THE QUASI-ZARISKI TOPOLOGY ON THE GRADED QUASI-PRIMARY SPECTRUM OF A GRADED MODULE OVER A GRADED COMMUTATIVE RING

MALIK JARADAT AND KHALDOUN AL-ZOUBI*

Abstract. Let $G$ be a group with identity $e$. Let $R$ be a $G$-graded commutative ring and $M$ a graded $R$-module. A proper graded submodule $Q$ of $M$ is called a graded quasi-primary submodule if whenever $r \in h(R)$ and $m \in h(M)$ with $rm \in Q$, then either $r \in Gr((Q :_RM))$ or $m \in Gr_M(Q)$. The graded quasi primary spectrum $qp.Spec_g(M)$ is defined to be the set of all graded quasi primary submodules of $M$. In this paper, we introduce and study a topology on $qp.Spec_g(M)$, called the Quasi-Zariski Topology, and investigate properties of this topology and some conditions under which $(qp.Spec_g(M), q.\tau^g)$ is a Noetherian, spectral space.

1. Introduction

The Zariski topology on the prime spectrum of a module over a commutative ring have been already studied in [12]. Also, the authors in [22] introduced a topology on the set of all quasi-primary submodules satisfying the primeful property. The Zariski topology on the graded spectrum of graded ring in [19, 20, 21] is generalized in different ways on the graded spectrum of graded modules over graded commutative rings as in [3, 6, 10, 11, 19]. Recently, Al-Zoubi and Alkhalef in [2] introduced the concept of graded quasi-primary submodules of graded modules over graded commutative rings. Therefore these results will be used in order to obtain the results of this paper.

Our main purpose is to study some new classes of graded modules and endow these classes of graded submodules with the quasi-Zariski topology. In the present work, we study the graded quasi primary submodules spectrum equipped with the quasi-Zariski topology of a given graded $R$-module $M$, denoted by $(qp.Spec_g(M), q.\tau^g)$.

In section 2, we give some basic properties of graded rings and graded modules which will be used in next sections.

In section 3, for a graded $R$-module $M$, we introduce the map $\varphi =: qp.Spec_g(M) \longrightarrow Spec_g(\overline{R})$ where $\overline{R} = R/Ann(M)$, given by $\varphi(Q) = Gr((Q :_RM)) = (Gr_M(Q) :_RM)$ for every $Q \in qp.Spec_g(M)$ and we investigate some conditions under which is injective, surjective, open, and closed (see Theorem 3.8 and Theorem 3.13). Also, we find a base for whose elements are quasi-compact (see Theorem 3.18).

Key words and phrases. Graded quasi-Zariski topology, graded quasi-primary spectrum, graded quasi-primary submodule.

* Corresponding author.
In section 4, we introduce a quasi-Zariski topology conditions on the graded quasi-
primary submodule spectrum of a graded module such as connectedness (see The-
orem 4.2), some equivalent conditions for \((qp.Spec_g(M), q, τ^g)\) to be \(T_1\)-space, ir-
reducibility (see Theorem 4.7) Theorem 4.8 Theorem 4.10 Corollary 4.11 and
Theorem 4.12 and Noetherianes (see Theorem 4.13). Also, we study this topol-
gy space from the point of view of spectral spaces (see Theorem 4.16).

2. Preliminaries

Throughout this paper all rings are commutative with identity and all modules
are unitary. First, we recall some basic properties of graded rings which will be
used in the sequel. We refer to \([15, 16]\) and \([17]\) for these basic properties and
more information on graded rings.

Let \(G\) be a group with identity \(e\). A ring \(R\) is called graded, or more precisely \(G-
graded, be a if there exist a family of subgroups \(\{R_g\}\) of \(R\) such that \(R = \oplus_{g \in G} R_g\)
as abelian groups, indexed by the elements \(g \in G\), and \(R_gR_h \subseteq R_{gh}\) for all \(g, h \in G\).
The summands \(R_g\) are called homogeneous components, and elements of these sum-
mands are called homogeneous elements. If \(r \in R\), then \(r\) can be written uniquely
\(r = \sum_{g \in G} r_g\), where \(r_g\) is the component of \(r\) in \(R_g\). Also, \(h(R) = \cup_{g \in G} R_g\).

Let \(R = \oplus_{g \in G} R_g\) be a \(G\)-graded ring. An ideal \(I\) of \(R\) is said to be a graded ideal if
\(I = \oplus_{g \in G}(I \cap R_g) := \oplus_{g \in G}I_g\), where an ideal of a graded ring need not be graded.

Let \(R\) be a \(G\)-graded ring. A proper graded ideal \(I\) of \(R\) is said to be a graded prime ideal if whenever \(rs \in I\), we have \(r \in I\) or \(s \in I\), where \(r, s \in h(R)\) (see \([20]\)).

The graded radical of \(I\), denoted by \(Gr(I)\), is the set of all \(r = \sum_{g \in G} r_g \in R\) such that
for each \(g \in G\) there exists \(n_g \in \mathbb{N}\) with \(r_g^{n_g} \in I\). Note that, if \(r\) is a homogeneous
element, then \(r \in Gr(I)\) if and only if \(r^n \in I\) for some \(n \in \mathbb{N}\) (see \([20]\)). It is shown in \([20]\)
that \(Gr(I)\) is the intersection of all graded prime ideals of \(R\) containing \(I\).

Let \(Spec_g(R)\) denote the set of all graded prime ideals of \(R\). For each graded ideal \(I\) of \(R\), the graded variety of \(I\) is the set \(V_R^g(I) = \{P \in Spec_g(R) \mid I \subseteq P\}\). Then the set \(\mathcal{G} = (R) = \{V_R^g(I) \mid I \text{ is a graded ideal of } R\}\) satisfies the axioms for the closed sets of a topology on \(Spec_g(R)\), called the Zariski topology on \(Spec_g(R)\),
denoted by \((Spec_g(R), τ^g)\) (see \([20, 21]\)).

A graded ideal \(I\) of \(R\) is said to be a graded maximal ideal of \(R\) if \(I \neq R\) and if \(J\) is a graded ideal of \(R\), such that \(I \subseteq J \subseteq R\), then \(I = J\) or \(J = R\). Let \(Max_g(R)\)
denote the set of all graded maximal ideals of \(R\).

Let \(R\) be a \(G\)-graded ring. A proper graded ideal \(I\) of \(R\) is said to be a graded quasi-
primary ideal if \(ab \in I\) for \(a, b \in h(R)\) implies \(a \in Gr(I)\) or \(b \in Gr(I)\).
Equivalently, \(q\) is a graded quasi-primary ideal of \(R\) if and only if \(Gr(q)\) is a graded prime ideal of \(R\), (see \([2]\)). We let \(qp.Spec_g(R)\) denote the set of all graded quasi-
primary ideals of \(R\). It is clear that every graded prime ideal is a graded quasi-
primary ideal, i.e., \(Spec_g(R) \subseteq qp.Spec_g(R)\). For a graded ideal \(I\) of \(R\), the set of all graded quasi-primary ideals of \(R\) containing \(I\) is denoted by \(qp-V_R^g(I)\), i.e., \(qp-V_R^g(I) = \{q \in qp.Spec_g(R) \mid I \subseteq q\}\).

In \([6, 19]\), the authors are defined another variety defined for a graded submodule
\(K\) of a graded \(R\)-module \(M\). They define the variety of \(K\) to be \(V_G(K) = \{P \in Spec_g(M) \mid (P :_R M) \supseteq (K :_R M)\}\). Then the set \(η^g(M) = \{V_G(K) \mid K\) is a graded submodule of \(M\}\) contains the empty set and \(Spec_g(M)\), satisfies the axioms for the
closed sets of a topology on \(Spec_g(M)\), called the Zariski topology on \(Spec_g(M)\),
Let $K$ be a graded submodule of a graded $R$-module $M$. We say that $K$ satisfies the graded primeful property if for each graded prime ideal $p$ of $R$ with $(K :_R M) \subseteq p$, there exists a graded prime submodule $P$ of $M$ containing $K$ such that $(P :_R M) = p$. A graded $R$-module $M$ is called graded primeful, if either $M = (0)$ or $M \neq (0)$ and the zero graded submodule of $M$ satisfies the graded primeful property (see [1]).

Let $\hat{R}$ be a $G$-graded ring and $M$ a graded $R$-module. A proper graded submodule $Q$ of $M$ is said to be a graded quasi-primary submodule if whenever $r \in h(R)$ and $m \in h(M)$ with $rm \in Q$, then either $r \in Gr((Q :_R M))$ or $m \in Gr_M(Q)$ (see [2]). Let $qp.Spec_g(M)$ denote the set of all graded quasi-primary submodules of $M$ satisfying the primeful property. Also if $p$ is a graded prime ideal of $R$, we let $qp.Spec_g^p(M) = \{Q \in qp.Spec_g(M) \mid Gr((Q :_R M)) = p\}$.

In the rest of this paper, for a graded $R$-module $M$ and for a graded ideal $I$ of $R$, $\overline{R} = R/Ann(M)$ and $\overline{T} = I/R$ will denote and respectively.

3. Quasi-Zariski Topology on $qp.Spec_g(M)$

In this section, we introduce the quasi-Zariski topology over the spectrum of all graded quasi-primary submodules of a graded module $qp.Spec_g(M)$ and then investigate relationships between $qp.Spec_g(M)$ and $Spec_g(\overline{R})$.

For any graded submodule $K$ of a graded $R$-module $M$, the variety for $K$, denoted by $qp.Spec_g^n(K)$, is the set of all graded quasi-primary submodules $Q$ of $M$ satisfying the primeful property, such that $Gr((Q :_R M)) \supseteq Gr((K :_R M))$.

The following Theorem shows that this variety satisfies the topology axioms for closed sets.

**Theorem 3.1.** Let $M$ be a graded $R$-module. Then for graded submodules $K$, $N$ and $\{K_i \mid i \in I\}$ of $M$ we have:

1. $qp-V_M^n(0) = qp.Spec_g(M)$ and $qp-V_M^n(M) = \phi$.
2. $\cap_{i \in I} qp-V_M^n(K_i) = qp-V_M^n((\sum_{i \in I} (K_i :_R M))M)$.
3. $qp-V_M^n(N) \cup qp-V_M^n(K) = qp-V_M^n(N \cap K)$.

**Proof.**

1. $qp-V_M^n(0) = \{Q \in qp.Spec_g(M) \mid Gr((Q :_R M)) \supseteq Gr((0 :_R M))\} = qp.Spec_g(M)$.
2. $qp-V_M^n(M) = \{Q \in qp.Spec_g(M) \mid Gr((Q :_R M)) \supseteq Gr((M :_R M))\} = \phi$.
3. Let $Q \in \cap_{i \in I} qp-V_M^n(K_i)$, it is easily verified that $((Gr_M(Q) :_R M)M :_R M) = \phi$.
(Gr\(_M\)(Q :_R\ M), thus we have
\[ Gr(Q :_R\ M) \supseteq Gr((K_i :_R\ M)), \text{for all } i \in I. \]
\[ Gr((Q :_R\ M)) \supseteq (K_i :_R\ M), \text{for all } i \in I. \]
\[ Gr((Q :_R\ M)) \supseteq \sum_{i \in I} (K_i :_R\ M). \]
\[ Gr((Q :_R\ M))M \supseteq \left( \sum_{i \in I} (K_i :_R\ M) \right)M. \]
\[ (Gr((Q :_R\ M)) :_R\ M) \supseteq \left( \sum_{i \in I} (K_i :_R\ M) :_R\ M \right). \]
\[ ((Gr\(_M\)(Q) :_R\ M) :_R\ M) \supseteq \left( \sum_{i \in I} (K_i :_R\ M) :_R\ M \right). \]
\[ (Gr\(_M\)(Q) :_R\ M) \supseteq \left( \sum_{i \in I} (K_i :_R\ M) :_R\ M \right). \]
\[ Gr(Q :_R\ M) \supseteq Gr((\sum_{i \in I} (K_i :_R\ M)) :_R\ M). \]
\[ Q \in qp\V_M^g(\sum_{i \in I} (K_i :_R\ M))M. \]

For the reverse inclusion let \( Q \in qp\V_M^g(\sum_{i \in I} (K_i :_R\ M))M \)
\[ \Rightarrow \quad Gr((Q :_R\ M)) \supseteq Gr((\sum_{i \in I} (K_i :_R\ M)) :_R\ M). \]
\[ \Rightarrow \quad Gr((Q :_R\ M)) \supseteq \left( \sum_{i \in I} (K_i :_R\ M) :_R\ M \right). \]
\[ \Rightarrow \quad Gr((Q :_R\ M)) \supseteq \left( (K_i :_R\ M) :_R\ M, \text{for all } i \in I. \right. \]
\[ \Rightarrow \quad Gr((Q :_R\ M)) \supseteq (K_i :_R\ M, \text{for all } i \in I. \right. \]
\[ \Rightarrow \quad Gr((Q :_R\ M)) \supseteq Gr((K_i :_R\ M), \text{for all } i \in I. \right. \]
\[ \Rightarrow \quad Q \in \cap_{i \in I} qp\V_M^g(K_i). \]

(3) From the fact that if \( N \subseteq K \), for a graded submodule \( N \) and \( K \) of \( M \), then \( qp\V_M^g(N) \supseteq qp\V_M^g(K) \), we have \( qp\V_M^g(N) \cup qp\V_M^g(K) \subseteq qp\V_M^g(N \cap K) \). To see the reverse inclusion, let \( Q \in qp\V_M^g(N \cap K) \).
\[ \Rightarrow \quad Gr((Q :_R\ M)) \supseteq Gr((N \cap K :_R\ M)) \]
\[ \Rightarrow \quad Gr((Q :_R\ M)) \supseteq Gr((N :_R\ M) \cap (K :_R\ M)) \]
\[ \Rightarrow \quad Gr((Q :_R\ M)) \supseteq Gr((N :_R\ M) \cap (K :_R\ M)) \cap Gr((K :_R\ M)). \]
\[ \Rightarrow \quad Gr((Q :_R\ M)) \supseteq Gr((N :_R\ M) \cap (K :_R\ M)). \] (By \[ \[ \Rightarrow \quad Gr((Q :_R\ M)) \supseteq Gr((N :_R\ M)) \cup Gr((K :_R\ M)). \] (By \[ \[ \Rightarrow \quad Gr((Q :_R\ M)) \supseteq Gr((K :_R\ M)). \] (By \[ \[ \Rightarrow \quad Q \in qp\V_M^g(N) \cup qp\V_M^g(K). \]

Now we state the definition of the quasi-Zariski topology over the spectrum of all graded quasi-primary submodules of a graded \( R \)-module \( M \).

**Definition 3.2.** Let \( M \) be a graded \( R \)-module. If \( qp\eta(M) \) denotes the collection of all subsets \( qp\V_M^g(K) \) of \( qp\Spec_g(M) \), then \( qp\eta(M) \) satisfies the axioms for the closed subsets of a topological space on \( qp\Spec_g(M) \). So, there exists a topology on \( qp\Spec_g(M) \) called quasi-Zariski topology, denoted by \( (qp\Spec_g(M), q.\tau^g) \).

Recall that a graded \( R \)-module \( M \) over \( G \)-graded ring \( R \) is said to be a graded multiplication module if for every graded submodule \( K \) of \( M \) there exists a graded ideal \( I \) of \( R \) such that \( K = IM \). It is clear that \( M \) is graded multiplication \( R \)-module if and only if \( K = (K :_R\ M)M \) for every graded submodule \( K \) of \( M \) (see
Let $Y$ be a subset of $qp.Spec_p(M)$ for a graded $R$-module $M$. We will denote the intersection of all elements in $Y$ by $\exists(Y)$. In the following Proposition, we gather some basic facts about the varieties.

**Proposition 3.3.** Let $M$ be a graded $R$-module. Let $N, K$ and $\{K_i \mid i \in I\}$ of $M$. Then the following hold:

1. If $N \subseteq K$, then $qp-V^g_M(K) \subseteq qp-V^g_M(N)$.
2. $qp-V^g_M(Gr_M(K)) \subseteq qp-V^g_M(K)$ and equality holds if $M$ is graded multiplication.
3. $qp-V^g_M(K) = qp-V^g_M(Gr((K :_R M))M)$.
4. If $Gr(N :_R M) = Gr((K :_R M))$, then $qp-V^g_M(N) = qp-V^g_M(K)$. The converse is also true if both $N, K \in qp.Spec_p(M)$.
5. $qp-V^g_M(K) = \bigcup_{(K :_R M) \subseteq p \in Spec_p(R)} qp.Spec^g_p(M)$.
6. Let $Y$ be a subset of $qp.Spec_p(M)$. Then $Y \subseteq qp-V^g_M(K)$ if and only if $Gr((K :_R M) \subseteq Gr(\exists(Y) :_R M)$.

**Proof.**

1. Is clear.
2. $qp-V^g_M(Gr_M(K)) \subseteq qp-V^g_M(K)$ is clearly true by (1). The equality can be deduced from the fact $Gr_M(K) = Gr((K :_R M))M$, where $K$ is a graded submodule of a graded multiplication module $M$ ([18 Theorem 9]).
3. Let $K$ be a proper graded submodule of $M$. Then $Q \in qp-V^g_M(K)$,

$$
\Rightarrow Gr((Q :_R M))M \supseteq Gr((K :_R M))M.
\Rightarrow Gr((Q :_R M)) \supseteq (Gr((K :_R M))M :_R M). \quad \text{(By [1, Lemma 3.5]).}
\Rightarrow Gr((Q :_R M)) \supseteq Gr((Gr((K :_R M))M :_R M)). \quad \text{(By [2, Lemma 2.3]).}
\Rightarrow Q \in qp-V^g_M(Gr((K :_R M))M).
$$
Thus $qp-V^g_M(K) \subseteq qp-V^g_M(Gr((K :_R M))M)$. For the reverse inclusion, we have $Q \in qp-V^g_M(Gr((K :_R M))M)$,

$$
\Rightarrow Gr((Q :_R M) \supseteq Gr(Gr((K :_R M))M :_R M))
\Rightarrow Gr((Q :_R M)) \supseteq (Gr((K :_R M))M :_R M).
\Rightarrow Gr((Q :_R M)) \supseteq Gr((K :_R M)).
\Rightarrow Q \in qp-V^g_M(K).
$$
Finally, (4), (5) and (6) are clearly true by definitions. □

Now we introduce the following maps.

**Remark 3.4.** Let $M$ be a graded $R$-module.

1. The map $\phi^R : qp.Spec_p(R) \rightarrow Spec_p(R)$ defined by $\phi^R(\overline{q}) = \overline{Gr(q)}$, is well-defined.
2. $\psi^g : qp.Spec_p(M) \rightarrow qp.Spec_p(R)$, defined by $\psi^g(Q) = \overline{(Q :_R M)}$, is well-defined.

**Proposition 3.5.** Let $M$ be a graded $R$-module. then we have the following statements:

1. $(\phi^R)^{-1}(V^g_R(\overline{I})) = qp-V^g_R(\overline{I})$ for every graded ideal $I$ of $R$ containing $Ann(M)$.
   In particular, $\varphi^{-1}(V^g_R(\overline{I})) = (\phi^R \circ \psi^g)^{-1}(V^g_R(\overline{I})) = (\psi^g)^{-1}(qp-V^g_R(\overline{I}))$.
2. $\phi^R(qp-V^g_R(\overline{I})) = V^g_R(\overline{I})$ and $\phi^R(qp.Spec_p(R) - qp-V^g_R(\overline{I})) = Spec(R) - V^g_R(\overline{I})$, respectively.
i.e. $\phi^R$ is both closed and open.

(3) $(\phi^M)^{-1}(V_g(K)) = qp-V^g_M(K)$, for every graded submodule $K$ of $M$, and therefore the map $\phi^M$ is continuous.

Proof. (1) Let $I$ be a graded ideal of $R$ containing $Ann(M)$. Then

$$\overline{q} \in (\phi^R)^{-1}(V^g_R(T))$$

$$\Leftrightarrow \phi^R(\overline{q}) \in V^g_R(T)$$

$$\Leftrightarrow Gr(q) \supseteq T$$

$$\Leftrightarrow Gr(q) \supseteq I$$

$$\Leftrightarrow q \in qp-V^g_R(T).$$

(2) As we have seen in (1), $\phi^R$ is a continuous map such that $(\phi^R)^{-1}(V^g_R(I)) = qp-V^g_R(I)$ for every graded ideal $I$ of $R$ containing $Ann(M)$. It follows that $\phi^R(qp-V^g_R(T)) = \phi^R((\phi^R)^{-1}(V^g_R(T))) = V^g_R(T)$ as $\phi^R$ is surjective. Similarly,

$$\phi^R(qp.Spec_g(R) - qp-V^g_R(T)) = \phi^R((\phi^R)^{-1}(Spec_g(R)) - (\phi^R)^{-1}(V^g_R(T))).$$

$$= \phi^R((\phi^R)^{-1}(Spec_g(R)) - V^g_R(T)).$$

$$= \phi^R \circ (\phi^R)^{-1}(Spec_g(R) - V^g_R(T)).$$

$$= Spec_g(R) - V^g_R(T).$$

(3) Suppose $(\phi^M)^{-1}(V_g(K))$. Then $\phi^M(Q) \in V_g(K)$ and so $p = (pM(p)) :_{R} M) \supseteq (K :_{R} M)$, in which $p = Gr((Q :_{R} M))$. Hence $Gr((Q :_{R} M)) \supseteq Gr((K :_{R} M))$ and so $Q \in qp-V^g_M(K)$. The argument is reversible and so $\phi^M$ is continuous. \qed

In the next Definition we provide the natural map of $qp.Spec_g(M)$.

**Definition 3.6.** Let $M$ be a graded $R$-module. The map $\varphi : qp.Spec_g(M) \rightarrow Spec_g(R)$ where $\overline{R} = R/Ann(M)$, defined by $\varphi(Q) = (Gr_M(Q) :_{R} M)$ for every $Q \in qp.Spec_g(M)$ will be called the natural map of $qp.Spec_g(M)$.

**Remark 3.7.** Let $M$ be a graded $R$-module.

(1) For every $Q \in qp.Spec_g(M)$, $(Gr_M(Q) :_{R} M)$ is a graded prime of $R$ by [2, Lemma 2.3], and $(Gr_M(Q) :_{R} M) = Gr(Q :_{R} M)$ by [3, Theorem 3.5]. Thus $\varphi(Q) = (Gr_M(Q) :_{R} M) = Gr(Q :_{R} M) \in \overline{R}.$

(2) It is clear to see that $\varphi = (\phi^R \circ \psi^g) : qp.Spec_g(M) \rightarrow Spec_g(R)$ where $\overline{R} = R/Ann(M)$, defined by $\varphi(Q) = Gr((Q :_{R} M)) = (Gr_M(Q) :_{R} M)$ for every $Q \in qp.Spec_g(M)$.

The following theorem provides some important characterizations about the quasi-Zariski topology over $qp.Spec_g(M)$.

**Theorem 3.8.** Let $M$ be a graded $R$-module and let $Q$, $P \in qp.Spec_g(M)$. Then the following statements are equivalent:

(1) If $qp-V^g_M(Q) = qp-V^g_M(P)$, then $Q = P$.

(2) $| qp.Spec^g_M(M) | \leq 1$ for every $p \in Spec_g(R)$.

(3) $\varphi$ is injective.
Proof. (1)⇒(2) Suppose that \( Q, P \in qp.Spec_q^p(M) \). Then \( (Gr_M(Q) : R M) = (Gr_M(P) : R M) \), and so \( qp-V_M^q(Q) = qp-V_M^q(P) \). Thus, by the assumption (1), \( Q = P \).

(2)⇒(3) Suppose that \( Q, P \in qp.Spec_q(M) \) and \( \varphi(Q) = \varphi(P) \). Then \( (Gr_M(Q) : R M) = (Gr_M(P) : R M) = p \), and so \( Q, P \in qp.Spec_q^p(M) \). Thus the assumption (2) implies that \( Q = P \).

(3)⇒(1) It is clear. \( \square \)

The following result is easy to verify.

**Corollary 3.9.** Let \( M \) be a graded \( R \)-module. If \( | qp.Spec^p_q(M) | = 1 \) for every \( p \in Spec_q(R) \), then \( \varphi \) is a bijective map.

**Proof.** By Theorem 3.8. \( \square \)

Now we generalize the definition of the graded primeful module to the graded quasi-primaryful.

**Definition 3.10.** A graded \( R \)-module \( M \) is called graded quasi-primaryful if either \( M = (0) \) or \( M \neq (0) \) and for every \( q \in qp-V_M^q(\text{Ann}(M)) \), there exists \( Q \in qp.Spec_q(M) \) such that \( Gr((Q : R M)) = Gr(q) \).

**Remark 3.11.** Let \( M \) be a graded \( R \)-module. Then \( M \) is a graded quasi-primaryful if and only if \( \varphi \) is surjective.

Recall that a function \( \Phi \) between two topological spaces \( X \) and \( Y \) is called a closed (open) map if for any closed (open) set \( V \) in \( X \), the image \( \Phi(V) \) is closed (open) in \( Y \), (see [13]).

**Theorem 3.12.** Let \( M \) be a graded \( R \)-module. The natural map \( \varphi = \phi^R \circ \psi^q \) is continuous with respect to the quasi-Zariski topology; more precisely for every graded ideal \( I \) of \( R \) containing \( \text{Ann}(M) \),

\[
\varphi^{-1}(V_R^q(\bar{T})) = (\phi^R \circ \psi^q)^{-1}(V_R^q(\bar{T})) = (\psi^q)^{-1}(qp-V_M^q(\bar{T})) = qp - V_M^q(IM).
\]

**Proof.** Suppose that \( Q \in \varphi^{-1}(V_R^q(\bar{T})) \). Then \( \varphi(Q) \in V_R^q(I) \), and so \((Gr_M(Q) : R M) \supseteq I \). It follows that

\[
Gr_M(Q) \supseteq (Gr_M(Q) : R M)M \supseteq IM.
\]

Hence \( Gr_M(Q) \in qp-V_M^q(IM) \). Therefore \( \varphi^{-1}(V_R^q(\bar{T})) \subseteq qp-V_M^q(IM) \). For the reverse inclusion, let \( Q \in qp-V_M^q(IM) \). Then \( \varphi(Q) = (Gr_M(Q) : R M) \supseteq (IM : R M) \supseteq \bar{T} \).

Hence \( Q \in \varphi^{-1}(V_R^q(\bar{T})) \). \( \square \)

**Theorem 3.13.** Let \( M \) be a graded \( R \)-module and \( M \) be a graded quasi-primaryful \( R \)-module. If \( \varphi = \phi^R \circ \psi^q \), then

\[
\varphi(qp-V_M^q(K)) = V_R^q(Gr((K : R M))
\]

and

\[
\varphi(q.Spec_q(M) - qp-V_M^q(K)) = Spec(R) - V_R^q(Gr((K : R M)));
\]

i.e., \( \varphi \) is both closed and open.
Proof. Since $M$ is a graded quasi-primaryful, $\varphi$ is surjective. Also by Theorem 3.12, $\varphi$ is a continuous map such that $\varphi^{-1}(V_{\mathbb{R}}^n(I)) = q_pV_{\mathbb{R}}^n(IM)$ for every graded ideal $I$ of $R$ containing $Ann(M)$. Hence, by Proposition 3.3, for every graded submodule $K$ of $M$,

$$\varphi^{-1}(V_{\mathbb{R}}^n(Gr((K :_R M)))) = q_pV_{\mathbb{R}}^n(Gr((K :_R M))M) = q_pV_{\mathbb{R}}^n(K).$$

Since the map $\varphi$ is surjective, we have

$$\varphi(q_pV_{\mathbb{R}}^n(K)) = \varphi \circ \varphi^{-1}(V_{\mathbb{R}}^n(Gr((K :_R M)))) = V_{\mathbb{R}}^n(Gr((K :_R M))).$$

Similarly, we conclude that

$$\varphi(q_pV_{\mathbb{R}}^n(M) - q_pV_{\mathbb{R}}^n(K)) = \varphi(\varphi^{-1}(Spec_g(\mathbb{R}))) - (\varphi^{-1}(V_{\mathbb{R}}^n(Gr((K :_R M)))))$$

$$\varphi(\varphi^{-1}(Spec_g(R) - V_{\mathbb{R}}^n(Gr((K :_R M)))) = \varphi \circ \varphi^{-1}(Spec_g(R) - V_{\mathbb{R}}^n(Gr((K :_R M))))$$

$$= Spec_g(\mathbb{R}) - V_{\mathbb{R}}^n(Gr((K :_R M))).$$

Corollary 3.14. Let $M$ be a graded $R$-module. Then $\varphi = \phi^R \circ \psi^g$ is bijective if and only if $\varphi$ is a graded $R$-homeomorphism.

Proof. By Theorem 3.12, $\varphi$ is continuous and by Theorem 3.13, $\varphi$ is both closed and open. Thus $\varphi$ is a bijection if and only if $\varphi$ is a graded $R$-homeomorphism. \hfill \Box

For any graded ideal $I$ of $R$, we define $GX^{q_p,R}(I) = q_pSpec_g(R) - q_pV_{\mathbb{R}}^n(I)$ as an open set of $q_pSpec_g(I)$. Also, $GX^{q_p,R}(rM) = GX^{q_p,R}(rM)$ for any $r \in h(R)$. Clearly, $GX^{q_p,R}(0) = \phi$ and $GX^{q_p,R}(1) = q_pSpec_g(R)$.

Theorem 3.15. Let $R$ be a graded ring and $r, s \in h(R)$.

(1) $GX^{q_p,R}_r = \phi$ if and only if $r$ is a graded nilpotent element of $R$.

(2) $GX^{q_p,R}_r = q_pSpec_g(R)$ if and only if $r$ is a graded unit element of $R$.

(3) For each pair of graded ideals $I$ and $J$ of $R$, $GX^{q_p,R}(I) = GX^{q_p,R}(J)$ if and only if $Gr(I) = Gr(J)$.

(4) $GX^{q_p,R}_r = GX^{q_p,R}_r \cap GX^{q_p,R}_s$.

(5) $(q_pSpec_g(R), q_p^R)$ is quasi-compact.

(6) $(q_pSpec_g(R), q_p^R)$ is a $T_0$-space.

Proof. (1) Let $r \in h(R)$. Then

$$\phi = GX^{q_p,R}_r = q_pSpec_g(R) - q_pV_{\mathbb{R}}^n(Ra).$$

$$\Leftrightarrow q_pV_{\mathbb{R}}^n(Ra) = q_pSpec_g(R).$$

$$\Leftrightarrow Gr(q) \supseteq Ra$$ for every $q \in q_pSpec_g(R)$.\hfill (2)

$$\Leftrightarrow r \text{ is in every graded prime ideal of } R.$$\hfill (3)

$$\Leftrightarrow r \text{ is a graded nilpotent element of } R.$$\hfill (4)

(2) Let $r \in h(R)$. Then

$$GX^{q_p,R}_r = q_pSpec_g(R) \Leftrightarrow r \notin Gr(q)$$ for all $q \in q_pSpec_g(R)$.\hfill (5)

$$\Rightarrow r \notin q$$ for all $q \in Max_g(R)$.\hfill (6)

$$\Rightarrow r \text{ is graded unit.}$$\hfill \Box
Conversely, if \( r \) is a graded unit, then clearly \( r \) is not in any graded quasi-primary ideal. That is, \( GX^{qp,R}(I) = q.Spec(R) \).

(3) Suppose that \( GX^{qp,R}(I) = GX^{qp,R}(J) \). Let \( p \) be a graded prime ideal of \( R \) containing \( I \). Since \( p \) is a graded quasi-primary ideal of \( R \) and \( p \supseteq Gr(I) \), we have \( p \in qp^{-1}V^g_I(R) \). Thus, by assumption, \( p \supseteq Gr(J) \subseteq J \) and so every graded prime ideal of \( R \) containing \( I \) is also a graded prime ideal of \( R \) containing \( J \), and vice versa. Therefore \( Gr(I) = Gr(J) \). The converse is trivially true.

(4) It suffices to show that \( qp^{-1}V^g_M(Rab) = qp^{-1}V^g_M(Ra) \cup qp^{-1}V^g_M(Rb) \). Let \( q \in qp^{-1}V^g_M(Rab) \). Then

\[
Gr(q) \supseteq Gr(Rab) = Gr(Ra) \cap Gr(Rb).
\]

\( \Leftrightarrow Gr(q) \supseteq Gr(Ra) \) or \( Gr(q) \supseteq Gr(Rb) \).

\( \Leftrightarrow q \in qp^{-1}V^g_M(Ra) \) or \( q \in qp^{-1}V^g_M(Rb) \).

\( \Leftrightarrow q \in qp^{-1}V^g_M(Ra) \cup qp^{-1}V^g_M(Rb) \).

(5) Let \( q.Spec_g(R) = \cup_{i \in I} GX^{qp,R}(J_i) \), where \( \{J_i\}_{i \in I} \) is a family of graded ideals of \( R \). We clearly have \( GX^{qp,R} = q.Spec_g(R) = GX^{qp,R}(\sum_{i \in I} J_i) \). Thus, by part (3), we have \( R = Gr(\sum_{i \in I} J_i) \) and hence, \( 1 \in \sum_{i \in I} J_i \). So there are \( i_1, i_2, \ldots, i_n \in I \), such that \( 1 \in \sum_{i \in I_k} J_{i_k} \), that is \( R = \sum_{i \in I_k} J_{i_k} \). Consequently \( q.Spec_g(R) = GX^{qp,R} = GX^{qp,R}(\sum_{i \in I_k} J_{i_k}) = \cup_{k=1}^n GX^{qp,R}_{J_{i_k}} \).

(6) Let \( q_1, q_2 \) be two distinct points of \( q.Spec_g(R) \). If \( q_1 \notin q_2 \), then obviously \( q_1 \notin GX^{qp,R}(aM) \) and \( q_1 \notin GX^{qp,R}(bM) \).

\[\square\]

**Proposition 3.16.** Let \( M \) be a graded \( R \)-module and \( r, s \in h(R) \).

(1) \( (\psi^g)^{-1}(GX^{qp,R}) = GX^{qp,M} \).

(2) \( \psi^g(GX^{qp,M}) \subseteq GX^{qp,R} \) and the equality holds if \( \psi^g \) is surjective.

(3) \( GX^{qp,M}_s = GX^{qp,M}_r \cap GX^{qp,M}_s \).

**Proof.** (1) Since \( \psi^g \) is continuous, by Proposition 3.5(3), we have

\[
(\psi^g)^{-1}(GX^{qp,R}) = (\psi^g)^{-1}(q.Spec_g(R) - qp^{-1}V^g_M(\overline{aM})).
\]

\[
= q.Spec_g(M) - (\psi^g)^{-1}(qp^{-1}V^g_M(\overline{aM})).
\]

\[
= q.Spec_g(M) - qp^{-1}V^g_M(\overline{aM}).
\]

\[
= GX^{qp,M}_r.
\]

(2) follows from part (1).

(3) Let \( r, s \in h(R) \). Then

\[
GX^{qp,M}_r = (\psi^g)^{-1}(GX^{qp,R}) \text{ by part (1)}.
\]

\[
= (\psi^g)^{-1}(GX^{qp,R} \cap GX^{qp,R}) \text{ by Theorem 3.15(4)}.
\]

\[
= (\psi^g)^{-1}(GX^{qp,R}) \cap (\psi^g)^{-1}(GX^{qp,R}).
\]

\[
= GX^{qp,M}_r \cap GX^{qp,M}_s.
\]

\[\square\]

For any graded submodule \( K \) of \( M \), we define \( GX^{qp,M}(K) = q.Spec_g(M) - qp^{-1}V^g_M(\overline{K}) \) as an open set of \( q.Spec_g(M) \). Also, \( GX^{qp,M} = GX^{qp,M}(rM) \) for any \( r \in h(R) \). Clearly, \( GX^{qp,M}(0) = \phi \) and \( GX^{qp,M}(1) = q.Spec_g(M) \). The following
result shows that the set $\beta = \{ GX^{qp,M} \mid r \in h(R) \}$ is a base for the quasi-Zariski topology on $q.Spec_g(M)$.

**Theorem 3.17.** Let $M$ be a graded $R$-module. The set $\beta = \{ GX^{qp,M} \mid r \in h(R) \}$ forms a base for the quasi-Zariski topology on $q.Spec_g(M)$.

**Proof.** We may assume that $q.Spec_g(M) \neq \emptyset$. We will show that every open subset of $(q.Spec_g(M), q.\tau^\emptyset)$ is a union of members of $\beta$. Let $U$ be an open subset in $(q.Spec_g(M), q.\tau^\emptyset)$. Thus $U = q.Spec_g(M) - qp.V_M^a(K)$ for some graded submodule $K$ of $M$. Therefore

$$U = q.Spec_g(M) - qp.V_M^a(K) = q.Spec_g(M) - qp.V_M^a(Gr((K : R M))M).$$

$$= q.Spec_g(M) - qp.V_M^a(\sum_{r \in Gr((K : R M))} rM).$$

$$= q.Spec_g(M) - qp.V_M^a(\sum_{r \in Gr((K : R M))} (rM : R M)M).$$

$$= q.Spec_g(M) - \bigcap_{r \in Gr((K : R M))} qp.V_M^a(aM).$$

$$= \bigcup_{r \in Gr((K : R M))} GX^{qp,M}.\square$$

In the next Theorem gives an important characterization of the quasi-Zariski topology over $qp.Spec_g(M)$ and will be need in the last Theorem of this paper.

**Theorem 3.18.** Let $M$ be a graded $R$-module. If $\psi^\emptyset$ is surjective, then the open set $GX^{qp,M}$ in $(q.Spec_g(M), q.\tau^\emptyset)$ is quasi-compact. In particular, the space $(q.Spec_g(M), q.\tau^\emptyset)$ is quasi-compact.

**Proof.** Since $B = \{ GX^{qp,M} \mid r \in h(R) \}$ forms a base for the quasi-Zariski topology on $q.Spec_g(M)$ by Theorem 3.17, for any open cover of $GX^{qp,M}$, there is a family $\{ r_i \in h(R) \mid i \in \Delta \}$ of elements of $R$ such that $GX^{qp,M} \subseteq \bigcup_{i \in \Delta} GX^{tp,M}$. By part (2), $GX^{tp,M} = \psi^\emptyset(GX^{qp,M}) \subseteq \bigcup_{i \in \Delta} \psi^\emptyset(GX^{tp,M}) = \bigcup_{i \in \Delta} GX^{qp,M}$. It follows that there exists a finite subset $\Lambda$ of $\Delta$ such that $GX^{qp,M} \subseteq \bigcup_{\lambda \in \Lambda} GX^{qp,M}$ as $GX^{qp,M}$ is quasi-compact, since $\phi^R$ is surjective, whence $GX^{qp,M} = (\psi^\emptyset)^{-1}(GX^{qp,M}) \subseteq \bigcup_{\lambda \in \Lambda} GX^{qp,M}$ by Proposition 3.16(1). $\square$

**Theorem 3.19.** Let $M$ be a graded $R$-module. If the map $\psi^\emptyset$ is a surjective, then the quasi-compact open sets of $(q.Spec_g(M), q.\tau^\emptyset)$ are closed under finite intersection and form an open base.

**Proof.** It suffices to show that the intersection $U = U_1 \cap U_2$ of two quasi-compact open sets $U_1$ and $U_2$ of $(q.Spec_g(M), q.\tau^\emptyset)$ is a quasi-compact set. Each $U_j, j = 1$ or $2$, is a finite union of members of the open base $\Phi = \{ GX^{qp,M} \mid r \in h(R) \}$, hence $\Phi$ is $U$ due to Proposition 3.16. Put $U = \cap_{i=1}^n GX^{qp,M}$ and let $\Omega$ be any open cover of $U$. Then $\Omega$ also covers each $GX^{qp,M}$ which is quasi-compact by Theorem 3.18. Hence, each $GX^{qp,M}$ has a finite subcover of $\Omega$ and so does $U$. The other part of the theorem is trivially true due to the existence of the open base $U$. $\square$
4. Topological properties on \((qp.Spec_g(M), q.τ^q)\)

Let \(M\) be a graded \(R\)-module. In this section we investigate and study some topological properties for \((qp.Spec_g(M), q.τ^q)\) such as the irreducibility.

Recall that a topological space \((X, τ)\) is said to be a connected if it is not the union \(X = X_0 \cup X_1\) of two disjoint closed non-empty subsets \(X_0\) and \(X_1\), (see [14, Definition 2.105]).

Remark 4.1. Let \((X, τ_1)\) and \((Y, τ_2)\) be two topological spaces and \(f\) be a continuous mapping from \((X, τ_1)\) to \((Y, τ_2)\).

(1) If \((X, τ_1)\) is a connected (resp. quasi compact) topological space, then \(f(X)\) is a connected (resp. quasi compact) topological space (see [14, Theorem 2.107 and Theorem 2.138]).

(2) For every irreducible subset \(E\) of \((X, τ_1)\), \(f(E)\) is an irreducible subset of \((Y, τ_2)\), (see [5, Proposition 2]).

The following Theorem give the relation between the connectedness of \((qp.Spec_g(M), q.τ^q)\) with other topological spaces.

Theorem 4.2. Let \(M\) be a graded quasi-primaryful R-module. Consider the following statements:

(1) \((Spec_g(\overline{R}), τ_1^q)\) is a connected space.

(2) \((q.Spec_g(\overline{R}), q.τ_1^q)\) is a connected space.

(3) \((qp.Spec_g(M), q.τ^q)\) is a connected space.

(4) \((Spec_g(M), τ^q)\) is a connected space.

Then (1)⇒(2)⇒(3)⇒(4). Moreover, if \(M\) is graded primaryful, then (4)⇒(1).

Proof. (1)⇒(2) Suppose that \((q.Spec_g(R), q.τ_1^q)\) is a connected space. By Proposition 3.5(1), the map \(φ_R\) is surjective and continuous and so \((Spec_g(\overline{R}), τ_2^q)\) is also a connected space. Conversely, suppose on the contrary that \((q.Spec_g(\overline{R}), q.τ_2^q)\) is disconnected. Then there exists a non-empty proper subset \(W\) of \(q.Spec_g(\overline{R})\) that is both open and closed. By Proposition 3.5(2), \(φ_R(W)\) is a non-empty subset of \(Spec_g(\overline{R})\) that is both open and closed. To complete the proof, it suffices to show that \(φ_R(W)\) is a proper subset of \(Spec_g(\overline{R})\) that in this case \((Spec_g(\overline{R}), τ_2^q)\) is disconnected, a contradiction. Since \(W\) is open, \(W = q.Spec_g(\overline{R}) - qp-V_τ^q(\overline{T})\) for some graded ideal \(I\) of \(R\) containing \(Ann(M)\). Thus \(φ_R(W) = Spec_g(R) - qp-V_τ^q(\overline{T})\) by Proposition 3.5(2). Therefore, if \(φ_R(W) = Spec_g(\overline{R})\), then \(qp-V_τ^q(\overline{T}) = φ\), and so \(\overline{T} = \overline{R}\), i.e., \(I = R\). It follows that \(W = q.Spec_g(\overline{R}) - qp-V_τ^q(\overline{T}) = q.Spec_g(R)\) which is impossible. Thus \(φ_R(W)\) is a proper subset of \(q.Spec_g(R)\).

(3)⇒(1) Follows since \(ψ = φ^R \circ ψ^q\) is a surjective and continuous map of the connected space \((qp.Spec_g(M), q.τ^q)\).

(1)⇒(3) Assume that \((Spec_g(\overline{R}), τ_1^q)\) is connected. If \((qp.Spec_g(M), q.τ^q)\) is disconnected, then \((qp.Spec_g(M), q.τ^q)\) must contain a non-empty proper subset \(Y\) that is both open and closed. Accordingly, \(φ(Y)\) is a non-empty subset of \((Spec_g(\overline{R}), τ_1^q)\) that is both open and closed by Proposition 3.13. To complete the proof, it suffices to show that \(φ(Y)\) is a proper subset of \(Spec_g(\overline{R})\) so that \((Spec_g(\overline{R}), τ_1^q)\) is disconnected, a contradiction. Since \(Y\) is open, \(Y = q.Spec_g(M) - qp-V_τ^q(K)\) for some graded submodule \(K\) of \(M\) whence \(φ(Y) = Spec_g(\overline{R}) - V_τ^q(Gr((K :_R M)))\).

\(\square\)
by Theorem 3.13. Therefore, if \( \varphi(Y) = Spec_g(\mathcal{R}) \), then \( V^q_{M}(Gr((K : R M))) = \phi \), and so \( Gr((K : R M)) = \mathcal{R} \), i.e., \( K = M \). It follows that \( Y = q.Spec_g(M) - qp.V^q_{M}(M) = q.Spec_g(M) \) which is impossible. Thus \( \varphi(Y) \) is a proper subset of \( Spec_g(\mathcal{R}) \).

(3)\( \Rightarrow \)(4) Assume by way of contradiction that \( (Spec_g(M), \tau^g) \) is a disconnected space. Thus \( Spec_g(M) = (Spec_g(M) - V_G(K_1)) \cup (Spec_g(M) - V_G(K_2)) \) with

\[
(Spec_g(M) - V_G(K_1)) \cap (Spec_g(M) - V_G(K_2)) = \phi,
\]

for some non-empty closed subsets \( V_G(K_1) \) and \( V_G(K_2) \) of \( (Spec_g(M), \tau^g) \). We show that

\[
qp.Spec_g(M) = (Spec_g(M) - V_G(K_1)) \cup (Spec_g(M) - V_G(K_2)).
\]

Suppose that \( Q \in qp.Spec_g(M) \). Since \( Gr_M(Q) \neq M \), there is \( P \in Spec_g(M) \) with \( P \supseteq Q \). Now since

\[
(P : R M) \nsubseteq (K_i : R M) \quad \text{for } i = 1 \text{ or } i = 2,
\]

we have \( (Gr_M(Q) : R M) \nsubseteq (K_i : R M) \) for \( i = 1 \) or \( i = 2 \). Thus

\[
Q \in (qp.Spec_g(M) - qp - V^g_{M}(K_1)) \cup (qp.Spec_g(M) - qp - V^g_{M}(K_2)).
\]

Moreover,

\[
(qp.Spec_g(M) - qp - V^g_{M}(K_1)) \cap (qp.Spec_g(M) - qp - V^g_{M}(K_2)) = \phi,
\]

because if

\[
Q \in (qp.Spec_g(M) - qp - V^g_{M}(K_1)) \cap (qp.Spec_g(M) - qp - V^g_{M}(K_2)),
\]

then

\[
(Gr_M(Q) : R M) \nsubseteq (Gr_M(K_i) : R M) \quad \text{for } i = 1, 2.
\]

It follows that there is \( P \in qp.Spec_g(M) \) such that

\[
(P : R M) \nsubseteq (Gr_M(K_i) : R M) \quad \text{for } i = 1, 2.
\]

This implies that

\[
P \in (Spec_g(M) - V_G(K_1)) \cap (Spec_g(M) - V_G(K_2)),
\]

a contradiction. Therefore \( (qp.Spec_g(M), q.\tau^g) \) is not a connected space. The last statement follows from [12] Corollary 3.8.

Let \( Y \) be a subset of \( qp.Spec_g(M) \) for a graded \( R \)-module \( M \). We will denote the intersection of all elements in \( Y \) by \( \exists(Y) \) and the closure of \( Y \) in \( qp.Spec_g(M) \) with respect to the quasi-Zariski topology by \( cl(Y) \).

**Theorem 4.3.** Let \( M \) be a graded \( R \)-module, \( Y \subseteq q.Spec_g(M) \) and let \( Q \in q.Spec_g(M) \). Then we have the following:

1. \( q.Spec_g(\exists(Y)) = cl(Y) \). In particular, \( cl(\{Q\}) = qp.V^q_{M}(Q) \).
2. If \( (0) \in Y \), then \( Y \) is dense in \( (qp.Spec_g(M), q.\tau^g) \), that is, \( cl(Y) = q.Spec_g(M) \).
3. The set \( \{Q\} \) is closed in \( (qp.Spec_g(M), q.\tau^g) \) if and only if \( p \) is a maximal element in \( \{Gr(\{K : R M\}) | K \in q.Spec_g(M)\} \), and \( q.Spec_g(M) = \{Q\} \).
4. If \( \{Q\} \) is closed in \( (qp.Spec_g(M), q.\tau^g) \), then \( Q \) is a maximal element of \( q.Spec_g(M) \).
Proof. (1) Suppose \( L \in Y \). Then \( \mathfrak{S}(Y) \subseteq L \). Therefore \( Gr((L :_R M)) \supseteq Gr((\xi(Y) :_R M)) \). Thus \( L \in qp-V^0_M(\mathfrak{S}(Y)) \) and so \( Y \subseteq qp-V^0_M(\mathfrak{S}(Y)) \). Next, let \( qp-V^0_M(K) \) be any closed subset of \( (qp.Specg(M), q.\tau^g) \) containing \( Y \). Then \( Gr((L :_R M)) \supseteq Gr((K :_R M)) \) for every \( L \in Y \) such that \( Gr((\mathfrak{S}(Y) :_R M)) \supseteq Gr((K :_R M)) \). Hence, \( qp-V^0_M(\mathfrak{S}(Y)) \subseteq qp-V^0_M(K) \). Thus \( qp-V^0_M(\mathfrak{S}(Y)) \) is the smallest closed subset of \( (qp.Specg(M), q.\tau^g) \) containing \( Y \), hence \( qp-V^0_M(\mathfrak{S}(Y)) = cl(Y) \).

(2) Is trivial by (1), for the last statement \( cl(Y) = qp-V^0_M(\mathfrak{S}(Y)) = qp-V^0_M(Gr(M)) \) of \( qp.Specg(M) \).

(3) Suppose that \( \{Q\} \) is closed. Then \( \{Q\} = qp-V^0_M(Q) \) by (1). Let \( K \in q.Specg(M) \) such that \( Gr((K :_R M)) \supseteq \{Q\} = Gr((Q :_R M)) \). Hence, \( K \in qp-V^0_M(Q) = \{Q\} \), and so \( q.Specg(M) = \{Q\} \). Conversely, assume that the hypothesis are hold. Let \( K \in cl(\{Q\}) \). Hence by (1), \( Gr((K :_R M)) \supseteq Gr((\{Q\} :_R M)) \). Thus, \( Gr((K :_R M)) = Gr((\{Q\} :_R M)) = \{Q\} \). This yields \( cl(\{Q\}) = \{Q\} \).

(4) Suppose \( P \in q.Specg(M) \) such that \( P \supseteq \{Q\} \). Then \( Gr((P :_R M)) \supseteq Gr((\{Q\} :_R M)) \). i.e., \( P \in qp-V^0_M(Q) = cl(\{Q\}) = \{Q\} \). Hence, \( P = Q \), and so \( Q \) is a maximal element of \( q.Specg(M) \).

\[ \square \]

A topological space \((X, \tau)\) is said to be a \( T_0 \)-space if for each pair of distinct points \( a, b \) in \( X \), either there exists an open set containing \( a \) and not \( b \), or there exists an open set containing \( b \) and not \( a \). It has shown that a topological space is \( T_0 \)-space if and only if the closures of distinct points are distinct, (see [13]).

**Theorem 4.4.** Let \( M \) be a graded \( R \)-module and let \( Q, P \in qp.Specg(M) \). Then the following statements are equivalent:

1. \((qp.Specg(M), q.\tau^g)\) is a \( T_0 \)-space
2. If \( qp-V^0_M(Q) = qp-V^0_M(P) \), then \( Q = P \).
3. \(|qp.Specg(M)| \leq 1 \) for every \( p \in Specg(R) \).
4. \( \varphi \) is injective.

**Proof.** follows from Theorem 3.8 and Theorem 4.3(1).

\[ \square \]

A topological space \((X, \tau)\) is called a \( T_1 \)-space if every singleton set \( \{x\} \) is closed in \((X, \tau)\). Clearly every \( T_1 \)-space is a \( T_0 \)-space, (see [13]).

**Theorem 4.5.** Let \( M \) be a graded \( R \)-module. Then we have the following:

1. \((qp.Specg(M), q.\tau^g)\) is a \( T_1 \)-space if and only if \((qp.Specg(M), q.\tau^g)\) is a \( T_0 \)-space and for every element \( Q \in qp.Specg(M) \), \( Gr((Q :_R M)) \) is a maximal element in \( \{Gr((K :_R M)) \mid K \in q.Specg(M)\} \).
2. \((qp.Specg(M), q.\tau^g)\) is a \( T_1 \)-space if and only if \((qp.Specg(M), q.\tau^g)\) is a \( T_0 \)-space and every graded quasi-primary submodule of \( M \) satisfying the graded primeful property is a maximal element of \( q.Specg(M) \).
3. Let \( \{0\} \in q.Specg(M) \). Then \((qp.Specg(M), q.\tau^g)\) is a \( T_1 \)-space if and only if \( \{0\} \) is the only graded quasi-primary submodule of \( M \) satisfying the graded primeful property.
4. If \((qp.Specg(M), q.\tau^g)\) is a \( T_0 \)-space and \( qp.Specg(M) = Maxg(M) \) then \((qp.Specg(M), q.\tau^g)\) is a \( T_1 \)-space.

**Proof.** (1) The result is easy to check from Theorem 4.3(3) and Theorem 4.4.

(2) The sufficiency is trivial by Theorem 4.3(4). Conversely, suppose \( Q, K \in q.Specg(M) \) such that \( Q \in cl(\{K\}) = qp-V^0_M(K) \). Thus \( Gr((Q :_R M)) \supseteq Gr((K :_R M)) \).
reverse inclusion is clear. Conversely, suppose that $K$ exists

Hence $K$ is irreducible if for every pair of closed subsets $A$ and $Q$ such that $A \subseteq P \subseteq M$. We will denote the set of all graded maximal submodules of $M$ by $Maxg(M)$, (see [17]).

In the next Theorem we study the relation between the $T_1$-space property and the graded maximal submodules of a graded $R$-module $M$.

**Theorem 4.6.** Let $M$ be a finitely generated graded $R$-module. Then $(qp.Spec_g(M), q.\tau^q)$ is a $T_1$-space if and only if $qp.Spec_g(M) = Maxg(M)$. In this case, $qp.Spec_g(M) = Spec_g(M) = Maxg(M)$.

**Proof.** Suppose that $(qp.Spec_g(M), q.\tau^q)$ is a $T_1$-space. Then every singleton subset of $(qp.Spec_g(M), q.\tau^q)$ is closed. Assume that $Q \in qp.Spec_g(M)$. Hence, by Theorem [13](1), $qp-V^q_M(Q) = cl(\{Q\}) = \{Q\}$. Since $M$ is finitely generated, there exists $K \in Maxg(M)$ such that $Q \subseteq K$. It follows that $(Q : R M) \subseteq (K : R M)$ and thus $K \in qp-V^q_M(Q) = \{Q\}$, since $K$ is a graded prime submodule of $M$. Hence $K = Q$, and so $Q \in Maxg(M)$. Therefore $qp.Spec_g(M) \subseteq Maxg(M)$. The reverse inclusion is clear. Conversely, suppose that $\{Q\}$ is a singleton subset of $qp.Spec_g(M)$. If $P \in qp-V^q_M(Q)$, then $Gr((P : R M)) \supseteq Gr((Q : R M))$. Since $(Q : R M)$ and $(P : R M)$ are graded maximal ideals of $R$, $(Q : R M) = (P : R M)$. It follows that $Q \cap P \in qp.Spec_g(M)$, and so $Q \cap P \in Maxg(M)$. Hence $Q = P$, and so $qp-V^q_M(Q) = \{Q\}$. Therefore $(qp.Spec_g(M), q.\tau^q)$ is a $T_1$-space. The final claim now follows from the fact that $Max(M) \subseteq Spec_g(M) \subseteq qp.Spec_g(M)$.

A topological space $(X, \tau)$ is called irreducible if $X \neq \phi$ and if every pair of non-empty open sets in $(X, \tau)$ intersect. A subset $A$ of a topological space $(X, \tau)$ is irreducible if for every pair of closed subsets $A_i (i = 1, 2)$ of $X$ with $A \subseteq A_1 \cup A_2$, we have $A \subseteq A_1$ or $A \subseteq A_2$. An irreducible component of a topological space $A$ is a maximal irreducible subset of $(X, \tau)$. A singleton subset and its closure in $(qp.Spec_g(M), q.\tau^q)$ are both irreducible (see [13]).

**Theorem 4.7.** Let $M$ be a graded $R$-module. Then, $qp-V^q_M(Q)$ is an irreducible closed subset of $(qp.Spec_g(M), q.\tau^q)$ for every graded quasi-primary submodule $Q$ of $M$ satisfying the graded primeful property.

**Proof.** By Theorem [13](1).

The next result is a good application of the quasi-Zariski topology on graded modules. Indeed, we show a link between the irreducible closed subsets of quasi-Zariski topology over $qp.Spec_g(M)$ and the graded quasi primary submodules of a the graded $R$-module.
Theorem 4.8. Let $M$ be a graded $R$-module and $Y \subseteq \text{q.Spec}_g(M)$. If $\mathcal{Y}(Y)$ is a graded quasi-primary submodule of $M$, then $Y$ is an irreducible space. The converse is true, if $M$ is a graded multiplication module and $\mathcal{Y}(Y)$ satisfies the graded primeful property.

Proof. Suppose $\mathcal{Y}(Y)$ is a graded quasi-primary submodule of $M$. Let $Y \subseteq Y_1 \cup Y_2$ where $Y_1$ and $Y_2$ are two closed subsets of $(\text{Spec}_g(R), \tau_g^R)$. Then there exist two graded submodules $N$ and $K$ of $M$ such that $Y_1 = \text{qp-V}_M^g(N)$ and $Y_2 = \text{qp-V}_M^g(K)$. Thus, $Y \subseteq \text{qp-V}_M^g(N) \cup \text{qp-V}_M^g(K) = \text{qp-V}_M^g(N \cap K)$ and so by Proposition 3.3(6), $\text{Gr}((N \cap K) :_R M) \subseteq \text{Gr}(\mathcal{Y}(Y) :_R M)$. Since $\text{Gr}((\mathcal{Y}(Y) :_R M))$ is a graded prime ideal, either $\text{Gr}((N :_R M)) \subseteq \text{Gr}(\mathcal{Y}(Y) :_R M)$ or $\text{Gr}((K :_R M)) \subseteq \text{Gr}(\mathcal{Y}(Y) :_R M))$. Again by using Proposition 3.3(6), either $Y \subseteq \text{qp-V}_M^g(N)$ or $Y \subseteq \text{qp-V}_M^g(K)$. Thus we conclude that $Y$ is irreducible. Conversely, assume that $M$ is a graded multiplication module and $Y$ is an irreducible space. By the above argument, it suffices to show that $(\mathcal{Y}(Y) :_R M)$ is a graded quasi-primary ideal of $R$. Let $ab \in (\mathcal{Y}(Y) :_R M)$ for some $a, b \in h(R)$. Suppose, on the contrary, that $Ra \not\subseteq \text{Gr}((\mathcal{Y}(Y) :_R M))$ and $Rb \not\subseteq \text{Gr}((\mathcal{Y}(Y) :_R M))$. Then $\text{Gr}((Ra :_R M)) \not\subseteq \text{Gr}((\mathcal{Y}(Y) :_R M))$ and $\text{Gr}((Rb :_R M)) \not\subseteq \text{Gr}((\mathcal{Y}(Y) :_R M))$. By Proposition 3.3(6), $Y \not\subseteq \text{qp-V}_M^g(RaM)$ and $Y \not\subseteq \text{qp-V}_M^g(RbM)$. Let $Q \in Y$. Then $\text{Gr}((Q :_R M) \supseteq \text{Gr}((\mathcal{Y}(Y) :_R M)) \supseteq \text{Rab}. This means that either $RaM \subseteq \text{Gr}(Q :_R M)M$ or $RbM \subseteq \text{Gr}(Q :_R M)M$. By Proposition 3.3(1),(3), either $\text{qp-V}_M^g(Q) \subseteq (RaM)$ or $\text{qp-V}_M^g(Q) \subseteq (RbM)$. Therefore, $Y \subseteq \text{qp-V}_M^g(RaM) \cup \text{qp-V}_M^g(RbM)$ and hence $Y \subseteq \text{qp-V}_M^g(RaM)$ or $Y \subseteq \text{qp-V}_M^g(RbM)$ as $Y$ is irreducible. It is a contradiction. □

The following Lemma is known, but we need it here to confirm the next theorem.

Lemma 4.9. [10] Theorem 3.4. Let $R$ be a graded $G$-ring and $Y$ be a subset of $(\text{Spec}_g(R), \tau_g^R)$. Then, $Y$ is irreducible subset of $(\text{Spec}_g(R), \tau_g^R)$ if and only if $\mathcal{Y}(Y)$ is a graded prime ideal of $R$.

Proof. Suppose that $Y$ is an irreducible subset of $(\text{Spec}_g(R), \tau_g^R)$. Let $I, J$ be a graded ideal of $R$ such that $I \cap J \subseteq \mathcal{Y}(Y)$ and suppose that $I \not\subseteq \mathcal{Y}(Y)$ and $J \not\subseteq \mathcal{Y}(Y)$. Then $\mathcal{Y}(Y) \not\subseteq \text{V}_M^g(I)$ and $\mathcal{Y}(Y) \not\subseteq \text{V}_M^g(J)$. Let $p \in Y$, then $I \cap J \subseteq \mathcal{Y}(Y) \subseteq p$. So, $p \in \text{V}_M^g(I \cap J) = \text{V}_M^g(I) \cup \text{V}_M^g(J)$. Therefore, $Y \subseteq \text{V}_M^g(I) \cup \text{V}_M^g(J)$ which is a contradiction to the irreducibility of $Y$. Therefore $I \subseteq \mathcal{Y}(Y)$ or $J \subseteq \mathcal{Y}(Y)$ that is $\mathcal{Y}(Y)$ is graded prime ideal by [20] Proposition 1.2. Conversely suppose that $Y \subseteq \text{Spec}_g(R)$ such that $\mathcal{Y}(Y)$ a graded prime ideal of $R$. Suppose that $Y \subseteq Y_1 \cup Y_2$, where $Y_1, Y_2$ are closed subset of $\text{Spec}_g(R)$, so there exist $I, J$ are a graded ideals of $R$, such that $Y_1 = \text{V}_M^g(I)$ and $Y_2 = \text{V}_M^g(J)$. Hence $Y \subseteq \text{V}_M^g(I) \cup \text{V}_M^g(J) = \text{V}_M^g(I \cap J)$. So, $I \cap J \subseteq p, \forall p \in Y$. Thus $I \cap J \subseteq \mathcal{Y}(Y)$, but $\mathcal{Y}(Y)$ is graded prime, so by [20] Proposition 1.2 we have $I \subseteq \mathcal{Y}(Y)$ or $J \subseteq \mathcal{Y}(Y)$; this means that either $\mathcal{Y}(Y) \subseteq \text{V}_M^g(I)$ or $\mathcal{Y}(Y) \subseteq \text{V}_M^g(J)$. So, $Y \subseteq \text{V}_M^g(I) = Y_1$ or $Y \subseteq \text{V}_M^g(J) = Y_2$. Therefore, $Y$ is irreducible. □

Let $Y$ be a closed subset of a topological space $(X, \tau)$. An element $y \in Y$ is said to be a generic point of $Y$ if $Y = \text{cl}(\{y\})$. Theorem 3.3(1) follows that every element $Q$ of $\text{q.Spec}_g(M)$ is a generic point of the irreducible closed subset $\text{qp-V}_M^g(Q)$ of $(\text{q.Spec}_g(M), q, \tau_g^q)$. Note that a generic point of a closed subset $Y$ of a topological space is unique if the topological space is a $T_0$-space (see [9]).
Theorem 4.10. Let $M$ be a graded quasi-primaryful $R$-module and $Y$ be a subset of $q.\text{Spec}_g(M)$. Then $Y$ is an irreducible closed subset of $(q.\text{Spec}_g(M), q,\tau^g)$ if and only if $Y = qp-V^g_M(Q)$ for some $Q \in q.\text{Spec}_g(M)$. In particular, every irreducible closed subset of $(q.\text{Spec}_g(M), q,\tau^g)$ has a generic point.

Proof. By Theorem 4.7, $Y = qp-V^g_M(Q)$ is an irreducible closed subset of $(q.\text{Spec}_g(M), q,\tau^g)$ for some $Q \in q.\text{Spec}_g(M)$. Conversely, let $Y$ be an irreducible space. Hence $\varphi(Y) = Y'$ is an irreducible subset of $(\text{Spec}_g(R), \tau^g)$ because $\varphi$ is continuous by Theorem 3.12. It follows from Lemma 4.9 that $3(Y') = Gr((3(Y) :_R M))$ is a graded prime ideal of $R$. Therefore $Gr((3(Y) :_R M))$ is a graded prime ideal of $R$. Since the map $\varphi$ is surjective, there exists $Q \in q.\text{Spec}_g(M)$ such that $Gr((Q :_R M)) = Gr((3(Y) :_R M))$. Since $Y$ is closed, there exists a graded submodule $K$ of $M$ such that $Y = qp-V^g_M(K)$. It means that $Gr((3(qp-V^g_M(K)) :_R M)) = Gr((Q :_R M))$ and hence $qp-V^g_M(3(Y)) = qp-V^g_M(3(qp-V^g_M(K))) = qp-V^g_M(Q)$ by Proposition 3.3(6). Thus $Y = qp-V^g_M(Q)$ by Theorem 4.11.

The next Corollary is an application of Theorem 4.7 and Theorem 4.10.

Corollary 4.11. Let $M$ be a graded $R$-module with surjective natural map $\varphi : \text{qp.\text{Spec}}_g(M) \rightarrow \text{Spec}_g(R)$ where $R = R/Ann(M)$, given by $\varphi(Q) = Gr((Q :_R M)) = (Gr_M(Q) :_R M)$ for every $Q \in \text{qp.\text{Spec}}_g(M)$. Then the correspondence $qp-V^g_M(Q) \rightarrow (Gr_M(Q) :_R M)$ provides a bijection from the set of irreducible components of $(q.\text{Spec}_g(M), q,\tau^g)$ to the set of graded minimal prime ideals of $R$.

Proof. First we show that the given correspondence is well-defined. For this, let $qp-V^g_M(Q_1) = qp-V^g_M(Q_2)$ for some $Q_1, Q_2 \in q.\text{Spec}_g(M)$. Then $(Gr_M(Q_1) :_R M) \supseteq (Gr_M(Q_2) :_R M)$ and $(Gr_M(Q_2) :_R M) \supseteq (Gr_M(Q_1) :_R M)$. Thus, we have $(Gr_M(Q_1) :_R M) = (Gr_M(Q_2) :_R M)$. Moreover, if $qp-V^g_M(Q)$ is an irreducible component, $q = (Gr_M(Q) :_R M)$, and $p \subseteq q$ for some $p \in \text{Spec}_g(R)$, then by the surjectivity of $\varphi$, there is $P \in q.\text{Spec}_g(M)$ such that $(Gr_M(P) :_R M) = p$. It follows that $qp-V^g_M(Q) \subseteq qp-V^g_M(P)$. Since, by Theorem 4.7, $qp-V^g_M(P)$ is irreducible, we have $qp-V^g_M(Q) = qp-V^g_M(P)$, which implies that $q = p$. Thus $p$ is a graded minimal prime ideal of $R$. For the surjectivity of the correspondence, assume that $p$ is a graded minimal prime ideal of $R$. Then, since $\varphi$ is surjective, there exists $Q \in q.\text{Spec}_g(M)$ such that $(Gr_M(Q) :_R M) = p$. Moreover, by Theorem 4.7, $qp-V^g_M(Q)$ is irreducible. Now let $qp-V^g_M(Q) \subseteq Y$ for some irreducible subset $Y$ of $(q.\text{Spec}_g(M), q,\tau^g)$. Without loss of generality, we may assume that $Y$ is closed, since the closure of an irreducible subset of $(q.\text{Spec}_g(M), q,\tau^g)$ is irreducible. Thus, by Theorem 4.10, there exists $P \in q.\text{Spec}_g(M)$ such that $Y = qp-V^g_M(P)$. It follows that $p = (Gr_M(Q) :_R M) \supseteq (Gr_M(P) :_R M)$, and so, by the minimality of $p$, we have $p = (Gr_M(Q) :_R M) = (Gr_M(P) :_R M)$. Hence $qp-V^g_M(Q) = qp-V^g_M(P) = Y$. This means that $qp-V^g_M(Q)$ is an irreducible component of $(q.\text{Spec}_g(M), q,\tau^g)$. □

Theorem 4.12. Let $M$ be a graded quasi-primaryful $R$-module. The set of all irreducible components of $(q.\text{Spec}_g(M), q,\tau^g)$ is of the form $\Phi = \{qp-V^g_M(Gr(q)M) \mid q \in qp-V^g_M(Ann(M)) \text{ and } Gr(q) \text{ is a minimal element of } V^g_R(Ann(M)) \}$ with respect to inclusion.
Theorem 4.14. Let $\langle p, q \rangle$ be a graded submodule of $M$. Hence, $Y = \text{qp}-\text{Gr}_M(Q) = \text{qp}-\text{Gr}_M(Q)$ by Proposition 3.3. Let $q = (Q : R)$. Now, it suffices to show that $Gr(q)$ is a minimal element of $V_R^q(\text{Ann}(M))$ with respect to inclusion. To see this last $q' \in V_R^q(\text{Ann}(M))$ and $q' \subseteq Gr(q)$. Then there exists an element $q' \in q.\text{Spec}(M)$ such that $Gr((Q' : R) M) = q'$ because $M$ is graded quasi-primary. So, $Y = \text{qp}-\text{Gr}_M(Q) \subseteq \text{qp}-\text{Gr}_M(Q')$. Hence, $Y = \text{qp}-\text{Gr}_M(Q) = \text{qp}-\text{Gr}_M(Q')$ due to the maximality of $\text{qp}-\text{Gr}_M(Q)$. It implies that $Gr(q) = q$.

Conversely, let $Y \in \Phi$. Then there exists $q \in \text{qp}-\text{Gr}_R(\text{Ann}(M))$ such that $Gr(q)$ is a minimal element of $V_R^q(\text{Ann}(M))$ and $Y = \text{qp}-\text{Gr}_M(Gr(q) M)$. Since $M$ is graded quasi-primary, there exists an element $Q \in q.\text{Spec}(M)$ such that $Gr((Q : R) M) = Gr(q)$. So, $Y = \text{qp}-\text{Gr}_M(Gr(q) M) = \text{qp}-\text{Gr}_M(Gr((Q : R) M)) = \text{qp}-\text{Gr}_M(Q)$, and so $Y$ is irreducible by Theorem 4.10. Suppose that $Y = \text{qp}-\text{Gr}_M(Q) \subseteq \text{qp}-\text{Gr}_M(Q')$, where $Q' \in q.\text{Spec}(M)$. Since $Q \in \text{qp}-\text{Gr}_M(Q')$ and $Gr(q)$ is minimal, it follows that $Gr((Q : R) M) = Gr((Q' : R) M)$. Now, by Proposition 3.3, we have $Y = \text{qp}-\text{Gr}_M(Q) = \text{qp}-\text{Gr}_M(Gr((Q : R) M) M) = \text{qp}-\text{Gr}_M(Gr((Q' : R) M)) M = \text{qp}-\text{Gr}_M(Q')$.

A topological space $(X, \tau)$ is said to be Noetherian if the open subsets of $X$ satisfy the ascending chain condition. Since closed subsets are complements of open subsets, it comes to the same thing to say that the closed subsets of $(X, \tau)$ satisfy the descending chain condition.

Let $(X, \tau)$ be a Noetherian topological space. Then every subspace of $(X, \tau)$ is compact. In particular, $(X, \tau)$ is compact (see [13]).

Definition 4.13. Let $M$ be a graded $R$-module. The graded Zariski quasi primary radical of a graded submodule $K$ of $M$, denoted by $Zq Gr_M(K)$, is the intersection of all members of $\text{qp}-\text{Gr}_M(K)$ for $(q.\text{Spec}_g(M), q.\text{Gr}_M)$, that is, $Zq Gr_M(K) = \bigcap_{Q \in \text{qp}-\text{Gr}_M(K)} Q = \bigcap_{Q \in q.\text{Spec}_g(M)} Gr((Q : R) M) \subseteq Gr((K : R) M)$. We say a graded submodule $K$ is a $Zq$-radical submodule if $K = Zq Gr_M(K)$.

We present the next important Theorem. It is one of the main results of this paper.

Theorem 4.14. Let $M$ be a graded $R$-module. Then, $(q.\text{Spec}_g(M), q.\text{Gr}_M)$ is a Noetherian topological space (and so is quasi-compact) if and only if the ACC for the graded Zariski quasi primary radical submodules of $M$ holds.

Proof. Suppose the ACC for the graded Zariski quasi primary radical submodules of $M$. Let $\text{qp}-\text{Gr}_M(K_1) \supseteq \text{qp}-\text{Gr}_M(K_2) \supseteq \ldots$ be a descending chain of closed sets $\text{qp}-\text{Gr}_M(K_i)$ of $(q.\text{Spec}_g(M), q.\text{Gr}_M)$, where $K_i$ is a graded submodule of $M$. Then $Z(q.\text{Gr}_M(K_1)) = Z(q.\text{Gr}_M(K_2)) = \ldots$ is an ascending chain of graded Zariski quasi primary radical submodules of $M$. So, by assumption, there exists $n \in \mathbb{N}$ such that for all $i \in \mathbb{N}$, $Zq Gr_M(K_n) = Zq Gr_M(K_{n+1})$. Now, by Theorem 3.3, $\text{qp}-\text{Gr}_M(K_n) = \text{qp}-\text{Gr}_M(K_{n+1})$. Thus $(q.\text{Spec}_g(M), q.\text{Gr}_M)$ is a Noetherian topological space. Conversely, suppose that $(q.\text{Spec}_g(M), q.\text{Gr}_M)$ is a Noetherian topological space. Let $K_1 \subseteq K_2 \subseteq \ldots$ be an ascending chain of a graded quasi primary radical submodules
of $M$. Thus $q_p V^q_M (K_1) \supseteq q_p V^q_M (K_2) \supseteq \ldots$ be a descending chain of closed sets $q_p V^q_M (K_i)$ of $(q.Spec_g (M), q.\mathcal{M})$. By assumption there is $n \in \mathbb{N}$ such that for all $i \in \mathbb{N}$, $q_p V^q_M (K_i) = q_p V^q_M (K_{n+i})$. Therefore, $K_n = Z q_p -{\mathcal{M}} (K_n) = Z (q_p V^q_M (K_n)) = Z (q_p V^q_M (K_{n+i})) = Z q_p -{\mathcal{M}} (K_{n+i}) = K_{n+i}$. Therefore the ACC for the graded Zariski quasi primary radical submodules of $M$ holds. □

Recall that every Noetherian topological space has only finitely many irreducible components, (see [5]).

As a consequence of Theorem 4.14, we have the following Theorem.

**Theorem 4.15.** Let $M$ be a graded quasi-primaryful $R$-module. If $(q.Spec_g (M), q.\mathcal{M})$ is a Noetherian space, then we have the following:

(1) If $\varphi$ is injective, then every ascending chain of graded quasi primary submodules of $M$ is stationary.

(2) $R$ has finitely many graded minimal prime ideals.

**Proof.** (1) Let $K_1 \subseteq K_2 \subseteq \ldots$ be an ascending chain of graded quasi primary submodules of $M$. Then $q_p V^q_M (K_1) \supseteq q_p V^q_M (K_2) \supseteq \ldots$ is a descending chain of closed subsets of $(q.Spec_g (M), q.\mathcal{M})$, which is stationary by assumption. There exists an integer $n \in \mathbb{N}$ such that $q_p V^q_M (K_i) = q_p V^q_M (K_{n+i})$ for each $i \in \mathbb{N}$. By Theorem 3.8, we have $K_n = K_{n+i}$ for each $i \in \mathbb{N}$. This completes the proof.

(2) Since every Noetherian topological space has finitely many irreducible components, the result follows from Corollary 4.11. □

Spectral spaces have been characterized by Hochster [9] p.52. Proposition 4] as the topological spaces $X$ which satisfy the following conditions:

(1) $X$ is a $T_0$-space.

(2) $X$ is quasi-compact.

(3) The quasi-compact open subsets of $X$ are closed under finite intersection and form an open base.

(4) Each irreducible closed subset of $X$ has a generic point.

The following theorem is one of the main result of this article. In particular, we observe $(q.Spec_g (M), q.\mathcal{M})$ from the point of view of spectral topological spaces.

**Theorem 4.16.** Let $M$ be a graded $R$-module and the map $\psi^q$ be surjective. Then the following statements are equivalent:

(1) $(q.Spec_g (M), q.\mathcal{M})$ is a spectral space.

(2) $(q.Spec_g (M), q.\mathcal{M})$ is a $T_0$-space.

(3) $\varphi$ is injective.

(4) If $q_p V^q_M (P) = q_p V^q_M (Q)$, then $P = Q$, for any $P, Q \in q.Spec_g (M)$.

(5) $|q.Spec_g (M)| \leq 1$ for every $q \in V^q (Ann (M))$ with $Gr^q (q) = p$.

(6) $\varphi$ is a graded $R$-homeomorphism.

**Proof.** (1)⇒(2) Is trivial

(2)⇒(1) Holds by combining Theorem 3.18 and Theorem 3.19 and Theorem 3.10

(2)⇒(3)⇒(4)⇒(5) Follows by Theorem 4.4

(3)⇒(6) By Corollary 3.13 □
