Abstract. Zassenhaus formula is used in a wide range of fields in physics or mathematics, from fluid dynamics to differential geometry. The non commutativity of the elements of the algebra implies that the exponential of a sum of operators cannot be splitted in the product of the exponentials multiplied by a supplementary term which form is generally an infinite product of exponentials. However, for some special commutators, closed forms can be found. We propose a closed form for Zassenhaus formula when the commutator of the operators $X$ and $Y$ satisfy the relation $[X,Y] = uX + vY + cI$.

Zassenhaus formula then reduces to the closed form

$$e^{X+Y} = e^{X} e^{g_r(u,v)e^{g_l(v,u)}},$$

a left-sided, centered and right-sided formula are found, with respective arguments,

$$g_r(u, v) = g_c(v, u)e^u = g_l(v, u) = \frac{u(e^{u-v} - e^v) + v(e^u - 1)}{ue^{u-v}}.$$ 

1. Introduction

Zassenhaus formula found recently a regain of interest [1, 2] due to its numerous applications in various fields such as Soliton physics, Dirac’s monopole problem, quantum lattices of spins or even fluids dynamics [3, 4, 5, 6]. It is also studied for mathematical fundamental purpose such as disentangling exponential operators [7, 8] or in differential geometry [9]. This formula is the dual formula of the very famous Baker-Campbell-Hausdorff (BCH) formula which aims at composing two exponential of operators.

When $X$ and $Y$ do not commute, the expansion of $e^{X+Y}$ is hard to find. Some approached forms have been proposed such as the Trotter-Suzuki decomposition [10]. Recently, some new methods have been suggested, such as using a recurrence [11]. However, for some special commutators, the expansion reduces to a closed form, the most famous one being Glauber formula, known as $e^{X+Y} = e^X e^Y e^{-\frac{1}{2}[X,Y]}$ for $[X,[X,Y]] = 0$ and $[Y,[X,Y]] = 0$. But if many articles are looking for closed forms of the BCH formula [12, 13, 14, 15, 16] or if some exotic forms of BCH have been found [17] it seems that Zassenhaus formula has been forgotten. Here we offer a closed form of Zassenhaus formula for the special commutator $[X,[X,Y]] = uX + vY + cI$. 
2. A closed form of Zassenhaus formula

Zassenhaus theorem states that $X, Y$ being the generators of a Lie algebra. $e^{X+Y}$ can be uniquely decomposed in the following way:

$$e^{X+Y} = e^X e^Y \prod_{n=2}^{\infty} e^{C_n(X,Y)} = e^X e^{C_2(X,Y)} e^{C_3(X,Y)} \ldots e^{C_n(X,Y)} \ldots$$

where $C_n(X,Y)$ is a Lie polynomial in X and Y of degree $n$.

The first terms are expressed in this way,

$$e^{X+Y} = e^X e^Y e^{-\frac{1}{2}[X,Y]} e^{\frac{1}{2}[2Y,[X,Y]]+[X,[X,Y]]} e^{-\frac{1}{24}([[[X,Y],X],X]+3[[[X,Y],X],Y]+3[[X,Y],Y],Y])} \ldots$$

In the case of the specific commutators, $[X,Y] = uX + vY + c\mathbb{I}$, the multiple commutators in the argument of the exponentials all reduce to a constant multiplied by $[X,Y]$. Equation (3) may be recasted in the form $e^{X+Y} = e^X e^Y e^\mu[X,Y]$ where $\mu$ is to be determined. We denote the adjoint operator $ad_A$ of an operator $A$, defined by recurrence from $ad_A^n B = [A, ad_A^{n-1}]$ with $ad_A^0 = B$ so that it is possible to rewrite $e^A B e^{-A} = e^{ad_A} B$. A first method to determine this constant is to express the Zassenhaus formula in an integral form, introducing a new variable $t$ in the exponential, as could be noticed in [10]

$$e^{t(X+Y)} = e^X e^Y (\int_0^t ds e^{-s[Y,X]} \left( e^{-s[Y,X]} - 1 \right) Y ).$$

This formula can be demonstrated in differentiating $e^{t(X+Y)} = e^X e^Y e^\mu$ with respect to the variable $t$ and noticing that $\frac{d}{dt} e^{s[Y,X]} = e^{-s[Y,X]} (e^{-s[Y,X]} - 1) Y$. It is then useful to notice that for the special commutator $[X,Y] = uX + vY + c\mathbb{I}$,

$$e^{-s[Y,X]} = e^{-s[Y,X]} - 1 = \frac{e^s(u-v) - e^s}{v}[X,Y].$$

Inserting (6) in (5) allows to perform the integration, then choosing $t = 1$ gives the closed expression for the Zassenhaus formula

$$e^{(X+Y)} = e^X e^Y \exp (g_r(u,v)[X,Y]).$$

With the right-sided coefficient $g_r(u,v)$,

$$g_r(u,v) = \frac{u (e^u - e^v) + v (e^v - 1)}{uv(u-v)}.$$

Equations (7) and (8) are our main result.

3. Left-sided Zassenhaus formula with a second demonstration

It is possible to derive (7) and (8) using another derivation, constructing the Zassenhaus formula from a closed form of BCH formula. We will derive here a left-sided expression of the Zassenhaus formula for the special commutator $[X,Y] = uX + vY + c\mathbb{I}$ with coefficient $g_l(u,v)$

$$\exp (X + Y) = \exp (g_l(u,v)[X,Y]) \exp (X) \exp (Y).$$

Van-Brunt and Visser [12] found a closed form BCH formula for the commutator $[X,Y] = uX + vY + c\mathbb{I}$,

$$\exp (X) \exp (Y) = \exp (X + Y + f(u,v)[X,Y]).$$

With $f$, the Van-Brunt and Visser function [12]
\[ f(u, v) = \frac{ue^u(e^v - 1) - ve^v(e^u - 1)}{uv(e^u - e^v)}. \]  

Inserting (10) in (9) one can find

\[ \exp (X + Y) = \exp (g_l(u, v)[X, Y]) \exp (X + Y + f(u, v)[X, Y]). \] (12)

In order to determine \( g_l(u, v) \) one can apply Van-Brunt Visser formula (10) directly to (12), and make the equality hold. It is useful to proceed to the change of variables \( \tilde{X} = g_l(u, v)[X, Y], \tilde{Y} = X + Y + f(u, v)[X, Y], \) and to compute the commutator

\[ [\tilde{X}, \tilde{Y}] = g_l(u, v)(u - v)[X, Y] \]

(13)

Furthermore, the commutator can also be written

\[ [\tilde{X}, \tilde{Y}] = \tilde{u}\tilde{X} + \tilde{v}\tilde{Y} + \tilde{c}1, \]

(15)

\[ = \{\tilde{u}g_l(u, v)u + \tilde{v}f(u, v)\tilde{v}u\}[X] + \{\tilde{u}g_l(u, v)v + \tilde{v}f(u, v)\tilde{v}v\}Y \]

\[ + \{\tilde{u}g_l(u, v)c + \tilde{v}f(u, v)c + \tilde{c}\}1. \]

(17)

This leads to the system of equations

\[ g_l(u, v)(u - v)u = \{\tilde{u}g_l(u, v) + f(u, v)\tilde{v}\}u + \tilde{v}, \]

(18)

\[ g_l(u, v)(u - v)v = \{\tilde{u}g_l(u, v) + f(u, v)\tilde{v}\}v + \tilde{v}, \]

(19)

\[ g_l(u, v)(u - v)c = \{\tilde{u}g_l(u, v) + f(u, v)\tilde{v}\}c + \tilde{c}. \]

(20)

That is satisfied for \( \tilde{u} = u - v, \tilde{v} = 0, \tilde{c} = 0. \)

Hence,

\[ \exp (X + Y) = \exp (g_l(u, v)[X, Y]) \exp (X + Y + f(u, v)[X, Y]), \]

(21)

\[ = \exp \{X + Y + [g_l(u, v) + f(u, v) + f(u - v, 0)(u - v)g_l(u, v)][X, Y]\}. \] (22)

To satisfy the previous equality, \( g_l(u, v) \) may take the form

\[ g_l(u, v) = \frac{v(e^u - e^v) + u(e^v - 1)}{uv(v - u)}. \] (23)

We notice that \( g_l(u, v) = g_r(v, u) \). The same demonstration can also be employed to find a right-sided formula confirming the previously found result (8).

4. Commuting the generators of the algebra

If \( X, Y \) are elements of an algebra which verify the commutation relationship \( [X, Y] = uX + vY + c1 \), we can find the commutation relation between the generators of the algebra \( e^X \) and \( e^Y \), and look for an expression of the form \( e^X e^Y = e^Y e^X e^{\gamma[X, Y]} \) where \( \gamma \) is to be determined. As \( X + Y = Y + X \) one can use (7) for both commutators \( [X, Y] = uX + vY + c1 \) and \( [Y, X] = \alpha Y + \beta X + \delta 1 = -uX - vY - c1 \) so that
\[e^X e^Y = e^X e^{g_r(u,v)[X,Y]} \quad \text{(24)}\]
\[e^Y e^X = e^Y e^{g_r(\alpha, \beta)[Y,X]} = e^Y e^{-g_r(-v,-u)[X,Y]} \quad \text{(25)}\]

From the previous equalities:
\[e^X e^Y = e^Y e^{g_r(-v,-u)+g_r(u,v))[X,Y]} \quad \text{(26)}\]
\[-g_r(-v,-u) - g_r(u,v) = \frac{1}{vu(u-v)} \{v (e^{-v} - 1)(e^u-1) + u (e^{-v} - 1) (1-e^u)\}. \quad \text{(27)}\]

5. Properties of \(g_r(u,v)\)
In order to compute \(g_r(u,v)\) in the special cases \(u=0, v=0\) or \(u=v=0\) De l’Hôpital’s rule may be used, we compute

\[g_r(0,v) = -\frac{e^{-v} - 1 + v}{v^2}, \quad g_r(u,0) = \frac{e^u(1-u) - 1}{u^2}, \quad g_r(0,0) = \frac{1}{2}. \quad \text{(28)}\]

For a commutator of the form \([X,Y] = c1\) one can express \(e^{X+Y} = e^X e^{Y} e^{-\frac{1}{2}[X,Y]}\) which is nothing but Glauber formula. Finally the case \(u=v\) is also interesting
\[g_r(u,u) = \frac{u + 1 - e^u}{u^2}. \quad \text{(29)}\]

Special forms of \(g_l\) and \(g_c\) are directly found from \(g_r\).

6. A centered formula
It is also possible to look for a centered formula with coefficient \(g_c(u,v)\) so that
\[e^X e^Y = e^X e^{g_c(u,v)[X,Y]} e^Y. \quad \text{(30)}\]

Starting from,
\[e^{X+Y} = e^{g_r(u,v)[X,Y]} e^X e^Y, \quad \text{(31)}\]
and setting \(\tilde{X} = g_l(u,v)[X,Y]\) and \(\tilde{Y} = X\) so that the commutator reads \([\tilde{X}, \tilde{Y}] = -v\tilde{X}\). Applying the result of (26), equation (31) becomes,
\[e^{X+Y} = e^{g_l(u,v)[X,Y]} e^{-g_r(0,v)+g_r(-v,0)[\tilde{X}, \tilde{Y}]} e^Y, \quad \text{(32)}\]
\[= e^{g_l(u,v)[X,Y]} e^{v(g_r(0,v)+g_r(-v,0))[g_l(u,v)][X,Y]} e^Y. \quad \text{(32)}\]

Where,
\[g_c(u,v) = \{1 + v (g_r(0,v) + g_r(-v,0))\} g_l(u,v), \quad \text{(33)}\]
\[= e^{-v} g_l(u,v). \quad \text{(34)}\]
7. Application to the Lie algebra \(\{a^{12}, a^2, a^1 a\}\)

One can apply the formula to the commutators \([a^{12}, a^1 a] = -2a^{12}, [a^2, a^1 a] = 2a^2\)

\[
e^{a^{12}+a^1 a} = e^{a^{12}} e^{a^1 a} e^{R(t,-2,0) [X,Y]} = e^{a^{12}} e^{a^1 a} e^{-\frac{a^{12}}{2}}.
\]

(35)

\[
e^{a^2+a^1 a} = e^{a^{12}} e^{a^1 a} e^{R(t,2,0) [X,Y]} = e^{a^2} e^{a^1 a} e^{-\frac{a^2+a^1 a}{2}}.
\]

(36)

8. A third derivation of the formula

In [11] the authors developed a technique to compute recursively the exponents of the Zassenhaus formula. But it can be shown that if \(X\) and \(Y\) verify the above mentioned commutation relation, their work can be used to recover the relation (8).

8.1. Computing the Zassenhaus formula exponents with a recurrence

To find the terms of Zassenhaus formula by recurrence, Casas et al. [11] introduce a differentiable formula with respect to \(t\) that recovers Zassenhaus formula (3) for \(t = 1\)

\[
e^{t(X+Y)} = e^{tX} e^{tY} e^{t^2 C_2} e^{t^3 C_3} ... \]

(37)

And the following compositions are considered

\[
R_1(t) = e^{-tY} e^{-tX} e^{t(X+Y)}.
\]

(38)

So that for each \(n \geq 2\),

\[
R_n(t) = e^{-t^n C_n} ... e^{-t^2 C_2} e^{-tY} e^{-tX} e^{t(X+Y)} = e^{-t^n C_n} R_{n-1}(t).
\]

(39)

The authors [11] define the functions \(F_n = (\frac{d}{dt} R_n(t)) R_n(t)^{-1}\) that allows to determine the polynomial \(C_n\) through the recurrence relations

\[
F_n(t) = e^{-t^{n+1} C_n} \left( F_{n-1}(t) - \frac{t^{n-1}}{(n-1)!} F_{n-1}^{(n-1)}(0) \right),
\]

(40)

\[
C_n = \frac{1}{n!} F_{n-1}^{(n-1)}(0),
\]

(41)

with the \(n^{th}\) derivative noted as \(F^{(n)} = \frac{\partial^n F}{\partial t^n}\). Furthermore, still from [11], one can get:

\[
F_1(t) = e^{-t^{ad} X} (e^{-t^{ad} X} - 1) Y.
\]

(42)

It is easily seen that from the knowledge of \(F_1, C_2\) is known and so does \(F_2\), etc. A recurrence scheme to determine de coefficients \(C_n\) is then established.

9. Impact of the closed form \([X, Y] = uX + vY + c1\) on the recurrence

This recurrence scheme can be exploited in order to find directly the \(C_n\) without any recurrence if the commutator between \(X\) and \(Y\) is appropriate. If \(X\) and \(Y\) are two elements of an algebra such that their commutator verify \([X, Y] = uX + vY + c1\). It is then obvious that \([X, [X, Y]] = v[X, Y]\) and \([Y, [X, Y]] = -u[X, Y]\). And \(F_1\) can be written,

\[
F_1(t) = e^{-t^{ad} (e^{-t^{ad} X} - 1)} Y = \frac{e^{tu} (e^{-tv} - 1)}{v} [X, Y].
\]

(43)
Let’s demonstrate by recurrence that $F_n$ is always proportional to the commutator $[X, Y]$, so that $F_n = \beta_n(t)[X, Y]$ where $\beta_n$ is a function depending on $t$. The initialization is clear since $F_1(t) = e^{tu(e^{-tv} - 1)} [X, Y]$. We wish to express $F_{n+1}(t)$ defined by

$$F_{n+1}(t) = e^{-tn} ad_{C_{n+1}} \left( F_n(t) - \frac{t^n}{n!} F_n^{(n)}(0) \right).$$

But according to the recurrence hypothesis,

$$C_{n+1} = \frac{1}{n+1}! \left( \frac{\partial^n}{\partial t^n} \beta_n \right) (0)[X, Y].$$

So that the adjoint operator is commuting with the term is acts on, leading to the simplification

$$F_{n+1}(t) = \left[ \beta_n(t) - \frac{t^n}{n!} \left( \frac{\partial^n}{\partial t^n} \beta_n \right) (0) \right] [X, Y],$$

so that,

$$\beta_{n+1}(t) = \beta_n(t) - \frac{t^n}{n!} \left( \frac{\partial^n}{\partial t^n} \beta_n \right) (0).$$

The $F_n$ being of the form $F_n = \beta_n[X, Y]$, one can express directly the coefficients $C_n$. 

9.1. Expression of the closed Zassenhaus formula

It is now possible to find a closed form of Zassenhaus formula in summing up all the $C_n$. The coefficients $C_{n+1}$ can be expressed $\forall n \geq 1$,

$$C_{n+1} = \frac{1}{(n+1)!} \left( \frac{\partial^n}{\partial t^n} \beta_n \right) (0)[X, Y].$$

According to (47),

$$\frac{\partial^{n+1}}{\partial t^{n+1}} \beta_{n+1} = \frac{\partial^n}{\partial t^n} \beta_n.$$  

From them on $\forall n \geq 1$,

$$C_{n+1} = \frac{1}{(n+1)!} \left( \frac{\partial^n}{\partial t^n} \beta_n \right) (0)[X, Y] = \frac{1}{(n+1)!} \left( \frac{\partial^n}{\partial t^n} \beta_1 \right) (0)[X, Y],$$

$$= \frac{1}{(n+1)!} \left( \frac{\partial^n}{\partial t^n} e^{tu(e^{-tv} - 1)} \right) (0)[X, Y].$$

Using a Cauchy product one can develop in whole series $\frac{e^{tu(e^{-tv} - 1)}}{v}$.

$$\frac{e^{tu(e^{-tv} - 1)}}{v} = \frac{1}{v} \sum_{k=0}^{\infty} \sum_{s=0}^{k} \left( \frac{u^s}{s!} \frac{(-v)^{k-s}}{(k-s)!} \right) t^k - \frac{1}{v} \sum_{k=0}^{\infty} \frac{u^k}{k!} t^k.$$

Hence,
\[ \frac{\partial^n}{\partial t^n} \left( \frac{e^{tu}(e^{-tv} - 1)}{v} \right) = \sum_{k=0}^{\infty} \frac{k!}{(k-n+1)!} \left[ \frac{1}{v} \left( \sum_{s=0}^{k} \frac{u^s (-v)^{k-s}}{s! (k-s)!} \right) - \frac{u^k}{k!} \right] t^{k-n}, \tag{52} \]

and,

\[ \frac{\partial^n}{\partial t^n} \left( \frac{e^{tu}(e^{-tv} - 1)}{v} \right) (0) = n! \left( \frac{1}{v} \left( \sum_{s=0}^{n} \frac{u^s (-v)^{n-s}}{s! (n-s)!} \right) - \frac{u^n}{n!} \right), \tag{53} \]

This leads to \( \forall n \geq 1 \)

\[ C_{n+1} = \frac{1}{(n+1)!} \frac{1}{v} ((u-v)^n - u^n). \tag{54} \]

Hence, one can get the series,

\[ \sum_{n=2}^{\infty} C_n = \sum_{n=1}^{\infty} C_{n+1} = \sum_{n=1}^{\infty} \frac{1}{(n+1)!} \frac{1}{v} ((u-v)^n - u^n) = \frac{1}{v(u-v)} \sum_{n=1}^{\infty} \frac{(u-v)^{n+1}}{(n+1)!} - \frac{1}{vu} \sum_{n=1}^{\infty} \frac{u^{n+1}}{(n+1)!}, \]

\[ = \frac{1}{v(u-v)} \sum_{n=2}^{\infty} \frac{(u-v)^n}{n!} - \frac{1}{vu} \sum_{n=2}^{\infty} \frac{u^n}{n!} = \frac{1}{v(u-v)} (e^{u-v} - 1 - (u-v)) - \frac{1}{vu} (e^n - 1 - u), \tag{55} \]

and obtain the closed form of the Zassenhaus formula given by equations (7) and (8).

**Conclusion**

We demonstrated a new closed form of Zassenhaus formula for a special commutator, this closed form can be expressed in three forms, a right-sided, left-sided and centered formula. This formula proves to be useful in quantum mechanics, for instance to disentangle operators. We hope this formula can be useful in a broad range of contexts, notably in quantum mechanics.

**Acknowledgement**

It is a great pleasure to thank Jean-Christophe Pain to have sparked the interest of the author in closed forms of Baker-Campbell-Hausdorff formula. It is also a pleasure to thank Adolfo del Campo and Iñigo Luis Egusquiza for bright comments. The author would like to acknowledge DIPC for financial support at early stage of this work.
