GENERALIZED KERNEL DISTANCE COVARIANCE IN HIGH DIMENSIONS: NON-NULL CLTS AND POWER UNIVERSALITY

QIYANG HAN AND YANDI SHEN

Abstract. Distance covariance is a popular dependence measure for two random vectors $X$ and $Y$ of possibly different dimensions and types. Recent years have witnessed concentrated efforts in the literature to understand the distributional properties of the sample distance covariance in a high-dimensional setting, with an exclusive emphasis on the null case that $X$ and $Y$ are independent. This paper derives the first non-null central limit theorem for the sample distance covariance, and the more general sample (Hilbert-Schmidt) kernel distance covariance in high dimensions, primarily in the Gaussian case. The new non-null central limit theorem yields an asymptotically exact first-order power formula for the widely used generalized kernel distance correlation test of independence between $X$ and $Y$. The power formula in particular unveils an interesting universality phenomenon: the power of the generalized kernel distance correlation test is completely determined by $n \cdot dCor^2(X, Y)/\sqrt{2}$ in the high dimensional limit, regardless of a wide range of choices of the kernels and bandwidth parameters. Furthermore, this separation rate is also shown to be optimal in a minimax sense. The key step in the proof of the non-null central limit theorem is a precise expansion of the mean and variance of the sample distance covariance in high dimensions, which shows, among other things, that the non-null Gaussian approximation of the sample distance covariance involves a rather subtle interplay between the dimension-to-sample ratio and the dependence between $X$ and $Y$.

1. Introduction

1.1. Overview. Given samples from a random vector \((X,Y)\) in \(\mathbb{R}^{p+q}\), it is of fundamental statistical interest to test whether \(X\) and \(Y\) are independent. The long history of this problem has given rise to a large number of dependence measures targeting at different types of dependence structure. Notable examples include the classical Pearson correlation coefficient [Pea95], rank-based correlation coefficients [Spe04, Ken38, Hoe48, BKR61, Yan70, Ros75, Feu93], Cramér-von Mises-type measures [dW80], measure based on characteristic functions [SRB07, SR09], kernel-based measures [GHS+05, GFT+07], sign covariance [BD14, WDM18]. We refer to the classical textbooks [And58, Chapter 9] and [Mui82, Chapter 11] for a systematic exposition on this topic.

Among the plentiful dependence measures for such a purpose, the distance covariance metric and its generalizations [SRB07, SR14] have attracted much attention in recent years. In one of its many equivalent forms, the distance covariance between \(X\) and \(Y\) can be defined as (cf. [SR09, Theorems 7 and 8])

\[
dCov^2(X,Y) \equiv E(\|X_1 - X_2\|\|Y_1 - Y_2\|) - 2E(\|X_1 - X_2\|E(\|Y_1 - Y_2\|)) + E(\|X_1 - X_2\|)E(\|Y_1 - Y_2\|). \tag{1.1}
\]

Here \((X_i,Y_i), i = 1,2,3\) are independent copies from the joint distribution of \((X,Y)\), and \(\|\cdot\|\) is the Euclidean norm. The distance covariance metric \(dCov^2(X,Y)\) is particularly appealing for several nice features. First, \(X\) and \(Y\) are independent if and only if \(dCov^2(X,Y) = 0\). Second, \(dCov^2(X,Y)\) can be used in cases where \(X\) and \(Y\) are of different dimensions and data type (discrete, continuous or mixed). Third, several estimators of \(dCov^2(X,Y)\) are known to allow for efficient calculation. Due to these reasons, the distance covariance has been utilized in a wide range of both methodological and applied contexts, see e.g. [KKK+12, LZZ12, SZ14, MT17, YZS18, ZYS18] for an incomplete list of references.

An estimator of \(dCov^2(X,Y)\) based on \(n\) i.i.d. samples \((X_1,Y_1), \ldots, (X_n,Y_n)\) from the distribution of \((X,Y)\) is first proposed in [SRB07], with its bias corrected version proposed in [SR14], which is now known as the sample distance covariance \(dCov^2_n(X,Y)\). The finite-sample distribution of \(dCov^2_n(X,Y)\) is generally intractable; so the literature has focused on deriving its asymptotic distribution in different growth regimes of \((n,p,q)\), cf. [SR13, HS16, ZZYS20, GFLS21]. In the fixed dimensional asymptotic regime when \(p,q\) are fixed and \(n\) diverges to infinity, [HS16] showed that \(dCov^2_n(X,Y)\) converges in distribution to a mixture of chi-squared distributions. This is complemented by the result of [SR13], where a \(t\)-distribution limit was derived in the so-called ‘high dimensional low sample size’
regime when \(n\) remains fixed and both \(p, q\) diverge to infinity. The high dimensional regime where both the sample size \(n\) and the data dimension \(p, q\) diverge was recently studied in [ZZYS20, GFLS21], where \(\text{dCov}^2(X, Y)\) was shown to obey a central limit theorem (CLT). Except for some non-null results in [ZZYS20, Proposition 2.2.2] under the fixed \(n\) regime, all these results are derived under the null scenario where \(X\) and \(Y\) are independent. This leaves open the more challenging but equally important issue of non-null limiting distributions of \(\text{dCov}^2(X, Y)\), which are the key to a complete characterization of the power behavior of distance covariance based tests. Bridging this significant theoretical gap is one of the main motivations of the current paper.

1.2. Non-null CLTs. Due to the general and challenging nature of the problem, for the majority of the paper, we work with the Gaussian assumption \((X, Y) \overset{d}{=} \mathcal{N}_{p+q}(0, \Sigma)\) and perform an exact analysis of the distributional properties of the sample distance covariance \(\text{dCov}^2(X, Y)\) in the following high dimensional regime:

\[
\min\{n, p, q\} \to \infty. \tag{1.2}
\]

Here \(\overset{d}{=}\) stands for equal in distribution and \(\mathcal{N}_{p+q}(0, \Sigma)\) denotes the \((p + q)\)-variate Gaussian distribution with some covariance matrix \(\Sigma\). Our first main result is the following non-null CLT (see Theorem 2.2 below for the formal statement): Uniformly over \(\Sigma\) with a compact spectrum in \((0, \infty)\),

\[
\frac{\text{dCov}^2(X, Y) - \text{dCov}^2(X, Y)}{\text{Var}^{1/2} \left( \text{dCov}^2(X, Y) \right)} \text{ converges in distribution to } \mathcal{N}(0, 1) \tag{1.3}
\]

in the regime (1.2). Here \(\mathcal{N}(0, 1)\) denotes the standard normal distribution. For simplicity, we have presented here the asymptotic version of the result; the more complete Theorem 2.2 below is non-asymptotic in nature and gives an error bound with explicit dependence on the problem parameters \((n, p, q)\). Furthermore, we show that an analogue of (1.3) also holds for \(\text{dCov}^2(X)\), the ‘marginal’ analogous unbiased estimator of \(\text{dCov}^2(X)\). To the best of our knowledge, (1.3) is the first non-null CLT for \(\text{dCov}^2(X, Y)\) in the literature.

Let us now give some intuition why one would expect a non-null CLT (1.3) that holds for a general \(\Sigma\) in the regime (1.2). It is well-known that the sample distance covariance \(\text{dCov}^2(X, Y)\) admits a \(U\)-statistics representation (cf. Proposition 2.1) with first-order degeneracy under the null. By classical theory in the fixed dimensional asymptotics (i.e., \(p, q\) fixed with \(n \to \infty\)), a CLT holds for \(\text{dCov}^2(X, Y)\) under any fixed alternative \(\Sigma \neq I_{p+q}\); while a non-Gaussian limit holds under the null \(\Sigma = I_{p+q}\). In such fixed dimensional asymptotics, the Gaussian limit is due to the non-degeneracy of \(\text{dCov}^2(X, Y)\) under the alternative, while the non-Gaussian limit is due to the degeneracy of \(\text{dCov}^2(X, Y)\) under the null. Now, as high dimensionality also enforces a Gaussian approximation of \(\text{dCov}^2(X, Y)\) under the null with degeneracy (cf. [ZZYS20, GFLS21]), one would naturally expect the finite-sample distribution of the centered \(\text{dCov}^2(X, Y)\) under a general \(\Sigma\), to be approximately a ‘mixture’ of a centered Gaussian component due to non-degeneracy and another centered Gaussian component due to degeneracy, which is again Gaussian. The non-null CLT (1.3) formalizes this intuition in the regime (1.2).

To formally implement the above intuition, an important step in the proof of (1.3) is to obtain precise mean and variance expansions for the sample distance
covariance $d\text{Cov}^2(X, Y)$ in the regime (1.2). In particular, we show in Theorem 8.5 that the mean can be expanded as

$$d\text{Cov}^2(X, Y) = \frac{\|\Sigma_{XY}\|^2_F}{2\sqrt{\text{tr}(\Sigma_X) \text{tr}(\Sigma_Y)}} (1 + o(1)), \quad (1.4)$$

and in Theorem 9.12 that the variance under the null $\sigma^2_{\text{null}}$ can be expanded as

$$\sigma^2_{\text{null}} = \frac{\|\Sigma_X\|^2_F \|\Sigma_Y\|^2_F}{2n(n-1) \text{tr}(\Sigma_X) \text{tr}(\Sigma_Y)} (1 + o(1)). \quad (1.5)$$

Here $\Sigma_X$, $\Sigma_Y$, and $\Sigma_{XY}$ are sub-blocks of the covariance matrix $\Sigma = [\Sigma_X, \Sigma_{XY}; \Sigma_{YX}, \Sigma_Y]$, $\text{tr}(\cdot)$ denotes the trace and $\|\cdot\|_F$ denotes the matrix Frobenious norm, and $o(1)$ is the standard small-o notation representing a vanishing term under the asymptotics (1.2). The variance formula for general $\Sigma$ (explicit form see Theorem 9.12) is rather complicated so is not presented here, but as explained above, it is expected to contain two parts that are contributed individually by the non-degenerate and the degenerate components of $d\text{Cov}^2(X, Y)$. Notably, the contributions of these two components to the Gaussian approximation in (1.3) depend on the dimension-to-sample ratio in a fairly subtle way. In ‘very high dimensions’, the non-null CLT is entirely driven by the degeneracy of $d\text{Cov}^2(X, Y)$ regardless of the degree of dependence between $X$ and $Y$. On the other hand, in ‘moderate high dimensions’, dependence between $X$ and $Y$ plays a critical role in determining the contributions of the (non-)degeneracy in the non-null CLT. See the discussion after Theorem 2.2 for details.

1.3. Independent test via distance covariance: power asymptotics. A major application of the non-null CLT derived in (1.3) is a precise power formula for the following popular distance correlation test of independence between $X$ and $Y$, first considered in [SR13]:

$$\Psi(X, Y; \alpha) \equiv 1\left(\left|\frac{n \cdot d\text{Cov}^2(X, Y)}{\sqrt{2d\text{Cov}^2(X) \cdot d\text{Cov}^2(Y)}}\right| > z_{\alpha/2}\right). \quad (1.6)$$

The above independence test and the null part of (1.3) is connected by the mean and variance expansions in (1.4) and (1.5). In fact, as will be detailed in Section 3 below, the above test is asymptotically (in the regime (1.2)) equivalent to the (infeasible) $z$-test built from the null part of (1.3). As a direct consequence, $\Psi(X, Y; \alpha)$ will also have an asymptotic size of $\alpha$. The null behavior of (a variant of) $\Psi(X, Y; \alpha)$ was first studied in [SR13] in the regime of fixed $n$ and $\min\{p, q\} \to \infty$, and then in [GFLS21] in a high dimensional regime slightly broader than ours (1.2).

Having understood the behavior of the test (1.6) under the null, we now turn to the more challenging question of its behavior under a generic alternative covariance $\Sigma$. Using again the non-null CLT in (1.3), we show that the test statistic in (1.6) is asymptotically normal with a mean shift (formal statement see Theorem 3.1):

$$E_\Sigma \Psi(X, Y; \alpha) = P(|N(m_n(\Sigma), 1)| > z_{\alpha/2}) + o(1). \quad (1.7)$$

Here $E_\Sigma$ denotes expectation under the data distribution with covariance $\Sigma$ so the left side is the power of the test $\Psi(X, Y; \alpha)$, and the mean shift parameter $m_n(\Sigma)$
can be either
\[
\frac{n \cdot \text{dCov}^2(X, Y)}{\sqrt{2}} = \frac{n \cdot \text{dCov}^2(X, Y)}{\sqrt{2 \text{dCov}^2(X) \text{dCov}^2(Y)}} \quad \text{or} \quad \frac{n \|\Sigma_X\|_F^2}{\sqrt{2 \|\Sigma_X\|_F \|\Sigma_Y\|_F}}.
\]

Here the (rescaled) left side is known as the distance correlation between $X$ and $Y$, and its asymptotic equivalence to the right side follows again from the mean expansion in (1.4). It follows directly from (1.7) that if the spectra of $\Sigma_X$ and $\Sigma_Y$ are appropriately bounded, $\Psi(X, Y; \alpha)$ has asymptotically full power if and only if $n \cdot \text{dCov}^2(X, Y) \to \infty$. A complementary minimax lower bound in Theorem 3.3 shows that this separation rate cannot be further improved from an information theoretic point of view.

Power results for tests based on distance covariance (correlation) are scarce, particularly in high dimensions when both $n$ and $p$ and/or $q$ diverge to infinity. [ZZYS20] gives a relatively complete power characterization for a related studentized test in the regime of fixed $n$ and $p \wedge q \to \infty$, followed by some partial results in the regime $\min\{p, q\}/n^2 \to \infty$. The same test $\Psi(X, Y; \alpha)$ as in (1.6) is recently analyzed in [GFLS21] in the slightly broader regime $\min\{n, \max\{p, q\}\} \to \infty$, but their analysis requires a much stronger condition $\sqrt{n} \cdot \text{dCov}^2(X, Y) \to \infty$ for power consistency (see their Theorem 5 and subsequent discussion). To the best of our knowledge, (1.7) gives the first complete characterization of the power behavior of the distance correlation test (1.6).

1.4. Kernel generalizations and power universality. Following [GHS+05, GFT+07], the distance covariance in (1.1) can be naturally generalized to the so-called Hilbert-Schmidt covariance:
\[
\text{dCov}^2(X, Y; f, \gamma) \equiv \mathbb{E}\left[ f_X(\|X_1 - X_2\|/\gamma_X) f_Y(\|Y_1 - Y_2\|/\gamma_Y) \right] - 2\mathbb{E}\left[ f_X(\|X_1 - X_2\|/\gamma_X) f_Y(\|Y_1 - Y_3\|/\gamma_X) \right] + \mathbb{E}\left[ f_X(\|X_1 - X_2\|/\gamma_X) \right] \mathbb{E}\left[ f_Y(\|Y_1 - Y_2\|/\gamma_Y) \right]. \tag{1.8}
\]

Here $f = (f_X, f_Y)$ are kernel functions, and $\gamma = (\gamma_X, \gamma_Y) \in \mathbb{R}_{\geq 0}^2$ are the bandwidth parameters for $X$ and $Y$ respectively. $\text{dCov}^2(X; f, \gamma)$ and $\text{dCov}^2(Y; f, \gamma)$ are defined analogously. The above definition reduces to the (rescaled) standard distance covariance in (1.1) when the kernel is taken to be the identity function. Let $\text{dCov}^2(X, Y; f, \gamma)$, $\text{dCov}^2(Y; f, \gamma)$, $\text{dCov}^2(X; f, \gamma)$ be the sample kernel distance covariance. As a key step of the universality results presented below, we show that these quantities can be related to the standard sample distance covariance: under mild conditions on kernels $f = (f_X, f_Y)$ and bandwidths $\gamma = (\gamma_X, \gamma_Y)$,
\[
\text{dCov}^2(X, Y; f, \gamma) = \varphi(\gamma) \text{dCov}^2(X, Y) (1 + \varphi(1)). \tag{1.9}
\]

Here $\varphi(1)$ is again under the asymptotics (1.2) and $\varphi(\gamma)$, whose exact definition is given in (2.10) below, depends on the kernels $f$, bandwidths $\gamma$, and population covariance $\Sigma$. Similar expansions hold for the marginal quantities $\text{dCov}^2(X; f, \gamma)$ and $\text{dCov}^2(Y; f, \gamma)$.

Relation (1.9) implies that as long as the scaling factor $\varphi(\gamma)$ stabilizes away from zero and infinity, $\text{dCov}^2(X, Y; f, \gamma)$ (up to a scaling) shares the same limiting distribution as $\text{dCov}^2(X, Y; f, \gamma)$, which has been studied in detail in the previous subsection. In particular, both the non-null CLT in (1.3) and the power expansion
in (1.7) hold for the kernelized distance covariance as well, upon changing the test
(1.6) to its kernelized version in the latter result; see Theorems 2.5 and 3.1 for formal
statements. In other words, the power behavior in (1.7) exhibits universality with
respect to both the choice of kernels and bandwidth parameters; see Section 4 for
numerical evidence.

1.5. Organization. The rest of the paper is organized as follows. Section 2 starts
with some background knowledge of the distance covariance metric and then states
the main non-null CLTs for both the canonical sample distance covariance and its
kernel generalizations. Section 3 studies the power behavior of a class of generalized
kernel distance correlation tests and discusses their minimax optimality. Some nu-
merical simulations for the main results in the preceding two sections are presented
in Section 4, with some concluding remarks in Section 5. Section 6 is devoted to a
proof outline for the non-null CLTs. Sections 7 - 11 and 12 - 13 contain the main
results in the preceding two sections are presented

1.6. Notation. For any positive integer \( n \), let \( [n] \) denote the set \{1, \ldots, n\}. For
\( a, b \in \mathbb{R} \), \( a \vee b = \max\{a, b\} \) and \( a \wedge b = \min\{a, b\} \). For \( a \in \mathbb{R} \), let \( a_\pm = a \vee 0 \) and
\( a_- = (-a) \vee 0 \). For \( x \in \mathbb{R}^n \), let \( \|x\|_p = \|x\|_{\ell^p(\mathbb{R}^n)} \) denote its p-norm \((0 \leq p \leq \infty)\)
with \( \|x\|_2 \) abbreviated as \( \|x\| \). Let \( B_p(r; x) = \{z \in \mathbb{R}^p : \|z - x\| \leq r\} \) be the unit \( \ell_2 \)
ball in \( \mathbb{R}^p \). By \( 1_n \) we denote the vector of all ones in \( \mathbb{R}^n \). For a matrix \( M \in \mathbb{R}^{n \times n} \), let
\( \|M\|_{\text{op}} \) and \( \|M\|_F \) denote the spectral and Frobenius norms of \( M \) respectively.
We use \( \{e_j\} \) to denote the canonical basis, whose dimension should be self-clear
from the context.

We use \( C_x \) to denote a generic constant that depends only on \( x \), whose numeric
value may change from line to line unless otherwise specified. Notations \( a \lesssim_x b \)
and \( a \gtrsim_x b \) mean \( a \leq C_x b \) and \( a \geq C_x b \) respectively, and \( a \asymp_x b \)
means \( a \lesssim_x b \) and \( a \gtrsim_x b \). The symbol \( a \lesssim b \) means \( a \leq C b \) for some absolute constant \( C \). For two
nonnegative sequences \( \{a_n\} \) and \( \{b_n\} \), we write \( a_n \ll b_n \) (respectively \( a_n \gg b_n \))
if \( \lim_{n \to \infty} (a_n/b_n) = 0 \) (respectively \( \lim_{n \to \infty} (a_n/b_n) = \infty \)). We write \( a_n \sim b_n \) if
\( \lim_{n \to \infty} (a_n/b_n) = 1 \). We follow the convention that \( 0/0 = 0 \).

Let \( \varphi, \Phi \) be the density and the cumulative distribution function of a standard
normal random variable. For any \( \alpha \in (0, 1) \), let \( z_\alpha \) be the normal quantile defined
by \( \mathbb{P}(N(0, 1) > z_\alpha) = \alpha \). For two random variables \( X, Y \) on \( \mathbb{R} \), we use \( d_{\text{Kol}}(X, Y) \)
to denote their Kolmogorov distance defined by
\[
d_{\text{Kol}}(X, Y) \equiv \sup_{t \in \mathbb{R}} |\mathbb{P}(X \leq t) - \mathbb{P}(Y \leq t)|. \tag{1.10}
\]
Here \( \mathcal{B}(\mathbb{R}) \) denotes the Borel \( \sigma \)-algebra of \( \mathbb{R} \).

2. Non-null central limit theorems

2.1. Distance covariance: a review. We start with a review for the distance
covariance (correlation). For two random vectors \( X \in \mathbb{R}^p \) and \( Y \in \mathbb{R}^q \), the squared
distance covariance [SRB07] is originally defined by
\[
d\text{Cov}^2(X, Y) \equiv \int_{\mathbb{R}^{p+q}} \frac{|\varphi(x,y)(t,s) - \varphi(x(t)\varphi(y(s))|^2}{c_p c_q \|t\|^{p+1} \|s\|^{q+1}} \, dt \, ds.
\]
Here \( c_p = \pi^{(p+1)/2} / \Gamma((p+1)/2) \) with \( \Gamma(\cdot) \) denoting the gamma function, and \( \varphi(\cdot) \) is
the characteristic function. The marginal quantities \( d\text{Cov}^2(X, X) \) and \( d\text{Cov}^2(Y, Y) \)
are defined analogously, and we will shorthand them as \( \text{dCov}^2(X) \) and \( \text{dCov}^2(Y) \) in the sequel. It is well-known that \( X \) and \( Y \) are independent if and only if \( \text{dCov}(X,Y) = 0 \), hence \( \text{dCov}^2(X,Y) \) captures any kind of dependence between \( X \) and \( Y \) including non-linear and non-monotone ones. Analogous to the standard notion of covariance and correlation, the squared distance correlation is defined by

\[
\text{dCor}^2(X,Y) = \frac{\text{dCov}^2(X,Y)}{\sqrt{\text{dCov}^2(X) \text{dCov}^2(Y)}}
\]

with convention \( \text{dCov}^2(X,Y) \equiv 0 \) if \( \text{dCov}^2(X) \text{dCov}^2(Y) = 0 \).

The distance covariance can be equivalently characterized in a number of different ways. In addition to (1.1), another useful representation that will be particularly relevant for our purpose is through the double centered distances:

\[
\begin{align*}
U(x_1, x_2) &\equiv \|x_1 - x_2\| - \mathbb{E}\|x_1 - X\| - \mathbb{E}\|X - x_2\| + \mathbb{E}\|X - X'\|, \\
V(y_1, y_2) &\equiv \|y_1 - y_2\| - \mathbb{E}\|y_1 - Y\| - \mathbb{E}\|Y - y_2\| + \mathbb{E}\|Y - Y'\|. 
\end{align*}
\]

(2.1)

Then by (1.1) or [Lyo13, pp. 3287], we have the identity

\[
\text{dCov}^2(X,Y) = \mathbb{E}U(X_1, X_2)V(Y_1, Y_2). 
\]  

(2.2)

Now we define the sample distance covariance. For \( n \) copies of i.i.d. observations \((X_1, Y_1), \ldots, (X_n, Y_n)\), define two symmetric matrices \( A, B \in \mathbb{R}^{n \times n} \) entrywise by

\[
A_{kl} \equiv \|X_k - X_l\|, \quad B_{kl} \equiv \|Y_k - Y_l\|, \quad 1 \leq k, l \leq n. 
\]

(2.3)

Following [SR14], the bias-corrected sample distance covariance is defined by

\[
\text{dCov}^2_s(X,Y) = \frac{1}{n(n-3)} \sum_{k \neq l} A^*_{kl} B^*_{kl}, 
\]

(2.4)

where \( A^*, B^* \in \mathbb{R}^{n \times n} \) are \( U \)-centered versions of \( A, B \) defined by

\[
A^* = A - \frac{11^T A + A11^T}{n - 2} + \frac{11^T A11^T}{(n-1)(n-2)}, \\
B^* = B - \frac{11^T B + B11^T}{n - 2} + \frac{11^T B11^T}{(n-1)(n-2)}. 
\]  

(2.5)

Marginal quantities \( \text{dCov}^2_s(X,X) \) and \( \text{dCov}^2_s(Y,Y) \) are defined analogously, and will be shorthanded as \( \text{dCov}^2_s(X) \) and \( \text{dCov}^2_s(Y) \) in the sequel.

The definition of the sample distance covariance \( \text{dCov}^2_s(X,Y) \) in (2.4) above looks a bit mysterious at first sight, but the following representation via a 4-th order \( U \)-statistic makes it clear why the definition is indeed natural. Recall the definitions of \( U, V \) in (2.1).

**Proposition 2.1** ([YZS18, GFLS21]). The following holds:

\[
\text{dCov}^2_s(X,Y) = \frac{1}{n} \sum_{i_1 < \cdots < i_4} k(Z_{i_1}, Z_{i_2}, Z_{i_3}, Z_{i_4}),
\]

where the symmetric kernel can be either

\[
k(Z_1, Z_2, Z_3, Z_4) = \frac{1}{4!} \sum_{(i_1, \ldots, i_4) \in \sigma(1,2,3,4)} \left\| X_{i_1} - X_{i_2} \right\| \left\| Y_{i_1} - Y_{i_2} \right\|
\]
\begin{equation}
+ \|X_{i_1} - X_{i_2}\|\|Y_{i_3} - Y_{i_4}\| - 2\|X_{i_1} - X_{i_2}\|\|Y_{i_3} - Y_{i_4}\|\right), \quad (2.6)
\end{equation}

or

\begin{equation}
k(Z_1, Z_2, Z_3, Z_4) = \frac{1}{4!} \sum_{(i_1, \ldots, i_4) \in \sigma(1, 2, 3, 4)} \left[U(X_{i_1}, X_{i_2})V(Y_{i_1}, Y_{i_2})
+ U(X_{i_1}, X_{i_2})V(Y_{i_3}, Y_{i_4}) - 2U(X_{i_1}, X_{i_2})V(Y_{i_1}, Y_{i_4})\right]. \quad (2.7)
\end{equation}

Here \(Z_i = (X_i, Y_i)\) for \(i \in \mathbb{N}\), and \(\sigma(1, 2, 3, 4)\) denotes the set of all ordered permutations of \(\{1, 2, 3, 4\}\).

It is a direct consequence of the above result that \(dCov^2(X, Y)\) is an unbiased estimator for \(\text{dCov}^2(X, Y)\). The fact that \(dCov^2(X, Y)\) can be represented as a \(U\)-statistic is first validated in \([\text{HS}16, \text{Section 3.2}]\). The kernel representation \((2.6)\) (proved in e.g. \([\text{YZS}18, \text{Lemma 2.1}]\)) is quite natural in that it gives an unbiased estimate for the population in the form \((1.1)\). The double centered version \((2.7)\), which turns out to be more convenient and useful for the purpose of theoretical developments in this paper, is essentially proved in \([\text{GFLS}21, \text{Lemma 5}]\) in a different form. For the convenience of the reader, we provide a self-contained proof in Appendix A.

2.2. General non-null CLTs I: distance covariance. We will work with the following Gaussian assumption throughout the paper.

**Assumption A.** \((X, Y) \in \mathbb{R}^{p+q}\) are jointly Gaussian with covariance matrix

\[\Sigma = \begin{pmatrix} \Sigma_X & \Sigma_{XY} \\ \Sigma_{YX} & \Sigma_Y \end{pmatrix}.\]

Some notation that will be used throughout the paper:

\[\tau_X^2 \equiv \mathbb{E}\|X - X'|\|^2 = 2 \text{tr}(\Sigma_X), \quad \tau_Y^2 \equiv \mathbb{E}\|Y - Y'|\|^2 = 2 \text{tr}(\Sigma_Y). \quad (2.8)\]

The following non-null central limit theorem is the first main result of this paper; its proof can be found in Section 11.

**Theorem 2.2.** Suppose that the spectrum of \(\Sigma\) is contained in \([1/M, M]\) for some \(M > 1\). Then there exists some \(C = C(M) > 0\) such that

\[d_{\text{Kol}}\left(\frac{dCov^2(X, Y) - dCov^2(X, Y)}{\sigma_n(X, Y)}, \mathcal{N}(0, 1)\right) \leq \frac{C}{(n \wedge p \wedge q)^{1/6}}.\]

Here \(\sigma_n(X, Y)\) can be either \(\text{Var}^{1/2}(dCov^2(X, Y))\) or \(\bar{\sigma}_n(X, Y)\), where

\[\bar{\sigma}^2_{n,1}(X, Y) \equiv \bar{\sigma}^2_{n,1}(X, Y) + \sigma^2_{n,2}(X, Y),\]

with

\[\bar{\sigma}^2_{n,1}(X, Y) \equiv \frac{4}{n \tau_X^2 \tau_Y^2} \left[\|\Sigma_{XY} \Sigma_{YX}\|_F^2 + \text{tr}(\Sigma_{XY} \Sigma_{YX} \Sigma_{X}) + \frac{\|\Sigma_{XY}\|_F^2 \|\Sigma_X\|_F^2}{2 \tau_X^2} + \frac{\|\Sigma_{XY}\|_F^2 \|\Sigma_Y\|_F^2}{2 \tau_Y^2} - \frac{2\|\Sigma_{XY}\|_F^2}{\tau_X^2} \text{tr}(\Sigma_{XY} \Sigma_{YX} \Sigma_{X}) - \frac{2\|\Sigma_{XY}\|_F^2}{\tau_Y^2} \text{tr}(\Sigma_{YX} \Sigma_{XY} \Sigma_{Y}) + \frac{\|\Sigma_{XY}\|_F^2}{\tau_X^2 \tau_Y^2}\right].\]
\[ \bar{\sigma}^2_{n,2}(X,Y) \equiv \frac{2}{n(n-1)\tau_Y^2} (\|\Sigma_X\|^2_F + \|\Sigma_Y\|^2_F + \|\Sigma_{XY}\|^2_F). \]

**Remark 2.3 (Variance formula).** The variance formula \( \text{Var}(\text{dCov}^2(X,Y)) = (1 + o(1))\bar{\sigma}^2_n(X,Y) \) is valid in the high dimensional limit \( n \wedge p \wedge q \to \infty \); see Section 9 ahead for details. The same is true for the variance formula in Theorem 2.4 below.

As mentioned in the introduction, most of the CLTs in the literature so far are derived under the null case that \( X \) and \( Y \) are independent, and to the best of our knowledge, Theorem 2.2 is the first non-null CLT that applies to a general class of alternatives. Due to the challenging nature of non-null analysis, the proof of the above theorem requires several technically involved and intertwined steps, so an outline will be provided in Section 6 that discusses the relevance of the groundwork laid in Sections 7-10, which culminates in the proof of Theorem 2.2 in Section 11.

Let us examine the variance structure in more detail. Roughly speaking, in the high dimensional regime \( n \wedge p \wedge q \to \infty \), the variance \( \bar{\sigma}^2_n(X,Y) \) of \( \text{dCov}^2_n(X,Y) \) only contains two possibly different sources—the first part \( \bar{\sigma}^2_{n,1}(X,Y) \) comes from the contribution of the non-degenerate first-order kernel, while the second part \( \bar{\sigma}^2_{n,2}(X,Y) \) comes from the contribution of the degenerate second-order kernel, in the Hoeffding decomposition of \( \text{dCov}^2_n(X,Y) \) to be detailed in Section 9 ahead.

One notable complication of \( \bar{\sigma}^2_n(X,Y) \) is the existence of terms with negative signs in the first-order variance \( \bar{\sigma}^2_{n,1}(X,Y) \). These terms may contribute to the same order of the leading quantities \( \|\Sigma_{XY}\|_F^2 \) and \( \text{tr}(\Sigma_{XY} \Sigma_{YX}) \), but a lower bound in Lemma 9.5 ahead shows that their contributions do not lead to ‘cancellations’ of the main terms. In fact, under the spectrum condition of Theorem 2.2, the second claim of Lemma 9.5 indicates the order of \( \bar{\sigma}^2_n(X,Y) \) with terms of positive signs only:

\[ \bar{\sigma}^2_n(X,Y) \preceq \max \left\{ \frac{\|\Sigma_{XY}\|_F^2}{npq}, \frac{1}{n^2} \right\} . \]

Here the first term in the above maximum is contributed by \( \bar{\sigma}^2_{n,1}(X,Y) \) while the second term is contributed by \( \bar{\sigma}^2_{n,2}(X,Y) \). Now we consider two regimes:

- **(Ultra high-dimensional regime \( \sqrt{pq} \gg n \)).** In this regime, as \( \|\Sigma_{XY}\|_F^2 \preceq_M n \) \( p \wedge q \leq \sqrt{pq} \) via Lemma F.5 in the appendix, the variance \( \bar{\sigma}^2_n(X,Y) \) in this ultra high-dimensional regime is completely determined by the contribution from the degenerate second-order kernel \( \bar{\sigma}^2_{n,2}(X,Y) \):

\[ \bar{\sigma}^2_n(X,Y) = (1 + o(1))\bar{\sigma}^2_{n,2}(X,Y). \]

- **(Moderate high-dimensional regime \( \sqrt{pq} \ll n \)).** In this regime, there are three possibilities:
  - If \( \|\Sigma_{XY}\|_F^2 \ll (pq)/n \), which includes the null \( \Sigma_{XY} = 0 \) as a special case, the variance \( \bar{\sigma}^2_n(X,Y) \) is again completely determined by the degenerate second-order kernel \( \bar{\sigma}^2_{n,2}(X,Y) \).
  - If \( \|\Sigma_{XY}\|_F^2 \gg (pq)/n \), then the variance \( \bar{\sigma}^2_n(X,Y) \) is completely determined by the non-degenerate first-order kernel \( \bar{\sigma}^2_{n,1}(X,Y) \):

\[ \bar{\sigma}^2_n(X,Y) = (1 + o(1))\bar{\sigma}^2_{n,1}(X,Y). \]
If furthermore $\|\Sigma_{XY}\|_F^2 \ll p \wedge q$ (i.e., excluding the critical regime $\|\Sigma_{XY}\|_F^2 \asymp p \wedge q$), then the first-order variance $\hat{\sigma}_{n,1}^2(X,Y)$ can be simplified to

$$\hat{\sigma}_{n,1}^2(X,Y) = \frac{4(1 + \sigma(1))}{n \tau_X^2 \tau_Y^2} \left[ \|\Sigma_{XY} \Sigma_{YX}\|_F^2 + \operatorname{tr}(\Sigma_{XY} \Sigma_Y \Sigma_{YX} \Sigma_X) \right].$$

- If $\|\Sigma_{XY}\|_F^2 \asymp (pq)/n$, the variance $\hat{\sigma}_{n}^2(X,Y)$ is contributed by both the non-degenerate first-order kernel $\hat{\sigma}_{n,1}^2(X,Y)$ and the degenerate second-order kernel $\hat{\sigma}_{n,2}^2(X,Y)$ so the general variance expression in Theorem 2.2 cannot be further simplified.

The smallest eigenvalue condition in Theorem 2.2 excludes the case $X = Y$, but a slight variation of the proof can cover this case as well. We record formally the result below.

**Theorem 2.4.** Suppose that the spectrum of $\Sigma_X$ is contained in $[1/M, M]$ for some $M > 1$. Then there exists some $C = C(M) > 0$ such that

$$d_{\text{Kol}} \left( \frac{\text{dCov}_n^2(X) - \text{dCov}^2(X)}{\sigma_n(X)} , \mathcal{N}(0,1) \right) \leq \frac{C}{(n \wedge p)^{1/\gamma}}.$$

Here $\sigma_n(X)$ can be either $\text{Var}^{1/2} \left( \text{dCov}_n^2(X) \right)$ or $\hat{\sigma}_n(X, X)$, where

$$\hat{\sigma}_n^2(X) \equiv \hat{\sigma}_{n,1}^2(X) + \hat{\sigma}_{n,2}^2(X),$$

with

$$\hat{\sigma}_{n,1}^2(X) = \frac{1}{n \operatorname{tr}(\Sigma_X)} \left[ 2\|\Sigma_X\|^2_F + \frac{\|\Sigma_X\|^6_F}{2 \operatorname{tr}(\Sigma_X)} - \frac{2\|\Sigma_X\|^2_F \operatorname{tr}(\Sigma_X^3)}{\operatorname{tr}(\Sigma_X)} \right],$$

$$\hat{\sigma}_{n,2}^2(X) = \frac{\|\Sigma_X\|^4_F}{n(n - 1) \operatorname{tr}(\Sigma_X^2)}.$$

The variance $\hat{\sigma}_n^2(X)$ in Theorem 2.4 is simpler than that in Theorem 2.2. In fact, a similar consideration using the variance lower bound in Lemma 9.5, we may obtain the order of $\hat{\sigma}_n^2(X)$:

$$\hat{\sigma}_n^2(X) \asymp_M \max \left\{ \frac{1}{np}, \frac{1}{n^2} \right\}.$$

Through the Hoeffding decomposition of $\text{dCov}_n^2(X)$, the first and second terms in the maximum are contributed by the variance of the non-degenerate first-order kernel and the the degenerate second-order kernel respectively. Therefore:

- In the ultra high-dimensional regime $p \gg n$, the variance $\hat{\sigma}_n^2(X)$ is completely determined by the degenerate second-order kernel $\hat{\sigma}_{n,2}^2(X)$.
- In the strictly moderate high-dimensional regime $p \ll n$, the variance $\hat{\sigma}_n^2(X)$ is completely determined by the non-degenerate first-order kernel $\hat{\sigma}_{n,1}^2(X)$.
- In the critical regime $p \asymp n$, the variance $\hat{\sigma}_n^2(X)$ is determined jointly by the first- and second-order kernels $\hat{\sigma}_{n,1}^2(X)$, $\hat{\sigma}_{n,2}^2(X)$ so cannot be in general simplified.

2.3. **General non-null CLTs II: generalized kernel distance covariance.**

The sample distance covariance $\text{dCov}_n^2(X, Y)$ can be generalized using kernel functions as follows. Given functions $f_X, f_Y : \mathbb{R}_{\geq 0} \to \mathbb{R}$, and bandwidth parameters $\gamma_X, \gamma_Y > 0$, let for $1 \leq k, \ell \leq n$

$$A_{k\ell}(f_X, \gamma_X) \equiv f_X(\|X_k - X_\ell\|/\gamma_X) \mathbf{1}_{k \neq \ell}, \quad B_{k\ell}(f_Y, \gamma_Y) \equiv f_Y(\|Y_k - Y_\ell\|/\gamma_Y) \mathbf{1}_{k \neq \ell}. $$
It is essential to set the diagonal terms \( \{A_{kk}(f_X, \gamma_X)\}_k, \{B_{kk}(f_Y, \gamma_Y)\}_k \) to be 0, so that the generalized kernel distance covariance to be introduced below can be analyzed in a unified manner; see Proposition E.1 in the appendix for details. Now with \( A_{kk}(f_X, \gamma_X), B_{kk}(f_Y, \gamma_Y) \) defined similarly as in (2.5) by replacing \( A_{\ell\ell}, B_{\ell\ell} \) with \( A_{kk}(f_X, \gamma_X), B_{kk}(f_Y, \gamma_Y) \), we may define the generalized sample distance covariance with kernels \( f = (f_X, f_Y) \) and bandwidth parameters \( \gamma = (\gamma_X, \gamma_Y) \in \mathbb{R}^2_{>0} \) by

\[
dCov^2_s(X, Y; f, \gamma) = \frac{1}{n(n-3)} \sum_{k \neq \ell} A^*_{kk}(f_X, \gamma_X)B^*_{kk}(f_Y, \gamma_Y), \tag{2.9}
\]

and its population version \( dCov^2(X, Y; f, \gamma) \) as in (1.8). Marginal quantities \( dCov^2(X; f, \gamma) \) and \( dCov^2(Y; f, \gamma) \) are defined analogously, and similar to distance correlation, the kernelized distance correlation is defined as

\[
dCor^2(X, Y; f, \gamma) \equiv \frac{dCov^2(X, Y; f, \gamma)}{\sqrt{dCov^2(X; f, \gamma) dCov^2(Y; f, \gamma)}},
\]

with convention \( dCor^2(X, Y; f, \gamma) \equiv 0 \) if \( dCov^2(X; f, \gamma) dCov^2(Y; f, \gamma) = 0 \).

A more general formulation, when replacing \( f_X(\|X - X_k\|/\gamma_X) \) (resp. \( f_Y(\|Y - Y_k\|/\gamma_X) \)) by some generic bivariate kernel \( k_X(X, X_k) \) (resp. \( k_Y(Y, Y_k) \)), is also known as the Hilbert-Schmidt independence criteria, see e.g. [GHS+05, GFT+07], which can in fact be written as the maximum mean discrepancy between the joint distribution and the marginal distributions of \( X \) and \( Y \); see e.g. [SSGF13, Section 3.3] for an in-depth discussion. Two particular important choices for \( f \) are the Laplace and Gaussian kernels:

- (Laplace kernel) \( f(w) = e^{-w}; \)
- (Gaussian kernel) \( f(w) = e^{-w^2/2}. \)

These kernels have been considered in, e.g., [GBR+12, ZZYS20].

**Assumption B (Conditions on the kernel \( f \)).** Suppose that \( f \in \{f_X, f_Y\} \) is four times differentiable on \((0, \infty)\) such that:

1. \( f \) is bounded on \([0, M]\) for any \( M > 0 \).
2. For any \( \varepsilon > 0 \), \( \max_{1 \leq \ell \leq 4} \sup_{x \geq \varepsilon} |f^{(\ell)}(x)| \leq C_\varepsilon \) for some \( C_\varepsilon > 0 \).
3. For any \( \varepsilon > 0 \), there exists some \( c_\varepsilon > 0 \) such that \( \inf_{x \in (\varepsilon, \varepsilon-1)} |f^{(\ell)}(x)| \geq c_\varepsilon \).
4. There exists some \( q > 0 \) such that \( \lim_{x \to 0} \max_{1 \leq \ell \leq 4} x^q |f^{(\ell)}(x)| < \infty \).

In words, Assumption B-(1)(2) require the kernel functions \( f_X, f_Y \) and its derivatives to be appropriately bounded, (3) requires the first derivative to be bounded from below on any compacta in \((0, \infty)\), and finally (4) regulates that the derivatives of \( f_X, f_Y \) up to the fourth order can only blow up at 0 with at most a polynomial rate of divergence. It is easy to check that both the Laplace/Gaussian kernels, and the canonical choice \( f(x) = x \) that recovers the distance covariance (up to a scaling factor) all satisfy Assumption B.

Let \( \rho_X \equiv \tau_X/\gamma_X, \rho_Y \equiv \tau_Y/\gamma_Y \) and

\[
\varrho(\gamma) = \frac{f'_X(\rho_X)f'_Y(\rho_Y)}{\gamma_X \gamma_Y}. \tag{2.10}
\]

We are now ready to state the following non-null CLT for the generalized kernel distance covariance \( dCov^2_s(X, Y; f, \gamma) \); its proof can be found in Appendix E.
Theorem 2.5. Suppose that Assumption B holds, and that (i) the spectrum of Σ (ii) ρ_X,ρ_Y are contained in [1/M,M] for some M > 1. Then there exists some C = C(f,M) > 0 such that
\[ d_{\text{Kol}}\left( \frac{\text{dCov}_n^2(X,Y;f,\gamma)}{\sigma_n^2(X,Y;f,\gamma)} - \mathcal{N}(0,1) \right) \leq \frac{C}{(n \wedge p \wedge q)^{1/6}}. \]
Here \( \sigma_n(X,Y;f,\gamma) = \phi(\gamma)\sigma_n(X,Y) \), where \( \sigma_n(X,Y) \) is defined in Theorem 2.2. In the case \( X = Y \), the conclusion continues to hold if (i) is replaced by: (i') the spectrum of \( \Sigma_X \) is contained in \([1/M,M]\) for some \( M > 1 \).

We note that the conditions posed in the above theorem are not the weakest possible; for instance one may relax all the conditions on the kernels \( f = (f_X,f_Y) \) and \( (\rho_X,\rho_Y) \) to some growth conditions involving \( n,p,q \) at the cost of a more involved error bound, but we have stated the current formulation to avoid unnecessary digressions.

The key step in the proof of Theorem 2.5 is to reduce the analysis of \( \text{dCov}_n^2(X,Y;f,\gamma) \) with general kernels \( f \) to that of the canonical \( \text{dCov}_n^2(X,Y) \). Analogous to the (1.1) for the canonical distance covariance, let
\[
U_{f_X,\gamma_X}(x_1,x_2) \equiv f_X(\|x_1 - x_2\|/\gamma_X) - Ef_X(\|x_1 - X\|/\gamma_X) - Ef_X(\|X - x_2\|/\gamma_X) + Ef_X(\|X - X'/\gamma_X),
\]
\[
V_{f_Y,\gamma_Y}(y_1,y_2) \equiv f_Y(\|y_1 - y_2\|/\gamma_Y) - Ef_Y(\|y_1 - Y\|/\gamma_Y) - Ef_Y(\|Y - y_2\|/\gamma_Y) + Ef_Y(\|Y - Y'/\gamma_Y).\]

Then it is shown in Lemma E.5 that
\[ U_{f_X,\gamma_X} \approx \frac{f_X(\rho_X)}{\gamma_X} U, \quad V_{f_Y,\gamma_Y} \approx \frac{f_Y(\rho_Y)}{\gamma_Y} V, \]

hence with appropriate control on the remainder terms, it follows from the \( U \)-statistic representation in (2.7) that
\[ \text{dCov}_n^2(X,Y;f,\gamma) \approx \frac{f_X(\rho_X)}{\gamma_X} \frac{f_Y(\rho_Y)}{\gamma_Y} \text{dCov}_n^2(X,Y) = \phi(\gamma) \text{dCov}_n^2(X,Y). \]

Following this line of arguments, we are then able to study the asymptotics of \( \text{dCov}_n^2(X,Y;f,\gamma) \) and \( \text{dCov}_n^2(X,Y) \) in a unified manner; see Appendix E for detailed arguments.

2.4. Local CLTs. As a corollary of the non-null CLT in Theorem 2.2, we state below a local CLT that will be important to obtain the power formula for the distance correlation test introduced in (1.6). Its proof is presented in Section 11.

Theorem 2.6. Suppose that the spectrum of \( \Sigma \) is contained in \([1/M,M]\) for some \( M > 1 \). Let
\[ A(\Sigma) \equiv \frac{n\|\Sigma_{XY}\|_F^2}{\|\Sigma_X\|_F\|\Sigma_Y\|_F}. \]

Then there exists some constant \( C = C(M) > 0 \) such that
\[ d_{\text{Kol}}\left( \frac{n(\tau_X\tau_Y - \|\Sigma_{XY}\|_F^2)}{\sqrt{2\|\Sigma_X\|_F\|\Sigma_Y\|_F}},\mathcal{N}(0,1) \right) \leq C \left( 1 \wedge \left( \frac{1}{n \wedge p \wedge q} \right)^{1/6} \right). \]
If Assumption $B$ holds and $\rho_X, \rho_Y$ are contained in $[1/M, M]$ for some $M > 1$, then the above conclusion holds with $dCov^2_2(X, Y)$ replaced by $dCov^2_2(X, Y; f, \gamma)/\varrho(\gamma)$ and $C$ replaced by $C' = C'(M, f)$.

The definition of the local (contiguity) parameter $A(\Sigma)$ is motivated by the critical parameter in the power expansion formula of the (generalized kernel) distance correlation test in Theorem 3.1 below. The interesting phenomenon in the local central limit theorem above is that in the local (contiguity) regime $\lim A(\Sigma) < \infty$, a central limit theorem holds for $dCov^2_2(X, Y)$ and $dCov^2_2(X, Y; f, \gamma)/\varrho(\gamma)$ with the null variance $\sigma^2_{null}$ in (1.5), i.e., the variance under $\Sigma_{XY} = 0$. Of course, this necessarily implies that (recall $\bar{\sigma}^2_n \equiv \sigma^2_n(X, Y)$ defined in Theorem 2.2)

$$\frac{\bar{\sigma}^2_n}{\sigma^2_{null}} \to 1, \quad \text{if} \quad \lim A(\Sigma) < \infty,$$

which can be verified via elementary calculations (see e.g. (11.2) ahead). This fact will be crucial in Theorem 3.1 ahead, where we obtain the asymptotic exact power formula for the distance correlation test using the distance correlation itself (or equivalently, $A(\Sigma)$) as the critical parameter.

3. Generalized kernel distance correlation tests

In this section, we study the performance of the distance correlation test $\Psi(X, Y; \alpha)$ in (1.6) and its kernel generalizations for the null hypothesis $H_0 : X$ is independent of $Y$, or equivalently under our Gaussian assumption, $\Sigma_{XY} = 0$.

Let us start with a motivation for the test $\Psi(X, Y; \alpha)$ in (1.6) by explaining its connection to the non-null CLT derived in Theorem 2.2 for the sample distance covariance $dCov^2_2(X, Y)$. The null part of Theorem 2.2 (i.e., the case of independent $X$ and $Y$) motivates the following ‘oracle’ independence test: for any prescribed size $\alpha \in (0, 1)$,

$$\tilde{\Psi}(X, Y; \alpha) \equiv 1\left(\frac{|dCov^2_2(X, Y)|}{\bar{\sigma}^2_{null}} > z_{\alpha/2}\right),$$

(3.1)

where $\bar{\sigma}^2_{null}$ is the variance of $dCov^2_2(X, Y)$ under the null in (1.5). Since $dCov^2_2(X, Y) = 0$ under the null, Theorem 2.2 implies immediately that the above test has an asymptotic size of $\alpha$. The test $\tilde{\Psi}(X, Y; \alpha)$, however, is not practical because even under the null, $\bar{\sigma}^2_{null}$ might still depend on the unknown marginal distributions of $X$ and $Y$. To see the connection between $\tilde{\Psi}(X, Y; \alpha)$ in (3.1) and $\Psi(X, Y; \alpha)$ in (1.6), note that by some preliminary variance bounds, $dCov^2_2(X)$ and $dCov^2_2(Y)$ appearing in the denominator of $\Psi(X, Y; \alpha)$ in (1.6) will concentrate around their mean values $dCov^2_2(X)$ and $dCov^2_2(Y)$ respectively (cf. Lemma 12.1). Furthermore, by the mean and variance formula in (1.4) and (1.5) (cf. Theorems 8.5 and 9.12),

$$\bar{\sigma}^2_{null} = \frac{2(1 + \sigma(1))}{n^2} dCov^2_2(X) dCov^2_2(Y).$$

The above identity implies the asymptotic equivalence between $\tilde{\Psi}(X, Y; \alpha)$ in (3.1) and $\Psi(X, Y; \alpha)$ in (1.6) under the null, showing in particular that $\Psi(X, Y; \alpha)$ will also have an asymptotic size of $\alpha$. The rest of the section is devoted to studying the power asymptotics of $\Psi(X, Y; \alpha)$ and its kernel generalizations.
3.1. **Power universality.** Recall the generalized kernel distance covariance in (2.9) with kernel functions $f = (f_X, f_Y)$ and bandwidth parameters $\gamma = (\gamma_X, \gamma_Y)$. Let the generalized kernel distance correlation test, i.e., a kernelized version of $\Psi(X, Y; \alpha)$, be defined by

$$
\Psi_{f,\gamma}(X, Y; \alpha) = 1 \left( \frac{1}{\sqrt{2dCov^2(X, \gamma) \cdot dCov^2(Y, \gamma)}} \right) > z_{\alpha/2}.
$$

(3.2)

The factor $n$ in the definition above is sometimes replaced by $\sqrt{n(n-1)}$ (e.g. [GFLS21]), but this will make no difference in the theory below. Using the (local) central limit theorems derived in Theorem 2.6, the following result gives a unified power expansion formula for the distance correlation test $\Psi(X, Y; \alpha)$ and the generalized kernel distance correlation test $\Psi_{f,\gamma}(X, Y; \alpha)$. Its proof can be found in Section 12.

**Theorem 3.1.** Suppose that the spectrum of $\Sigma$ is contained in $[1/M, M]$ for some $M > 1$. Then there exists some constant $C = C(\alpha, M) > 0$ such that

$$
\left| \mathbb{E}_{\Sigma} \Psi(X, Y; \alpha) - \mathbb{P}(\mathcal{N}(m_n(\Sigma), 1) > z_{\alpha/2}) \right| \leq \frac{C}{(n \wedge p \wedge q)^{1/2}}.
$$

Here $m_n(\Sigma)$ can be either

$$
\frac{n \text{dCov}^2(X, Y)}{\sqrt{2 \text{dCov}^2(X, X) \text{dCov}^2(Y, Y)}} = \frac{n \text{dCov}^2(X, Y)}{\sqrt{2}} \quad \text{or} \quad \frac{n \|\Sigma_{XY}\|^2_F}{\sqrt{2}\|\Sigma_X\|_F \|\Sigma_Y\|_F} = \frac{\Lambda(\Sigma)}{\sqrt{2}}.
$$

If Assumption B holds and $\rho_X, \rho_Y$ are contained in $[1/M, M]$ for some $M > 1$, then the above conclusion holds with $\Psi(X, Y; \alpha)$ replaced by $\Psi_{f,\gamma}(X, Y; \alpha)$ and $C$ replaced by $C' = C'(\alpha, M, f) > 0$.

A direct message of the above theorem is that, interestingly, for a large class of kernels $f = (f_X, f_Y)$ and bandwidth parameters $\gamma = (\gamma_X, \gamma_Y)$, the generalized kernel distance correlation test $\Psi_{f,\gamma}(X, Y; \alpha)$ in (3.2) exhibits exactly the same power behavior with the distance correlation test $\Psi(X, Y; \alpha)$ in (1.6) in the high dimensional limit $n \wedge p \wedge q \to \infty$. Here we have focused on deterministic choices of $\gamma_X, \gamma_Y$ merely for simplicity of exposition; analogous results for data driven choices of $\gamma_X, \gamma_Y$ can also be proved with further concentration arguments, for instance for the popular choice

$$
\gamma_X \equiv \text{median}\{\|X_s - X_t\| : s \neq t\}, \quad \gamma_Y \equiv \text{median}\{\|Y_s - Y_t\| : s \neq t\}.
$$

We omit formal developments of these digressive lines here.

The proof of Theorem 3.1 crucially depends on the local central limit theorem in Theorem 2.6. An interesting feature of Theorem 3.1 is that although one may expect that the power formula of the distance correlation test $\Psi(X, Y; \alpha)$ in (1.6) and the generalized kernel distance correlation test $\Psi_{f,\gamma}(X, Y; \alpha)$ in (3.2) involves the complicated expression of the variance $\tilde{\sigma}_n^2$ in Theorem 2.2, in fact only the null variance plays a role as in Theorem 2.6. The main reason for this phenomenon to occur is due to the fact that the regime in which the local central theorem in Theorem 2.6 with the null variance holds covers the entire local contiguity regime $\lim A(\Sigma) < \infty$. In other words:

- In the contiguity regime $\lim A(\Sigma) < \infty$, the ratio of the non-null variance and the null variance is asymptotically 1, cf. (2.12).
In the large departure regime $A(\Sigma) \to \infty$, both the distance correlation test $\Psi(X, Y; \alpha)$ in (1.6) and the generalized kernel distance correlation test $\Psi_{f,\gamma}(X, Y; \alpha)$ in (3.2) achieve asymptotically full power.

As a result, the ‘driving parameter’ $n \, d\text{Cor}^2(X, Y)/\sqrt{2}$ (or equivalently $A(\Sigma)/\sqrt{2}$) in the power formula for the distance correlation test $\Psi(X, Y; \alpha)$ in (1.6) and its kernelized version $\Psi_{f,\gamma}(X, Y; \alpha)$ in (3.2), inherited from the local CLT in Theorem 2.6 is in a similar form of the test itself, although its proof to reach such a conclusion is far from being obvious.

3.2. Minimax optimality. Theorems 3.1 directly implies a separation rate for the (generalized) distance correlation test in the Frobenius norm $\| \cdot \|_F$ in a minimax framework. To formulate this, for any $\zeta > 0$ and $\Sigma_0 \equiv \text{diag}(\Sigma_X, \Sigma_Y)$, consider the alternative class

$\Theta(\zeta, \Sigma_0) \equiv \{ \Sigma = \begin{pmatrix} \Sigma_X & \Sigma_{XY} \\ \Sigma_{YX} & \Sigma_Y \end{pmatrix} \in \mathbb{R}^{(p+q)\times(p+q)} : \|\Sigma_{XY}\|_F > \zeta \sqrt{pq/n} \}.$

A direct consequence of Theorem 3.1 is the following (for simplicity we only state the result for the distance correlation test $\Psi(X, Y; \alpha)$ in (1.6)).

**Corollary 3.2.** Fix $\alpha \in (0, 1)$. Suppose that the spectrum of $\Sigma$ is contained in $[1/M, M]$ for some $M > 1$. Then there exists some constant $C = C(\alpha, M) > 0$ such that the distance correlation test (1.6) satisfies

$$\sup_{\Sigma \in \Theta(\zeta, \Sigma_0)} (\mathbb{E}_{\Sigma_0} \Psi(X, Y; \alpha) + \mathbb{E}_\Sigma (1 - \Psi(X, Y; \alpha))) \leq \alpha + C \left[ e^{-\zeta^2/C} + \frac{1}{(n \wedge p \wedge q)^{1/2}} \right].$$

In particular, the above corollary shows that the distance correlation test (1.6) gives a separation rate in $\| \cdot \|_F$ of order $(pq)^{1/4}/n^{1/2}$, i.e., the testing error (Type I + Type II error) on the left side is bounded by any prescribed $\alpha$ for $\zeta \to \infty$ in the regime (1.2). In view of the power universality derived in Theorem 3.1, the above results continues to hold when the distance correlation test $\Psi(X, Y; \alpha)$ in (1.6) is replaced by the generalized kernel distance correlation test $\Psi_{f,\gamma}(X, Y; \alpha)$ in (3.2) under the assumption that Assumption B holds and $\rho_X, \rho_Y$ are contained in $[1/M, M]$ for some $M > 1$.

The separation rate $(pq)^{1/4}/n^{1/2}$ in $\| \cdot \|_F$, as will be shown in the following theorem, cannot be improved in a minimax sense, and therefore the (generalized) distance correlation tests (1.6) and (3.2) are rate-optimal in this minimax sense.

**Theorem 3.3.** Suppose that the spectrum of $\Sigma_X, \Sigma_Y$ is contained in $[1/M, M]$ and $\sqrt{pq}/n \leq M$ for some $M > 1$. Then for any small $\delta \in (0, 1)$, there exists some positive constant $\zeta = \zeta(\delta, M)$ such that

$$\inf_{\Psi} \sup_{\Sigma \in \Theta(\zeta, \Sigma_0)} (\mathbb{E}_{\Sigma_0} \psi(X, Y) + \mathbb{E}_\Sigma (1 - \psi(X, Y))) \geq 1 - \delta,$$

where the infimum is taken over all measurable test functions.

The proof of Theorem 3.3 follows a standard minimax reduction in that we only need to find a prior $\Pi$ on $\Theta(\zeta, \Sigma_0)$ with sufficient separation from $\Sigma_0$, while at the same time the chi-squared divergence between the posterior density corresponding to $\Pi$ and the density corresponding to $\Sigma_0$ is small. For $\Sigma_0 = I$, the prior $\Pi$ we construct takes the form

$$\Sigma_{u,v}(a) = \begin{pmatrix} I_p & a \bar{u}v^T \\ a \bar{u}v^T & I_q \end{pmatrix},$$
with component-wise independent priors $\tilde{u}_i \sim \text{i.i.d. } \sqrt{q} \cdot \text{Unif}\{\pm 1\}$ for $\tilde{u} \in \mathbb{R}^p$ and $\tilde{v}_j \sim \text{i.i.d. } \sqrt{p} \cdot \text{Unif}\{\pm 1\}$ for $\tilde{v} \in \mathbb{R}^q$, and some $a > 0$ to be chosen in the end. The calculations of the chi-squared divergence require an exact evaluation of the eigenvalues of certain inverse of $\Sigma_{u,v}(a)$, which eventually leads to a bound of order $a^4 n^{2/p} q^{3/q}$. So under the constraint that the chi-squared distance is bounded by some sufficiently small constant, the maximal choice $a = a^* \approx n^{-1/2} p^{-3/4} q^{-3/4}$ leads to a minimax separation rate in $\|\cdot\|_{L^2}$ of the order $\|\Sigma_{u,v}(a^*) - I\|_{L^2} \approx \|a^* \tilde{u} \tilde{v}^\top\|_{L^2} = a^2 \|\tilde{u}\|^2 \|\tilde{v}\|^2 = a^2 p^2 q^2 \approx (pq)^{1/2}/n$. Details of the arguments can be found in Section 13.

Remark 3.4. In Theorem 3.3 above, the growth condition $\sqrt{pq}/n \leq M$ for some $M > 1$ is similar to the condition ‘$p/n \leq M$’ in the covariance testing literature (e.g. [CM13]), under which the lower bound construction mentioned above is valid. Whether this condition can be removed (and similarly the condition in [CM13]) remains open.

4. Simulation studies

In this section, we perform a small scale simulation study to validate the theoretical results established in previous sections. We consider the balanced case $p = q$ under the following data-generating scheme: i.i.d. across $j \in [p]$, 

$$(X_j, Y_j) \overset{d}{=} (\sqrt{\rho} Z_1 + \sqrt{1-\rho} Z_2, \sqrt{\rho} Z_1 + \sqrt{1-\rho} Z_3),$$

where $\rho \in (0,1)$ is the dependence parameter, and $Z_1, Z_2, Z_3$ are independent variables with mean zero and variance one. The leading Gaussian case considered in Assumption A corresponds to the setting $Z_1, Z_2, Z_3$ as standard normal variables, in which case we have $\Sigma_X = \Sigma_Y = I_p$ and $\Sigma_X Y = \rho I_p$.

![Figure 1](image-url)  

**Figure 1.** Verification of CLTs. Solid lines correspond to the standard normal quantiles, and dashed lines correspond to sample quantiles with the identity, Gaussian, and Laplace kernels, respectively. Simulation parameters: $(n, p, q) = (1000, 100, 100)$, $B = 200$ replications, bandwidth choices $\rho_X = \rho_Y = \sqrt{2}$ for both Gaussian and Laplace kernels.

We start by verifying the CLTs derived in Theorems 2.2 and 2.6 in Figure 1. We take $\rho = 0$ for the null case and $\rho = 0.1$ for the non-null case, and compare the
normal quantiles with the corresponding sample quantiles. Normal approximation appears to be accurate in all three cases.

Figure 2. Verification of power universality in choice of bandwidth parameter (left and middle) and choice of kernel (right). Solid lines correspond to the standard normal quantiles, and dashed lines correspond to sample quantiles.

Figure 2 verifies power universality demonstrated via Theorem 3.1 in two aspects: (i) the choice of kernel; (ii) the choice of bandwidth parameters $\gamma_X, \gamma_Y$ when using the Gaussian and Laplace kernels. The first two figures illustrates the second point, where the Gaussian and Laplace kernels are used with different bandwidth parameters $\rho_X = \rho_Y \in \{0.5, 1, \sqrt{2}, 5\}$. The third figure uses a fixed bandwidth $\rho_X = \rho_Y = \sqrt{2}$ for both Gaussian and Laplace kernels and compares the performances of different kernels.

Finally we examine the robustness of our theory for non-Gaussian data. We take two choices for $Z_1-Z_3$ in the set-up (4.1): (i) uniform distribution on $[-\sqrt{3}, \sqrt{3}]$; (ii) $t$-distribution with 4 degrees of freedom scaled by $\sqrt{2}$. These parameters are chosen such that $Z_1-Z_3$ have mean zero and variance one. Normal approximation and power universality are examined in Figure 3 for the uniform distribution and the (rescaled) $t$-distribution. These figures suggest that our theory continues to hold for a broader class of data distributions.

5. Concluding remarks and open questions

In this paper, we establish in Theorem 2.2 a general non-null central limit theorem (CLT) for the sample distance covariance $dCov^2(X, Y)$ in the high dimensional regime $n \wedge p \wedge q \to \infty$ under a Gaussian assumption on $(X, Y)$ and a spectral condition on its covariance $\Sigma$. The non-null CLT then applies to obtain a first-order power expansion for the distance correlation test $\Psi(X, Y; \alpha)$ in (1.6):

$$E(\Psi(X, Y; \alpha)) \sim \mathbb{P}\left(N\left(\frac{ndCor^2(X, Y)}{\sqrt{2}}, 1\right) > z_{\alpha/2}\right).$$

The non-null CLT and the power expansion (5.1) are also established for a more general class of Hilbert-Schmidt kernel distance covariance, and the associated generalized kernel distance correlation test $\Psi_{f,\alpha}(X, Y; \alpha)$ in (3.2), under mild conditions on the kernels and the bandwidth parameters. This result in particular implies that the generalized kernel distance correlation test admits a universal power behavior with respect to a wide range of choices of kernels and bandwidth parameters.
An important open question is the universality of the non-null CLT and the power expansion formula (5.1) with respect to the distribution of ($X,Y$). The assumed Gaussianity in this paper is used mainly to give exact moment calculations for $E p(X,Y)$, where $p : \mathbb{R}^p \times \mathbb{R}^q \to \mathbb{R}$ is a polynomial. We believe it is relatively straightforward to extend the results of this paper to the following setting:

$(X_i,Y_i)'s$ ($i = 1, \ldots, n$) are i.i.d. copies of $X^\top(Y^\top)^\top = \Sigma^{1/2}Z$.

Here $Z \in \mathbb{R}^{p+q}$ has i.i.d. components satisfying strong enough moment conditions and a Poincaré inequality: there exists some $c_\ast > 0$ such that $\text{Var}(f(Z_1)) \leq c_\ast E f'(Z_1)^2$ holds for any absolutely continuous function $f$.

In particular, under such a setting, we believe that the non-null CLT in Theorem 2.2 still holds with a modification in the variance formula due to additional terms coming from exact moment calculations, and that the power expansion formula (5.1) also holds.

The more interesting question of greater universality, recorded below, is motivated by the fact that the power expansion formula in the form of (5.1) does not explicitly involve any Gaussianity (or the specific form of $(X,Y)$ assumed above).

**Problem 5.1.** Establish the universality of (5.1) for general data distributions.

Note that in this paper we established (5.1) by a precise mean and variance expansion for the sample distance covariance $dCov_2^2(X,Y)$. This is the place where some specific form of the data generating distribution is crucially used, either
functions in (2.1) involve the square root of the squared $U,V$.

In principle, one can obtain ‘some’ mean and variance formulae for general data distributions by expanding the square root of $X_k - X_\ell$, $Y_k - Y_\ell$ to further sufficient many ‘higher-order terms’ in (6.1) below. However, it seems likely this approach will suffer from significant deficiencies in certain regimes within $n \wedge p \wedge q \to \infty$ as a cost of handling the ‘residual term’ of the highest order. In fact, even with the Gaussian assumption, it is already a fairly complicated task to handle the residual terms sharply enough to allow a mean and variance expansion in the entire regime $n \wedge p \wedge q \to \infty$; see Section 6 below for an outline of the complications involved. A new approach may be needed for this problem.

6. Proof road-map of Theorem 2.2

We give a road-map for the proof of the main Theorem 2.2. The basic strategy is to identify the ‘main terms’ in the Hoeffding decomposition of the 4-th order $U$-statistics representation in Proposition 2.1. An immediate problem is that the $U,V$ functions in (2.1) involve the square root of the squared $\ell_2$ norm which causes differentiability problems. A simple idea is to use the expansion

$$
\|X_1 - X_2\|_{\tau_X} = \left(1 + \frac{\|X_1 - X_2\|^2 - \tau_X^2}{\tau_X^2}\right)^{1/2} \approx \frac{\|X_1 - X_2\|^2 - \tau_X^2}{2\tau_X^2},
$$

$$
\|Y_1 - Y_2\|_{\tau_Y} = \left(1 + \frac{\|Y_1 - Y_2\|^2 - \tau_Y^2}{\tau_Y^2}\right)^{1/2} \approx \frac{\|Y_1 - Y_2\|^2 - \tau_Y^2}{2\tau_Y^2},
$$

(6.1)

as the fluctuation of $\|X_1 - X_2\|^2$ (resp. $\|Y_1 - Y_2\|^2$) around $\tau_X^2$ (resp. $\tau_Y^2$) is expected to be of smaller order than $\tau_X^2$ (resp. $\tau_Y^2$) in high dimensions. Proceeding with this heuristic, with some book-keeping calculations, we may obtain the following approximation of $U,V$ functions:

$$
U(x_1, x_2) \approx -x_1^\top x_2 / \tau_X, \quad V(y_1, y_2) \approx -y_1^\top y_2 / \tau_Y.
$$

(6.2)

Now if we replace $U,V$ in the $k$ function defined in (2.7) with the above approximation (6.2), the approximate first- and second-order kernels $g_{1,*}, g_{2,*}$ associated with the $k$ function may be computed as follows:

$$
g_{1,*}(x_1, y_1) \equiv \frac{1}{2\tau_X \tau_Y} \left[ (x_1^\top \Sigma_{XY} y_1 - \|\Sigma_{XY}\|_F^2) \right],
$$

$$
g_{2,*}(x_1, y_1, x_2, y_2) \equiv \frac{1}{6\tau_X \tau_Y} \left[ (x_1^\top x_2 y_1^\top y_2 - x_1^\top \Sigma_{XY} y_1 - x_2^\top \Sigma_{XY} y_2 + \|\Sigma_{XY}\|_F^2) \right.

- \left. (x_1^\top \Sigma_{XY} y_2 + x_2^\top \Sigma_{XY} y_1) \right].
$$

Although the heuristic so far seems plausible, it turns out that the above approximation falls short of fully capturing the behavior of the sample distance covariance, even pretending that the effect of higher order kernels can be neglected. In fact, the approximation (6.2) is not good enough, in a somewhat subtle way, in the entire high-dimensional regime $p \wedge q \to \infty$: The first-order kernel $g_{1,*}$ requires the
Using the estimates in (1), validate that the corrected first-order kernel \( \tilde{g}_{1,*}(x_1, y_1) \)

\[ \frac{1}{2r_X r_Y} \left[ \frac{\| \Sigma_X Y \|_F^2}{2r_X^2} (\|x_1\|^2 - \text{tr}(\Sigma_X)) + \frac{\| \Sigma_X Y \|_F^2}{2r_Y^2} (\|y_1\|^2 - \text{tr}(\Sigma_Y)) \right], \]

whereas, interestingly, no correction is required for the second-order kernel \( g_{2,*} \).

The underlying reason for the correction terms in the first-order kernel appears to be non-negligible interaction of the approximation of \( U, V \) in (6.1), while such interaction is of a strict smaller order in the second-order kernel approximation. In fact, the correction terms in \( \tilde{g}_{1,*}(x_1, y_1) \) above contributes to the difficult terms of negative signs in the first-order variance \( \tilde{\sigma}^2_{XY}(X, Y) \) in Theorem 2.2. As a consequence, the variance of \( g_{1,*} \) and \( \tilde{g}_{1,*} \) are of the same order but not asymptotically equivalent. Of course, at this point there is no apriori reason to explain why the correction terms must take this form—they come out of exact calculations.

From here, a road-map of the proof of Theorem 2.2 can be outlined:

1. Derive sharp enough estimates for the approximation errors of \( U, V \) in (6.2) and their interactions. This will be detailed in Section 8. These sharp enough estimates will immediately give a mean expansion for the sample distance covariance in Theorem 8.5.

2. Using the estimates in (1), validate that the corrected first-order kernel \( \tilde{g}_{1,*} \) and the vanilla second-order kernel \( g_{2,*} \) are indeed ‘good enough main terms’ to approximate the sample distance covariance. This is done via variance considerations detailed in Section 9. As a result, a sharp variance expansion of the sample distance covariance is obtained in Theorem 9.12.

3. Using the mean and variance expansion established in (1)-(2), we establish a non-null CLT for the ‘good enough main terms’ involving the kernels \( \tilde{g}_{1,*} \) and \( g_{2,*} \). The main tool is Chatterjee’s discrete second-order Poincaré inequality [Cha08]. This is accomplished in Section 10.

Finally Section 11 assembles all these steps to complete the proof for Theorem 2.2. In the next Section 7 below, we record some further notations and preliminary results that will be used throughout the proofs.

## 7. Proof preliminaries

### 7.1. \( G_{[:]} \) and \( H_{[:]} \)

Let \( I_{[ij]} \equiv (1_{(i', j')=(i,j)})_{1 \leq i', j' \leq 2} \) be the indicator of the block matrix, and \( \Sigma_{[ij]} \equiv (\Sigma_{(i', j')=(i,j)})_{1 \leq i', j' \leq 2} \). Let

\[ G_{[ij]} \equiv \Sigma^{1/2}_{[ij]} \Sigma^{1/2}, \quad H_{[ij]} \equiv \Sigma^{1/2} I_{[ij]} \Sigma^{1/2}. \]

Then \( G_{[ij]} = G_{[ji]} \) and \( H_{[ij]} = H_{[ji]} \). Let \( \tilde{G}_{[1,2]} \equiv (G_{[12]} + G_{[21]})/2 \).

We summarize some basic properties of these matrices below.

**Lemma 7.1.** The following hold.

1. \( H_{[11]}^2 = G_{[11]}, H_{[22]}^2 = G_{[22]}, H_{[11]} H_{[22]} = G_{[12]}, H_{[22]} H_{[11]} = G_{[21]} \).
2. \( \| G_{[11]} \|_F^2 = \| \Sigma_X \|_F^2, \| G_{[22]} \|_F^2 = \| \Sigma_Y \|_F^2, \| G_{[12]} \|_F^2 = \| G_{[21]} \|_F^2 = \| \Sigma_{XY} \|_F^2 \).
3. \( \text{tr}(G_{[11]}) = \| \Sigma_X \|_F^2, \text{tr}(G_{[22]}) = \| \Sigma_Y \|_F^2, \text{tr}(G_{[12]}) = \text{tr}(G_{[21]}) = \| \Sigma_{XY} \|_F^2 \).
4. \( \| H_{[11]} \|_F^2 = \| \Sigma_X \|_F^2, \| H_{[22]} \|_F^2 = \| \Sigma_Y \|_F^2, \| H_{[12]} \|_F^2 = \| H_{[21]} \|_F^2 = \| \Sigma_{XY} \|_F^2 \).
5. \( \text{tr}(H_{[11]}) = \text{tr}(\Sigma_X), \text{tr}(H_{[22]}) = \text{tr}(\Sigma_Y), \text{tr}(G_{[12]}) = \text{tr}(G_{[21]}) = \text{tr}(\Sigma_{XY}) \).
6. \( \text{tr}(\tilde{G}_{[11]} G_{[22]}) = \text{tr}(G_{[12]} G_{[21]})) = \text{tr}(\Sigma_X \Sigma_{XY} \Sigma_Y \Sigma_{XY}) \).

**Proof.** These claims follow from direct calculations so we omit the details. \( \square \)
7.2. The function \( h \). Let
\[
 h(u) \equiv \sqrt{1 + u} - 1 - \frac{u}{2} = -\frac{u^2}{4} \int_0^1 \frac{(1-s)}{(1+su)^{3/2}} \, ds. \tag{7.1}
\]
We summarize below some basic properties of \( h \).

**Lemma 7.2.** We have
\[
|h(u)| \lesssim u^2, \quad |h'(u)| \lesssim \frac{|u|}{(1+u)^{1/2}}, \quad u > -1.
\]
Furthermore,
\[
 h(u) = -\frac{u^2}{8} + \frac{u^3}{16} - u^4 \int_0^1 \frac{5(1-s)^3}{32(1+su)^{7/2}} \, ds \equiv -\frac{u^2}{8} + h_3(u).
\]

**Proof.** The bound for \( h \) follows by considering two regimes \( u \in [-1, -1/2] \) and \( u > -1/2 \) separately. In particular, for \( u \in [-1, -1/2] \), \( |h(u)| = |\sqrt{1+u}-1-u/2| \lesssim 1 \). For \( u > -1/2 \), \( \inf_{s \in [0,1]} (1+su)^{3/2} \gtrsim 1 \) so using the second equality of (7.1) leads to the bound \( |h(u)| \lesssim u^2 \). Combining the two cases to conclude \( |h(u)| \lesssim u^2 \) for \( u > -1 \). Next, as
\[
h''(u) = -\frac{1}{4(1+u)^{3/2}}, \quad h^{(3)}(u) = \frac{3}{8(1+u)^{5/2}}, \quad h^{(4)}(u) = -\frac{15}{16(1+u)^{7/2}},
\]
by Taylor expansion,
\[
h(u) = -\frac{1}{4} \int_0^u \frac{u-t}{(1+t)^{3/2}} \, dt
= \frac{h''(0)}{2} u^2 + u^3 \int_0^1 h^{(3)}(su) \frac{(1-s)^2}{2} \, ds = -\frac{u^2}{8} + u^3 \int_0^1 \frac{3(1-s)^2}{16(1+su)^{5/2}} \, ds
= \frac{h''(0)}{2} u^2 + \frac{h^{(3)}(0)}{6} u^3 + u^4 \int_0^1 h^{(4)}(su) \frac{(1-s)^3}{6} \, ds
= -\frac{u^2}{8} + \frac{u^3}{16} - u^4 \int_0^1 \frac{5(1-s)^3}{32(1+su)^{7/2}} \, ds.
\]
The bound for \( h' \) follows by noting that \( h'(u) = 2^{-1}(1-\sqrt{1+u})/\sqrt{1+u} \) and \( |1-\sqrt{1+u}| \lesssim |u| \). \( \square \)

7.3. \( L_X, L_Y \) and \( R_X, R_Y \). Let
\[
 L_X(x_1, x_2) \equiv \frac{\|x_1 - x_2\|^2 - \tau_X^2}{\tau_X^2} \geq -1, \quad R_X(x_1, x_2) \equiv h(L_X(x_1, x_2))
\]
\[
 L_Y(y_1, y_2) \equiv \frac{\|y_1 - y_2\|^2 - \tau_Y^2}{\tau_Y^2} \geq -1, \quad R_Y(y_1, y_2) \equiv h(L_Y(y_1, y_2)), \tag{7.2}
\]
and the double centered quantities
\[
 \bar{R}_X(x_1, x_2) \equiv R_X(x_1, x_2) - \mathbb{E}[R_X(x_1, X)] - \mathbb{E}[R_X(X, x_2)] + \mathbb{E}[R_X(X, X')],
\]
\[
 \bar{R}_Y(y_1, y_2) \equiv R_Y(y_1, y_2) - \mathbb{E}[R_Y(y_1, Y)] - \mathbb{E}[R_Y(Y, y_2)] + \mathbb{E}[R_Y(Y, Y')].
\]

Using these quantities, we may represent the square root of the Euclidean distance as follows.
Lemma 7.3. The following hold:
\[
\frac{\|x_1 - x_2\|}{\tau_X} \equiv 1 + \frac{L_X(x_1, x_2)}{2} + R_X(x_1, x_2) = 1 + \frac{L_X(x_1, x_2)}{2} + h(L_X(x_1, x_2)),
\]
\[
\frac{\|y_1 - y_2\|}{\tau_Y} \equiv 1 + \frac{L_Y(y_1, y_2)}{2} + R_Y(y_1, y_2) = 1 + \frac{L_Y(y_1, y_2)}{2} + h(L_Y(y_1, y_2)),
\]
and
\[
U(x_1, x_2) = -\frac{1}{\tau_X} \left( x_1^\top x_2 - \tau_X^2 \tilde{R}_X(x_1, x_2) \right),
\]
\[
V(y_1, y_2) = -\frac{1}{\tau_Y} \left( y_1^\top y_2 - \tau_Y^2 \tilde{R}_Y(y_1, y_2) \right).
\]

Proof. The first two equations follow from the definition. For the second two equations, note that by definition of \(U(x_1, x_2)\),
\[
U(x_1, x_2) = \frac{\tau_X}{2} \left[ \|x_1 - x_2\|^2/\tau_X^2 - E[\|x_1 - X\|^2/\tau_X^2] 
- E[\|X - X - \|X - X\|^2/\tau_X^2] + 2\tilde{R}_X(x_1, x_2) \right] = -\frac{1}{\tau_X} \left( x_1^\top x_2 - \tau_X^2 \tilde{R}_X(x_1, x_2) \right),
\]
as desired. Similar derivation applies to \(V(y_1, y_2)\). \(\Box\)

The following moment estimate will be used repeatedly.

Lemma 7.4. The following moment estimates hold:

(1) For any positive integer \(s \in \mathbb{N}\),
\[
E L_X^s(X_1, X_2) \lesssim_s \tau_X^{-2s} \|\Sigma_X\|_F^s, \quad E L_Y^s(Y_1, Y_2) \lesssim_s \tau_Y^{-2s} \|\Sigma_Y\|_F^s.
\]

(2) For any positive integer \(s \in \mathbb{N}\),
\[
E R_X^s(X_1, X_2) \lesssim_s \tau_X^{-4s} \|\Sigma_X\|_F^{2s}, \quad E R_Y^s(Y_1, Y_2) \lesssim_s \tau_Y^{-4s} \|\Sigma_Y\|_F^{2s}.
\]

Consequently the same estimates hold with \(E R_X^s(X_1, X_2), E R_Y^s(Y_1, Y_2)\) replaced by their double-centered analogues \(E R_X^s(X_1, X_2), E R_Y^s(Y_1, Y_2)\).

(3) Suppose the spectrum of \(\Sigma_X, \Sigma_Y\) is contained in \([1/M, M]\) for some \(M > 1\). Then for any positive integer \(s \in \mathbb{N}\), for \(p \wedge q \geq 2s + 1\),
\[
E h'(L_X(X_1, X_2))^s \lesssim_{M,s} \tau_X^{-s}, \quad E h'(L_Y(Y_1, Y_2))^s \lesssim_{M,s} \tau_Y^{-s}.
\]

Proof. (1). This claim follows immediately by Hanson-Wright inequality. 
(2). As \(|h(u)| \lesssim u^2\), we have
\[
E R_X^s(X_1, X_2) = E h'(L(X_1, X_2))^s \lesssim E L_X^s(X_1, X_2) \lesssim_s \tau_X^{-4s} \|\Sigma_X\|_F^{2s}.
\]
The bound for \(R_Y\) is similar.
(3). As \(|h'(u)| \lesssim |u|/(1 + u)^{1/2}\), we have
\[
E h'(L_X(X_1, X_2))^s \lesssim E \left[ \frac{|L_X(X_1, X_2)|^s}{(1 + L_X(X_1, X_2))^{s/2}} \right] \leq E^{1/2} L_X^s(X_1, X_2) \cdot E^{1/2} (1 + L_X(X_1, X_2))^{-s} \lesssim_{M,s} \tau_X^{-2s} \|\Sigma_X\|_F^s.
\]
Here in the last inequality we used that for \(p \geq 2s + 1\),
\[
E (1 + L_X(X_1, X_2))^{-s} = \tau_X^{2s} \cdot E \|X_1 - X_2\|^{-2s}
\]
\[ \sum_{i=1}^{n} \tau_X^2 \cdot \mathbb{E}\left( \sum_{\ell=1}^{p} Z_{\ell}^2 \right)^{-s} \lesssim \tau_X^2 p^{-s} \lesssim_M 1. \]  

(7.4)

The proof is complete. \qed

8. Residual estimates and mean expansion

8.1. Residual estimates. Let

\[
\begin{align*}
\psi_X(x_1, y_1) &\equiv \mathbb{E}_{X_2, Y_2} [\tilde{R}_X(x_1, X_2)Y_2^\top y_1], \\
\psi_Y(x_1, y_1) &\equiv \mathbb{E}_{X_2, Y_2} [\tilde{R}_Y(y_1, Y_2)X_2^\top x_1], \\
\psi_{X,Y}(x_1, y_1) &\equiv \mathbb{E}_{X_2, Y_2} [\tilde{R}_X(x_1, X_2)\tilde{R}_Y(y_1, Y_2)].
\end{align*}
\]

(8.1)

In view of Lemma 7.3, these terms appear naturally as the interaction error terms when \(U(x_1, x_2)V(y_1, y_2)\) is approximated using (6.2). As mentioned in Section 6, sharply controlling these ‘residual terms’ constitutes the first crucial step in the proof of Theorem 2.2.

First, we have the following representation of \(\psi_X(x_1, y_1), \psi_Y(x_1, y_1)\).

**Lemma 8.1.** The following decomposition holds:

\[
\begin{align*}
\psi_X(x_1, y_1) &= A_{1,X}(x_1, y_1) + A_{2,X}(x_1, y_1), \\
\psi_Y(x_1, y_1) &= A_{1,Y}(x_1, y_1) + A_{2,Y}(x_1, y_1).
\end{align*}
\]

Here

\[
\begin{align*}
A_{1,X}(x_1, y_1) &= \frac{1}{2\tau_X^2} \left[ (\|x_1\|^2 - \text{tr}(\Sigma_X))x_1^\top \Sigma_{XY}y_1 + 2x_1^\top \Sigma_X \Sigma_{XY}y_1 \right], \\
A_{1,Y}(x_1, y_1) &= \frac{1}{2\tau_Y^2} \left[ (\|y_1\|^2 - \text{tr}(\Sigma_Y))x_1^\top \Sigma_{XY}y_1 + 2x_1^\top \Sigma_X \Sigma_{XY}y_1 \right],
\end{align*}
\]

and

\[
\begin{align*}
A_{2,X}(x_1, y_1) &= \mathbb{E} \left[ h_3(L_X(x_1, X)) (Y^\top y_1) \right], \\
A_{2,Y}(x_1, y_1) &= \mathbb{E} \left[ h_3(L_Y(y_1, Y)) (X^\top x_1) \right],
\end{align*}
\]

with \(h_3\) defined in Lemma 7.2.

**Proposition 8.2.** Suppose that the spectrum of \(\Sigma\) is contained in \([1/M, M]\) for some \(M > 1\), and that \(p, q\) are larger than a big enough absolute constant.

(1) (First moments) The following hold:

\[
\tau_X^2 \|\mathbb{E}\psi_X(X_1, Y_1)\| \leq_M \|\Sigma_{XY}\|^2_F.
\]

(2) (Second moments) The following hold:

\[
\begin{align*}
\tau_X^4 \mathbb{E}\psi_X^2(X_1, Y_1) \bigvee \tau_Y^4 \mathbb{E}\psi_Y^2(X_1, Y_1) \\
\bigvee \tau_X^4 \tau_Y^4 (\tau_X \land \tau_Y)^2 \mathbb{E}\psi_{X,Y}^2(X_1, Y_1) \leq_M \|\Sigma_{XY}\|^2_F (1 \lor \|\Sigma_{XY}\|^2_F).
\end{align*}
\]

The claims remain valid with \(X = Y\) when the spectrum of \(\Sigma_X = \Sigma_Y\) is contained in \([1/M, M]\) for some \(M > 1\).
The role and sharpness of these bounds will be gradually clear in later sections. In particular, these bounds will be essential in the proof of the mean expansion Theorem 8.5 and the variance expansion Theorem 9.12 ahead.

Note that here the first moment bounds in Proposition 8.2 do not follow directly by the stated second moment bounds, as the ‘first moments’ here are obtained by first taking expectation followed by the absolute value. In fact, these first moment estimates are stronger by those derived directly from the second moment estimates, indicating the essential role of the order of taking expectation and absolute value in this setting.

An important feature of the bounds in Proposition 8.2 above is that when $\Sigma_{XY} = 0$, all estimates reduce to 0. Furthermore the exponent in $\|\Sigma_{XY}\|_F \tau_X \tau_Y$ also need be correct to allow precise mean and variance expansions in Theorems 8.5 and 9.12, and therefore the non-null CLT in Theorem 2.2, under the entire high dimensional regime $n \wedge p \wedge q \to \infty$. It is for this reason that the proof of Proposition 8.2 is rather involved, the details of which can be found in Appendix B. The following lemmas are representative in terms of the techniques in proving Proposition 8.2 and may be of broader interest.

**Lemma 8.3.** Suppose that $\psi : \mathbb{R} \to \mathbb{R}$ is a smooth function, and that the spectrum of $\Sigma_X$ is contained in $[1/M, M]$ for some $M > 1$. Then

$$\left| \mathbb{E} \left[ \psi(L_X(X_1, X_2))Y_1^\top Y_2 \right] \right| \lesssim_M \mathbb{E}^{1/2}(\psi \circ L_X)^2 \cdot \|\Sigma_{XY}\|_F^2.$$

**Lemma 8.4.** Suppose the spectrum of $\Sigma$ is contained in $[1/M, M]$ for some $M > 1$. Let $\psi_{X,Y} : \mathbb{R} \to \mathbb{R}$ be smooth functions. For any $k, k', \ell, \ell' \in \{1, 2\}$, define

$$\psi_{X,Y}(\Sigma_{XY}) \equiv \mathbb{E} \left[ \psi_X(L_X(X_k, X_{k'})) \psi_Y(L_Y(Y_{\ell'}, Y_{\ell'})) \right].$$

Then

$$\mathbb{E} \left( \psi_{X,Y}(\Sigma_{XY}) - \psi_{X,Y}(0) \right)^2 \lesssim_M \|\Sigma_{XY}\|_F^2 \left( 1 \vee \|\Sigma_{XY}\|_F^2 \right) \times \left( \tau_X^{-4} \cdot \mathbb{E}^{1/4}(\psi_X' \circ L_X)^8 \cdot \mathbb{E}^{1/4}(\psi_Y' \circ L_Y)^8 + \tau_Y^{-4} \cdot \mathbb{E}^{1/4}(\psi_Y' \circ L_Y)^8 \cdot \mathbb{E}^{1/4}(\psi_X' \circ L_X)^8 \right).$$

The claims remain valid with $X = Y$ when the spectrum of $\Sigma_X = \Sigma_Y$ is contained in $[1/M, M]$ for some $M > 1$.

Lemma 8.3 gives a generic method of controlling the ‘first moment’ (first taking expectation than absolute value), and Lemma 8.4 gives a general recipe of bounding the second moment, in terms of the dependence measure $\|\Sigma_{XY}\|_F$. These lemmas are proved by different methods: The proof of Lemma 8.3 utilizes an explicit representation of $(X, Y) \overset{d}{=} (\Sigma_{X}^{1/2}Z_X, \Sigma_{Y \setminus X}^{1/2}Z_Y + \Sigma_{X}Z_X^{-1/2}Z_X)$, where $Z = (Z_X^\top, Z_Y^\top)^\top \sim \mathcal{N}(0, I_{p+q})$; while the proof of Lemma 8.4 depends on an interpolation technique that finds the matrix derivatives of $\Sigma_{XY} \mapsto \psi_{X,Y}(\Sigma_{XY})$. Details see Appendix B.

### 8.2. Mean expansion

As a quick application of the residual estimates in Proposition 8.2, we may get the following mean expansion.

**Theorem 8.5.** Suppose that the spectrum of $\Sigma$ is contained in $[1/M, M]$ for some $M > 1$. Then the following expansion holds for the distance covariance:

$$m_{\Sigma} = \mathbb{E}_{\Sigma} \text{dCov}_2^2(X, Y) = \text{dCov}^2(X, Y) = \frac{\|\Sigma_{XY}\|_F^2}{\tau_X \tau_Y} \left[ 1 + O_M \left( (\tau_X \wedge \tau_Y)^{-1} \right) \right].$$
The claims remain valid with \( X = Y \) when the spectrum of \( \Sigma_X = \Sigma_Y \) is contained in \([1/M, M]\) for some \( M > 1 \).

Proof. Note that
\[
\text{dCov}^2(X, Y) = \mathbb{E}[U(X_1, X_2)V(Y_1, Y_2)]
\]
\[
= \frac{1}{\tau_X \tau_Y} \left[ \|\Sigma_{XY}\|_F^2 - \tau_X^2 \mathbb{E}(\bar{R}_X(X_1, X_2)Y_1^\top Y_2)
- \tau_Y^2 \mathbb{E}(\bar{R}_Y(Y_1, Y_2)X_1^\top X_2) + \tau_X^2 \tau_Y^2 \mathbb{E}(\bar{R}_X(X_1, X_2)\bar{R}_Y(Y_1, Y_2)) \right]
\]
\[
\equiv \frac{1}{\tau_X \tau_Y} \left[ \|\Sigma_{XY}\|_F^2 - \tau_X^2 \mathbb{E}\psi_X(X_1, X_2) - \tau_Y^2 \mathbb{E}\psi_Y(Y_1, Y_2) + \tau_X^2 \tau_Y^2 \mathbb{E}\psi_{X,Y}(X_1, Y_1) \right].
\]
The claim now follows by invoking Proposition 8.2-(1). \( \square \)

A stochastic version of the above theorem was previously derived in [ZZYS20, Theorem 2.1.1], where the main term \( \|\Sigma_{XY}\|_F^2/(\tau_X \tau_Y) \) was replaced by an unbiased estimator and the remainder term was controlled at the order \((p \wedge q)^{-1/2}\). In comparison, thanks to the sharp residual estimates in Proposition 8.2, our bound for the remainder term is much more refined in that it contains an important multiplicative factor \( \|\Sigma_{XY}\|_F^2 \), which makes it asymptotically negligible in the null case as well.

9. **Hoeffding Decomposition and Variance Expansion**

We first review the basics of Hoeffding decomposition that will be relevant to our purpose. Following [Ser80, Section 5.1.5, pp. 177], for a generic 4-th order \( U \)-statistic with symmetric kernel \( k : \mathcal{Z}^4 \to \mathbb{R} \), let
\[
k_c(z_1, \ldots, z_c) \equiv \mathbb{E}[k(z_1, \ldots, z_c, Z_{c+1}, \ldots, Z_4)], \quad z_1, \ldots, z_c \in \mathcal{Z},
\]
and for any \( z_1, z_2, z_3, z_4 \in \mathcal{Z} \),
\[
g_0(1) \equiv \mathbb{E}k(Z), \quad g_1(z_1) \equiv k_1(z_1) - \mathbb{E}k(Z),
\]
\[
g_2(z_1, z_2) \equiv k_2(z_1, z_2) - k_1(z_1) - k_2(z_2) + \mathbb{E}k(Z),
\]
\[
g_3(z_1, z_2, z_3) \equiv k_3(z_1, z_2, z_3) - \mathbb{E}k(Z) - \sum_{\ell=1}^3 g_1(z_\ell) - \sum_{1 \leq \ell_1 < \ell_2 \leq 3} g_2(z_{\ell_1}, z_{\ell_2}),
\]
\[
g_4(z_1, z_2, z_3, z_4) \equiv k_4(z_1, z_2, z_3, z_4) - \mathbb{E}k(Z) - \sum_{\ell=1}^3 g_1(z_\ell)
- \sum_{1 \leq \ell_1 < \ell_2 \leq 3} g_2(z_{\ell_1}, z_{\ell_2}) - \sum_{1 \leq \ell_1 < \ell_2 < \ell_3 \leq 4} g_3(z_{\ell_1}, z_{\ell_2}, z_{\ell_3}). \quad (9.1)
\]
Then the Hoeffding decomposition says that
\[
U_n(k) = \sum_{c=0}^{4} \binom{4}{c} U_n(g_c).
\]
Here for a generic symmetric kernel \( g : \mathcal{Z}^c \to \mathbb{R} \),
\[
U_n(g) = \begin{cases} \binom{n}{c}^{-1} \sum_{i_1 < \ldots < i_c} g(z_{i_1}, \ldots, z_{i_c}), & c \geq 1; \\ g, & c = 0. \end{cases}
\]
For $c = 0$, $g$ is understood as a real number. In what follows, we will take $Z \equiv \mathcal{X} \times \mathcal{Y}$, and $k$ as the kernel defined in Proposition 2.1. We will evaluate the variance of $\text{dCov}^2_2(X, Y) = U_n(k)$ by evaluating the variance of $g_1, g_2, g_3, g_4$ associated with $k$ as defined above.

9.1. **Hoeffding decomposition: 1st order.** The goal of this subsection is to prove the following variance expansion for the first-order kernel associated with $k$.

**Proposition 9.1.** Suppose the spectrum of $\Sigma$ is contained in $[1/M, M]$ for some $M > 1$. Then for any $\varepsilon > 0$, the first-order variance is given by

$$
\frac{4}{1} \binom{n}{1}^{-1} \mathbb{E}^2_{1}(X_1, Y_1) = (1 + \varepsilon) \cdot \tilde{\sigma}_{n,1}^2(X, Y) \cdot \left[ 1 + O_M \left( \frac{1}{\varepsilon \cdot (\tau_X \wedge \tau_Y)} \right) \right].
$$

Here $\tilde{\sigma}_{n,1}^2(X, Y)$ is as defined in Theorem 2.2. The claim remains valid with $X = Y$ when the spectrum of $\Sigma_X = \Sigma_Y$ is contained in $[1/M, M]$ for some $M > 1$.

The proof of the above proposition will be presented towards the end of this subsection. First, we may compute:

**Lemma 9.2.** The first order kernel is given by

$$
k_1(z_1) = \mathbb{E}k(z_1, Z_2, Z_3, Z_4) = \frac{1}{2} \left[ \mathbb{E}U(x_1, X)V(y_1, Y) + \text{dCov}^2(X, Y) \right]
$$

$$
g_1(z_1) = k_1(z_1) - \mathbb{E}k(Z) = \frac{1}{2} \left[ \mathbb{E}U(x_1, X)V(y_1, Y) - \text{dCov}^2(X, Y) \right].
$$

We will use the above lemma to devise an expansion for $g_1$. From the approximation of $U, V$ in (6.2), one may hope that the main term for $g_1$ would be $2^{-1} \mathbb{E}U(x_1, X)V(y_1, Y) \approx (x_1^T \Sigma_X y_1 - \|\Sigma_X y_1\|_F^2)/2 \tau_X \tau_Y$. As announced in Section 6, this is however not the case. Let the ‘main term’ be defined as

$$
\tilde{g}_1(x_1, y_1) \equiv \frac{1}{2 \tau_X \tau_Y} \left[ (x_1^T \Sigma_X y_1 - \|\Sigma_X y_1\|_F^2) + \omega_{1, X}(x_1, y_1) + \omega_{1, Y}(x_1, y_1) \right],
$$

where

$$
\omega_{1, X}(x_1, y_1) \equiv -\frac{\|\Sigma_X y_1\|_F^2}{2 \tau_X^2} (\|x_1\|^2 - \text{tr}(\Sigma_X)), \omega_{1, Y}(x_1, y_1) \equiv -\frac{\|\Sigma_X y_1\|_F^2}{2 \tau_Y^2} (\|y_1\|^2 - \text{tr}(\Sigma_Y)).
$$

The terms $\omega_{1, X}(x_1, y_1), \omega_{1, Y}(x_1, y_1)$ are essential to correct the naive approximation (6.2), in that these terms contribute to the somewhat difficult terms of negative sign in the variance expansion of $\tilde{g}_1$ in Lemma 9.4, which cannot be neglected as they may have the same order as that of the leading terms.

With the main term defined above, let the ‘residual term’ be defined by

$$
\tilde{R}_1(x_1, y_1) \equiv -\tau^2_X \tilde{\psi}_X(x_1, y_1) - \tau^2_Y \tilde{\psi}_Y(x_1, y_1) + \tau^2_X \tau^2_Y \tilde{\psi}_{X,Y}(x_1, y_1),
$$

where $\tilde{\psi}_{X,Y}$ is defined in (8.1), and

$$
\tilde{\psi}_X(x_1, y_1) \equiv \frac{1}{2 \tau_X} \left[ (\|x_1\|^2 - \text{tr}(\Sigma_X)) (x_1^T \Sigma_X y_1 - \|\Sigma_X y_1\|_F^2) + 2x_1^T \Sigma_X \Sigma_X y_1 \right] + A_{2, X}(x_1, y_1),
$$

$$
\tilde{\psi}_Y(x_1, y_1) \equiv \frac{1}{2 \tau_Y} \left[ (\|y_1\|^2 - \text{tr}(\Sigma_Y)) (x_1^T \Sigma_X y_1 - \|\Sigma_X y_1\|_F^2) + 2x_1^T \Sigma_X \Sigma_X y_1 \right] + A_{2, Y}(x_1, y_1).
$$
Here $A_{2,X}, A_{2,Y}$ are defined in Lemma 8.1. Using $\bar{g}_1, \bar{R}_1$ defined above, we may expand $g_1$ into the sum of main and residual terms as follows.

**Lemma 9.3.** The following expansion holds:

$$g_1(x_1, y_1) = \bar{g}_1(x_1, y_1) + \frac{1}{2\tau_X \tau_Y} (\bar{R}_1(x_1, y_1) - \mathbb{E}R_1(X_1, Y_1)). \quad (9.5)$$

Now we will evaluate the variance of $\bar{g}_1$ and $\bar{R}_1$. The variance of $\bar{g}_1$ is given by the following.

**Lemma 9.4.** The following holds:

$$\mathbb{E}g_1^2(X, Y) = \frac{1}{4\tau_X^2 \tau_Y^2} \left[ \left\| \Sigma_{XY} \Sigma_{YX} \right\|^2_F + \text{tr}(\Sigma_{XY} \Sigma_Y \Sigma_{YX} \Sigma_X) + \frac{\left\| \Sigma_{XY} \right\|^2_F \left\| \Sigma_X \right\|^2_F}{2\tau_X^4} \right]$$

$$+ \frac{\left\| \Sigma_{XY} \right\|^2_F \left\| \Sigma_Y \right\|^2_F}{2\tau_Y^4} \text{tr}(\Sigma_{XY} \Sigma_{YX} \Sigma_X) - \frac{2\left\| \Sigma_{XY} \right\|^2_F}{\tau_X^2} \text{tr}(\Sigma_{XY} \Sigma_Y \Sigma_{YX} \Sigma_X)$$

$$- \frac{2\left\| \Sigma_{XY} \right\|^2_F}{\tau_Y^2} \text{tr}(\Sigma_{XY} \Sigma_X \Sigma_Y) + \frac{\left\| \Sigma_{XY} \right\|^2_F}{\tau_X^2 \tau_Y^2} - 4^{-2} \cdot \sigma_{n,1}^2. \tag{9.4}$$

As mentioned above, the variance of $\bar{g}_1$ as above involves terms with a negative sign that are contributed by the ‘correction terms’ $\mathcal{A}_{1,X}(x_1, y_1), \mathcal{A}_{1,Y}(x_1, y_1)$. These terms can be of the same order as the main terms. It is therefore important to have a lower bound on this quantity.

**Lemma 9.5.** (1) Suppose $\left\| \Sigma^{-1} \right\|_{op} \leq M$ for some $M > 1$. Then $\mathbb{E}g_1^2(X, Y) \gtrsim_M \tau_X^{-2} \tau_Y^{-2} \left\| \Sigma_{XY} \right\|^2_F$. If furthermore $\left\| \Sigma \right\|_{op} \leq M$, then $\mathbb{E}g_1^2(X, Y) \approx_M \tau_X^{-2} \tau_Y^{-2} \left\| \Sigma_{XY} \right\|^2_F$.

(2) Suppose $X = Y$, and $\left\| \Sigma^{-1} \right\|_{op} \leq M$ for some $M > 1$. Then $\mathbb{E}g_1^2(X, X) \gtrsim_M \tau_X^{-2} \cdot p \left\| \Sigma_X \right\|^2_F$. If furthermore $\left\| \Sigma_X \right\|_{op} \leq M$, then $\mathbb{E}g_1^2(X, X) \approx_M \tau_X^{-2}$.

Lemma 9.5 above is an important result, showing that the negative contributions of the ‘correction terms’ $\mathcal{A}_{1,X}(x_1, y_1), \mathcal{A}_{1,Y}(x_1, y_1)$ will not affect the order the variance $\bar{g}_1$. In other words, these terms will contribute a non-vanishing but small proportion of the main terms.

Next to the variance of the main term $\bar{g}_1$, an important step to obtain variance bound for the residual term $R_1$ is to obtain variance bounds for $\hat{\psi}_X, \hat{\psi}_Y$ defined in (9.4).

**Lemma 9.6.** Suppose that the spectrum of $\Sigma_X, \Sigma_Y$ is contained in $[1/M, M]$ for some $M > 1$. Then

$$\tau_X^6 \text{Var} (\hat{\psi}_X(X, Y)) \vee \tau_Y^6 \text{Var} (\hat{\psi}_Y(X, Y)) \lesssim_M \left\| \Sigma_{XY} \right\|^2_F.$$

This variance bound plays an important role to keep the residual terms small when $\left\| \Sigma_{XY} \right\|_F$ is large. In particular, if one use the vanilla versions $\psi_X, \psi_Y$ defined in (8.1), the right hand side of the above display scales as $\left\| \Sigma_{XY} \right\|^2_F$ that would lead to essential difficulties in controlling the residuals. In other words, the reduction from $\left\| \Sigma_{XY} \right\|^2_F$ to $\left\| \Sigma_{XY} \right\|^2_F$ is made possible by the ‘correction terms’ $\mathcal{A}_{1,X}(x_1, y_1), \mathcal{A}_{1,Y}(x_1, y_1)$ that, in a certain sense, ‘center’ the vanilla versions $\psi_X, \psi_Y$ to reduce the variance.

Detailed proofs of Lemmas 9.2-9.6 are deferred to Appendix C. Now we are in a good position to prove Proposition 9.1.
Proof of Proposition 9.1. By (9.3),
\[ \text{Var}(\tilde{R}_1(X_1, Y_1)) \lesssim \tau_X^{-4} \tau_Y^{-4} \left[ \| \Sigma_{XY} \|_F^2 + \| \Sigma_{XY} \|_F^4 / (\tau_X \wedge \tau_Y)^2 \right] \wedge 1. \]

The first two terms can be handled by Lemma 9.6, while the last term can be bounded by
\[ E\psi_{X,Y}^2(X_1, Y_1) \lesssim_M \tau_X^{-4} \tau_Y^{-4} \left[ \| \Sigma_{XY} \|_F^2 + \| \Sigma_{XY} \|_F^4 / (\tau_X \wedge \tau_Y)^2 \right] \wedge 1. \]

This follows by Proposition 8.2-(2) and the simple bound
\[ E\psi_{X,Y}^2(X_1, Y_1) \leq E\tilde{R}_X^2 \cdot E\tilde{R}_Y^2 \lesssim_M \tau_X^{-4} \tau_Y^{-4} \]
by using Lemma 7.4. Summarizing the estimates, we have
\[ \text{Var}(\tilde{R}_1(X_1, Y_1)) \lesssim \| \Sigma_{XY} \|_F^2 / (\tau_X \wedge \tau_Y)^2 + \| \Sigma_{XY} \|_F^4 / (\tau_X \wedge \tau_Y)^2 \wedge 1. \]

As \( \text{Var}(g_1) = (1 \pm \varepsilon) \text{Var}(\tilde{g}_1) + O(\varepsilon^{-1} \cdot \tau_X^{-2} \tau_Y^{-2} \text{Var}(\tilde{R}_1(X, Y))) \) for any \( \varepsilon > 0 \), the proof is now complete by noting that
\[ \frac{\text{Var}(\tilde{R}_1(X, Y))}{\tau_X \tau_Y / \text{Var}(\tilde{g}_1)} \lesssim_M \frac{\| \Sigma_{XY} \|_F^2 / (\tau_X \wedge \tau_Y)^2 + \| \Sigma_{XY} \|_F^4 / (\tau_X \wedge \tau_Y)^2 \wedge 1}{\| \Sigma_{XY} \|_F^2} \lesssim \frac{1}{\tau_X \wedge \tau_Y}, \]
using Lemma 9.5 in the first inequality. \( \square \)

9.2. \textbf{Hoeffding decomposition: 2nd order.} The goal of this subsection is to prove the following variance expansion for the second-order kernel associated with \( k \).

**Proposition 9.7.** Suppose that the spectrum of \( \Sigma \) is contained in \([1/M, M]\) for some \( M > 1 \). For any \( \varepsilon > 0 \), the second-order variance is given by
\[ \left( \frac{n}{2} \right) \left( \frac{4}{2} \right)^{-1} \text{Eg}_2^2((X_1, Y_1), (X_2, Y_2)) = (1 \pm \varepsilon) \cdot \bar{\sigma}_{n,2}^2(X, Y) \cdot \left[ 1 + O_M \left( \frac{1}{\varepsilon \cdot (\tau_X \wedge \tau_Y)^2} \right) \right]. \]
Here \( \bar{\sigma}_{n,2}^2(X, Y) \) is as defined in Theorem 2.2. The claim remains valid with \( X = Y \) when the spectrum of \( \Sigma_X = \Sigma_Y \) is contained in \([1/M, M]\) for some \( M > 1 \).

The prove Proposition 9.7, we will first get an expansion for \( g_2 \), which requires a calculation of \( k_2 \):

**Lemma 9.8.**
\[ k_2(z_1, z_2) = E k(z_1, z_2, Z_3, Z_4) = \frac{1}{6} \left[ U(x_1, x_2) V(y_1, y_2) + 2E U(x_1, X) V(y_1, Y) + 2E U(x_2, X) V(y_2, Y) + dCov^2(X, Y) \right. \]
\[ - E U(x_1, X) V(y_2, Y) - E U(x_2, X) V(y_1, Y) \].

We will use the above lemma to devise an expansion for \( g_2 \). In the first-order expansion in the previous subsection, we have seen that the approximation of \( U, V \)
in (6.2) is not enough to get a precise variance expansion of $g_1$. Somewhat interestingly, as announced in Section 6 such approximation is good enough in the second-order expansion. Formally, let the ‘main term’ of $g_2$ be defined by

$$
\bar{g}_2((x_1, y_1), (x_2, y_2)) = \frac{1}{6\tau_X \tau_Y} \left[ (x_1^\top x_2 y_1^\top y_2 - x_1^\top \Sigma_{XY} y_1 - x_2^\top \Sigma_{XY} y_2 + \|\Sigma_{XY}\|_F^2) - (x_1^\top \Sigma_{XY} y_2 + x_2^\top \Sigma_{XY} y_1) \right],
$$

(9.6)

and the ‘residual term’ be defined by [recall the definitions of $\bar{R}_X, \bar{R}_Y$ after (7.2)]

$$
\bar{R}_2((x_1, y_1), (x_2, y_2))
= -\tau_X^2 x_1^\top x_2 \bar{R}_Y(y_1, y_2) - \tau_X^2 y_1^\top y_2 \bar{R}_X(x_1, x_2) + \tau_X^2 \tau_Y^2 \bar{R}_X(x_1, x_2) \bar{R}_Y(y_1, y_2)
- R_1(x_1, y_1) - R_1(x_2, y_2) - R_1(x_1, y_2) - R_1(x_2, y_1),
$$

with $R_1$ defined by [recall the definition of $\psi_X, \psi_Y, \psi_{XY}$ in (8.1)]

$$
R_1(x_1, y_1) \equiv -\tau_X^2 \psi_X(x_1, y_1) - \tau_Y^2 \psi_Y(x_1, y_1) + \tau_X^2 \tau_Y^2 \psi_{XY}(x_1, y_1).
$$

(9.7)

The following lemma gives an expansion of $g_2$ into the sum of the main term $\bar{g}_2$ and the centered residual term $\bar{R}_2$.

**Lemma 9.9.** The following expansion holds:

$$
g_2((x_1, y_1), (x_2, y_2)) = \bar{g}_2((x_1, y_1), (x_2, y_2)) + \frac{1}{6\tau_X \tau_Y} \left[ \bar{R}_2((x_1, y_1), (x_2, y_2)) - E\bar{R}_2((X_1, Y_1), (X_2, Y_2)) \right].
$$

Proofs of the proceeding lemmas can be found in Appendix C. Using the above decomposition, we only need to compute the variance for the two terms $\bar{g}_2, \bar{R}_2$ on the right hand side of the above display for the proof of Proposition 9.7. Clearly the variance of $\bar{g}_2$ can be evaluated by a book-keeping calculation, and the variance of $\bar{R}_2$ can be handled by the residual estimates in Proposition 8.2. The proof below illustrates the strength of the bounds obtained in Proposition 8.2.

**Proof of Proposition 9.7.** First note that we may expand $E\bar{g}_2^2((X_1, Y_1), (X_2, Y_2))$ as

$$
E\left[ X_1^\top X_2 Y_1^\top Y_2 - X_1^\top \Sigma_{XY} Y_1 - X_2^\top \Sigma_{XY} Y_2 + \|\Sigma_{XY}\|_F^2 \right] + E\left[ X_1^\top \Sigma_{XY} Y_2 + X_2^\top \Sigma_{XY} Y_1 \right] = E_1 + E_2.
$$

This follows as the cross term has expectation 0 due to the symmetry of Gaussian distributions. Now we use Lemma F.4 to compute $E_1, E_2$:

$$
E_1 = E(X_1^\top X_2 Y_1^\top Y_2)^2 + 2E(X_1^\top \Sigma_{XY} Y_1)^2 + \|\Sigma_{XY}\|_F^4 - 4E(X_1^\top X_2 Y_1^\top Y_2 X_2^\top \Sigma_{XY} Y_1)
+ 2\|\Sigma_{XY}\|^2_F + 2E(X_1^\top \Sigma_{XY} Y_1 X_2^\top \Sigma_{XY} Y_2) - 4\|\Sigma_{XY}\|^4_F
= \|\Sigma_X\|^2_F \|\Sigma_Y\|^2_F + 2 \text{tr}(\Sigma_{XY} \Sigma_Y \Sigma_X) + \|\Sigma_{XY}\|^4_F,
$$

and

$$
E_2 = 2E(X_1^\top \Sigma_{XY} Y_2)^2 + 2E(X_1^\top \Sigma_{XY} Y_2 X_2^\top \Sigma_{XY} Y_1)
= 2 \text{tr}(\Sigma_{XY} \Sigma_Y \Sigma_X) + 2\|\Sigma_{XY}\|^2_F.
$$
Combining the identities and applying Lemma F.5 yields that
\[ E_{g_2^2}((X_1, Y_1), (X_2, Y_2)) = \frac{1}{36\tau_X^2 \tau_Y^2} \left( \|\Sigma_X\|^2_F \|\Sigma_Y\|^2_F + 4 \text{tr}(\Sigma_{XY} \Sigma_Y \Sigma_{YX} \Sigma_X) \\
+ 2 \|\Sigma_{XY}\|^2_F \right) \]
\[ = \frac{1}{36\tau_X^2 \tau_Y^2} \left( \|\Sigma_X\|^2_F \|\Sigma_Y\|^2_F + 2 \|\Sigma_{XY}\|^2_F \right) \left[ 1 + O_M \left( \frac{1}{(\tau_X \wedge \tau_Y)^2} \right) \right]. \]

For the residual term, it can be bounded as follows:
\[ E\tilde{R}_2^2((X_1, Y_1), (X_2, Y_2)) \lesssim \tau_X^4 \|\Sigma_X\|^4_F \cdot \|\Sigma_Y\|^4_F \cdot \|\Sigma_{YX}\|^2_F \cdot \|\Sigma_{XY}\|^2_F \]
\[ + \tau_Y^4 \|\Sigma_Y\|^4_F \cdot \|\Sigma_{YX}\|^2_F \cdot \|\Sigma_{XY}\|^2_F \cdot \|\Sigma_{XY}\|^2_F. \]

Using Proposition 8.2-(2), it follows that
\[ \|\Sigma_X\|^2_F \|\Sigma_Y\|^2_F \|\Sigma_{YX}\|^2_F \lesssim_M \frac{\|\Sigma_X\|^2_F (1 \vee \|\Sigma_{XY}\|^2_F)}{(\tau_X \wedge \tau_Y)^2}. \]

This, combined with Lemma 7.4-(2) and an easy calculation that \( E(X_1^T X_2)^4 \lesssim \|\Sigma_X\|^4_F \) and \( E(Y_1^T Y_2)^4 \lesssim \|\Sigma_Y\|^4_F \), shows that
\[ E\tilde{R}_2^2((X_1, Y_1), (X_2, Y_2)) \lesssim M \tau_X^4 \|\Sigma_X\|^4_F \cdot \|\Sigma_Y\|^4_F \cdot \|\Sigma_{YX}\|^2_F \cdot \|\Sigma_{XY}\|^2_F \]
\[ + \tau_Y^4 \|\Sigma_Y\|^4_F \cdot \|\Sigma_{YX}\|^2_F \cdot \|\Sigma_{XY}\|^2_F \cdot \|\Sigma_{XY}\|^2_F \]
\[ \lesssim_M \frac{\|\Sigma_X\|^2_F \|\Sigma_Y\|^2_F \|\Sigma_{YX}\|^2_F \|\Sigma_{XY}\|^2_F (1 \vee \|\Sigma_{XY}\|^2_F)}{(\tau_X \wedge \tau_Y)^2}. \]

As \( \text{Var}(g_2) = (1 + \varepsilon) \text{Var}(\tilde{g}_2) + O(\varepsilon^{-1} \cdot \tau_X^{-2} \sigma_Y^{-2}) \text{Var}(\tilde{R}_2(X, Y)) \) for any \( \varepsilon > 0 \), the proof is now complete by noting that
\[ \frac{\text{Var}(\tilde{R}_2(X, Y))}{\tau_X^2 \tau_Y^2 \text{Var}(g_2)} \lesssim_M \frac{\|\Sigma_X\|^2_F \|\Sigma_Y\|^2_F \|\Sigma_{YX}\|^2_F \|\Sigma_{XY}\|^2_F}{(\tau_X \wedge \tau_Y)^2} \lesssim_M \frac{1}{(\tau_X \wedge \tau_Y)^2}, \]

as desired. \( \square \)

9.3. **Hoeffding decomposition: higher orders.** The goal of this section is to prove the following.

**Proposition 9.10.** Suppose that the spectrum of \( \Sigma \) is contained in \([1/M, M]\) for some \( M > 1 \). Then the third- and fourth- order variance are bounded by
\[ \text{E}g_3^2 + \text{E}g_4^2 \lesssim_M \tau_X^{-2} \tau_Y^{-2} \left( \|\Sigma_X\|^2_F \|\Sigma_Y\|^2_F + \|\Sigma_{XY}\|^2_F + \|\Sigma_{XZ}\|^2_F \right). \]

The claims remain valid with \( X = Y \) when the spectrum of \( \Sigma_X = \Sigma_Y \) is contained in \([1/M, M]\) for some \( M > 1 \).

To prove this proposition, we need to evaluate \( k_3 \) and \( k_4 \). \( k_4 = k \) is already given by Proposition 2.1, so we only need to compute \( k_3 \) as follows.

**Lemma 9.11.** The third order kernel is given by
\[ k_3(z_1, z_2, z_3) = \text{E}k(z_1, z_2, z_3, Z_4) \]
\[ = \frac{1}{12} \sum_{1 \leq i_1 < i_2 \leq 3} U(x_{i_1}, x_{i_2}) V(y_{i_1}, y_{i_2}) + 2 \sum_{1 \leq i \leq 3} \text{E}U(X, x_i) V(Y, y_i) \]
- \sum_{(i_1,i_2,i_3) \in \sigma(1,2,3)} U(x_{i_1},x_{i_2})V(y_{i_1},y_{i_2}) - \sum_{1 \leq i_1 \neq i_2 \leq 3} \mathbb{E}U(X,x_{i_1})V(Y,y_{i_1}) \right].

The proof of the above lemma can be found in Appendix C.

**Proof of Proposition 9.10.** For the second moment of \( g_3 \), we each term in its definition (9.1) can be bounded as follows:

- First we have
  \[
  \mathbb{E}k_2^2((X_1,Y_1),(X_2,Y_2),(X_3,Y_3)) 
  \lesssim \mathbb{E}^{1/2}U^4(X_1,X_2) \cdot \mathbb{E}^{1/2}V^4(Y_1,Y_2) \lesssim \tau_X^{-2}\tau_Y^{-2}\|\Sigma_X\|_F^2\|\Sigma_Y\|_F^2.
  \]

  The last inequality follows as
  \[
  \mathbb{E}U^4(X_1,X_2) \lesssim \tau_X^{-4}\left(\mathbb{E}(X_1^7X_2^4) + \tau_X^2\mathbb{E}\bar{R}_X^4(X_1,X_2)\right)
  \lesssim \tau_X^{-4}\left(\|\Sigma_X\|_F^4 + \|\Sigma_X\|_F^8\right) \lesssim \tau_X^{-4}\|\Sigma_X\|_F^4,
  \]

  and similarly \( \mathbb{E}V^4(Y_1,Y_2) \lesssim \tau_Y^{-4}\|\Sigma_Y\|_F^4 \), using Lemma 7.4 in (\( \ast \)).

- By Theorem 8.5,
  \[
  (\text{dCov}^2(X,Y))^2 \lesssim_M \tau_X^{-2}\tau_Y^{-2}\|\Sigma_{XY}\|_F^4.
  \]

- By Proposition 9.1 and Lemma F.5,
  \[
  \mathbb{E}g_1^2(X_1,Y_1) \lesssim_M \tau_X^{-2}\tau_Y^{-2}\|\Sigma_{XY}\|_F^2.
  \]

- By Proposition 9.7,
  \[
  \mathbb{E}g_2^2((X_1,Y_1),(X_2,Y_2)) \lesssim_M \tau_X^{-2}\tau_Y^{-2}\left(\|\Sigma_X\|_F^2\|\Sigma_Y\|_F^2 + \|\Sigma_{XY}\|_F^4\right).
  \]

  Collecting the above bounds and using the variance lower bound in Lemma 9.5,
  \[
  \mathbb{E}g_3^2 \lesssim_M \tau_X^{-2}\tau_Y^{-2}\left(\|\Sigma_X\|_F^2\|\Sigma_Y\|_F^2 + \|\Sigma_{XY}\|_F^4\right) \lesssim_M \mathbb{E}g_1^2 + \mathbb{E}g_2^2.
  \]

The second moment bound for \( g_4 \) can be obtained in a similar way so we omit the proof.

**9.4. Variance expansion.** With the groundwork laid above, we are now able to prove the following variance expansion formula.

**Theorem 9.12.** Suppose that the spectrum of \( \Sigma \) is contained in \([1/M,M]\) for some \( M > 1 \). Then

\[
\left| \frac{\text{Var}(\text{dCov}_\Sigma^2(X,Y))}{\sigma_\Sigma^2(X,Y)} - 1 \right| \lesssim_M n^{-1/2} + (p \land q)^{-1/4}.
\]

Here \( \sigma_\Sigma^2(X,Y) \) is defined in Theorem 2.2. The claims remain valid with \( X = Y \) when the spectrum of \( \Sigma_X = \Sigma_Y \) is contained in \([1/M,M]\) for some \( M > 1 \).

**Proof.** By Hoeffding decomposition \( \text{dCov}_\Sigma^2(X,Y) = \sum_{c=0}^4 (\binom{n}{c})U_n(g_c) \), so \( \sigma_\Sigma^2 = \text{Var}_\Sigma(\text{dCov}_\Sigma^2(X,Y)) = \sum_{c=1}^4 (\binom{n}{c})^2(n-c)^{-1}\mathbb{E}g_c^2 \). Now we may apply Propositions 9.1, 9.7, and 9.10 to conclude that the left hand side of the desired inequality is bounded by

\[
\inf_{\varepsilon > 0} \left( 1 + \varepsilon \right) \left( 1 + \frac{\mathbb{O}_M(n^{-1} + (p \land q)^{-1/2})}{\varepsilon} \right) - 1 \approx n^{-1/2} + (p \land q)^{-1/4}.
\]

The claim follows.
10. Normal approximation of truncated $\text{dCov}^2$

Let $\bar{g}_t \equiv \mathbb{E} \text{dCov}^2_t(\mathbf{X}, \mathbf{Y}) = \text{dCov}^2(\mathbf{X}, \mathbf{Y})$. Recall $\bar{g}_1, \bar{g}_2$ defined in (9.2) and (9.6). Define the truncated sample distance covariance:

$$\bar{T}_n(\mathbf{X}, \mathbf{Y}) = \sum_{c=0}^{2} \binom{4}{c} U_c(\bar{g}_c).$$  \tag{10.1}$$

The goal of this section is to prove the following non-null central limit theorem for $\bar{T}_n(\mathbf{X}, \mathbf{Y})$.

**Theorem 10.1.** Suppose that the spectrum of $\Sigma_X$ and $\Sigma_Y$ lie in some compacta $[1/M, M]$ for some $M > 0$. Then there exists some $C = C(M) > 0$ such that

$$\text{err}_n \equiv d_{\text{Kol}}\left(\frac{\bar{T}_n(\mathbf{X}, \mathbf{Y}) - \mathbb{E}\bar{T}_n(\mathbf{X}, \mathbf{Y})}{\text{Var}^{1/2}(\bar{T}_n(\mathbf{X}, \mathbf{Y}))}, \mathcal{N}(0, 1)\right) \leq C \left(\frac{1}{n} + \frac{1}{pq}\right)^{1/4}.$$

Here $\text{Var}(\bar{T}_n(\mathbf{X}, \mathbf{Y})) = \sigma_n^2(\mathbf{X}, \mathbf{Y})$ as defined in Theorem 2.2.

The major tool to prove the CLT in Theorem 10.1 is the following discrete second-order Poincaré inequality proved by Chatterjee [Cha08].

**Lemma 10.2** (Discrete second-order Poincaré inequality). Let $\mathbf{X} = (X_1, \ldots, X_n)$ be a vector of independent $\mathbb{R}$-valued random variables, and $\mathbf{X}' = (X'_1, \ldots, X'_n)$ be an independent copy of $\mathbf{X}$. For any $A \subseteq [n]$, define the random variable

$$X_i^A \equiv \begin{cases} X'_i, & \text{if } i \in A, \\ X_i, & \text{if } i \notin A. \end{cases}$$

Define $\Delta_j f \equiv f(X) - f(X^{(\{j\})})$, $T_A \equiv \sum_{j \notin A} \Delta_j f(X) \Delta_j f(X^A)$, and

$$T \equiv \frac{1}{2} \sum_{A \subseteq [n]} \frac{T_A}{n^{|A|}(n - |A|)}.$$

Then with $W \equiv f(X)$ admitting finite variance $\sigma^2$,

$$d_{\text{Kol}}\left(\frac{W - \mathbb{E}(W)}{\text{Var}^{1/2}(W)}, \mathcal{N}(0, 1)\right) \leq 2 \left[\frac{\text{Var}^{1/2}(\mathbb{E}(T|W))}{\sigma^2} + \frac{1}{2\sigma^3} \sum_{j=1}^{n} \mathbb{E}|\Delta_j f(X)|^3\right]^{1/2}.$$

**Proof.** This follows from [Cha08, Theorem 2.2] and Lemma F.2. \qed

We start with the following decomposition of $\bar{T}_n(\mathbf{X}, \mathbf{Y})$. Its proof will be presented in Appendix D.1.

**Lemma 10.3.** Let

$$\psi_1(\mathbf{X}, \mathbf{Y}) \equiv \sum_{i \neq j} \left(\langle X_i^\top X_j \rangle_{\mathcal{F}_0} - \|\Sigma_X\|_{\mathcal{F}}^2\right),$$

$$\psi_2(\mathbf{X}, \mathbf{Y}) \equiv \sum_{i \neq j} \left(\langle X_i^\top \Sigma_X Y_j + X_j^\top \Sigma_X Y_i \rangle_{\mathcal{F}}\right),$$

$$\psi_3(\mathbf{X}, \mathbf{Y}) \equiv \sum_{i=1}^{n} \left[\frac{\|\Sigma_{XY}\|_{\mathcal{F}}^2}{\tau_X^2}\left(\|X_i\|^2 - \text{tr}(\Sigma_X)\right) + \frac{\|\Sigma_{XY}\|_{\mathcal{F}}^2}{\tau_Y^2}\left(\|Y_i\|^2 - \text{tr}(\Sigma_Y)\right)\right].$$

Then

$$\bar{T}_n(\mathbf{X}, \mathbf{Y}) = \text{dCov}^2(X, Y) + \frac{1}{\tau_X \tau_Y \cdot 2^{\alpha}_2} \left(\psi_1(\mathbf{X}, \mathbf{Y}) - \psi_2(\mathbf{X}, \mathbf{Y})\right) - \frac{2}{\tau_X \tau_Y n} \psi_3(\mathbf{X}, \mathbf{Y}).$$
Outline of the proof of Theorem 10.1. Define $T_{\psi_1}(X,Y)-T_{\psi_2}(X,Y)$ and $\Delta_{\psi_1}(X,Y)-\Delta_{\psi_2}(X,Y)$ as in the discrete second-order Poincaré inequality (cf. Lemma 10.2). The following three propositions give variance and third moment bounds for these quantities.

Proposition 10.4 (Analysis of $\psi_1$). Assume the conditions in Theorem 10.1. Then the following hold:

(1) (Variance bound)\[ \text{Var} \left[ \mathbb{E}(T_{\psi_1}|X,Y) \right] \lesssim_M n^3 \cdot \|\Sigma_X\|_F^2 \|\Sigma_Y\|_F^2 + n^4 \cdot (1 \vee \|\Sigma_{XY}\|_F^2) \|\Sigma_X\|_F^2 \|\Sigma_Y\|_F^2 + n^5 \cdot (1 \vee \|\Sigma_{XY}\|_F^2) \|\Sigma_{XY}\|_F^2. \]

(2) (Third moment bound)\[ \sum_{i=1}^n \mathbb{E} |\Delta_{\psi_1}(X,Y)|^3 \lesssim_M n^{5/2} \text{tr}^{3/2}(\Sigma_X) \text{tr}^{3/2}(\Sigma_Y) + n^4 \|\Sigma_{XY}\|_F^2. \]

Proposition 10.5 (Analysis of $\psi_2$). Assume the conditions in Theorem 10.1. Then the following hold.

(1) \[ \text{Var} \left[ \mathbb{E}(T_{\psi_2}|X,Y) \right] \lesssim_M n^4 \|\Sigma_{XY}\|_F^4. \]

(2) \[ \sum_{i=1}^n \mathbb{E} |\Delta_{\psi_2}(X,Y)|^3 \lesssim_M n^{5/2} \|\Sigma_{XY}\|_F^3. \]

Proposition 10.6 (Analysis of $\psi_3$). Assume the conditions in Theorem 10.1. Then the following hold.

(1) \[ \text{Var} \left[ \mathbb{E}(T_{\psi_3}|X,Y) \right] \lesssim n \cdot \|\Sigma_{XY}\|_F^4 (\tau_X^{-4} + \tau_Y^{-4}). \]

(2) \[ \sum_{i=1}^n \mathbb{E} |\Delta_{\psi_3}(X,Y)|^3 \lesssim n \cdot \|\Sigma_{XY}\|_F^2 (\tau_X^{-3} + \tau_Y^{-3}). \]

The proofs of these propositions will be detailed in Appendix D. By the proceeding propositions and Lemma F.5, we have \[ D_1 = \frac{\text{Var}^{1/2} \left( \mathbb{E}(T_{\psi_1}|X,Y) \right)}{n^{3/2} r_X r_Y} + \frac{\text{Var}^{1/2} \left( \mathbb{E}(T_{\psi_2}|X,Y) \right)}{n^{3/2} r_X r_Y} + \frac{\text{Var}^{1/2} \left( \mathbb{E}(T_{\psi_3}|X,Y) \right)}{n^{3/2} r_X r_Y} \lesssim_M \sum_{i=1}^n \mathbb{E} |\Delta_{\psi_i}(X,Y)|^3 \text{tr}^{3/2}(\Sigma_X) \text{tr}^{3/2}(\Sigma_Y) + \sum_{i=1}^n \mathbb{E} |\Delta_{\psi_i}(X,Y)|^3 \text{tr}^{3/2}(\Sigma_X) \text{tr}^{3/2}(\Sigma_Y) \]

and \[ D_2 = \sum_{i=1}^n \mathbb{E} |\Delta_{\psi_i}(X,Y)|^3 \text{tr}^{3/2}(\Sigma_X) \text{tr}^{3/2}(\Sigma_Y) + \sum_{i=1}^n \mathbb{E} |\Delta_{\psi_i}(X,Y)|^3 \text{tr}^{3/2}(\Sigma_X) \text{tr}^{3/2}(\Sigma_Y) \lesssim_M n \cdot \|\Sigma_{XY}\|_F (\tau_X^{-4} + \tau_Y^{-4}). \]

Using Theorem 9.12 with the lower bound Lemma 9.5, we have \[ \sigma_n^2 = \text{Var} \left( \hat{T}_n(X,Y) \right) \gtrsim_M \frac{1}{n^{3/2} r_X r_Y} \left[ n \|\Sigma_{XY}\|_F^2 + \tau_X^{-3} \tau_Y^{-3} + \|\Sigma_{XY}\|_F^4 \right]. \]

This entails that \[ \frac{D_1}{\sigma_n^2} \lesssim_M \frac{n^{-1/2} r_X^{-3} r_Y^{-3} + \tau_X^{-3} \tau_Y^{-3} + n^{1/2} (1 \vee \|\Sigma_{XY}\|_F) \|\Sigma_{XY}\|_F^2}{n \|\Sigma_{XY}\|_F^2 + \tau_X^{-3} \tau_Y^{-3} + \|\Sigma_{XY}\|_F^2} \]

(10.2)
\[ \Delta_n \equiv \text{dCov}^2(X, Y) - \tilde{T}_n(X, Y) = 2 \sum_{c=1} U_n(g_c - \bar{g}_c) + 4 \sum_{c=3} U_n(g_c). \]

This means
\[ \frac{\text{Var}(\Delta_n)}{\sigma^2_n(X, Y)} \lesssim 2 \sum_{c=1} \frac{\text{Var}[U_n(g_c - \bar{g}_c)]}{\sigma^2_n(X, Y)} + 4 \sum_{c=3} \frac{\text{Var}[U_n(g_c)]}{\sigma^2_n(X, Y)}. \]

For \( c = 1 \), by Lemma 9.3 and the proof of Proposition 9.1, we have
\[ \frac{\text{Var}[U_n(g_1 - \bar{g}_1)]}{\sigma^2_n(X, Y)} \lesssim \frac{\text{Var}(\bar{R}_1(X, Y))}{n \tau_X^2 \tau_Y^2 \sigma^2_n(X, Y)} \lesssim \frac{\text{Var}(\bar{R}_1)}{\tau_X^2 \tau_Y^2 \text{Var}(\bar{g}_1)} \lesssim_M \frac{1}{\tau_X \wedge \tau_Y}. \]

For \( c = 2 \), by Lemma 9.9 and the proof of Proposition 9.7, we have
\[ \frac{\text{Var}[U_n(g_2 - \bar{g}_2)]}{\sigma^2_n(X, Y)} \lesssim_M \frac{\text{Var}(\bar{R}_2)}{n^2 \tau_X^2 \tau_Y^2 \sigma^2_n(X, Y)} \lesssim_M \frac{\text{Var}(\bar{R}_2)}{\tau_X^2 \tau_Y^2 \text{Var}(\bar{g}_2)} \lesssim_M \frac{1}{(\tau_X \wedge \tau_Y)^2}. \]

For \( c = 3, 4 \), the proof of Proposition 9.10 yields that
\[ \text{Var}[U_n(g_3)] + \text{Var}[U_n(g_4)] \lesssim_M \frac{1}{n^3 \tau_X^2 \tau_Y^2} \left( \| \Sigma_X \|_F^2 \| \Sigma_Y \|_F^2 + \| \Sigma_{XY} \|_F^2 + \| \Sigma_{XY} \|_F^4 \right), \]
so using the variance lower bound in (10.2), we have
\[ \text{Var}[U_n(g_3)] + \text{Var}[U_n(g_4)] \lesssim_M \frac{1}{n}. \]

Collecting the bounds, we have
\[ \frac{\text{Var}(\Delta_n)}{\sigma^2_n(X, Y)} \lesssim_M \frac{1}{n} + \frac{1}{\tau_X \wedge \tau_Y}. \]

As outlined above, the major step in the proof is to obtain good enough variance and third moment bounds for \( \mathbb{E}[T_{\psi_1}|X, Y] - \mathbb{E}[T_{\psi_3}|X, Y] \) and \( \Delta_\psi_1(X, Y) - \Delta_\psi_3(X, Y) \), as claimed in Propositions 10.4-10.6. The proofs to these propositions are fairly delicate and involved. The most complicated case appears to be the control for \( \mathbb{E}[T_{\psi_1}|X, Y], \Delta_\psi_1(X, Y) \) associated with the first term \( \psi_1(X, Y) \) due to its highest polynomial order by definition. The structure of the bounds in Propositions 10.4-10.6 also reveals a careful balance among the power in the terms \( n, \| \Sigma_X \|_F, \| \Sigma_Y \|_F, \| \Sigma_{XY} \|_F^2 \). Such a balance turns out to be crucial to reach the announced error bound in Theorem 10.1 that requires no more than a bounded spectrum condition. See Appendix D for proof details.

11. Proofs of Theorems 2.2 and 2.6

Proof of Theorem 2.2. (Step 1) By definition of \( \tilde{T}_n(X, Y) \) in (10.1), we have
\[ \Delta_n \equiv \text{dCov}^2(X, Y) - \tilde{T}_n(X, Y) = 2 \sum_{c=1} U_n(g_c - \bar{g}_c) + 4 \sum_{c=3} U_n(g_c). \]
On the other hand, by Theorem 8.5 we have

Therefore combined with Theorem 9.12, we have

Next, with the normalization Var

So with

By Lemma F.1 and Theorem 2.2,

Then with \( \bar{\Sigma} \)

Proof of Theorem 2.6. □

by Lemma F.1 and Theorem 10.1 (note that \( \mathbb{E}\Delta_n = 0 \)),

\[
d_{\text{Kol}}\left( \frac{\text{dCov}_n^2(X,Y) - \text{dCov}^2(X,Y)}{\sigma_n(X,Y)}, N(0,1) \right)
\]

\[
\leq d_{\text{Kol}}\left( \frac{\bar{T}_n(X,Y) - \mathbb{E}\bar{T}_n(X,Y)}{\text{Var}^{1/2}(\bar{T}_n(X,Y))}, N(0,1) \right) + 2 \left( \frac{\text{Var}(\Delta_n)}{\sigma_n^2(X,Y)} \right)^{1/3} \lesssim M \left( \frac{1}{n \land p \land q} \right)^{1/6}.
\]

Next, with the normalization Var\(^{1/2}(\text{dCov}_n^2(X,Y))\), consider the decomposition

\[
\frac{\text{dCov}_n^2(X,Y) - \text{dCov}^2(X,Y)}{\text{Var}^{1/2}(\text{dCov}_n^2(X,Y))} = \bar{L}_n + \bar{I}_n \left( \frac{\bar{\sigma}_n(X,Y)}{\text{Var}^{1/2}(\text{dCov}_n^2(X,Y))} - 1 \right) \equiv \bar{L}_n + \bar{\Delta}_n.
\]

By Theorem 9.12, \( \text{Var}(\Delta_n) \leq M n^{-1} + (p \land q)^{-1/2} \). The claim now follows by invoking Lemma F.1.

Proof of Theorem 2.6. We write \( A(\Sigma) \) as \( A \) for simplicity in the proof. Let

\[
m_0 = \frac{\| \Sigma_{XY} \|_F^2}{\tau_X \tau_Y}, \quad \sigma_0^2 = \frac{2 \| \Sigma_X \|_F^2 \| \Sigma_Y \|_F^2}{n^2 \tau_X^2 \tau_Y^2}.
\]

Then with \( \bar{\sigma}_n = \bar{\sigma}_n(X,Y) \) in the proof,

\[
\frac{\text{dCov}_n^2(X,Y) - m_0}{\sigma_0} = \frac{\text{dCov}_n^2(X,Y) - \text{dCov}^2(X,Y)}{\bar{\sigma}_n} + \Delta_1 + \Delta_2,
\]

where

\[
\Delta_1 = \frac{\text{dCov}_n^2(X,Y) - \text{dCov}^2(X,Y)}{\bar{\sigma}_n} \left( \frac{\bar{\sigma}_n}{\sigma_0} - 1 \right), \quad \Delta_2 = \frac{\text{dCov}^2(X,Y) - m_0}{\sigma_0}.
\]

By Lemma F.1 and Theorem 2.2,

\[
d_{\text{Kol}}\left( \frac{\text{dCov}_n^2(X,Y) - m_0}{\sigma_0}, N(0,1) \right) \leq C_M \left( \frac{1}{n \land p \land q} \right)^{1/6} + 2 \text{Var}^{1/3}(\Delta_1) + |\Delta_2|.
\]

To give a variance bound for \( \Delta_1 \), first by using Lemma F.5, it follows that

\[
\bar{\sigma}_n^2 = \mathcal{O}_M \left( \frac{\| \Sigma_{XY} \|_F^2}{n^2 \tau_X^2 \tau_Y^2} + \frac{\| \Sigma_{XY} \|_F^4}{n^2 \tau_X^4 \tau_Y^4 (n \land p \land q)} \right) + \frac{2 \| \Sigma_X \|_F^2 \| \Sigma_Y \|_F^2}{n^2 \tau_X^2 \tau_Y^2}.
\]

So with \( \rho(A) \equiv A/(n \land p \land q)^{1/2} \),

\[
\frac{\bar{\sigma}_n^2}{\sigma_0^2} = 1 + \mathcal{O}_M \left( \frac{A^2}{(pq)^{1/2} n (n \land p \land q)} \right) = 1 + \mathcal{O}_M(\rho(A) + \rho^2(A)).
\]

Therefore combined with Theorem 9.12, we have

\[
\text{Var} \left( \Delta_1 \right) = \left( \frac{\bar{\sigma}_n}{\sigma_0} - 1 \right)^2 \cdot \frac{\text{Var} \left( \text{dCov}_n^2(X,Y) \right)}{\sigma_0^2} \lesssim_M (\rho(A) + \rho^2(A))^2.
\]

On the other hand, by Theorem 8.5 we have

\[
|\Delta_2| \lesssim_M \frac{A}{(p \land q)^{1/2}} \lesssim \rho(A).
\]
The claim follows by collecting the estimates and using $1 \wedge t \lesssim 1 \wedge t^\alpha$ for $\alpha \in (0, 1)$.

12. Proof of Theorem 3.1

**Lemma 12.1.** Suppose that the spectrum of $\Sigma$ is contained in $[1/M, M]$ for some $M > 1$. Then with $\Delta_X$ and $\Delta_Y$ defined by

$$
\frac{d\text{Cov}_n(X)}{d\text{Cov}(X)} = 1 + \Delta_X, \quad \frac{d\text{Cov}_n(Y)}{d\text{Cov}(Y)} = 1 + \Delta_Y,
$$

we have $E\Delta_X^2 \vee E\Delta_Y^2 \leq C(n \wedge p \wedge q)^{-2}$ for some constant $C = C(M) > 0$.

**Proof.** By mean and variance expansions in Theorems 8.5 and 9.12,

$$
d\text{Cov}^2(X) = \left\| \frac{\Sigma_X}{\tau_X} \right\|^2 \left[ 1 + O_M(\tau_X^{-1}) \right], \quad \text{Var} \left( d\text{Cov}^2(X) \right) \lesssim_M \frac{\|\Sigma_X\|^2_{L^2}}{n \tau_X^4} + \frac{\|\Sigma_X\|^4_{L^2}}{n^2 \tau_X^6}.
$$

Then

$$
E\Delta_X^2 = E \left[ \frac{d\text{Cov}^2(X) - d\text{Cov}^2(X)}{d\text{Cov}(X)(d\text{Cov}_n(X) + d\text{Cov}(X))} \right]^2 \leq d\text{Cov}^{-4}(X) \cdot E \left( d\text{Cov}^2(X) - d\text{Cov}^2(X) \right)^2
$$

$$
= d\text{Cov}^{-4}(X) \cdot \text{Var} \left( d\text{Cov}^2(X) \right) \approx_M (n \tau_X^2)^{-1} + n^{-2} \lesssim_M (n \wedge p \wedge q)^{-2}.
$$

Similar bounds can be derived for $\Delta_Y$.

**Proof of Theorem 3.1.** Let $d_{X,Y}^2 = d\text{Cov}^2(X) \cdot d\text{Cov}^2(Y)$, and $\Delta_d$ be defined by $d_{X,Y} / (\|\Sigma_X\|_{L^2} \cdot \|\Sigma_Y\|_{L^2}) = 1 + \Delta_d$. Then by Theorem 8.5, $\Delta_d = O_M \left( (\tau_X \wedge \tau_Y)^{-1} \right)$.

Recall the definitions of (random) $\Delta_X$ and $\Delta_Y$ in Lemma 12.1, and note that by definition $\Delta_d, \Delta_X, \Delta_Y \geq -1$. For any $t \geq 0$,

$$
p_n(t) \equiv P \left( \frac{n \cdot d\text{Cov}^2(X,Y)}{\sqrt{2} d_{X,Y}^2} \leq t \right) = P \left( \frac{n \cdot d\text{Cov}^2(X,Y)}{\sqrt{2} d_{X,Y}^2} \leq t(1 + \Delta_X)(1 + \Delta_Y) \right)
$$

$$
= P \left( \frac{n \cdot \tau_X \tau_Y d\text{Cov}^2(X,Y)}{\sqrt{2} \|\Sigma_X\|_{L^2} \|\Sigma_Y\|_{L^2}} \leq t(1 + \Delta_X)(1 + \Delta_Y)(1 + \Delta_d) \right).
$$

(12.1)

Let $\Delta_1$ be defined by $(1 + \Delta_X)(1 + \Delta_Y)(1 + \Delta_d) = 1 + \Delta_1 + \Delta_d$. Then Lemma 12.1 yields that $E\Delta_1^2 \leq_M (n \wedge p \wedge q)^{-2}$.

From (12.1), it holds for any $\delta_1, \delta_d \in (0, 1/2]$

$$
p_n(t) \leq P \left[ \frac{n \cdot \tau_X \tau_Y d\text{Cov}^2(X,Y)}{\sqrt{2} \|\Sigma_X\|_{L^2} \|\Sigma_Y\|_{L^2}} \leq t(1 + \delta_1 + \delta_d) \right] + P(|\Delta_1| \geq \delta_1) + 1_{|\Delta_d| \geq \delta_d}
$$

$$
\leq P \left[ \frac{n \cdot \tau_X \tau_Y d\text{Cov}^2(X,Y)}{\sqrt{2} \|\Sigma_X\|_{L^2} \|\Sigma_Y\|_{L^2}} \leq t(1 + \delta_1 + \delta_d) \right] + \frac{C_M(n \wedge p \wedge q)^{-2}}{\delta_1^2} + 1_{|\Delta_d| \geq \delta_d},
$$

(12.2)

using the bound on $E\Delta_1^2$ in the second inequality. Next we give two estimates for the upper bound of $p_n(t)$ useful for different magnitudes of $A \equiv A(\Sigma)$.

**(Estimate 1).** By the local central limit theorem in Theorem 2.6, with $A$ defined therein, $\rho(A) = A/(n \wedge p \wedge q)^{1/2}$, and

$$
e(A) \equiv 1 \wedge \left( \frac{1 + A^2}{n \wedge p \wedge q} \right)^{1/6} \leq (n \wedge p \wedge q)^{-1/6} + 1 \wedge \rho^{1/3}(A),
$$

we have by using $\Delta_d = O_M \left( (\tau_X \wedge \tau_Y)^{-1} \right)$

$$
p_n(t) \leq \inf_{\delta_1, \delta_d \in (0, 1/2]} \left\{ \Phi \left[ t(1 + \Delta_1 + \Delta_d) - A \right] + C_M \cdot e(A) + \frac{C_M(n \wedge p \wedge q)^{-2}}{\delta_1^2} + 1_{|\Delta_d| \geq \delta_d} \right\}
$$

(12.2)
The term in the bracket can be bounded by, via balancing the leading terms

\[ \inf_{\delta_1 \in (0, 1/2]} \left( \delta_1 + \frac{(n \land p \land q)^2}{\delta_1^2} \right) + \inf_{\delta_d \in (0, 1/2]} \left( \delta_d + 1 \land \rho^{1/3}(A) \right) \]

(\textbf{Estimate 2}). Note that by Theorem 8.5 and (11.2), we have

\[
\begin{align*}
\mathbb{E} \left[ \frac{n \cdot \tau_X \tau_Y \text{dCov}^2(X, Y)}{\sqrt{2} \|\Sigma_X\|_F \|\Sigma_Y\|_F} \right] &= \frac{A}{\sqrt{2}} (1 + O_M((\rho \land q)^{-1/2}), \\
\text{Var} \left[ \frac{n \cdot \tau_X \tau_Y \text{dCov}^2(X, Y)}{\sqrt{2} \|\Sigma_X\|_F \|\Sigma_Y\|_F} \right] &\approx \rho^2(A).
\end{align*}
\]

Hence by choosing \( u = A/(2\sqrt{2}C_M(1 + \rho(A))) \), and \( \delta_1 = \delta_d = 1/2 \) in (12.2), we have

\[
\begin{align*}
p_n(t) &\leq \mathbb{P}(A/\sqrt{2} - C_M \cdot u(1 + \rho(A)) \leq 2t) + u^{-2} + C_M(n \land p \land q)^{-2} \\
&\leq 1_{A \leq 4\sqrt{2}t} + C_M \cdot \left( \left[ 1 + \rho(A)^2 \right]/A^2 + (n \land p \land q)^{-2} \right).
\end{align*}
\]

which implies

\[
p_n(t) - \Phi \left( t - \frac{A}{\sqrt{2}} \right) \leq C_{t,M} \left( e^{-A^2/C} + \frac{1 + \rho^2(A)}{A^2} + 1_{A \leq 4\sqrt{2}t} + \frac{1}{(n \land p \land q)^2} \right).
\]

Combining the estimates (1) and (2), we have

\[
p_n(t) - \Phi \left( t - \frac{A}{\sqrt{2}} \right) \leq C_{t,M} \left[ \left( (n \land p \land q)^{-1/6} + 1 \land \rho^{1/3}(A) \right) \right. \\
\left. \land \left( e^{-A^2/C} + \frac{1}{A^2} + 1_{A \leq 4\sqrt{2}t} + \frac{1}{(n \land p \land q)^2} \right) \right].
\]

The term in the bracket can be bounded by, via balancing the leading terms \( \rho^{1/3}(A) \) and \( A^{-2} \),

\[
p_n(t) - \Phi \left( t - \frac{A}{\sqrt{2}} \right) \leq \frac{C_{t,M}}{(n \land p \land q)^{1/3}},
\]

(12.3)

By applying similar arguments to the other direction (lower bound) and the case \( t \leq 0 \), we arrive at

\[
\left| p_n(t) - \Phi \left( t - \frac{A}{\sqrt{2}} \right) \right| \leq \frac{C_{t,M}}{(n \land p \land q)^{1/3}}, \quad t \in \mathbb{R}.
\]

Finally, using Theorem 8.5 and its analogous expansion to \( \text{dCov}^2(X), \text{dCov}^2(Y) \), we have

\[
n \text{dCor}^2(X, Y) = \frac{n \text{dCov}^2(X, Y)}{\sqrt{\text{dCov}^2(X) \text{dCov}^2(Y)}}
\]

\[
= \frac{n \|\Sigma_{XY}\|_F^2}{\|\Sigma_X\|_F^2 \|\Sigma_Y\|_F^2} \left[ 1 + O_M((\tau_X \land \tau_Y)^{-1}) \right] = A \left[ 1 + O_M((\tau_X \land \tau_Y)^{-1}) \right],
\]

the \( A \) term in (12.3) can be replaced by \( n \text{dCov}^2(X, Y) \) at the lost of a larger constant \( C_{t,M} \) by [HJS21, Lemma 2.4].
13. Proof of Theorem 3.3

Proof of Theorem 3.3. Let \( \phi_\Sigma \) denote the Lebesgue density for \( \mathcal{N}(0, \Sigma) \). For any prior \( \Pi \) on \( \Theta(\zeta, \Sigma_0) \), let \( P_{\Pi} \) the probability measure corresponding to the density \( \phi_{\Pi}(x) = \int p_{\Sigma}(x) d\Pi(\Sigma) \). Then

\[
\inf_{\psi} \sup_{\Sigma \in \Theta(\zeta, \Sigma_0)} \left( E_{\Sigma_0} \psi + E_\Sigma (1 - \psi) \right) \geq \inf_{\psi} \left( P_{\Sigma_0}(\psi) + P_{\Pi}(1 - \psi) \right)
\]

\[
= 1 - d_{TV}(P_{\Pi}, P_0) \geq 1 - \left( \int \frac{\phi_{\Pi}}{\phi_{\Sigma_0}} - 1 \right)^{1/2}.
\]

The last inequality follows from, e.g. [Tsy09, Equation (2.27), pp. 90]. So the goal is to find the smallest possible \( \zeta \) such that the right hand side of the above display has a non-trivial lower bound under a constructed prior \( \Pi \) on \( \Theta(\zeta, \Sigma_0) \).

First consider the case \( \Sigma_0 = \mathbb{I} \). For any \( \tilde{u} \in \mathbb{R}^p \) and \( \tilde{v} \in \mathbb{R}^q \), let \( u \equiv [\tilde{u}, 0_q] \in \mathbb{R}^{p+q} \) and \( v \equiv [0_p, \tilde{v}] \in \mathbb{R}^{p+q} \). For any \( a > 0 \), let

\[
\Sigma_{u,v} \equiv \Sigma_{u,v}(a) = I + a (uv^\top + vu^\top) = \begin{pmatrix} I & a \tilde{u} \tilde{v}^\top \\ a \tilde{u} \tilde{v}^\top & I \end{pmatrix}.
\]

We place independent priors \( \tilde{u}_i \sim \text{i.i.d.} \sqrt{q} \cdot \text{Unif}\{\pm 1\} \) on \( \tilde{u} \) and \( \tilde{v}_j \sim \text{i.i.d.} \sqrt{p} \cdot \text{Unif}\{\pm 1\} \) on \( \tilde{v} \), so that \( \|\tilde{u}\|^2 = \|u\|^2 = \|\tilde{v}\|^2 = \|v\|^2 = pq \) and \( \langle u, v \rangle = 0 \). Then by direct calculation,

\[
(uv^\top + vu^\top)(u + v) = u \cdot \|v\|^2 + v \cdot \|u\|^2 = pq \cdot (u + v),
\]

\[
(uv^\top + vu^\top)(u - v) = -u \cdot \|v\|^2 + v \cdot \|u\|^2 = -pq \cdot (u - v).
\]

This entails that the rank two matrix \((uv^\top + vu^\top)\) has eigenvalue \( pq \) with eigenvector \( u + v \) and eigenvalue \(-pq\) with eigenvector \( u - v \). Hence \( \Sigma_{u,v} \) has eigenvalues \( 1 + apq \) with eigenvector \( u + v \), \( 1 - apq \) with eigenvector \( u - v \), and all rest eigenvalues as 1, hence \( \det(\Sigma_{u,v}) = 1 - (apq)^2 \). So by writing \( \{s_i\}_{i=1}^{p+q-2} \) as a basis for the orthogonal complement of \( u + v \) and \( u - v \) in \( \mathbb{R}^{p+q} \), we have the eigenvalue decomposition

\[
\Sigma_{u,v} = \sum_{i=1}^{p+q-2} s_i s_i^\top + (1 + apq) \frac{(u + v)(u + v)^\top}{\|u + v\|^2} + (1 - apq) \frac{(u - v)(u - v)^\top}{\|u - v\|^2}.
\]

This implies that

\[
\Sigma_{u,v}^{-1} = \sum_{i=1}^{p+q-2} s_i s_i^\top + \frac{1}{1 + apq} \frac{(u + v)(u + v)^\top}{\|u + v\|^2} + \frac{1}{1 - apq} \frac{(u - v)(u - v)^\top}{\|u - v\|^2}
\]

\[
= \left[ I - \frac{(u + v)(u + v)^\top}{\|u + v\|^2} - \frac{(u - v)(u - v)^\top}{\|u - v\|^2} \right]
\]

\[
+ \frac{1}{1 + apq} \frac{(u + v)(u + v)^\top}{\|u + v\|^2} + \frac{1}{1 - apq} \frac{(u - v)(u - v)^\top}{\|u - v\|^2}
\]

\[
= I - \frac{apq}{1 + apq} \frac{(u + v)(u + v)^\top}{\|u + v\|^2} + \frac{apq}{1 - apq} \frac{(u - v)(u - v)^\top}{\|u - v\|^2}
\]

\[
= I - \frac{a}{2(1 + apq)} (u + v)(u + v)^\top + \frac{a}{2(1 - apq)} (u - v)(u - v)^\top.
\]

Let \( \phi_{\Pi} \) be the joint density of \( \{(X_i, Y_i)\}_{i=1}^n \) under the prescribed prior on \( \tilde{u} \) and \( \tilde{v} \), and \( \phi_\psi \) be the joint density under the null. With

\[
\tilde{\Sigma}(u_1, u_2, v_1, v_2)
\]
\[ \frac{a}{2(1 + apq)} (u_1 + v_1)(u_1 + v_1) + \frac{a}{2(1 - apq)} (u_1 - v_1)(u_1 - v_1) \]
\[ + \frac{a}{2(1 + apq)} (u_2 + v_2)(u_2 + v_2) + \frac{a}{2(1 - apq)} (u_2 - v_2)(u_2 - v_2) \]  
we have
\[ \int \frac{\phi_I^2}{\phi_I} \, dx = \int \left[ \sum_{u,v} 2^{-(p+q)} (2\pi)^{-n(p+q)/2} \det^{-n/2}(\Sigma_{u,v}) e^{-\frac{1}{2} \sum_{i=1}^n x_i^\top \Sigma_{i,u,v}^{-1} x_i} \right]^2 \, dx \]
\[ = \sum_{(u_1,v_1),(u_2,v_2)} \frac{2^{-2(p+q)}}{[(1 - (apq)^2)^2]^{n/2}} \int (2\pi)^{-n(p+q)/2} e^{-\frac{1}{2} \sum_{i=1}^n x_i^\top \Sigma_{i,u,v}^{-1} x_i} \, dx \]
\[ \approx E_{(u_1,v_1),(u_2,v_2)} \left[ \frac{1}{(1 - (apq)^2)^n} \det(I + \tilde{\Sigma}(u_1, u_2, v_1, v_2))^{-n/2} \right]. \]

Here in \((*)\), \((u_1, v_1)\) and \((u_2, v_2)\) denote two independent copies of the prescribed prior on \((u, v)\).

By Lemma 13.1 and the notation \(\{\lambda_i = \lambda_i(u_1, u_2, v_1, v_2)\}_{i=1}^d\) therein, \(I + \tilde{\Sigma}\) has \(p + q - 4\) eigenvalues of 1, and the other four eigenvalues being \(1 + \lambda_i, 1 \leq i \leq 4\). Hence by the second claim of Lemma 13.1, for any \(a\) such that \(apq \leq 1/4\), we have
\[ \int \frac{\phi_I^2}{\phi_I} = E_{(u_1,v_1),(u_2,v_2)} \left[ \frac{1}{(1 - (apq)^2)^n} \right] \left[ \frac{1}{(1 + \lambda_1)(1 + \lambda_2)(1 + \lambda_3)(1 + \lambda_4)} \right]^{n/2} \]
\[ = E_{(u_1,v_1),(u_2,v_2)} \left[ \frac{1}{(1 - (apq)^2)^n} \right] \left[ \frac{1}{(1 + \lambda_1)(1 + \lambda_2)(1 + \lambda_3)(1 + \lambda_4)} \right]^{n/2} \]
\[ = E_{(u_1,v_1),(u_2,v_2)} \left[ \frac{1}{(1 - a^2 \langle u_1, u_2 \rangle \langle v_1, v_2 \rangle)^n} \right] \]
\[ = 1 + nE(a^2 \langle u_1, u_2 \rangle \langle v_1, v_2 \rangle) \]
\[ + n(n+1)E \left[ (a^2 \langle u_1, u_2 \rangle \langle v_1, v_2 \rangle)^2 \right] \int_0^1 \frac{1}{(1 - ta^2 \langle u_1, u_2 \rangle \langle v_1, v_2 \rangle)^{n+2}} \, dt. \]

To calculate the right hand side of the above display, first note that the first order term vanishes: \(E(a^2 \langle u_1, u_2 \rangle \langle v_1, v_2 \rangle) = 0\). Next we compute the second order term. With \(\varepsilon_i\)'s denoting i.i.d. Rademacher random variables,
\[ E(a^2 \langle u_1, u_2 \rangle \langle v_1, v_2 \rangle)^4 \leq a^8 p^4 q^4 \cdot E \left( \sum_{i=1}^p \varepsilon_i \right)^4 \cdot E \left( \sum_{i=1}^q \varepsilon_i \right)^4 \leq a^8 p^4 q^6. \]

On the other hand, under \(a^2 p^2 q^2 \leq 1/2\), there exists some absolute constant \(c_0 > 0\) such that for any \(t \in [0, 1]\),
\[ E \left[ \frac{1}{(1 - ta^2 \langle u_1, u_2 \rangle \langle v_1, v_2 \rangle)^{2(n+2)}} \right] \leq E e^{c_0 a^2 n \langle u_1, u_2 \rangle \langle v_1, v_2 \rangle} \]
\[ = E e^{c_0 a^2 n p q \sum_{i=1}^p \varepsilon_i \sum_{j=1}^q \varepsilon_j} \leq \sqrt{\frac{1}{q} \sum_{j=1}^q \varepsilon_j^2} \leq \sqrt{\frac{1}{q} \sum_{j=1}^q \varepsilon_j^2} \]
\[ \leq \exp \left[ \left( \frac{c_0}{2} \right) a^4 n^2 p^4 q^4 \left( \frac{1}{\sqrt{q}} \sum_{j=1}^q \varepsilon_j^2 \right)^2 \right]. \]
Under $c_2^2a^4n^2p^3q^3 \leq 1/2$, the above display is bounded by an absolute constant. Collecting all the estimates, we have established that if
\[
\max \left\{ a^2p^2q^2, c_0^2a^4n^2p^3q^3 \right\} \leq 1/2, \tag{13.2}
\]
the following bound holds: for some absolute constant $C > 0$,
\[
\int \frac{\phi_{\Sigma}^2}{\phi_{I}} - 1 \leq C \cdot a^4n^2p^3q^3.
\]
Now for any $\delta > 0$, by taking $a_* = \tau n^{-1/2}p^{-3/4}q^{-3/4}$ for some sufficiently small $\tau = \tau(\delta) > 0$, we have $\int \phi_{\Sigma}^2/\phi_{I} - 1 \leq \delta$ and (13.2) is satisfied. As $\Sigma(u,v)(a^*) \in \Theta(\zeta)$ for such choice of $a_*$ and any realization of $(u,v)$, this completes the proof for the lower bound when $\Sigma_0 = I$ of the order $\|a_*uv^\top\|^2_{I} = a_*^2\|u\|^2\|v\|^2 = a_*^2p^2q^2 \approx \sqrt{pq}/n$. For the general case $\Sigma_0$, we may proceed with the above calculations using $\Sigma_{u,v}^{1/2} \Sigma_{u,v}^{-1/2}$ instead of $\Sigma_{u,v}$, which gives the same separation rate under the assumption on the spectrum of $\Sigma_{X,Y}$.

**Lemma 13.1.** The matrix $\widetilde{\Sigma}(u_1, u_2, v_1, v_2)$ defined in (13.1) has at most 4 non-trivial eigenvalues of the form:
\[
\lambda_i = (c_2 - c_1)(pq + \langle u_1, u_2 \rangle) - \beta_i(c_1 + c_2)(\langle v_1, v_2 \rangle + pq), \quad i = 1, 2,
\]
\[
\lambda_i = (c_2 - c_1)(pq - \langle u_1, u_2 \rangle) + \beta_i(c_1 + c_2)(\langle v_1, v_2 \rangle - pq), \quad i = 3, 4.
\]
Here $(\beta_1, \beta_2)$ and $(\beta_3, \beta_4)$ are solutions to equations (13.3) and (13.4) below, respectively. Furthermore,
\[
(1 + \lambda_1)(1 + \lambda_2) = (1 + \lambda_3)(1 + \lambda_4) = 1 + \frac{a^2}{1 - (apq)^2}(p^2q^2 - \langle u_1, u_2 \rangle \langle v_1, v_2 \rangle).
\]

**Proof of Lemma 13.1.** We write $\widetilde{\Sigma}(u_1, u_2, v_1, v_2)$ as $\widetilde{\Sigma}$ in the proof for simplicity. Define
\[
b \equiv \alpha_1u_1 + \alpha_2u_2 + \alpha_3v_1 + \alpha_4v_2, \quad c_1 \equiv \frac{a}{2(1 + apq)}, \quad c_2 \equiv \frac{a}{2(1 - apq)}.
\]
Then
\[
\widetilde{\Sigma} \equiv -c_1 \left[ (u_1 + v_1)(u_1 + v_1)^\top + (u_2 + v_2)(u_2 + v_2)^\top \right]
\]
\[
+ c_2 \left[ (u_1 - v_1)(u_1 - v_1)^\top + (u_2 - v_2)(u_2 - v_2)^\top \right],
\]
and
\[
\widetilde{\Sigma}b \equiv T_1u_1 + T_2u_2 + T_3v_1 + T_4v_2,
\]
where
\[
T_1 = \alpha_1 \cdot (c_2 - c_1)pq + \alpha_2 \cdot (c_2 - c_1)(u_1, u_2) - \alpha_3 \cdot (c_1 + c_2)\langle v_1, v_2 \rangle, \\
T_2 = \alpha_1 \cdot (c_2 - c_1)(u_1, u_2) + \alpha_2 \cdot (c_2 - c_1)\langle v_1, v_2 \rangle - \alpha_3 \cdot (c_1 + c_2)pq - \alpha_4 \cdot (c_1 + c_2)\langle v_1, v_2 \rangle, \\
T_3 = -\alpha_1 \cdot (c_1 + c_2)pq - \alpha_2 \cdot (c_1 + c_2)(u_1, u_2) + \alpha_3 \cdot (c_2 - c_1)pq + \alpha_4 \cdot (c_2 - c_1)(u_1, u_2), \\
T_4 = -\alpha_1 \cdot (c_1 + c_2)(u_1, u_2) - \alpha_2 \cdot (c_1 + c_2)pq + \alpha_3 \cdot (c_2 - c_1)(v_1, v_2) + \alpha_4 \cdot (c_2 - c_1)pq.
\]
Hence the identity $T_1/\alpha_1 = T_2/\alpha_2 = T_3/\alpha_3 = T_4/\alpha_4$ is equivalent to (denoting $\rho_{ij} \equiv \alpha_i/\alpha_j$)
\[
\rho_{21} \cdot (c_2 - c_1)(u_1, u_2) - \rho_{31} \cdot (c_1 + c_2)pq - \rho_{41} \cdot (c_1 + c_2)(v_1, v_2) \tag{i}
\]
\[
= \rho_{12} \cdot (c_2 - c_1)(u_1, u_2) - \rho_{13} \cdot (c_1 + c_2)(v_1, v_2) - \rho_{14} \cdot (c_1 + c_2)pq \tag{ii}
\]
\[
= -\rho_{13} \cdot (c_1 + c_2)pq - \rho_{23} \cdot (c_1 + c_2)(u_1, u_2) + \rho_{43} \cdot (c_2 - c_1)(v_1, v_2) \tag{iii}
\]
\[
(1 + \lambda_1)(1 + \lambda_2) = (1 + \lambda_3)(1 + \lambda_4) = 1 + \frac{a^2}{1 - (apq)^2}(p^2q^2 - \langle u_1, u_2 \rangle \langle v_1, v_2 \rangle).
\]
and \( \beta \).

The two (possible identical) solutions of the above quadratic equation (existence

Hence we have

\[
\rho_{14} \cdot (c_1 + c_2) \langle u_1, u_2 \rangle - \rho_{24} \cdot (c_1 + c_2) \rho_{34} \cdot (c_2 - c_1) \langle v_1, v_2 \rangle. \tag{iv}
\]

For the first set of two solutions, let \( \alpha_1 = \alpha_2 = 1 \) and \( \alpha_3 = \alpha_4 = \beta \). Then (i) = (ii) and (iii) = (iv) automatically holds, and (ii) = (iii) is equivalent to

\[
(c_1 + c_2)\langle v_1, v_2 \rangle + pq \cdot \beta^2 + (c_2 - c_1)\langle v_1, v_2 \rangle - (u_1, u_2) \cdot \beta
\]

Hence \( (13.3) \) has two (possible identical) solutions, and these two solutions denoted

Let

\[
\alpha_i = \alpha_2 = \beta (1 + \lambda_i), \quad i = 1, \ldots, 3, \quad \beta (1 + \lambda_i) = \beta (1 + \lambda_i) = \beta (1 + \lambda_i).
\]

Hence \( (13.3) \) has two (possible identical) solutions, and these two solutions denoted by \( \beta_1 \) and \( \beta_2 \) lead to two eigenvectors of \( \Sigma \). For the second set of two solutions, let \( \alpha_1 = -\alpha_2 = 1 \) and \( \alpha_3 = -\alpha_4 = \beta \). Then again (i) = (ii) and (iii) = (iv) automatically, and (ii) = (iii) is equivalent to

\[
(c_1 + c_2)\langle v_1, v_2 \rangle - pq \cdot \beta^2 + (c_2 - c_1)\langle v_1, v_2 \rangle - (u_1, u_2) \cdot \beta
\]

The two (possible identical) solutions of the above quadratic equation (existence due to similar reason as \( (13.3) \)), denoted by \( \beta_3 \) and \( \beta_4 \), lead to the other two eigenvectors. Summarizing the above arguments, \( \Sigma \) has four eigenvalue

\[
\lambda_i = (c_2 - c_1)(pq + \langle u_1, u_2 \rangle) - \beta_i (c_1 + c_2)(\langle v_1, v_2 \rangle + pq), \quad i = 1, 2,
\]

\[
\lambda_i = (c_2 - c_1)(pq - \langle u_1, u_2 \rangle) + \beta_i (c_1 + c_2)(\langle v_1, v_2 \rangle - pq), \quad i = 3, 4.
\]

For the second claim of the lemma, note that \( (13.3) \) implies that

\[
\beta_1 + \beta_2 = \frac{(c_2 - c_1)(\langle u_1, u_2 \rangle - \langle v_1, v_2 \rangle)}{(c_1 + c_2)(\langle v_1, v_2 \rangle + pq)},
\]

\[
\beta_1 \cdot \beta_2 = \frac{(c_1 + c_2)(\langle u_1, u_2 \rangle + pq)}{(c_1 + c_2)(\langle v_1, v_2 \rangle + pq)}.
\]

Hence we have

\[
(1 + \lambda_1)(1 + \lambda_2)
\]

\[
= \left[1 + (c_2 - c_1)(pq + \langle u_1, u_2 \rangle)\right] - \beta_1 (c_1 + c_2)(\langle v_1, v_2 \rangle + pq)
\]

\[
\cdot \left[1 + (c_2 - c_1)(pq + \langle u_1, u_2 \rangle)\right] - \beta_2 (c_1 + c_2)(\langle v_1, v_2 \rangle + pq)
\]

\[
= \left[1 + (c_2 - c_1)(pq + \langle u_1, u_2 \rangle)\right]^2
\]

\[
- (\beta_1 + \beta_2)(c_1 + c_2)(\langle v_1, v_2 \rangle + pq)\left[1 + (c_2 - c_1)(pq + \langle u_1, u_2 \rangle)\right]
\]

\[
+ \beta_1 \beta_2 (c_1 + c_2)(\langle v_1, v_2 \rangle + pq)^2
\]

\[
= \left[1 + (c_2 - c_1)(pq + \langle u_1, u_2 \rangle)\right]^2
\]

\[
- (c_2 - c_1)(\langle u_1, u_2 \rangle - \langle v_1, v_2 \rangle)\left[1 + (c_2 - c_1)(pq + \langle u_1, u_2 \rangle)\right]
\]

\[
- (c_1 + c_2)^2(\langle u_1, u_2 \rangle + pq)(\langle v_1, v_2 \rangle + pq)
\]

\[
= 1 + (c_2 - c_1)(2pq + \langle u_1, u_2 \rangle + \langle v_1, v_2 \rangle) - 4c_1 c_2(\langle u_1, u_2 \rangle + pq)(\langle v_1, v_2 \rangle + pq).
\]

By plugging in the definition of \( c_1 \) and \( c_2 \), we have

\[
(1 + \lambda_1)(1 + \lambda_2) = 1 + \frac{\alpha^2 pq}{1 - (apq)^2}(2pq + \langle u_1, u_2 \rangle + \langle v_1, v_2 \rangle)
\]
Recall Lemma A.1. The argument for the expression \(1 + \lambda_3\) is similar, so the proof is complete.

\[
\sum_{i \neq j} A_{ij} B_{ij} = \frac{2}{n-2} c_k^\top A 1 + \frac{1}{(n-1)(n-2)} 1^\top A 1,
\]

we have

\[
\sum_{k=1}^n A_{kk}^* B_{kk}^* = \sum_{k=1}^n \left( -\frac{2}{n-2} c_k^\top A 1 + \frac{1}{(n-1)(n-2)} 1^\top A 1 \right) \times \left( -\frac{2}{n-2} B 1 + \frac{1}{(n-1)(n-2)} 1^\top B 1 \right)
\]

\[
= \frac{4}{(n-2)^2} 1^\top AB 1 + \left( -\frac{4}{(n-1)(n-2)^2} + \frac{n}{(n-1)^2(n-2)^2} \right) \cdot 1^\top A 1 1^\top B 1
\]

For the first term, using the definition of \(A^*, B^*\),

\[
\text{tr}(A^* B^*) = \text{tr} \left[ \left( A - \frac{1}{n-2} 1 1^\top A - \frac{1}{n-2} A 11^\top + \frac{1}{(n-1)(n-2)} 11^\top \right) \times \left( B - \frac{1}{n-2} 11^\top B - \frac{1}{n-2} B 11^\top + \frac{1}{(n-1)(n-2)} 11^\top \right) \right]
\]

\[
= \text{tr}(AB) + \frac{8n - 2(n-2)^2}{(n-2)^2} 1^\top AB 1 + \frac{n^2 - 6n + 6}{(n-1)^2(n-2)^2} 1^\top A 1 1^\top B 1.
\]

Combining the two identities above to conclude.

\[
\text{Proof of Proposition 2.1.} \text{ By the proceeding lemma,}
\]

\[
d\text{Cov}_n^2(X, Y) = \frac{1}{n(n-3)} \left( \text{tr}(AB) + \frac{1}{(n-1)(n-2)} 1^\top AB 1 - \frac{2}{n-2} \sum_{i \neq j} A_{ij} B_{ij} \right)
\]

\[
= \frac{1}{n(n-3)} \left( \sum_{i \neq j} A_{ij} B_{ij} + \frac{1}{(n-1)(n-2)} \sum_{i \neq j, k \neq \ell} A_{ij} B_{k\ell} - \frac{2}{n-2} \sum_{i \neq j, i \neq k} A_{ij} B_{ik} \right)
\]
\[
\begin{align*}
&= \frac{1}{n(n-3)} \left( \frac{n-3}{n-1} \sum_{i \neq j} A_{ij} B_{ij} \right) \\
&\quad + \frac{1}{(n-1)(n-2)} \sum_{i \neq j, k \neq \ell} A_{ij} B_{k\ell} - \frac{2(n-3)}{(n-1)(n-2)} \sum_{i \neq j} A_{ij} B_{ik} \\
&= \frac{1}{4!} \sum_{i \neq j, k \neq \ell} (A_{ij} B_{ij} + A_{ij} B_{ik} - 2A_{ij} B_{ik}) = \frac{1}{4!} \sum_{i_1 < \ldots < i_4} k_0(Z_{i_1}, Z_{i_2}, Z_{i_3}, Z_{i_4}),
\end{align*}
\]

Here (*) follows from the identities:

\[
\begin{align*}
\sum_{i \neq j, k \neq \ell} A_{ij} B_{ik} &= \sum_{i \neq j} A_{ij} B_{ik} + \sum_{i \neq j} A_{ij} B_{ij}, \\
\sum_{i \neq j, k \neq \ell} A_{ij} B_{k\ell} &= \sum_{i \neq j, k \neq \ell} A_{ij} B_{k\ell} + 4 \sum_{i \neq j, k \neq \ell} A_{ij} B_{ik} + 2 \sum_{i \neq j} A_{ij} B_{ij},
\end{align*}
\]

and \(k_0\) is the symmetrized kernel

\[
k_0(Z_1, Z_2, Z_3, Z_4) \]

\[
= \frac{1}{4!} \sum_{(i_1, \ldots, i_4) \in \sigma(1,2,3,4)} \left( \|X_{i_1} - X_{i_2}\| \left(\|Y_{i_1} - Y_{i_2}\| + \|Y_{i_3} - Y_{i_4}\| - 2\|Y_{i_1} - Y_{i_4}\|\right) \right)
\]

\[
= E_{\ell \in \sigma_4} (i_1, i_2) X \left((i_1, i_2) Y + (i_3, i_4) Y - 2(i_1, i_3) Y - (i_2, i_4) Y\right)
\]

\[
= E_{\ell \in \sigma_4} (i_1, i_2) X \left((i_1, i_2) Y + (i_3, i_4) Y - 2(i_1, i_3) Y - 2(i_2, i_4) Y\right) \quad (1 \leftrightarrow 2, 3 \leftrightarrow 4),
\]

where we abbreviate \((i, j)_X = (X_i, X_j), (i, j)_Y = (Y_i, Y_j)\) and the expectation \(E_{\ell \in \sigma_4}\) is taken over uniform distribution of permutation group over \{1, 2, 3, 4\}. So by averaging the above two equations, we have

\[
k_0(Z) \overset{(a)}{=} E_{\ell \in \sigma_4} (i_1, i_2) X \left((i_1, i_2) Y + (i_3, i_4) Y - (i_1, i_3) Y - (i_2, i_4) Y\right)
\]

\[
\overset{(b)}{=} E_{\ell \in \sigma_4} (i_1, i_2) X \left((i_1, i_2) Y + (i_3, i_4) Y - (i_1, i_3) Y - (i_2, i_4) Y\right) \quad (a: 1 \leftrightarrow 3, 2 \leftrightarrow 4)
\]

\[
\overset{(c)}{=} E_{\ell \in \sigma_4} (i_1, i_2) X \left((i_1, i_3) Y + (i_2, i_4) Y - (i_1, i_2) Y - (i_3, i_4) Y\right) \quad (a: 2 \leftrightarrow 3)
\]

\[
= E_{\ell \in \sigma_4} (i_1, i_2) X \left((i_1, i_3) Y + (i_2, i_4) Y - (i_1, i_2) Y - (i_3, i_4) Y\right) \quad (c: 1 \leftrightarrow 3, 2 \leftrightarrow 4).
\]

Using that

\[
(i_1, i_2)_X + (i_3, i_4)_X - (i_1, i_3)_X - (i_2, i_4)_X
\]

\[
= U(X_{i_1}, X_{i_2}) + U(X_{i_3}, X_{i_4}) - U(X_{i_1}, X_{i_4}) - U(X_{i_2}, X_{i_4}),
\]

and a similar equation for \((\cdot, \cdot)_Y\) replacing \(U\) by \(V\), we have

\[
k_0(Z) = \frac{1}{4!} \sum_{(i_1, \ldots, i_4) \in \sigma(1,2,3,4)} \left((U(X_{i_1}, X_{i_2}) + U(X_{i_3}, X_{i_4}) - U(X_{i_1}, X_{i_4}) - U(X_{i_2}, X_{i_4})\right) \times \left((V(Y_{i_1}, Y_{i_2}) + V(Y_{i_3}, Y_{i_4}) - V(Y_{i_1}, Y_{i_3}) - V(Y_{i_2}, Y_{i_4})\right)
\]

\[
= \frac{1}{4!} \sum_{(i_1, \ldots, i_4) \in \sigma(1,2,3,4)} \left(U(X_{i_1}, X_{i_2})\left(V(Y_{i_1}, Y_{i_2}) + V(Y_{i_3}, Y_{i_4}) - V(Y_{i_1}, Y_{i_3}) - V(Y_{i_2}, Y_{i_4})\right)\right.
\]

\[
+ U(X_{i_3}, X_{i_4})\left(V(Y_{i_1}, Y_{i_2}) + V(Y_{i_3}, Y_{i_4}) - V(Y_{i_1}, Y_{i_3}) - V(Y_{i_2}, Y_{i_4})\right)
\]

\[
- U(X_{i_1}, X_{i_2})\left(V(Y_{i_1}, Y_{i_2}) + V(Y_{i_3}, Y_{i_4}) - V(Y_{i_1}, Y_{i_3}) - V(Y_{i_2}, Y_{i_4})\right)
\]
- \frac{1}{4!} \sum_{(i_1, \ldots, i_4) \in \sigma(1, 2, 3, 4)} \left[ U(X_{i_1}, X_{i_2})V(Y_{i_1}, Y_{i_2}) + U(X_{i_1}, X_{i_2})V(Y_{i_3}, Y_{i_4}) - 2U(X_{i_1}, X_{i_2})V(Y_{i_1}, Y_{i_3}) \right] = k(Z).

The proof is complete. \qed

**APPENDIX B. PROOFS FOR SECTION 8**

B.1. **Proof of Lemma 8.1.**

**Proof of Lemma 8.1.** We only prove the formula for \( \psi_X \). Note that

\[
\psi_X(X_1, Y_1) = \mathbb{E}_{X_2, Y_2} \left[ (R_X(X_1, X_2) - \mathbb{E}_X R_X(X_1, X) - \mathbb{E}_X R_X(X, X_2) + (\mathbb{E} R_X)) Y_2^T Y_1 \right] \\
= \mathbb{E}_{X_2, Y_2} \left[ R_X(X_1, X_2) Y_2^T Y_1 \right] = \mathbb{E}_{X_2, Y_2} \left[ h(L_X(X_1, X_2)) Y_2^T Y_1 \right].
\]

Here in (*) we use the fact that \( E_{X_1, X_2, Y_2} R_X(X_1, X_2)(Y_2^T Y_1) = 0 \) for fixed \( Y_1 \), because \( R_X(X_1, X_2)(Y_2^T Y_1) \) has equal distribution as \( R_X(-X_1, -X_2)(-Y_2^T Y_1) \) for any fixed \( Y_1 \). On the other hand, by Lemma 7.2 we have

\[
\mathbb{E}_{X_2, Y_2} \left[ h(L_X(X_1, X_2)) Y_2^T Y_1 \right] = \frac{1}{8} \mathbb{E}_{X_2, Y_2} \left[ L_X(X_1, X_2) Y_2^T Y_1 \right] + \mathbb{E}_{X_2, Y_2} \left[ h_3(L_X(X_1, X_2)) Y_2^T Y_1 \right].
\]

To compute the first term, use the representation \( X_1 = \Sigma_1^{1/2} Z_X, Y_1 = \Sigma_Y^{1/2} Z_Y + \Sigma_{XX}^{-1/2} Z_X \), where \( \Sigma_Y \backslash X \equiv \Sigma_Y - \Sigma_{YX} \Sigma_X^{-1} \Sigma_{XY} \), we have

\[
\tau_4^4 \cdot \mathbb{E}_{X_2, Y_2} \left[ L_X(X_1, X_2) Y_2^T Y_1 \right] \\
= \mathbb{E}_{X_2, Y_2} \left[ \left( \|X_1\|^2 + \|\Sigma_X^{1/2} Z_X\|^2 - 2\|X_1\| \Sigma_X^{1/2} Z_X - \tau_X^2 \right) Z_X^T \Sigma_X^{-1/2} \Sigma_{XY} Y_1 \right] \\
= \mathbb{E}_{X_2, Y_2} \left[ -4\|X_1\|^2 X_1^T \Sigma_X^{1/2} Z_X Z_X^T \Sigma_X^{-1/2} \Sigma_{XY} Y_1 \right] \\
- 4\|\Sigma_X^{1/2} Z_X\|^2 X_1^T \Sigma_X^{1/2} Z_X Z_X^T \Sigma_X^{-1/2} \Sigma_{XY} Y_1 + 4\tau_X^2 X_1^T \Sigma_X^{1/2} Z_X Z_X^T \Sigma_X^{-1/2} \Sigma_{XY} Y_1 \\
= -4\|X_1\|^2 X_1^T \Sigma_{XY} Y_1 - 4\left( \text{tr}(\Sigma_X) \text{tr}(X_1 Y_1^T \Sigma_{XY}) + 2 \text{tr}(X_1 Y_1^T \Sigma_{YX} \Sigma_X) \right) + 4\tau_X^2 X_1^T \Sigma_{XY} Y_1 \\
= -4\left( \|X_1\|^2 - \text{tr}(\Sigma_X) \right) X_1^T \Sigma_{XY} Y_1 + 2X_1^T \Sigma_X \Sigma_{XY} Y_1.
\]

The claim follows. \qed

B.2. **Proof of Lemma 8.3.**

**Proof of Lemma 8.3.** For the first inequality, using the representation

\[
X_\ell = \Sigma_X^{1/2} Z_{\ell;X}, \quad Y_\ell = \Sigma_Y^{1/2} Z_{\ell;Y} + \Sigma_{XY} \Sigma_X^{-1/2} Z_{\ell;X}, \quad \ell = 1, 2,
\]
where $\Sigma_{Y \setminus X} \equiv \Sigma_Y - \Sigma_{Y,X} \Sigma_X^{-1} \Sigma_{Y,Y}$, and with the notation $D \equiv \Sigma_X^{-1/2} \Sigma_{X,Y} \Sigma_X^{-1/2}$, the left hand side of the desired inequality equals

$$E \left[ h(L_X(\Sigma_X^{1/2} Z_{1,X}, \Sigma_X^{1/2} Z_{2,X})) Z_{1,X}^T D Z_{2,X} \right],$$

whose absolute value is bounded, up to an absolute constant, by

$$E^{1/2} h^2(L_X(X_1, X_2)) \cdot E^{1/2}(Z_{1,X}^T D Z_{2,X})^2$$

$$= E^{1/2} h^2(L_X(X_1, X_2)) \cdot \|D\|_F \lesssim_M E^{1/2} h^2(L_X(X_1, X_2)) \cdot \|\Sigma_{XY}\|_F^2,$$

as desired. \hfill \Box

**B.3. Proof of Lemma 8.4.** Let $\mathcal{M}^d$ be the set of $d \times d$ matrices and $\mathcal{M}^d_{\text{p.d.}}$ the set of p.s.d. matrices of size $d \times d$. We need the following matrix derivative formulae.

**Lemma B.1.** Let $I \subset \mathbb{R}$.

1. Suppose that $S : I \to \mathcal{M}_d$ is a smooth map. Then for any integer $m \in \mathbb{N}$, and $t \in \text{int}(I)$,

$$\frac{d^m}{dt^m} S(t)^m = \sum_{k=0}^{m-1} S(t)^k \frac{d}{dt} S(t) S(t)^{m-1-k}. \quad (B.1)$$

2. Suppose that $S : I \to \mathcal{M}_d$ is a smooth map. Then for any $t \in \text{int}(I)$,

$$\frac{d}{dt} e^{S(t)} = \int_0^1 e^{uS(t)} \frac{d}{dt} S(t) e^{(1-u)S(t)} \, du. \quad (B.2)$$

3. Suppose that $S : I \to \mathcal{M}^d_{\text{p.d.}}$ is a smooth map. Then for any $t \in \text{int}(I)$ such that $S(t)$ is p.d.,

$$\frac{d}{dt} S^{1/2}(t) = \int_0^\infty e^{-u S^{1/2}(t)} \frac{d}{dt} S(t) e^{-u S^{1/2}(t)} \, du. \quad (B.3)$$

These formulae are well-known. We provide a self-contained proof below for the convenience of the reader.

**Proof.** (1). We prove the claim by induction on $m$. The base case $m = 1$ is trivial, so we suppose the claim holds up to $m - 1$. Now differentiating on both sides of the identity $S(t)^m = S(t)^{m-1} S(t)$ and using the induction hypothesis, we have

$$\frac{d}{dt} S(t)^m = \frac{d}{dt} S(t)^{m-1} S(t) + S(t)^{m-1} \frac{d}{dt} S(t)$$

$$= \left[ \sum_{k=0}^{m-2} S(t)^k \frac{d}{dt} S(t) S(t)^{m-2-k} \right] S(t) + S(t)^{m-1} \frac{d}{dt} S(t) = \text{RHS of (B.1)}.$$

(2). Using the expansion $e^A = \sum_{k=0}^\infty A^k / k!$,

RHS of (B.2) = \int_0^1 \sum_{k,\ell} \frac{1}{k! \ell!} (u S(t))^{k \ell} \frac{d}{dt} S(t) ((1 - u) S(t))^{\ell} \, du

$$\overset{(*)}{=} \sum_{k,\ell} \frac{1}{(k + \ell + 1)!} S(t)^k \frac{d}{dt} S(t) S(t)^\ell$$

$$= \sum_{m=0}^\infty \frac{1}{m!} \sum_{k=0}^{m-1} S(t)^k \frac{d}{dt} S(t) S(t)^{m-1-k} \quad \text{(rearranging the summation)}$$

$$= \sum_{m=0}^\infty \frac{1}{m!} \sum_{k=0}^{m-1} S(t)^k \frac{d}{dt} S(t) S(t)^{m-1-k} \quad \text{(rearranging the summation)}$$

$$= \sum_{m=0}^\infty \frac{1}{m!} \sum_{k=0}^{m-1} S(t)^k \frac{d}{dt} S(t) S(t)^{m-1-k} \quad \text{(rearranging the summation)}$$

$$= \sum_{m=0}^\infty \frac{1}{m!} \sum_{k=0}^{m-1} S(t)^k \frac{d}{dt} S(t) S(t)^{m-1-k} \quad \text{(rearranging the summation)}$$
By direct calculation, we have
\[
= \sum_{m=0}^{\infty} \frac{1}{m!} \frac{d}{dt} S(t)^m = \text{LHS of (B.2)}.
\]
Here in the last line we used (1), whereas in (\*) we used the simple fact that
\[
\int_0^1 u^k(1-u)\ell \, du = k!\ell!/(k+\ell+1)!
\]
that can be proved by induction on \(\ell\):
\[
\int_0^1 u^k(1-u)\ell \, du = \int_0^1 u^k(1-u)^{\ell-1}(1-u) \, du
= \int_0^1 u^k(1-u)^{\ell-1} \, du - \int_0^1 u^{k+1}(1-u)^{\ell-1} \, du
= \frac{k!(\ell-1)!}{(k+\ell)!} - \frac{(k+1)!(\ell-1)!}{(k+\ell+1)!} = \frac{k!\ell!}{(k+\ell+1)!}.
\]
(3). The derivative \(D(t) \equiv \frac{d}{dt} S^{1/2}(t)\) solves the Sylvester equation
\[
D(t)S^{1/2}(t) + S^{1/2}(t)D(t) = \frac{d}{dt} S(t). \tag{B.4}
\]
We will verify \(D(t)\) given by the right hand side of (B.3) satisfies (B.4). As \(S(t)\) is p.d., the integral in (B.3) converges. Now we compute
\[
\left( \int_0^\infty e^{-uS^{1/2}(t)} \frac{d}{dt} S(t) e^{-uS^{1/2}(t)} \, du \right) S^{1/2}(t)
+ S^{1/2}(t) \left( \int_0^\infty e^{-uS^{1/2}(t)} \frac{d}{dt} S(t) e^{-uS^{1/2}(t)} \, du \right)
= -\int_0^\infty \frac{d}{du} \left[ e^{-uS^{1/2}(t)} \frac{d}{dt} S(t) e^{-uS^{1/2}(t)} \right] \, du = \frac{d}{dt} S(t),
\]
as desired. \(\square\)

**Proof of Lemma 8.4: compact spectrum case.** We may represent \((X_\ell^T, Y_\ell^T)^T = \Sigma^{1/2} Z_\ell\) for \(\ell \in \mathbb{N}\). Let \(Z_{k,\ell} \equiv Z_k - Z_\ell\), where \(k, \ell \in \mathbb{N}\), and
\[
\Sigma_0 = \begin{pmatrix} \Sigma & 0 \\ 0 & \Sigma_Y \end{pmatrix}, \quad \Sigma_\ell = \Sigma_0 + t \begin{pmatrix} 0 & \Sigma_{XY} \\ \Sigma_{YX} & 0 \end{pmatrix} = \Sigma_0 + t(\Sigma_{[12]} + \Sigma_{[21]}),
\]
and \(H_{[ij]}(t) \equiv \Sigma_i^{1/2} I_{[ij]} \Sigma_i^{1/2}\). Then
\[
\psi_{b_X, b_Y}(t \Sigma_{XY}) \equiv \mathbb{E} \left[ h_X \left( \frac{Z_{k,\ell}^\top H_{[1]}(t) Z_{k,\ell}}{\tau_X^2} - 1 \right) h_Y \left( \frac{Z_{k',\ell'}^\top H_{[22]}(t) Z_{k',\ell'}}{\tau_Y^2} - 1 \right) \right] Z_1.
\]
By direct calculation, we have
\[
\frac{d}{dt} \psi_{b_X, b_Y}(t \Sigma_{XY})
= \mathbb{E} \left[ h_X \left( \frac{Z_{k,\ell}^\top H_{[1]}(t) Z_{k,\ell}}{\tau_X^2} - 1 \right) h_Y \left( \frac{Z_{k',\ell'}^\top H_{[22]}(t) Z_{k',\ell'}}{\tau_Y^2} - 1 \right) \tau_X^{-2} Z_{k,\ell} \frac{d}{dt} H_{[1]}(t) Z_{k,\ell} \right] Z_1
+ \mathbb{E} \left[ h_X \left( \frac{Z_{k,\ell}^\top H_{[1]}(t) Z_{k,\ell}}{\tau_X^2} - 1 \right) h_Y \left( \frac{Z_{k',\ell'}^\top H_{[22]}(t) Z_{k',\ell'}}{\tau_Y^2} - 1 \right) \tau_Y^{-2} Z_{k',\ell'} \frac{d}{dt} H_{[1]}(t) Z_{k',\ell'} \right] Z_1
\equiv B_1(t) + B_2(t).
Now we compute the term $dH_{[1]}(t)/dt$ in $B_1$. Using Lemma B.1-(3) and the fact that $(d\Sigma_i/dt)_{k,\ell} = \Sigma_{[12]} + \Sigma_{[21]}$, we have
\[
\frac{d}{dt}\Sigma_t^{1/2} = \int_0^\infty e^{-u\Sigma_t^{1/2}} \cdot (\Sigma_{[12]} + \Sigma_{[21]}) \cdot e^{-u\Sigma_t^{1/2}} du.
\]
This entails
\[
\frac{d}{dt}H_{[1]}(t) = \frac{d}{dt}(\Sigma^{1/2}I_{[11]}\Sigma^{1/2}) = \frac{d}{dt}\Sigma^{1/2} \cdot I_{[11]}\Sigma^{1/2} + \Sigma^{1/2}I_{[11]} \cdot \frac{d}{dt}\Sigma^{1/2}
\]
\[
= \int_0^\infty T \left[ e^{-u\Sigma_t^{1/2}} (\Sigma_{[12]} + \Sigma_{[21]}) e^{-u\Sigma_t^{1/2}} I_{[11]}\Sigma_t^{1/2} \right] du. \tag{B.5}
\]
Here for a square matrix $A$, $T(A) \equiv A + A^\top$. This implies
\[
\int_0^1 B_1(t) \, dt = \tau_X^{-2} \int_0^1 \mathbb{E} \left[ \frac{Z_k^\top H_{[1]}(t)Z_k - 1}{\tau_X^2} \right] \bY \left( \frac{Z_k^\top H_{[2]}(t)Z_k - 1}{\tau_Y^2} \right) \times T \left( \int_0^\infty \mathbb{E} \left[ e^{-u\Sigma_t^{1/2}} (\Sigma_{[12]} + \Sigma_{[21]}) e^{-u\Sigma_t^{1/2}} I_{[11]}\Sigma_t^{1/2} Z_k \right] du \right) \, dt.
\]
To continue calculations, we may write $e^{-u\Sigma_t^{1/2}}$ as follows: by Lemma B.1-(2), $A \mapsto e^A$ as a map from $\mathbb{R}^{(p+q)\times(p+q)}$ to $\mathbb{R}^{(p+q)\times(p+q)}$ has Frechét derivative $[\nabla(e^A)](A) \cdot H = \int_0^1 e^A e^H e^{-A} e^{-H} \, du$, so a first-order Taylor expansion yields that
\[
e^{-u\Sigma_t^{1/2}} - e^{-u\Sigma_0^{1/2}} = \int_0^1 [\nabla(e^A)]( - u\Sigma_t^{1/2} + s(-u)\Sigma_0^{1/2} - \Sigma_0^{1/2}) \cdot [-u(\Sigma_t^{1/2} - \Sigma_0^{1/2})] ds
\]
\[
= (-u) \int_0^1 \int_0^1 e^{-u[s\Sigma_0^{1/2} + s(\Sigma_t^{1/2} - \Sigma_0^{1/2})]} (\Sigma_t^{1/2} - \Sigma_0^{1/2}) e^{-u(1-v)[s\Sigma_0^{1/2} + s(\Sigma_t^{1/2} - \Sigma_0^{1/2})]} dv ds
\]
\[
\equiv \mathcal{R}_1(u,t). \tag{B.6}
\]
On the other hand, by Lemma B.1-(3), $A \mapsto A^{1/2}$ as a map from p.s.d. matrices in $\mathbb{R}^{(p+q)\times(p+q)}$ to itself has Frechét derivative $[\nabla(\cdot)^{1/2}](A) \cdot H = \int_0^\infty e^{-zA^{1/2}} H e^{-zA^{1/2}} \, dz$, so again a first-order Taylor expansion yields that
\[
\Sigma_t^{1/2} - \Sigma_0^{1/2} = \int_0^1 \left[ [\nabla(\cdot)^{1/2}] (\Sigma_0 + w(\Sigma_t - \Sigma_0)) \cdot (\Sigma_t - \Sigma_0) \right] dw
\]
\[
= \int_0^1 \int_0^\infty e^{-z(\Sigma_0 + w(\Sigma_t - \Sigma_0))} (\Sigma_t - \Sigma_0) e^{-z(\Sigma_0 + w(\Sigma_t - \Sigma_0))} \, dz dw
\]
\[
\equiv \mathcal{R}_2(t). \tag{B.7}
\]
Now using (B.6)-(B.7) and that
\[
e^{-u\Sigma_0^{1/2}} (\Sigma_{[12]} + \Sigma_{[21]}) e^{-u\Sigma_0^{1/2}} I_{[1]} = \begin{pmatrix} 0 & e^{-u\Sigma_t^{1/2}} \Sigma_{YX} e^{-u\Sigma_t^{1/2}} \Sigma_X & 0 \\ e^{-u\Sigma_t^{1/2}} \Sigma_{X} & 0 & 0 \\ 0 & 0 & 0 \end{pmatrix},
\]
we arrive at
\[
M(u,t) \equiv e^{-u\Sigma_t^{1/2}} (\Sigma_{[12]} + \Sigma_{[21]}) e^{-u\Sigma_t^{1/2}} I_{[1]} \Sigma_t^{1/2}
\]
\[
= \begin{pmatrix} 0 & e^{-u\Sigma_t^{1/2}} \Sigma_{YX} e^{-u\Sigma_t^{1/2}} \Sigma_X & 0 \\ e^{-u\Sigma_t^{1/2}} \Sigma_{X} & 0 & 0 \\ 0 & 0 & 0 \end{pmatrix} + e^{-u\Sigma_0^{1/2}} (\Sigma_{[12]} + \Sigma_{[21]}) e^{-u\Sigma_0^{1/2}} I_{[1]} \mathcal{R}_2(t)
\]
\[
+ \mathcal{R}_1(u,t) (\Sigma_{[12]} + \Sigma_{[21]}) e^{-u\Sigma_0^{1/2}} I_{[1]} \Sigma_t^{1/2} + e^{-u\Sigma_t^{1/2}} (\Sigma_{[12]} + \Sigma_{[21]}) \mathcal{R}_1(u,t) I_{[1]} \Sigma_t^{1/2}.
\]
Hence by using again $\|e^{-u\Sigma_0^{1/2}}\|_{op} \leq e^{-c_0 u}$ for some $c_0 = c_0(M) > 0$, there exist another positive $c_1$ only depending on $M$ such that

$$|\text{tr} M(u, t)| \lesssim_M e^{-c_1 u} \|\Sigma_{12}\|_F (\|R_1(u, t)\|_F + \|R_2(t)\|_F) \lesssim_M t(u \lor 1) e^{-c_1 u} \|\Sigma_{XY}\|_F^2,$$

which further leads to, with $\bar{M}(t) \equiv \int_0^\infty M(u, t) du$,

$$|\text{tr} (\bar{M}(t))| \leq \int_0^\infty |\text{tr}(M(u, t))| \lesssim_M t \|\Sigma_{XY}\|_F^2,$$

$$\|\bar{M}(t)\|_F \leq \int_0^\infty \|M(u, t)\|_F du \lesssim_M t \|\Sigma_{XY}\|_F.$$

Therefore by Cauchy-Schwarz,

$$\mathbb{E} \left( \int_0^1 B_1(t) \, dt \right)^2 \lesssim_\tau \int_0^\infty \mathbb{E} \mathbb{E}^{1/4} h_X(L_X(X_1, X_2))^8 \cdot \mathbb{E}^{1/4} h_Y(L_Y(Y_1, Y_2)) \cdot \sup_{t \in [0, 1]} \mathbb{E}^{1/2} (Z_1^T \bar{M}(t) Z_1)^4 \lesssim_\tau \int_0^\infty \mathbb{E} \mathbb{E}^{1/4} h_X(L_X(X_1, X_2))^8 \cdot \mathbb{E}^{1/4} h_Y(L_Y(Y_1, Y_2)) \cdot \sup_{t \in [0, 1]} \left[ |\text{tr}(\bar{M}(t))| \lor \|\bar{M}(t)\|_F \right]^2 \lesssim_M \tau \int_0^\infty \mathbb{E} \mathbb{E}^{1/4} h_X(L_X(X_1, X_2))^8 \cdot \mathbb{E}^{1/4} h_Y(L_Y(Y_1, Y_2)) \cdot \|\Sigma_{XY}\|_F^2 (1 \lor \|\Sigma_{XY}\|_F^2).

Flip the roles of $X$ and $Y$ to conclude that

$$\mathbb{E} \left( \int_0^1 B_2(t) \, dt \right)^2 \lesssim_M \tau \int_0^\infty \mathbb{E} \mathbb{E}^{1/4} h_Y(L_Y(Y_1, Y_2))^8 \cdot \mathbb{E}^{1/4} h_X(L_X(X_1, X_2)) \cdot \|\Sigma_{XY}\|_F^2 (1 \lor \|\Sigma_{XY}\|_F^2).

The claim follows by noting that

$$\psi_{h_X, h_Y}(\tau_{XY}) - \psi_{h_X, h_Y}(0) = \int_0^1 \frac{d}{dt} \psi_{h_X, h_Y}(t\Sigma_{XY}) \, dt = \int_0^1 [B_1(t) + B_2(t)] \, dt,$$

as desired.

**Proof of Lemma 8.4:** $X = Y$ case. The proof is largely similar so we only sketch the key steps. Let $X_\ell \equiv \Sigma_{XY}^{1/2} Z_\ell$ for $\ell \in \mathbb{N}$. Then with $h_X, h_Y$ denoted as $h, g$ to avoid confusion, we have

$$\psi_{h,g}(t\Sigma_X) = E \left[ h \left( \frac{\bar{Z}_{k,t}(t\Sigma_X) \bar{Z}_{k,t}}{\tau_X} - 1 \right) g \left( \frac{\bar{Z}_{k,t}(t\Sigma_X) \bar{Z}_{k,t}}{\tau_X} - 1 \right) \right] Z_1.$$
\[
\begin{align*}
&= \mathbb{E}\left[ b'\left( \frac{\tilde{Z}_{k,t}^\top (\Sigma X) \tilde{Z}_{k,t}}{\tau_X^2} - 1 \right) \mathbb{g}\left( \frac{\tilde{Z}_{k',t'}^\top (\Sigma X) \tilde{Z}_{k',t'}}{\tau_X^2} - 1 \right) \tau_X^{-2} \tilde{Z}_{k,t}^\top \Sigma_X \tilde{Z}_{k,t} \bigg| Z_1 \right] \\
&+ \mathbb{E}\left[ b\left( \frac{\tilde{Z}_{k,t}^\top (\Sigma X) \tilde{Z}_{k,t}}{\tau_X^2} - 1 \right) \mathbb{g}'\left( \frac{\tilde{Z}_{k',t'}^\top (\Sigma X) \tilde{Z}_{k',t'}}{\tau_X^2} - 1 \right) \tau_X^{-2} \tilde{Z}_{k',t'}^\top \Sigma_X \tilde{Z}_{k',t'} \bigg| Z_1 \right] \\
&\equiv B_1(t) + B_2(t).
\end{align*}
\]

Using Cauchy-Schwarz directly to conclude that
\[
\mathbb{E}\left( \int_0^1 B_1(t) \, dt \right)^2 \lesssim \tau_X^{-4} \cdot \mathbb{E}^{1/4} (b' \circ L_X)^8 \cdot \mathbb{E}^{1/4} (b \circ L_X)^8 \cdot \mathbb{E}^{1/2} (Z_{k,t}^\top \Sigma_X Z_1)^4.
\]

As \( \mathbb{E}^{1/2} (Z_{k,t}^\top \Sigma_X Z_1)^4 \lesssim_M \tau_X \approx_M \| \Sigma_X \|^p_2 \), the claim follows by treating \( B_2 \) in a similar way. \( \square \)

**B.4. Proof of Proposition 8.2.**

**Lemma B.2.** The following hold:

(1) For any integer \( k \geq 2 \) we have
\[
|\mathbb{E}[L_X^k(X_1, X_2) Y_1^r Y_2]| \lesssim_{k,M} \tau_X^{-4} \| \Sigma_{XY} \|^2_2.
\]

(2) For any \( k \in \mathbb{N} \) and real number \( \ell > 0 \), there exists some constant \( C = C(k, \ell, M) > 0 \) such that for \( p \geq 8\ell + 1 \), uniformly in \( s \in [0, 1] \) and \( r > 0 \),
\[
\left| \mathbb{E}\left[ L_X^k(X_1, X_2)(Y_1^s Y_2) \cdot \int_0^s \frac{(s-t)^r}{(1+tL_X(X_1, X_2))^\ell} \, dt \right] \right| \leq C \cdot \tau_X^{-k} \| \Sigma_{XY} \|^2_2.
\]

**Proof.** (1). The case \( k \geq 4 \) follows from Lemmas 7.4 and 8.3. The case \( k = 2, 3 \) can be checked by a direct calculation. We only verify \( k = 3 \) below. Using the parametrization \( (X, Y) \overset{d}{=} (\Sigma X^1/2 Z_X, \Sigma Y^1/2 Z_Y + \Sigma_{XY} \Sigma_X^{-1} Z_X) \), we have
\[
\mathbb{E}[L_X^3(X_1, X_2) Y_1^r Y_2] = \tau_X^{-6} \mathbb{E}[\| X_1 - X_2 \|^6 (X_1^\top D X_2) + (-6p) \cdot \mathbb{E}[X_1 - X_2]^4 (X_1^\top D X_2) + (12p^2) \cdot \mathbb{E}[X_1 - X_2]^2 (X_1^\top D X_2)]
\]
\[
\equiv L_1 - 6p L_2 + 12p^2 L_3.
\]

We first calculate \( L_1 \). Using the identity
\[
\| X_1 - X_2 \|^4 = \| X_1 \|^4 + \| X_2 \|^4 + 4(\| X_1 \|^2 \| X_2 \|^2) + 2\| X_1 \|^2 \| X_2 \|^2 - \| X_1 \|^2 (X_1^\top X_2) - 4\| X_2 \|^2 (X_1^\top X_2),
\]
we have
\[
L_1 = \mathbb{E}\left[ (\| X_1 \|^2 + \| X_2 \|^2 - 2X_1^\top X_2) \cdot (X_1^\top D X_2)
\right.
\]
\[
\times \left( (\| X_1 \|^4 + \| X_2 \|^4 + 4(\| X_1 \|^2 \| X_2 \|^2) + 2\| X_1 \|^2 \| X_2 \|^2 - 4\| X_1 \|^2 (X_1^\top X_2) - 4\| X_2 \|^2 (X_1^\top X_2)) \right]
\]
\[
\overset{(a)}{=} \mathbb{E}\left[ (\| X_1 \|^2 + \| X_2 \|^2 - 2X_1^\top X_2) \cdot (X_1^\top D X_2) \right].
\]
\[
\begin{align*}
\cdot \left( 2\|X_1\|^4 + 4(X_1^\top X_2)^2 + 2\|X_1\|^2\|X_2\|^2 - 8\|X_1\|^2(X_1^\top X_2) \right)
= -8E\|X_1\|^2\|X_2\|^2(X_1^\top X_2)(X_1^\top D X_2)
- 4E(X_1^\top X_2)(X_1^\top D X_2)\|X_1\|^4
- 4E(X_1^\top X_2)(X_1^\top D X_2)\|X_1\|^2\|X_2\|^2
- 8E(X_1^\top X_2)(X_1^\top D X_2),
\end{align*}
\]
using the symmetry between \(X_1\) and \(X_2\) in (*). Now by direct calculation, we have:

- By first taking expectation of \(X_2\), we have
  \[
  E\|X_1\|^4(X_1^\top D X_2) = E\|X_1\|^4(X_1^\top D X_1) = (p^2 + O(p)) \text{tr}(D).
  \]
- By first taking expectation of \(X_1\), we have by Lemma F.3-(1)
  \[
  E\|X_1\|^2\|X_2\|^2(X_1^\top D X_2) = E(X_1^\top X_1)(X_1^\top D X_2)(X_1^\top X_2)
  = [p + O(1)]\cdot E(X_2^\top D X_2)\|X_2\|^2 = (p^2 + O(p)) \text{tr}(D).
  \]
- By first taking expectation of \(X_1\), we have by Lemma F.3-(1)
  \[
  E(X_1^\top X_2)(X_1^\top D X_2) = E(X_1^\top X_2)(X_1^\top X_2)(X_1^\top X_2)
  \leq E(X_2^\top D X_2)(X_1^\top X_2) = O(p) \cdot \text{tr}(D).
  \]
Combining the pieces yields that
\[
L_1 = -24(p^2 + O(p)) \text{tr}(D).
\]
On the other hand, direct calculation of \(L_2\) via (B.8) and \(L_3\) yields that
\[
L_2 = -8(p + O(1)) \text{tr}(D), \quad L_3 = -2 \text{tr}(D).
\]
Putting together the estimates for \(L_1\) and \(L_3\) concludes that \(\tau_X^k \mathbb{E}[L_X^k(X_1, X_2)^1 Y_1^\top Y_2] = \mathcal{O}(p) \text{tr}(D) \lesssim p \cdot \|\Sigma_{XY}\|_F^2\), as desired.

(2). The left hand side of the desired inequality equals
\[
E\left[ L_X^k \left( \Sigma_{1, X}^{1/2} Z_{1, X, X}^{1/2} Z_{2, X} \right) Z_{1, X}^\top D Z_{2, X} \cdot \int_0^s \frac{(s - t)^r}{\left(1 + t L_X(\Sigma_{1, X}^{1/2} Z_{1, X, X}^{1/2} Z_{2, X})\right)^{r}} dt \right],
\]
\[
\lesssim_M E^{1/4} L_X^k(1, X_2) \cdot E^{1/2}(Z_{1, X}^\top D Z_{2, X})^2 \cdot E^{1/4} \left[ \int_0^s \frac{(s - t)^r}{\left(1 + t L_X(1, X_2)\right)^{r}} dt \right]^4.
\]
Here in (*) we used the calculation: as \(1 + t L_X(1, X_2) = (1 + t)\|X_1 - X_2\|^2/\tau_X^2\),
\[
E\left[ \int_0^s \frac{(s - t)^r}{\left(1 + t L_X(1, X_2)\right)^{r}} dt \right]^4 \lesssim \int_0^s \mathbb{E}(1 + t L_X(1, X_2))^{-4r} dt
\]
\[
\lesssim \int_0^s (1 - t)^{-4r} \wedge [t^{-4r}(\|X_1 - X_2\|^2/\tau_X^2)^{-4r}] dt \lesssim \int_0^s [(1 - t)^{-4r} \wedge t^{-4r}] dt \lesssim 1,
\]
using in (***) (7.4) which holds under \(p \geq 8\ell + 1\).
Proof of Proposition 8.2-Part 1: first moment bounds for $\psi_X, \psi_Y$. In view of Lemma 8.1, and the calculation
\[
E[\|X_1\|^2 X_1^\top \Sigma_{XY} Y_1] = \text{tr}(\Sigma_X)\text{tr}(\Sigma_{XY} \Sigma_{YX}) + 2 \text{tr}(\Sigma_{XY} \Sigma_{YX} \Sigma_X),
\]
we have
\[
EA_{1,X}(X_1, Y_1) = 2\tau_X^{-4} \text{tr}(\Sigma_{XY} \Sigma_{YX} \Sigma_X). \quad (B.9)
\]
Now we handle the ‘residual’ term $EA_{2,X}(X_1, Y_1)$: By Lemmas 7.2 and B.2,
\[
|EA_{2,X}(X_1, Y_1)| \lesssim |E[\mathcal{L}_X^2(X_1, X_2)Y_1^\top Y_2]|
+ \left| \mathcal{L}_X^4(X_1, X_2)Y_1^\top Y_2 \cdot \int_0^1 \frac{(1-s)^3}{(1+sL_X(X_1, X_2))^{7/2}} \, ds \right| \lesssim_M \tau_X^{-4}\|\Sigma_{XY}\|_F^2.
\]
The claim follows.

Proof of Proposition 8.2-Part 2: second moment bounds for $\psi_X, \psi_Y$. We write $A_{1,X}, A_{2,X}$ as $A_1, A_2$ in the proof. We only need to bound
\[
E\psi_X^2(X_1, Y_1) \lesssim |EA_1^2(X_1, Y_1) + EA_2^2(X_1, Y_1)|.
\]
Next we bound the above two summands separately.

Let $Z \sim \mathcal{N}(0, I_{p+q})$. To bound $\text{Var}(A_1(X_1, Y_1))$, we write
\[
A_1(X_1, Y_1) \overset{d}{=} A_1(Z) = (2\tau_X^{-4})^{-1} \left[ (Z^\top H_{[1]} Z - \text{tr}(H_{[1]})) Z^\top \bar{G}_{[1,2]} Z + 2Z^\top \bar{G} Z \right].
\]
Here $\bar{G}_{[1,2]} = (G_{[12]} + G_{[21]})/2$ and
\[
\bar{G}_X \equiv \frac{1}{2} \Sigma^{1/2} \begin{pmatrix} 0 & \Sigma_X \Sigma_{XY} \\ \Sigma_{YX} & 0 \end{pmatrix} \Sigma^{1/2}. \quad (B.10)
\]
By Gaussian-Poincaré inequality and Lemma 7.1, we have
\[
\text{Var}(2\tau_X^{-4} A_1(X_1, Y_1)) = 4\tau_X^{6} \cdot \text{Var}(A_1(Z))
\lesssim E(Z^\top \bar{G}_{[1,2]} Z)^2 Z^\top H_{[1]}^2 Z + E(Z^\top H_{[1]} Z - \text{tr}(H_{[1]}))^2 Z^\top \bar{G}_{[1,2]}^2 Z + EZ^\top \bar{G}_X^2 Z
\lesssim (\text{tr}^2(\bar{G}_{[1,2]}))^2 \|H_{[1]}\|_F^2 + \|\bar{G}_X\|_F^2
\lesssim_M \|\Sigma_X\|_F^2 \left( \|\Sigma_{XY}\|_F + \|\Sigma_{XY} \Sigma_X \|_F \right) + \|\Sigma_{XY} \Sigma_X \|_F \lesssim_M \tau_X^{-6} \|\Sigma_{XY}\|_F^2.
\]
This together with (B.9) yields that
\[
EA_1^2(X_1, Y_1) = \text{Var}(A_1(X_1, Y_1)) + (EA_1(X_1, Y_1))^2 \lesssim_M \tau_X^{-6} \|\Sigma_{XY}\|_F^2. \quad (B.11)
\]
Next we handle $A_2$: By definition of $h_3$ in Lemma 7.2 and the parametrization $Y_2 = \Sigma_{YX}^{-1/2} Z_{2,Y} + \Sigma_{XY} \Sigma_X^{-1/2} Z_{2,X}$,
\[
EA_2^2(X_1, Y_1) \lesssim \text{Ex}_{X,Y_1} \left\{ \text{Ex}_{X,Y_2} \left[ L_X^2(X_1, X_2)Y_1^\top Y_2 \int_0^1 \frac{(1-s)^2}{(1+sL_X(X_1, X_2))^{5/2}} \, ds \right] \right\}^2
\lesssim E^{1/4} L_X^{24}(X_1, X_2)^2 \cdot E^{1/2} (Z_{2,X}^\top \Sigma_X^{-1/2} \Sigma_{XY} Y_1)^4 \cdot E^{1/4} \left( \int_0^1 \frac{(1-s)^2}{(1+sL_X(X_1, X_2))^{5/2}} \, ds \right)^8.
\]
The three terms above can be bounded as follows:
- Lemma 7.4 yields that $E^{1/4} L_X^{24}(X_1, X_2) \lesssim_M \tau_X^{-6}$.
- With $L \equiv \Sigma_X^{-1/2} \Sigma_{XY} \Sigma_Y^{1/2}$, we have
  \[
  E^{1/2} (Z_{2,X}^\top \Sigma_X^{-1/2} \Sigma_{XY} Y_1)^4 = E^{1/2} (Z_{X1}^\top L Z_Y)^4 \lesssim \|L\|_F^2 \lesssim_M \|\Sigma_{XY}\|_F^2.
  \]
The claim follows as ψC.1.

Proof of Lemma 9.2.

Combining the estimates yields that

\[ \mathbb{E}A_f^2(X_1, Y_1) \lesssim_M \tau_X^{-b}\|\Sigma_{XY}\|_F^2. \]  

(B.12)

Combine (B.11)-(B.12) to conclude the estimate for \( \mathbb{E}\psi_2^2(X_1, Y_1) \). A similar argument applies to \( \mathbb{E}\psi_2^2(X_1, Y_1) \).

\[ \square \]

Proof of Proposition 8.2-Part 3: second moment bound for \( \psi_{X,Y} \). Using the notation in the proof of Lemma 8.4, and viewing \( \psi_{X,Y} \) as a function of \( \Sigma_{XY} \), for any \( t \in [0,1] \),

\[ \psi_{X,Y}(t\Sigma_{XY}) = \mathbb{E}_{Z_2} \left[ Dh \left( \frac{\bar{Z}_{1,2}^\top H_{[11]}(t)\bar{Z}_{1,2}}{\tau_X^2} - 1 \right) Dh \left( \frac{\bar{Z}_{1,2}^\top H_{[22]}(t)\bar{Z}_{1,2}}{\tau_Y^2} - 1 \right) \right], \]

where

\[ Dh(Z_1, Z_2) \equiv g(Z_1, Z_2) - \mathbb{E}_{Z_1}g(Z_1, 2) - \mathbb{E}_{Z_2}g(Z_1, 2) + \mathbb{E}_{Z_1, Z_2}g(Z_1, Z_2). \]

Expanding the product results in 16 terms of form

\[ B_{(k,\ell),(k',\ell')}(t\Sigma_{XY}) \equiv \mathbb{E} \left[ h \left( \frac{\bar{Z}_{k,\ell}^\top H_{[11]}(t)\bar{Z}_{k,\ell}}{\tau_X^2} - 1 \right) h \left( \frac{\bar{Z}_{k',\ell'}^\top H_{[22]}(t)\bar{Z}_{k',\ell'}}{\tau_Y^2} - 1 \right) \right] Z_1, \]

where \( k \neq \ell, k' \neq \ell' \). Using Lemma 8.4 and the moment estimates in Lemma 7.4, we have

\[ \mathbb{E}(\psi_{X,Y}(\Sigma_{XY}) - \psi_{X,Y}(0))^2 \lesssim \sup_{k,k',\ell,\ell'} \mathbb{E}(B_{(k,\ell),(k',\ell')}(\Sigma_{XY}) - B_{(k,\ell),(k',\ell')}(0)) \lesssim_M \tau_X^{-4}\tau_Y^{-4}\|\Sigma_{XY}\|_F^2(1 \vee \|\Sigma_{XY}\|_F^2)(\tau_X \wedge \tau_Y)^{-2}. \]

The claim follows as \( \psi_{X,Y}(0) = 0 \).

\[ \square \]

Appendix C. Proofs for Section 9

Proof of Lemma 9.2. As \( \mathbb{E}_{Z_2, z_3, z_4}U(X_{i_1}, X_{i_2})V(Y_{i_1}, Y_{i_2}) = 0 \), Proposition 2.1 yields that

\[ k_1(z_1) = \frac{1}{4!} \sum_{(i_1, ..., i_4) \in \sigma(1,2,3,4)} \left[ \mathbb{E}_{Z_2, z_3, z_4}U(X_{i_1}, X_{i_2})V(Y_{i_1}, Y_{i_2}) \right. \]

\[ \left. - 2\mathbb{E}_{Z_2, z_3, z_4}U(X_{i_1}, X_{i_2})V(Y_{i_1}, Y_{i_1}) \right]. \]

The claim now follows by calculating

\[ \sum_{(i_1, ..., i_4) \in \sigma(1,2,3,4)} \mathbb{E}_{Z_2, z_3, z_4}(U(X_{i_1}, X_{i_2})V(Y_{i_1}, Y_{i_2})) \]

\[ = 12(\mathbb{E}U(x_1, X)V(y_1, Y) + \mathbb{E}U(X, X')V(Y, Y')), \]

and

\[ \mathbb{E}_{Z_2, z_3, z_4}U(X_{i_1}, X_{i_2})V(Y_{i_1}, Y_{i_3}) = 0, \]

using the double-centered property of \( U, V \).

\[ \square \]
C.2. **Proof of Lemma 9.3.**

**Proof of Lemma 9.3.** Recall the identities involving $U, V$ in (7.3). Then we have

$$g_1(x_1, y_1) \equiv \frac{1}{2} \left[ EU(x_1, X_2)V(y_1, Y_2) - d Cov^2(X, Y) \right] = \frac{1}{2\tau_X \tau_Y} \left[ (x_1^\top \Sigma_{XY} y_1 - \| \Sigma_{XY} \|_F^2 ) + (R_1(x_1, y_1) - \mathbb{E} R_1(X_1, Y_1)) \right],$$

where, with $\psi_X, \psi_Y, \psi_{XY}$ defined in (8.1),

$$R_1(x_1, y_1) \equiv -\tau_X^2 \psi_X(x_1, y_1) - \tau_Y^2 \psi_Y(x_1, y_1) + \tau_X^2 \tau_Y \psi_{XY}(x_1, y_1).$$

By Lemma 8.1, we may write [recall the definitions of $\tilde{\psi}_X$ and $\tilde{\psi}_Y$ in (9.4)]

$$\psi_X(x_1, y_1) = \frac{1}{2\tau_X} \left( \| x_1 \|^2 - \text{tr}(\Sigma_X) \right) \| \Sigma_{XY} \|_F^2 + \tilde{\psi}_X(x_1, y_1),$$

$$\psi_Y(x_1, y_1) = \frac{1}{2\tau_Y} \left( \| y_1 \|^2 - \text{tr}(\Sigma_Y) \right) \| \Sigma_{XY} \|_F^2 + \tilde{\psi}_Y(x_1, y_1).$$

The claim follows.

\[ \square \]

C.3. **Proof of Lemma 9.4.**

**Proof of Lemma 9.4.** Note that

$$\mathbb{E} \tilde{\eta}_1^2(X, Y) = \frac{1}{4\tau_X^2 \tau_Y^2} \left[ \mathbb{E} (X^\top \Sigma_{XY} Y - \| \Sigma_{XY} \|_F^2)^2 + \mathbb{E} \varphi_1, X(Y, Y)^2 + \mathbb{E} \varphi_1, Y(Y, Y)^2 \right. $$

$$+ \left. 2\mathbb{E} (X^\top \Sigma_{XY} Y) \varphi_1, X(Y, Y) + 2\mathbb{E} (X^\top \Sigma_{XY} Y) \varphi_1, Y(Y, Y) \right].$$

The terms can be calculated as follows:

- Direct calculation yields that
  $$\mathbb{E} (X^\top \Sigma_{XY} Y - \| \Sigma_{XY} \|_F^2)^2 = \| \Sigma_{XY} \Sigma_{YX} \|_F^2 \cdot \text{tr}(\Sigma_{XY} \Sigma_{YX} \Sigma_X).$$

- Direct calculation yields that
  $$\mathbb{E} \varphi_1, X(Y, Y)^2 = \| \Sigma_{XY} \|_F^2 \cdot \| \Sigma_{YX} \|_F^2 = \frac{\| \Sigma_{XY} \|_F^2 \cdot \| \Sigma_{YX} \|_F^2}{2\tau_X^2 \tau_Y^2}$$

and similarly $\mathbb{E} \varphi_1, Y(Y, Y)^2 = \| \Sigma_{XY} \|_F^2 \cdot \| \Sigma_{YX} \|_F^2 / (2\tau_Y^2)$.

- We have
  $$\mathbb{E} (X^\top \Sigma_{XY} Y) \varphi_1, X(Y, Y) = -\frac{\| \Sigma_{XY} \|_F^2}{2\tau_X^2} \mathbb{E} (X^\top \Sigma_{XY} (\| X \|^2 - \text{tr}(\Sigma_X)))$$

  $$= -\frac{\| \Sigma_{XY} \|_F^2}{\tau_X} \cdot \text{tr}(\Sigma_{XY} \Sigma_{YX} \Sigma_X),$$

and similarly $\mathbb{E} (X^\top \Sigma_{XY} Y) \varphi_1, Y(Y, Y) = -\| \Sigma_{XY} \|_F^2 \cdot \text{tr}(\Sigma_{XY} \Sigma_{YX} \Sigma_X) / (2\tau_Y^2)$. 

- We have
  $$\mathbb{E} \varphi_1, X(Y, Y) \varphi_1, Y(Y, Y) = \frac{\| \Sigma_{XY} \|_F^2}{4\tau_X^2 \tau_Y^2} \mathbb{E} ((\| X \|^2 - \text{tr}(\Sigma_X))((\| Y \|^2 - \text{tr}(\Sigma_Y)))$$

  $$= \frac{\| \Sigma_{XY} \|_F^2}{4\tau_X^2 \tau_Y^2} \cdot 2\| \Sigma_{XY} \|_F^2 = \frac{\| \Sigma_{XY} \|_F^2}{2\tau_X^2 \tau_Y^2}.$$ 

The proof is complete.

\[ \square \]
C.4. Proof of Lemma 9.5.

Proof of Lemma 9.5. (1) Let $Z_i \sim \mathcal{N}(0, I_{p+q})$. Then we may write
\[
\tilde{g}_1(X, Y) \overset{d}{=} \tilde{g}_1(Z) = \frac{1}{4\tau_X \tau_Y} \cdot \left[ Z^T AZ - \mathbb{E}(Z^T AZ) \right],
\]
where the symmetric matrix $A$ is defined by
\[
A = G_{[12]} + G_{[21]} - \frac{\|\Sigma_{XY}\|^2_{F}}{\tau_X^2} H_{[11]} - \frac{\|\Sigma_{XY}\|^2_{F}}{\tau_Y^2} H_{[22]}.
\]
So by Lemma F.3-(1), we have
\[
\mathbb{E}\tilde{g}_1^2(X, Y) = \frac{1}{16\tau_X^2 \tau_Y^2} \cdot \|A\|^2_F.
\]

If the spectrum of $\Sigma$ is bounded above as well, then using Lemma F.5, we have
- $\|\Sigma_{XY}\Sigma_{YX}\|^2_{F} \lesssim_M \|\Sigma_{XY}\|^2_{F}$;
- $\|\Sigma_{XY}\Sigma_{YX} \Sigma_{YX}\|_{F} \lesssim_M \|\Sigma_{XY}\|^2_{F}$;
- $\|\Sigma_{XY}\|^2_{F} \|\Sigma_{XY} \Sigma_{YX}\|_{F} \lesssim_M (\tau_X^{-2} \vee \tau_Y^{-2}) \|\Sigma_{XY}\|^2_{F} (\tau_X^{-2} \wedge \tau_Y^{-2}) \lesssim \|\Sigma_{XY}\|^2_{F}$;
- $\frac{\|\Sigma_{XY}\|^2_{F} \|\Sigma_{XY} \Sigma_{YX}\|_{F}}{\tau_X^2} \lesssim_M \frac{\|\Sigma_{XY}\|^2_{F} \|\Sigma_{YX} \Sigma_{XY}\|_{F}}{\tau_Y^2} \lesssim_M \frac{\|\Sigma_{XY}\|^2_{F}}{\tau_Y^2} \lesssim_M \|\Sigma_{XY}\|^2_{F}$;
- $\frac{\|\Sigma_{XY}\|^2_{F}}{\tau_X^2} \lesssim_M \frac{\|\Sigma_{XY}\|^2_{F} \|\Sigma_{XY} \Sigma_{YX}\|_{F}}{\tau_Y^2} \lesssim \|\Sigma_{XY}\|^2_{F}$.

Collecting the bounds we conclude that $\mathbb{E}\tilde{g}_1^2(X, Y) \lesssim_M \tau_X^{-2} \tau_Y^{-2} \|\Sigma_{XY}\|^2_{F}$.

(2) When $X = Y$, we may write with $Z \sim \mathcal{N}(0, I_p)$ that
\[
\tilde{g}_1(Z) = \tilde{g}_1(X, Y) \overset{d}{=} \frac{1}{2\tau_X^2} \cdot \left[ Z^T AZ - \mathbb{E}(Z^T AZ) \right],
\]
with the symmetric matrix $\tilde{A}$ defined by $\tilde{A} \equiv \Sigma_{X}^{1/2} \left[ \Sigma_{X} - \|\Sigma_{X}\|^2_{F}/\tau_X^2 \right] \Sigma_{X}^{1/2}$. So
\[
\mathbb{E}\tilde{g}_1^2(X, Y) \approx \tau_X^{-4} \|\Sigma_{X} - \|\Sigma_{X}\|^2_{F}/\tau_X^2 \|_{F}^2 \lesssim_M \tau_X^{-4} \|\Sigma_{X} - \|\Sigma_{X}\|^2_{F}/\tau_X^2 \|_{F}^2 = \tau_X^{-4} \cdot \|\Sigma_{X}\|^2_{F}/\tau_X^2.
\]
A matching upper bound can be easily proved under the condition $\|\Sigma_{X}\|_{op} \leq M$. The proof is complete.

Proof of Lemma 9.6. We only prove the case for $\tilde{\psi}_X$. In the definition (9.4) of $\tilde{\psi}_X(X, Y)$, we write $\tilde{\psi}_X(x_1, y_1) \equiv A_{1,X}(x_1, y_1) + A_{2,X}(x_1, y_1)$. Then we have
\[
\text{Var} \left( \tilde{\psi}_X(X, Y) \right) \lesssim \text{Var} \left( A_{1,X}(X, Y) \right) + \text{Var} \left( A_{2,X}(X, Y) \right).
\]
Let $Z \sim \mathcal{N}(0, I_{p+q})$. We may write
\[
\tilde{A}_{1,X}(X, Y) = \frac{1}{2\tau_X^2} \left( \|X_1\|^2 - \text{tr}(\Sigma_X) \right) (X^T \Sigma_{XY} Y - \|\Sigma_{XY}\|^2_{F}) + 2X^T \Sigma_{X} \Sigma_{XY} Y.
\]
with \( \tilde{G}_X \) is defined in (B.10). By Gaussian-Poincaré inequality, we have
\[
\text{Var}(\tau_X^4 \tilde{A}_{1,X}(X,Y)) = \text{Var}(\tau_X^4 \tilde{A}_{1,X}(Z)) \leq \mathbb{E}(Z^T H_{[11]} Z - \text{tr}(H_{[11]}))^2 Z^T \tilde{G}_{[1,2]} Z
\]
\[
+ \mathbb{E}(Z^T \tilde{G}_{[1,2]} Z - \text{tr}(\tilde{G}_{[1,2]}))^2 Z^T G_{[1,2]} Z + \mathbb{E}Z^T \tilde{G}_X Z \leq \|G_{[12]}\|^2_F \|H_{[11]}\|^2_F + \|\tilde{G}_X\|^2_F \lesssim_M \tau_X^2 \|\Sigma_{XY}\|^2_F.
\]
On the other hand, by the estimate in (B.12),
\[
\text{Var}(A_{2,X}(X,Y)) \leq \mathbb{E}A_{2,X}^2(X,Y) \lesssim_M \tau_X^{-6} \|\Sigma_{XY}\|^2_F.
\]
Collecting the bounds to conclude.

\section*{C.6. Proof of Lemma 9.8.}
Proof of Lemma 9.8. As \( \mathbb{E}Z_{3,4} U(X_{i_1},X_{i_2}) V(Y_{i_3},Y_{i_4}) = 0 \), Proposition 2.1 yields that
\[
k_2(z_1,z_2) = \frac{1}{4!} \sum_{(i_1,\ldots,i_4) \in \sigma(1,2,3,4)} \left[ \mathbb{E}Z_{3,4} U(X_{i_1},X_{i_2}) V(Y_{i_3},Y_{i_4}) - 2\mathbb{E}Z_{3,4} U(X_{i_1},X_{i_2}) V(Y_{i_3},Y_{i_4}) \right].
\]
The claim now follows by calculating
\[
\sum_{(i_1,\ldots,i_4) \in \sigma(1,2,3,4)} \mathbb{E}Z_{3,4} U(X_{i_1},X_{i_2}) V(Y_{i_3},Y_{i_4}) = 4U(x_1,x_2)V(y_1,y_2) + 8\mathbb{E}U(x_1,X)V(y_1,Y) + 8\mathbb{E}U(x_2,X)V(y_2,Y) + 4 \text{dCov}^2(X,Y),
\]

\section*{C.7. Proof of Lemma 9.9.}
Proof of Lemma 9.9. By definition of \( g_2 \), we have
\[
g_2((x_1,y_1),(x_2,y_2)) = k_2((x_1,y_1),(x_2,y_2)) - k_1(x_1,y_1) - k_1(x_2,y_2) + \text{dCov}^2(X,Y)
\]
\[
= \frac{1}{6} \left[ U(x_1,x_2)V(y_1,y_2) - \mathbb{E}U(x_1,X)V(y_1,Y) - \mathbb{E}U(x_2,X)V(y_2,Y) + \text{dCov}^2(X,Y)
\right]
\]
\[
- \mathbb{E}U(x_1,X)V(y_2,Y) - \mathbb{E}U(x_2,X)V(y_1,Y) \right].
\]

Proof of Lemma 9.11. As $\mathbb{E}_z U(X_{i_1}, X_{i_2})V(Y_{i_3}, Y_{i_4}) = 0$, Proposition 2.1 yields that

$$k_3(z_1, z_2, z_3) = \frac{1}{4!} \sum_{(i_1, ..., i_4) \in \sigma(1, 2, 3, 4)} \left[ \mathbb{E}_z U(X_{i_1}, X_{i_2})V(Y_{i_1}, Y_{i_2}) - 2\mathbb{E}_z U(X_{i_1}, X_{i_2})V(Y_{i_3}, Y_{i_4}) \right].$$

The claim follows by calculating

$$\sum_{(i_1, ..., i_4) \in \sigma(1, 2, 3, 4)} \mathbb{E}_z U(X_{i_1}, X_{i_2})V(Y_{i_1}, Y_{i_2})$$

$$= \left[ \sum_{(i_1, ..., i_4) \in \sigma(1, 2, 3, 4), \ i_1 \neq 4} + \sum_{(i_1, ..., i_4) \in \sigma(1, 2, 3, 4), \ i_1 = 4} + \sum_{(i_1, ..., i_4) \in \sigma(1, 2, 3, 4), \ i_2 = 4} \right] \mathbb{E}_z U(X_{i_1}, X_{i_2})V(Y_{i_1}, Y_{i_2})$$

$$= 2 \sum_{1 \leq i_1 \neq i_2 \leq 3} U(x_{i_1}, x_{i_2})V(y_{i_1}, y_{i_2}) + 4 \sum_{1 \leq i \leq 3} \mathbb{E}U(X, x_i)V(Y, y_i),$$

and

$$\sum_{(i_1, ..., i_4) \in \sigma(1, 2, 3, 4)} \mathbb{E}_z U(X_{i_1}, X_{i_2})V(Y_{i_1}, Y_{i_3})$$

$$= \left[ \sum_{(i_1, ..., i_4) \in \sigma(1, 2, 3, 4), \ i_1 = 4} + \sum_{(i_1, ..., i_4) \in \sigma(1, 2, 3, 4), \ i_1 = 4} \right] \mathbb{E}_z U(X_{i_1}, X_{i_2})V(Y_{i_1}, Y_{i_3})$$

$$= \sum_{1 \leq i_1 \neq i_2 \leq 3} \mathbb{E}U(X, x_{i_1})V(Y, y_{i_2}) + \sum_{(i_1, i_2, i_3) \in \sigma(1, 2, 3)} U(x_{i_1}, x_{i_2})V(y_{i_1}, y_{i_3}),$$

as desired. $\square$

Appendix D. Proofs for Section 10

D.1. Proof of Lemma 10.3.

Proof of Lemma 10.3. This follows calculations with the definition (10.1) of $\hat{T}_n$:

$$\hat{T}_n(X, Y) = d\text{Cov}^2(X, Y)$$

$$+ \frac{2}{\tau_X \tau_Y n} \sum_i \left( X_i^T \Sigma_{XY} Y_i - \|\Sigma_{XY}\|^2 \frac{\|\Sigma_{XY}\|^2}{2\tau_X^2} \left(\|X_i\|^2 - \text{tr}(\Sigma_X)\) - \frac{\|\Sigma_{XY}\|^2}{2\tau_Y^2} (\|Y_i\|^2 - \text{tr}(\Sigma_Y)) \right)$$

$$+ \frac{1}{\tau_X \tau_Y \cdot 2 \binom{n}{2}} \sum_{i \neq k} \left[ \left( X_i^T X_{i_1} Y_{i_2} Y_{i_1} - X_i^T \Sigma_{XY} Y_{i_1} - X_{i_1}^T \Sigma_{XY} Y_{i_2} + \|\Sigma_{XY}\|^2 \frac{\|X_i\|^2}{2}\right)$$

$$- \left( X_i^T \Sigma_{XY} Y_{i_2} + X_{i_2}^T \Sigma_{XY} Y_{i_1} \right) \right]$$

$$= d\text{Cov}^2(X, Y) - \frac{2}{\tau_X \tau_Y n} \sum_{i = 1}^n \left[ \frac{\|\Sigma_{XY}\|^2}{2\tau_X^2} (\|X_i\|^2 - \text{tr}(\Sigma_X)) + \frac{\|\Sigma_{XY}\|^2}{2\tau_Y^2} (\|Y_i\|^2 - \text{tr}(\Sigma_Y)) \right]$$
\[ + \frac{1}{\gamma_1^2} \sum_{i=1}^{n} \left[ \left( X_i^T X_i + \Sigma_{X_X} ight) - \left( X_i^T \Sigma_{X_X} Y_i + X_i^T \Sigma_{X_Y} Y_i \right) \right]. \]

The claim now follows by the definitions of \( \psi_1-\psi_3 \). \( \Box \)

Proof of Proposition 10.4·(1). With \( W_i \equiv X_i Y_i^T \), we have

\[
\Delta \psi_1 (X, Y) = \psi_1 (X, Y) - \psi_1 (X^{(i)}, Y^{(i)})
\]

\[
= \sum_{i_1 \neq i_2} \text{tr} (W_{i_1} W_{i_2}^T) + 2 \sum_{j \neq i} \text{tr} (W_i W_j^T) - \left[ \sum_{i_1 \neq i_2} \text{tr} (W_{i_1} W_{i_2}^T) + 2 \sum_{j \neq i} \text{tr} (W_i W_j^T) \right]
\]

\[
= 2 \text{tr} \left[ (W_i - W_j) \sum_{j \neq i} W_j^T \right] = 2 \left[ \left( \sum_{j \neq i} Y_j X_j^T \right) X_i - \left( \sum_{j \neq i} Y_j X_j^T \right) X_i \right]. \tag{D.1}
\]

So for any \( A \subset \{1, \ldots, n\} \) and \( i \notin A \),

\[
\Delta \psi_1 (X^A, Y^A) = 2 \text{tr} \left[ (W_i - W_j) \left( \sum_{j \notin A \cup \{i\}} W_j + \sum_{j \in A} W_j \right)^T \right]
\]

\[
= 2 \left[ \left( \sum_{j \notin A \cup \{i\}} Y_j X_j^T + \sum_{j \in A} Y_j X_j^T \right) X_i - Y_i^T \left( \sum_{j \notin A \cup \{i\}} Y_j X_j^T + \sum_{j \in A} Y_j X_j^T \right) X_i \right].
\]

Then with \( E' \equiv E'(X', Y') \), we have

\[
4^{-1} E' [\Delta \psi_1 (X, Y) \Delta \psi_1 (X^A, Y^A)]
\]

\[
= E' \left[ Y_i^T \left( \sum_{j \notin A \cup \{i\}} Y_j X_j^T \right) X_i \cdot Y_i^T \left( \sum_{j \notin A \cup \{i\}} Y_j X_j^T + \sum_{j \in A} Y_j X_j^T \right) X_i \right] - E' \left[ Y_i^T \left( \sum_{j \notin A \cup \{i\}} Y_j X_j^T \right) X_i \cdot Y_i^T \left( \sum_{j \notin A \cup \{i\}} Y_j X_j^T + \sum_{j \in A} Y_j X_j^T \right) X_i \right] - E' \left[ Y_i^T \left( \sum_{j \notin A \cup \{i\}} Y_j X_j^T \right) Y_i^T \left( \sum_{j \notin A \cup \{i\}} Y_j X_j^T + \sum_{j \in A} Y_j X_j^T \right) X_i \right] + E' \left[ Y_i^T \left( \sum_{j \notin A \cup \{i\}} Y_j X_j^T \right) Y_i^T \left( \sum_{j \notin A \cup \{i\}} Y_j X_j^T + \sum_{j \in A} Y_j X_j^T \right) X_i \right]
\]

\[
\equiv B_1(i, A) - B_2(i, A) - B_3(i, A) + B_4(i, A).
\]

The four terms can be calculated as follows:

- By direct calculation,

\[
B_1(i, A) = Y_i^T \left( \sum_{j \notin A \cup \{i\}} Y_j X_j^T \right) X_i \cdot Y_i^T \left( \sum_{j \notin A \cup \{i\}} Y_j X_j^T + \left| A \right| \cdot \Sigma_{X_X} \right) X_i
\]

\[
= \sum_{j \notin i, k \notin A \cup \{i\}} (X_i^T X_j)(Y_i^T Y_j)(X_i^T X_k)(Y_i^T Y_k)
\]

\[
+ \left| A \right| (X_i^T \Sigma_{X_X} Y_i) \cdot \sum_{j \notin i} (X_i^T X_j)(Y_i^T Y_j).
\]

- Using independence between \( (X_i', Y_{i}') \) and \( \{(X_j', Y_{j}')\}_{j \in A} \) as \( i \notin A \),

\[
B_2(i, A) = Y_i^T \left( \sum_{j \notin A \cup \{i\}} Y_j X_j^T \right) X_i \cdot \text{tr} \left[ \left( \sum_{j \notin A \cup \{i\}} Y_j X_j^T + \left| A \right| \cdot \Sigma_{X_X} \right) \Sigma_{XY} \right]
\]
This implies that

\[ B_4(i, A) = \sum_{j \neq i, k \notin A \cup \{i\}} (X_j^\top \Sigma X_k)(Y_j^\top Y_k) + |A| \cdot \sum_{j \neq i} X_j^\top \Sigma X_Y Y_j. \]

By Lemma F.4-(4), we have

\[ B_4(i, A) = \mathbb{E}'\left[ X_i^\top \left( \sum_{j \notin A \cup \{i\}} X_j Y_j^\top + |A| \cdot \Sigma X_Y \right) Y_i \right] \]

Again by independence between \((X_i', Y'_i)\) and \(\{(X_j', Y'_j)\}_{j \in A}\) as \(i \notin A\),

\[ B_3(i, A) = \text{tr} \left[ \left( \sum_{j \notin A \cup \{i\}} X_j Y_j^\top \right) \Sigma X_Y \left( \sum_{j \notin A \cup \{i\}} X_j Y_j^\top + |A| \cdot \Sigma X_Y \right) \Sigma X_Y \right] \]

\[ = \text{tr} \left[ \left( \sum_{j \notin A \cup \{i\}} X_j^\top \Sigma X_Y \right)^2 \right] \]

\[ = \sum_{j \neq i, k \notin A \cup \{i\}} (X_j^\top \Sigma X_k)(Y_j^\top Y_k) + |A| \cdot \sum_{j \neq i} X_j^\top \Sigma X_Y Y_j. \]

Hence we have

\[ B_1(i, A) - B_2(i, A) = \sum_{j \neq i, k \notin A \cup \{i\}} (X_i^\top X_j)(Y_i^\top Y_j) \left[ X_j^\top (X_i Y_i^\top - \Sigma X_Y) Y_k \right] \]

\[ + |A| \cdot (X_i^\top \Sigma X_Y Y_i - \|\Sigma X_Y\|_F^2) \cdot \sum_{j \neq i} (X_i^\top X_j)(Y_i^\top Y_j), \]

and, by combining \(-B_3(i, A)\) with the last term of \(B_4(i, A)\),

\[ B_4(i, A) - B_3(i, A) \]

\[ = \sum_{j \neq i, k \notin A \cup \{i\}} (X_j^\top \Sigma X_k)(Y_j^\top Y_k) + |A| \cdot \sum_{j \neq i} X_j^\top \Sigma X_Y Y_j \]

This implies that

\[ 4^{-1} \mathbb{E}'[\Delta_i \psi_1(X, Y) \Delta_i \psi_1(X^A, Y^A)] \]
= \sum_{j \neq i, k \notin A \cup \{i\}} (X_j^T \Sigma_X X_k)(Y_j^T \Sigma_Y Y_k) + \sum_{j \neq i, k \notin A \cup \{i\}} (X_j^T \Sigma_X Y_k)(X_k^T \Sigma_X Y_j)
+ \sum_{j \neq i, k \notin A \cup \{i\}} [X_j^T (X_i Y_i^T - \Sigma_X Y_j)] [X_k^T (X_i Y_i^T - \Sigma_X Y_k)]
+ |A| \cdot \sum_{j \neq i} X_j^T \Sigma_X \Sigma_Y Y_j + |A| \cdot \sum_{j \neq i} X_j^T \Sigma_X \Sigma_Y \Sigma_Y Y_j
+ |A| \cdot (X_j^T \Sigma_X Y_i - \|\Sigma_X Y_i\|^2_F) \cdot \sum_{j \neq i} X_j^T (X_i Y_i^T - \Sigma_X Y_j)
≡ 4^{-1} \cdot \sum_{\ell=1}^6 T_\ell(i, A).

By definition, we have

\[ T_1 \equiv \frac{1}{2} \sum_{A \subseteq \{1, \ldots, n\}} \sum_{i \notin A} \left( \frac{\binom{n}{|A|}}{(n - |A|)} \right) T_1(i, A) \]

= \sum_{A \subseteq \{1, \ldots, n\}} \sum_{i \notin A} \left( \frac{\binom{n}{|A|}}{(n - |A|)} \right) \frac{(X_j^T \Sigma_X X_k)(Y_j^T \Sigma_Y Y_k)}{\left( \binom{n}{|A|} \right) (n - |A|)}
\[ + \sum_{A \subseteq \{1, \ldots, n\}} \sum_{i \notin A} \left( \frac{\binom{n}{|A|}}{(n - |A|)} \right) \frac{1}{\left( \binom{n}{|A|} \right) (n - |A|)} \]
\[ = 2 \sum_{1 \leq i \leq n, j \neq i, k \neq i} (X_j^T \Sigma_X X_k)(Y_j^T \Sigma_Y Y_k) \cdot \left[ \sum_{A \subseteq \{i, k\} = \emptyset} \left( \frac{n^2}{\binom{n}{|A|}} \right) (n - |A|) \right] \]
\[ \equiv \sum_{1 \leq i \leq n, j \neq i, k \neq i} (X_j^T \Sigma_X X_k)(Y_j^T \Sigma_Y Y_k) = (n - 2) \sum_{j, k} (X_j^T \Sigma_X X_k)(Y_j^T \Sigma_Y Y_k). \]

Here in (*) we used

\[ \sum_{A \cap \{i, k\} = \emptyset} \left( \frac{1}{\binom{n}{|A|}} \right) (n - |A|) = \sum_{a=0}^{n^2} \sum_{A \cap \{i, k\} = \emptyset, |A| = a} \frac{1}{\binom{n}{a}} (n - a) \]
\[ = \sum_{a=0}^{n^2} \left( \frac{n^2 - a}{\binom{n}{a}} \right) (n - a) = \sum_{a=0}^{n^2} \frac{n^2 - a}{n(n - 1)} = \frac{n^2}{2}. \] (D.2)

With completely analogous definitions and calculations, we have

\[ T_2 = (n - 2) \sum_{j, k} (X_j^T \Sigma_X Y_k)(X_k^T \Sigma_X Y_j), \]
\[ T_3 = \sum_{1 \leq i \leq n} \left[ \sum_{j \neq i} X_j^T (X_i Y_i^T - \Sigma_X Y_j) \right]^2. \]

Next, we have

\[ T_4 \equiv \frac{1}{2} \sum_{A \subseteq \{1, \ldots, n\}} \sum_{i \notin A} \left( \frac{T_4(i, A)}{\binom{n}{|A|}} \right) (n - |A|) \]
\[ = 2 \sum_{A \subseteq \{1, \ldots, n\}} \sum_{i \notin A} \sum_{j \neq i} |A| \cdot (X_j^T \Sigma_X \Sigma_X \Sigma_Y Y_j) \left( \frac{n^2}{\binom{n}{|A|}} (n - |A|) \right) \]
\[ = \frac{1}{2} \sum_{A \subseteq \{1, \ldots, n\}} \sum_{i \notin A} \left( \frac{T_4(i, A)}{\binom{n}{|A|}} \right) (n - |A|). \]
\[
\begin{align*}
= 2 \sum_{1 \leq i \leq n, j \neq i} (X_j^T \Sigma_X \Sigma_X \Sigma_Y Y_j) \cdot \left[ \sum_{A : i \notin A} \frac{|A|}{(n-|A|)(n-|A|)} \right] \\
\Rightarrow (\ast) \quad (n-1) \cdot \sum_{1 \leq i \leq n, j \neq i} X_j^T \Sigma_X \Sigma_X \Sigma_Y Y_j = (n-1)^2 \cdot \sum_{j=1}^n X_j^T \Sigma_X \Sigma_X \Sigma_Y Y_j.
\end{align*}
\]

Here in \((\ast)\) we used
\[
\sum_{A : i \notin A} \frac{|A|}{(n-|A|)(n-|A|)} = \sum_{a=0}^{n-1} \sum_{A : i \notin A, |A| = a} \frac{a}{(n-a)(n-a)} = \sum_{a=0}^{n-1} \frac{a(n-a)}{n} = \frac{n-1}{2}.
\]

With completely analogous definitions and calculations, we have
\[
T_5 = (n-1)^2 \cdot \sum_{j=1}^n X_j^T \Sigma_X \Sigma_X \Sigma_Y Y_j,
\]
\[
T_6 = (n-1) \cdot \sum_{1 \leq i \leq n, j \neq i} (X_i^T \Sigma_X \Sigma_Y Y_i - \|\Sigma_X\|_F^2) \cdot \left[ X_i^T (X_i Y_i^T - \Sigma_X Y_i) \right].
\]

Putting together the pieces, we have \(E(T_{i,j} | X, Y) = \sum_{i=1}^6 T_i\). The proof is now complete by invoking Lemma D.1 that gives bounds for the variances of \(T_i\)'s. □

**Lemma D.1.** Recall the terms \(T_1, T_6\) defined in the proof of Proposition 10.4-(1) above. The following hold.

1. \(\text{Var}(T_1) \lesssim_M n^3 \cdot (n \vee \tau_X^2 \vee \tau_Y^2) \cdot (\|\Sigma_X\|_F^4 + \|\Sigma_Y\|_F^2)^2).
2. \(\text{Var}(T_2) \lesssim_M n^3 \cdot \|\Sigma_X\|_F^4 + n^5 \cdot \|\Sigma_Y\|_F^2^2).
3. \(\text{Var}(T_3) \lesssim_M n^3 \cdot \|\Sigma_X\|_F^2 \cdot \|\Sigma_Y\|_F^2 + n^4 \cdot (1 \vee \|\Sigma_X\|_F^2)^2 \cdot \|\Sigma_X\|_F^2 \cdot \|\Sigma_Y\|_F^2 + n^5 \cdot \|\Sigma_X\|_F^2^2.
4. \(\text{Var}(T_4) \vee \text{Var}(T_5) \lesssim_M n^3 \cdot \|\Sigma_X\|_F^2 \cdot \|\Sigma_Y\|_F^2 + \|\Sigma_X\|_F^2^2.
5. \(\text{Var}(T_6) \lesssim_M n^3 \cdot \|\Sigma_X\|_F^2 \cdot \|\Sigma_Y\|_F^2 + \|\Sigma_X\|_F^2^2.

Consequently,
\[
\text{Var}(T_{i,j}) \lesssim_M n^3 \cdot \|\Sigma_X\|_F^2 \cdot \|\Sigma_Y\|_F^2 + n^4 \cdot (1 \vee \|\Sigma_X\|_F^2)^2 \cdot \|\Sigma_X\|_F^2 \cdot \|\Sigma_Y\|_F^2^2 + n^5 \cdot (1 \vee \|\Sigma_X\|_F^2)^2 \cdot \|\Sigma_X\|_F^2^2.
\]

**Proof of Lemma D.1.** (Variance of \(T_1\)) Note that
\[
T_1 = (n-2) \cdot \sum_{k, \ell} (X_k^T \Sigma_X X_l) Y_k^T \Sigma_Y Y_l = (n-2) \cdot \sum_{k, \ell} (Z_k^T G_{[11]} Z_l)(Z_l^T G_{[22]} Z_k).
\]

Hence for any \(i \in [n]\) and \(j \in [p + q]\), we have
\[
\frac{\partial T_1}{\partial Z_{ij}} = 2(n-2) \cdot \sum_{k=1}^n \left[ e_j^T G_{[11]} Z_k \right] (Z_k^T G_{[22]} Z_k). 
\]

By direct calculation, we have
\[
E \parallel T_{11} \parallel_F^2 = \sum_{i,j} E \left[ e_j^T G_{[11]} \left( \sum_{k=1}^n Z_k Z_k^T \right) G_{[22]} Z_i Z_i^T G_{[22]} \left( \sum_{k=1}^n Z_k Z_k^T \right) G_{[11]} e_j \right] = n \cdot \sum_{k_1, k_2=1}^n E \left[ (Z_{k_1}^T G_{[22]} Z_{k_1})(Z_{k_1}^T G_{[22]} Z_{k_2})(Z_{k_1}^T G_{[11]} Z_{k_2}) \right]
\]
By direct calculation, we have

\[ A \text{ similar calculation for } T \]

\[ \text{Variance of } T \]

\[ \| \Sigma_Y \|_F^2 \| \Sigma_X \|_F^2 \]

\[ + n \cdot \left[ \text{tr}(\Sigma_{XY} \Sigma_Y \Sigma_Y \Sigma_X) + \| \Sigma_Y \|_F^2 \cdot \text{tr}(\Sigma_{XY} \Sigma_Y \Sigma_Y \Sigma_X) \right] 

\[ + n \cdot \| \Sigma_X \|_F^2 \| \Sigma_Y \|_F^2 + n^2 \cdot \text{tr}(\Sigma_{XY} \Sigma_Y \Sigma_Y \Sigma_X) \right] \]

\[ \approx_M n \cdot \left[ \tau_X^2 \tau_Y^2 + n \cdot \tau_X^2 \| \Sigma_{XY} \|_F^2 + n \tau_X^2 \tau_Y^2 + n^2 \| \Sigma_{XY} \|_F^2 \right] 

\[ \approx n \cdot (n \vee \tau_X^2) \cdot (\tau_X^2 \tau_Y^2 + n \| \Sigma_{XY} \|_F^2) \]

A similar calculation for \( T_{12} \) yields that

\[ \mathbb{E}[T_{11}]_F^2 \lesssim_M n \cdot (n \vee \tau_X^2) \cdot (\tau_X^2 \tau_Y^2 + n \| \Sigma_{XY} \|_F^2) \]

so we conclude by the Gaussian-Poincaré inequality that

\[ \text{Var}(T_1) \lesssim_M n^3 \cdot (n \vee \tau_X^2 \vee \tau_Y^2) \cdot (\tau_X^2 \tau_Y^2 + n \| \Sigma_{XY} \|_F^2) \]

(Variance of \( T_2 \)) Note that

\[ T_2 = (n - 2) \cdot \sum_{k,l} (Z_k^\top G_{[12]} Z_l)(Z_k^\top G_{[21]} Z_l) \]

Hence for any \( i \in [n] \) and \( j \in [p + q] \),

\[ \frac{\partial T_2}{\partial Z_{ij}} = 2(n - 2) \cdot \sum_k \left[ (e_k^\top G_{[12]} Z_k)(Z_k^\top G_{[21]} Z_k) + (Z_k^\top G_{[12]} e_j)(Z_k^\top G_{[21]} Z_k) \right] 

\[ \equiv 2(n - 2) \cdot \left[ (T_{21})_{(ii)} + (T_{22})_{(ij)} \right] \]

By direct calculation, we have

\[ \mathbb{E}[T_{21}]_F^2 = \sum_{i,j} \mathbb{E} \left[ Z_i^\top G_{[12]} \left( \sum_k Z_k Z_k^\top \right) G_{[12]} e_j e_j^\top G_{[12]} \left( \sum_k Z_k Z_k^\top \right) G_{[12]} Z_i \right] 

\[ = n \cdot \sum_{k_1, k_2} \mathbb{E} \left[ (Z_1^\top G_{[12]} Z_{k_1})(Z_1^\top G_{[21]} Z_{k_2})(Z_{k_1}^\top G_{[21]} G_{[12]} Z_{k_2}) \right] 

\[ = n \cdot \mathbb{E} \left[ 1 \cdot (Z_1^\top G_{[21]} Z_1)(Z_1^\top G_{[21]} Z_1)(Z_1^\top G_{[12]} Z_1) \right. 

\[ + 2(n - 1) \cdot (Z_1^\top G_{[21]} Z_1)(Z_1^\top G_{[21]} Z_2)(Z_1^\top G_{[21]} G_{[12]} Z_2) 

\[ \left. + (n - 1) \cdot (Z_1^\top G_{[21]} Z_2)(Z_1^\top G_{[21]} Z_2)(Z_1^\top G_{[21]} G_{[12]} Z_2) \right] 

\[ + (n - 1)(n - 2) \cdot (Z_1^\top G_{[21]} Z_2)(Z_1^\top G_{[21]} Z_3)(Z_1^\top G_{[21]} G_{[12]} Z_3) \right] \]

\[ \lesssim_M n \cdot \left[ \| \Sigma_{XY} \|_F^6 + n \cdot \| \Sigma_{XY} \|_F^6 + n^2 \cdot \| \Sigma_{XY} \|_F^2 \right] \]
\[ \sim n \cdot (\|\Sigma_{XY}\|_F^6 + n^2 \|\Sigma_{XY}\|_F^2). \]

A similar bound holds for \( T_{22} \).

**Variance of \( T_3 \)** Note that
\[
T_3 = \sum_{k=1}^n \left[ \sum_{\ell \neq k} X_\ell^\top (X_\ell Y_\ell^\top - \Sigma_{XY}) Y_\ell \right]^2 = \sum_{k=1}^n \left[ \sum_{\ell \neq k} Z_\ell^\top \left( H_{11} Z_k Z_k^\top H_{22} - G_{12} \right) Z_\ell \right]^2.
\]

Hence for any \( i \in [n] \) and \( j \in [p+q] \), we have
\[
2^{-1} \frac{\partial T_3}{\partial Z_{ij}} = \sum_{k=1}^n \left[ \sum_{\ell \neq k} Z_\ell^\top \left( H_{11} Z_k Z_k^\top H_{22} - G_{12} \right) Z_\ell \right] 
\times \sum_{\ell \neq k} \left[ \delta_{ij} \epsilon_j^\top \left( H_{11} Z_k Z_k^\top H_{22} - G_{12} \right) Z_\ell 
+ \delta_{ik} \epsilon_i^\top \left( H_{11} Z_k Z_k^\top H_{22} - G_{12} \right) Z_\ell 
+ \delta_{ik} \epsilon_j^\top \left( H_{11} Z_k Z_k^\top H_{22} + H_{11} Z_k e_j H_{22} \right) Z_\ell \right] 
+ \left[ \sum_{\ell \neq i} Z_\ell^\top \left( H_{11} Z_i Z_i^\top H_{22} - G_{12} \right) Z_\ell \right] \cdot \left[ \sum_{\ell \neq i} (Z_\ell^\top H_{11} \epsilon_i) (Z_\ell^\top H_{22} Z_\ell) \right] 
+ \left[ \sum_{\ell \neq i} Z_\ell^\top \left( H_{11} Z_i Z_i^\top H_{22} - G_{12} \right) Z_\ell \right] \cdot \left[ \sum_{\ell \neq i} (Z_\ell^\top H_{11} \epsilon_i) (\epsilon_i^\top H_{22} Z_\ell) \right] 
+ \left[ \sum_{k \neq i} \left[ \sum_{\ell \neq k} Z_\ell^\top \left( H_{11} Z_k Z_k^\top H_{22} - G_{12} \right) Z_\ell \right] \cdot \left[ \sum_{\ell \neq k} (Z_\ell^\top H_{11} \epsilon_j) (Z_\ell^\top H_{22} Z_\ell) \right] 
+ \left[ \sum_{k \neq i} \left[ \sum_{\ell \neq k} Z_\ell^\top \left( H_{11} Z_k Z_k^\top H_{22} - G_{12} \right) Z_\ell \right] \cdot \left[ \sum_{\ell \neq k} (Z_\ell^\top H_{11} \epsilon_j) (\epsilon_j^\top H_{22} Z_\ell) \right] 
+ \sum_{k \neq i} \left[ \sum_{\ell \neq k} (Z_\ell^\top H_{12} Z_i) (Z_\ell^\top H_{22} Z_i) \cdot \left[ \sum_{\ell \neq k} (Z_\ell^\top H_{11} \epsilon_j) (\epsilon_j^\top H_{22} Z_i) \right] \right] \] 
\equiv (T_{31})_{(ij)} + (T_{32})_{(ij)} + (T_{33})_{(ij)} + (T_{34})_{(ij)}.
\]

For \( T_{31} \), we have
\[
\mathbb{E}\|T_{31}\|_F^2 = n \cdot \mathbb{E}\left[ \sum_{\ell \neq 1} \left( H_{11} Z_1 Z_1^\top H_{22} - G_{12} \right) Z_\ell \right]^2 \cdot \left\| \sum_{\ell \neq 1} (Z_\ell^\top H_{22} Z_\ell) H_{11} \right\|_F^2 
\leq n \cdot \mathbb{E}^{1/2}\left[ \sum_{\ell \neq 1} \left( H_{11} Z_1 Z_1^\top H_{22} - G_{12} \right) Z_\ell \right]^4 \cdot \mathbb{E}^{1/2}\left\| \sum_{\ell \neq 1} (Z_\ell^\top H_{22} Z_\ell) H_{11} \right\|_F^4.
\]

The two terms can be bounded as follows:

- **Let** \( U_1 \equiv H_{11} Z_1 Z_1^\top H_{22} - G_{12} \). By first conditioning on \( Z_1 \), we have
  \[
  \mathbb{E}\left[ \sum_{\ell \neq 1} Z_\ell^\top U_1 Z_\ell \right]^4 \lesssim \mathbb{E}\left[ n \cdot \text{tr}(U_1) + n^{1/2} \cdot \|U_1\|_F \right]^4 
  \lesssim M \cdot n^4 \cdot \|\Sigma_{XY}\|_F^4 + n^2 \cdot \|\Sigma_X\|_F^4 \cdot \|\Sigma_Y\|_F^4, \quad (D.3)
  \]
  where the last inequality follows from Lemma D.2-(4).
- **Let** \( M_{-1} \equiv \sum_{k \neq 1} Z_k Z_k^\top \). Then by first taking expectation with respect to \( Z_1 \), we have
  \[
  \mathbb{E}\left[ \left\| \sum_{\ell \neq 1} (Z_\ell^\top H_{22} Z_\ell) H_{11} \right\|_F^4 \right]^4 \asymp \mathbb{E} \text{tr}^2 \left( H_{22}^\top M_{-1} H_{22}^\top M_{-1} H_{22} \right)
  \]
= \mathbb{E} \left[ \sum_{k_1, k_2 \neq 1} (Z_{k_1}^\top H_{[1]}^2 Z_{k_2}) (Z_{k_1} H_{[2]}^2 Z_{k_2}) \right]^2 \\
= \mathbb{E} \sum_{k_1, k_2, k_3, k_4 \neq 1} (Z_{k_1}^\top H_{[1]}^2 Z_{k_2}) (Z_{k_1}^\top H_{[2]}^2 Z_{k_2}) (Z_{k_3}^\top H_{[1]}^2 Z_{k_4}) (Z_{k_3}^\top H_{[2]}^2 Z_{k_4}).

(i) When \( k_1 - k_4 \) take one distinct value, there are up to \( n \) such terms, and each term has contribution

\[
\mathbb{E}(Z_{1}^\top H_{[1]}^2 Z_{1})^2 (Z_{1}^\top H_{[2]}^2 Z_{1})^2 \lesssim \mathbb{E}^{1/2}(Z_{1}^\top H_{[1]}^2 Z_{1})^4 \cdot \mathbb{E}^{1/2}(Z_{1}^\top H_{[2]}^2 Z_{1})^4 \\
\lesssim \|H_{[1]}\|^4_F \|H_{[2]}\|^4_F = \|\Sigma_X\|^2_F \|\Sigma_Y\|^2_F.
\]

(ii) When \( k_1 - k_4 \) take two distinct values, there are up to \( n^2 \) such terms, and each term has contribution

\[
\mathbb{E}\left[ (Z_{1}^\top H_{[1]}^2 Z_{1})(Z_{1}^\top H_{[2]}^2 Z_{1})(Z_{2}^\top H_{[1]}^2 Z_{2})(Z_{2}^\top H_{[2]}^2 Z_{2}) \right] \\
= \mathbb{E}\left[ (Z_{1}^\top H_{[1]}^2 Z_{1})(Z_{1}^\top H_{[2]}^2 Z_{2})(Z_{1}^\top H_{[1]}^2 H_{[2]}^2 Z_{1}) \right] \\
\leq \mathbb{E}^{1/4}(Z_{1}^\top H_{[1]}^2 Z_{1})^4 \cdot \mathbb{E}^{1/4}(Z_{1}^\top H_{[2]}^2 Z_{1})^4 \cdot \mathbb{E}^{1/2}(Z_{1}^\top H_{[1]}^2 H_{[2]}^2 Z_{1})^2 \\
\lesssim \|H_{[1]}\|^2_F \|H_{[2]}\|^2_F \|\tr(H_{[1]}^2 H_{[2]}^2)\| + \|H_{[1]}^2 H_{[2]}\|F \\
\lesssim_M \|\Sigma_X\|^2_F \|\Sigma_Y\|^2_F \|\Sigma_{XY}\|^2_F + \|\Sigma_{XY}\|F^2.
\]

(iii) When \( k_1 - k_4 \) take three distinct values in the form of \( (k_1 = k_2) \neq k_3 \neq k_4 \), there are up to \( n^3 \) such terms, and each term has contribution

\[
\mathbb{E}\left[ (Z_{1}^\top H_{[1]}^2 Z_{1})(Z_{1}^\top H_{[2]}^2 Z_{1})(Z_{2}^\top H_{[1]}^2 Z_{2})(Z_{3}^\top H_{[2]}^2 Z_{3}) \right] \\
= \mathbb{E}\left[ (Z_{1}^\top H_{[1]}^2 Z_{1})(Z_{1}^\top H_{[2]}^2 Z_{2})(Z_{1}^\top H_{[1]}^2 H_{[2]}^2 Z_{1}) \right] \\
\lesssim \|H_{[1]}\|^2_F \|H_{[2]}\|^2_F \|\tr(H_{[1]}^2 H_{[2]}^2)\| \lesssim_M \|\Sigma_X\|^2_F \|\Sigma_Y\|^2_F \|\Sigma_{XY}\|^2_F.
\]

(iv) When \( k_1 - k_4 \) take three distinct values in the form of \( (k_1 = k_3) \neq k_2 \neq k_4 \), there are up to \( n^3 \) such terms, and each term has contribution

\[
\mathbb{E}\left[ (Z_{1}^\top H_{[1]}^2 Z_{2})(Z_{1}^\top H_{[2]}^2 Z_{2})(Z_{1}^\top H_{[1]}^2 Z_{3})(Z_{1}^\top H_{[2]}^2 Z_{3}) \right] \\
= \mathbb{E}(Z_{1}^\top H_{[1]}^2 H_{[2]}^2 Z_{1})^2 \lesssim_M \|\Sigma_{XY}\|^4_F + \|\Sigma_{XY}\|^4_F.
\]

(v) When \( k_1 - k_4 \) take four distinct values, there are up to \( n^4 \) such terms, and each term has contribution

\[
\mathbb{E}\left[ (Z_{1}^\top H_{[1]}^2 Z_{2})(Z_{1}^\top H_{[2]}^2 Z_{2})(Z_{2}^\top H_{[1]}^2 Z_{4})(Z_{2}^\top H_{[2]}^2 Z_{4}) \right] \\
= \mathbb{E}(Z_{1}^\top H_{[1]}^2 H_{[2]}^2 Z_{1})^2 = \tr^2(H_{[1]}^2 H_{[2]}^2) \lesssim_M \|\Sigma_{XY}\|^6_F.
\]

Putting together estimates (i)-(v) yields that

\[
\mathbb{E} \left\| \sum_{\ell \neq 1} (Z_{\ell}^\top H_{[2]}^2 Z_{\ell}) H_{[1]}^2 Z_{\ell} \right\|^4 \\
\lesssim_M n \cdot \tau_X^4 \tau_Y^4 + n^2 \cdot \tau_X^2 \tau_Y^2 \|\Sigma_{XY}\|F + n^3 \cdot \tau_X^2 \tau_Y^2 \|\Sigma_{XY}\|F + n^4 \cdot \|\Sigma_{XY}\|F \\
\lesssim n^2 \cdot \tau_X^4 \tau_Y^4 + n^4 \cdot \|\Sigma_{XY}\|F.
\] (D.4)
Combining (D.3) and (D.4) yields that
\[ T_{31} \lesssim_M n^3 \cdot (n\|\Sigma_{XY}\|_F^2 + \|\Sigma_X\|_F^2\|\Sigma_Y\|_F^2)^2. \]  
(A.5)

A similar bound holds for \( T_{32} \).

Next we bound \( T_{33} \). For any \( k \in [n] \), let \( U_k \equiv H_{[1]} Z_k Z_k^\top H_{[2]} - G_{[2]} \) be a centered random matrix. Then by definition, we have
\[
\mathbb{E}[T_{33}^2] = n \cdot \sum_{k_1, k_2 \neq 1} \mathbb{E}\left[ \left( \sum_{\ell \neq k_1} Z_{k_1}^\top U_{k_1} Z_{\ell} \right) \cdot \left( \sum_{\ell \neq k_2} Z_{k_2}^\top U_{k_2} Z_{\ell} \right) \cdot (Z_{1}^\top U_{k_1} U_{k_2} Z_{1}) \right]
\]
\[
= n \cdot \sum_{\ell_1, \ell_2 = 1} \mathbb{E}(Z_{\ell_1}^\top U_{k_1} Z_{\ell_1}) (Z_{\ell_2}^\top U_{k_2} Z_{\ell_2}) (Z_{1}^\top U_{k_1} U_{k_2} Z_{1}).
\]

We now divide the analysis of \( T_{33} \) into the following four cases: \( \ell_1 = \ell_2 = 1 \) (Case 1), \( \ell_1 = 1, \ell_2 \neq 1 \) (Case 2), \( \ell_1 = \ell_2 \neq 1 \) (Case 3), \( \ell_1 \neq \ell_2 \neq 1 \) (Case 4).

- When \( \ell_1 = \ell_2 = 1 \),
  \[ S_1 = \sum_{k_1 \neq 1, k_2 \neq 1} \mathbb{E}(Z_{k_1}^\top U_{k_1} Z_{1}) (Z_{1}^\top U_{k_1} U_{k_2} Z_{1}) (Z_{1}^\top U_{k_1} U_{k_2} Z_{1}) \]
  \[ \lesssim n \cdot \mathbb{E}(Z_{1}^\top U_{2} Z_{1})^2 \cdot (Z_{1}^\top U_{1}^2 U_{2} Z_{1}) + n^2 \cdot \mathbb{E}(Z_{1}^\top U_{2} Z_{1}) (Z_{1}^\top U_{3} Z_{1}) (Z_{1}^\top U_{2}^2 U_{3} Z_{1}). \]
  (i) By Lemma D.2,
  \[ \mathbb{E}(Z_{1}^\top U_{2} Z_{1})^2 \cdot (Z_{1}^\top U_{1}^2 U_{2} Z_{1}) \lesssim \mathbb{E}[\|U_2\|_F]^2 \cdot \mathbb{E}[\|U_1\|^4] \lesssim \mathbb{E}[\|U_2\|_F]^2 \lesssim_M \|\Sigma_X\|_F^2 \|\Sigma_Y\|_F^2. \]

- When \( \ell_1 = 1, \ell_2 \neq 1 \), we have (by letting \( \ell_2 = 2 \))
  \[ S_2 = \sum_{k_1 \neq 1, k_2 \notin \{1, 2\}} \mathbb{E}(Z_{k_1}^\top U_{k_1} Z_{1}) (Z_{2}^\top U_{k_2} Z_{2}) (Z_{1}^\top U_{k_1} U_{k_2} Z_{1}) \]
  \[ = \sum_{k_2 \notin \{1, 2\}} \mathbb{E}(Z_{1}^\top U_{2} Z_{1}) (Z_{2}^\top U_{k_2} Z_{2}) (Z_{1}^\top U_{2}^2 U_{k_2} Z_{1}) \]
  \[ + \sum_{k_1, k_2 \notin \{1, 2\}} \mathbb{E}(Z_{k_1}^\top U_{k_1} Z_{1}) (Z_{2}^\top U_{k_2} Z_{2}) (Z_{1}^\top U_{k_1} U_{k_2} Z_{1}) \]
  \[ \lesssim n \cdot \mathbb{E}(Z_{1}^\top U_{2} Z_{1}) (Z_{2}^\top U_{3} Z_{2}) (Z_{1}^\top U_{2}^2 U_{3} Z_{1}) \]
  \[ + n \cdot \mathbb{E}(Z_{1}^\top U_{3} Z_{1}) (Z_{2}^\top U_{3} Z_{2}) (Z_{1}^\top U_{2}^2 U_{3} Z_{1}). \]
+ n^2 \cdot \mathbb{E}(Z_1^T U_3 Z_1)(Z_2^T U_4 Z_2)(Z_3^T U_5^T U_4 Z_1).

(i) Using similar argument as in the previous case, we have

\[ \mathbb{E}(Z_1^T U_3 Z_1)(Z_2^T U_3 Z_2)(Z_3^T U_3^T U_3 Z_1) \lesssim_M \|\Sigma_X\|_F^2 \cdot \|\Sigma_Y\|_F^2. \]

\[ \mathbb{E}(Z_1^T U_3 Z_1)(Z_2^T U_3 Z_2)(Z_3^T U_3^T U_3 Z_1) \lesssim_M \|\Sigma_X\|_F^2 \cdot \|\Sigma_Y\|_F^2. \]

(ii) For the third summand, by taking expectation with respect to \( Z_2 \) and then \( Z_1 \), we have

\[ \mathbb{E}(Z_1^T U_3 Z_1)(Z_2^T U_3 Z_2)(Z_3^T U_3^T U_3 Z_1) = \mathbb{E}(Z_1^T U_3 Z_1)(Z_2^T U_3 Z_2) \operatorname{tr}(U_4 U_4 Z_1) \]

\[ = \mathbb{E} \operatorname{tr}(U_3^T \cdot \operatorname{tr}(U_4) U_4^T) + \mathbb{E} \operatorname{tr}(U_3^T \operatorname{tr}(U_4) U_4^T) + \mathbb{E} \operatorname{tr}(U_3) \operatorname{tr}(U_4) \operatorname{tr}(U_4^T) \]

\[ \asymp_M \mathbb{E} \left[ \mathbb{E}(U_3^T) \cdot \mathbb{E}(\operatorname{tr}(U_4) U_4^T) \right] + \mathbb{E} \left[ \mathbb{E}(U_3 U_3^T) \cdot \mathbb{E}(\operatorname{tr}(U_4) U_4) \right] + \|\Sigma_X Y X\|_F^2. \]

The last line follows from Lemma D.2-(6). By Lemma D.2-(1)(2)(3), we have

\[ \mathbb{E}(U_3^T) \cdot \mathbb{E}(\operatorname{tr}(U_4) U_4^T) = \mathbb{E}\left[ (G_{11} G_{22} + \operatorname{tr}(G_{12}) G_{11} G_{22}) (G_{22} G_{11} + G_{21}^2) \right] \]

\[ = \operatorname{tr}(G_{11} G_{22} G_{22} G_{11}) + \operatorname{tr}(G_{11} G_{22} G_{22} G_{11}) \]

\[ \asymp_M \|\Sigma_X Y X\|_F^2 + \|\Sigma_X Y X\|_F^2 + \|\Sigma_X Y X\|_F^2 + \|\Sigma_X Y X\|_F^2 \]

\[ \lesssim \|\Sigma_X Y X\|_F^2. \]

and

\[ \mathbb{E}(U_3 U_3^T) \cdot \mathbb{E}(\operatorname{tr}(U_4) U_4) = \mathbb{E}\left[ (G_{12} G_{21} + G_{11} \operatorname{tr}(G_{22}) G_{11} G_{21}) (G_{11} G_{22} + G_{12}^2) \right] \]

\[ = \operatorname{tr}(G_{12} G_{21} G_{11} G_{22}) + \operatorname{tr}(G_{12} G_{21} G_{11} G_{22}) \]

\[ \asymp_M \|\Sigma_X Y X\|_F^2 + \mathbb{E}\left[ (\Sigma_X Y X)^3 \right] + \|\Sigma_X Y X\|_F^2 + \|\Sigma_X Y X\|_F^2 \]

\[ \lesssim \|\Sigma_X Y X\|_F^2. \]

Using Lemma F.5, we have

\[ \mathbb{E}(Z_1^T U_3 Z_1)(Z_2^T U_3 Z_2)(Z_3^T U_3^T Z_1) \]

\[ = \mathbb{E}(Z_1^T U_3 Z_1)(Z_2^T U_3 Z_2) \operatorname{tr}(U_4) U_4^T Z_1) \lesssim_M \|\Sigma_Y\|_F^2 \cdot \|\Sigma_X Y X\|_F^2. \]

Combining (i) and (ii) yields that in this second case,

\[ S_2 \lesssim_M n \cdot \|\Sigma_X\|_F^2 \cdot \|\Sigma_Y\|_F^2 + n^2 \cdot (\|\Sigma_X\|_F^2 + \|\Sigma_Y\|_F^2) \cdot \|\Sigma_X Y X\|_F^2. \quad (D.8) \]

A similar estimate holds for the case \( \ell_1 = \ell_2 = 1 \).

bullet When \( \ell_1 = \ell_2 = 2 \) we have (letting \( \ell_1 = \ell_2 = 2 \))

\[ S_3 = \sum_{k_1, k_2 \notin \{1, 2\}} \mathbb{E}(Z_1^T U_{k_1} Z_2)(Z_2^T U_{k_2} Z_2)(Z_3^T U_{k_1} U_{k_2} Z_1) \]

\[ \asymp n \cdot \mathbb{E}(Z_2^T U_3 Z_2) Z_2^T U_3 Z_2) (Z_3^T U_3^T U_3 Z_1) + n^2 \cdot \mathbb{E}(Z_2^T U_3 Z_2) (Z_2^T U_3 Z_2) (Z_1^T U_3^T U_3 Z_1) \]

\[ = n \cdot \mathbb{E}(Z_2^T U_3 Z_2)^2 \|U_3\|_F^2 + n^2 \mathbb{E}(Z_2^T U_3 Z_2) (Z_2^T U_3 Z_2) \operatorname{tr}(U_3^T U_4) \]

\[ \asymp n \cdot \mathbb{E}\|U_3\|_F^2 + \mathbb{E} \operatorname{tr}(U_3) \|U_3\|_F^2 \]

\[ + n^2 \cdot \left[ \mathbb{E} \operatorname{tr}(U_3 U_4) + \mathbb{E} \operatorname{tr}(U_3 U_4) \operatorname{tr}(U_3 U_4) + \mathbb{E} \operatorname{tr}(U_3) \operatorname{tr}(U_4) \operatorname{tr}(U_4^T U_4) \right]. \]
By Lemma D.2 and Lemma F.5,
\[\mathbb{E}||U_3||_{F}^2 + \mathbb{E} \text{tr}^2(U_3)||U_3||_{F}^2 \lesssim_M \|\Sigma_X\|_F^4\|\Sigma_Y\|_F^2 + \|\Sigma_{XY}\|_F^2\|\Sigma_X\|_F^2\|\Sigma_Y\|_F^2 \]
\[\asymp_M \|\Sigma_X\|_F^4\|\Sigma_Y\|_F^2 , \]
and
\[\mathbb{E} \text{tr}^2(U_3 U_3^T) + \mathbb{E} \text{tr}(U_3 U_4) \text{tr}(U_3 U_3^T) + \mathbb{E} \text{tr}(U_3) \text{tr}(U_4) \text{tr}(U_3 U_4) \]
\[\lesssim_M \|\Sigma_X\|_F^2\|\Sigma_Y\|_F^2 + \|\Sigma_X\|_F\|\Sigma_Y\|_F\|\Sigma_{XY}\|_F^2 + \|\Sigma_{XY}\|_F^2 \lesssim \|\Sigma_X\|_F^2\|\Sigma_Y\|_F^2 . \]  
Consequently,
\[S_3 \asymp_M n\|\Sigma_X\|_F^4\|\Sigma_Y\|_F^2 + n^2\|\Sigma_X\|_F^2\|\Sigma_Y\|_F^2 . \]  
(D.9)

- When \(\ell_1, \ell_2 \neq 1 \) and \(\ell_1 \neq \ell_2\), we have (letting \(\ell_1 = 2, \ell_2 = 3\))

\[S_4 \equiv \sum_{k_1 \notin \{1.2\}, k_2 \notin \{1.3\}} \mathbb{E}(Z_3^T U_{k_1} Z_2)(Z_3^T U_{k_2} Z_3)(Z_1^T U_{k_1} U_{k_2} Z_1) \]
\[= \left[ \sum_{k_1=3, k_2=2} + \sum_{k_1=3.2 \notin \{1.3\}, k_2=2} + \sum_{k_1, k_2 \notin \{1.2.3\}} \right] (\cdots) \]
\[\lesssim \mathbb{E}(Z_3^T U_3 Z_2)(Z_3^T U_2 Z_3)(Z_1^T U_1 U_2 Z_1) + n \cdot \mathbb{E}(Z_2^T U_3 Z_2)(Z_3^T U_3 Z_3)(Z_1^T U_3 U_4 Z_1) \]
\[+ n \cdot \mathbb{E}(Z_2^T U_4 Z_2)(Z_3^T U_4 Z_3)(Z_1^T U_1 U_2 Z_1) \]
\[+ n^2 \cdot \mathbb{E}(Z_2^T U_4 Z_2)(Z_3^T U_5 Z_3)(Z_1^T U_5 Z_1) \equiv \sum_{\ell} S_{4,\ell} . \]

(i) By (D.6), \(S_{4,1} \lesssim_M \|\Sigma_X\|_F^4\|\Sigma_Y\|_F^2 . \)

(ii) By first taking expectation with respect to \(Z_1\) and \(Z_2\), we have by Lemma D.2-(4)

\[S_{4,2/n} = \mathbb{E} \text{tr}(U_3)(Z_3^T U_4 Z_3) \text{tr}(U_3 U_4) \]
\[\lesssim M \|\Sigma_{XY}\|_F\|\Sigma_X\|_F^2\|\Sigma_Y\|_F^2 \lesssim (1 \lor \|\Sigma_{XY}\|_F^2)(\|\Sigma_X\|_F^2\|\Sigma_Y\|_F^2) . \]

(iii) By taking expectation with respect to \(Z_1, Z_3\), a similar argument as in (ii) yields that

\[S_{4,3/n} = \mathbb{E}(Z_2^T U_4 Z_2) \text{tr}(U_2) \text{tr}(U_2 U_5) \lesssim_M (1 \lor \|\Sigma_{XY}\|_F^2)(\|\Sigma_X\|_F^2\|\Sigma_Y\|_F^2) . \]

(iv) By taking expectation with respect to \(Z_1, Z_2, Z_3\), we have by Lemma D.2-(6)

\[S_{4,4/n^2} = \mathbb{E} \text{tr}(U_4) \text{tr}(U_4 U_5) \lesssim_M \|\Sigma_{XY}\|_F^2 . \]

Putting together the estimates in (i)-(iv), we have in this case

\[S_4 \lesssim_M \|\Sigma_X\|_F^2\|\Sigma_Y\|_F^2 + n \cdot (1 \lor \|\Sigma_{XY}\|_F^2)(\|\Sigma_X\|_F^2\|\Sigma_Y\|_F^2 + n^2 \cdot \|\Sigma_{XY}\|_F^2) . \]  
(D.10)

Finally combine (D.7) - (D.10) (and recall the notation \(S_1 \sim S_4\) defined at the end of each case) to conclude the bound for \(\mathbb{E}||T_{33}||_F^2\):
Then by inequality and a change of variable, we then have
\[ \text{Variance of } T_i \equiv n^3 \cdot \| \Sigma_X \|_F^4 \cdot \| \Sigma_Y \|_F^4 + n^4 \cdot (1 \lor \| \Sigma_{XY} \|_F^2) \| \Sigma_X \|_F^2 \| \Sigma_Y \|_F^2 + n^5 \cdot \| \Sigma_{XY} \|_F^4. \]
A similar bound holds for \( T_{34} \). The above bound dominates the bound (D.5) for \( T_{31} \) and \( T_{32} \) and hence is a valid bound for \( T_3 \).

(Variance of \( T_4 \) and \( T_3 \)) By direct calculation, we have
\[ \text{Var}(T_4) \approx n^5 \text{Var} \left( X_i^T \Sigma_X \Sigma_{XY} \Sigma_Y Y_1 \right) \equiv n^5 \text{Var}(U). \]

Then
\[ \mathbb{E} \left\| \nabla X_i (X_i^T \Sigma_X \Sigma_{XY} \Sigma_Y Y_1) \right\|^2 = \mathbb{E} \left\| \nabla X_i (\Sigma_X \Sigma_{XY} \Sigma_Y Y_1) \right\|^2 \lesssim_M \| \Sigma_{XY} \|_F^2. \]
A similar bound holds for the gradient with respect to \( Y_1 \). By Gaussian-Poincaré inequality and a change of variable, we then have
\[ \text{Var}(T_3) \lesssim_M \| \Sigma_{XY} \|_F^2. \]
A similar bound holds for \( \text{Var}(T_5) \).

(Variance of \( T_6 \)) Recall the notation \( U_k \equiv H_{[12]} Z_k Z_k^T H_{[22]} - G_{[12]} \). Then
\[ T_6 = (n - 1) \sum_{k \neq \ell} (Z_k^T G_{[12]} Z_k - \| \Sigma_{XY} \|_F^2) \cdot (Z_\ell^T U_k Z_\ell). \]
Then for any \( i \in [n] \) and \( j \in [p + q] \), we have
\[ \frac{\partial T_6}{\partial Z_{ij}} = (n - 1) \cdot \sum_{k \neq \ell} \left[ \delta_{ki} (Z_k^T G_{[12]} e_j + e_j^T G_{[12]} Z_k) \cdot (Z_\ell^T U_k Z_\ell)
+ \delta_{ki} (Z_k^T G_{[12]} Z_k - \| \Sigma_{XY} \|_F^2) (e_j^T U_k Z_\ell + Z_\ell^T U_k e_j)
+ \delta_{ki} (Z_k^T G_{[12]} Z_k - \| \Sigma_{XY} \|_F^2) \cdot Z_\ell^T [H_{[12]} (Z_k e_j^T + e_j Z_k^T) H_{[22]}] Z_\ell \right]
= (n - 1) \cdot \sum_{k \neq i} \left[ (e_j^T G_{[12]} Z_i) (Z_k^T U_i Z_k) + (Z_i^T G_{[12]} e_j) (Z_k^T U_i Z_k)
+ (Z_i^T G_{[12]} Z_k - \| \Sigma_{XY} \|_F^2) (e_j^T U_i Z_k) + (Z_i^T G_{[12]} Z_k - \| \Sigma_{XY} \|_F^2) (Z_i^T U_k e_j)
+ (Z_i^T G_{[12]} Z_k - \| \Sigma_{XY} \|_F^2) (Z_i^T H_{[12]} Z_k) + (Z_i^T H_{[12]} Z_k - \| \Sigma_{XY} \|_F^2) (Z_i^T U_k e_j)
+ (Z_i^T H_{[12]} Z_k - \| \Sigma_{XY} \|_F^2) (Z_i^T H_{[22]} Z_k) \right]
\equiv (n - 1) \cdot (T_{61} + T_{62} + T_{63} + T_{64} + T_{65} + T_{66})_{ij}. \]

For \( T_{61} \), we have
\[ \mathbb{E} \left\| T_{61} \right\|_F^2 = n \cdot \sum_{k_1, k_2 \neq 1} (Z_{k_1}^T U_1 Z_{k_1}) (Z_{k_2}^T U_1 Z_{k_2}) (Z_i^T G_{[21]} G_{[12]} Z_1)
\approx n \cdot \left[ n \cdot \mathbb{E} (Z_2^T U_1 Z_2)^2 (Z_i^T G_{[12]} G_{[21]} Z_1)
+ n^2 \cdot \mathbb{E} (Z_{2}^T U_1 Z_2) (Z_{2}^T U_1 Z_3) (Z_i^T G_{[12]} G_{[21]} Z_1) \right]. \]
The two terms can be bounded as follows:
- By Lemma D.2-(4), we have
\[ \mathbb{E} (Z_2^T U_1 Z_2)^2 (Z_i^T G_{[12]} G_{[21]} Z_1) \leq \mathbb{E}^{1/2} (Z_2^T U_1 Z_2)^4 \cdot \mathbb{E}^{1/2} (Z_i^T G_{[12]} G_{[21]} Z_1)^2 \]
\[ \lesssim \mathbb{E} \left[ U_1^2 \| U_1 \|_F^2 \right] \cdot \| G_{[12]} \|_F^4 \approx_M \| \Sigma_X \|_F^2 \| \Sigma_Y \|_F^2 \| \Sigma_{XY} \|_F^2 \| \Sigma_{XY} \|_F^2 + \| \Sigma_{XY} \|_F^4. \]
Again by Lemma D.2-(4), we have
\[
E(Z_i^\top U_1 Z_2)(Z_i^\top U_1 Z_3)(Z_i^\top G_{[12]} G_{[21]} Z_1) = E \text{tr}(U_1)^2(Z_i^\top G_{[12]} G_{[21]} Z_1)
\]
\[
\leq E^{1/2} \text{tr}(U_1)^4 \cdot E^{1/2}(Z_i^\top G_{[12]} G_{[21]} Z_1)^2 \lesssim \|\Sigma_X\|_F^2 \cdot \|\Sigma_Y\|_F^2 = \|\Sigma_X \Sigma_Y\|_F^2.
\]
In summary we have
\[
(n - 1) \cdot E\|T_{61}\|_F^2 \lesssim_M n^3 \cdot \|\Sigma_X\|_F^2 \|\Sigma_Y\|_F^2 \|\Sigma_X \Sigma_Y\|_F^2 + n^4 \cdot \|\Sigma_X \Sigma_Y\|_F^2. \tag{D.11}
\]
A similar bound holds for \(T_{62}\).

For \(T_{63}\), we have
\[
E\|T_{63}\|_F^2 = \mathbb{E} \sum_i \left\| \sum_{k \neq i} (Z_k^\top G_{[12]} Z_k - \text{tr}(G_{[12]})) U_k Z_k \right\|^2
\]
\[
= n \cdot \sum_{k_1, k_2 \neq 1} E(Z_{k_1}^\top G_{[21]} Z_{k_1} - \text{tr}(G_{[12]}))(Z_{k_2}^\top G_{[12]} Z_{k_2} - \text{tr}(G_{[12]}))(Z_1^\top U_{k_1} U_{k_2} Z_1)
\]
\[
\lesssim n \cdot \left[ n \cdot E(Z_2^\top G_{[21]} Z_2 - \text{tr}(G_{[12]}))^2 \|U_2\|_F^2
\]
\[
+ n^2 \cdot E(Z_2^\top G_{[12]} Z_2 - \text{tr}(G_{[12]}))(Z_3^\top G_{[12]} Z_3 - \text{tr}(G_{[12]})) \text{tr}(U_2^\top U_3) \right].
\]
The two terms can be bounded as follows:

• By Lemma D.2-(4),
\[
E(Z_2^\top G_{[21]} Z_2 - \text{tr}(G_{[12]}))^2 \|U_2\|_F^2 \leq E^{1/2}(Z_2^\top G_{[21]} Z_2 - \text{tr}(G_{[12]}))^4 \cdot E^{1/2} \|U_2\|_F^2
\]
\[
\lesssim_M \|G_{[12]}\|_F^2 \cdot \|\Sigma_X\|_F^2 \|\Sigma_Y\|_F^2 = \|\Sigma_X\|_F^2 \|\Sigma_Y\|_F^2 \|\Sigma_X\Sigma_Y\|_F^2.
\]

• By Lemma D.2-(4)(5), we have
\[
E(Z_2^\top G_{[12]} Z_2 - \text{tr}(G_{[12]}))(Z_3^\top G_{[12]} Z_3 - \text{tr}(G_{[12]})) \text{tr}(U_2^\top U_3)
\]
\[
\leq E^{1/4}(Z_2^\top G_{[12]} Z_2 - \text{tr}(G_{[12]}))^4 \cdot E^{1/4}(Z_3^\top G_{[12]} Z_3 - \text{tr}(G_{[12]}))^4 \cdot E^{1/2} \text{tr}^2(U_2^\top U_3)
\]
\[
\lesssim_M \|\Sigma_X\|_F \|\Sigma_Y\|_F \|\Sigma_X \Sigma_Y\|_F^2.
\]

In summary, we have
\[
(n - 1) \cdot E\|T_{63}\|_F^2 \lesssim_M n^4 \cdot \|\Sigma_X\|_F^2 \|\Sigma_Y\|_F^2 \|\Sigma_X \Sigma_Y\|_F^2. \tag{D.12}
\]
A similar bound holds for \(T_{64}\).

For \(T_{65}\), we have
\[
E\|T_{65}\|_F^2 = \sum_i E \left\| \sum_{k \neq i} (Z_k^\top G_{[12]} Z_k - \text{tr}(G_{[12]}))(Z_k H_{[11]} Z_1) H_{[22]} Z_k \right\|^2
\]
\[
= n \cdot \sum_{k_1, k_2 \neq 1} E(Z_1^\top G_{[12]} Z_1 - \text{tr}(G_{[12]}))^2(Z_k^\top H_{[11]} Z_1)(Z_k^\top H_{[11]} Z_1)(Z_k G_{[22]} Z_{k_2})
\]
\[
\lesssim n \cdot \left[ n \cdot E(Z_1^\top G_{[12]} Z_1 - \text{tr}(G_{[12]}))^2(Z_2^\top H_{[11]} Z_1)^2(Z_3^\top G_{[22]} Z_2)
\]
\[
+ n^2 \cdot E(Z_1^\top G_{[12]} Z_1 - \text{tr}(G_{[12]}))^2(Z_2^\top H_{[11]} Z_1)(Z_3^\top H_{[11]} Z_1)(Z_2^\top G_{[22]} Z_3) \right].
\]
The two terms can be bounded as follows

• By first taking expectation with respect to \(Z_2\), we have
\[
E(Z_1^\top G_{[12]} Z_1 - \text{tr}(G_{[12]}))^2(Z_2^\top H_{[11]} Z_1)^2(Z_3^\top G_{[22]} Z_2)
\]
\[
\lesssim E(Z_1^\top G_{[12]} Z_1 - \text{tr}(G_{[12]}))^2(Z_1^\top G_{[11]} Z_1) \text{tr}(G_{[22]})
\]
In summary we have
\[ (n - 1) \cdot \mathbb{E} \left[ \left\| T_{65} \right\|_F^2 \right] \lesssim_M n^3 \cdot \left\| \Sigma_X \right\|_F^2 \cdot \left\| \Sigma_Y \right\|_F^2 \cdot \left\| \Sigma_{XY} \right\|_F^4 + n^4 \cdot \left\| \Sigma_{XY} \right\|_F^4. \] (D.13)

A similar bound holds for \( T_{64} \). Combining (D.11) - (D.13) and Lemma F.5 concludes the proof. □

**Lemma D.2.** Let \( U \equiv H_{[1]} Z Z^\top H_{[22]} - G_{[12]} \) with \( Z \sim \mathcal{N}(0, I_{p+q}) \), and \( U_1, U_2, \ldots \) be independent copies of \( U \). Then the following hold.

1. \( \mathbb{E} U^2 = G_{[11]} G_{[22]} + \text{tr}(G_{[12]} G_{[12]}) \).
2. \( \mathbb{E} U^\top U = G_{[11]} G_{[12]} + G_{[22]} \text{tr}(G_{[11]}), \quad \mathbb{E} U U^\top = G_{[12]} G_{[21]} + G_{[11]} \text{tr}(G_{[22]}). \)
3. \( \mathbb{E} \text{tr}(U) U = G_{[11]} G_{[22]} + G_{[12]}^2. \)
4. \( \mathbb{E} \text{tr}^4(U) \lesssim_M \left\| \Sigma_{XY} \right\|_F^4 \) and \( \mathbb{E} \left\| U \right\|_F^4 \lesssim_M \left\| \Sigma_X \right\|_F^4 \cdot \left\| \Sigma_Y \right\|_F^4. \)
5. \( \mathbb{E} \text{tr}^2(U_1^\top U_2) \approx \left\| \Sigma_X \right\|_F^2 \cdot \left\| \Sigma_Y \right\|_F^2, \quad \mathbb{E} \text{tr}^2(U_1 U_2) \approx \left\| \Sigma_{XY} \right\|_F^2 \cdot \left\| \Sigma_Y \right\|_F^2. \)
6. \( \mathbb{E} \text{tr}(U_1) \text{tr}(U_2) \text{tr}(U_1^\top U_2) \approx_M \left\| \Sigma_{XY} \Sigma_Y X \right\|_F^2. \)

**Proof.** (1). By Lemma F.3,
\[
\mathbb{E} U^2 = \mathbb{E} \left( H_{[11]} Z Z^\top H_{[22]} H_{[11]} Z Z^\top H_{[22]} \right) - G_{[12]}^2
= H_{[11]} \cdot \mathbb{E} (Z Z^\top) (Z^\top H_{[22]} H_{[11]} Z) \cdot H_{[22]} - G_{[12]}^2
= H_{[11]} \left( H_{[11]} H_{[22]} + H_{[22]} H_{[11]} + \text{tr}(G_{[12]}) \cdot I \right) H_{[22]} - G_{[12]}^2
= G_{[11]} G_{[22]} + \text{tr}(G_{[12]} G_{[12]}). \]

(2). By Lemma F.3,
\[
\mathbb{E} U^\top U = \mathbb{E} \left( H_{[22]} Z Z^\top H_{[11]} Z Z^\top H_{[22]} \right) - G_{[21]} G_{[12]}
= H_{[22]} \cdot \mathbb{E} (Z Z^\top) (Z^\top H_{[11]} Z) \cdot H_{[22]} - G_{[21]} G_{[12]}
= H_{[22]} \left( 2 H_{[11]}^2 + \text{tr}(G_{[11]}) \cdot I \right) H_{[22]} - G_{[21]} G_{[12]}
= G_{[21]} G_{[12]} + G_{[22]} \text{tr}(G_{[11]}),
\]
and similarly
\[
\mathbb{E} U U^\top = G_{[12]} G_{[21]} + G_{[11]} \text{tr}(G_{[22]}). \]

(3). We have
\[
\mathbb{E} \text{tr}(U) U = \mathbb{E} \left( Z^\top G_{[12]} Z - \text{tr}(G_{[12]}) \right) \left( H_{[11]} Z Z^\top H_{[22]} - G_{[12]} \right)
= H_{[11]} \cdot \mathbb{E} (Z Z^\top) (Z^\top G_{[12]} Z) \cdot H_{[22]} - \text{tr}(G_{[12]} G_{[12]})
= H_{[11]} \left( H_{[11]} H_{[22]} + H_{[22]} H_{[11]} + \text{tr}(G_{[12]}) \cdot I \right) H_{[22]} - \text{tr}(G_{[12]} G_{[12]})
= G_{[11]} G_{[22]} + G_{[12]}^2. \]
\[
\begin{align*}
(4). \text{ We have } & \\
\mathbb{E} \text{tr}(U^4) &= \mathbb{E} \left[ (Z^\top G_{[12]} Z - \mathbb{E}(Z^\top G_{[12]} Z))^4 \right] \lesssim \|G_{[12]}\|_F^n \lesssim_M \|\Sigma_X Y\|_F^4, \\
\mathbb{E}\|U\|_F^p &\leq \mathbb{E}\|H_{[11]} ZZ^\top H_{[22]}\|_F^p + \|G_{[12]}\|_F^p \\
&\lesssim_M \mathbb{E}\|H_{[11]} Z\|^4 H_{[22]} Z\|^4 + \|\Sigma_X Y\|_F^p \lesssim \|\Sigma_X\|_F^p \|\Sigma_Y\|_F^p + \|\Sigma_X Y\|_F^4.
\end{align*}
\]

The claim follows by Lemma F.5.

(5). By definition, we have

\[
\begin{align*}
\text{tr}(U_1^\top U_2) &= \text{tr} \left( [H_{[22]} Z_1 Z_1^\top H_{[11]} - G_{[21]}] [H_{[11]} Z_2 Z_2^\top H_{[22]} - G_{[12]}] \right) \\
&= (Z_1^\top G_{[11]} Z_2)(Z_1^\top G_{[22]} Z_2) - Z_1^\top G_{[11]} G_{[22]} Z_1 - Z_2^\top G_{[11]} G_{[22]} Z_2 + \text{tr}(G_{[11]} G_{[22]}) \\
&= Z_1^\top \left( G_{[11]} Z_2 Z_2^\top G_{[22]} - G_{[11]} G_{[22]} \right) Z_1 - \text{tr}(G_{[11]} Z_2 Z_2^\top G_{[22]} - G_{[11]} G_{[22]}) \\
&\equiv Z_1^\top A(Z_2) Z_1 - \mathbb{E}_1 (Z_1^\top A(Z_2) Z_1),
\end{align*}
\]

where \(\mathbb{E}_1\) denotes expectation only with respect to \(Z_i\). Hence,

\[
\begin{align*}
\mathbb{E} \text{tr}^2(U_1^\top U_2) &= \mathbb{E}_2 \text{Var}_1(Z_1^\top A(Z_2) Z_1) = \mathbb{E} \|A(Z)\|_F^2 \\
&= \mathbb{E}\|G_{[11]} ZZ^\top G_{[22]} - G_{[11]} G_{[22]}\|^2_F \\
&= \mathbb{E} \left[ \|Z^\top G_{[11]}^2 Z\|^2 + \|G_{[11]}^2 G_{[22]}^2 Z + \text{tr}(G_{[11]} G_{[22]}^2) \| \right] \\
&= \|G_{[11]}^2 G_{[22]}^2\|_F^2 + \|G_{[11]}\|_F^2 \|G_{[22]}\|_F^2 + \|G_{[11]}\|_F^2 \|G_{[22]}\|_F^2 \\
&\approx \|\Sigma_X\|_F^2 \|\Sigma_Y\|_F^2 \lesssim_M \|\Sigma_X\|_F^2 \|\Sigma_Y\|_F^2.
\end{align*}
\]

On the other hand, as

\[
\begin{align*}
\text{tr}(U_1 U_2) &= \text{tr} \left( [H_{[11]} Z_1 Z_1^\top H_{[22]} - G_{[12]}] [H_{[11]} Z_2 Z_2^\top H_{[22]} - G_{[12]}] \right) \\
&= (Z_1^\top G_{[12]} Z_2)(Z_1^\top G_{[21]} Z_2) - Z_1^\top G_{[12]}^2 Z_1 - Z_2^\top G_{[12]}^2 Z_2 + \text{tr}(G_{[12]}^2) \\
&= Z_1^\top \left( G_{[12]} Z_2 Z_2^\top G_{[21]} - G_{[12]}^2 \right) Z_1 - \text{tr}(G_{[12]} Z_2 Z_2^\top G_{[21]} - G_{[12]}^2) \\
&\equiv Z_1^\top B(Z_2) Z_1 - \mathbb{E}_1 (Z_1^\top B(Z_2) Z_1),
\end{align*}
\]

so using a similar argument as in the case for \(\mathbb{E} \text{tr}^2(U_1^\top U_2)\), we have

\[
\begin{align*}
\mathbb{E} \text{tr}^2(U_1 U_2) &= \mathbb{E}\|G_{[12]} ZZ^\top G_{[12]} - G_{[12]}^2\|^2_F \\
&= \mathbb{E} \left[ \|Z^\top G_{[12]} G_{[21]} Z\|^2 + \|G_{[12]} G_{[21]}^2 Z + \text{tr}(G_{[12]} G_{[21]}^2) \| \right] \\
&= \|G_{[12]} G_{[21]}^2\|_F^2 + \|G_{[12]}\|_F^2 \|G_{[21]}\|_F^2 + \|G_{[12]}\|_F^2 \|G_{[21]}^2\|_F^2 \\
&\approx \|\Sigma_X Y\|_F^2 \lesssim_M \|\Sigma_X\|_F^2 \|\Sigma_Y\|_F^2.
\end{align*}
\]

(6). Using the formula for \(\text{tr}(U_1^\top U_2)\) in the proof of (5) above,

\[
\begin{align*}
\mathbb{E} \text{tr}(U_1) &\text{tr}(U_2) \text{tr}(U_1^\top U_2) \\
&= \mathbb{E}(Z_1^\top G_{[12]} Z_1 - \text{tr}(G_{[12]}))(Z_2^\top G_{[12]} Z_2 - \text{tr}(G_{[12]}))(Z_1^\top A(Z_2) Z_1 - \text{tr}(A(Z_2))) \\
&= \mathbb{E}(Z_2^\top G_{[12]} Z_2 - \text{tr}(G_{[12]})) \cdot \text{tr}(G_{[12]} A(Z_2) + G_{[12]} A(Z_2)^\top) \quad \text{(by Lemma F.3-(1))} \\
&= \mathbb{E}(Z_2^\top G_{[12]} Z_2 - \text{tr}(G_{[12]})) \\
&\quad \cdot \left[ Z_2^\top \left( G_{[11]} G_{[12]} + G_{[21]} G_{[22]} \right) Z_2 - \text{tr} \left( G_{[11]} (G_{[12]} + G_{[21]} G_{[22]} ) \right) \right] \\
&\approx \text{tr} \left[ G_{[12]} \cdot \left( G_{[11]} (G_{[12]} + G_{[21]} G_{[22]} ) \right) \right] \lesssim_M \|\Sigma_X Y\|_F^2 + \|\Sigma_X Y\|_F^2.
\end{align*}
\]
\begin{align*}
\|\Sigma_{XY}\Sigma_{YX}\|_F^2.
\end{align*}

The proof is complete. \hfill \Box

D.2.2. Third moment bound.

Proof of Proposition 10.4-(2). For any \(i \in \{n\}, \) let \(M_{-i} \equiv \sum_{k \neq i} X_k Y_k^\top. \) By definition of \(\Delta; \psi_1(X, Y), \) we have
\[E|\Delta; \psi_1(X, Y)|^3 \lesssim \mathbb{E}^{3/4}(X_i^\top M_{-i} Y_i - X_i' M_{-i} Y_i')^4 \lesssim \mathbb{E}^{3/4}[X_i^\top M_{-i} Y_i - \mathbb{E}(X_i, Y_i)(X_i^\top M_{-i} Y_i)]^4 + \mathbb{E}^{3/4}[X_i' M_{-i} Y_i' - \mathbb{E}(X_i', Y_i')(X_i'^\top M_{-i} Y_i')]^4 = \mathbb{E}^{3/4}[Z_i^\top \tilde{M}_{-i} Z_i - \mathbb{E}(Z_i^\top \tilde{M}_{-i} Z_i)]^4 + \mathbb{E}^{3/4}[Z_i'^\top \tilde{M}_{-i} Z_i' - \mathbb{E}(Z_i'^\top \tilde{M}_{-i} Z_i')]^4.
\]

Here \(\tilde{M}_{-i} \) is the random matrix defined by
\begin{align*}
\tilde{M}_{-i} &\equiv \Sigma^{1/2} \begin{pmatrix} M_{-i} & 0 \\ 0 & 0 \end{pmatrix} \Sigma^{1/2}.
\end{align*}

Hence we have
\[E|\Delta; \psi_1(X, Y)|^3 \lesssim \mathbb{E}^{3/4}||\tilde{M}_{-i}||^4_P \lesssim_M \mathbb{E}^{3/4}||M_{-i}||^4_P \lesssim_M n^{3/2} \text{tr}^{3/2}(\Sigma_X) \text{tr}^{3/2}(\Sigma_Y) + n^3||\Sigma_{XY}||^3_F,
\]
using Lemma D.3 in the last step. \hfill \Box

Lemma D.3. For any \(i \in \{n\}, \) let \(M_{-i} \equiv \sum_{k \neq i} X_k Y_k^\top. \) Then the mean and variance of \(||M_{-i}||^2_P \) satisfy:
\begin{align*}
E||M_{-i}||^2_P &= n(n-1)||\Sigma_{XY}||_F^2 + (n-1)\text{tr}(\Sigma_X) \text{tr}(\Sigma_Y), \\
\text{Var}(||M_{-i}||^2_P) &\lesssim_M n \cdot [\tau_X^2 \tau_Y^2 (n \lor \tau_X^2 \lor \tau_Y^2) + n^2||\Sigma_{XY}||_F^2].
\end{align*}

Consequently, \(E||M_{-i}||^2_P \lesssim n^2 \text{tr}^2(\Sigma_X) \text{tr}^2(\Sigma_Y) + n^4||\Sigma_{XY}||_F^4.

Proof. Without loss of generality we let \(i = 1. \) Note that
\[||M_{-1}||^2_P = \sum_{k_1, k_2 \neq 1} (X_{k_1}^\top X_{k_2})(Y_{k_1}^\top Y_{k_2}) = \sum_{k_1, k_2 \neq 1} (Z_{k_1}^\top H_{[11]} Z_{k_2})(Z_{k_1}^\top H_{[22]} Z_{k_2}).
\]

Hence the mean formula is
\begin{align*}
E||M_{-1}||^2_P &= (n-1)E(Z_{[1]}^\top H_{[11]} Z_{[1]})(Z_{[2]}^\top H_{[22]} Z_{[2]}) + (n-1)(n-2)E(Z_{[1]}^\top H_{[11]} Z_{[2]})(Z_{[1]}^\top H_{[22]} Z_{[2]}) \\
&= (n-1) \cdot [2 \text{tr}(G_{[12]}) + \text{tr}(H_{[11]}) \text{tr}(H_{[22]})] + (n-1)(n-2) \text{tr}(G_{[12]}) \\
&= n(n-1)||\Sigma_{XY}||_F^2 + (n-1)\text{tr}(\Sigma_X) \text{tr}(\Sigma_Y).
\end{align*}

To bound the variance of \(||M_{-1}||^2_P, \) write
\[T(Z) \equiv ||M_{-1}||^2_P = \sum_{k_1, k_2 \neq 1} (Z_{k_1}^\top H_{[11]} Z_{k_2})(Z_{k_1}^\top H_{[22]} Z_{k_2}).
\]

So for any \(i \neq 1, \)
\begin{align*}
\nabla_{Z_i} T(Z) &= \sum_{k_1, k_2 \neq 1} \left[ (\delta_{k_1,i} \cdot H_{[11]} Z_{k_2} + \delta_{k_2,i} \cdot H_{[11]} Z_{k_1})(Z_{k_1}^\top H_{[22]} Z_{k_2}) \\
&+ (\delta_{k_1,i} \cdot H_{[22]} Z_{k_2} + \delta_{k_2,i} H_{[22]} Z_{k_1})(Z_{k_1}^\top H_{[11]} Z_{k_2}) \right] \\
&= 2 \cdot \sum_{k \neq 1} (Z_{k}^\top H_{[22]} Z_{i})H_{[11]} Z_{k} + 2 \cdot \sum_{k \neq 1} (Z_{k}^\top H_{[11]} Z_{i})H_{[22]} Z_{k} \equiv [T_{11} + T_{12}]i.
\end{align*}
Hence
\[
\mathbb{E}\|T_{11}\|_F^2 \approx n \cdot \mathbb{E} \left\| \sum_{k \neq 1} (Z_k^\top H_{[22]} Z_2) H_{[11]} Z_k \right\|^2 \\
= n \cdot \sum_{k_1, k_2 \neq 1} \mathbb{E}(Z_{k_1}^\top H_{[22]} Z_2)(Z_{k_2}^\top H_{[22]} Z_2)(Z_{k_1}^\top G_{[11]} Z_{k_2}) \\
\approx n \cdot \left[ \mathbb{E}(Z_1^\top H_{[22]} Z_2)^2 + n \cdot \mathbb{E}(Z_2^\top H_{[22]} Z_2)(Z_3^\top H_{[22]} Z_2)(Z_2^\top G_{[11]} Z_3) \\
+ n \cdot \mathbb{E}(Z_3^\top H_{[22]} Z_2)^2 + n^2 \mathbb{E}(Z_1^\top H_{[22]} Z_2)(Z_4^\top H_{[22]} Z_2)(Z_3^\top G_{[11]} Z_4) \right] \\
\lesssim_M n(\tau_X^2 \tau_Y^2 + n \tau_X^2 \tau_Y^2 + n^2 \|\Sigma_{XY}\|_F^2).
\]

Flipping \(X, Y\) for \(T_{12}\) to conclude that
\[
\|\nabla_2 T(Z)\|_F^2 \lesssim_M n \cdot [\tau_X^2 \tau_Y^2 (n \vee \tau_X^2 \vee \tau_Y^2) + n^2 \|\Sigma_{XY}\|_F^2],
\]
completing the proof. \(\square\)

### D.3. Proof of Proposition 10.5.

**Proof of Proposition 10.5.** We only prove the claim for the term \(X_i^\top \Sigma_{XY} Y_j\), the bound for the other term is completely analogous. With some abuse of notation, we write in the proof \(\psi_2(X, Y) \equiv \sum_{i \neq j} X_i^\top \Sigma_{XY} Y_j\).

1. For any \(i \in [n]\), as
\[
\psi_2(X, Y) = \sum_{i, j \neq i} X_i^\top \Sigma_{XY} Y_j + \sum_{i \neq j} X_i^\top \Sigma_{XY} Y_i + \sum_{i \neq j} X_i^\top \Sigma_{XY} Y_i,
\]
we have
\[
\Delta_i \psi_2(X, Y) \equiv \psi_2(X, Y) - \psi_2(X^{(i)}, Y^{(i)}) \\
= \left( \sum_{j \neq i} X_j \right)^\top \Sigma_{XY} (Y_i - Y'_i) + (X_i - X'_i)^\top \Sigma_{XY} \left( \sum_{j \neq i} Y_j \right).
\]

Hence for any \(A \subset [n]\) such that \(i \notin A\),
\[
\Delta_i \psi_2(X^A, Y^A) = \left( \sum_{j \in A} X'_j + \sum_{j \notin A \cup \{i\}} X_j \right)^\top \Sigma_{XY} (Y_i - Y'_i) \\
+ (X_i - X'_i)^\top \Sigma_{XY} \left( \sum_{j \in A} Y'_j + \sum_{j \notin A \cup \{i\}} Y_j \right).
\]
This implies that
\[
\mathbb{E}'[\Delta_i \psi_2(X, Y) \Delta_i \psi_2(X^A, Y^A)] \\
= \mathbb{E}'\left[ \left( \sum_{j \neq i} X_j \right)^\top \Sigma_{XY} (Y_i - Y'_i) \cdot \left( \sum_{j \in A} X'_j + \sum_{j \notin A \cup \{i\}} X_j \right)^\top \Sigma_{XY} (Y_i - Y'_i) \right] \\
+ \mathbb{E}'\left[ \left( \sum_{j \neq i} X_j \right)^\top \Sigma_{XY} (Y_i - Y'_i) \cdot (X_i - X'_i)^\top \Sigma_{XY} \left( \sum_{j \in A} Y'_j + \sum_{j \notin A \cup \{i\}} Y_j \right) \right] \\
+ \mathbb{E}'\left[ (X_i - X'_i)^\top \Sigma_{XY} \left( \sum_{j \neq i} Y_j \right) \cdot \left( \sum_{j \in A} X'_j + \sum_{j \notin A \cup \{i\}} X_j \right)^\top \Sigma_{XY} (Y_i - Y'_i) \right].
\]
Using similar calculations, we have

\[ E_i(2) = \sum_{j \neq i} X_j^\top \Sigma_{XY} (\sum_{j \in A} Y_j) \cdot (X_i - X_i')^\top \Sigma_{XY} \left( \sum_{j \notin A \cup \{i\}} Y_j \right) \]

\[
= \left( \sum_{j \neq i} X_j \right)^\top \Sigma_{XY} (Y_i Y_i^\top + \Sigma_Y) \Sigma_{XY} \left( \sum_{j \notin A \cup \{i\}} X_j \right) \\
+ \left( \sum_{j \neq i} X_j \right)^\top \Sigma_{XY} (Y_i X_i^\top + \Sigma_{XY}) \Sigma_{XY} \left( \sum_{j \notin A \cup \{i\}} Y_j \right) \\
+ \left( \sum_{j \neq i} Y_j \right)^\top \Sigma_{XY} (X_i Y_i^\top + \Sigma_{XY}) \Sigma_{XY} \left( \sum_{j \notin A \cup \{i\}} X_j \right) \\
+ \left( \sum_{j \neq i} Y_j \right)^\top \Sigma_{XY} (X_i X_i^\top + \Sigma_X) \Sigma_{XY} \left( \sum_{j \notin A \cup \{i\}} Y_j \right)
\]

\[
\equiv S_1(i, A) + S_2(i, A) + S_3(i, A) + S_4(i, A)
\]

Hence by using (D.2) we have

\[
S_1 = \frac{1}{2} \sum_{A \subseteq [n]} \sum_{i \notin A} \frac{S_1(i, A)}{\binom{n}{|A|}(n - |A|)} \\
= \frac{1}{2} \sum_{1 \leq i < n} \left[ X_i^\top \Sigma_{XY} (Y_i Y_i^\top + \Sigma_Y) \Sigma_{XY} X_k \cdot \left( \sum_{A \subseteq \{i, k\} = \emptyset} \frac{1}{\binom{n}{|A|}(n - |A|)} \right) \right]
\]

\[
= \frac{1}{4} \sum_{1 \leq i < n} \left[ X_i^\top \Sigma_{XY} (Y_i Y_i^\top + \Sigma_Y) \Sigma_{XY} X_k \right].
\]

Using similar calculations, we have

\[
S_2 = \frac{1}{2} \sum_{A \subseteq [n]} \sum_{i \notin A} \frac{S_2(i, A)}{\binom{n}{|A|}(n - |A|)} = \frac{1}{4} \sum_{1 \leq i < n} \left[ X_i^\top \Sigma_{XY} (Y_i X_i^\top + \Sigma_{XY}) \Sigma_{XY} X_k \right]
\]

\[
S_3 = \frac{1}{2} \sum_{A \subseteq [n]} \sum_{i \notin A} \frac{S_3(i, A)}{\binom{n}{|A|}(n - |A|)} = \frac{1}{4} \sum_{1 \leq i < n} \left[ Y_i^\top \Sigma_{XY} (X_i Y_i^\top + \Sigma_{XY}) \Sigma_{XY} X_k \right]
\]

\[
S_4 = \frac{1}{2} \sum_{A \subseteq [n]} \sum_{i \notin A} \frac{S_4(i, A)}{\binom{n}{|A|}(n - |A|)} = \frac{1}{4} \sum_{1 \leq i < n} \left[ Y_i^\top \Sigma_{XY} (X_i X_i^\top + \Sigma_X) \Sigma_{XY} X_k \right]
\]

As \( E[\psi_2|X, Y] = \sum_{i=1}^4 S_i \), the proof is complete by invoking Lemma D.4 below.

(2). By definition, we have for each \( i \in [n] \),

\[
E[\Delta_i \psi_2(X, Y)]^2 \leq \mathbb{E}\left[ \left( \sum_{j \neq i} X_j \right)^\top \Sigma_{XY} (Y_i - Y_i') \right] + \mathbb{E}\left[ \left( \sum_{j \neq i} Y_j \right)^\top \Sigma_{XY} (X_i - X_i') \right]
\]

\[
\lesssim \left( n^2 \mathbb{E}(X_i^\top \Sigma_{XY} X_i) \right)^{3/4} \leq n^{3/2} \mathbb{E}^{1/2} \left( Z_1 G_{1|2} Z_2 \right) \lesssim n^{3/2} \|G_{1|2}\|_F^3 \lesssim n^{3/2} \|\Sigma_{XY}\|_F^3.
\]

The proof is complete.
Here M to control the variance of On the other hand, as following variance bound holds.

Proof. We only give a bound for $S_1$: bounds for $S_2$-$S_4$ follow from completely analogous arguments. By definition we have $S_1 = 4^{-1}(S_{11} + S_{12})$, where

$$S_{11} = \sum_{1 \leq i \leq n, j \neq i, k \neq i} (X_j^\top \Sigma_{XY} Y_i)(Y_i^\top \Sigma_{XY} X_k) = \sum_{k=1}^n Z_k^\top \left( \sum_{\ell \neq k} G_{[21]} Z_\ell \right) \left( \sum_{\ell \neq k} Z_\ell^\top G_{[12]} \right) Z_k,$$

$$S_{12} = \sum_{1 \leq i \leq n, j \neq i, k \neq i} X_j^\top \Sigma_{XY} \Sigma_Y \Sigma_{XY} X_k = (n-2) \cdot \sum_{j,k=1}^n X_j^\top \Sigma_{XY} \Sigma_Y \Sigma_{XY} X_k.$$ To control the variance of $S_{11}$, note that for any $\ell \in [n],$

$$\nabla_{X_\ell} S_{11} = \sum_{1 \leq i \leq n, j \neq i, k \neq i} \delta_{ij} \Sigma_{XY} Y_i (Y_i^\top \Sigma_{XY} X_k) + \delta_{ik} \Sigma_{XY} Y_i (Y_i^\top \Sigma_{XY} X_j) = 2 \sum_{j \neq i, j \neq i} \Sigma_{XY} Y_i (Y_i^\top \Sigma_{XY} X_j) = 2 \sum_j \Sigma_{XY} M_{Y,-(j,\ell)} \Sigma_{XY} X_j.$$ Here $M_{Y,-A} \equiv \sum_{k \notin A} Y_k Y_k^\top$ for $A \subset [n]$. Then

$$\mathbb{E} \|\nabla_{X_\ell} S_{11}\|^2 = 4 \sum_j \mathbb{E} \text{tr} \left( \Sigma_{XY} M_{Y,-(j,\ell)} \Sigma_{XY} \Sigma_{XY} M_{Y,-(j,\ell)} \Sigma_{XY} \right) = 4 \sum_j \sum_{k_1, k_2 \neq j, \ell} \mathbb{E} (Y_{k_1}^\top \Sigma_{XY} \Sigma_Y X_{k_2})^2 \lesssim_M n^3 \|\Sigma_{XY} \Sigma_{XY} \|^2_F \leq n^3 \|\Sigma_{XY} \|^3_F.$$ On the other hand, as

$$\nabla_{Y_\ell} S_{11} = \sum_{1 \leq i \leq n, j \neq i, k \neq i} \delta_{ij} \left[ \Sigma_{XY} X_j (X_k^\top \Sigma_{XY} Y_i) + \Sigma_{XY} X_k (X_j^\top \Sigma_{XY} Y_i) \right] = 2 \sum_{j, k \neq \ell} \Sigma_{XY} X_j (X_k^\top \Sigma_{XY} Y_i),$$

we have

$$\mathbb{E} \|\nabla_{Y_\ell} S_{11}\|^2 = 4 \sum_{j_1, j_2, k_1, k_2 \neq \ell, \|\{j_1, j_2, k_1, k_2\}\|=1,2} \mathbb{E} (X_{j_1}^\top \Sigma_{XY} \Sigma_Y \Sigma_{XY} X_{j_2}) (X_{k_1}^\top \Sigma_{XY} \Sigma_{XY} X_{k_2}) \lesssim_M n \|\Sigma_{XY} \|^4_F + n^2 (\|\Sigma_{XY} \|^4_F + \|\Sigma_{XY} \Sigma_{XY} \|^2_F) \approx n^2 \|\Sigma_{XY} \|^5_F.$$ Putting together the two estimates and using the Gaussian-Poincaré inequality and a change of variable yield that

$$\text{Var}(S_{11}) \lesssim_M \sum_\ell \left( \mathbb{E} \|\nabla_{X_\ell} S_{11}\|^2 + \mathbb{E} \|\nabla_{Y_\ell} S_{11}\|^2 \right) \lesssim_M n^4 \|\Sigma_{XY} \|^4_F.$$ On the other hand, as $\sum_{j=1}^n X_j \overset{d}{=} \sqrt{n} \cdot X$, direct calculation yields that

$$\text{Var}(S_{12}) \approx n^2 \cdot \text{Var} \left[ \left( \sum_{j=1}^n X_j \right)^\top \Sigma_{XY} \Sigma_Y \Sigma_{XY} \left( \sum_{k=1}^n X_k \right) \right]$$
Putting together the estimates for $S_{11}$ and $S_{12}$ concludes the proof for $S_1$. □

Proof of Proposition 10.6. We will bound the $X$ component, and the bound for the $Y$ component is completely analogous.

(1). By direct calculation, we have for each $i \in [n]$,

$$\Delta_i \psi_3 (X, Y) = \tau_X^{-2} ||\Sigma_{XY}||_F^4 (||X_i||^2 - ||X'_i||^2).$$

Hence for any $A \subset [n]$ such that $i \notin A$, we have also $\Delta_i \psi_3 (X^A, Y^A) = \tau_X^{-2} ||\Sigma_{XY}||_F^2 (||X_i||^2 - ||X'_i||^2)$, thus by Lemma D.2

$$T_{\psi_3} = \sum_{A \subseteq [n]} \sum_{i \notin A} \tau_X^{-4} ||\Sigma_{XY}||_F^4 (||X_i||^2 - ||X'_i||^2)^2 \left( \frac{1}{|A|} \right) \left( n - |A| \right)$$

$$= \sum_{i=1}^{n} \tau_X^{-4} ||\Sigma_{XY}||_F^4 (||X_i||^2 - ||X'_i||^2)^2 \cdot \sum_{A \subseteq [n]: i \notin A} \frac{1}{|A|} \left( n - |A| \right)$$

$$\asymp \sum_{i=1}^{n} \tau_X^{-4} ||\Sigma_{XY}||_F^4 (||X_i||^2 - ||X'_i||^2)^2.$$

This means

$$\text{Var} \left[ \mathbb{E}(T_{\psi_3} | X, Y) \right] \leq \text{Var}(T_{\psi_3}) = n \tau_X^{-8} ||\Sigma_{XY}||_F^8 \cdot \text{Var} \left[ (||X||^2 - ||X'||^2)^2 \right]$$

$$\asymp n \tau_X^{-8} \cdot ||\Sigma_{XY}||_F^8 \cdot \mathbb{E}(||X||^2 - \text{tr}(\Sigma_X))^4 \lesssim_M n \tau_X^{-4} \cdot ||\Sigma_{XY}||_F^8.$$

(2). We have

$$\mathbb{E} |\Delta_3 \psi_3 (X, Y)|^3 = \tau_X^{-6} ||\Sigma_{XY}||_F^6 \cdot \mathbb{E} ||X||^2 - ||X'||^2 ||^3 \lesssim_M \tau_X^{-6} ||\Sigma_{XY}||_F^6 \mathbb{E} ||X||^2 - \text{tr}(\Sigma_X) ||^3$$

$$\asymp \tau_X^{-6} ||\Sigma_{XY}||_F^6 \cdot ||\Sigma_X||_F^3 \lesssim_M \tau_X^{-3} ||\Sigma_{XY}||_F^6.$$

The proof is complete. □

Appendix E. Proof of Theorem 2.5

For notational simplicity, we only prove the case $f_X = f_Y = f$; the general case only requires formal modifications.

E.1. Notation and preliminaries. Let

$$U_{f, \gamma_X} (x_1, x_2) \equiv f(||x_1 - x_2||/\gamma_X) - \mathbb{E} f(||x_1 - X||/\gamma_X)$$

$$- \mathbb{E} f(||X - x_2||/\gamma_X) + \mathbb{E} f(||X - X'||/\gamma_X),$$

$$V_{f, \gamma_Y} (y_1, y_2) \equiv f(||y_1 - y_2||/\gamma_Y) - \mathbb{E} f(||y_1 - Y||/\gamma_Y)$$

$$- \mathbb{E} f(||Y - y_2||/\gamma_Y) + \mathbb{E} f(||Y - Y'||/\gamma_Y).$$

The sample kernel distance covariance $\text{dCov}_n^2 (X, Y; f, \gamma)$ in (2.9) can be represented as a 4-th order $U$-statistics using $U_{f, \gamma_X}, V_{f, \gamma_Y}$ similar to Proposition 2.1.
Proposition E.1. The following holds:
\[
\text{dCov}_2^2(X, Y; f, \gamma) = \frac{1}{4} \sum_{i_1, \ldots, i_4} h_{f, \gamma}(Z_{i_1}, Z_{i_2}, Z_{i_3}, Z_{i_4}),
\]
where
\[
h_{f, \gamma}(Z_1, Z_2, Z_3, Z_4) = \frac{1}{4!} \sum_{(i_1, \ldots, i_4) \in \sigma(1,2,3,4)} \left[ U_{f, \gamma X}(X_{i_1}, X_{i_2}) V_{f, \gamma Y}(Y_{i_1}, Y_{i_2}) + U_{f, \gamma X}(X_{i_1}, X_{i_2}) V_{f, \gamma Y}(Y_{i_1}, Y_{i_4}) - 2U_{f, \gamma X}(X_{i_1}, X_{i_2}) V_{f, \gamma Y}(Y_{i_1}, Y_{i_4}) \right].
\]

Proof. The proof follows the same lines as that of Proposition 2.1; we omit repetitive details.

We need the following basic properties of \( f_{\sqrt{\cdot}}(\cdot) \) inherited from Assumption B.

Lemma E.2. Under Assumption B for \( f(\cdot) \), conclusions (1)-(4) therein hold for \( f_{\sqrt{\cdot}}(\cdot) \) with different constants \( c', C', q' \). Furthermore, \( c', C', q' \) only depend on \( c, C, \varepsilon \) and \( \varepsilon \), and \( q' \) only depends on \( q \).

Proof. The claims hold by definitions of \( f_{\sqrt{\cdot}}(\cdot) \), \( \ell = 0, 1, 2, 3, 4 \).

A useful consequence of Assumption B is the following.

Lemma E.3. Suppose that Assumption B holds, and the spectrum of \( \Sigma_X, \Sigma_Y \) is contained in \([1/M, M]\) for some \( M > 1 \). Then for any integer \( s \in \mathbb{N} \), there exists \( K \equiv K(s, q) > 0 \) such that if \( p, q \geq K \),
\[
\max_{1 \leq \ell \leq 4} \sup_{\rho^2 \in [1/M, M]} \sup_{\rho \in [0,1]} \mathbb{E}\left| f_{\sqrt{\cdot}}^{(\ell)}(\rho^2(1+tW)) \right|^s \lesssim_M 1,
\]
where \( W \) is either \( L_X(X_1, X_2) \) or \( L_Y(Y_1, Y_2) \) defined in (7.2).

Proof. We only prove the case for \( W = L_X(X_1, X_2), \ell = 1 \). By Lemma E.2, for all \( x \geq 0 \), \( |f_{\sqrt{\cdot}}^{(1)}(x)| \leq C_f(1+x^{-q'}) \) for some \( C_f > 0 \) and \( q' \in \mathbb{N} \). This means that
\[
\mathbb{E}\left| f_{\sqrt{\cdot}}^{(1)}(\rho^2(1+tL_X(X_1, X_2))) \right|^s \lesssim 1 + \rho^{-2sq'} \mathbb{E}(1+tL_X(X_1, X_2))^{-sq'}
\lesssim 1 + \rho^{-2sq'} \min\{(1-t)^{-sq'}, t^{-sq'} \mathbb{E}(\tau_X^{-2}\|X_1 - X_2\|)^{-sq'}\}.
\]
Now use (7.4) to conclude.

We define the analogue of the \( h \) function in (7.1): For \( u \geq -1 \), let
\[
h_{f, \rho}(u) = \frac{f_{\sqrt{\cdot}}(\rho^2(1+u)) - f_{\sqrt{\cdot}}(\rho^2) - f'_{\sqrt{\cdot}}(\rho^2)\rho^2 u}{2f'_{\sqrt{\cdot}}(\rho^2)\rho^2} = \frac{\rho^2}{2f'_{\sqrt{\cdot}}(\rho^2)} \cdot u^2 \int_0^1 f'_{\sqrt{\cdot}}(\rho^2(1+su))(1-s) \, ds.
\]
When \( f(x) = x \) so that \( f_{\sqrt{\cdot}}(x) = \sqrt{x} \) and \( \rho = 1 \), we recover the \( h \) function in (7.1).

Lemma E.4. Suppose that Assumption B holds and \( 1/M \leq \rho^2 \leq M \) for some \( M > 1 \). Then
\[
|h_{f, \rho}(u)| \lesssim_M u^2, \quad |h'_{f, \rho}(u)| \lesssim_M |u| \cdot |F_{f, \rho; 2}(u)|,
\]
where
\[ F_{f,\rho;2}(u) = u^{-1} \int_{0}^{u} f''_{\sqrt{\rho}}(\rho^{2}(1 + t)) \, dt = \int_{0}^{1} f''_{\sqrt{\rho}}(\rho^{2}(1 + us)) \, ds. \]

Furthermore
\begin{align*}
 h_{f,\rho}(u) &= \frac{f''_{\sqrt{\rho}}(\rho^{2}) \rho^{2}}{4 f'_{\sqrt{\rho}}(\rho^{2})} \cdot u^{2} + \frac{\rho^{4}}{2 f'_{\sqrt{\rho}}(\rho^{2})} \cdot u^{3} \int_{0}^{1} f^{(3)}_{\sqrt{\rho}}(\rho^{2}(1 + su)) \frac{(1 - s)^{2}}{2} \, ds \\
 &= \frac{f''_{\sqrt{\rho}}(\rho^{2}) \rho^{2}}{4 f'_{\sqrt{\rho}}(\rho^{2})} \cdot u^{2} + \frac{f^{(3)}_{\sqrt{\rho}}(\rho^{2}) \rho^{4}}{12 f'_{\sqrt{\rho}}(\rho^{2})} \cdot u^{3} + \frac{\rho^{6}}{2 f'_{\sqrt{\rho}}(\rho^{2})} \cdot u^{4} \int_{0}^{1} f^{(4)}_{\sqrt{\rho}}(\rho^{2}(1 + su)) \frac{(1 - s)^{3}}{6} \, ds \\
 &= \frac{f''_{\sqrt{\rho}}(\rho^{2}) \rho^{2}}{4 f'_{\sqrt{\rho}}(\rho^{2})} \cdot u^{2} + h_{f,\rho;3}(u).
\end{align*}

**Proof.** The bound for \( h_{f,\rho} \) follows by the following consideration: if \( u \in [-1, -1/2] \), it holds by Lemma E.2 - Conclusion (2) and the fact \( \rho \geq M \) that \( |h_{f,\rho}(u)| \lesssim_{M} 1 \lesssim_{M} u^{2} \); if \( u > -1/2 \), if follows from the lower bound on \( |f'_{\sqrt{\rho}}| \) and upper bound on \( |f''_{\sqrt{\rho}}| \) that
\[
|h_{f,\rho}(u)| = \left| \frac{\rho^{2}}{2 f'_{\sqrt{\rho}}(\rho^{2})} \cdot u^{2} \int_{0}^{1} f''_{\sqrt{\rho}}(\rho^{2}(1 + su))(1 - s) \, ds \right| \lesssim_{M} u^{2} \cdot \sup_{u > -1/2} \sup_{s \in [0, 1]} |f''_{\sqrt{\rho}}(\rho^{2}(1 + su))| \lesssim_{M} u^{2}.
\]

On the other hand, by Taylor expansion
\begin{align*}
 f_{\sqrt{\rho}}(\rho^{2}(1 + u)) - f_{\sqrt{\rho}}(\rho^{2}) - f'_{\sqrt{\rho}}(\rho^{2}) \rho^{2} u &= \int_{0}^{\rho^{2}u} f''_{\sqrt{\rho}}(\rho^{2} + t)(\rho^{2}u - t) \, dt \\
 &= \frac{f''_{\sqrt{\rho}}(\rho^{2})}{2} (\rho^{2}u)^{2} + (\rho^{2}u)^{3} \int_{0}^{1} f^{(3)}_{\sqrt{\rho}}(\rho^{2}(1 + su)) \frac{(1 - s)^{2}}{2} \, ds \\
 &= \frac{f''_{\sqrt{\rho}}(\rho^{2})}{2} (\rho^{2}u)^{2} + \frac{f^{(3)}_{\sqrt{\rho}}(\rho^{2})}{6} (\rho^{2}u)^{3} + (\rho^{2}u)^{4} \int_{0}^{1} f^{(4)}_{\sqrt{\rho}}(\rho^{2}(1 + su)) \frac{(1 - s)^{3}}{6} \, ds.
\end{align*}

The first equality shows that
\[
|h'_{f,\rho}(u)| = \left| \frac{1}{2 f'_{\sqrt{\rho}}(\rho^{2})} \int_{0}^{\rho^{2}u} f''_{\sqrt{\rho}}(\rho^{2} + t) \, dt \right| \lesssim_{M} \left| \int_{0}^{u} f''_{\sqrt{\rho}}(\rho^{2} + t) \, dt \right| = |u \cdot F_{f,\rho;2}(u)|,
\]

as desired. \( \square \)

**E.2. Residual estimates.** Let
\[
 R_{X,f}(x_{1},x_{2}) \equiv h_{f,\rho_{X}}(L_{X}(x_{1},x_{2})), \quad R_{Y,f}(y_{1},y_{2}) \equiv h_{f,\rho_{Y}}(L_{Y}(y_{1},y_{2})).
\]

These quantities are analogues of \( R_{X}, R_{Y} \) defined in (7.2). Now we may develop an expansion of \( U_{f,\gamma_{X}}, V_{f,\gamma_{Y}} \) similar to Lemma 7.3.

**Lemma E.5.** With \( \bar{R}_{X,f}, \bar{R}_{Y,f} \) denoting the double centered versions of \( R_{X,f}, R_{Y,f} \), we have
\[
 U_{f,\gamma_{X}}(x_{1},x_{2}) = - \frac{2 f'_{\sqrt{\rho_{X}}}(\rho_{X}^{2})}{\tau_{X}^{2}} \left[ x_{1}^{\top} x_{2} - \tau_{X}^{2} \bar{R}_{X,f}(L_{X}(x_{1},x_{2})) \right],
\]
\[ V_{f, \gamma_Y}(y_1, y_2) = \frac{2f'_\rho(\rho_X^2)}{\gamma_Y^2} \left[ y_1^\top y_2 - \tau_Y^2 \bar{R}_{Y,f}(L_Y(y_1, y_2)) \right]. \]

**Proof.** Using the definition of \( R_{X,f} \), we have
\[ f \left( \frac{\|x_1 - x_2\|}{\gamma_X} \right) = f_{\sqrt{\cdot}}(\rho_X^2 + \rho_X^2 L_X(x_1, x_2)) \]
\[ = f_{\sqrt{\cdot}}(\rho_X^2) + f'_{\sqrt{\cdot}}(\rho_X^2) \rho_X^2 \left[ L_X(x_1, x_2) + 2 \cdot R_{X,f}(L_X(x_1, x_2)) \right], \]
The claim follows by using the fact that double centered version of \( L_X(x_1, x_2) \) equals \(-2x_1^\top x_2/\tau_X^2\). \( \square \)

The following moment estimates give an analogy of Lemma 7.4.

**Lemma E.6.** Suppose Assumption B holds, and that (i) the spectrum of \( \Sigma_X, \Sigma_Y \) and (ii) \( \rho_X, \rho_Y \) are contained in \([1/M, M]\) for some \( M > 1 \). Then:
1. For any positive integer \( s \in \mathbb{N} \),
   \[ \tau_X^{2s} \mathbb{E} R_{X,f}^s(X_1, X_2) \sqrt{\tau_Y^s \mathbb{E} R_{Y,f}^s(Y_1, Y_2)} \lesssim_{M,s} 1. \]
2. For any positive integer \( s \in \mathbb{N} \),
   \[ \tau_X^{2s} \mathbb{E} h_{f, \rho_X}^s(L_X(x_1, X_2)) \sqrt{\tau_Y^s \mathbb{E} h_{f, \rho_Y}^s(L_Y(Y_1, Y_2))} \lesssim_{M} 1 \]
   holds for \( p, q \) large (possibly depending on \( s, q \)).

**Proof.** Combining with estimates in Lemma 7.4, (1) follows by \( |h_{f, \rho}(u)| \lesssim_M u^2 \), and (2) follows by \( |h'_{f, \rho, \delta}(u)| \lesssim_M |u \cdot F_{f, \rho, \delta}(u)| \) and noting that for any \( s \in \mathbb{N} \),
\[ \mathbb{E} |F_{f, \rho, \delta}(L_X(x_1, X_2))|^s \lesssim \sup_{t \in [0, 1]} \mathbb{E} |f'_{\sqrt{\cdot}}(\rho^2(1 + t L_X(x_1, X_2)))|^s \lesssim_{M} 1 \]
by Lemma E.3. \( \square \)

Let
\[ \psi_{X,f}(x_1, y_1) = \mathbb{E}_{X_2, Y_2} \left[ \bar{R}_{X,f}(x_1, X_2) Y_2^\top y_1 \right], \]
\[ \psi_{Y,f}(x_1, y_1) = \mathbb{E}_{X_2, Y_2} \left[ \bar{R}_{Y,f}(y_1, Y_2) X_2^\top x_1 \right], \]
\[ \psi_{X,Y,f}(x_1, y_1) = \mathbb{E}_{X_2, Y_2} \left[ \bar{R}_{X,f}(x_1, X_2) \bar{R}_{Y,f}(y_1, Y_2) \right]. \]

**Proposition E.7.** Suppose that Assumption B holds, and that \( \rho_X, \rho_Y \) are contained in \([1/M, M]\) for some \( M > 1 \). Then the bounds in Proposition 8.2 hold when \( \psi_X, \psi_Y, \psi_{X,Y} \) are replaced with \( \psi_{X,f}, \psi_{Y,f}, \psi_{X,Y,f} \) under the same spectrum conditions, for \( p, q \) large (possibly depending on \( q \)).

**Proof.** The proof essentially proceeds the same way as in the proof of Proposition 8.2. We sketch some differences.

(First moment) First, using a similar argument as in Lemma 8.1, we have the decomposition
\[ \psi_{X,f}(x, y) = A_{1,X,f}(x, y) + A_{2,X,f}(x, y), \]
where \( A_{2,X,f}(x, y) = \mathbb{E} \left[ h_{f, \rho_X, \delta}(L_X(x, X)) Y^\top y \right] \) (\( h_{f, \rho_X, \delta} \) defined in Lemma E.4), and
\[ A_{1,X,f}(x, y) = \frac{f''_{\rho}(\rho_X^2) \rho_X^2}{f'_{\rho}(\rho_X^2) \tau_X^2} \left[ \|x\|^2 - \text{tr}(\Sigma_X) \right] x^\top \Sigma_X y + 2x^\top \Sigma_X \Sigma_{XY} y. \]
The bound $|\mathbb{E}A_{1,1}(X, Y)| \lesssim_M \tau_X^4 \|\Sigma_{XY}\|^2_F$ follows from Lemma E.2, and the bound for $|\mathbb{E}A_{2,1}(X_1, Y_1)|$ follows from the following modification: by Lemma E.2,

$$\mathbb{E}A_{2,1}(X_1, Y_1) \lesssim_M \mathbb{E}[L^3_X(X_1, X_2)Y_1^TY_2] + \mathbb{E}\left[L^4_X(X_1, X_2)Y_1^TY_2 \cdot \int_0^1 (1-s)^3 f^{(4)}_\gamma (\rho^2(1+sL_X(X_1, X_2))) \, ds\right].$$

The first term can be handled by Lemma B.2 of order at most $\tau_X^{-4} \|\Sigma_{XY}\|^2_F$, while by Lemmas 8.3 and E.3, the second term can be bounded, up to a constant depending on $M$, by

$$\mathbb{E}^{1/2} \mathbb{E}[L^3_X(X_1, X_2) \int_0^1 (1-s)^3 f^{(4)}_\gamma (\rho^2(1+sL_X(X_1, X_2))) \, ds] \cdot \|\Sigma_{XY}\|^2_F \lesssim_M \tau_X^{-4} \|\Sigma_{XY}\|^2_F \cdot \sup_{s \in [0,1]} \mathbb{E}^{1/4} [f^{(4)}_\gamma (\rho^2(1+sL_X(X_1, X_2)))]^4 \lesssim_{M, s} \tau_X^{-4} \|\Sigma_{XY}\|^2_F.$$

(Second moment) The proof of the second moment bounds for $\psi_{X,f}, \psi_{Y,f}$ requires a modification for controlling $\mathbb{E}A_{2,1}(X_1, Y_1)$:

$$\mathbb{E}A_{2,1}(X_1, Y_1) \lesssim_M \mathbb{E}_{X_1, Y_1} \left\{ \mathbb{E}_{X_2, Y_2} \left[ L^3_X(X_1, X_2)Y_1^TY_2 \int_0^1 (1-s)^2 f^{(3)}_\gamma (\rho^2(1+sL_X(X_1, X_2))) \, ds \right] \right\}^2 \lesssim_M \tau_X^{-6} \|\Sigma_{XY}\|^2_F \cdot \sup_{s \in [0,1]} \mathbb{E}^{1/4} [f^{(3)}_\gamma (\rho^2(1+sL_X(X_1, X_2)))]^6 \lesssim_M \tau_X^{-6} \|\Sigma_{XY}\|^2_F.$$

using Lemma E.3 in the last step. The proof of the second moment bound for $\psi_{X,f}$ proceeds along the same lines upon using Lemma E.6. \hfill \square

E.3. Mean and variance expansion. Now we may prove the mean and variance expansion formulæ:

**Proposition E.8.** Suppose that Assumption B holds, and that (i) the spectrum of $\Sigma_X, \Sigma_Y$ (ii) $\rho_X, \rho_Y$ are contained in $[1/M, M]$ for some $M > 1$.

(1) The following mean expansion holds:

$$m_{\Sigma; f, \gamma} \equiv \mathbb{E} \text{dCov}^2(X, Y; f, \gamma) = \text{dCov}^2(X, Y; f, \gamma) = \phi(\gamma) m_{\Sigma} \left[ 1 + O_M \left( (\tau_X \wedge \tau_Y)^{-1} \right) \right],$$

where $m_{\Sigma}$ is the mean for distance covariance defined in Theorem 8.5.

(2) The following variance expansion holds:

$$\text{Var}(\text{dCov}^2(X, Y; f, \gamma)) = \sigma^2(\gamma) \sigma_{\Sigma}^2(X, Y) \left[ 1 + O_M \left( n^{-1/2} + (p \wedge q)^{-1/4} \right) \right].$$

Here $\sigma_{\Sigma}^2(X, Y)$ is defined in Theorem 2.2.

**Proof.** The mean and variance expansions can be proved using exactly the same lines as in the proof of Theorems 8.5 and 9.12, but using Proposition E.7. The scaling can be checked, e.g., as the leading term in $m_{\Sigma; f, \gamma}$ equals, by Lemma E.5,

$$\frac{4f^{(4)}_\gamma (\rho_X^2) f^{(4)}_\gamma (\rho_Y^2)}{\tau_X^2 \tau_Y^2} \|\Sigma_{XY}\|^2_F = \frac{4f^{(4)}_\gamma (\rho_X^2) f^{(4)}_\gamma (\rho_Y^2)}{\tau_X^2 \tau_Y^2} \frac{\tau_X \tau_Y}{\tau_X \tau_Y} \|\Sigma_{XY}\|^2_F = \phi(\gamma) \frac{\tau_X \tau_Y}{\tau_X \tau_Y},$$

where the leading term is $\tau_X^{-4} \|\Sigma_{XY}\|^2_F$.
whereas $\|\Sigma_{XY}\|_F^2/(\tau_X \tau_Y)$ is the leading term in $m_{\Sigma}$ as established in Theorem 8.5.

The rest of the proof of Theorem 2.5 follows exactly the same lines as that of the proof of Theorem 2.2. Details are omitted.

**Appendix F. Auxiliary Lemmas**

**Lemma F.1.** For real-valued random variables $W, R, N \sim \mathcal{N}(0, 1)$ and a deterministic real number $D$, we have

$$d_{\text{Kol}}(W + R + D, N) \leq d_{\text{Kol}}(W, N) + 2(\mathbb{E}R^2)^{1/3} + |D|.$$  

**Proof.** Fix $u > 0$, on an event $E_u$ with probability at least $1 - u^{-2}$, $|R| \leq u \cdot \mathbb{E}^{1/2} R^2$. Then for any $t \in \mathbb{R}$

$$\mathbb{P}(W + R + D \leq t) \leq \mathbb{P}(W + D \leq t + u \mathbb{E}^{1/2} R^2) + u^{-2}$$

$$\leq \mathbb{P}(N \leq t + |D| + u \mathbb{E}^{1/2} R^2) + u^{-2} + d_{\text{Kol}}(W, N)$$

Optimizing the above display over $u > 0$ to conclude one side of the inequality. The reverse direction is similar. \hfill \square

**Lemma F.2.** For two random variables $X, Y$, with $\varphi_Y$ denoting the Lebesgue density of $Y$, we have $d_{\text{Kol}}^2(X, Y) \leq 4\|\varphi_Y\|_\infty d_W(X, Y)$, where $d_W$ is the Wasserstein distance.

**Proof.** Fix $t \in \mathbb{R}$ and $\varepsilon > 0$. Let $g_{t, \varepsilon}(\cdot) \equiv 1$ on $(-\infty, t]$, $g_{t, \varepsilon}(\cdot) \equiv 0$ on $[t + \varepsilon, \infty)$ and be linearly interpolated on $(t, t + \varepsilon)$. As $g_{t, \varepsilon}$ is $\varepsilon^{-1}$-Lipschitz,

$$\mathbb{P}(X \leq t) - \mathbb{P}(Y \leq t) \leq \mathbb{E}g_{t, \varepsilon}(X) - \mathbb{E}g_{t, \varepsilon}(Y) - \mathbb{E}\mathbf{1}_{(-\infty, t]}(Y)$$

$$\leq \varepsilon^{-1}d_W(X, Y) + \mathbb{P}(t \leq Y \leq t + \varepsilon) \leq \varepsilon^{-1}d_W(X, Y) + \varepsilon\|\varphi_Y\|_\infty.$$  

Optimizing over $\varepsilon > 0$ obtains the one-sided inequality. The other direction is similar. \hfill \square

**Lemma F.3.** Suppose $Z, Z_1, Z_2, \ldots$ are independent copies of $\mathcal{N}(0, I_d)$. The following hold.

1. For any matrices $A, B \in \mathbb{R}^{d \times d}$,

$$\mathbb{E}(Z^T AZ)(Z^T BZ) = \text{tr}(A) \text{tr}(B) + \text{tr}(AB) + \text{tr}(AB^\top),$$

$$\mathbb{E}(Z^T AZ - \text{tr}(A))(Z^T BZ - \text{tr}(B)) = \text{tr}(AB) + \text{tr}(AB^\top).$$

2. For any matrices $A, B \in \mathbb{R}^{d \times d}$,

$$\mathbb{E}(Z_1^T AZ_2 Z_2^T BZ_1)^2 = 2(\mathbb{E}^2(AB) + \text{tr}(ABAB) + 2 \text{tr}(ABB^\top A^\top))$$

$$+ \text{tr}(AA^\top) \text{tr}(BB^\top).$$

3. For any matrix $A \in \mathbb{R}^{d \times d}$,

$$\mathbb{E}(ZZ^\top)(Z^T AZ) = A + A^\top + \text{tr}(A)I_d.$$
Proof. (1). Note that
\[ E(Z^T AZ)(Z^T BZ) = \mathbb{E} \text{tr} \left( AZZ^T BZZ^T \right) \]
\[ = \mathbb{E} \sum_{i,j,k,\ell} A_{ij}(Z^T)_{jk} B_{k\ell}(Z Z^T)_{\ell i} = \sum_{i,j,k,\ell} A_{ij} B_{k\ell} \cdot \mathbb{E} Z_i Z_j Z_k Z_\ell. \]

To make the expectation on the right hand side non-vanishing:
- \((i = j) \neq (k = \ell)\). This contributes to \(\sum_{i \neq k} A_{ii} B_{kk}\).
- \((i = k) \neq (j = \ell)\). This contributes to \(\sum_{i,j} A_{ij} B_{ji}\).
- \((i = \ell) \neq (j = k)\). This contributes to \(\sum_{i,j} A_{ij} B_{ji}\).
- \(i = j = k = \ell\). This contributes to \(3 \sum_i A_{ii} B_{ii}\).

Collecting the terms to conclude the first equality. The second equality follows a direct expansion.

(2). Note that
\[ E(Z_1^T A Z_2 Z_2^T B Z_1)^2 = \mathbb{E} \left[ E[Z_1^T (AZ_2 Z_2^T B) Z_1 \cdot Z_1^T (AZ_2 Z_2^T B) Z_1 | Z_2] \right] \]
\[ = \mathbb{E} \text{tr}^2(AZ_2 Z_2^T B) + \mathbb{E} \text{tr}(AZ_2 Z_2^T BAZ_2 Z_2^T B) + \mathbb{E} \text{tr}(AZ_2 Z_2^T BB^T Z_2 Z_2^T A^T) \]
\[ = \mathbb{E} (Z_2^T BAZ_2)^2 + \mathbb{E} (Z_2^T BAZ_2)^2 + \mathbb{E} Z_2^T BB^T Z_2 \cdot Z_2^T A^T A Z_2 \]
\[ = 2 \left( \text{tr}^2(AB) + \text{tr}(ABAB) + 2 \text{tr}(ABB^T A^T) \right) + \text{tr}(BB^T) \text{tr}(AA^T). \]

(3). For \(i \neq j\),
\[ (E(ZZ^T)(Z^T AZ))_{ij} = E \left[ Z_i Z_j \sum_{k,\ell} Z_k A_{k\ell} Z_\ell \right] = A_{ij} + A_{ji}. \]

For \(i = j\),
\[ (E(ZZ^T)(Z^T AZ))_{ii} = E \left[ Z_i^2 \sum_{k,\ell} Z_k A_{k\ell} Z_\ell \right] = E Z_i^4 \cdot A_{ii} + \sum_{k \neq i} (\mathbb{E} Z_i^2)(\mathbb{E} Z_k^2) A_{kk} = 3A_{ii} + \sum_{k \neq i} A_{kk} = 2A_{ii} + \text{tr}(A). \]

The proof is complete. \(\square\)

Lemma F.4. The following hold:
(1) \(\|X_1\|^2 \|Y_1\|^2 = \text{tr}(\Sigma_X) \text{tr}(\Sigma_Y) + 2\|\Sigma_{XY}\|^2_F\).
(2) \(E(X_1^T Y_1 X_1 Y_1^T)^2 = \text{tr}(\Sigma_X \Sigma_X Y \Sigma_Y \Sigma_Y)\).
(3) \(E(X_1^T X_2 Y_1^T Y_2) = 2\|\Sigma_{XY}\|^2_F + 2\|\Sigma_{XY} \Sigma_{YX} \Sigma_{X} \|_F^2 + 4 \text{tr}(\Sigma_{XY} \Sigma_{Y} \Sigma_{X} \Sigma_{X}) + \|\Sigma_X\|^2_F \|\Sigma_Y\|^2_F \).
(4) For any matrix \(A,B\),
\[ E(X_1^T A Y_1)(X_1^T B Y_1) = \text{tr}(A \Sigma_{Y} X) \text{tr}(B \Sigma_{Y} X) + \text{tr}(A \Sigma_{Y} X B \Sigma_{Y} X) + \text{tr}(A \Sigma_{Y} X B \Sigma_{Y} X)^T. \]
In particular, for \(A = B = \Sigma_{XY}\), we have \(E(X_1^T \Sigma_{XY} Y_1)^2 = \|\Sigma_{XY}\|^2_F + \|\Sigma_{XY} \Sigma_{YX} \Sigma_{X} \|_F^2 + \text{tr}(\Sigma_{XY} \Sigma_{Y} \Sigma_{X} \Sigma_{X})\).
(5) For any matrix \(A,B\),
\[ E(X_1^T A X_1)(Y_1^T B Y_1) = \text{tr}(A \Sigma_{X} X) \text{tr}(B \Sigma_{X} Y) + \text{tr}(A \Sigma_{X} Y B \Sigma_{X} Y) + \text{tr}(A \Sigma_{X} Y B \Sigma_{X} Y)^T. \]

Proof. (1) follows from \(E\|X_1\|^2 \|Y_1\|^2 = EZ_1^T H_{[11]} Z_1 \cdot Z_1^T H_{[22]} Z_1\).
\[= \text{tr}(H_{11}) \text{tr}(H_{22}) + 2 \text{tr}(H_{11}H_{22}) = \text{tr}(\Sigma_X) \text{tr}(\Sigma_Y) + 2\|\Sigma_{XY}\|_F^2.\]

(2) follows from
\[\mathbb{E}(X_1^T \Sigma_{XY} Y_2)^2 = \mathbb{E} \text{tr} (\Sigma_{XY} Y_2 Y_2^T \Sigma_{XY} X_1 X_1^T) = \text{tr}(\Sigma_{XY} \Sigma_Y \Sigma_{X} \Sigma_X).\]

(3). Note that
\[\mathbb{E}(X_1^T X_2)^2(Y_1^T Y_2)^2 = \mathbb{E}(Z_{11}^T H_{111} Z_{22})^2 \mathbb{E}(Z_{11}^T H_{222} Z_{22})^2\]
\[= 2(\text{tr}^2(H_{111}H_{222}) + \text{tr}(H_{111}H_{222}H_{111}H_{222}^2) + 2 \text{tr}(H_{111}^2H_{222}^2)) + \text{tr}(H_{111}^2) \text{tr}(H_{222}^2)\]
\[= 2\|\Sigma_{XY}\|_F^4 + 2\|\Sigma_{XY} \Sigma_{X} \Sigma_{X} \Sigma_{Y}\|_F^2 + 4\text{tr}(\Sigma_{XY} \Sigma_Y \Sigma_{X} \Sigma_{X}) + \|\Sigma_X\|_F^2 \|\Sigma_Y\|_F^2.\]

(4). Let \(A_\Sigma \equiv \Sigma^{1/2} \begin{pmatrix} 0 & A \\ 0 & 0 \end{pmatrix} \Sigma^{1/2}, \quad B_\Sigma \equiv \Sigma^{1/2} \begin{pmatrix} 0 & B \\ 0 & 0 \end{pmatrix} \Sigma^{1/2}.\) Then
\[\mathbb{E}(X_1^T AY_1)(X_1^T BY_1) = \mathbb{E}(Z_{11}^T A_\Sigma Z_{11})(Z_{11}^T B_\Sigma Z_{11}) = \text{tr}(A_\Sigma) \text{tr}(B_\Sigma) + \text{tr}(A_\Sigma B_\Sigma) + \text{tr}(A_\Sigma B_\Sigma^T)\]
\[= \text{tr}(A_\Sigma X) \text{tr}(B_\Sigma Y) + \text{tr}(A_\Sigma Y X) B_\Sigma X + \text{tr}(\Sigma_X A_\Sigma B_\Sigma^T).\]

(5). Abusing notation, let \(A_\Sigma \equiv \Sigma^{1/2} \begin{pmatrix} A & 0 \\ 0 & 0 \end{pmatrix} \Sigma^{1/2}, \quad B_\Sigma \equiv \Sigma^{1/2} \begin{pmatrix} 0 & B \\ 0 & 0 \end{pmatrix} \Sigma^{1/2}.\) Then
\[\mathbb{E}(X_1^T AX_1)(Y_1^T BY_1) = \mathbb{E}(Z_{11}^T A_\Sigma Z_{11})(Z_{11}^T B_\Sigma Z_{11}) = \text{tr}(A_\Sigma) \text{tr}(B_\Sigma) + \text{tr}(A_\Sigma B_\Sigma) + \text{tr}(A_\Sigma B_\Sigma^T)\]
\[= \text{tr}(A_\Sigma X) \text{tr}(B_\Sigma Y) + \text{tr}(A_\Sigma Y X) B_\Sigma X + \text{tr}(\Sigma_X A_\Sigma B_\Sigma^T \Sigma_X Y).\]

The proof is complete. \(\square\)

**Lemma F.5.** It holds that \(\|\Sigma_{XY}\|_F^2 \leq \|\Sigma_X\|_F \|\Sigma_Y\|_F.\) If in addition \(\|\Sigma_X^{-1}\|_{op} \vee \|\Sigma_Y^{-1}\|_{op} \leq M\) for some \(M > 1\), then \(\|\Sigma_{XY}\|_F^2 \lesssim_M \tau_X^2 \wedge \tau_Y^2\).

**Proof.** For the first claim, note that
\[\|\Sigma_{XY}\|_F^2 = \text{tr} \left( \mathbb{E}(X_1^T Y_1^T \Sigma_{XY} Y_2) \right) \mathbb{E}(X_1^T X_2)(Y_1^T Y_2) \]
\[\leq \mathbb{E}^{1/2}(X_1^T X_2)^2 \cdot \mathbb{E}^{1/2}(Y_1^T Y_2)^2 = \|\Sigma_X\|_F \|\Sigma_Y\|_F,\]
as desired. For the second claim, as the conditional covariance \(\Sigma_{X|Y} = \Sigma_X - \Sigma_{XY} \Sigma_Y^{-1} \Sigma_{YX}\) is p.s.d., we have
\[\|\Sigma_{XY}\|_F^2 \lesssim_M \text{tr}(\Sigma_{XY} \Sigma_Y^{-1} \Sigma_{YX}) \leq \text{tr}(\Sigma_X) = \tau_X^2 / 2.\]
Flipping the role of \(X, Y\) to conclude. \(\square\)
