yjchae@ucdavis.edu

Abstract

A series invariant for a certain class of closed 3-manifolds associated with a type I Lie superalgebra \(sl(m|n)\) was introduced recently. We find a q-series for the other Lie superalgebra of the same type of the minimum rank.

1 Introduction

Motivated by a prediction for a categorification of the Witten-Reshitikhin-Turaev invariant of a closed oriented 3-manifold \([19, 17, 18]\) in \([11, 10]\), a topological invariant q-series for graph 3-manifolds associated with a type I Lie superalgebra \(sl(m|n)\) was introduced recently in \([4]\). This q-series denoted as \(\hat{Z}_{ab}\) is labeled by a pair of Spin\(^c\) structures of the manifolds as opposed to one label for a q-series \(\hat{Z}_b\) corresponding to a classical Lie algebra \([16]\). Another core difference is that the q-series invariant \(\hat{Z}_{ab}\) decomposes an extension of the WRT invariant, namely, the CGP invariant based on a Lie superalgebra \([2]\). In the most general topological setting, the CGP invariant is a topological invariant of a triple consisting of a closed oriented 3-manifold, a link and a certain
The construction of the CGP invariant associated to a Lie (super)algebra involves a new facet: the modified quantum dimension, which was first introduced in [8] for the quantum groups of Lie superalgebra of type I and then for the quantum groups of \( sl(2) \) at roots of unity [9]. In general, for a complex Lie superalgebra, the standard quantum dimension vanishes, which makes the WRT invariant of links and 3-manifolds trivial. The modified quantum dimension overcomes the obstacle. In the case of a complex simple Lie algebra, the modified quantum dimension enables to extend the WRT invariant to the above mentioned triplet. Furthermore, for a fixed Lie (super)algebra, the modified dimension can be defined for semisimple and nonsemisimple ribbon categories. Specific examples of the former type were given in [9] and [5]. The latter type, which is relevant to this paper, was first dealt with in [6]. And then it was expanded into a Lie superalgebra in [1] and [12] in which finite dimensional irreducible representations of the (unrolled) quantum groups of \( sl(m|n) \) \((m \neq n)\) at roots of unity was analyzed (the latter paper focuses on \( sl(2|1) \)). The CGP invariant contains a variety of information such as the multivariable Alexander polynomial and the ADO polynomial of a link. The relation between the CGP invariant and the WRT invariant for \( sl(2; \mathbb{C}) \) was conjectured in [3] and was proved for certain classes of 3-manifolds.

In this paper we analyze \( \hat{Z}_{ab} \) associated with \( osp(2|2) \) for plumbed 3-manifolds and observe that it is either even or odd power series in the examples. The rest of the paper is organized as follows. In Section 2 we review the ingredients involved in the CGP invariant and in \( \hat{Z}_{ab} \) for \( sl(m|n) \). In Section 3 we present the formula for homological blocks \( \hat{Z}_{ab} \) for \( osp(2|2) \). And then in Section 4, we apply the formula to a few examples.

Acknowledgments. I am grateful to Bertrand Patureau-Mirand and Pavel Putrov for helpful explanations, as well as to Sergei Gukov for reading a draft of this paper.

2 Background

The twist \( \theta \), the S-matrix and the modified quantum dimension \( d \) for the quantum group \( \mathcal{U}_h(g) \) of \( g = \text{type I} = sl(m|n), \text{osp}(2|2n) \) are given in [8], where \( h \) is a formal variable related to \( q = e^{h/2} \):

\[
\theta_V(\lambda) = q^{(\lambda, \lambda + 2\rho)} 1_V,
\]

where \( \lambda \) is the highest weight of a highest weight \( \mathcal{U}_h(g) \)-module \( V \) coloring the a link component and \( \rho = \rho_0 - \rho_1 \) and \( (\cdot, \cdot) \) is the bilinear form (see the appendix A for the details of representation theoretic concepts).

\[
S(V, V') = \varphi_{\mu + \rho}(\text{sch}(V(\lambda))),
\]

where \( \lambda \) and \( \mu \) are weights of (irreducible) \( \mathcal{U}_h(g) \)-modules \( V \) and \( V' \), respectively, coloring each link component. Moreover, \( \text{sch}(V(\lambda)) \) is a supercharacter of \( V \) and \( \varphi_\beta \) is a map from a group ring \( \mathbb{Z}[\Lambda] \) to \( \mathbb{C}[[h]] \). The modified quantum dimension \( d \) is

\[
d(\mu)S(\lambda, \mu) = d(\lambda)S(\mu, \lambda).
\]

In the case of \( sl(m|n) \), for the unrolled quantum group at roots of unity \( \mathcal{U}_H^*(sl(m|n)) \) \((m \neq n)\),

\[e^{\alpha} \mapsto q^{\langle \alpha, \beta \rangle} \quad \text{for any weight } \beta\]
the above formulas modify [1]:

\[ \theta_V(\lambda; l) = \xi^{(\lambda, \lambda+\pi)}_V, \quad \xi = e^{i\frac{\pi l}{\rho}} \quad l \geq m + n - 1 \]

\[ S(V, V'; l) = \varphi_{\lambda + \frac{\pi}{2}}(\text{sch}(V(\lambda))), \quad \pi = 2\rho - 2l\rho_0 \in \Lambda_R \]

\[ = \xi^{2(\lambda + \frac{\pi}{2}, \mu + \frac{\pi}{2})} \prod_{\alpha \in \Delta_0^+} \left\{ \frac{\langle \lambda + \frac{\pi}{2}, \alpha \rangle}{\langle \lambda + \frac{\pi}{2}, \alpha \rangle} \right\} \xi \prod_{\alpha \in \Delta_1^+} \left\{ \frac{\langle \lambda + \frac{\pi}{2}, \alpha \rangle}{\langle \lambda + \frac{\pi}{2}, \alpha \rangle} \right\} \xi \]

\[ d(\mu; l)S(\lambda, \mu; l) = d(\lambda; l)S(\mu, \lambda; l). \]

The second equality in the S-matrix element assumes V is a simple \( U^H_l(sl(m|n)) \)-module that is typical having dimension D. The changes of the formula are due to the different pivotal structure of \( U^H_l(sl(m|n)) \). Since the modifications are on the representation theory level and don’t seem to involve unique features of \( sl(m|n) \), we assume that the same modifications occur for \( osp(2|2n) \). We next summarize the concepts involved in the homological blocks \( Z_{ab} \) associated with a Lie superalgebra [4].

**Generic graph** In type I Lie superalgebra case, plumbing graph used in practice needs to satisfy certain conditions due to the functional form of the edge factor in the integrand of \( \hat{Z} \); a plumbing graph is called generic, if

1. at least one vertex of a graph has degree > 2
2. \( V|_{\text{deg}>2} \neq U \sqcup W \) such that \( B^{-1}_{IJ} = 0 \) for some \( I \in V, J \in W \),

where V is a set of vertices of a graph.

**Good Chamber** For \( \hat{Z} \) associated with type I Lie superalgebra, there is a notion of a good chamber introduced in [4]. Existence of a good chamber guarantees that \( \hat{Z} \) is a power series with integer coefficients. Specifically, an adjacency matrix \( B \) of a generic plumbing graph needs to admit a good chamber. It turns out that \( osp(2|2) \) requires positive definite (generic) plumbing graphs, its criteria for good chamber existence shown below are opposite of \( sl(2|1) \) criteria in [4]. Good chamber exists, if there exists a vector \( \alpha \) whose components are

\[ \alpha_I = \pm 1, \quad I \in V|_{\text{deg}\neq 2} \]

such that

\[ B^{-1}_{IJ}\alpha_I\alpha_J \geq 0 \quad \forall I \in V|_{\text{deg}=1}, \quad J \in V|_{\text{deg}\neq 2} \]

\[ B^{-1}_{IJ}\alpha_I\alpha_J > 0 \quad \forall I, J \in V|_{\text{deg}=1}, \quad I \neq J \]

\( X_{IJ} \) is copositive

\[ X_{IJ} = B^{-1}_{IJ}\alpha_I\alpha_J \quad I, J \in V|_{\text{deg}>2} \]

are satisfied. Furthermore, a good chamber corresponding to such \( \alpha \) is

\[ \text{deg}(I) = 1 : \begin{cases} |y_I|^{\alpha_I} < 1 \\ |z_I|^{\alpha_I} > 1 \end{cases} \]

\[ \text{deg}(I) > 2 : \begin{cases} |y_I|^{\alpha_I} < 1 \end{cases} \]
Chamber Expansion The series expansions for the good chambers for $osp(2|2)$ turn out to be the same as that of $sl(2|1)$ in \[4\]. We record here the expansions.

- degree$(I) = 2 + K > 2$

\[
\left(\frac{1 - z_I(1 - y_I)}{y_I - z_I}\right)^K = \begin{cases} 
(1 - 1)^K (1 - y_I^{-1})^K \sum_{r_I = 0}^\infty \frac{(r_I + 1)(r_I + 2)\ldots(r_I + K - 1)}{(K - 1)!} (z_I/y_I)^r, & |z_I| < |y_I| \\
(1 - y_I)^K (1 - z_I^{-1})^K \sum_{r_I = 0}^\infty \frac{(r_I + 1)(r_I + 2)\ldots(r_I + K - 1)}{(K - 1)!} (y_I/z_I)^r, & |z_I| > |y_I|
\end{cases}
\]

- degree$(I) = 1$

\[
\frac{y_I - z_I}{(1 - z_I)(1 - y_I)} = \begin{cases} 
\sum_{r_I = 1}^\infty y_I^{r_I} + \sum_{r_I = 0}^\infty z_I^{-r_I}, & |y_I| < 1, |z_I| > 1 \\
- \sum_{r_I = 0}^\infty y_I^{-r_I} - \sum_{r_I = 1}^\infty z_I^{r_I}, & |y_I| > 1, |z_I| < 1
\end{cases}
\]

### 3 Result

For closed oriented plumbed 3-manifolds $Y(\Gamma)$ having $b_1(Y) = 0$ and $a, b \in Spin^c(Y) \cong H_1(Y)$, $\hat{Z}_{ab}[Y; q]$ associated with $osp(2|2)$ is

\[
\hat{Z}_{ab}^{osp(2|2)}[Y; q] = (-1)^{\Delta_{ab}} \int_{\Omega} \prod_{I \in V} \frac{dz_I}{i2\pi z_I} \frac{dy_I}{i2\pi y_I} \left(\frac{y_I - z_I}{(1 - z_I)(1 - y_I)}\right)^{2 - \text{deg}(I)} \sum_{n \in BZ^+} \sum_{m \in BZ^+} q^{-2nB^{-1}m} \prod_{J \in V} z_I^{m_J} y_J^n
\]

where $B = B(\Gamma)$ is an adjacency matrix of a generic plumbing graph $\Gamma$. Moreover, the convergent q-series in a complex unit disc requires $\Gamma$ to be positive definite plumbing graphs inside a complex unit disc. This is opposite of the $sl(m|n)$ case (and for $su(n)$). The edge factor in the integrand turns out to be the same as that of $sl(2|1)$\footnote{This seems to be no longer true in higher rank cases}. The integration prescription states that one chooses a chamber for an expansion of the integrand using the chamber expansion in the previous section and then picks constant terms in $y_I$ and $z_I$.

### 4 Examples

We apply the above formula to $\mathbb{Z}HS^3$ and $\mathbb{Q}HS^3$. Each $\hat{Z}$ is either even or odd power series and the regularized constants are given by the zeta function $\zeta(s)$ or the Hurwitz zeta function $\zeta(s, x)$ (see \[4\] for details).

- $Y = S^3$ The adjacency matrix of a generic plumbing graph of $S^3$ (Figure 1 in appendix B) is

\[
\text{degree}(I) = 1
\]
\[
B(\Gamma) = \begin{pmatrix}
4 & 1 & 1 & 1 \\
1 & 1 & 0 & 0 \\
1 & 0 & 1 & 0 \\
1 & 0 & 0 & 1
\end{pmatrix} \quad \text{Det} B = 1 \quad |H_1(Y)| = |\text{Det} B|
\]

The two chambers are \( \alpha = \pm (1, -1, -1, -1) \).

\[\hat{\mathcal{Z}}_{00}^{(2|2)}[Y; q] = 1 + 2\zeta(-1) + 2\zeta(0) - 2q^2 - 4q^4 - 4q^6 - 6q^8 - 4q^{10} - 8q^{12} - 4q^{14} - 8q^{16} - 6q^{18} + \cdots\]

- **Y = \Sigma(2, 3, 7)** The adjacency matrix of a (generic) plumbing graph (Figure 2 in appendix B) is

\[
B(\Gamma) = \begin{pmatrix}
1 & 1 & 1 & 1 \\
1 & 2 & 0 & 0 \\
1 & 0 & 3 & 0 \\
1 & 0 & 0 & 7
\end{pmatrix} \quad \text{Det} B = 1
\]

The two chambers are \( \alpha = \pm (1, -1, -1, -1) \).

\[\hat{\mathcal{Z}}_{00}^{(2|2)} = 1 + 2\zeta(-1) + 2\zeta(0) - 2q^2 - 4q^4 - 4q^6 - 6q^8 - 4q^{10} - 6q^{12} - 4q^{14} - 6q^{16} - 6q^{18} - 8q^{20} - 4q^{22} - 10q^{24} - 6q^{26} - 8q^{28} + \cdots\]

- **Y = M(−1|\frac{1}{2}, \frac{1}{2}, \frac{1}{8})** The adjacency matrix of a (generic) plumbing graph (Figure 3 in appendix B) is

\[
B(\Gamma) = \begin{pmatrix}
1 & 1 & 1 & 1 \\
1 & 2 & 0 & 0 \\
1 & 0 & 3 & 0 \\
1 & 0 & 0 & 8
\end{pmatrix} \quad \text{Det} B = 2
\]

The two chambers are \( \alpha = \pm (1, -1, -1, -1) \).

The independent \( \hat{Z}_{ab} \) are

\[
\hat{Z}_{00} = 1 + 2\zeta(-1) + 2\zeta(0) - 2q^2 - 4q^4 - 4q^6 - 6q^8 - 4q^{10} - 6q^{12} - 4q^{14} - 6q^{16} - 6q^{18} - 8q^{20} - 2q^{22} - 4q^{24} + \cdots
\]

\[
\hat{Z}_{11} = -2q^3 - 2q^5 - 2q^7 - 4q^9 - 4q^{11} - 2q^{13} - 6q^{15} - 4q^{17} - 4q^{19} - 6q^{21} - 4q^{23} - 6q^{27} + \cdots
\]

\[
\hat{Z}_{01} = 2\zeta(-1, 1/2) + \zeta(0, 1/2) - q^2 - q^4 - 3q^6 - 2q^8 - 3q^{10} - 4q^{12} - 4q^{14} - 3q^{16} - 5q^{18} - 5q^{20} + \cdots
\]

where the labels denote the last components of elements of \( H_1(Y) \).
\begin{itemize}
\item $Y = M(-1, 1, 1, 1) \frac{1}{2}, \frac{1}{3}, \frac{1}{9})$ The adjacency matrix of a (generic) plumbing graph (Figure 4 in appendix B) is
\[ B(\Gamma) = \begin{pmatrix}
1 & 1 & 1 & 1 \\
1 & 2 & 0 & 0 \\
1 & 0 & 3 & 0 \\
1 & 0 & 0 & 9 \\
\end{pmatrix} \quad \text{Det} B = 3 \]

The independent $\hat{Z}^{osp(2|2)}_{ab}[Y]$ are
\[
\hat{Z}_{00} = 1 + 2\zeta(1) + 2\zeta(0) - 2q^6 - 2q^8 - 4q^{12} - 2q^{14} - 2q^{16} - 4q^{18} - 2q^{20} - 2q^{22} - 6q^{24} - 2q^{26} - 2q^{28} + \ldots \\
\hat{Z}_{11} = q^{\frac{1}{3}} (-q - q^3 - 3q^5 - 2q^7 - 3q^9 - 2q^{11} - 5q^{13} - 2q^{15} - 4q^{17} - 2q^{19} - 5q^{21} - 4q^{23} - 2q^{25} - q^{27} - 3q^{29} + \ldots) \\
\hat{Z}_{22} = q^{\frac{1}{3}} (-q - q^3 - 3q^5 - 2q^7 - 3q^9 - 2q^{11} - 5q^{13} - 2q^{15} - 4q^{17} - 2q^{19} - 5q^{21} - 4q^{23} - 2q^{25} - q^{27} - 3q^{29} + \ldots) \\
\hat{Z}_{01} = 3\zeta(-1, 1/2) + \zeta(0, 1/2) - 2q^4 - q^6 - 2q^8 - 3q^{10} - 3q^{12} - 2q^{14} - 4q^{16} - 2q^{18} - 5q^{20} - 3q^{22} - 2q^{24} - 2q^{26} - 3q^{28} + \ldots \\
\hat{Z}_{02} = 3\zeta(-1, 1/2) + \zeta(0, 1/2) - q^2 - q^4 - q^6 - 3q^{10} - 2q^{12} - 3q^{14} - 4q^{16} - 2q^{18} - 4q^{20} - 2q^{22} - 3q^{24} - 2q^{26} - 4q^{28} + \ldots \\
\hat{Z}_{12} = q^{-\frac{1}{3}} (-2q^3 - 2q^5 - 2q^7 - 2q^9 - 4q^{11} - 2q^{13} - 4q^{15} - 2q^{17} - 6q^{19} - 2q^{21} - 4q^{23} - 2q^{25} - 4q^{27} + \ldots) 
\]
\end{itemize}

Appendix

A Type I Lie superalgebra and its quantization

We give a summary of the representation theory of $osp(2|2n)$ and the quantum group $U_h(\text{type I})$ in \[15\]. For $osp(2|2n)$, the set of positive roots is $\Delta^+ = \Delta^+_0 \cup \Delta^+_1$, with
\[
\Delta^+_0 = \{ \delta_i \pm \delta_j | 1 \leq i < j \leq n \} \cup \{ 2\delta_i \} \quad \text{and} \quad \Delta^+_1 = \{ \epsilon \pm \delta_i \}, \quad n \in \mathbb{Z}_+, 
\]
where $\{ \epsilon, \delta_1, \ldots, \delta_n \}$ form the dual basis of the Cartan subalgebra. Their inner products are
\[
\langle \epsilon, \epsilon \rangle = 1 \quad \langle \delta_i, \delta_j \rangle = -\delta_{ij} \quad \langle \epsilon, \delta_j \rangle = 0 
\]
The half sums of positive roots are
\[
\rho_0 = \sum_i (n + 1 - i) \delta_i, \quad \rho_1 = n\epsilon \quad \text{and} \quad \rho = \rho_0 - \rho_1.
\]

\[15\] For reviews on Lie superalgebras, see \[13\] [14] [15].
The fundamental weights are
\[ w_1 = \epsilon \quad w_k = \epsilon + \sum_{i=1}^{k} \delta_i \quad \text{and} \quad k = 1, \cdots, n. \]

The weight \( \lambda_a \) decomposes as
\[ \lambda_a = a w_1 + c_1 w_2 + \cdots + c_n w_{n+1}, \]
where \( c \in \mathbb{N}^{r-1}, a \in \mathbb{C} \).

Let \( g \) be a Lie superalgebra of type I, \( sl(m|n) \) or \( osp(2|2n) \) \((m \neq n)\). \( U_h(g) \) is the \( \mathbb{C}[[h]] \)-Hopf superalgebra generated by
\[ E_i, F_i, h_i, \quad i = 1, \cdots, r = m+n-1 \quad \text{or} \quad n+1 \]
satisfying the relations
\[
\begin{align*}
[h_i, h_j] &= 0, \quad [h_i, E_j] = A_{ij} E_j, \quad [h_i, F_j] = A_{ij} F_j, \\
[E_i, F_j] &= \delta_{ij} \frac{q^{h_i} - q^{-h_i}}{q - q^{-1}}, \quad E_s^2 = F_s^2 = 0
\end{align*}
\]
and the quantum Serre-type relations; they are quadratic, cubic and quartic relations among \( E_i \) or \( F_i \) (see [20] Definition 4.2.1). \( A_{ij} \) is \( r \times r \) Cartan matrix and \( \{s\} = \tau \subset \{1, \cdots, r\} \) determining the parity of the generators. \( E_s, F_s \) are the only odd generators. Moreover, the (anti)commutator is \([x, y] := xy - (-1)^d yx\). The Hopf algebra structure is
\[
\begin{align*}
\Delta(E_i) &= \Delta(E_i) \otimes 1 + q^{-h_i} \otimes \Delta(E_i), \quad \epsilon(\Delta(E_i)) = 0, \quad S(\Delta(E_i)) = -q^{h_i} \Delta(E_i) \\
\Delta(F_i) &= \Delta(F_i) \otimes 1 + q^{-h_i} \otimes \Delta(F_i), \quad \epsilon(\Delta(F_i)) = 0, \quad S(\Delta(E_i)) = -\Delta(F_i)q^{h_i} \\
\Delta(h_i) &= \Delta(F_i) \otimes 1 + 1 \otimes \Delta(h_i), \quad \epsilon(\Delta(h_i)) = 0, \quad S(\Delta(h_i)) = -h_i
\end{align*}
\]

B Invariance checks

We display the weighted positive definite generic plumbing graphs and their equivalent graphs of the examples in Section 4. Each vertex corresponds to a \( S^1 \)-bundle over \( S^2 \); a positive integer is the Euler number of a bundle. The graphs are related by the Kirby-Neumman moves:

The invariance of \( \hat{Z}_{ab} \) under the Kirby-Neumman moves for the exhibited graphs and the graphs mentioned in the captions of Figure 3 and 4 were verified.
Figure 1: A generic plumbing graph of $S^3$ (left most) and its equivalent graphs

Figure 2: A generic plumbing graph of $\Sigma(2, 3, 7)$ (the first graph) and its equivalent graphs
C Derivations

We setup for the derivations of the ingredients in the CGP invariant formula using the appendix A and outline the derivation of $\hat{Z}^{osp(2|2)}$ in Section 3.

The root lattice $\Lambda_R$ of $osp(2|2)$ are generated by $2\delta$ and $\epsilon - \delta$, hence, two dimensional. The pivotal element $\pi$

$$\pi = 2(\rho_0 - \rho_1) - 2l\rho_0 \in \Lambda_R$$

$$= -2(\epsilon - \delta) - l(2\delta)$$

This implies that

$$K_{\pi} = K_1^{-1}K_2^{-2} \in \mathcal{U}_\xi(osp(2|2))$$

The weight $\lambda$ of $V$ is

$$\lambda = \mu_1 w_1 + \mu_2 w_2$$

$$= (\mu_1 + \mu_2)\epsilon + \mu_2\delta,$$

where $w_1 = \epsilon$ and $w_2 = \epsilon + \delta$. Under the assumption mentioned in Section 2, we arrive at

$$\theta_V(\vec{\mu}; l) = \xi^{2l\mu_2} s^{2(\mu_1 + 2\mu_2)} - 2(\mu_1 + 2\mu_2)$$

$$S(\vec{\mu}, \vec{\mu}'; l) = \xi^{2l(\mu_2 + \mu_2')} s^{2(\mu_1 + \mu_1' + \mu_2 + \mu_2')} - 2(\mu_1 + \mu_1' + \mu_2 + \mu_2')$$

$$\times \left\{ \frac{2l(\mu_2' + 1 - l)}{(2\mu_2 + 1 - l)} \right\} \left\{ \frac{\mu_1' - 2 + l}{\mu_1' + 2\mu_2 - l} \right\}$$

9
\[ d(\vec{\mu}; l) = \frac{\{2(\mu_2 + 1 - l)\}}{\{2l(\mu_2 + 1 - l)\}} \frac{1}{\{\mu_1 - 2 + l\} \{\mu_1 + 2\mu_2 - l\}} \{x\}_{\xi} := \xi^x - \xi^{-x} \quad \xi = q^{1/2} = e^{2\pi i/l} \]

where \((\mu_1, \mu_2)\) and \((\mu'_1, \mu'_2)\) are the coefficients in the weight decompositions of \(\lambda\) and \(\mu\) for \(V\) and \(V'\), respectively (see appendix A). For the S-matrix, notations for \(V\) and \(V'\) are switched.

In order to apply the derivation of the superalgebra \(\hat{Z}\) given in [4], we need to adapt the above three expressions into a plumbing graph setup. We first let

\[ \vec{\alpha} = (\alpha_1 = \mu_1 - 2 + l, \alpha_2 = 2\mu_2 + 2 - 2l) \in \mathbb{C}^2 \]

Then

\[ \theta_V = \xi^{\alpha_2^2 + \alpha_1 \alpha_2} \]

\[ S' = \xi^{2\alpha_1^' \alpha_1^' + \alpha_1^' \alpha_2^' + \alpha_2^' \alpha_1^'} \{l \alpha_2'\}_{\xi} \{\alpha_1'\}_{\xi} \{\alpha_1' + \alpha_2'\}_{\xi} \]

\[ \{\alpha_2'\}_{\xi} \]

We next shift \(\alpha_1\) and \(\alpha_2\) by \(s\) and \(t\), respectively. And then we associate \(\theta_V\) to each vertex. This leads to

\[ \theta_{V_{\alpha_1^s I}} = \xi^{(\mu_1-2+s)^I(\mu_1+2\mu_2+s+t)^I}. \]

Similarly, the S-matrix elements between to vertices \(I\) and \(J\) of graphs contain

\[ \prod_{(I,J) \in \text{Edges}} S'((\alpha'_J)_{s'^J I}, (\alpha^I)_{s'I J}) \supset \xi^{\sum_{I,J} B_{IJ}(\mu_1-2+s)^I(\mu_1+2\mu_2+s+t)^J}, \]

which is the relevant part for the derivation. For the modified quantum dimension \(d(\vec{\alpha})\)

\[ d(\vec{\alpha}) = \{\alpha_2\}_{\xi} \]

\[ \{l \alpha_2\}_{\xi} \{\alpha_1\}_{\xi} \{\alpha_1 + \alpha_2\}_{\xi}, \]

after shifting by \(s\) and \(t\) as above and some manipulations, the roots of unity dependent factor becomes

\[ d(\vec{\alpha}) \supset \frac{\xi^{2(\mu_1+2\mu_2+s+t)}}{(1 - \xi^{2(\mu_1+2\mu_2+s+t)})} - \frac{\xi^{2(\mu_1+s-2)}}{(1 - \xi^{2(\mu_1+s-2)})} \]

We define coordinates of the 2D Cartan subalgebra of \(osp(2|2)\) to be

\[ y = \xi^{2(\mu_1+2\mu_2+s+t)} \quad z = \xi^{2(\mu_1+s-2)} \]

Then the modified quantum dimension for a graph contains

\[ d(y, z) \supset \frac{yI - zI}{(1 - yI)(1 - zI)} \]
We next sketch the derivation of $\hat{Z}^{osp(2|2)}$ in Section 3 by applying the procedure in the appendix D of [2]. For a closed oriented graph 3-manifold $Y$ equipped with $\omega \in H^1(Y; \mathbb{Q}/\mathbb{Z} \times \mathbb{Q}/\mathbb{Z})$, the CGP invariant for a pair $(Y, \omega)$ in which $Y$ is presented by Dehn surgery is

$$N_l(Y, \omega) = \sum_{s^l, t^l=0}^{l-1} \prod_{v \in Vert} d(\alpha_{s^l t^l}) \prod_{(v, v') \in Edges} d(\alpha_{s^l t^l}(v, v')) B_{l^l} \prod_{(l, j) \in Edges} S'(\alpha_{s^l t^l}, \alpha_{s^l t^l})$$

$$\omega \in H^1(Y; \mathbb{Q}/\mathbb{Z} \times \mathbb{Q}/\mathbb{Z}) \cong B^{-1}\mathbb{Z}/\mathbb{Z} \times B^{-1}\mathbb{Z}/\mathbb{Z}$$

$$\omega([m_l]) = \mu^l = (\mu_1^l, \mu_2^l) \in \mathbb{Q}/\mathbb{Z} \times \mathbb{Q}/\mathbb{Z}, \quad \sum J B_{l^l} \mu_j^l = 0 \mod \mathbb{Z} \times \mathbb{Z},$$

where $m_l$ is a meridian of $I$-th component $L_l$ of a surgery link $L$ and $[m_l]$ is its homology class and $B$ is a linking matrix of $L$. A color of $L_l$ is set by $\omega([m_l])$. The origin of $\omega$ can be found in the footnote in Section 1.3 of [2]. After substituting the ingredients, the right hand side becomes

$$N_l(Y, \omega) = \frac{1}{l+1} \prod_{v \in V} \left( e^{i2\pi \mu^l} - e^{-i2\pi \mu^l} \right)^{deg(l)-2} \sum_{a^l, b^l \in \mathbb{Z}^L/\mathbb{Z}^L} F \left( \begin{pmatrix} \xi^{2(\mu_1+2\mu_2+a)} & \xi^{2(\mu_1+b)} \end{pmatrix} \right) \xi^{\sum J B_{l^l} (\mu_1+2\mu_2+a)^l (\mu_1+b)^l},$$

where $a^l = s^l + t^l$, $b^l = s^l - 2$ and

$$F(y, z) = \prod_{I \in V} \left( \frac{y_I - z_I}{1 - y_I}(1 - z_I) \right)^{2-\deg(I)}.$$

We next expand $F(y, z)$, which modifies the summand as

$$\sum_{a^l, b^l \in \mathbb{Z}^L/\mathbb{Z}^L} \xi^{\sum J B_{l^l} (\mu_1+2\mu_2+a)^l (\mu_1+b)^l + 2 \sum I n_I (\mu_1+2\mu_2+a)^l + m_I (\mu_1+b)^l}$$

And then we recast it in terms of matrices by forming

$$M = \frac{1}{2} \begin{pmatrix} 0 & B \\ B & 0 \end{pmatrix}, \quad r = \begin{pmatrix} b \\ a \end{pmatrix}, \quad p = \begin{pmatrix} B(\mu_1+2\mu_2) + 2m \\ B\mu_1 + 2n \end{pmatrix},$$

This enables us to apply the appropriate Gauss reciprocity formula

$$\sum_{r \in \mathbb{Z}^L/\mathbb{Z}^L} e^{i\pi \sigma(M)/4(l/2)^N/2} = \sum_{\delta \in \mathbb{Z}^L/2\mathbb{Z}^L} e^{i\pi \sigma(M)/4(l/2)^N/2} \left( -\frac{i\pi}{2} \left( \delta + \frac{p}{l} \right)^T M^{-1} \left( \delta + \frac{p}{l} \right) \right),$$

where $M$ is a non-degenerate symmetric $2L \times 2L$ matrix over $\mathbb{Z}$ and $\sigma(M)$ is its signature. From the p-quadratic term in the exponential we read off

$$RHS \supset \xi^{-4mT B^{-1} n},$$

which becomes the q-term in the summand in Section 3 after we analytically continue from a complex unit circle into an interior of an unit disc coordinatized by $q$.
