GENERATING FUNCTIONS OF THE HURWITZ CLASS NUMBERS ASSOCIATED WITH CERTAIN MOCK THETA FUNCTIONS

DANDAN CHEN AND RONG CHEN

Abstract. We find the Hecke-Rogers type series representations of generating functions of the Hurwitz class numbers which is very close to certain mock theta functions. We also prove two combinatorial interpretation of Hurwitz class numbers appeared on OEIS.

1. Introduction

Following [11, Section 5.3], we define the Hurwitz class number $H(N)$, Where $N$ is a non-negative integer, as follows.

1. If $N \equiv 1, 2 \pmod{4}$ then $H(N) = 0$.
2. If $N = 0$ then $H(0) = -1/12$.
3. If $N > 0$, $N \equiv 0, 3 \pmod{4}$, then $H(N)$ is the class number of positive definite binary quadratic forms of discriminant $-N$, with those classes that contain a multiple of $x^2 + y^2$ or $x^2 + xy + y^2$ counted with weight $1/2$ or $1/3$, respectively.

For the modular behaviors, we use Kronecker’s notation [19] $F(n)$ satisfying $F(8n + 7) = H(8n + 7)$ and $F(8n + 3) = 3H(8n + 3)$, see also [23] where denote $H(n)$ as $F_1(n)$. The generating functions of $F(an + b)$ define as

$$\mathcal{F}_{a,b}(q) := \sum_{n=0}^{\infty} F(an + b)q^n.$$ 

The generating functions of $H(n)$ (or $F(n)$) were studied by many authors. For example, Humbert [18] showed lots of identities by using theory of quadratic form. Watson [23] studied the transformations of such generating functions by Mordell integrals. Hirzebruch and Zagier [17, Section 2.2] discussed the relation between the generating functions and certain weight $3/2$ modular forms. On the other hand, Zwegers [26] found that mock theta functions is related to weight $1/2$ modular forms. In this paper, we find some similar results between the generating functions of Hurwitz class numbers and certain mock theta functions.

Mock theta functions were first mentioned by Ramanujan in his last letter to Hardy in 1920 as Eulerian forms. To study the modular behaviors, many authors such as Watson [24, 25], Andrews [2], Andrews and Hickerson [3], Berndt and Chan [4], Choi [7, 8, 9, 10], Garvan [13], Gordon and McIntosh [14], Hickerson [15] and Zwegers [27] find the Appell-Lerch series and Hecke-Rogers series of mock theta functions. In a recent work, Hickerson
and Mortenson [16] using the “m-block” to list the Appell-Lerch series of all the mock theta functions.

As they are half-integer lower weight “mock modular forms”, we study $F_{a,b}(q)$ by following one of the method of studying mock theta functions, to find the Hecke-Rogers series of some of $F_{a,b}(q)$. Something amazing is that the Hecke-Rogers series we find are quite close to certain mock theta functions.

See example [6], we know that $F_{8,3}(q)$, $F_{24,7}(q)$, $F_{24,11}(q)$ and $F_{24,19}(q)$ are nice eta-quotients, and $F_{4,-1}(q)$, $F_{8,-1}(q)$, $F_{12,-1}(q)$ and $F_{24,-1}(q)$ are associated with the eighth order mock theta function $V_1(q)$, the second order mock theta function $A(q)$, the sixth order mock theta function $\sigma(q)$ and the sixth order mock theta function $\phi_-(q)$ modulo 4, respectively.

In Section 2, we introduce the preparation in our works, including Appell-Lerch series, Garvan’s MAPLE packages and derivative of certain theta functions.

In Section 3, we find further connections between Hurwitz class numbers and certain mock theta functions. Let

$$A(q) := \sum_{n=0}^{\infty} \frac{q^{(n+1)^2}(-q; q^2)_n}{(q; q^2)_n^2}$$

be one of the second order mock theta functions (see [20]), where we always assume that $|q| < 1$ and in common

$$(a; q)_n = \prod_{k=1}^{n} (1 - aq^{k-1}).$$

Cui, Gu and Hao [12, Eq. (2.24)] showed the Hecke-Rogers series of $A(q)$ and we rewrite it as

$$\frac{J_1^2}{J_2} A(q) = \sum_{1 \leq j \leq |n|} sg(n)(-1)^{n-1} q^{2n^2-n-j^2+j},$$

where, as usual, $sg(n) = 1$ if $n \geq 0$ and $sg(n) = -1$ if $n < 0$ and

$$J_k := (q^k; q^k)_\infty.$$

For $F_{8,-1}(q)$, there is a similar identity

$$\frac{J_1^2}{J_2} F_{8,-1}(q) = \sum_{1 \leq j \leq |n|} sg(n)(-1)^{j-1}(2j - 1) q^{2n^2-n-j^2+j},$$

which appeared in [18, P.376]. (1.2) is quite close to (1.1) and we find a $z$-analog of this two identities

$$(zq, q/z, q^2; q^2)_\infty F_8(z, q) = \sum_{1 \leq j \leq |n|} sg(n)(-1)^{j-1} q^{2n^2-n-j^2+j} \frac{z^{1-j} - z^j}{1 - z},$$
where

\begin{align}
F_8(z, q) &= \sum_{n=0}^{\infty} \frac{(-1)^n (q; q^2)_n q^{(n+1)^2}}{(zq, q/z; q^2)_{n+1}}. 
\end{align}

Our proof is based on the formulas of generating functions of Hurwitz class numbers by Alfes, Bringmann and Lovejoy [11], then use the formulas of Appell-Lerch series by Hickerson and Mortenson [16]. [1, Eq. (1.5)] showed that \(F_8(1, q) = F_{8,-1}(q)\) as a special case of \(N^0(a, b; z; q)\) in their paper. Setting \((z, q) = (1, q)\) and \((z, q) = (-1, -q)\), noting that \(F_8(-1, -q) = -A(q)\), (1.3) yields (1.2) and (1.1), respectively. Furthermore, we also find a Appell-Lerch series of \(F_8(z, q)\) which is

\begin{align}
(z^2 q^2, q^2/z^2, q^4; q^4)_\infty F_8(z, q) &= \sum_{k=-\infty}^{\infty} \frac{(-1)^k q^{2k} z^{1-2k - z^{2k}}} {1 + q^{2k-1} 1 - z},
\end{align}

Recall the eighth order mock theta function \(V_1(q)\) [14]

\begin{align}
V_1(q) &= \sum_{n=0}^{\infty} \frac{q^{(n+1)^2} (-q; q^2)_n} {(q; q^2)_{n+1}},
\end{align}

and two sixth order mock theta functions \(\sigma(q)\) [3] and \(\phi_-(q)\) [4]

\begin{align}
\sigma(q) &= \sum_{n=0}^{\infty} \frac{q^{(n+1)(n+2)/2} (-q; q)_n} {(q; q^2)_{n+1}},
\end{align}

\begin{align}
\phi_-(q) &= \sum_{n=1}^{\infty} \frac{q^n (-q; q)_{2n-1}} {(q; q^2)_n}.
\end{align}

We also find and prove Hecke-Rogers series of \(\mathcal{F}_{a,-1}(q)\), \((a = 4, 12, 24)\) which is close to these three mock theta functions, which is

\begin{align}
\frac{J_1 J_4}{J_2} \mathcal{F}_{4,-1}(q) &= \sum_{1 \leq j \leq n} (-1)^{n-1+j(j-1)/2} n q^{n^2-j(j-1)/2},
\end{align}

\begin{align}
\frac{J_1^2}{J_2} \mathcal{F}_{12,-1}(q) &= \sum_{1-|n| \leq j \leq |n|} \text{sg}(n) (-1)^{j-1} (4n - 1) q^{4n^2 - 2n - 3j^2 + 2j},
\end{align}

and

\begin{align}
\frac{J_1^2}{J_2} \mathcal{F}_{24,-1}(q) &= \sum_{1-|n| \leq j \leq |n|} \text{sg}(n) (-1)^{n-1} (4j - 1) q^{3n^2 - n - 2j^2 + j}.
\end{align}

In the final section, we prove combinatorial interpretation of \(F(4n - 1)\) and \(H(8n - 1)\) appeared on OEIS.
2. Preparation

2.1. Appell-Lerch series. Following [16], we define

\[ j(x; q) := (x, q/x, q; q) = \sum_{n=0}^{\infty} (-1)^n q^{n(n+1)/2} x^n, \]

where in common \((a_1, a_2, \ldots, a_k; q)_n := (a_1; q)_n(a_2; q)_n(\ldots(a_k; q)_n, \text{ and the Appell-Lerch series} \]

\[ m(x, q, z) := \frac{1}{j(z; q)} \sum_{r=-\infty}^{\infty} \frac{(-1)^r q^{r(r+1)/2} z^r}{1 - q^{-r} xz}, \]

and the "building block" of mock theta functions

\[ f_{a,b,c}(x, y, q) := \sum_{s(q) = s(q)} s(q)(-1)^{r+s} x^r y^s q^{ar(r-1)/2 + brs + cs(s-1)/2}, \]

and

\[ g_{a,b,c}(x, y, q, z_1, z_2) \]

\[ := \sum_{t=0}^{a-1} (-y)^t q^{ct(t-1)/2} j(q^{bt}; q^a) m(-q^{ob(b+1)/2 - ca(a+1)/2 - t(b^2 - ac)} (-y)^a \]

\[ \times (-x)^b, q^{ob(b+1)/2 - ac(a+1)/2 - t(b^2 - ac)} (-y)^c, q^{ob(b+1)/2 - ac(a+1)/2 - t(b^2 - ac)} (-z)^d, q^{ob(b+1)/2 - ac(a+1)/2 - t(b^2 - ac)} \]

We will use the formulas of Appell-Lerch series in [16] such as the following theorems. Let \( n = 1 \) in [16, Theorem 1.16]

**Theorem 2.1.** For generic \( x, y \in \mathbb{C}^* \)

\[ f_{1,2,1}(x, y, q) = g_{1,2,1}(x, y, q, y/x, x/y). \]

Let \( n = 1 \) in [16, Theorem 1.11]

**Theorem 2.2.** For generic \( x, y \in \mathbb{C}^* \)

\[ f_{1,5,1}(x, y, q) = g_{1,5,1}(x, y, q, y/x, x/y) - \Theta_{1,4}(x, y, q), \]

where

\[ \Theta_{1,4}(x, y, q) := \frac{-qxy j(y/x; q^{24})}{j(y/x; q^{24}) j(-q^{10} x^4; q^{24}) j(-q^{10} y^4; q^{24})} \left( j(q^4; q^{16}) S_1 - q j(q^8; q^{16}) S_2 \right), \]

with

\[ S_1 := \frac{j(q^{22} x^2 y^2; q^{24}) j(-q^{12} y/x; q^{24}) j(q^5 xy; q^{12})}{J_{12} J_{24}} \left( j(-q^{10} x^2 y^2; q^{24}) j(q^{12} y^2/x^2; q^{24}) J_{24}^2 \right.

\[ + \frac{q^{5} x^2 j(-q^{22} x^2 y^2; q^{24}) j(q^{12} y/x; q^{24})^2 j(-y/x; q^{24})}{J_{24}^2} \right), \]
Proposition 2.3. For generic $x, z \in \mathbb{C}^*$

\[ m(x, q, z) = m(x, q, qz), \]
\[ m(x, q, z) = x^{-1}m(x^{-1}, q, z^{-1}), \]
\[ m(qx, q, z) = 1 - xm(x, q, z), \]
\[ m(x, q, z) = 1 - q^{-1}xm(q^{-1}x, q, z), \]
\[ m(x, q, z) = x^{-1} - x^{-1}m(qx, q, z). \]

Theorem 2.4. For generic $x, z_0, z_1 \in \mathbb{C}^*$

\[ m(x, q, z_1) - m(x, q, z_0) = \frac{z_0J_1^2j(z_1/z_0; q)j(xz_0z_1; q)}{j(z_0; q)j(z_1; q)j(xz_0; q)j(xz_1; q)}. \]

Corollary 2.5. For generic $x, z \in \mathbb{C}^*$

\[ m(x, q, z) = m(-qx^2, q^4, z^4) - \frac{x}{q}m(-x^2/q, q^4, q^4) - \frac{J_2J_4j(-xz^2; q)j(-xz^2; q)}{xj(xz; q)j(z^4; q^4)j(-qx^2z^4; q^2)}. \]

2.2. Garvan’s MAPLE package. Define the usual Atkin $U_p$ operator which acts on a formal power series

\[ f(q) = \sum_{n \in \mathbb{Z}} a(n)q^n, \]

by

\[ U_p(f(q)) = \sum_{n \in \mathbb{Z}} a(pn)q^n. \]

We will use Garvan’s MAPLE programs to prove identities in this paper. The programs rely on theory of modular functions. For details, see [3, Section 2]. Identities which have only eta-quotients (or with $U_p$ operator) can be proved by ETA-package algorithmically, see

(2.1) https://qseries.org/fgarvan/qmaple/ETA/
2.3. Derivative of theta functions. We also need the derivative of certain theta functions.

Lemma 2.6.

\[(2.2)\] \[\frac{d}{dz} j(\pm zq; q^2) \big|_{z=1} = 0.\]

Proof. By

\[j(zq; q^2) = \sum_{n=-\infty}^{\infty} (-1)^n q^{n^2} z^n,\]

we have

\[\frac{d}{dz} j(zq; q^2) \big|_{z=1} = \sum_{n=-\infty}^{\infty} (-1)^n n q^{n^2} = 0,\]

and replacing \(q\) by \(-q\)

\[\frac{d}{dz} j(-zq; q^2) \big|_{z=1} = \sum_{n=-\infty}^{\infty} n q^{n^2} = 0.\]

\[\square\]

Using the results by Oliver [22, Theorem 1.1], we can prove more identities like (2.2).

Lemma 2.7.

\[(2.3)\] \[\frac{d}{dz} \left(\frac{1}{z} j(z^6 q; q^3)\right) \big|_{z=1} = -\frac{J_4}{J_3} - 9q \frac{J_3^3 J_4}{J_3},\]

\[(2.4)\] \[\frac{d}{dz} \left(\frac{1}{z} j(-z^6 q; q^3)\right) \big|_{z=1} = -\frac{J_5}{J_2}.\]

Proof. Similar to Lemma 2.6

\[\frac{d}{dz} \left(\frac{1}{z} j(z^6 q; q^3)\right) \big|_{z=1} = \sum_{n=-\infty}^{\infty} (-1)^n (6n - 1) q^{n(3n-1)/2}.\]

By the result of Oliver [22, Theorem 1.1], we have

\[J_3^3 = \sum_{n=1}^{\infty} (-1)^{n-1} (2n - 1) q^{n(n-1)/2}.\]

So that by 3-dissection of \(J_3^3\)

\[U_3(J_3^3) = \sum_{n=-\infty}^{\infty} (-1)^{n-1} (6n - 1) q^{n(3n-1)/2}.\]

Then

\[\frac{d}{dz} \left(\frac{1}{z} j(z^6 q; q^3)\right) \big|_{z=1} = -U_3(J_3^3) = -\frac{J_4^4}{J_3} - 9q \frac{J_3^3 J_4}{J_3},\]
where the last equation was verified by MAPLE (2.1). Also by [22, Theorem 1.1]
\[
\frac{d}{dz} \left( \frac{1}{z^j} j(-z^6 q; q^3) \right) \bigg|_{z=1} = \sum_{n=-\infty}^{\infty} (6n-1)q^{(3n-1)/2} = -\frac{J_5^5}{J_2^2}.
\]

The following two lemmas can also be proved by [22, Theorem 1.1] and [22, Theorem 1.2]. Since the proofs are similar to (2.7), we omit the proofs.

**Lemma 2.8.**
\[
\frac{d}{dz} \left( \frac{1}{z^j} j(z^4 q; q^4) \right) \bigg|_{z=1} = -\frac{J_2^9}{J_1^2 J_3^3},
\]
\[
\frac{d}{dz} \left( \frac{1}{z^j} j(-z^4 q; q^4) \right) \bigg|_{z=1} = -J_1^3.
\]

**Lemma 2.9.**
\[
\frac{d}{dz} \left( \frac{1}{z^j} j(z^3 q; q^6) \right) \bigg|_{z=1} = -\frac{J_2^5}{J_1^2},
\]
\[
\frac{d}{dz} \left( \frac{1}{z^j} j(-z^3 q; q^6) \right) \bigg|_{z=1} = -\frac{J_2^5 J_1^2}{J_2^2}.
\]

The case for \(q^{12}\) may be slightly more complicated.

**Lemma 2.10.**
\[
\frac{d}{dz} \left( \frac{1}{z^j} j(-z^{12} q^5; q^{12}) \right) \bigg|_{z=1} = -\frac{1}{2} \left( \frac{J_4^4}{J_3^2} + \frac{9qJ_9^3 J_1}{J_3} + \frac{J_1^5}{J_2^2} \right),
\]
\[
\frac{d}{dz} \left( \frac{1}{z^5 j(-z^{12} q; q^{12})} \right) \bigg|_{z=1} = -\frac{1}{2} \left( \frac{J_4^4}{qJ_3} + \frac{9J_9^3 J_1}{J_3} - \frac{J_1^5}{qJ_2^2} \right).
\]

**Proof.** Let
\[
f(z) := \frac{1}{z^j} j(-z^{12} q^5; q^{12}),
\]
and
\[
g(z) := \frac{1}{z^5} j(-z^{12} q; q^{12}).
\]
Then it’s easy to see that
\[
f(z) + qg(1/z) = \frac{1}{z^j} j(-z^6 q; q^3),
\]
and
\[
f(z) - qg(1/z) = \frac{1}{z^j} j(z^6 q; q^3).
\]
So that by (2.3) and (2.4)
\[
f'(1) - qg'(1) = -\frac{J_1^5}{J_2^2}.
\]
and
\[ f'(1) + qg'(1) = -\frac{J_4}{J_3} - \frac{9qJ_9^3J_1}{J_3}. \]
Hence the lemma holds. \(\square\)

Replacing \(q\) by \(-q\) in (2.9) and (2.10) we have

\begin{equation}
(2.11) \quad \frac{d}{dz} \left( \frac{1}{z} j(z^{12}; q^{12}) \right) \bigg|_{z=1} = -\frac{1}{2} \left( \frac{J_{12}J_3J_2^{12}}{J_6^3J_4^4J_1^4} - \frac{9qJ_9^0J_{12}J_3J_2^3}{J_3^3J_9^3J_6^3J_4J_1} + \frac{J_2^{13}}{J_4^5J_1^5} \right),
\end{equation}

\begin{equation}
(2.12) \quad \frac{d}{dz} \left( \frac{1}{z^5} j(z^{12}q; q^{12}) \right) \bigg|_{z=1} = \frac{1}{2} \left( \frac{J_{12}J_3J_2^{12}}{qJ_6^3J_4^4J_1} - \frac{9J_{12}^0J_{12}J_3J_2^3}{J_3^3J_9^3J_6^3J_4J_1} - \frac{J_2^{13}}{qJ_4^5J_1^5} \right).
\end{equation}

Finally, it is easy to see that

\begin{equation}
(2.13) \quad \frac{d}{dz} \left( \frac{1}{z} j(-z^2; q) \right) \bigg|_{z=1} = 0.
\end{equation}

3. Hecke-Rogers series

3.1. Hecke-Rogers series of \(\mathcal{F}_{4,-1}(q)\). Following Alfes, Bringmann and Lovejoy \[1\], define

\[ F_4(z, q) := -N^o(1, -1/q, -z, -q) = \sum_{n=0}^{\infty} (-1)^n(q; q)_{2n}z^{n+1}, \]

and \[1\] showed \(F_4(1, q) = \mathcal{F}_{4,-1}(q)\) and \(F_4(i, -q) = -V_i(q)\). Mortenson \[21\, Eq. (2.12)\] also studied this function and showed the Appell-Lerch series

\begin{equation}
(3.1) \quad \left(1 - \frac{1}{z}\right) F_4(z, q) = m(-z, q^2, -q).
\end{equation}

The following theorem is equivalent to (3.1).

**Theorem 3.1.** For \(z \in \mathbb{C}^*\) and \(z \neq 1\), we have

\begin{equation}
(3.2) \quad (zq, q/z, q^2; q^2)_{\infty} F_4(z, q) = \frac{1}{1-z} \sum_{k=-\infty}^{\infty} \frac{(-1)^{k-1}q^{k^2}}{1 + q^{2k-1}} z^{1-k} = -\frac{1}{1-z} \sum_{k=-\infty}^{\infty} \frac{(-1)^{k-1}q^{k^2}}{1 + q^{2k-1}} z^k
\end{equation}

\[ = \sum_{k=1}^{\infty} \frac{(-1)^{k-1}q^{k^2}}{1 + q^{2k-1}} \cdot \frac{z^{1-k} - z^k}{1 - z}. \]

**Proof.** By Theorem 2.4

\[ m(-z, q^2, -q) = m(-z, q^2, q/z). \]

And by Proposition 2.3

\[ m(-z, q^2, q/z) = -\frac{1}{z} m(-1/z, q^2, z/q) = -\frac{1}{z} m(-1/z, q^2, qz). \]

Then (3.2) holds obviously. \(\square\)
Letting $z \to 1$ in (3.2) we have the Appell-Lerch series of $\mathcal{F}_{4,-1}(q)$

**Corollary 3.2.**

(3.3) $\frac{J_1^2}{J_2} \mathcal{F}_{4,-1}(q) = \sum_{k=1}^{\infty} \frac{(-1)^{k-1}(2k-1)q^{k^2}}{1 + q^{2k-1}}.$

Then we prove the Hecke-Rogers series of $F_4(z, q)$.

**Theorem 3.3.** For $z \in \mathbb{C}^*$ and $z \neq 1$, we have

(3.4) $(-zq, -1/z, q; q)_\infty F_4(z, -q) = \sum_{1 \leq j \leq n} q^{n^2 - j(j-1)/2} \frac{z^n - z^{-n}}{1 - z}.$

**Proof.** Replacing $q$ by $-q$ in (3.2), we have

$(-zq, -q/z, q^2; q^2)_\infty F_4(z, -q) = \frac{1}{1 - z} \sum_{k=-\infty}^{\infty} \frac{q^{k^2}}{1 - q^{2k-1}} z^k.$

So that (3.4) is equivalent to

(3.5) $(-zq, -1/z, q; q)_\infty \sum_{k=-\infty}^{\infty} \frac{q^{k^2}}{1 - q^{2k-1}} z^k = (-zq, -q/z, q^2; q^2)_\infty \sum_{1 \leq j \leq |n|} sg(n) q^{n^2 - j(j-1)/2} z^n.$

Noting that

$\frac{(-zq, -1/z, q; q)_\infty}{(-zq, -q/z, q^2; q^2)_\infty} = \frac{J_1}{J_2} (-zq^2, -1/z; q^2)_\infty,$

(3.5) can be simplify as

$$\sum_{m=-\infty}^{\infty} q^{m(m+1)} z^m \sum_{k=-\infty}^{\infty} \frac{q^{k^2}}{1 - q^{2k-1}} z^k = \frac{J_2^2}{J_1} \sum_{1 \leq j \leq |n|} sg(n) q^{n^2 - j(j-1)/2} z^n.$$
(2) For all \( n \in \mathbb{N} \)
\[
\frac{B_{n+1}}{q^{(n+1)^2}} - \frac{B_n}{q^{n^2}} = q^{-\frac{n(n+1)}{2}} J_2^2 / J_1.
\]
Noting that (1) implies \( B_0 = 0 \). If \( A_n \) also satisfy (1) and (2), then \( A_n = B_n \) for all \( n \in \mathbb{Z} \) by mathematical induction.

\[
A_{-n} = \sum_{k=-\infty}^{\infty} \frac{q^{k^2 + (-n-k)(-n-k+1)}}{1 - q^{2k-1}} = - \sum_{k=-\infty}^{\infty} \frac{q^{k^2 + (n-k)(n-k+1)}}{1 - q^{2k-1}} = -A_n,
\]
by replacing \( k \) by \( 1-k \). So that \( A_n \) satisfy (1).

\[
A_n = \sum_{k=-\infty}^{\infty} \frac{q^{k^2 + (n-k)(n-k+1)}}{1 - q^{2k-1}} = q^{n^2} \sum_{k=-\infty}^{\infty} \frac{q^{(k-n)(2k-1)}}{1 - q^{2k-1}}.
\]
So that

\[
\frac{A_{n+1}}{q^{(n+1)^2}} - \frac{A_n}{q^{n^2}} = \sum_{k=-\infty}^{\infty} \frac{q^{(k-n-1)(2k-1)}}{1 - q^{2k-1}} - \frac{q^{(k-n)(2k-1)}}{1 - q^{2k-1}} = \sum_{k=-\infty}^{\infty} q^{(k-n-1)(2k-1)}.
\]
Let

\[
C_n := \sum_{k=-\infty}^{\infty} q^{(2k-n)(2k+1-n)/2} = \sum_{k=-\infty}^{\infty} q^{(k-n-1)(2k-1)+n(n+1)/2}.
\]
Then

\[
C_{n+1} = \sum_{k=-\infty}^{\infty} q^{(2k-n-1)(2k-n)/2} = \sum_{k=-\infty}^{\infty} q^{(2(n-k)-n+1)(2(n-k)-n)/2} = C_n.
\]
So that

\[
C_n = C_0 = \frac{J_2^2}{J_1}.
\]
By (3.6) - (3.8)

\[
\frac{A_{n+1}}{q^{(n+1)^2}} - \frac{A_n}{q^{n^2}} = q^{-\frac{n(n+1)}{2}} C_n = q^{-\frac{n(n+1)}{2}} \frac{J_2^2}{J_1},
\]
and \( A_n \) satisfy (2). Hence \( A_n = B_n \) for all \( n \in \mathbb{Z} \) and (3.5) holds. □

(3.4) yields the Hecke-Rogers series of \( V_1(q) \) by \( z = i \), which is equivalent to [12, Eq. (2.37)]

\[
\frac{J_1 J_4}{J_2} V_1(q) = \sum_{1 \leq j \leq n} \left( \frac{-4}{n} \right) q^{n^2 - j(j-1)/2},
\]
where \( (\cdot) \) denote the Kronecker symbol. Replacing \( q \) by \( -q \) and letting \( z \rightarrow 1 \) in (3.4) we have the Hecke-Rogers series of \( \mathcal{F}_{4,-1}(q) \) which is close to (3.9).
Corollary 3.4.
\[
\frac{J_1J_4}{J_2} \mathcal{H}_{4,-1}(q) = \sum_{1 \leq j \leq n} (-1)^{n-1+j(j-1)/2} nq^{n^2-j(j-1)/2}.
\]

3.2. Hecke-Rogers series of \( \mathcal{F}_{8,-1}(q) \). Let
\[
F_8(z, q) := \sum_{n=0}^{\infty} (-1)^n (q^2; q)_{n} (q^{n+1})^2 \frac{(zq, q/z; q^2)_{n+1}}{(z, q; q^2)_{n+1}}.
\]

This function was also studied by Alfes, Bringmann and Lovejoy \cite{alfes} where showed that
\( F_8(1, q) = N^0(0, -1, 1, q) = \mathcal{F}_{8,-1}(q) \) and \( F_8(-1, -q) = -N^0(0, 1, 1, q) = -A(q) \) in page 3, and Mortenson \cite{mortenson} where showed the the Appell-Lerch series of \( F_8(z, q) \). In this subsection, again, we use the formulas of Appell-Lerch series to rewrite \( F_8(z, q) \) as another form and then prove the Hecke-Rogers identity.

Lemma 3.5. If \( z \in \mathbb{C}^* \) is not an integral power of \( q \), then
\[
m(-z, q, -1) = m(-qz^2, q^4, q^2/z^2) - \frac{1}{z} m(-q/z^2, q^4, q^2z^2) + \frac{j(q; q^2)^2}{2j(z; q)}. \tag{3.10}
\]

Proof. Setting \( x = -z, z_1 = -1 \) and \( z_0 = \sqrt{z/q} \) in Theorem 2.4, we have
\[
m(-z, q, -1) = m(-z, q, \sqrt{z/q}) + \frac{j(q; q^2)^2}{2j(z; q)}. \tag{3.11}
\]
Then by Corollary 2.5 and Proposition 2.3
\[
m(-z, q, \sqrt{z/q}) = m(-qz^2, q^4, q^2/z^2) + \frac{z}{q} m(-z^2/q, q^4, q^2/z^2) \\
= m(-qz^2, q^4, q^2/z^2) - \frac{1}{z} m(-q/z^2, q^4, z^2/q^2) \\
= m(-qz^2, q^4, q^2/z^2) - \frac{1}{z} m(-q/z^2, q^4, q^2z^2). \tag{3.12}
\]

(3.10) holds by (3.11) and (3.12). \( \square \)

Theorem 3.6. For \( z \in \mathbb{C}^* \) and \( z \neq 1 \), we have
\[
(z^2q^2, q^2/z^2, q^4; q^4)_{\infty} F_8(z, q) = \sum_{k=-\infty}^{\infty} \frac{(-1)^k q^{2k^2}}{1 + q^{4k-1}} \cdot \frac{z^{1-2k} - z^{2k}}{1 - z}. \tag{3.13}
\]

Proof. If \( z \) is an integral power of \( q \), it is easy to check both sides of (3.6) are zero. For \( z \) is not an integral power of \( q \), setting \( x = -z \) in \cite{mortenson} Eq. (2.15)
\[
F_8(z, q) = \frac{-z}{1 - z} \left( m(-z, q, -1) - \frac{j(q; q^2)^2}{2j(z; q)} \right).
\]
By Lemma 3.5
\[
F_8(z, q) = \frac{1}{1 - z} \left( m(-q/z^2, q^2, z^2) - zm(-q^2, q^4, z^2) \right)
\]
\[
= \frac{1}{j(q^2z^2; q^4)} \sum_{k=-\infty}^{\infty} (-1)^{k-1}q^{2k^2} \cdot \frac{1 + q^{4k-1}}{z^{1-2k} - z^{2k}}.
\]
which is (3.13). □

Letting \( z \to 1 \), (3.13) yields

**Corollary 3.7.**

\[
\frac{J_2}{J_4} F_8, -1(q) = \sum_{k=-\infty}^{\infty} (-1)^{k-1}(4k - 1)q^{2k^2} \frac{1}{1 + q^{4k-1}}.
\]

And (3.13) yields [16, Eq. (5.1)]

\[
\frac{J_2}{J_4} A(q) = \sum_{k=-\infty}^{\infty} (-1)^{k-1}q^{2k^2} \frac{1}{1 - q^{4k-1}},
\]

by replacing \( q \) by \(-q\) and \( z = -1\). These easily imply that [6, Lemma 3.1]

\[
F_8, -1(q) \equiv -A(-q) \pmod{4}.
\]

**Theorem 3.8.** For \( z \in \mathbb{C}^* \) and \( z \neq 1 \), we have

\[
(zq/qz, q^2; q^2) \sum_{1 \leq j \leq |n|} sg(n)(-1)^{j-1}q^{2n^2-n-j^2+j} \cdot \frac{z^{1-j} - z^j}{1 - z}.
\]

**Proof.** By Theorem 3.6 (3.15) is equivalent to for \( z \in \mathbb{C}^* \)

\[
(1 - z)F_8(z, q) = \left( z^2q^2, q^2/z^2, q^4; q^4 \right) \sum_{k=-\infty}^{\infty} (-1)^{k-1}q^{2k^2} \frac{1 + q^{4k-1}}{z^{1-2k} - z^{2k}}
\]

\[
= \left( zq, q/z, q^2; q^2 \right) \sum_{1 \leq j \leq |n|} sg(n)(-1)^{j-1}q^{2n^2-n-j^2+j} \cdot \frac{z^{1-j} - z^j}{1 - z},
\]

which can be simplify as

\[
\sum_{m=-\infty}^{\infty} (-1)^m q^{2m^2} \sum_{k=-\infty}^{\infty} (-1)^{k-1}q^{2k^2} \frac{1 + q^{4k-1}}{z^{1-2k} - z^{2k}}
\]

\[
= \sum_{m=-\infty}^{\infty} q^{m^2}z^m \sum_{1 \leq j \leq |n|} sg(n)(-1)^{j-1}q^{2n^2-n-j^2+j} \cdot \frac{z^{1-j} - z^j}.
Denote \( A_k \) and \( B_k \) be the coefficients of \( z^k \) on both sides. It is easy to see that

\[
A_{2k} = -A_{1-2k} = \frac{J_2^2}{J_4} \cdot \frac{(-1)^k q^{2k^2}}{1 + q^{4k-1}}.
\]

For \( B_k \), by (3.16) we have

\[
B_k = \sum_{1 \leq j \leq |n|} sg(n) (-1)^{j-1} q^{2n^2 - n - j^2 + j} \left( q^{(k-1 + j)^2} - q^{(k-j)^2} \right).
\]

So we can verify that

\[
B_{2k} = -B_{1-2k},
\]

and

\[
B_{2k} = \sum_{1 \leq j \leq |n|} sg(n) (-1)^{j-1} q^{2n^2 - n - j^2 + j} \left( q^{(2k-1 + j)^2} - q^{(2k-j)^2} \right)
\]

\[
= \sum_{n=-\infty}^\infty sg(n) q^{4k^2 + 2n^2 - n} \left( \frac{1 - (-1)^n q^{n|n|/(4k-1)}}{1 + q^{4k-1}} - \frac{1 - (-1)^n q^{-n|n|/(4k-1)}}{1 + q^{4k-1}} \right)
\]

\[
= \frac{q^{4k^2}}{1 + q^{4k-1}} \sum_{n=-\infty}^\infty sg(n) (-1)^n q^{2n^2 - n} \left( q^{n|n|/(4k-1)} - q^{-n|n|/(4k-1)} \right)
\]

\[
= \frac{q^{4k^2}}{1 + q^{4k-1}} \left( \sum_{n=-\infty}^\infty (-1)^n q^{2n^2 - 4nk} - \sum_{n=-\infty}^\infty (-1)^n q^{2n^2 - 2n + 4nk} \right)
\]

\[
= \frac{(-1)^k q^{2k^2}}{1 + q^{4k-1}} \sum_{n=-\infty}^\infty (-1)^{n-k} q^{2(n-k)^2}
\]

\[
= \frac{J_2^2}{J_4} \cdot \frac{(-1)^k q^{2k^2}}{1 + q^{4k-1}}.
\]

Hence \( A_k = B_k \) for all integers \( k \) and (3.16) holds. □

(3.15) yields the Hecke-Rogers series of \( A(q) \) [12, Eq. (2.24)] by replacing \( q \) by \(-q\) and \( z = -1\)

\[
\frac{J_1^2}{J_2} A(q) = \sum_{1 \leq j \leq |n|} sg(n) (-1)^{n-1} q^{2n^2 - n - j^2 + j}.
\]

Letting \( z \to 1 \) in (3.15) we have the Hecke-Rogers series of \( F_{8, -1}(q) \) [18, P. 376] which is close to (3.17)

**Corollary 3.9.**

\[
\frac{J_1^2}{J_2} F_{8, -1}(q) = \sum_{1 \leq j \leq |n|} sg(n) (-1)^{j-1} (2j - 1) q^{2n^2 - n - j^2 + j}.
\]
3.3. Hecke-Rogers series of $\mathcal{F}_{12,-1}(q)$. Unlike $\mathcal{F}_{4,-1}(q)$ and $\mathcal{F}_{8,-1}(q)$, we didn't find Eulerian type series of $\mathcal{F}_{12,-1}(q)$ and $\mathcal{F}_{24,-1}(q)$. So we didn't find a nice $z$-analog of $\mathcal{F}_{12,-1}(q)$ and mock theta functions $\sigma(q)$. By the 3-dissection of $\mathcal{F}_{4,-1}(q)$, we have the Appell-Lerch series which is close to [3, Eq. (4.8)] with $z = q^3$

$$\frac{J_3^2}{J_6} \sigma(q) = \sum_{k=-\infty}^{\infty} \frac{(-1)^{k-1} q^{3k^2}}{1 - q^{6k-1}}.$$

**Theorem 3.10.**

$$\frac{J_3^2}{J_6} \mathcal{F}_{12,-1}(q) = \sum_{k=-\infty}^{\infty} \frac{(-1)^{k-1} (6k - 1) q^{3k^2}}{1 + q^{6k-1}} + \frac{2q J_{12} J_6 J_5^2}{J_4 J_1^2}.$$

**Proof.** We denote the 3-dissection on both sides of (3.3) by

$$\frac{J_3^2}{J_6} = A_0(q^3) + q A_1(q^3) + q^2 A_2(q^3),$$

$$\mathcal{F}_{4,-1}(q) = B_0(q^3) + q B_1(q^3) + q^2 B_2(q^3),$$

and

$$\sum_{k=1}^{\infty} \frac{(-1)^{k-1} (2k - 1) q^{k^2}}{1 + q^{2k-1}} = C_0(q^3) + q C_1(q^3) + q^2 C_2(q^3).$$

So that

$$A_0(q) B_0(q) + q A_1(q) B_2(q) + q A_2(q) B_1(q) = C_0(q).$$

We have

$$B_0(q) = \mathcal{F}_{12,-1}(q),$$

and we note that

$$\frac{J_3^2}{J_6} = \sum_{k=-\infty}^{\infty} (-1)^k q^{k^2} = \sum_{k=-\infty}^{\infty} (-1)^k q^{9k^2} - 2q \sum_{k=-\infty}^{\infty} (-1)^k q^{9k^2+6k} = \frac{J_9^2}{J_{18}} - 2q \frac{J_{18}^2 J_3}{J_9 J_6}.$$

So that

$$A_0(q) = \frac{J_3^2}{J_6}, A_1(q) = -2 \frac{J_6^2 J_1}{J_3 J_2} \text{ and } A_2(q) = 0.$$

By [9, Eq. (2.7), (2.9)]

$$B_2(q) = \mathcal{F}_{12,7}(q) = \sum_{n=0}^{\infty} H(24n + 7) q^{2n} + 3q \sum_{n=0}^{\infty} H(24n + 19) q^{2n}$$

$$= \frac{J_6^2 J_4^5}{J_{12} J_2^3} + 3q \frac{J_3^2 J_4}{J_2} = \frac{J_{12} J_3 J_5^2}{J_6 J_4 J_1^3}.$$
where the last equation was verified by MAPLE (2.1). Since
\[ \sum_{k=1}^{\infty} \frac{(-1)^{k-1}(2k - 1)q^k}{1 + q^{2k-1}} = \sum_{k=1}^{\infty} \frac{(-1)^{k-1}(2k - 1)q^k}{1 + q^{6k-3}}(1 - q^{2k-1} + q^{4k-2}), \]
we have
\[ (3.22) \quad C_0(q^3) \]
\[ = \sum_{k=1}^{\infty} \frac{(-1)^{3k-1}(2 \cdot (3k) - 1)q^{(3k)^2}}{1 + q^{6(3k-3)}} + \sum_{k=0}^{\infty} \frac{(-1)^{3k+1-1}(2 \cdot (3k + 1) - 1)q^{(3k+1)^2+4(3k+1)-2}}{1 + q^{6(3k+1)-3}} \]
\[ = \sum_{k=-\infty}^{\infty} \frac{(-1)^{k-1}(6k - 1)q^{9k^2}}{1 + q^{18k-3}}. \]
So that
\[ C_0(q) = \sum_{k=-\infty}^{\infty} \frac{(-1)^{k-1}(6k - 1)q^{3k^2}}{1 + q^{6k-1}}. \]
Hence (3.19) is
\[ \frac{J_3^2}{J_6} \Phi_{12,-1}(q) - \frac{2qJ_{12}J_6J_2^2}{J_4J_1^2} = \sum_{k=-\infty}^{\infty} \frac{(-1)^{k-1}(6k - 1)q^{3k^2}}{1 + q^{6k-1}}. \]

The following lemmas is needed for proving the Hecke-Rogers identity of \( \Phi_{12,-1}(q) \).

**Lemma 3.11.** Let
\[ g(z) := \frac{1}{z} j(-z^2; q^2)m(q, q^6, -z^2/q). \]
Then
\[ g'(1) = -\frac{J_3^2}{J_6} \frac{J_4^2}{J_1^2} \frac{J_2^3}{J_2}. \]

**Proof.** From Theorem 2.4
\[ m(q, q^6, -z^2/q) = m(q, q^6, -1) - \frac{J_3^3 j(z^2/q; q^6) j(z^2; q^6)}{j(-1; q^6) j(-q; q^6) j(-z^2/q; q^6) j(-z^2; q^6)}. \]
Let
\[ f(z) := \frac{j(z^2/q; q^6) j(z^2; q^6)}{j(-z^2/q; q^6) j(-z^2; q^6)}. \]
Then
\[ f'(1) = \lim_{z \to 1} \frac{f(z) - f(1)}{z - 1} \]
\[ = \lim_{z \to 1} (1 + z)(q^6/z, q^6/z, q^6, q^6) \frac{j(z^2/q; q^6)}{j(-z^2/q; q^6) j(-z^2; q^6)}. \]
\[
\frac{J_6^2 J_4 J_1^2}{J_{12}^3 J_3^2 J_2^*}
\]
So that
\[
\frac{d}{dz} m(q, q^6, -z^2/q) \bigg|_{z=1} = -\frac{J_6^{12} J_4^2 J_1^3}{2J_{12}^6 J_3^3 J_2^*},
\]
and by (2.13)
\[
\frac{d}{dz} \left( \frac{1}{z} j(-z^2; q^2) \right) \bigg|_{z=1} = 0.
\]
Hence
\[
g'(1) = -j(-1; q^2) \frac{J_6^{12} J_4^2 J_1^3}{2J_{12}^6 J_3^3 J_2^*} = -\frac{J_6^{12} J_4^2 J_1^3}{J_{12}^6 J_3^3 J_2^*}.
\]

\[\Box\]

Lemma 3.12. Let
\[
g(z) := \frac{1}{z} j(qz^4; q^2) m(-q^2/z^6, q^6, q^3 z^6).
\]
Then
\[
g'(1) = -\frac{J_6 J_4}{J_3^2 J_2} \sum_{k=-\infty}^{\infty} \frac{(-1)^{k-1}(6k-1)q^{3k^2}}{1 + q^{6k-1}}.
\]

Proof. Since by (2.2)
\[
\frac{d}{dz} j(qz^4; q^2) \bigg|_{z=1} = 0,
\]
we have
\[
g'(1) = j(q; q^2) \frac{d}{dz} \left( \frac{1}{z} m(-q^2/z^6, q^6, q^3 z^6) \right) \bigg|_{z=1}
= j(q; q^2) \left( \frac{d}{dz} m(-q^2/z^6, q^6, q^3 z^6) \bigg|_{z=1} - m(-q^2, q^6, q^3) \right)
= -\frac{J_6 J_4}{J_3^2 J_2} \sum_{k=-\infty}^{\infty} \frac{(-1)^{k-1}(6k-1)q^{3k^2}}{1 + q^{6k-1}}.
\]

\[\Box\]

Lemma 3.13. Let
\[
g(z) := \frac{j(qz^4; q^2) j(-q^4 z^4; q^6) j(q^4 z^2; q^6)}{z j(-q^5 z^2; q^6) j(q^3 z^6, q^6) j(-q^5; q^6) j(q^5 z^4; q^6)}.
\]
Then
\[
g'(1) = -\frac{J_6^9 J_4^4 J_1^3}{J_{12}^6 J_3^3 J_2^2} - \frac{2qJ_{12} J_4^4}{J_6 J_4 J_3^3}.
\]
Proof. Let
\[ g_1(z) := \frac{j(q; q^2)}{j(q^3; q^6)} j(-z^4q^4; q^6), \]
Then by (2.2)
\[ g_1'(1) = g'(1). \]
Let
\[ u_1(z) := z^{2/3}j(-z^4q^4; q^6) = z^{2/3}j(-q^2/z^4; q^6), \]
\[ u_2(z) := z^{1/3}j(z^2q^4; q^6) = z^{1/3}j(q^2/z^2; q^6), \]
\[ v_1(z) := z^{2/3}j(-z^4q^5; q^6) = z^{2/3}j(-q/z^2; q^6), \]
\[ v_2(z) := z^{4/3}j(z^4q^5; q^6) = z^{4/3}j(q/z^4; q^6). \]
By (2.3), (2.4), (2.7) and (2.8), we have
\[ g_1'(1) = g_0'(1) \left( \frac{u_1'(1)}{u_2(1)} - \frac{u_2'(1)}{u_1(1)} \right) = \frac{2J_6J_2^3J_3^3}{3J_6^2J_3^3} + \frac{J_6^3J_2J_4}{J_6^3J_2J_3^3} \left( \frac{J_6^3}{3J_6} + \frac{3q^2J_3^3}{J_6} \right) - \frac{2J_6^3J_4^3}{3J_6^2J_3^3J_2^3} - \frac{4J_6J_4J_2^2}{3J_6^2J_3^3}, \]
where the last equation was verified by MAPLE (2.1).

Now we can prove the Hecke-Rogers identity.

Theorem 3.14.
\[ \frac{J_2}{J_1} F_{12,-1}(q) = \sum_{1-|n| \leq j \leq |n|} sg(n)(-1)^{j-1}(4n - 1)q^{4n^2 - 2n - 3j^2 + 2j}. \]

Proof. Let
\[ f(z) := z^3 f_{1.2.1}(q^3z^4, -q^4z^2, q^2). \]
The right side of (3.24) is
\[ \sum_{1-|n| \leq j \leq |n|} sg(n)(-1)^{j-1}(4n - 1)q^{4n^2 - 2n - 3j^2 + 2j} = \sum_{sg(r) = sg(s)} (-1)^r(2s + 4r + 3)q^{(2r+1)s+(r+s+1)^2} = f'(1). \]
Hence (3.24) is equivalent to
\[ \frac{J_2}{J_1} f'(1) = \frac{J_6}{J_3} \sum_{k=-\infty}^{\infty} \frac{(-1)^{k-1}(6k - 1)q^{3k^2}}{1 + q^{6k-1}} + \frac{2qJ_1J_2^3J_3^2}{J_4J_3^2J_1^2}. \]
By Theorem 2.1
\[ f(z) = \frac{1}{z}(j(-z^2; q^2)m(q, q^6, -z^2/q) - j(qz^4; q^2)m(-q^2/z^6, q^6, -q^5z^2)). \]

And by Theorem 2.4
\[ m(-q^2/z^6, q^6, -q^5z^2) = m(-q^2/z^6, q^6, q^3z^6) + \frac{J^3_6 j(-q^4z^2; q^6) j(q^4z^2; q^6)}{j(-q^5z^2; q^6) j(q^3z^6; q^6) j(-q^5q^6) j(q^5z^4; q^6)}. \]

(3.25) holds by (3.26) - (3.27) and Lemma 3.11 - Lemma 3.13.

We rewrite [3, Eq. (4.2)] as
\[ \sigma(q) = \sum_{1-|n|\leq j\leq |n|} sg(n)(-1)^{j-1} q^{4n^2-2n-3j^2+2j}. \]

(3.24) is close to (3.28) and which imply that
\[ \mathcal{F}_{12, -1}(q) \equiv -\sigma(q) \pmod{4}, \]
which is equivalent to [6, Lemma 3.11].

3.4. Hecke-Rogers series of \( \mathcal{F}_{24, -1}(q) \). We first prove the Appell-Lerch series of \( \mathcal{F}_{24, -1}(q) \) which is more complex than \( \mathcal{F}_{12, -1}(q) \).

**Theorem 3.15.**
\[ \frac{J_6^2}{J_{12}} \mathcal{F}_{24, -1}(q) = \sum_{k=-\infty}^{\infty} \frac{(-1)^{k-1}(12k-1)q^{6k^2}}{1+q^{12k-1}} + \sum_{k=-\infty}^{\infty} \frac{(-1)^{k-1}(12k-7)q^{6k^2-2}}{1+q^{12k-7}} + \frac{2qJ_{12}^2J_3^6J_2^6}{J_6^2J_4J_3^3}. \]

**Proof.** We denote the 3-dissection on both sides of (3.14) by
\[ \frac{J_2^2}{J_4} = A_0(q^3) + qA_1(q^3) + q^2A_2(q^3), \]
\[ \mathcal{F}_{8, -1}(q) = B_0(q^3) + qB_1(q^3) + q^2B_2(q^3), \]
and
\[ \sum_{k=-\infty}^{\infty} \frac{(-1)^{k-1}(4k-1)q^{2k^2}}{1+q^{4k-1}} = C_0(q^3) + qC_1(q^3) + q^2C_2(q^3). \]
So that
\[ A_0(q)B_0(q) + qA_2(q)B_1(q) + qA_1(q)B_2(q) = C_0(q). \]

Similar to (3.20)-(3.22) we have
\[ A_0(q) = \frac{J_6^2}{J_{12}}, \]
\[ A_1(q) = 0, \]
We complete the proof by substituting (3.30) - (3.35) into (3.29).

\begin{align}
\sum_{k=-\infty}^{\infty} \frac{(-1)^{k-1}(12k-1)q^{6k^2}}{1 + q^{12k-1}} + \sum_{k=-\infty}^{\infty} \frac{(-1)^{k-1}(12k-7)q^{6k^2-2}}{1 + q^{12k-7}}.
\end{align}

The following lemma can be proved similar to Lemma 3.13. We use (2.2) - (2.13) to calculate each term to sum of eta-quotients then use MAPLE (2.1) to verified the eta-quotients identity. We omit the proof.

**Lemma 3.16.** Let
\[
g(z) := \frac{z^5 J_{12} J_{14} j(-q^4; q^{12})}{q J_{8, 6} j(-z^8; q^{12})} \left( \frac{J_{12} J_{8} j(q^{14} z^8; q^{24})}{J_{24} J_{4}} \right)^2 - \frac{q J_{12} J_{8} J_{14} j(q^8 z^8; q^{12})}{J_{12} J_{8} J_{14}} \left( \frac{J(-q^2 z^4; q^{12})}{J(-q^4 z^8; q^{12})j(-q^{11}; q^{12})} + \frac{q J(-q^6 z^4; q^{12})}{q j(-q^8; q^{12})j(-q^5; q^{12})} \right).
\]
\[
then
g'(1) = -\frac{2 q J_{12} J_{8} J_{14} j}{J_{6} J_{4} J_{1}}.
\]

The Hecke-Rogers series of \( \mathcal{F}_{24, -1}(q) \) is

**Theorem 3.17.**
\[
\frac{J_{2}^2}{J_{2}} \mathcal{F}_{24, -1}(q) = \sum_{1-|n| \leq j \leq |n|} s g(n)(-1)^{n-1}(4j - 1)q^{3n^2 - 2n - 2j^2 + j}.
\]
\[
Proof. Let
\[
f(z) := \frac{q_1}{z} f_{1, 5, 1}(iz^2 q_1^7; i q_1^3 z^2, q_1^2).
\]
Letting \( q = q_1^4 \), the right side of (3.36) is
\[
\sum_{1-|n| \leq j \leq |n|} s g(n)(-1)^{n-1}(4j - 1)q_1^{12n^2 - 4n - 8j^2 + 4j}
\]
\[
= \sum_{s g(r) = s g(s)} s g(r)(-1)^{r}(2r - 2s - 1)q_1^{r^2 + 6r + 10rs + s^2 + 2s + 1}
\]
\[
= \text{Im} \left( \sum_{s g(r) = s g(s)} s g(s)(-i)^{r+s}(2r - 2s - 1)q_1^{r^2 + 6r + 10rs + s^2 + 2s + 1} \right)
\]
where Im$(z)$ denote the imaginary part of $z$. Then by Theorem 2.2 we have

$$\text{Im}(f(z)) = \frac{q_1}{z} \text{Im}(g_{1,5,1}(iz^2, iz^2, q^2, 1/q^4z^4, qz^4)),$$

where it is easy to calculate that

$$\frac{q_1}{z} \text{Im}(g_{1,5,1}(iz^2, iz^2, q^2, 1/q^4z^4, qz^4))$$

$$= zj(q^4; q^2) \left( m(-q^5z^{12}, q^{12}, 1/qz^4) - \frac{1}{q^{2}z^{8}}m(-1/qz^{12}, q^{12}, qz^4) \right),$$

and

$$\frac{q_1}{z} \text{Im}(\Theta_{1,4}(iq^2z^2, iq^2z^2, q^2, 1/q^4z^4, qz^4))$$

$$= \frac{z^5J_{12}J_2}{qJ_8J_6j(-z^8; q^{12})} \left( \frac{J_{12}J_8}{J_{24}J_4}j(q^{14}z^8; q_{24})^2 - \frac{q^2J_{24}J_6J_4}{J_{12}J_8J_2}j(q^8z^8; q^{12}) \right).$$

Hence by Theorem 3.15 (3.36) is equivalent to

$$(3.37) \frac{J_2^2J_{12}}{J_6^2J_2} \left( \sum_{k=-\infty}^{\infty} \frac{(-1)^{k-1}(12k-1)q^{6k^2}}{1 + q^{12k-1}} \right) + \sum_{k=-\infty}^{\infty} \frac{(-1)^{k-1}(12k-7)q^{6k^2-2}}{1 + q^{12k-7}} + \frac{2qJ_{12}^2J_6^2J_4^2}{J_6^2J_4^2J_2^2}$$

$$= g'(1),$$

where

$$g(z) := \text{Im}(f(z))$$

$$= zj(q^4; q^2) \left( m(-q^5z^{12}, q^{12}, 1/qz^4) - \frac{1}{q^{2}z^{8}}m(-1/qz^{12}, q^{12}, qz^4) \right)$$

$$- \frac{z^5J_{12}J_2}{qJ_8J_6j(-z^8; q^{12})} \left( \frac{J_{12}J_8}{J_{24}J_4}j(q^{14}z^8; q_{24})^2 - \frac{q^2J_{24}J_6J_4}{J_{12}J_8J_2}j(q^8z^8; q^{12}) \right).$$

By Theorem 2.4

$$m(-q^5z^{12}, q^{12}, 1/qz^4) = m(-q^5z^{12}, q^{12}, q^6/z^2)$$

$$+ \frac{J_{12}^2j(q^5z^8; q^{12})j(-q^2z^4; q^{12})}{j(q^4; q^{12})j(q^6z^{12}; q^{12})j(-q^4z^8; q^{12})j(-q^{11}; q^{12})},$$

and

$$m(-1/qz^{12}, q^{12}, qz^4) = m(-1/qz^{12}, q^{12}, q^6z^{12})$$

$$- \frac{q^2z^{12}J_{12}^2j(q^5z^8; q^{12})j(-q^6z^4; q^{12})}{j(q^4; q^{12})j(q^6z^{12}; q^{12})j(-q^8; q^{12})j(-q^5; q^{12})}.$$
So that \( g(z) = g_1(z) - g_2(z) \) where
\[
g_1(z) := z j(q z^4; q^2) \left( m(-q^5 z^{12}, q^{12}, q^6/z^{12}) - \frac{1}{q^2 z^8} m(-1/q z^{12}, q^{12}, q^6 z^{12}) \right),
\]
and
\[
g_2(z) := \frac{z^5 J_{12} J_2^4 J_4 J_8}{q J_8 J_6 j(-z^5; q^{12}) j(-q^4 z^8; q^{12})} \left( J_{12}^2 J_8 \left( \frac{J_8^2 J_{12}^4}{J_2 J_4} j(q^{14} z^8; q^{24})^2 - \frac{q^2 J_{12}^4 J_6 J_4^2}{J_{12}^2 J_8 J_2} j(q^8 z^8; q^{12}) \right) \right.
- \frac{z J_{12}^3 j(q^4 z^2)}{j(q^4 z^8; q^{12})} \left( j(-q^2 z^4; q^{12}) - \frac{q^4 j(-q^6 z^4; q^{12})}{q j(-z^8; q^{12}) j(-q^5; q^{12})} \right).
\]
Since by (2.2)
\[
\frac{d}{dz} j(q z^2; q^2) \bigg|_{z=1} = 0
\]
by definition of \( m(x, q, z) \) we have
\[
g_1'(1) = \sum_{k=-\infty}^{\infty} \frac{(-1)^{k-1} (12k - 1) q^{6k}}{1 + q^{12k-1}} + \sum_{k=-\infty}^{\infty} \frac{(-1)^{k-1} (12k - 7) q^{6k^2-2}}{1 + q^{12k-7}}.
\]
and by Lemma 3.16 we have
\[
g_2'(1) = -\frac{2q J_{12}^3 J_2^4 J_4^4 J_1^4}{J_6^4 J_4 J_1}.
\]
Hence (3.37) holds. \( \square \)

(3.36) is very close to \([4, \text{Eq. (2.1)}]\)
\[
\frac{J_2^2}{J_2} \phi_-(q) = \sum_{1-|n| \leq j \leq |n|} s g(n)(-1)^{n-1} q^{3n^2 - n - 2j^2 + j},
\]
which easily implies that \([6, \text{Lemma 3.8}]\)
\[
\mathcal{F}_{24, -1}(q) \equiv -\phi_-(q) \pmod{4}.
\]
And (3.36) also close to \([6, \text{Lemma 4.4}]\)
\[
\frac{J_2^2}{J_2} \psi(q) = \sum_{1-|n| \leq j \leq |n|} s g(n)(-1)^{j-1} q^{3n^2 - n - 2j^2 + j}.
\]

4. Hurwitz Class Numbers and Partitions

In this section, we start with a formula by Humbert \([18, \text{P. 346}]\)
\[
\mathcal{F}_{4, -1}(q) = \sum_{m=0}^{\infty} \sum_{u=m}^{m} q^{(2m+1)^2/4 + (2m+1)/2 + 1/4 - u^2} \frac{1 - q^{2m+1}}{1 - q^{2m+1}}.
\]
\[
= \sum_{m=0}^{\infty} \sum_{u=-m}^{m} q^{(m+1)^2 - u^2} \frac{1 - q^{2m+1}}{1 - q^{2m+1}}.
\]
And we will prove the combinatorial interpretation of $F(4n - 1)$ and $H(8n - 1)$ appeared on OEIS.

Denote $P(n)$ be the number of strongly unimodal compositions of $n$ with absolute difference of successive parts equal to 1 (see A238872 on OEIS). It is easy to see that

$$n = x + (x + 1) + ... + (y - 1) + y + (y - 1) + ... + (z + 1) + z = y^2 - \frac{x(x - 1)}{2} - \frac{z(z - 1)}{2}.$$

So that

$$\sum_{n=1}^{\infty} P(n)q^n = \sum_{y=1}^{\infty} \sum_{x=1}^{y} \sum_{z=1}^{y} q^{y^2 - x(x-1)/2 - z(z-1)/2}.$$

**Theorem 4.1.** For all $n \in \mathbb{N}^*$, we have

$$P(n) = F(4n - 1).$$

**Proof.** Let

$$A(m, u) := \frac{q^{m+1}}{1 - q^{2m+1}},$$

and

$$B(y, x, z) := q^{y^2 - x(x-1)/2 - z(z-1)/2}.$$

Then

$$A(m, u) = \frac{q^{(m+1)^2 - u^2}}{1 - q^{2m+1}} = \sum_{k=1}^{\infty} q^{m^2 - u^2 + k(2m+1)} = \sum_{k=1}^{\infty} q^{(k+m)^2 - (k+u)(k+u-1)/2 - (k-u)(k-u-1)/2}$$

$$= \sum_{k=1}^{\infty} B(k + m, k + u, k - u).$$

So that by (4.1) and (4.2) and noting that

$$B(y, x, z) = B(y, x, 1 - z) = B(y, 1 - x, z),$$

we have

$$\sum_{n=1}^{\infty} F(4n - 1)q^n = \sum_{m=0}^{\infty} \sum_{u=-m}^{m} A(m, u) = \sum_{m=0}^{\infty} \sum_{u=-m}^{m} \sum_{k=1}^{\infty} B(k + m, k + u, k - u)$$

$$= \sum_{y=1}^{\infty} \sum_{(x, z) \in D_y} B(y, x, z) = \sum_{y=1}^{\infty} \sum_{x=1}^{y} \sum_{z=1}^{y} B(y, x, z) = \sum_{n=1}^{\infty} P(n)q^n,$$

where

$$D_y := \{(x, z) : x \leq y, z \leq y, x + z \geq 2, x \equiv z \pmod{2}\}$$

$\square$
Denote $Q(n)$ be the number of partitions of $n$ into consecutive parts, all singletons except the largest (see A321440 on OEIS). It is easy to see that

$$n = (m + 1) + (m + 2) + \ldots + (l - 1) + l + l + \ldots + l = l(l + 1)/2 - m(m - 1)/2 + kl$$

So that

$$\sum_{n=1}^{\infty} Q(n)q^n = \sum_{l=1}^{\infty} \sum_{m=1}^{l} \sum_{k=0}^{\infty} q^{l(l+1)/2 - m(m-1)/2 + kl}$$

(4.3)

$$= \sum_{l=1}^{\infty} \sum_{m=1}^{l} q^{l(l+1)/2 - m(m-1)/2} \frac{1}{1 - q^l}.$$ 

Theorem 4.2. For all $n \in \mathbb{N}^*$, we have

$$Q(n) = H(8n - 1).$$

Proof. It is easy to see that

$$\sum_{l=1}^{\infty} \sum_{m=1}^{l} q^{l(l+1)/2 - m(m-1)/2} = \sum_{D} q^{l(l+1)/2 - m(m-1)/2} \frac{1}{1 - q^l},$$

where

$$D = \{(l, m) : 1 - l \leq m \leq l, m \equiv l + 1 \pmod{2}\}.$$ 

So replacing $l, m$ by $s + t + 1$ and $s - t$ respectively in (4.3) we have

$$\sum_{n=1}^{\infty} Q(n)q^n = q \sum_{s=0}^{\infty} \sum_{t=0}^{\infty} q^{2st + 2s + t} \frac{1}{1 - q^{s+t+1}} = q \sum_{s=0}^{\infty} \sum_{t=0}^{\infty} q^{2st + 2s + t} \frac{1}{1 - q^{2s + 2t + 2}} (1 + q^{s+t+1})$$

$$= q \sum_{sg(s) = sg(t)} q^{2st + 2s + t} \frac{1}{1 - q^{2(s+t)+2}}.$$ 

Replacing $m, u$ by $s + t$ and $s - t$ respectively in the right side of (4.1), we have

$$\sum_{D_0} q^{(m+1)^2 - u^2} = \sum_{s=0}^{\infty} \sum_{t=0}^{\infty} q^{4st + 2s + 2t + 1} \frac{1}{1 - q^{4(s+t)+2}} + \sum_{s=0}^{\infty} \sum_{t=0}^{\infty} q^{4st + 4s + 4t + 2} \frac{1}{1 - q^{4(s+t)+2}},$$

and replacing $m, u$ by $s + t + 1$ and $s - t$ respectively in the right side of (4.1), we have

$$\sum_{D_1} q^{(m+1)^2 - u^2} = \sum_{s=0}^{\infty} \sum_{t=0}^{\infty} q^{4st + 6s + 6t + 7} \frac{1}{1 - q^{4(s+t)+6}},$$

where

$$D_i = \{(m, u) : -m \leq u \leq m, m - u \equiv i \pmod{2}\}.$$ 

By (4.1), (4.4) and (4.5) we have

$$\mathcal{F}_{8,-1}(q) = \sum_{s=0}^{\infty} \sum_{t=0}^{\infty} q^{2st + 2s + 2t + 1} \frac{1}{1 - q^{2(s+t)+1}} + \sum_{s=0}^{\infty} \sum_{t=0}^{\infty} q^{2st + 2s + 2t + 2} \frac{1}{1 - q^{2(s+t)+3}}.$$
= q \sum_{sg(s) = sg(t)} sg(s) \frac{q^{2st+2s+2t}}{1 - q^{2(s+t)+1}}.

So that
\[ \mathcal{F}_{S,-1}(q) = \sum_{n=1}^{\infty} Q(n)q^n, \]

since
\[ q \sum_{sg(s) = sg(t)} sg(s) \frac{q^{2st+2s+2t}}{1 - q^{2(s+t)+1}} = q \sum_{sg(s) = sg(t) = sg(r)} q^{2(st+sr+tr)+2s+2t+r} \]
\[ = q \sum_{sg(s) = sg(t) = sg(r)} q^{2(st+sr+tr)+2s+t+2r} = q \sum_{sg(s) = sg(t)} sg(s) \frac{q^{2st+2s+t}}{1 - q^{2(s+t)+2}}. \]

□

**Corollary 4.3.** For all \( n \in \mathbb{N}^* \), we have
\[ Q(n) = P(2n). \]
