ON LIU MORPHISMS IN NON-ARCHIMEDEAN GEOMETRY

MINGCHEN XIA

Abstract. We define Liu morphisms and quasi-Liu morphisms between Berkovich analytic spaces. We show that Liu morphisms and quasi-Liu morphisms behave exactly as affine morphisms and quasi-affine morphisms of schemes. In particular, we prove that both Liu morphisms and quasi-Liu morphisms descend effectively with respect to fpqc coverings.

1. Introduction

1.1. Motivation. In classical algebraic geometry, the theories of affine morphisms and quasi-affine morphisms play a prominent role. In particular, it is known that affine morphisms and quasi-affine morphisms can be effectively descended under a fpqc covering. In non-Archimedean world, it is highly desirable to have analogous results as well. However, there are two principal difficulties in the non-Archimedean setting:

(1) First of all, there is no satisfactory theory of quasi-coherent sheaves in non-Archimedean geometry. There is indeed an ad hoc notion of quasi-coherent sheaves in rigid geometry defined by Conrad in [Con06]: a quasi-coherent sheaf is a sheaf of modules which can be expressed as a filtered colimit of coherent sheaves locally. However, Conrad’s notion of quasi-coherent sheaves does not behave as expected: on an affinoid space, the higher cohomologies of a quasi-coherent sheaf do not vanish in general. This makes it hard to handle affine morphisms in terms of quasi-coherent sheaves of algebras. The same problem persists in Berkovich geometry.

(2) Secondly, a more severe problem is proposed by Liu [Liu88], [Liu90]. It is shown that there is a quasi-compact, separated non-affinoid rigid space $X$, a morphism $f : X \rightarrow Y$ to an affinoid space $Y$, an admissible affinoid covering $\{U_i\}$ of $Y$, such that $f^{-1}U_i$ affinoid for each $i$. This means, the property that the inverse image of an affinoid domain is affinoid is not G-local.

Thankfully, both problems can be fixed. For problem (2), recall that in classical algebraic geometry, we have the celebrated Serre’s criterion ([EGA II, Théorème 5.2.1]): affine schemes can be characterized by cohomological triviality among quasi-compact separated schemes. Similarly, in non-Archimedean setting, we replace the usual local notion of affinoid spaces by cohomologically trivial spaces. Such spaces are studied by Maculan–Poineau in [MP18] under the name of Liu spaces, we follow their terminology.
Definition 1.1 (c.f. Definition 3.1). Let \( k \) be a complete non-Archimedean valued field. A quasi-compact, separated \( k \)-analytic space \( X \) (in the sense of Berkovich) is said to be Liu if for any analytic extension \( k'/k \), any coherent sheaf \( \mathcal{F} \) on \( X_{k'} \) is acyclic.

On the morphism level, we define a Liu morphism as a morphism under which the inverse image of a Liu domain is a Liu space, see Definition 4.1. In contrast to the corresponding notion defined by affinoid domains, we show that the property of being a Liu morphism is \( G \)-local on the target if the target is separated, see Theorem 4.4. Similarly, we have a notion of quasi-Liu morphisms analogous to the classical notion of quasi-affine morphisms:

Definition 1.2 (c.f. Definition 5.2). Let \( f : X \to Y \) be a morphism of \( k \)-analytic spaces. We say \( f \) is quasi-Liu if for any Liu domain \( Z \) in \( Y \), \( f^{-1}Z \) can be embedded in a Liu \( k \)-analytic space as a compact analytic domain and if \( H^0(f^{-1}Z, \mathcal{O}_X) \) is a Liu \( k \)-algebra (Definition 3.4).

The property of being a quasi-Liu morphism is also \( G \)-local on the target if the target is separated, see Proposition 5.5.

As for problem (1), due to the progress made by Ben-Bassat–Kremnizer in [BBK17], it is by far clear that the natural notion on a non-Archimedean analytic space is not that of the quasi-coherent sheaves, but the derived category of quasi-coherent sheaves instead. However, as we will see, in the special case of sheaves of Liu algebras studied below, the derived notion reduces to a bona fide notion of quasi-coherence at the non-derived level. In particular, on a separated space, there is a global notion of quasi-coherent sheaves of Liu algebras, see Definition 4.2.

1.2. Main results. We fix a complete non-Archimedean valued field \( k \). We allow the valuation on \( k \) to be trivial. We work in the framework of Berkovich spaces as in [Ber93].

Our first result is that Liu morphisms and quasi-coherent sheaves of Liu \( k \)-algebras are essentially equivalent.

Theorem 1.1 (=Corollary 4.9). Let \( X \) be a separated \( k \)-analytic space. Then the functor

\[
\text{Sp}_X : \text{LiuAlg}_{X,k}^{QCoh} \to \text{Liu}_{X,k}
\]

is an anti-equivalence of categories.

Here \( \text{LiuAlg}_{X,k}^{QCoh} \) is the category of quasi-coherent sheaves of Liu \( k \)-algebras on \( X \), \( \text{Liu}_{X,k} \) is the category of Liu morphisms \( Y \to X \). The functor \( \text{Sp}_X \) is the relative spectrum functor defined in Definition 4.3. This result is analogous to the classical result on affine morphisms and quasi-coherent sheaves of algebras ([EGA II, Proposition 1.2.7, Proposition 1.3.1]).

The second main result is about the fpqc descent of Liu and quasi-Liu morphisms.

Theorem 1.2 (=Theorem 6.1+Theorem 6.2). Let \( S \) be a \( k \)-analytic space. Let \( \{p_i : X_i \to S\}_{i \in I} \) be a fpqc covering of \( S \). Assume that \( S \) and all \( X_i \)'s are separated.

1. Let \( \pi_i : V_i \to X_i \) be Liu morphisms. Let \( (V_i, \varphi_{ij}) \) be a descent datum with respect to \( \{p_i\} \). Then the descent datum is effective.

2. Let \( \pi_i : V_i \to X_i \) be quasi-Liu morphisms. Let \( (V_i, \varphi_{ij}) \) be a descent datum with respect to \( \{p_i\} \). Assume furthermore that for each \( i, j \in I \), each affinoid domains \( \text{Sp} D \) (resp. \( \text{Sp} C_i, \text{Sp} C_j \)) in \( S \) (resp. \( X_i, X_j \)), such that \( p_i(\text{Sp} C_i) \subseteq \text{Sp} D \), \( p_j(\text{Sp} C_j) \subseteq \text{Sp} D \), \( H^0(\text{Sp} C_i, \pi_i^* \mathcal{O}_{V_i}) \) is transversal to the morphism \( C_i \to C_i \hat{\otimes}_D C_j \). Then the descent datum is effective.

The transversality condition is defined in Definition 2.2, which means the vanishing of certain Tor functors. This theorem is analogous to the well-known result about fpqc descent of affine and quasi-affine morphisms in classical algebraic geometry, see [Stacks, Tag 0244] and [Stacks, Tag 0246].

Once the fundamental properties of Liu and quasi-Liu morphisms have been established, the proof of Theorem 1.2 is just a combination of the classical method and the general reduction method developed recently by Daylies [Day21] and Ducros [Duc20].
1.3. **Structure of the paper.** In Section 2, we recall some basic results about Berkovich analytic spaces and the language developed by Ben-Bassat and Kremnizer ([BBK17]). Due to the lack of references, we also prove a representability theorem (Theorem 2.1) about presheaves on the category of analytic spaces.

In Section 3, we recall the basic theory of Liu spaces and Liu algebras. We prove that Liu algebras behave very similar to affinoid algebras in many aspects.

In Section 4, we introduce Liu morphisms and study their relation to quasi-coherent sheaves of Liu algebras.

In Section 5, we introduce and study quasi-Liu morphisms. In particular, we prove that Liu morphisms and quasi-Liu morphisms can be effectively descent with respect to a fpqc covering.

In Section 6, we prove that Liu morphisms and quasi-Liu morphisms can be effectively descent with respect to a fpqc covering.

In Section 7, we give a list of unsolved problems related to this work.

Theorem 2.1. Let $F$ be a presheaf on $\mathcal{A}_k$. Assume that

1. $F$ satisfies the sheaf property for the $G$-topology, namely, for any $k$-analytic space $X$, any $G$-covering $\{U_i\}$ of $X$, $F(X)$ is the equalizer of

$$\prod_i F(U_i) \rightrightarrows \prod_{i,j} F(U_i \cap U_j).$$

2. There is a family $\{F_i\}$ of subfunctors of $F$, such that
   (a) Each $F_i$ is representable by a $k$-analytic space $X_i$.
   (b) Each $F_i \to F$ is representable by a closed (resp. open) analytic domain. In particular, on $X_j$, $F_i \to X$ is represented by a closed (resp. open) analytic domain $U_{ij}$. In the closed case, we assume further more for each $i$, the collection of $j$, such that $U_{ij} \neq \emptyset$ is finite.
   (c) The collection $F_i$ covers $F$.

Then $F$ is representable.

**Proof.** Let $\xi_i \in F_i(X_i)$ be the universal family of the presheaf $F_i$. By assumption a morphism of $k$-analytic spaces $T \to X_i$ factors through $U_{ij}$ iff $\xi_i|_T \in F_i(T)$. In particular, $\xi_i|_{U_{ij}} \in F_i(U_{ij})$. So we get a morphism $f_{ij} : U_{ij} \to X_j$, such that $f_{ij}^* \xi_j = \xi_i|_{U_{ij}}$. By definition of $U_{ij}$, we know that $f_{ij}$ factors through $U_{ij}$. Now observe that $(f_{ij} \circ f_{ji})^* \xi_j = f_{ij}^* \xi_j = \xi_j$, we conclude that $f_{ij} \circ f_{ji} = \text{id}_{U_{ij}}$. In particular, all $f_{ij}$ are isomorphisms. It is formal to see that the glueing conditions are satisfied by $f_{ij}$’s hence we can glue $X_i$’s...
together to get a $k$-analytic space $X$ by [Ber93, Proposition 1.3.3]. It is formal to check that $X$ together with the glueing $\xi$ of $\xi_i$ represents $F$. We refer to [Stacks, Tag 01JJ] for the omitted details. □

2.3. Polyradii.

**Definition 2.1.** A polyradius is an element $r \in \mathbb{R}_{>0}^n$ for some $n \in \mathbb{N}$. A polyradius $r$ is $k$-free if $r$ is the components of $r$ are linearly independent as elements in the $\mathbb{Q}$-vector space $\mathbb{Q} \otimes_{\mathbb{Z}} (\mathbb{R}_{>0}/|k^*|)$.

For any $k$-polyradius $r \in \mathbb{R}_{>0}^n$, define $k_r$ as the $k$-affinoid algebra of formal series

$$ \left\{ \sum_{\alpha \in \mathbb{Z}^n} a_{\alpha}T^\alpha \in k[[T_1, \ldots, T_n]] \mid a_{\alpha} \in k, |a_{\alpha}|r^\alpha \to 0 \text{ when } |\alpha| \to \infty \right\} $$

endowed with the multiplicative norm $\sum_{\alpha \in \mathbb{Z}^n} a_{\alpha}T^\alpha \to \max_{\alpha \in \mathbb{Z}^n} a_{\alpha}T^\alpha$.

When $r$ is $k$-free, $k_r$ is a field.

For a given $k$-free polyradius $r$, a given Banach $k$-algebra $A$, for any Banach $A$-algebra $M$, we write $M_r = A \hat{\otimes}_k k_r$. Note that $A_r$ is a Banach $k_r$-algebra and $M_r$ is a Banach $A_r$-module. Similarly, given any $k$-analytic space, write $X_r := X \times_{\text{Sp} k} \text{Sp} k_r$.

2.4. The category of Banach modules. We briefly summarize a few results in [BBK17]. For the basic theory of quasi-Abelian categories, see [Sch99].

Let $\text{Ban}_k$ be the category of Banach $k$-modules, where morphisms are bounded homomorphisms. Recall that $\text{Ban}_k$ is a closed symmetric monoidal quasi-Abelian category with all finite limits and finite colimits, where the $\otimes$ operator is given by the completed tensor product $\hat{\otimes}$. Moreover, finite products and finite coproducts coincide. The category $\text{Ban}_k$ has enough projectives. All projective objects in $\text{Ban}_k$ are flat in the sense of [BBB16]. We have derived categories $D^+(\text{Ban}_k)$, where $\ast$ means $+$, $-$, $b$ or empty. Let $\text{Ban}_k\text{Alg}_k$ be the category of Banach $k$-algebras, which is also the category of algebras in the symmetric monoidal category $\text{Ban}_k$ in the abstract sense. Let $A \in \text{Ban}_k\text{Alg}_k$ be a Banach $k$-algebra. Let $\text{Ban}_k\text{Mod}_A$ be the category of Banach $A$-modules, which is also the category of $A$-modules in the symmetric monoidal category $\text{Ban}_k$ in the abstract sense. Recall that $\text{Ban}_k\text{Mod}_A$ is also a closed symmetric monoidal quasi-Abelian category with all finite limits and finite colimits, where the $\otimes$ operator is also given by $\hat{\otimes}$. We write $D^+(A) = D^+(\text{Ban}_k\text{Mod}_A)$.

**Definition 2.2.** Let $f : A \to B$ be a morphism in $\text{Ban}_k\text{Alg}_k$. Let $M \in \text{Ban}_k\text{Mod}_A$. We say that $M$ is transversal to $f$ if the natural morphism

$$ M \hat{\otimes}_A B \to M \hat{\otimes}_A B $$

in $D^-(A)$ is an isomorphism.

**Proposition 2.2** ([Ber12, Proposition 2.1.2]). For any $k$-free polyradius, the Banach $k$-module $k_r$ is flat in $\text{Ban}_k$: for any admissible exact short sequence $0 \to E \to F \to G \to 0$ in $\text{Ban}_k$, the following sequence is also admissible and exact:

$$ 0 \to E_r \to F_r \to G_r \to 0. $$

3. Liu spaces and Liu algebras

Let $k$ be a complete non-Archimedean valued field.

3.1. Liu spaces. In this section, we recall the basic theory of Liu $k$-analytic spaces following [MP18] and [Liu90].

**Definition 3.1** ([MP18, Definition 1.9]). A $k$-analytic space $X$ is called $\text{Liu}$ if

1. $X$ is quasi-compact, separated.
2. $X$ is holomorphically separable: for any $x, y \in X$, $x \neq y$, there is $f \in H^0(X, \mathcal{O}_X)$, such that $|f(x)| \neq |f(y)|$.
3. $\mathcal{O}_X$ is universally acyclic: for any analytic extension $k'/k$, $H^i(X_{k'}, \mathcal{O}_{X,k'}) = 0$ for any $i > 0$.

A morphism of $k$-analytic spaces is a morphism of the underlying $k$-analytic spaces. We denote the category of $k$-analytic spaces by $\text{Liu}_k$.

**Example 3.1.** Any $k$-affinoid space is a $k$-analytic space. But the converse fails in general. We refer to [Liu90] for details.
Definition 3.2. Let $X$ be a $k$-analytic space. An analytic domain $Z$ of $X$ is called a Liu domain if $Z$ is a Liu $k$-analytic space.

Definition 3.3. Let $X$ be a $k$-analytic space. We say $X$ is cohomologically Stein if for any coherent sheaf of $\mathcal{O}_X$-modules $\mathcal{F}$,

$$H^i(X, \mathcal{F}) = 0, \quad i > 0.$$  

We say $X$ is universally cohomologically Stein if for any analytic extension $k'/k$, $X_{k'}$ is cohomologically Stein.

Theorem 3.1 ([MP18, Theorem 1.11], [Liu90, Théorème 2]). Let $X$ be a separated, quasi-compact $k$-analytic space. Then the following are equivalent:

1. $X$ is Liu.
2. $X$ is universally cohomologically Stein.
3. $X$ is holomorphically separable and $\mathcal{O}_X$ is acyclic.

Moreover, if $k$ is non-trivially valued and $X$ is strict, then the conditions are equivalent to

4. $X$ is rig-holomorphically separable and $\mathcal{O}_X$ is acyclic.

For the definition of rig-holomorphically separability, we refer to [MP18, Definition 1.5].

Theorem 3.2 ([MP18, Theorem 1.11]). Let $f : Y \to X$ be a finite morphism of $k$-analytic spaces. Then

1. If $X$ is Liu, then so is $Y$.
2. If $Y$ is Liu and $f$ is surjective, then $X$ is Liu.

Theorem 3.3 ([MP18, Corollary 1.15, Corollary 1.17]). Let $X$ be a $k$-analytic space. Then

1. For any analytic extension $k'/k$, $X_{k'}$ is Liu iff $X$ is Liu.
2. Assume that $X$ is separated. Then $X$ is Liu iff $X_{\text{red}}$ is.
3. Assume that $X$ is separated. Then $X$ is Liu iff each irreducible component of $X$ is.

Proof. We only have make the following remark to (1): $X$ is separated iff $X_{k'}$ is. This follows from [CT21, Theorem 1.2].

Proposition 3.4. Let $f : Y \to X$, $g : X' \to X$ be morphisms in $\mathcal{Liu}_k$. Then $Y' := Y \times_X X' \in \mathcal{Liu}_k$.

Proof. We have the following Cartesian diagram

$$
\begin{array}{c}
Y' \rightarrow Y \times X' \\
(f,g) \downarrow \quad \quad \quad \quad \quad \quad \quad \downarrow f \times g \\
X \rightarrow \Delta_X \rightarrow X \times X
\end{array}
$$

As $X$ is separated, $\Delta_X$ is a closed immersion, so is the morphism $Y' \to Y \times X'$. By Theorem 3.2, in order to show that $Y'$ is Liu, it suffices to show that $Y \times X'$ is Liu. This follows from [MP18, Theorem A.6] or [PP, Corollary 3.24].

Corollary 3.5. Let $X$ be a separated $k$-analytic space. Let $Y_1, Y_2$ be Liu domains in $X$, then $Y_1 \cap Y_2$ is also a Liu domain.

3.2. Liu algebras.

Definition 3.4. A Liu $k$-algebra is a Banach $k$-algebra $A$, such that there is a Liu $k$-analytic space such that $A \cong H^0(X, \mathcal{O}_X)$, where the isomorphism is an isomorphism of Banach $k$-algebras. A Liu $k$-algebra is said to be strict if there is a strict Liu $k$-analytic space with $A \cong H^0(X, \mathcal{O}_X)$ in $\text{BanAlg}_k$.

A morphism of Liu $k$-algebras is a bounded homomorphism of the underlying Banach $k$-algebras.

The category of Liu $k$-algebras is denoted by $\mathcal{LiuAlg}_k$. It is a full subcategory of $\text{BanAlg}_k$.

In Appendix B, we give an algebraic characterization of Liu algebras.

Proposition 3.6. Let $A$ be a Liu $k$-algebra. Then

1. $A$ is Noetherian and all of its ideals are closed.
2. Suppose that $k$ is non-trivially valued and $A$ is strictly Liu. For any maximal ideal $m$ of $A$, $A/m$ is finite dimensional as a vector space over $k$. 

(3) We have
\[ \bigcap_{m \in \text{Max}(A)} \bigcap_{n=1}^{\infty} m^n = 0. \]

Proof. (1) That $A$ is noetherian follows from [MP18, Proposition 2.6(3), Remark 2.7]. When $k$ is non-trivially valued, all ideals are closed by [BGR84, Proposition 3.7.2]. In general, this follows from a base field extension argument, see [Ber12, Proposition 2.1.3].

(2) By [Liu90, Proposition 1.3], there is a rigid point $x \in X$, such that $m = m_{\text{Sp } A,x}$. Take a strictly affinoid domain $\text{Sp } B$ of $\text{Sp } A$ containing $x$. Then $x$ is also rigid in $\text{Sp } B$. It is well-known that $B/m_{\text{Sp } B,x}$ is finite dimensional, hence so is $A/m$.

(3) Take an element $a \in A$ that lies in the intersection of all $m^n$ for any $m \in \text{Max } A$, $n \geq 1$. Then By Krull’s intersection theorem, for each $m \in \text{Max } A$, there is an element $m \in m$, such that $(1 - m)a = 0$. Thus the annihilator of $f$ does not lie in any maximal ideal of $A$, hence $a = 0$. □

Corollary 3.7. Let $A$ be a Liu $k$-algebra. All $k$-algebra homomorphisms from a Banach $k$-algebra to $A$ are bounded. In particular, the Liu $k$-algebra structure of $A$ is uniquely determined by the underlying algebraic structure.

Proof. When $k$ is non-trivially valued and $A$ is strict, this follows from Proposition 3.6 and [BGR84, Proposition 3.7.5.2].

In general, this follows from the change of base argument. □

Theorem 3.8 (Liu). The functor of global sections gives an anti-equivalence $\text{Liu}_k \rightarrow \text{Liu}_{\text{Alg}_k}$. The inverse functor is denoted by $\text{Sp } A$. Moreover, for any $k$-analytic space $Y$, any Liu $k$-analytic space $X$, the canonical map

\[ \text{Hom}_{\text{Alg}_k}(Y, X) \rightarrow \text{Hom}_{\text{Alg}_k}(H^0(X, \mathcal{O}_X), H^0(Y, \mathcal{O}_Y)) \]

is bijective.

Remark 3.1. The space $\text{Sp } A$ as a topological space coincides with the spectrum in the sense of Berkovich [Ber12, Section 1.2]. See [MP18, Corollary 3.17] for example.

Proof. The latter statement is a formal consequence of the former.

When $k$ is non-trivially valued, by [Liu90, Proposition 3.2] and [Ber93, Theorem 1.6.1], we know that the global section functor is an anti-equivalence from the category of strict Liu $k$-analytic spaces to the category of strict Liu $k$-algebras.

In general, let $X$, $Y$ be Liu $k$-analytic spaces. Let $A = H^0(X, \mathcal{O}_X)$, $B = H^0(Y, \mathcal{O}_Y)$. Let $F : A \rightarrow B$ be a homomorphism of $k$-algebras. We want to construct a morphism $Y \rightarrow X$, whose induced map on global sections is given by $F$. We may assume that $Y$ is affinoid. Take an analytic field extension $k'/k$, so that $k'$ is non-trivially valued, $A_{k'}$ and $B_{k'}$ become strict Liu $k$-algebras. We may assume that $k' = k_r$ for some $k$-free polyradius. Then there is a unique morphism $g : Y_{k'} \rightarrow X_{k'}$ inducing $F_{k'}$. We claim that there is a unique morphism $f : Y \rightarrow X$, such that $g = f_{k'}$. Note that it is automatic that $f$ induces $F$ on global sections by [Ber12, Proposition 2.1.2]. By [MP18, Proposition 3.13], there is a $k$-affinoid space $Z$, a locally closed immersion $h : X \rightarrow Z$, such that there is a finite covering $Z_1, \ldots, Z_m$ of $Z$ by rational domains, such that $h^{-1}(Z_i) \rightarrow Z_i$ is a Runge immersion for each $i$:

Now $h_{k'} \circ g$ is a morphism of $k'$-affinoid spaces, the corresponding homomorphism of $k'$-algebras is the extension of a homomorphism of $k$-algebras. So there is a unique morphism $w : Y \rightarrow Z$, such that $w_{k'} = h_{k'} \circ g$. Replacing $Y$ by $w^{-1}(Z_i)$, $X$ by $h^{-1}Z_i$ and $Z$ by $Z_i$, and applying [Ber93, Proposition 1.3.2], we may assume that $X \rightarrow Z$ is a Runge immersion. In particular $X$ is affinoid. We can take $f$ to be the morphism corresponding to $F$. Moreover, such $f$ (so that $g = f_{k'}$) is clearly unique. We conclude. □
**Corollary 3.9.** Let $A$ be a Liu $k$-algebra. Let $B$, $C$ be Liu $k$-algebras over $A$, then $B \otimes_A C$ is Liu. In particular, for any $k$-free polyradius $r$, $A_r$ is a Liu $k$-algebra.

**Proof.** Let $Z = \text{Sp} B \times_{\text{Sp} A} \text{Sp} C$. By Proposition 3.4 and Theorem 3.8, it suffices to prove
\[(3.1) \quad H^0(Z, \mathcal{O}_Z) = B \otimes_A C.\]
Firstly, we consider the morphism
\[\Delta_{\text{Sp} A}: \text{Sp} A \to \text{Sp} A \times \text{Sp} A.\]
It is easy to see that this is a closed immersion, corresponding to the closed ideal $J$ generated by $1 \otimes a - a \otimes 1$ for $a \in A$ in $A \hat{\otimes} A$. Hence the closed immersion $Z \to \text{Sp} B \times \text{Sp} C$ correspond to the closed of $B \hat{\otimes} C$ generated by $J(B \hat{\otimes}_A C)$. In particular, (3.1) holds. \hfill \Box

**Definition 3.5.** Let $A$ be a Liu $k$-algebra. A Banach $A$-module $M$ is finite if there is an admissible epimorphism $A^n \to M$.

Let $\text{Mod}^\text{fin}(A)$ be the category of finite $A$-modules.

**Proposition 3.10.** Let $A$ be a Liu $k$-algebra. The forgetful functor from the category of finite Banach $A$-modules (with bounded $A$-algebra homomorphisms as morphisms) to $\text{Mod}^\text{fin}(A)$ is an equivalence.

**Proof.** The functor is fully faithful. In fact, we prove more generally that for any finite Banach $A$-module $M$, any Banach $A$-module $N$, any $A$-linear map $F: M \to N$ is bounded. In fact, taking an admissible epimorphism $A^n \to M$, we may assume that $M = A^n$. In this case, the claim is clear.

The functor is essentially surjective. Take an $A$-linear epimorphism $\pi: A^n \to M$, then $\ker \pi$ is closed by Proposition 3.6 (1) and [BGR84, Proposition 3.7.2.2], so we can endow $M$ with the residue Banach norm. \hfill \Box

**Proposition 3.11.** Let $A$ be a Liu $k$-algebra. Let $r$ be a $k$-free polyradius. Let $M$ be Banach $A$-module. Then $M$ is a finite Banach $A$-module iff $M_r$ is a finite Banach $A_r$-module.

**Proof.** This follows verbatim from [Ber12, Proof of Proposition 2.1.11]. \hfill \Box

**Theorem 3.12.** Let $X = \text{Sp} A$ be a Liu $k$-analytic space. Let $r$ be a $k$-free polyradius. Consider a descent datum $(M_r, \varphi)$ of Banach modules over $A_r$. Then the descent datum is effective with respect to the natural morphism $\text{Sp} A_r \to \text{Sp} A$. Moreover, if $M_r$ is finitely generated as $A_r$-module, then the descent $M$ is finitely generated as $A$-module.

**Proof.** The first part follows verbatim from [Day21, Proof of Proposition 3.3]. The second part follows from Proposition 3.11. \hfill \Box

3.3. Coherent sheaves on Liu $k$-analytic spaces.

**Definition 3.6.** Let $X = \text{Sp} A$ be a Liu $k$-analytic space. Let $M$ be a finite $A$-module. Then we define a sheaf $\tilde{M}$ on $X$ as the sheafification of the presheaf $\text{Sp} B \mapsto M \otimes_A B$, where $\text{Sp} B$ runs over the set of affinoid domains in $X$.

**Proposition 3.13** ([MP18, Lemma 2.4]). Let $X = \text{Sp} A$ be a Liu $k$-analytic space. Let $M$ be a finite $A$-module. Then $\tilde{M}$ is a coherent sheaf on $X$. Moreover, for each affinoid domain $\text{Sp} B$ in $X$,
\[(3.2) \quad H^0(\text{Sp} B, \tilde{M}) = M \otimes_A B.\]
Now we recall the theory of coherent sheaves on Liu $k$-analytic spaces. The following is the analogue of Cartan’s Theorem A.

**Theorem 3.14** ([MP18, Proposition 2.1]). Assume that $k$ is non-trivially valued. Let $X$ be a Liu $k$-analytic space. For each coherent sheaf $F$ on $X$ and each $x \in X$, $H^0(x, F)$ generates $\mathcal{F}_x$ as an $\mathcal{O}_{X,x}$-module.

In rigid setting, Cartan’s Theorem A and Theorem B are due to Kiehl ([Kie67]) and Tate ([Tat71]).

As explained in [Kie67], Theorem A and Theorem B together imply the following result:

**Theorem 3.15.** Let $X = \text{Sp} A$ be a Liu $k$-analytic space. Then the category of coherent sheaves on $X$ is equivalent to the category of finite $A$-modules. The functors are given by $F \mapsto H^0(X, F)$ and $M \mapsto \tilde{M}$ respectively.
Proof. This result was proved in [MP18, Proposition 2.6] under the assumption that \( k \) is non-trivially valued. In general, take a \( k \)-free polyradius \( r \) with at least one component. By [Day21, Théorème 3.13], the category of coherent sheaves on \( X \) is equivalent to the category of descent data of coherent sheaves on \( X_r \) with respect to \( X_r \to X \). The latter category is equivalent to the category of descent data of finite \( A_r \)-modules with respect to \( A \to A_r \), which is then equivalent to the category of finite \( A \)-modules by Theorem 3.12. It is easy to see that the composition of these functors is exactly the one given in the theorem. The functors in the proof are summarized in the following diagram:

\[
\begin{array}{ccc}
\text{Des}(\text{Coh}, X_r \to X) & \longrightarrow & \text{Des}(\text{Mod}^{\text{fin}}, A \to A_r) \\
\downarrow & & \downarrow \\
\text{Coh}(X) & \longrightarrow & \text{Mod}^{\text{fin}}(A)
\end{array}
\]

In particular, Theorem 3.14 holds even when \( k \) is trivially valued.

3.4. Quasi-coherent sheaves on Liu spaces.

Definition 3.7. Let \( f : A \to B \) be a morphism in \( \text{LiuAlg}_k \). We say \( f \) is a homotopy epimorphism if the corresponding morphism \( \text{Sp} B \to \text{Sp} A \) of Liu \( k \)-spaces identifies \( \text{Sp} B \) with a Liu domain in \( \text{Sp} A \).

Definition 3.8. Let \( A \) be a Liu \( k \)-algebra. A Banach \( A \)-module \( M \) is called transversal if \( M \) is transversal to all homotopy epimorphisms from \( A \): for all homotopy epimorphism \( A \to B \) to a Liu \( k \)-algebra \( B \), the natural morphism

\[M \hat{\otimes}_A B \to M \hat{\otimes}_A B\]

is an isomorphism.

The following result will be proved in Appendix A.

Theorem 3.16. Let \( A \) be a Liu \( k \)-algebra. Let \( B, C \) be Liu \( k \)-algebras over \( A \), such that \( \text{Sp} C \to \text{Sp} A \) is a Liu domain. Then the natural morphism

\[C \hat{\otimes}_A B \to C \hat{\otimes}_A B\]

is an isomorphism.

Definition 3.9. Let \( A \) be a Liu \( k \)-algebra. Let \( M \) be a transversal Banach \( A \)-module. Write \( X = \text{Sp} A \). We define a sheaf of \( \mathcal{O}_X \)-modules \( \tilde{M} \) as the sheafification of the presheaf

\[\text{Sp} B \mapsto M \hat{\otimes}_A B\]

on \( X \), where \( \text{Sp} B \) runs over the set of affinoid domains in \( X \). We call \( \tilde{M} \) the sheaf associated to \( M \).

An \( \mathcal{O}_X \)-module \( \mathcal{M} \) is quasi-coherent if there is a transversal \( A \)-module \( M \), such that \( \mathcal{M} = \tilde{M} \).

Example 3.2. Let \( X \) be a Liu \( k \)-analytic space. Then all coherent sheaves on \( X \) are quasi-coherent. See for example [MP18, Proof of Proposition 2.6(1)].

Theorem 3.17 (Tate acyclicity theorem). Let \( X = \text{Sp} A \) be a Liu \( k \)-analytic space. Let \( \text{Sp} A_1, \ldots, \text{Sp} A_n \) be a finite \( G \)-covering of \( X \) by Liu domains. Let \( M \) be a transversal Banach \( A \)-module, then the following sequence is admissible and exact

\[(3.3) \quad 0 \to M \to \prod_{i_1} M \hat{\otimes}_A A_{i_1} \to \prod_{i_1 < i_2} M \hat{\otimes}_A A_{i_1} \hat{\otimes}_A A_{i_2} \to \cdots \to M \hat{\otimes}_A A_1 \hat{\otimes}_A A_2 \hat{\otimes}_A \cdots \hat{\otimes}_A A_n \to 0.
\]

Proof. It follows from the same proof as [BBK17, Lemma 5.34 and Remark 5.35]. We give a sketch for the convenience of the readers. When \( M = A \), we can prove (3.3) exactly as in the affinoid setting, namely it suffices to treat the case where the covering is given by \( \{A(f), A(f^{-1})\} \) for some \( f \in A \). Then the acyclicity follows from a direct computation. See [BGR84, Chapter 8] for details. For a general \( M \), taking derived tensor product with (3.3) for \( M = A \) and apply the transversality condition, we get (3.3) for \( M \). \( \square \)
Corollary 3.18. Let $X = \text{Sp}A$ be a Liu $k$-analytic space. Let $\mathcal{M}$ be a quasi-coherent sheaf on $X$. Let $M = H^0(X, \mathcal{M})$. Then for any Liu domain $\text{Sp}B$ in $X$, we have

$$H^0(\text{Sp}B, \mathcal{M}) = M \hat{\otimes}_A B.$$ 

Corollary 3.19. Let $X = \text{Sp}A$ be a Liu $k$-analytic space. Let $\mathcal{M}$ be a quasi-coherent sheaf on $X$. Then

$$H^i(X, \mathcal{M}) = 0, \quad i > 0.$$ 

Proof. This follows from [Stacks, Tag 01EW] and Theorem 3.17. \hfill \Box

Definition 3.10. Let $X$ be a $k$-analytic space. Let $\mathcal{F}$ be a sheaf of $\mathcal{O}_X$-module (resp. $\mathcal{O}_X$-algebras). A Banach structure on $\mathcal{F}$ is the following data: given any Liu domain $\text{Sp}A$ in $X$, $\mathcal{F}(\text{Sp}A)$ is topologicalized so that it forms a Banach $A$-module (resp. Banach $A$-algebra). We assume that the following condition holds: if $\text{Sp}A$, $\text{Sp}B$ are Liu domains in $X$, such that $\text{Sp}A$ is an analytic domain of $\text{Sp}B$, then the natural morphism of $A$-modules (resp. $A$-algebras) $\mathcal{F}(\text{Sp}B) \hat{\otimes}_BA \rightarrow \mathcal{F}(\text{Sp}A)$ is bounded.

An $\mathcal{O}_X$-module (resp. $\mathcal{O}_X$-algebra) with a given Banach structure is called a sheaf of Banach modules (resp. sheaf of Banach algebras) on $X$.

A morphism $\mathcal{F} \rightarrow \mathcal{G}$ of sheaves of Banach modules (resp. sheaves of Banach algebras) on $X$ is a morphism of the underlying sheaves of modules (resp. sheaves of algebras), such that for each Liu domain $\text{Sp}B$ in $X$, $\mathcal{F}(\text{Sp}B) \rightarrow \mathcal{G}(\text{Sp}B)$ is bounded.

The category of sheaves of Banach modules on $X$ is denoted by $\text{BanMod}_X$.

Corollary 3.20. Let $X = \text{Sp}A$ be a Liu $k$-analytic space. Let $\mathcal{M}$ be a quasi-coherent sheaf on $X$. Let $M = H^0(X, \mathcal{M})$. Let $\mathcal{F}$ be a sheaf of Banach $\mathcal{O}_X$-modules. Then

$$\text{Hom}_{\text{BanMod}_X}(\mathcal{M}, \mathcal{F}) = \text{Hom}_{\text{BanMod}_X}(M, H^0(X, \mathcal{F})).$$

Proof. Given a morphism $f : \mathcal{M} \rightarrow \mathcal{F}$ in $\text{BanMod}_X$, by taking global sections, we get $H^0(f) : M \rightarrow H^0(X, \mathcal{F})$. Conversely, given a bounded homomorphism $F : M \rightarrow H^0(X, \mathcal{F})$, we construct the morphism of sheaves $f : \mathcal{M} \rightarrow \mathcal{F}$ as follows: for any affinoid domain $\text{Sp}B$ in $X$, define $f(\text{Sp}B) : M \hat{\otimes}_A B \rightarrow H^0(\text{Sp}B, \mathcal{F})$ as the natural homomorphism of Banach $B$-modules induced by the homomorphism of Banach $A$-modules:

$$M \hat{\otimes}_A B \rightarrow H^0(\text{Sp}B, \mathcal{F}).$$

By the obvious functoriality, this is a monomorphism of Banach $\mathcal{O}_X$-modules. It is easy to verify that these maps are inverse to each other. \hfill \Box

Theorem 3.21. Let $f : \text{Sp}B \rightarrow \text{Sp}A$ be a morphism in $\text{Liu}_k$. Let $\mathcal{M}$ be a quasi-coherent sheaf on $\text{Sp}B$. Then $f_*\mathcal{M}$ is a quasi-coherent sheaf on $\text{Sp}A$ associated to the transversal $A$-module $H^0(\text{Sp}B, \mathcal{M})$.

Proof. Let $F : A \rightarrow B$ be the corresponding homomorphism of Liu $k$-algebras. Let $M = H^0(\text{Sp}B, \mathcal{M})$. We claim that $M$ is transversal as Banach $A$-module.

This is proved in [BBK17, Lemma 4.48], we reproduce the argument: let $\text{Sp}D \rightarrow \text{Sp}A$ be a Liu domain. We need to show that

$$M \hat{\otimes}_A D = M \hat{\otimes}_A D.$$

Observe that

$$M \hat{\otimes}_A D = M \hat{\otimes}_A (C \hat{\otimes}_A D) = M \hat{\otimes}_A (C \hat{\otimes}_A D) = M \hat{\otimes}_A (C \hat{\otimes}_A D) = M \hat{\otimes}_A D,$$

where we have applied Theorem 3.16. This concludes the claim.

In order to prove the theorem, it suffices to show $M^A = f_*\mathcal{M}$. Here $M^A$ is $M$ regarded as a Banach $A$-module. To prove this, take an affinoid domain $\text{Sp}C$ in $\text{Sp}A$ and it suffices to show that

$$M \hat{\otimes}_A C = \mathcal{M}(f^{-1} \text{Sp}C).$$

Taking an affinoid cover of $\text{Sp}A$, we immediately reduce to the case where $A$ is affinoid as well. In this case (3.4) is trivial. \hfill \Box

Lemma 3.22. Let $A$ be a Liu $k$-algebra. Consider an admissible exact sequence

$$0 \rightarrow F \rightarrow G \rightarrow H$$

in $\text{BanMod}_A$. Assume that $G$, $H$ are both transversal, then so is $F$. 

---

*This result is only stated for a ringed space, but it is easy to check that the proof works in the current situation as well.*
Corollary 3.23. Let \( f : Y \to X \) be a quasi-compact and quasi-separated morphism of \( k \)-analytic spaces. Assume that \( X = \text{Sp} A \) is Liu. Let \( \mathcal{F} \) be a Banach sheaf of \( \mathcal{O}_Y \)-modules, such that for each affinoid domain \( \text{Sp} C \) in \( Y \), \( \mathcal{F}|_{\text{Sp} C} \) is quasi-coherent. Then \( f_* \mathcal{F} \) is quasi-coherent on \( X \).

Proof. Let \( \{ U_i = \text{Sp} B_i \} \) be a finite affinoid covering of \( Y \). For each \( i, j \), let \( U_{ij} = U_i \cap U_j \), take a finite affinoid covering \( \{ U_{ijk} \} \) of \( U_{ij} \). Let \( f_i \) (resp. \( f_{ijk} \)) be the restriction of \( f \) to \( U_i \) (resp. \( U_{ijk} \)). Then \( f_{i*} \mathcal{F} \) (resp. \( f_{ijk*} \mathcal{F} \)) is the quasi-coherent sheaf associated to \( \mathcal{F}(U_i) \) (resp. \( \mathcal{F}(U_{ijk}) \)) by Theorem 3.21. In particular, \( \mathcal{F}(U_i) \) (resp. \( \mathcal{F}(U_{ijk}) \)) is a transversal Banach \( A \)-module.

There is an admissible exact sequence
\[
0 \to \mathcal{F}(Y) \to \prod_i \mathcal{F}(U_i) \to \prod_{i,j,k} \mathcal{F}(U_{ijk}).
\]
Thus \( \mathcal{F}(Y) \) is a transversal Banach \( A \)-module by Lemma 3.22. In particular, for any affinoid domain \( \text{Sp} B \) in \( X \), we have an admissible exact sequence
\[
0 \to \mathcal{F}(Y) \otimes_A B \to \prod_i \mathcal{F}(U_i) \otimes_A B \to \prod_{i,j,k} \mathcal{F}(U_{ijk}) \otimes_A B.
\]
By our assumption, this sequence can be rewritten as
\[
0 \to \mathcal{F}(Y) \otimes_A B \to \prod_i \mathcal{F}(U_i) \otimes f^{-1}(\text{Sp} B) \to \prod_{i,j,k} \mathcal{F}(U_{ijk} \cap f^{-1}(\text{Sp} B)).
\]
It is now clear that \( \mathcal{F}(Y)^A = f_* \mathcal{F} \) and \( f_* \mathcal{F} \) is quasi-coherent. \( \square \)

Theorem 3.24. Let \( f : Y = \text{Sp} B \to X = \text{Sp} A \) be a morphism in \( \text{Liu}_k \). Let \( \mathcal{F} \) be a quasi-coherent sheaf on \( X \). Let \( F = H^0(X, \mathcal{F}) \). Assume that \( \mathcal{F} \) is transversal to \( f \):
\[
\mathcal{F} \otimes_A^L C = \mathcal{F} \otimes_A C
\]
for all Liu domains \( \text{Sp} C \) in \( \text{Sp} B \). Then the left adjoint \( f^* \) of \( f_* : \text{BanMod}_Y \to \text{BanMod}_X \) at \( \mathcal{F} \) exists and \( f^* \mathcal{F} \) is the quasi-coherent sheaf associated to \( \mathcal{F} \otimes_A B \).

Proof. We claim that \( \mathcal{F} \otimes_A B \) is a transversal Banach \( B \)-module.

This is proved in [BBK17, Lemma 4.48], we reproduce their proof: let \( \text{Sp} C \to \text{Sp} B \) be a Liu domain, we need to show
\[
(\mathcal{F} \otimes_A B) \otimes_B^L C = (\mathcal{F} \otimes_A B) \otimes_B C.
\]
In fact,
\[
(\mathcal{F} \otimes_A B) \otimes_B^L C = (\mathcal{F} \otimes_A B) \otimes_B^L C = \mathcal{F} \otimes_A C = (\mathcal{F} \otimes_A B) \otimes_B C,
\]
which concludes the claim.

By Corollary 3.20,
\[
\text{Hom}_{\text{BanMod}_Y}(\mathcal{F} \otimes_A B, \mathcal{G}) = \text{Hom}_{\text{BanMod}_Y}(\mathcal{F} \otimes_A B, H^0(Y, \mathcal{G})) = \text{Hom}_{\text{BanMod}_A}(F, H^0(Y, \mathcal{G})).
\]
On the other hand, for any sheaf of Banach \( \mathcal{O}_Y \)-modules \( \mathcal{G} \), by Corollary 3.20, we have
\[
\text{Hom}_{\text{BanMod}_X}(F, \mathcal{G}) = \text{Hom}_{\text{BanMod}_A}(F, H^0(Y, \mathcal{G})).
\]
We conclude. \( \square \)

4. Liu morphisms and quasi-coherent sheaves of Liu algebras

Let \( k \) be a complete non-Archimedean valued field.
4.1. Liu morphisms.

**Definition 4.1.** Let $f : X \to Y$ be a morphism in $\mathcal{A}_{nk}$. We say $f$ is Liu if for any Liu domain $Z$ of $Y$, $f^{-1}Z$ is a Liu domain.

For any $k$-analytic space $Y$, let $\mathcal{Liu}_Y$ denote the category of Liu morphisms $X \to Y$. A morphism between two Liu morphisms $X_1 \to Y$ and $X_2 \to Y$ is a morphism of in the over-category $\mathcal{A}_{nk}/Y$.

The following two propositions are obvious.

**Proposition 4.1.** Let $f : X \to Y$, $g : Y \to Z$ be morphisms in $\mathcal{A}_{nk}$. Assume that $f$, $g$ are both Liu, then so is $g \circ f$.

**Proposition 4.2.** Let $f : X \to Y$ be a Liu morphism in $\mathcal{A}_{nk}$. Then $f$ is separated and quasi-compact.

**Lemma 4.3.** Let $f : X \to Y$ be a morphism in $\mathcal{Liu}_k$. Let $\mathcal{F}$ be a coherent sheaf on $X$. Then $R^if_*\mathcal{F} = 0$ for all $i > 0$.

**Proof.** The problem is local, so it suffices to show that $H^i(f^{-1}(\text{Sp } A), \mathcal{F}) = 0$ for any affinoid domain $\text{Sp } A$ of $Y$. This follows from the fact that $f^{-1}(\text{Sp } A)$ is Liu (Proposition 3.4).

Now we prove that Liu morphism is a G-local property on the base.

**Theorem 4.4.** Let $f : X \to Y$ be a morphism in $\mathcal{A}_{nk}$. Assume that $Y$ is separated. Then the following are equivalent:

1. $f$ is Liu.
2. There is a $G$-covering $\{U_i\}$ of $Y$ by Liu domains, such that $f^{-1}U_i$ is Liu for each $i$.

If moreover $Y$ is Liu. Then the conditions are further equivalent to

3. $f$ is quasi-compact and separated, for any analytic field extension $k'/k$, and coherent sheaf $\mathcal{F}$ on $X_{k'}$, $R^i f_{k'}_* \mathcal{F} = 0$, $i > 0$.

4. $X$ is Liu.

**Proof.** (1) $\implies$ (2): Trivial.

(2) $\implies$ (1): Let $Z$ be a Liu domain of $Y$. Let $A = H^0(Z, \mathcal{O}_Z)$. We show that $f^{-1}Z$ is Liu. Take a finite sub-$G$-covering $\{U_1, \ldots, U_n\}$ from $\{U_i\}$ that covers $Z$. By [CT21, Theorem 1.2], the morphism $f$ is separated. Hence $f^{-1}Z$ is separated. As $Y$ is separated, $U_i \cap f^{-1}Z$ is Liu by Corollary 3.5.

It suffices to prove that $f^{-1}Z$ is universally cohomologically Stein. As our assumptions are invariant under base field extension, it suffice to show the following: for any coherent sheaf $\mathcal{F}$ on $f^{-1}Z$,

$$H^i(X, \mathcal{F}) = 0, \quad i > 0.$$  

By Lemma 4.3 (1) and Leray spectral sequence, it suffices to show that

$$H^i(Z, f_* \mathcal{F}) = 0, \quad i > 0.$$  

This follows from Corollary 3.23 and Corollary 3.19.

Now assume that $Y$ is Liu.

(2) $\implies$ (3): As in the previous part, we may assume that $k' = k$ and it suffices to prove that for any affinoid domain $\text{Sp } A$ in $Y$, $H^i(f^{-1}(\text{Sp } A), \mathcal{F}) = 0$ for all $i > 0$, which is already proved in the previous part.

(3) $\implies$ (4): Trivial.

(4) $\implies$ (1): This follows from Proposition 3.4.

**Example 4.1.** Recall [Day21, Définition 3.18]: a morphism $f : X \to Y$ in $\mathcal{A}_{nk}$ is said to be almost affinoid (presque affinoïde in French) if there is a $G$-covering of $Y$ by affinoid domains $\{U_i\}$, such that $f^{-1}U_i$ is affinoid for each $i$.

Let $f : X \to Y$ be an almost affinoid morphism in $\mathcal{A}_{nk}$. Assume that $Y$ is separated, then $f$ is Liu. This follows immediately from Theorem 4.4.

**Corollary 4.5.** Let $f : X \to Y$ be a Liu morphism in $\mathcal{A}_{nk}$. Let $g : Y' \to Y$ be a morphism in $\mathcal{A}_{nk}$. Assume that $Y$ and $Y'$ are separated. Let $f' : X' \to Y'$ be the base change of $X$ by $g$. Then $f'$ is also Liu.

**Proof.** The problem is G-local on $Y$ and $Y'$, so we may assume that both of them are affinoid. Now $X'$ is Liu by Proposition 3.4.
Corollary 4.6. Let $f : X \to Y$ be a morphism of $k$-analytic spaces. Assume that $Y$ is separated. Let $k'/k$ be an analytic extension. Suppose $f$ is Liu, then so is $f_{k'}$.

4.2. Quasi-coherent sheaves of Liu algebras.

Definition 4.2. Let $X$ be a $k$-analytic space. A sheaf of Banach algebras $F$ on $X$ is a quasi-coherent sheaf of Liu $k$-algebras if for each Liu domain $\text{Sp} A$ in $X$, $H^0(\text{Sp} A, F)$ is a Liu $k$-algebra and such that $F|_{\text{Sp} A}$ is a quasi-coherent sheaf (in the sense of Definition 3.9). A morphism of two quasi-coherent sheaves of Liu $k$-algebras on $X$ is a homomorphism of the underlying sheaves of $\text{O}_X$-algebras. We define the category of quasi-coherent sheaves of Liu $k$-algebras on $X$ by $\mathcal{LiuAlg}_{Q Coh}$.

Remark 4.1. By Corollary 3.7, a sheaf of Liu $k$-algebras admits a natural Banach structure. Moreover, a morphism of two quasi-coherent sheaves of Liu $k$-algebras on $X$ is automatically a morphism in $\text{BanMod}_X$. Hence $\mathcal{LiuAlg}_{Q Coh}$ is a full subcategory of $\text{BanMod}_X$.

Remark 4.2. We do not define a quasi-coherent sheaf on a $k$-analytic space. In fact, according to the philosophy of [BBK17], in global setting, the correct notion to consider is the derived category of quasi-coherent sheaves.

Proposition 4.7. Let $X$ be a separated $k$-analytic space. Let $A$ be a quasi-coherent sheaf of Liu $k$-algebras on $X$. Consider the presheaf $F$ on $\mathcal{A}_{An}$:

$$T \mapsto \{ (f, \varphi) : f \in \text{Hom}_{\mathcal{A}_{An}}(T, X), \varphi \in \text{Hom}_{\mathcal{O}_T}(f^* A, \mathcal{O}_T) \} .$$

Then $F$ is representable.

Proof. Assume first that $X$ is paracompact. It suffices to verify the conditions of Theorem 2.1 are satisfied.

1. The sheaf condition follows from [Ber93, Proposition 1.3.2].

2. Take a locally finite affinoid covering $\{U_i\}$ of $X$. Observe that each $U_i$ is closed as $X$ is separated. Take $F_i$ to be the subfunctor of $F$ consisting of pairs $(f : T \to S, \varphi)$ such that $f(T) \subseteq U_i$. The conditions (2)(a), 2(b), 2(c) are all clear.

In general, take a paracompact open covering $\{V_i\}$ of $X$ instead of $\{U_i\}$ and apply the other part of Theorem 2.1.

Remark 4.3. Of course, in Proposition 4.7, one can weaken the separateness assumption to Hausdorff condition. It is not clear to the author if one can remove this condition.

Definition 4.3. Let $X$ be a separated $k$-analytic space. Let $A$ be a quasi-coherent sheaf of Liu $k$-algebras on $X$. We define the relative spectrum $\text{Sp}_X A$ as the $k$-analytic space representing the presheaf $F$ in Proposition 4.7. Note that there is a natural morphism $\pi : \text{Sp}_X A \to X$. We sometimes call $\pi$ the relative spectrum as well.

Proposition 4.8. Let $X$ be a separated $k$-analytic space. Let $A$ be a quasi-coherent sheaf of Liu $k$-algebras on $X$. Let $\pi : \text{Sp}_X A \to X$ be the relative spectrum, then

1. For each Liu domain $\text{Sp} A$ in $X$, the restriction of $\pi$ to $\pi^{-1}(\text{Sp} A) \to \text{Sp} A$ is the same as $\text{Sp} F|_{\text{Sp} B} \to \text{Sp} A$.

2. For any morphism of separated $k$-analytic spaces $g : X' \to X$, $g^* A$ is a quasi-coherent sheaf of Liu $k$-algebras and the natural morphism

$$X' \times_X \text{Sp}_X A \to \text{Sp}_X g^* A$$

is an isomorphism over $X'$.

3. The universal map

$$A \to \pi_* \mathcal{O}_{\text{Sp}_X A}$$

is an isomorphism of sheaves of Banach algebras on $X$.

We omit the straightforward proof. See [Stacks, Tag 01LQ] for example.

Corollary 4.9. Let $X$ be a separated $k$-analytic space. Then the functor

$$\text{Sp}_X : \mathcal{LiuAlg}_{Q Coh} \to \mathcal{Liu}_{X, k}$$

is an anti-equivalence of categories. The quasi-inverse is given by $f \mapsto f_*$. 

Now we prove that being a quasi-coherent sheaf of Liu $k$-algebras is a $G$-local property.

**Proposition 5.1.** Let $X$ be a separated $k$-analytic space. Let $\mathcal{F}$ be a sheaf of Banach algebras on $X$. Let $\{U_i\}$ be a $G$-covering of $X$ by Liu domains. Then the following are equivalent:

1. $\mathcal{F}$ is a quasi-coherent sheaf of Liu $k$-algebras.
2. For each $i$, $H^0(U_i, \mathcal{F})$ is a Liu $k$-algebra and $\mathcal{F}|_{U_i}$ is quasi-coherent.

**Proof.** (1) $\implies$ (2): Trivial.

(2) $\implies$ (1): Let Sp $A$ be a Liu domain in $X$. We need to show that $H^0(\text{Sp } A, \mathcal{F})$ is a Liu $k$-algebra and that $\mathcal{F}|_{\text{Sp } A}$ is quasi-coherent. By assumption, $X$ is separated, hence for each $i$, $U_i \cap \text{Sp } B$ is a Liu domain. We take finitely many $U_1, \ldots, U_n$ from $\{U_i\}$, that covers Sp $A$. Then we may assume that $X = \text{Sp } A$ and $\{U_i\} = \{U_1, \ldots, U_n\}$. By [Ber93, Proposition 1.3.3], the spaces $\text{Sp } H^0(U_i, \mathcal{F})$ glue together to form a space $Y$, we get a natural morphism $f : Y \to X$. Moreover, $\mathcal{F} = f_* \mathcal{O}_Y$. Hence $\mathcal{F}$ is quasi-coherent by Corollary 3.23. By Theorem 4.4, $f$ is a Liu morphism, hence $Y$ is Liu. This proves that $H^0(\text{Sp } A, \mathcal{F}) = H^0(Y, \mathcal{O}_Y)$ is a Liu $k$-algebra. \hfill $\square$

5. **Quasi-Liu Morphisms**

Let $k$ be a complete non-Archimedean valued field.

**Definition 5.1.** A $k$-analytic space $X$ is called quasi-Liu if the following conditions hold:

1. $X$ is quasi-compact.
2. $H^0(X, \mathcal{O}_X)$ is Liu $k$-algebra.
3. There is a Liu $k$-analytic space $\text{Sp } B$, such that there is a morphism $i : X \to \text{Sp } B$, which realizes $X$ as an analytic domain in $\text{Sp } B$.

**Proposition 5.1.** Let $X$ be a quasi-Liu $k$-analytic space. Then the natural morphism $X \to \text{Sp } A$ is an analytic domain embedding.

**Proof.** Let $Y = \text{Sp } B$ be a Liu $k$-analytic space such that there is a morphism $i : X \to Y$, which is an analytic domain embedding. Now we have a natural homomorphism $B \to A$ given by the restriction map $B = H^0(Y, \mathcal{O}_Y) \to A = H^0(X, \mathcal{O}_X)$. In particular, we get a factorization $X \to \text{Sp } A \to Y$ of $i$ by Theorem 3.8. Now it remains to show that $X \to \text{Sp } A$ is an analytic domain. Take $x \in X$, we can take rational domains $V_1, \ldots, V_n$ of $Y$, such that $x \in \cap_i V_i$ and $\cup_i V_i$ is a neighborhood of $x$ in $Y$. Let $U_i$ be the rational domains of $\text{Sp } A$ induced by $V_i$. Then $x \in \cup_i U_i$ and $\cup_i U_i$ is a neighborhood of $x$ in $\text{Sp } A$. \hfill $\square$

**Lemma 5.2.** Let $f : X \to Y$ be a morphism in $\mathcal{A}_k$. Assume that $Y$ is Liu and $X$ is quasi-Liu. Let $g : Y' \to Y$ be a Liu domain in $Y$. Let $f' : X' \to Y'$ be the base change of $f$. Then $X'$ is also quasi-Liu.

**Proof.** It suffices to show that $H^0(X', \mathcal{O}_{X'})$ is a Liu $k$-algebra. By decomposing $X \to Y$ as in Proposition 5.1, we may assume that $H^0(X, \mathcal{O}_X) = H^0(Y, \mathcal{O}_Y)$. Take a finite affinoid $G$-covering $X_i$ of $X$, then we get an admissible exact sequence

$$0 \to H^0(Y, \mathcal{O}_Y) \to \prod_i H^0(X_i, \mathcal{O}_{X_i}) \to \prod_{i,j} H^0(X_{ij}, \mathcal{O}_{X_{ij}}),$$

where $X_{ij} := X_i \cap X_j$. Taking the derived tensor $\mathcal{O}_{Y'}^L \cdot H^0(Y', \mathcal{O}_{Y'})$, we get an admissible exact sequence

$$0 \to H^0(Y', \mathcal{O}_{Y'}) \to \prod_i H^0(g'^{-1}(X_i), \mathcal{O}_{X'}) \to \prod_{i,j} H^0(g'^{-1}(X_{ij}), \mathcal{O}_{X'}).$$

Here $g' : X' \to X$ is the base change of $g$.

In particular,

$$H^0(Y', \mathcal{O}_{Y'}) = H^0(X', \mathcal{O}_{X'}).$$

**Corollary 5.3.** Let $i : X \to Y$ be a quasi-compact separated morphism in $\mathcal{A}_k$. Assume that $X$ is quasi-Liu, $Y$ is Liu. Then for any quasi-coherent sheaf of Liu $k$-algebras $\mathcal{A}$ on $X$, $i_* \mathcal{A}$ is a quasi-coherent sheaf of Liu $k$-algebras on $Y$. \hfill $\square$
Proof. First of all, observe that $i_*A$ is quasi-coherent by Corollary 3.23. We only have to prove that space of sections of $i_*A$ on each Liu domain is Liu.

By Proposition 4.10 and Lemma 5.2, we may assume that $Y = \text{Sp} B$ is affinoid and it suffices to show that $H^0(Y, i_*A) = H^0(X, A)$ is Liu, which is part of our assumptions. □

**Definition 5.2.** Let $f : X \to Y$ be a morphism of $k$-analytic spaces. We say $f$ is quasi-Liu if for any Liu domain $Z$ in $Y$, $f^{-1}Z$ is quasi-Liu.

**Proposition 5.4.** Let $f : X \to Y$ be a quasi-Liu morphism in $\mathcal{A}_{nk}$. Then $f$ is separated and quasi-compact.

This is obvious.

**Remark 5.1.** The natural morphism in (3) can be characterized as the morphism corresponding to the identity homomorphism $H^0(X, \mathcal{O}_X) \to H^0(X, \mathcal{O}_X)$ by Theorem 3.8.

**Proposition 5.5.** Let $f : X \to Y$ be a morphism of $k$-analytic spaces. Assume that $Y$ is separated. The following are equivalent:

1. $f$ is quasi-Liu.
2. There is a $G$-covering of $Y$ by Liu domains $\{U_i\}$, such that each $f^{-1}(U_i)$ is quasi-Liu.
3. $f_*\mathcal{O}_X$ is a quasi-coherent sheaf of Liu $k$-algebras and the natural morphism $X \to \text{Sp}_Y f_*\mathcal{O}_X$ is quasi-compact and realizes $X$ as an analytic domain.
4. $f_*\mathcal{O}_X$ is a quasi-coherent sheaf of Liu $k$-algebras on $Y$ and $X$ can be realized as an analytic domain in $\text{Sp}_Y A$ through a quasi-compact morphism $X \to \text{Sp}_Y A$ over $Y$, where $A$ is a quasi-coherent sheaf of Liu $k$-algebras on $Y$.

**Proof.** It is clear that (3) $\implies$ (4) $\implies$ (1) $\implies$ (2).

(2) $\implies$ (3): This follows from Corollary 5.3 and Proposition 5.1. □

**Proposition 5.6.** Let $f : X \to Y$, $g : Y \to Z$ be morphisms in $\mathcal{A}_{nk}$. Assume that $f$, $g$ are both quasi-Liu, then so is $g \circ f$.

**Proof.** We need to show that the inverse image of a Liu domain $U$ in $Z$ by $g \circ f$ is quasi-Liu. For this purpose, we may assume that $Z$ is Liu and $U = Z$.

Now by Proposition 5.5, the natural map $(g \circ f)^{-1}(Z) \to \text{Sp}_{g^{-1}Z} A$ is quasi-compact and is an analytic domain embedding, where $A = f_*\mathcal{O}_X|_{g^{-1}Z}$. Let $j : g^{-1}Z \to V := \text{Sp} H^0(Y, \mathcal{O}_Y)$ be the analytic domain embedding given by Proposition 5.1. Then $j_*A$ is a quasi-coherent sheaf of Liu $k$-algebras by Corollary 5.3. Now $\text{Sp}_{g^{-1}Z} A \to \text{Sp}_{g^{-1}Z} j_*A$, as the base change of $j$, is an analytic domain embedding. Hence $(g \circ f)^{-1}(Z) \to \text{Sp}_{g^{-1}Z} j_*A$ is an analytic domain embedding. In particular, $(g \circ f)^{-1}(Z)$ is quasi-Liu. □

6. **Fpqc descent of Liu morphisms and quasi-Liu morphisms**

Let $k$ be a complete non-Archimedean valued field.

**Definition 6.1.** Let $S$ be a $k$-analytic space. A family of morphisms $\{f_i : X_i \to S\}_{i \in I}$ is called a fpqc covering of $S$ if the following conditions are satisfied:

1. Each $f_i$ is flat in the sense of [Duc17].
2. For any compact analytic domain $Z$ in $S$, there is a finite subset $J \subseteq I$, a compact analytic domain $Y_j$ in $X_j$ for each $j \in J$, such that

$$Z = \bigcup_{j \in J} f_j(X_j).$$

It is easy to see that fpqc coverings form a Grothendieck pre-topology. The corresponding Grothendieck topology is called the fpqc topology. This topology has been studied in the literature under the name of Tate-flat topology ([CT21]).

**Theorem 6.1.** The descent data of Liu morphisms are effective with respect to the fpqc topology on separated spaces: Let $\{p_i : X_i \to S\}_{i \in I}$ be a fpqc covering of a separated $k$-analytic space $S$. Assume that each $X_i$ is also separated. Let $\pi_i : V_i \to X_i$ be Liu morphisms. Let $(V_i, \phi_{ij})$ be a descent datum with respect to $\{p_i\}$. Then the descent datum is effective.
Proof. According to the general method of reduction (see the proof of [Stacks, Tag 02W3]), we may assume that $X_i$’s and $S$ are all affinoid.

In this case, the theorem can be proved exactly as in [Day21, Théorème 3.25]. To be more precise, we want to apply [Day21, Théorème A], so it suffices to check that the three conditions in that theorem are satisfied:

1. For any $k$-affinoid algebra, any $k$-free polyradius, the morphism $\text{Sp} A_r \to \text{Sp} A$ is an effective descent morphism.
2. Any finite, faithfully flat morphism $\text{Sp} A \to \text{Sp} B$ of $k$-affinoid spaces is an effective descent morphism.
3. For any finite $G$-covering by affinoid domains $\prod \text{Sp} B_i \to \text{Sp} B$ of a $k$-affinoid space is an effective descent morphism.

Condition (3) follows from Proposition 4.10. Condition (1) follows from [Day21, Remarque 3.4] and the fact that $k \to k_r$ is flat in $\text{Ban}_k$ if $r$ is a free polyradius (Proposition 2.2). So it remains to check Condition (2):

Let $p : X = \text{Sp} A \to S = \text{Sp} B$ be a faithfully flat, finite morphism between $k$-affinoid spaces. Let $\pi : V = \text{Sp} C \to X$ be a morphism in $\mathcal{L}^{U_k}$. Let $\varphi$ be the descent datum. Then as in [Day21, Proof of Proposition 3.9], $C$ can be descended to a Banach $k$-algebra $D$ over $B$. Now as $B \to A$ is finite and flat, it preserves the higher direct image sheaves. So we conclude that $\text{Sp} D$ is Liu by Theorem 4.4.

Theorem 6.2. Let $\{p_i : X_i \to S\}_{i \in I}$ be a fpqc covering of a separated $k$-analytic space $S$. Assume that each $X_i$ is also separated. Let $\pi_i : V_i \to X_i$ be quasi-Liu morphisms. Let $(V_i, \varphi_{ij})$ be a descent datum with respect to $\{p_i\}$. Assume furthermore that for each $i, j \in I$, each affinoid domains $\text{Sp} D$ (resp. $\text{Sp} C_i, \text{Sp} C_j$) in $S$ (resp. $X_i, X_j$), such that $p_i(Sp C_i) \subseteq \text{Sp} D$, $p_j(Sp C_j) \subseteq \text{Sp} D$, $H^0(\text{Sp} C_i, \pi_i^* O_{X_i})$ is transversal to the morphism $C_i \to C_j \otimes D C_j$. Then the descent datum is effective.

Proof. Step 1. We reduce to the case where $S$ is affinoid. Assume that the result has been proved when $S$ is affinoid. In general, cover $S$ by affinoid domains $\{S_\alpha\}$. As $S$ is separated, $S_\alpha$ are all closed. In this case, we descent the restriction of $\pi_i$ to $\pi_i^{-1} p_i^{-1} S_\alpha \to p_i^{-1} S_\alpha$ to get a quasi-Liu morphism $g_\alpha : T_\alpha \to S_\alpha$. It is easy to verify that these $g_\alpha$’s glue together to give the desired descent $g : T \to S$.

Step 2. We reduce to the case where the family $\{p_i\}$ consists of a single element $p : X \to S$ and $X$ is affinoid. It suffices to take affinoid covering $\{X_\alpha\}$ of each $X_i$ and pull-back the descent datum to the refined family in order to reduce to the case where each $X_i$ is affinoid. By assumption, there is a finite subfamily that covers $S$, so we may assume that the family is finite. Take the coproduct of $X_i$’s, we may reduce to the case where $I$ consists of a single element.

From now on, we drop the sub-indices $i, j$.

Step 3. As in the previous proof, we may assume that $X \to S$ is one of the following types:

1. For a $k$-affinoid algebra $A$, any $k$-free polyradius, the morphism $\text{Sp} A_r \to \text{Sp} A$;
2. A finite, faithfully flat morphism $\text{Sp} A \to \text{Sp} B$ of $k$-affinoid spaces;
3. A finite $G$-covering by affinoid domains $\prod \text{Sp} B_i \to \text{Sp} B$ of a $k$-affinoid space.

Let $W = \text{Sp}_X \pi_* O_V$. Then $W = \text{Sp} E$ is Liu. Write $X = \text{Sp} C, S = \text{Sp} D$, then our assumption says

$$E^{\otimes_C} (C \otimes D C) = E^{\otimes C} (C \otimes D C).$$

In particular, if we denote by $q_1, q_2 : X \times_S X \to X$ the two projections, then by Theorem 3.24,

$$q_1^* \pi_* O_V = (\pi \times \text{id}_X)_* O_{X \times_S X}, \quad q_2^* \pi_* O_V = (\text{id}_X \times \pi)_* O_{X \times_S V}.$$

Thus $\varphi : V \times_S X \to X \times_S V$ induces an isomorphism

$$q_1^* \pi_* O_V \to q_2^* \pi_* O_V.$$

It is easy to verify this is a descent datum for $W$. By Theorem 6.1, we descent $W \to X$ to a Liu morphism $U \to S$. Now the image $T$ of $V$ in $U$ is an analytic domain by [Duc17, Theorem 9.2.1]. Observe that $H^0(T, O_T) = H^0(U, O_U)$ under any of the three conditions. It is clear that $T \to S$ is the desired descent of $\pi : V \to X$.

7. Open problems

Let $k$ be a complete non-Archimedean valued field.

We give a list of unsolved problems related to Liu $k$-algebras and Liu morphisms.
Question 7.1. Is there a global version of Zariski’s main theorem in non-Archimedean geometry?

A local version is proved by Ducros in [Duc07, Théorème 3.2] based on Temkin’s graded reduction. This theorem roughly says that a quasi-finite morphism of separated $k$-analytic spaces can be written locally as the composition of an étale morphism, an analytic domain embedding and a finite morphism. This theorem, however, does not tell us much information about the global structure of a quasi-finite morphism, in contrast to the classical Zariski’s main theorem ([Stacks, Tag 02LR]).

We would like to know if the following holds:

Conjecture 7.1. Let $f : X \to S$ be a quasi-finite morphism of quasi-compact, separated $k$-analytic spaces. Then we can decompose $f$ into $h \circ i \circ g$, where $g : X \to Y$ is finite, $i : Y \to Z$ is a quasi-compact analytic domain embedding, $h : Z \to S$ is étale.

We hope to find suitable extra conditions on $f$, which guarantee that $i$ is a Liu domain embedding as well.

Question 7.2. Are Liu $k$-algebras excellent?

In the case of affinoid algebras, this is proved by Ducros [Duc09]. The author is not sure if Ducros’ argument can be generalized to the current setting.

Appendix A. Results from Ben-Basser–Kremnizer

We slightly generalize a few results in [BBK17].

Definition A.1. Let $f : A \to B$ be a morphism in $\text{BanAlg}_k$. We say $f$ is a homotopy epimorphism if the following equivalent conditions are satisfied

1. $Lf_* : D^{-}(B) \to D^{-}(A)$ is fully faithful.
2. The natural morphism $Lf^* \circ Lf_* \to \text{id}_{D^{-}(B)}$
   is a natural equivalence.

Definition A.2. Let $f : \text{Sp} A \to \text{Sp} B$ be a morphism in $\text{Liu}_k$. We say $f$ is a homotopy monomorphism if the corresponding morphism $B \to A$ in $\text{LiuAlg}_k$ is a homotopy epimorphism (Definition A.1).

Lemma A.1. Let $A \to B$ be a morphism in $\text{LiuAlg}_k$. For any $r > 0$, $f \in A$, we have the natural isomorphisms in $D^{-}(A)$:

$$B \widehat{\otimes}_A A(r^{-1}f) \to B \widehat{\otimes}_A A(r^{-1}f), \quad B \widehat{\otimes}_A A(r^{-1}f) \to B \widehat{\otimes}_A A(r^{-1}f).$$

Proof. We only treat the former. As in the case of affinoid algebras ([BBK17, Lemma 5.13]), it suffices to prove the morphism

$$T - f : A(r^{-1}f) \to A(r^{-1}f)$$

is a strict monomorphism. That this morphism is a monomorphism is well-known (and can be proved exactly as in the affinoid case).

To see $T - f$ is strict, by [Ber12, Proposition 2.1.2], we could assume that $k$ is non-trivially valued. Then the image of $T - f$ is closed by Proposition 3.6. Hence $T - f$ is strict.

Lemma A.2. Let $A \to B$ be a morphism in $\text{LiuAlg}_k$. Let $f_1, \ldots, f_n, g \in A$ be elements that generate $A$. Let $r_1, \ldots, r_n \in \mathbb{R}_{>0}$, Then we have the natural isomorphism in $D^{-}(A)$:

$$B \widehat{\otimes}_A A(r^{-1}_i g^{-1} f_i) \to B \widehat{\otimes}_A A(r^{-1}_i g^{-1} f_i).$$

The proof goes exactly as [BBK17, Lemma 5.14].

Lemma A.3. Let $A$ be a Liu $k$-algebra. Let $A_1, A_2, B$ be Liu $k$-algebras over $A$. Assume that

1. $\text{Sp} A_i \to \text{Sp} A$ ($i = 1, 2$) are Liu domains.
2. $\text{Sp} A_1 \cup \text{Sp} A_2$ is also a Liu domain in $\text{Sp} A$ with Liu $k$-algebra $C$.
(3) Let $A_0$ be the Liu $k$-algebra of the Liu domain $\text{Sp} A_1 \cap \text{Sp} A_2$ (c.f. Corollary 3.5). Then the following natural morphisms are isomorphisms
\[
A_i \hat{\otimes}_A B \to A_i \hat{\otimes}_A B
\]
for $i = 0, 1, 2$.

Then we have a natural isomorphism
\[
C \hat{\otimes}_A B \to C \hat{\otimes}_A B.
\]

This is obvious.

**Theorem A.4.** Let $A$ be a Liu $k$-algebra. Let $B, C$ be Liu $k$-algebras over $A$, such that $\text{Sp} C \to \text{Sp} A$ is a Liu domain. Then we have a natural isomorphism
\[
C \hat{\otimes}_A^L B \to C \hat{\otimes}_A B.
\]

In particular, $\text{Sp} C \to \text{Sp} A$ is a homotopy monomorphism.

**Proof.** Having established the three preceding lemmas, the proof is the same as [BBK17, Proof of Theorem 5.16].

**Theorem A.5.** Let $f : A \to B$ be a morphism in $\text{LiuAlg}_k$. Then $f$ is a homotopy epimorphism iff the corresponding morphism $\text{Sp} B \to \text{Sp} A$ is a Liu domain.

**Proof.** Same proof as [BBK17, Theorem 5.31].

In terms of [BBK17], we have shown that $\text{LiuAlg}_k$ is a homotopy Zariski transversal subcategory of $\text{Ban}_k$.

**APPENDIX B. ALGEBRAIC CHARACTERIZATION OF LIU SPACES**

In this section, we prove an algebraic characterization of Liu spaces following an idea of Temkin ([Tem21]).

**Definition B.1.** Let $A$ be a Banach $k$-algebra. A localization of $A$ is a Banach $k$-algebra of the form $A\{r^{-1}f/g\}$, where $f = (f_1, \ldots, f_n)$ is a tuple of elements in $A$, $g \in A$, $f_1, \ldots, f_n, g$ generates the unit ideal. We also say $\text{Sp} \{r^{-1}f/g\}$ is a rational subdomain of $\text{Sp} A$. We say $\text{Sp} \{r^{-1}f/g\}$ is strict if we can take $r = 1$.

**Remark B.1.** As a set, we can identify $\text{Sp} \{r^{-1}f/g\}$ with the subset of $\text{Sp} A$ consisting of those $x$, such that $|f_i(x)| \leq r|g(x)|$ for each $i$.

**Definition B.2.** Let $A$ be a Banach $k$-algebra. We say $A$ is locally affinoid if there exist finitely many localizations $A_i$ ($i = 1, \ldots, n$) of $A$, such that

1. Each $A_i$ is affinoid.
2. The sets $\text{Sp} A_i$ cover $\text{Sp} A$.
3. For each localization $A\{r^{-1}f/g\}$ of $A$, the map $A\{r^{-1}f/g\} \to \prod_i A_i\{r^{-1}f/g\}$ is injective.

**Lemma B.1.** Let $A$ be a locally affinoid Banach $k$-algebra. Let $r$ be a $k$-free polyradius. Then $A_kr$ is a locally affinoid Banach $k_r$-algebra.

**Proof.** This follows from [Ber12, Proposition 2.1.2].

We construct an analytic structure on $X := \text{Sp} A$. In fact, there is a canonical analytic structure on each $X_i$, moreover, $X_i \cap X_j$ can be identified with a rational domain in $X_i$. Hence by [Ber93, Proposition 1.3.3], the analytic structures on $X_i$ glue together to give an analytic structure on $X$.

Similarly, $\text{Sp} A\{r^{-1}f/g\}$ admits an analytic structure by glueing $\text{Sp} A_i\{r^{-1}f/g\}$.

**Proposition B.2.** Let $A$ be a locally affinoid Banach $k$-algebra. Let $X = \text{Sp} A$. Let $f = (f_1, \ldots, f_n)$, $f_1, \ldots, f_n, g$ are elements in $A$ generating the unit ideal. Let $A_i$ be affinoid localizations of $A$, such that $A \to \prod_i A_i$ is injective.

1. $X$ is separated.
2. $X$ is holomorphically separated.
3. The canonical map $A \to H^0(X, \mathcal{O}_X)$ is injective.
4. $\text{Sp} A\{r^{-1}f/g\}$ is an analytic domain in $X$. 
(5) Assume moreover that $A\{r^{-1}f/g\}$ is affinoid, then the analytic structure on $\text{Sp} A\{r^{-1}f/g\}$ is the same as the usual one.

(6) $A\{r^{-1}f/g\}$ is a locally affinoid Banach $k$-algebra.

(7) The analytic structure defined above does not depend on the choice of $A_i$.

**Proof.** (1) By a base extension, we may assume that $A_i$ has the form $A\{f_i/g_i\}$ and $g_i$ is one component of $f$. It suffices to show that the diagonal $\Delta : X \to X \times_k X$ is a closed immersion. As being a closed immersion is G-local, it suffices to show that $X_i \cap X_j \to X_i \times_k X_j$ is a closed immersion, namely

$$A\{f_i/g_i\} \otimes_k A\{f_j/g_j\} \to A\{f_if_j/g_ig_j\}$$

is an admissible epimorphism, which is obvious.

(2) Let $x, y \in X$, by definition, there is $f \in A$, such that $|f(x)| \neq |f(y)|$. On the other hand, as $f \in A_i$ for all $i$, we know that $f \in H^0(X, O_X)$. Hence we conclude our assertion.

(3) This follows from our assumption.

(4) The problem is G-local, so it suffices to show that $\text{Sp} A\{rf/g\} \cap X_i = \text{Sp} A_i\{rf/g\}$ is an analytic domain in $\text{Sp} A_i$, which is clear.

(5) Clear.

(6) Clear.

(7) This follows from (4) and (5). \qed

**Lemma B.3.** Let $A$ be a locally affinoid Banach $k$-algebra. Let $A_j$ ($j = 1, \ldots, m$) be localizations of $A$, such that $\text{Sp} A_j$ covers $\text{Sp} A$. Then the map $A \to \prod_j A_j$ is injective.

**Proof.** Let $B_i$ ($i = 1, \ldots, n$) be affinoid localizations of $A$, such that $\text{Sp} B_i$ covers $\text{Sp} A$ and that $A \to \prod_i B_i$ is injective. Then for each $i = 1, \ldots, n$, $(\text{Sp} A_j \cap \text{Sp} B_i)_j$ is an affinoid covering of $\text{Sp} B_i$. Hence $B_i \to \prod_j \text{Sp} A_j \otimes_A B_i$ is injective. Hence $A \to \prod_{i,j} \text{Sp} A \otimes_A B_i$ is also injective. Thus $A \to \prod_j A_j$ is also injective. \qed

**Definition B.3.** Let $A$ be a locally affinoid Banach $k$-algebra. A **Laurent covering** (by strict rational domains) of $A$ is

$$\left\{ \bigcup_{i=1}^r \text{Sp} A_i \{f_i^{\epsilon_i}\} \right\},$$

where $f_1, \ldots, f_r \in A$, $\epsilon_i = \pm 1$. In this case, we also say that the covering is generated by $f_1, \ldots, f_r$.

**Definition B.4.** Let $A$ be a locally affinoid Banach $k$-algebra. A **rational covering** (by strict rational domains) of $A$ is

$$\left\{ \bigcup_{i=1}^r \text{Sp} A \{f_i/f_i\} \right\},$$

where $f_1, \ldots, f_r \in A$ generates the unit ideal, $f = (f_1, \ldots, f_r)$. In this case, we also say that the covering is generated by $f_1, \ldots, f_r$.

The proof of the following theorem follows closely the classical proof of Tate acyclicity theorem, see [BGR84, Section 8.2].

**Theorem B.4.** Let $A$ be a Banach $k$-algebra. Then the followings are equivalent:

1. $A$ is a Liu $k$-algebra.
2. $A$ is locally affinoid.

**Proof.** Assume that $A$ is a Liu $k$-algebra. Then by Liu’s Gerritzen–Grauert theorem ([MP18, Proposition 3.12]), $\text{Sp} A$ is a finite union of affinoid rational domains. Hence all three conditions in **Definition B.2** are clearly satisfied.

Conversely, assume that $A$ is locally affinoid. Let $A_i$ be localizations of $A$ as in **Definition B.2**. Let $X_i := \text{Sp} A_i$. Now we show that $X$ is a Liu space. By **Theorem 3.1**, it suffices to show that $\mathcal{O}_X$ is acyclic, which is equivalent to that each finite covering $\mathcal{U}$ of a rational domain $Y$ in $X$ by rational domains is $\mathcal{O}_Y$-acyclic. By **Lemma B.1** and [Ber12, Proposition 2.1.2], we may assume that $k$ is non-trivially valued and that each element in $\mathcal{U}$ is strict. By **Proposition B.2** (7), we may assume that $Y = X$. Hence we are reduced to prove: For each finite covering $\mathcal{U}$ of $X$ by affinoid rational domains $X_i = \text{Sp} A\{f_i/g_i\}$, we have

$$\tilde{H}^a(\mathcal{U}, \mathcal{O}_X) = 0, \quad a > 0.$$
Step 1. We show that we may assume that \( \mathcal{U} \) is a rational covering.

In fact, by Lemma B.5, there is a rational covering \( \mathcal{V} \) refining \( \mathcal{U} \). By [BGR84, Corollary 8.1.4.3], in order to show (B.1), it suffices to prove

\[
\hat{H}^a(\mathcal{V}|_U, \mathcal{O}_X) = 0, \quad a > 0,
\]

where \( U \) is the intersection of finitely many elements from \( \mathcal{U} \). By Proposition B.2 (6), \( U \) is locally affinoid. Replacing \( X \) by \( U \), we are done.

Step 2. We show that we may assume that \( \mathcal{U} \) is generated by units in \( A \).

By Lemma B.6, we may find a Laurent covering \( \mathcal{V} \) of \( X \), such that \( \mathcal{U}|_\mathcal{V} \) is a rational covering generated by units. Then by [BGR84, Theorem 8.1.4.2], we are done.

Step 3. We show that we may assume that \( \mathcal{U} \) is a Laurent covering.

The proof is similar to Step 1, we just apply Lemma B.7 instead.

Step 4. We show that we may assume that \( \mathcal{U} \) is the Laurent covering generated by a single \( f \in A \).

It suffices to apply [BGR84, Corollary 8.1.4.4] and make an induction.

Step 5. We need to show that

\[
0 \to A \to A\{f\} \times A\{f^{-1}\} \to A\{f, f^{-1}\} \to 0
\]

is exact. We have a commutative diagram

\[
\begin{array}{cccccc}
0 & & & & & 0 \\
& \downarrow & & & \downarrow & \\
(\xi - f)A\{\xi\} \times (1 - f\eta)A\{\eta\} & \longrightarrow & (\xi - f)A\{\xi, \xi^{-1}\} & \longrightarrow & 0 \\
& \downarrow & & & \downarrow & \\
0 & \longrightarrow & A \longrightarrow & A\{\xi\} \times A\{\eta\} & \longrightarrow & A\{\xi, \xi^{-1}\} \longrightarrow 0 \\
& \downarrow & & & \downarrow & \\
0 & \longrightarrow & A \longrightarrow & A\{f\} \times A\{f^{-1}\} & \longrightarrow & A\{f, f^{-1}\} \longrightarrow 0 \\
& & & \downarrow & & \downarrow & \\
0 & & & 0 & & 0
\end{array}
\]

Exactly as in the classical setting, the rows are all exact and the middle row is exact. It follows from a simple diagram chasing that it suffices to show that \( A \to A\{f\} \times A\{f^{-1}\} \), which follows from Lemma B.3. \( \square \)

**Lemma B.5.** Assume that \( k \) is non-trivially valued. Let \( A \) be a locally affinoid Banach \( k \)-algebra. Let \( \mathcal{U} \) be a covering of \( \text{Sp} A \) by strict rational domains. Then there is a rational covering of \( X \) refining \( \mathcal{U} \).

**Proof.** Write \( \mathcal{U} = \{\text{Sp} A_i\} \), where \( A_i = A\{p_i/q_i\} \). We may assume that \( q_i \) is the last component of \( p_i \). Let us write \( p_i = (p_i^1, \ldots, p_i^n) \). Let \( V_i^j := \text{Sp} A\{p_i^j/p_i^j\} \). Let

\[
I := \{ (\nu_1, \ldots, \nu_r) \in \mathbb{Z}_{\geq 0}^s : 1 \leq \nu_i \leq n_i \}
\]

and

\[
I' := \{ (\nu_1, \ldots, \nu_r) \in I : 1 \leq \nu_i = n_i \text{ for some } i \}.
\]

For \( (j_1 \cdots j_r) \in I \), write

\[
V_{j_1 \cdots j_r} := V_i^{j_1} \cap \cdots \cap V_i^{j_r} = \text{Sp} A\{p_i^1 \cdots p_i^{j_r}/p_i^1 \cdots p_i^{j_r} : (\nu_1, \ldots, \nu_r) \in I \}.
\]

It is easy to see that when \( (j_1 \cdots j_r) \in I' \),

\[
V_{j_1 \cdots j_r} = V_i^{j_1} \cap \cdots \cap V_i^{j_r} = \text{Sp} A\{p_i^1 \cdots p_i^{j_r}/p_i^1 \cdots p_i^{j_r} : (\nu_1, \ldots, \nu_r) \in I' \}.
\]

To see, let \( x \in X \) such that

\[
\max_{(\nu_1, \ldots, \nu_r) \in I'} |p_i^1 \cdots p_i^{j_r}(x)| = |p_i^1 \cdots p_i^{j_r}(x)|.
\]

Let \( (\mu_1, \ldots, \mu_r) \in I \setminus I' \). As \( x \) belongs to some \( Y_i \), say \( x \in Y_1 \), we have

\[
|p_i^1 \cdots p_i^{j_r}(x)| \leq |q_1 p_2^{j_2} \cdots p_i^{j_r}(x)| \leq |p_i^1 \cdots p_i^{j_r}(x)|
\]
as \((n_1, \mu_2, \ldots, \mu_r) \in I'\). In particular, \((p_1^n \cdots p_r^n)\) \(((\nu_1, \ldots, \nu_r) \in I)\) generate the unit ideal. It follows that the right-hand side of (B.2) is well-defined and (B.2) holds. Now the covering \(\{V_{j_1,\ldots,j_r} : (j_1, \ldots, j_r) \in I'\}\) answers our claim. 

Lemma B.6. Assume that \(k\) is non-trivially valued. Let \(A\) be a locally affinoid Banach \(k\)-algebra. Let \(U\) be a covering of \(\text{Sp} A\) by strict rational domains. Then there is a Laurent covering \(V\) refining \(U\), such that \(U|_V\) is generated by units.

Proof. Assume that \(U\) is generated by \(p_1, \ldots, p_r \in A\). Take a constant \(c \in k^*\), such that 
\[
|c|^{-1} = \inf_{x \in X} \max_{i=1,\ldots,r} |p_i(x)|.
\]
Let \(V\) be the Laurent covering generated by \(c f_1, \ldots, c f_r\). Then we claim that \(V\) is as desired. In fact, let 
\[
V = \text{Sp} A \{cp_1, \ldots, cp_s, (cp_{s+1})^{-1}, \ldots, (cp_r)^{-1}\}.
\]
Then clearly by our choice of \(c\), 
\[
\text{Sp} A \{p/p_i\} \cap V = \emptyset, \quad i = 1, \ldots, s.
\]
Hence \(f_{s+1}, \ldots, f_n\) generates \(\{Y_i|_V\}\). Moreover, \(f_i\) is clearly a unit for \(i > s\). 

Lemma B.7. Assume that \(k\) is non-trivially valued. Let \(A\) be a locally affinoid Banach \(k\)-algebra. Let \(U\) be a covering of \(\text{Sp} A\) by strict rational domains generated by units \(p_1, \ldots, p_n \in A\). Then there is a Laurent covering refining \(U\).

Proof. It suffices to take the Laurent covering generated by all products \(p_ip_{j}^{-1}, i < j\). In fact, consider a set \(V\) in this Laurent covering: 
\[
V = \bigcap_{(i,j) \in I_1} \text{Sp} A \{p_ip_{j}^{-1}\} \cap \bigcap_{(i,j) \in I_2} \text{Sp} A \{p_{j}p_{i}^{-1}\},
\]
where \(I_1, I_2\) is a partition of \(I = \{(i,j) \in \mathbb{Z}_2^2 : 1 \leq i < j \leq n\}\).

For \(i < j\), write \(i \preceq j\) if \((i,j) \in I_1\) and \(j \preceq i\) if \((i,j) \in I_2\). Consider a maximal chain of elements in \(\{1, \ldots, n\}\): 
\[
i_1 \preceq i_2 \preceq \cdots \preceq i_r.
\]
Then \(i \preceq i_r\) for all \(i = 1, \ldots, n\), different from \(i_r\). Thus \(|f_i(x)| \leq |f_{i_r}(x)|\) for all \(i = 1, \ldots, n\). Thus 
\[
V \subseteq \text{Sp} A \{p/p_{i_r}\}.
\]
