{\alpha \cdot \beta} H^{(m+n)} + \kappa m \delta_{m+n,0} & \alpha + \beta = 0, \\ 0 & \text{otherwise}. \end{cases}$$
Let $Q$ be a grading operator and consider a decomposition of the affine algebra $\hat{G}$ into grades subspaces, $\mathcal{G}_g$ such that,

$$\hat{G} = \sum_{a \in \mathbb{Z}} \mathcal{G}_a, \quad [Q, \mathcal{G}_a] = a \mathcal{G}_a, \quad [\mathcal{G}_a, \mathcal{G}_b] \in \mathcal{G}_{a+b} \quad (A.1)$$

In this paper we shall discuss $\hat{G} = \mathfrak{sl}(n+1)$ endowed with the principal gradation in which

$$Q^{\text{ppal}} = (n+1)d + \sum_{a=1}^n \mu_a \cdot h \quad (A.2)$$

where $d$ is the derivation operator, i.e.,

$$[d, T_i^{(m)}] = mT_i^{(m)}, \quad T_i^{(m)} = h_i^{(m)} \text{ or } E_\alpha^{(m)} \quad (A.3)$$

and

$$[\mu_a \cdot h_i^{(m)}, E_\alpha] = (\mu_a \cdot \alpha)E_\alpha. \quad (A.4)$$

Here $\mu_a$ and $\alpha_a$ are the fundamental weights and simple roots respectively, $\mu_a \cdot \alpha_b = \delta_{a,b}, \quad a, b = 1, \ldots, n$, and have normalized all roots of $\mathfrak{sl}(n+1)$ such that $\alpha^2 = 2$. The operator $Q$ in (A.2) induces the following graded subspaces,

$$\mathcal{G}_{m(n+1)} = \{h_1^{(m)}, \ldots, h_n^{(m)}\},$$

$$\mathcal{G}_{m(n+1)+1} = \{E_{\alpha_1}^{(m)}, \ldots, E_{\alpha_n}^{(m)}, E_{-\alpha_1-\cdots-\alpha_n}^{(m+1)}\},$$

$$\mathcal{G}_{m(n+1)+2} = \{E_{\alpha_1+\alpha_2}^{(m)}, E_{\alpha_2+\alpha_3}^{(m)}, \ldots, E_{-\alpha_1-\cdots-\alpha_{n-1}+\alpha_n}^{(m+1)}\},$$

$$\vdots$$

$$\mathcal{G}_{m(n+1)+n} = \{E_{-\alpha_1}^{(m+1)}, \ldots, E_{-\alpha_n}^{(m+1)}, E_{\alpha_1+\cdots+\alpha_n}^{(m)}\}. \quad (A.5)$$

where $h_i^{(m)} = \alpha_i \cdot H^{(m)}$.

Let $\hat{K}$ denote the Kernel of $E$ composed by all elements within each subspace of grade $q$ commuting with $E$ \footnote{In fact there are precisely $n$ generators commuting with $E$ of grade given by the exponents modulo the Coxeter number $h$ which in the $A_n$ case are $q = 1, \ldots, n$ modulo $n+1$}. In particular denote them by $E^{(-q)} \in \hat{K}, q = 1, \cdots n \mod (n+1)$, (see appendix of ref. [3]) e.g.,

$$E^{(-n)} = \sum_{k=1}^n E_{\alpha_k}^{(-1)} + E_{-(\alpha_1+\cdots+\alpha_n)}^{(0)},$$

$$E^{(-n+1)} = \sum_{k=1}^{n-1} E_{\alpha_k+\alpha_{k+1}}^{(-1)} + E_{-(\alpha_1+\cdots+\alpha_{n-1})}^{(0)} + E_{-(\alpha_2+\cdots+\alpha_n)}^{(0)},$$

$$\vdots$$

$$E^{(-1)} = \sum_{k=1}^n E_{-\alpha_k}^{(0)} + E_{-(\alpha_1+\cdots+\alpha_n)}^{(-1)}. \quad (A.6)$$
B Miura Transformation for sl(4) - Example

We now consider $\mathcal{G} = sl(4)$ where $E \equiv E^{(1)} = E_{\alpha_1} + E_{\alpha_2} + E_{\alpha_3} + \lambda E_{-\alpha_1 - \alpha_2 - \alpha_3}$ and propose 4 solutions for $S$ satisfying (4.1),

$$S_1 = I + s^{(-1)} + s^{(-2)} + s^{(-3)}$$

$$= \begin{pmatrix}
1 & 0 & 0 & 0 \\
v_1 & 1 & 0 & 0 \\
-\partial_x v_1 + v_1^2 & v_2 & 1 & 0 \\
\partial_x^2 v_1 - 3v_1 \partial_x v_1 + v_1^3 & -\partial_x v_1 - \partial_x v_2 + v_1^2 - v_1 v_2 + v_2^2 & v_3 & 1
\end{pmatrix} \quad (B.1)$$

leading to the Miura transformation

$$J_1^{(1)} = -\partial_x (v_1 + v_2 + v_3) + v_1^2 + v_2^2 + v_3^2 - v_1 v_2 - v_2 v_3,$$

$$J_2^{(1)} = \partial_x^2 (2v_1 + v_2) + (-4v_1 + v_2)(\partial_x v_1) + 2(v_1 - v_2)(\partial_x v_2) + v_2(\partial_x v_3) + v_1^2 v_2 - v_1 v_2^2 + v_2^2 v_3 - v_2 v_3^2,$$

$$J_3^{(1)} = -\partial_x^3 v_1 + v_1 \partial_x^2 (2v_1 - v_2) + v_1^2 (v_1 - v_2 - v_3)(\partial_x v_1) + (v_1^2 + v_2^2 - 2v_1 v_2 - v_2 v_3)(\partial_x v_1)$$

$$+ (-v_1^3 + v_1 v_2)(\partial_x v_2) + (v_1^2 - v_1 v_2)(\partial_x v_3) + v_1^2 v_2 v_3 - v_1 v_2 v_3^2 + v_1 v_2^2 v_3 + v_1 v_2 v_3^2 - v_1^2 v_3^2. \quad (B.2)$$

The second solution is given by

$$S_2 = E^{(-1)} + s^{(-2)} + s^{(-3)} + s^{(-4)}$$

$$= \begin{pmatrix}
0 & 0 & 0 & \lambda^{-1} \\
1 & 0 & 0 & -\lambda^{-1} v_3 \\
v_1 - v_3 & 1 & 0 & \lambda^{-1} (\partial_x v_3 + v_3^2) \\
-\partial_x v_1 + 2\partial_x v_3 + v_1^2 - v_1 v_3 + v_3^2 & v_2 - v_3 & 1 & -\lambda^{-1} (\partial_x^2 v_3 + 3v_3 \partial_x v_3 + v_3^2) \\
\end{pmatrix} \quad (B.3)$$

for $E^{(-1)} = E^t = E_{-\alpha_1} + E_{-\alpha_2} + E_{-\alpha_3} + \lambda^{-1} E_{\alpha_1 + \alpha_2 + \alpha_3}$, which leads to the Miura transformation

$$J_1^{(2)} = -\partial_x (v_1 + v_2 - 3v_3) + v_1^2 + v_2^2 + v_3^2 - v_1 v_2 - v_2 v_3,$$

$$J_2^{(2)} = \partial_x^2 (v_1 - 3v_3) - 2v_1 (\partial_x v_1) + (v_1 - v_3)(\partial_x v_2) - 2v_3 (\partial_x v_3) + v_1^2 v_2 - v_1 v_2^2 + v_2^2 v_3 - v_2 v_3^2,$$

$$J_3^{(2)} = \partial_x^3 v_3 + v_3 \partial_x^2 (v_1 + v_3) + \partial_x (v_1 + v_2)(\partial_x v_3) + (v_1^2 - 2v_1 v_3)(\partial_x v_1) + v_1 v_3 (\partial_x v_2)$$

$$+ (-v_1^3 - v_2^2 + v_1 v_2 + v_2 v_3)(\partial_x v_3) + v_1^2 v_2 v_3 - v_1 v_2^2 v_3 + v_1 v_2 v_3^2 - v_1^2 v_3^2. \quad (B.4)$$

A third solution is given by

$$S_3 = E^{(-2)} + s^{(-3)} + s^{(-4)} + s^{(-5)} = \begin{pmatrix}
0 & 0 & \lambda^{-1} \\
0 & 0 & \lambda^{-1} (v_3 - v_2) \\
1 & 0 & \lambda^{-1} s_{33} \\
v_1 - v_2 & 1 & \lambda^{-1} s_{43} \\
\end{pmatrix} \quad (B.5)$$

for $E^{(-2)} = \lambda^{-1} E = \lambda^{-1} E_{\alpha_1 + \alpha_2} + \lambda^{-1} E_{\alpha_2 + \alpha_3} + E_{-\alpha_1 - \alpha_2} + E_{-\alpha_2 - \alpha_3}$ and

$$s_{33} = \partial_x (v_2 - v_3) + (v_2 - v_3)^2, \quad s_{44} = \partial_x (2v_2 - v_3) + (v_2 - v_3)^2,$$

$$s_{43} = \partial_x^2 (-v_2 + v_3) - 3(v_2 - v_3) \partial_x (v_2 - v_3) - (v_2 - v_3)^3,$$
leading to the Miura transformation

\[ J_1^{(3)} = \partial_x(3v_1 - v_2 - v_3) + v_1^2 + v_2^2 + v_3^2 - v_1v_2 - v_2v_3, \]
\[ J_2^{(3)} = \partial_x^2(-v_2 + 2v_3) - v_2(\partial_xv_1) + 2(-v_2 + v_3)(\partial_xv_2) + (3v_2 - 4v_3)(\partial_xv_3) + v_1^2v_2 - v_1v_2^2 + v_2^2v_3 - v_2v_3^2, \]
\[ J_3^{(3)} = -\partial_x^2(v_2 - v_3) + (v_2 - v_3)\partial_x^2(v_2 - 2v_3) + \partial_x(v_1 - 2v_3)\partial_x(v_2 - v_3) + (v_3^2 - 2v_2v_3)(\partial_xv_1) \]
\[ + (v_1^2 + v_1v_2 - v_2v_3)(\partial_xv_2) + (v_1^2 - v_2^2 - v_1v_2 + 2v_2v_3)(\partial_xv_3) + v_1^2v_2v_3 - v_1v_2^2v_3 + v_1v_2v_3^2 - v_1^2v_3^2. \]

(B.6)

The fourth solution is

\[ S_4 = E^{(-3)} + s^{(-4)} + s^{(-5)} + s^{(-6)} = \begin{pmatrix} 0 & \lambda^{-1} & 0 \\ 0 & \lambda^{-1}(v_2 - v_1) & \lambda^{-1} \\ 0 & \lambda^{-1}t_{32} & -\lambda^{-1}(v_3 - v_1) \\ 1 & \lambda^{-1}t_{42} & \lambda^{-1} \end{pmatrix} \]

(B.7)

for \( E^{(-3)} = \lambda^{-1}E_{a_1} + \lambda^{-1}E_{a_2} + \lambda^{-1}E_{a_3} + E_{-a_1-a_2-a_3} \) and

\[ t_{32} = \partial_x(v_1 - v_2) + (v_1 - v_2)^2, \]
\[ t_{42} = \partial_x^2(-v_1 + v_2) - 3(v_1 - v_2)\partial_x(v_1 - v_2) + (v_1 - v_2)^3, \]
\[ t_{43} = \partial_x(2v_1 - v_2 - v_3) + v_1^2 + v_2^2 + v_3^2 - v_1v_2 - v_1v_3 - v_2v_3, \]

(B.8)

leading to the Miura transformation

\[ J_1^{(4)} = \partial_x(3v_1 - v_2 - v_3) + v_1^2 + v_2^2 + v_3^2 - v_1v_2 - v_2v_3, \]
\[ J_2^{(4)} = \partial_x^2(-3v_1 + 2v_2 + v_3) + 2(-v_1 + v_2)(\partial_xv_1) + (3v_1 - 4v_2 + v_3)(\partial_xv_2) + 2(v_2 - v_3)(\partial_xv_3) \]
\[ + v_1^2v_2 - v_1v_2^2 + v_2^2v_3 - v_2v_3^2, \]
\[ J_3^{(4)} = \partial_x^2(v_1 - v_2) + (v_1 - v_2)\partial_x^2(v_1 - 2v_2 + v_3) - \partial_x(v_1 - v_2)\partial_x(2v_2 - v_3) + (-v_3^2 - v_1v_2 + v_2v_3)(\partial_xv_1) \]
\[ + (v_1^2 + v_2^2 + 2v_1v_2 - 2v_2v_3 + v_1v_3)(\partial_xv_2) + (v_1^2 - v_2^2 - 2v_1v_3 + 2v_2v_3)(\partial_xv_3) \]
\[ + v_1^2v_2v_3 - v_1v_2^2v_3 + v_1v_2v_3^2 - v_1^2v_3^2. \]

(B.9)
