CHARACTERIZATION OF EXPONENTIAL POLYNOMIAL AS SOLUTION OF CERTAIN TYPE OF NON-LINEAR DELAY-DIFFERENTIAL EQUATION

ABHIJIT BANERJEE AND TANIA BISWAS

Abstract. In this paper, we have characterized the nature and form of solutions of the following non-linear delay-differential equation:

\[ f^n(z) + \sum_{i=1}^{n-1} b_i f^i(z) + q(z)e^{Q(z)}L(z, f) = P(z), \]

where \( b_i \in \mathbb{C} \), \( L(z, f) \) be a linear delay-differential polynomial of \( f \); \( n \) be positive integers; \( q, Q \) and \( P \) respectively be non-zero, non-constant and any polynomials. Different special cases of our result will accommodate all the results of ([J. Math. Anal. Appl., 452(2017), 1128-1144.], [Mediterr. J. Math., 13(2016), 3015-3027], [Open Math., 18(2020), 1292-1301]). Thus our result can be considered as an improvement of all of them. We have also illustrated a handful number of examples to show that all the cases as demonstrated in our theorem actually occurs and consequently the same are automatically applicable to the previous results.

1. Introduction, Results and Examples

Throughout the paper, we denote by \( f \) a meromorphic function in the complex plane \( \mathbb{C} \) and related to the function, we assume that the readers are familiar with the basic terms like \( T(r, f) \), \( N(r, f) \), \( m(r, f) \), of Nevanlinna value distribution theory of meromorphic functions (see [6, 8]). The notation \( S(r, f) \), will be used to define any quantity satisfying \( S(r, f) = o(T(r, f)) \) as \( r \to \infty \), possibly outside a set \( E \) of \( r \) of finite logarithmic measure. In addition, we will respectively use the symbols \( \rho(f) \), \( \lambda(f) \) and \( \tau(f) \) to denote the order, exponent of convergent and type of \( f \). The symbol \( L(f) \) will be used to represent a linear differential polynomial in \( f \) with polynomial coefficients. Also, throughout this paper, by \( \text{card}(S) \), we mean the cardinality of a set \( S \), i.e., the number of elements in \( S \).

Considering the non-linear differential equation

\[ L(f) - p(z)f^n(z) = h(z), \]

in 2001, Yang [17] investigated about the transcendental finite order entire solutions \( f \) of the equation, where \( p(z) \) is a non-vanishing polynomial, \( h(z) \) is entire and \( n \geq 4 \) is an integer.

In 2010, Yang-Laine [18] showed that the equation

\[ f(z)^2 + q(z)f(z+1) = p(z), \]

where \( p(z) \), \( q(z) \) are polynomials, admits no transcendental entire solutions of finite order.

In the last two decades researchers mainly studied (see [1, 9, 11, 17, 20] etc.) about the following three distinct features of solutions of shift or delay-differential or differential equations:

i) existence and non-existence conditions,

ii) order of growth and

iii) different types of forms of solutions.

Next, let us consider the exponential polynomial \( f(z) \), defined by the form

\[ f(z) = P_1(z)e^{Q_1(z)} + \cdots + P_k(z)e^{Q_k(z)}, \tag{1.1} \]

2010 Mathematics Subject Classification: 39B32, 30D35.

Key words and phrases: Exponential polynomial, differential-difference equation, convex hull, Nevanlinna theory.

Typeset by \( \LaTeX \).
where $P_j$'s and $Q_j$'s are polynomials in $z$. Steinmetz [14], showed that (1.1) can be written in the normalized form
\[ f(z) = H_0(z) + H_1(z)e^{\omega_1 z} + \cdots + H_m(z)e^{\omega_m z}, \quad (1.2) \]
where $H_j$ are either exponential polynomials of order $< t$ or ordinary polynomials in $z$, the leading coefficients $\omega_j$ are pairwise distinct and $m \leq k$.

Let $co(W)$ be the convex hull of a set $W \subset \mathbb{C}$ which is the intersection of all convex sets containing $W$. If $W$ contains finitely many elements then $co(W)$ is obtained as an intersection of finitely many half-planes, then $co(W)$ is either a compact polygon with a non-empty interior or a line segment. We denote by $C(co(W))$, the circumference of $co(W)$. If $co(W)$ is a line-segment, then $C(co(W))$ is equals to twice the length of this line segment. Throughout the paper, we denote $W = \{\tilde{\omega}_1, \tilde{\omega}_2, \ldots, \tilde{\omega}_m\}$ and $W_0 = W \cup \{0\}$.

Now-a-days, to find the form of exponential polynomials as solution of certain non-linear differential-difference equation has become an interesting topic among researchers (see [3, 4, 16]). Most probably, in this regard, the first attempt was made by Wen-Heittokangas-Laine [15]. In 2012, they considered the equation
\[ f(z)^n + q(z)e^{Q(z)} f(z + c) = P(z), \quad (1.3) \]
where $q(z), Q(z), P(z)$ are polynomials, $n \geq 2$ is an integer, $c \in \mathbb{C} \setminus \{0\}$. Wen-Heittokangas-Laine also pointed out that for a non-constant polynomial $\alpha(z)$ and $d \in \mathbb{C}$, every solution $f$ of the form (1.2) reduces to a function which belongs to one of the following classes:
\[ \Gamma_1 = \{e^{\alpha(z)} + d\}, \]
\[ \Gamma_0 = \{e^{\alpha(z)}\}, \]
and classified finite order entire/meromorphic solutions of (1.3) as follows:

**Theorem A.** [15] Let $n \geq 2$ be an integer, let $c \in \mathbb{C} \setminus \{0\}$, $q(z), Q(z), P(z)$ be polynomials such that $Q(z)$ is not a constant and $q(z) \neq 0$. Then the finite order entire solutions $f$ of equation (1.3) satisfies the following conclusions:

(a) Every solution $f$ satisfies $\rho(f) = \deg Q$ and is of mean type.
(b) Every solution $f$ satisfies $\lambda(f) = \rho(f)$ if and only if $P(z) \equiv 0$.
(c) A solution $f$ belongs to $\Gamma_0$ if and only if $P(z) \equiv 0$. In particular, this is the case if $n \geq 3$.
(d) If a solution $f$ belongs to $\Gamma_0$ and if $g$ is any other finite order entire solution of (1.3), then $f = ng$, where $n^{n-1} = 1$.
(e) If $f$ is an exponential polynomial solution of the form (1.2), then $f \in \Gamma_1$. Moreover, if $f \in \Gamma_1 \setminus \Gamma_0$, then $\rho(f) = 1$.

Inspired by Theorem A, in 2016, Liu [12] replaced $f(z + c)$ by $f^{(k)}(z + c)$ in (1.3) and for two polynomials $p_1(z), p_2(z)$ and a non-constant polynomial $\alpha(z)$, introduced two new classes of solutions:
\[ \Gamma_1' = \{p_1(z)e^{\alpha(z)} + p_2(z)\}, \]
\[ \Gamma_0' = \{p_1(z)e^{\alpha(z)}\}, \]
to obtain the following theorem.

**Theorem B.** [12] Under the same situation as in Theorem A with $k \geq 1$, the finite-order transcendental entire solution $f$ of
\[ f(z)^n + q(z)e^{Q(z)} f^{(k)}(z + c) = P(z), \quad (1.4) \]
should satisfy the results (a), (b), (d) and

(1) A solution $f$ belongs to $\Gamma_0'$ if and only if $P(z) \equiv 0$. In particular, this is the case if $n \geq 3$.
(2) If $f$ is an exponential polynomial solution of (1.4) of the form (1.2), then $f \in \Gamma_1'$.

Recently, Liu-Mao-Zheng [13] considered $\Delta_c f(z)$ instead of $f(z + c)$ in (1.3) and proved that...
Theorem C. [10] Under the same situation as in Theorem A, the finite order entire solutions $f$ of the equation
\[ f(z)^n + q(z)e^{Q(z)} \Delta_z f(z) = P(z), \] (1.5)
satisfies the results (a), (b) and

1. $\lambda(f) = \rho(f) - 1$ if and only if $P(z) \equiv 0$. In particular, this is the case if $n \geq 3$.
2. If $n \geq 3$ or $P(z) \equiv 0$, $f$ is of the form $f(z) = A(z)e^{\omega z}$, where $s = \deg Q$, $\omega$ is a non-zero constant and $A(z)(\neq 0)$ is an entire function satisfying $\lambda(A) = \rho(A) = \deg Q - 1$. In particular, if $\deg Q = 1$, then $A(z)$ reduces to a polynomial.
3. If $f$ is an exponential polynomial solution of (1.5) of the form (1.2), then $f$ is of the form
\[ f(z) = H_0(z) + H_1(z)e^{\omega_1 z}, \]
where $H_1(z)$, $H_2(z)$ are non-constant polynomials and $\omega_1$ is a non-zero constant satisfying $e^{\omega_1 c} = 1$.

In 2017, Li-Yang [10] considered the following form of equation
\[ f^n(z) + a_{n-1}f^{n-1}(z) + \cdots + a_1 f(z) + q(z)e^{Q(z)} f(z + c) = P(z), \] (1.6)
where $a_i \in \mathbb{C}$ and proved the following results.

Theorem D. [10] Under the same situation as in Theorem A, the finite order entire solutions $f$ of equation (1.6) satisfies the results (a), (d) and

1. If zero is a Borel exceptional value of $f(z)$, then we have $a_{n-1} = \cdots = a_1 = P(z) \equiv 0$.
2. If $P(z) \equiv 0$, then we have $z^{n-1} + a_{n-1}z^{n-2} + \cdots + a_1 = (z + a_{n-1}/n)^{n-1}$. Furthermore, if there exists $i_0 \in \{1, \ldots, n-1\}$ such that $a_{i_0} = 0$, then all of the $a_j (j = 1, \ldots, n-1)$ must be zero as well and we have $\lambda(f) < \rho(f)$; otherwise we have $\lambda(f) = \rho(f)$.
3. A solution $f$ belongs to $\Gamma_0$ if and only if $P(z) \equiv 0$ and there exists an $i_0 \in \{1, \ldots, n-1\}$ such that $a_{i_0} = 0$.
4. When $n \geq 3$, if there exists an $i_0 \in \{1, \ldots, n-1\}$ such that $a_{i_0} = 0$ and $\text{card}\{z : p(z) = p'(z) = p''(z) = 0\} \geq 1$ or $\text{card}\{z : p(z) = p'(z) = 0\} \geq 2$, where $p(z) = z^n + a_{n-1}z^{n-1} + \cdots + a_1$, then $f$ belongs to $\Gamma_0$ and $a_{n-1} = \cdots = a_1 = 0 \equiv P(z)$.

In the same paper, Li-Yang [10] also proved the following result.

Theorem E. [10] If $f$ is an exponential polynomial solution of the form (1.2) of the equation (1.6) for $n = 2$ and $a_1 \neq 0$, then the following conclusions hold.

1. when $m \geq 2$, there exists $i, j \in \{1, 2, \ldots, m\}$ such that $\omega_i = 2\omega_j$.
2. when $m = 1$, then $f \in \Gamma_1$. Moreover, if $f \in \Gamma_1 \setminus \Gamma_0$, then $\rho(f) = 1$, $f(z) = Ke^{\frac{1}{2}(2k\pi i - \log \frac{2d+1}{d})}z$, $Q(z) = \frac{1}{2}(2k\pi i - \log \frac{2d+1}{d})z$, $q(z) = -\frac{2d+1}{d}$ and $d^2 + a_1d = P(z)$, where $K, d \in \mathbb{C} \setminus \{0\}$ and $k \in \mathbb{Z}$.

We now introduce the generalized linear delay-differential operator of $f(z)$,
\[ L(z, f) = \sum_{i=0}^{k} b_i f^{(r_i)}(z + c_i) (\neq 0), \] (1.7)
where $b_i, c_i \in \mathbb{C}$, $r_i$ are non-negative integers, $c_0 = 0$, $r_0 = 0$. In view of the above theorems it is quiet natural to characterize the nature of exponential polynomial as solution of certain non-linear complex equation involving generalized linear delay-differential operator. In this regard, we consider the following non-linear delay-differential equation
\[ f^n(z) + \sum_{i=1}^{n-1} a_i f^i(z) + q(z)e^{Q(z)} L(z, f) = P(z), \] (1.8)
where \( a_i \in \mathbb{C} \), \( n \) be non-negative integers; \( q, Q, P \) respectively be non-zero, non-constant, any polynomials. We also introduce, for any polynomials \( p_i(z) \) and non-constant polynomials \( \alpha_i(z) \), a new class of solution as follows:

\[
\Gamma'_2 = \{ p_1(z)e^{\alpha_1(z)} + p_2(z)e^{\alpha_2(z)} + p_3(z) \}
\]

Now we are at a state to present our main result which improves all the above mentioned results as follows:

**Theorem 1.1.** Under the same situation as in Theorem A, the finite order entire solutions \( f \) of equation (1.8) satisfies

(i) Every solution \( f \) satisfies \( \rho(f) = \deg Q \) and is of mean type.

(ii) If zero is a Borel exceptional value of \( f(z) \), then we have \( a_{n-1} = \cdots = a_1 = P(z) \equiv 0 \). Conversely, if \( P(z) \equiv 0 \) and there exists an \( i_0 \in \{1, \ldots, n-1\} \) such that \( a_{i_0} = 0 \), then all of \( a_j \)'s (\( j = 1, \ldots, n-1 \)) must be zero and we have \( \lambda(f) < \rho(f) \); otherwise we have \( \lambda(f) = \rho(f) \).

(iii) If a solution \( f \) belongs to \( \Gamma'_0 \), then \( a_{n-1} = \cdots = a_1 = P(z) \equiv 0 \). Conversely, let \( P(z) \equiv 0 \) and there exists an \( i_0 \in \{1, \ldots, n-1\} \) such that \( a_{i_0} = 0 \), then either \( \lambda(f) = \rho(f) - 1 \) for \( c_i = c_j, 1 \leq i, j \leq k \) or \( f \) belongs to \( \Gamma'_0 \).

(iv) Let \( n \geq 3 \). If at least one \( a_{i_0} = 0 \) (\( i_0 = 1, 2, \ldots, n-1 \)) and \( p(z) = z^n + a_{n-1}z^{n-1} + \cdots + a_1z \) such that \( \text{card} \{ p(z) = p'(z) = p''(z) = 0 \} \geq 1 \) or \( \text{card} \{ p(z) = p'(z) = 0 \} \geq 2 \), then \( P(z) \equiv 0 = a_{n-1} = \cdots = a_1 = 0 \) and \( f \in \Gamma'_0 \). Moreover, \( \text{card} \{ p(z) = p'(z) = 0 \} \geq 2 \) is not possible.

(v) Let \( f \) be given by (1.2), which is a solution of (1.8) for \( n = 2 \) and \( a_1 \neq 0 \). Then the following conclusions hold:

(a) when \( m \geq 2 \), there exists \( i, j \in \{1, 2, \ldots, m\} \) such that \( \omega_i = 2\omega_j \). In this case, \( f \in \Gamma' \).

(b) when \( m = 1 \), then \( f \) takes the form \( f(z) = H_0(z) + H_1(z)e^{\omega z} \), i.e., \( f \in \Gamma'_1 \). In this case,

(I) either \( t = 1 \), \( \rho(f) = 1 \) and \( H_0(z) \), \( H_1(z) \) are polynomials and \( Q \) is a polynomial of degree 1

(II) or \( H_0(z) = -a_2 \), \( P(z) = -a_1^2 \), \( H_1^2(z) = \frac{b_{n+1}}{2}q(z)e^{Q(z)} \) and \( L(z, f) \) is a polynomial of degree 1

(III) or \( H_0(z) = -a_2 \), \( P(z) = -a_1^2 \), \( H_1^2(z) = -q(z)e^{Q(z)}A_1(z) \) and \( L(z, f) \) is a polynomial of degree 1

\( A_1(z) = \sum_{i=0}^{k} b_i t(z+c_i)e^{\omega z^{1+c_i}} \) such that \( \lambda_1(z+c_i) \) is the delay-differential polynomial of \( H_1(z) \).

**Remark 1.1.** Note that Cases (i)-(iv) and (v) of Theorem 1.1 improve Theorems D and E, respectively. Also, since \( L(z, f) \) includes \( f^{(k)}(z+c) \) and \( \Delta_e f(z) \), Theorem 1.1 improves Theorems B-C as follows:

(I) Cases (i), (ii) and (iii)-(iv) of Theorem 1.1 improve Case (a), (b) and (1) of each of Theorems B-C, respectively.

(II) Case (v)-(b) of Theorem 1.1 improves, respectively, Case (2) and Case (3) of Theorem B and Theorem C.

This following three examples clarify Cases (ii)-(iii).

**Example 1.1.** Take \( L(z, f) = f''(z+c) \). Then the function \( f = e^{2z} \) satisfies the equation \( f^2 - \frac{1}{4}e^{2z}L(z, f) = 0 \) such that \( e^{2c} = 1 \). Clearly, \( 0 = \lambda(f) = \rho(f) - 1 \). This example clarifies Theorem B as well.

**Example 1.2.** Let \( L(z, f) = \Delta_e f(z) \). Then the function \( f = e^{\alpha z} \) satisfies the equation \( f^2 - \frac{1}{4}e^{\alpha z}L(z, f) = 0 \) such that \( e^{\alpha c} = 3 \). Clearly, \( 0 = \lambda(f) = \rho(f) - 1 \). This example also satisfies Theorem C.

**Example 1.3.** Let \( L(z, f) = (z+1)^{f''(z+1)} - f''(z+1) \). Then the function \( f = (z+1)e^z \) satisfies the equation \( f^2 - (z+1)e^{z-1}L(z, f) = 0 \). Note that, here \( c_1 = c_2 = c_3 = 1 \) and \( f \in \Gamma'_0 \).
The next example satisfies Case \((iv)\).

**Example 1.4.** Let \(L(z, f) = f(z + \log 2) + f''(z + \pi i)\). Then the function \(f = e^{i\pi}z\) satisfies the equation \(f^3 + qe^{2iz}L(z, f) = 0\), where \(q = \frac{e^{i\pi}}{z^2}\). Note that, here \(p(z) = z^3\) and \(\text{card}(z : p(z) = p'(z) = p''(z) = 0) = 1\). Also, \(a_2 = a_1 = 1 \equiv P(z)\) and \(f \in \Gamma_0^2\).

By the following example, it is clear that the Case \((v)-(a)\) occurs significantly.

**Example 1.5.** Take \(L(z, f) = f'(z + \log 4) - 4f(z + \log 3)\) and \(m = 2\). Then the function \(f = e^{2z} - e^z + 1\) satisfies the equation \(f^3 - 2f^2 + \frac{1}{4}e^{4z}L(z, f) = -1\). Note that here \(f \in \Gamma_2^2\).

The following two examples show that the Case \((v)-(b)-(I)\) actually holds.

**Example 1.6.** We take \(L(z, f) = f(z + \log 2)\). Then the function \(f = d + e^{az}\) satisfies the equation \(f^2 - df - e^{az}L(z, f) = 0\) such that \(e^{ac} = 1\). Here, \(P(z) \equiv 0\). Also, the same function satisfies \(f^2 - 3df + e^{az}L(z, f) = -2d^2\) such that \(e^{ac} = -1\). Here, \(f \in \Gamma_1^2\). Here, \(P(z) \neq 0\). This example is true for Theorem E as well.

**Example 1.7.** Put \(L(z, f) = f(z + \log 2) + f'(z + \pi i) + f''(z + 2\pi i)\) and \(m = 1\). Then the function \(f = 2 + e^{3z}\) satisfies the equation \(f^2 - 3f - \frac{1}{2}e^{2z}L(z, f) = -2\). Here, \(P(z) \neq 0\). Also, let \(L(z, f) = f(z + \log 3) - f'(z + \log 1) + f''(z + \log 2)\) and \(m = 1\). Then the function \(f = 3 + e^z\) satisfies the equation \(f^2 - 3f - e^{2z}L(z, f) = 0\). Here, \(P(z) \equiv 0\).

Next example shows that the Case \((v)-(b)-(II)\) actually occurs.

**Example 1.8.** Let \(L(z, f) = 3f(z) + f'(z + \log 2) - 3f''(z + 2\pi i)\) and \(m = 1\). Then the function \(f = -\frac{9}{4} + 2e^{3z}\) satisfies the equation \(f^2 + 2f + e^{6z}L(z, f) = -\frac{49}{4}\). Note that here \(b_0 = 3\), \(H_0 = -\frac{b_0}{2}\) and so, \(L(z, f) = -\frac{3a_0}{2} = b_0H_0\).

Next example shows that the Case \((v)-(b)-(III)\) actually occurs.

**Example 1.9.** Let \(L(z, f) = f(z) - f(z - \log 2) + \frac{3}{2}f'(z + \log 2) + \frac{2}{9}f'(z + \log 3) - \frac{1}{9}f''(z + \log 3)\) and \(m = 1\). Then the function \(f = -\frac{a_0}{2} - ze^{2z}\) satisfies the equation \(f^2 + a_1f - ze^{2z}L(z, f) = -\frac{a_0}{2}\). Note that here, \(q(z) = -z\), \(Q(z) = 2z\), \(Q_{L-1}(z) = 0\). Also, \(A_1(z) = \sum_{i=0}^{5} (b_iH_1(z + c_i)e^{2c_i}) = z, \quad H_1^2(z) = z^2 = -q(z) = Q_{L-1}(z)\) and \(L(z, f) = A_1(z)e^{2z} = \sum_{i=0}^{5} (b_iH_1(z + c_i)e^{2c_i}) e^{2z} = ze^{2z}\).

2. **Lemmas**

We give the following well-known results which are important to prove our theorems.

**Lemma 2.1.**[5] **Let** \(f\) **be a non-constant meromorphic function and** \(c_1, c_2\) **be two complex numbers such that** \(c_1 \neq c_2\). **Let** \(f(z)\) **be a meromorphic function with finite order** \(\rho\), **then for each** \(\varepsilon > 0\),

\[
m \left( r, \frac{f(z+c_1)}{f(z+c_2)} \right) = S(r, f).
\]

**Lemma 2.2.**[8] **Corollary** 2.3.4. **Let** \(f\) **be a transcendental meromorphic function and** \(k \geq 1\) **be an integer. Then** \(m \left( r, \frac{f^{(k)}}{f} \right) = S(r, f)\).

Combining Lemmas 2.1 and 2.2 we have the following lemma:

**Lemma 2.3.** **Let** \(f(z)\) **be a meromorphic function of finite order and let** \(c \in \mathbb{C}, k \geq 1\) **be an integer. Then** \(m \left( r, \frac{f^{(k)}(z+c)}{f} \right) = S(r, f)\).

Proof.

\[
m \left( r, \frac{f^{(k)}(z+c)}{f} \right) = m \left( r, \frac{f^{(k)}(z+c)}{f(z+c)} \frac{f(z+c)}{f(z)} \right) = S(r, f).
\]

\(\square\)
Lemma 2.4. Let \( f \) be a non-constant meromorphic function of hyper order less than 1 and \( c \in \mathbb{C} \). Then
\[
N(r, 1/f(z + c)) = N(r, 0; f(z)) + S(r, f).
\]

Lemma 2.5. Suppose \( f_j(z) (j = 1, 2, ..., n + 1) \) and \( g_k(z) (k = 1, 2, ..., n) \) are entire functions satisfying the following conditions:
(i) \( \sum_{j=1}^{n} f_j(z) e^{\varphi j(z)} \equiv f_{n+1}(z) \),
(ii) The order of \( f_j(z) \) is less than the order of \( e^{g_k(z)} \) for \( 1 \leq j \leq n + 1 \), \( 1 \leq k \leq n \) and furthermore, the order of \( f_j(z) \) is less than the order of \( e^{g_k(z) - g_l(z)} \) for \( n \geq 2 \) and \( 1 \leq j \leq n + 1, 1 \leq h < k \leq n \). Then \( f_j(z) \equiv 0, \ (j = 1, 2, ..., n + 1) \).

Lemma 2.6. Let \( f \) be a meromorphic function and suppose that
\[
R(z) = a_n f(z)^n + \cdots + a_0(z)
\]
has small meromorphic coefficients \( a_j(z) \), \( a_n \neq 0 \) in the sense of \( T(r, a_j) = S(r, f) \). Moreover, assume that
\[
\mathcal{N}(r, 1/R) + \mathcal{N}(r, f) = S(r, f).
\]
Then
\[
R(z) = a_n (f + \frac{a_{n-1}}{na_n}).
\]

The following lemma gives the Nevanlinna characteristic and counting functions of an exponential polynomial.

Lemma 2.7. Let \( f(z) \) be given by (1.2). Then
\[
T(r, f) = C(co(W_0)) \frac{r^t}{2\pi} + o(r^t).
\]
If \( H_0(z) \neq 0 \), then
\[
m(r, 1/f) = o(r^t),
\]
while if \( H_0(z) \equiv 0 \), then
\[
N(r, 1/f) = C(co(W)) \frac{r^t}{2\pi} + o(r^t).
\]

Next, we proof the following lemmas which are the core parts of our paper.

Lemma 2.8. Let \( f \) be given by (1.2) which is a solution of (1.8) for \( n = 2 \) and \( \varomega_1 \neq 2\varomega_3 \). If the points \( 0, \varomega_1, \varomega_2, ..., \varomega_m \) are collinear, then \( n = 1 \).

Proof. Assume on the contrary to the assertion that \( m \geq 2 \). For each \( i \in \{1, 2, ..., m\} \), we may write \( \varomega_i = \xi_i \varomega \), where the constants \( \xi_i \in \mathbb{C} \setminus \{0\} \) are distinct, \( \xi_0 = 0 \) and \( \varomega \in \mathbb{C} \setminus \{0\} \). Moreover, we may suppose that \( \xi_i > \xi_j \) for \( i > j \). Equation (1.8) can be written as
\[
\sum_{i,j=0}^{m} H_i(z)H_j(z) e^{(\xi_i + \xi_j)\varomega z^t} + a_1 \sum_{l=0}^{m} H_l(z)e^{\xi_l\varomega z^t} + q(z)e^{Q_{t-1}(z)} \left[ A_0(z)e^{\varomega z^t} + \sum_{h=1}^{m} A_h(z)e^{(\varomega + \xi_h)\varomega z^t} \right] = P(z), \tag{2.1}
\]

where \( Q_{t-1}(z) = Q(z) - \varomega z^t \) with \( \deg Q_{t-1}(z) \leq t - 1 \) and \( A_0(z) = \sum_{i=0}^{k} b_i H_i^{(r_i)}(z + c_i) \), \( A_h(z) = \sum_{i=0}^{k} b_i H_i(z + c_i)e^{\xi h_{(z+c_i)})t - \varomega h \varomega z^t}, \ h = 1, 2, ..., m \) such that \( H_h(z + c_i) \) are the delay-differential polynomial of \( H_k(z) \).

Now we consider following two cases to derive contradiction.

Case 1. Let \( \xi_m > 0 \). Note that \( \max\{|\xi_i + \xi_j| : i, j = 0, 1, ..., m\} = 2\xi_m \). Since \( L(z, f) \neq 0 \), then at least one of \( A_h(z), h = 0, 1, ..., m \) is not vanishing.

Case 1.1. Let all \( A_h(z) = 0, h = 1, 2, ..., m \). Then \( A_0(z) \neq 0 \), i.e., \( H_0(z) \neq 0 \). If \( 2\xi_m \varomega \neq \varomega_t \),
applying Lemma 2.2.3 on (2.1), we obtain $H^2_m(z) = 0$, a contradiction. Next, let $2\xi_m \omega = v_t$. Since, $\omega_j \neq 2\omega_j$, applying Lemma 2.2.3 on (2.1), we obtain $H^2(z) = 0$, a contradiction.

**Case 1.2.** Let at least one of $A_h(z) \neq 0$, for $h = 1, 2, \ldots, m$.

**Case 1.2.1.** Let $A_0(z) \neq 0$. Then by Lemma 2.2.3 from (2.1), there exists one $h_0 \in \{0, 1, \ldots, m\}$ such that $2\xi_m \omega = v_t + \xi_h \omega$. Otherwise, we have $H^2_m(z) = 0$, a contradiction.

**Case 1.2.1.1.** If $h_0 = m$, then we have $v_t = \xi_m \omega$. Since $2\xi_i \neq \xi_j$, $j = 0, 1, \ldots, m$ and $2\xi_i \notin \{\xi_i + \xi_j : 0 \leq i, j \leq m, (i, j) \neq (1, 1)\}$ and $2\xi_i \notin \{\xi_m + \xi_j : i = 0, 1, \ldots, m\}$, By Lemma 2.2.3 we obtain $H^1(z) = 0$, a contradiction.

**Case 1.2.1.2.** If $h_0 \in \{0, 1, \ldots, m - 1\}$, then $0 = \xi_0 < \xi_1 < \xi_2 < \cdots < \xi_{m-1} < \xi_m$ and $2\xi_i \neq \xi_j$, $i, j = 0, 1, \ldots, m$, then for $m > h_0$,

$$2\xi_m - \xi_{h_0} + \xi_m > \max\{2\xi_m - \xi_{h_0} + \xi_i : i = 0, 1, \ldots, m - 1\}.$$ 

Also, $2\xi_m = \max\{\xi_i \vee \xi_j : i, j = 0, 1, \ldots, m\}$. In view of Lemma 2.2.3 we obtain $q(z)e^Q(z)A_m \equiv 0$, i.e., $q(z) \equiv 0$, a contradiction.

**Case 1.2.2.** Let $A_0(z) = 0$ and $H_0(z) \neq 0$. Then (2.1) becomes

$$\sum_{i,j=0}^m H_i(z)H_j(z)e^{(\xi_i + \xi_j)\omega z} + a_1 \sum_{i=0}^m H_i(z)e^{(\xi_i \omega z)} + q(z)e^Q(z) \sum_{h=1}^m A_h(z)e^{(v_r + \xi_h \omega)z} = P(z).$$

Then similar as Case 1.2.1, by Lemma 2.2.3 from (2.2), we have there exists one $h_0 \in \{1, 2, \ldots, m\}$ such that $2\xi_m \omega = v_t + \xi_{h_0} \omega$ and proceeding similarly as done in Case 1.2.1, we can get a contradiction.

**Case 1.2.3.** Let $A_0(z) = 0$ and $H_0(z) = 0$. Then (2.1) becomes

$$\sum_{i,j=1}^m H_i(z)H_j(z)e^{(\xi_i + \xi_j)\omega z} + a_1 \sum_{i=1}^m H_i(z)e^{(\xi_i \omega z)} + q(z)e^Q(z) \sum_{h=1}^m A_h(z)e^{(v_r + \xi_h \omega)z} = P(z).$$

Next, similar as Case 1.2.1, by Lemma 2.2.3 from (2.3), we have there exists one $h_0 \in \{1, 2, \ldots, m\}$ such that $2\xi_m \omega = v_t + \xi_{h_0} \omega$ and adopting the same method as done in Case 1.2.1, we get a contradiction.

**Case 2.** $\xi_m < 0$. Note that min$\{\xi_i \vee \xi_j : i, j = 0, 1, \ldots, m\} = 2\xi_1$. Similar as Case 1, we divide the following cases.

**Case 2.1.** Let all $A_h(z) = 0$, $h = 1, 2, \ldots, m$. Then $A_0(z) \neq 0$, i.e., $H_0(z) \neq 0$. If $2\xi_1 \omega \neq v_t$, applying Lemma 2.2.3 on (2.1), we obtain $H^2(z) = 0$, a contradiction. Next, let $2\xi_1 \omega = v_t$. Since, $\omega_j \neq 2\omega_j$, applying Lemma 2.2.3 on (2.1), we obtain $H^2_m(z) = 0$, a contradiction.

**Case 2.2.** Let at least one of $A_h(z) \neq 0$ for $h = 1, 2, \ldots, m$.

**Case 2.2.1.** Let $A_0(z) \neq 0$. Then by Lemma 2.2.3 there exists one $h_0 \in \{0, 1, \ldots, m\}$ such that $2\xi_1 \omega = v_t + \xi_{h_0} \omega$. Otherwise, we have $H^2(z) = 0$, a contradiction.

**Case 2.2.1.1.** If $h_0 = 1$, then we have $v_t = \xi_1 \omega$.

Since, $2\xi_i \neq \xi_j$ and $2\xi_m \notin \{\xi_i + \xi_j : 0 \leq i, j \leq m, (i, j) \neq (m, m)\}$ and $2\xi_m \notin \{\xi_i + \xi_j : i = 0, 2, \ldots, m\}$. By Lemma 2.2.3 we obtain $H^2_m(z) = 0$, a contradiction.

**Case 2.2.1.2.** If $h_0 \in \{0, 2, 3, \ldots, m\}$, since $0 = \xi_0 < \xi_1 < \xi_2 < \cdots < \xi_{m-1} < \xi_m$ and $2\xi_i \neq \xi_j$, $i, j = 0, 1, \ldots, m$, then

$$2\xi_1 - \xi_{h_0} + \xi_1 < \min\{2\xi_1 - \xi_{h_0} + \xi_i : i = 0, 2, 3, \ldots, m\}.$$ 

Also, min$\{\xi_i \vee \xi_j : i, j = 0, 1, \ldots, m\} = 2\xi_1$. In view of Lemma 2.2.3 we obtain $q(z)e^Q(z)A_1(z) \equiv 0$, i.e., $q(z) \equiv 0$, a contradiction.

**Case 2.2.2.** Let $A_0(z) = 0$ and $H_0(z) \neq 0$. Then in this case, we get equation (2.2). Similar as Case 2.2.1, by Lemma 2.2.3 there exists one $h_0 \in \{2, 3, \ldots, m\}$ such that $2\xi_1 \omega = v_t + \xi_{h_0} \omega$ and proceeding similarly as adopted in Case 2.2.1, we can get a contradiction.

**Case 2.2.3.** Let $A_0(z) = 0$ and $H_0(z) = 0$. Then, we have equation (2.3). Similar as Case 2.2.1, by Lemma 2.2.3 there exists one $h_0 \in \{2, 3, \ldots, m\}$ such that $2\xi_1 \omega = v_t + \xi_{h_0} \omega$. Next, adopting the same method as executing in Case 2.2.1, we get a contradiction. □
Lemma 2.9. If \( m \geq 2 \) and \( \omega_i \neq 2\omega_j \) for any \( i \neq j \), then \( f \) of the form \((1.3)\) is not a solution of \((1.3)\) for \( n = 2 \).

**Proof.** Suppose on the contrary to the assertion that, \( m \geq 2 \). Substituting \( f \) of the form \((1.2)\) into \((1.3)\), we get

\[
F(z) = f^2(z) + a_1f(z) - P(z)
\]

\[
= G(z) + \sum_{\omega_i + \omega_j \neq 0}^{m} H_i(z)H_j(z)e^{(\omega_i + \omega_j)z} + a_1 \sum_{l=1}^{m} H_l(z)e^{\omega_l z}, \tag{2.4}
\]

where \( G(z) = H_0(z)(H_0(z) + a_1) - P(z) \) is either an exponential polynomial of degree \( < t \) or a polynomial in \( z \).

Therefore, also

\[
F(z) = -q(z)e^{Q(z)}L(z, f) = -q(z)e^{Q(z)} \sum_{h=0}^{m} A_h(z)e^{\omega_h z}, \tag{2.5}
\]

such that \( A_h(z) \) is defined as in \((2.1)\).

Now we set

\[
X_1 = \{\omega_1, \ldots, \omega_m, \omega_i + \omega_j : \omega_i + \omega_j \neq 0, i, j = 1, \ldots, m\},
\]

\[
X_2 = \{\omega_1, \ldots, \omega_m, 2\omega_1, \ldots, 2\omega_m\},
\]

\[
X_3 = \{2\omega_1, \ldots, 2\omega_m\}.
\]

Clearly, by the theory of convexity, we have \( \omega_i + \omega_j = \frac{1}{3} \cdot 2\omega_i + (1 - \frac{1}{3}) \cdot 2\omega_j \), i.e., \( co(X_1) = co(X_2) \).

Since, \( X_3 \subset X_2 \), we have \( co(X_3) \leq co(X_2) \), respectively.

Next, we consider the following cases to show a contradiction.

**Case 1.** If all \( A_h(z) = 0 \) for \( h = 1, \ldots, m \), then we have \( A_0(z) \neq 0 \), which implies \( H_0(z) \neq 0 \). Then \((2.5)\) becomes \( F(z) = -q(z)e^{Q(z)}A_0(z) \). Then applying Lemma 2.7 we get

\[
N \left( r, \frac{1}{F(z)} \right) = N \left( r, \frac{1}{A_0(z)} \right) = o(r^t). \tag{2.6}
\]

**Sub-case 1.1.** Let \( G(z) \equiv 0 \). Applying Lemma 2.7 on \((2.4)\), we have

\[
N \left( r, \frac{1}{F(z)} \right) = C(co(X_1)) \frac{r^t}{2\pi} + o(r^t). \tag{2.7}
\]

Therefore, \((2.6)\) and \((2.7)\) yields a contradiction.

**Sub-case 1.2.** Let \( G(z) \neq 0 \). Applying Lemma 2.7 on \((2.4)\), we have \( m \left( r, \frac{1}{F(z)} \right) = o(r^t) \) and then

\[
m \left( r, \frac{1}{F(z)} \right) + N \left( r, \frac{1}{F(z)} \right) = T(r, F(z)) + O(1) = 2T(r, f(z)) + S(r, f)
\]

\[
= 2 \left( C(co(W_0)) \frac{r^t}{2\pi} + o(r^t) \right) + S(r, f)
\]

\[
\Rightarrow N \left( r, \frac{1}{F(z)} \right) = 2C(co(W_0)) \frac{r^t}{2\pi} + o(r^t). \tag{2.8}
\]

Therefore, using \((2.6)\) and \((2.8)\), we get a contradiction.

**Case 2.** Let there exists some \( h_0 \in \{1, 2, \ldots, m\} \) such that \( A_{h_0}(z) \neq 0 \). Now, we denote the following set as

\[
V = \{\omega_{h_0} : h_0 \in \{1, 2, \ldots, m\} \text{ for which } A_{h_0}(z) \neq 0 \} \text{ and } V_0 = V \cup \{0\}.
\]

Since, \( V \subseteq W \) and \( V_0 \subseteq W_0 \), then \( C(co(V)) \leq C(co(W)) \) and \( C(co(V_0)) \leq C(co(W_0)) \), respectively.
Case 2.1. Let \( A_0(z) = 0 \) and \( H_0(z) = 0 \). Then using Lemma 2.7 on (2.5), we have

\[
N \left( r, \frac{1}{F(z)} \right) = N \left( r, \frac{1}{L(z, f)} \right) + O(\log r) = C(\text{co}(V)) \frac{r^t}{2\pi} + o(r^t).
\] (2.9)

Case 2.1.1. If \( G(z) \neq 0 \). Then similar as Sub-case 1.2, we have equation (2.8). From (2.8) and (2.9), we obtain a contradiction by \( C(\text{co}(W_0)) \geq C(\text{co}(V)) \geq 2C(\text{co}(V)) \).

Case 2.1.2. If \( G(z) = 0 \), using Lemma 2.7 on (2.4), we have equation (2.7). Using (2.7) and (2.10), we get a contradiction.

Case 2.2. Let \( A_0(z) = 0 \) and \( H_0(z) \neq 0 \). Then similar as done in Case 2.1, we get a contradiction.

Case 2.3. Let \( A_0(z) \neq 0 \), which implies \( H_0(z) \neq 0 \). Then using Lemma 2.7 on (2.4), we have

\[
m \left( r, \frac{1}{L(z, f)} \right) = o(r^t) \quad \text{and then} \quad N \left( r, \frac{1}{F(z)} \right) = N \left( r, \frac{1}{L(z, f)} \right) + O(\log r) = T(r, L(z, f)) + o(r^t) = C(\text{co}(V)) \frac{r^t}{2\pi} + o(r^t). \] (2.10)

Case 2.3.1. If \( G(z) \neq 0 \). Then, from (2.8) and (2.10), we get \( C(\text{co}(W_0)) \geq C(\text{co}(V)) = 2C(\text{co}(W_0)) \), a contradiction.

Case 2.3.2. If \( G(z) = 0 \). Using (2.7) and (2.10), we get

\[
C(\text{co}(V_0)) = C(\text{co}(X_1)).
\] (2.11)

Now, since \( m \geq 2 \), by Lemma 2.8, \( \text{co}(W_0) \) can not be a line-segment. Therefore, \( \text{co}(W_0) \) must be a polygon with non-empty interior. If \( 0 \) is not a boundary point of \( \text{co}(W_0) \), then we have \( \text{co}(W_0) = \text{co}(W) \). Then we have \( C(\text{co}(W)) = C(\text{co}(V)) \geq C(\text{co}(V_0)) = C(\text{co}(X_1)) = C(\text{co}(X_2)) \geq C(\text{co}(X_3)) = 2C(\text{co}(W)) \), a contradiction. So, \( 0 \) is a boundary point of \( \text{co}(W_0) \).

We choose the other non-zero corner points of \( \text{co}(W_0) \) among the points \( u_1, \ldots, u_m \) are \( u_1, \ldots, u_t, t \leq m \) such that \( 0 \leq \arg(u_t) \leq \arg(u_{t+1}) \leq 2\pi \) for \( 1 \leq i \leq t - 1 \). Hence,

\[
C(\text{co}(W_0)) = |u_1| + |u_2 - u_1| + \cdots + |u_t - u_{t-1}| + |u_t|.
\] (2.12)

Let \( X_4 = \{u_1, 2u_1, 2u_2, \ldots, 2u_t, u_t\} \). Therefore, the points \( 2u_1, 2u_2, \ldots, 2u_t \) are the corner points of \( \text{co}(X_4) \). However, since \( t \leq m \), \( \text{co}(X_4) \) may have more corner points. Then, using (2.12), we have

\[
C(\text{co}(X_3)) > C(\text{co}(X_4)) > |2u_1 - u_1| + |2u_2 - 2u_1| + \cdots + |2u_t - 2u_{t-1}| + |u_t - 2u_t|
= |u_1| + |u_2 - u_1| + \cdots + |u_t - u_{t-1}| + |u_t|
> |u_1| + |u_2 - u_1| + \cdots + |u_t - u_{t-1}| + |u_t|
= C(\text{co}(W_0)).
\]

Therefore,

\[
C(\text{co}(X_1)) = C(\text{co}(X_2)) \geq C(\text{co}(X_3)) > C(\text{co}(W_0)) \geq C(\text{co}(V_0)),
\]

which contradicts (2.11).

Hence, the proof is completed.

\[\square\]

Lemma 2.10. Let \( f \) be given by (1.2), which is a solution of (1.8) for \( n = 2 \), then \( f \) takes the form,

\[ f(z) = H_0(z) + H_1(z)e^{\omega_1z^t}, \]

i.e., \( f \in \Gamma' \). In this case,

(I) either \( t = 1 \), \( \rho(f) = 1 \) and \( H_0(z) \), \( H_1(z) \) are polynomials and \( Q(z) \) is a polynomial of degree 1

(II) or \( H_0(z) = -\frac{4\pi}{\omega_1}, P(z) = -\frac{\omega_1^2}{4}, H_1^2(z) = \frac{b_0}{b_1}q(z)e^{Q_1(z)} \) and \( L(z, f) = b_0H_0(z) \).
(III) or $H_0(z) = -\frac{q}{z^2}$, $P(z) = -\frac{q}{z}$, $H_1^2(z) = -q(z)e^{Q_{t-1}(z)}A_1(z)$ and $L(z, f) = A_1(z)e^{\omega_1 z^t}$, where $A_1(z) = \sum_{i=0}^{k} b_i H_1(z + c_i) e^{\omega_1(z + c_i)^t} = \omega_1 z^t$ such that $H_1(z + c_i)$ are the delay-differential polynomial of $H_1(z)$.

**Proof.** For $n = 2$, (1.8) becomes

$$f^2(z) + a_1 f(z) + q(z)e^{Q(z)}L(z, f) = P(z).$$

(2.13)

By Lemma 2.2, we have $m = 1$, i.e., (1.2) becomes

$$f(z) = H_0(z) + H_1(z)e^{\omega_1 z^t},$$

where $H_0(z)$, $H_1(z)(\neq 0)$ are either exponential polynomials of order $< t$ or ordinary polynomials in $z$. Substituting (2.13) in (2.13), we have

$$H_1(z)(2H_0(z) + a_1)e^{\omega_1 z^t} + H_1^2(z)e^{2\omega_1 z^t} + q(z)e^{Q_{t-1}(z)}A_0(z)e^{\omega_1 z^t}$$

$$+ q(z)e^{Q_{t-1}(z)}A_1(z)e^{\omega_1 z^t} = P(z) - H_0(z)(H_0(z) + a_1).$$

(2.15)

where $Q_{t-1}(z) = Q(z) - v_1 z^t$ with $\deg Q_{t-1}(z) \leq q - 1$ and $A_0(z) = \sum_{i=0}^{k} b_i H_1^{(n)}(z + c_i)$, $A_1(z) = \sum_{i=0}^{k} b_i H_1(z + c_i) e^{\omega_1(z+c_i)^t}$ such that $h(z + c_i)$ are the delay-differential polynomial of $H_0(z)$ for $h = 1, 2$. Since, $L(z, f) \neq 0$, then at least one of $A_0(z)$ and $A_1(z)$ is non-vanishing. Next, we divide the following cases to prove our result.

**Case 1.** Let $A_1(z) \equiv 0$. Then $A_0(z) \neq 0$, which implies $H_0(z) \neq 0$.

If $v_1 \neq \omega_1, 2\omega_1$ or $v_1 = \omega_1$, applying Lemma 2.2 on (2.15), we have $H_1^2(z) \equiv 0$, a contradiction. If $v_1 = 2\omega_1$, then, applying Lemma 2.2 on (2.15), we have

$$H_1(2H_0(z) + a_1) = 0,$$

$$H_1^2(z) + q(z)e^{Q_{t-1}(z)}A_0(z) = 0,$$

$$P(z) - H_0(z)(H_0(z) + a_1) = 0.$$

Since, $H_1(z) \neq 0$. Therefore, solving these three equations, we have $H_0(z) = -\frac{q}{z^2}$, $P(z) = -\frac{q}{z}$ and $H_1^2(z) = \frac{q}{z^2} q(z)e^{Q_{t-1}}$. Therefore, in this case $L(z, f) = b_0 H_0(z)$.

**Case 2.** Let $A_0(z) \equiv 0$. Then $A_1(z) \neq 0$.

**Sub-case 2.1.** Let $H_0(z) \equiv 0$. If $v_1 = \pm \omega_1$, using Lemma 2.2 on (2.15), we have $H_1 \equiv 0$, a contradiction.

**Sub-case 2.2.** Let $H_0(z) \neq 0$. If $v_1 = -\omega_1$, in view of Lemma 2.2, from (2.15), we have $H_1 \equiv 0$, a contradiction. If $v_1 = \omega_1$, similar as Case 1, we have $H_0(z) = -\frac{q}{z^2}$, $P(z) = -\frac{q}{z}$ and $H_1^2(z) = -q(z)e^{Q_{t-1}}A_1$. Also, in this case $L(z, f) = A_1 e^{\omega_1 z^t}$.

**Case 3.** Let $A_0(z) \neq 0$ and $A_1(z) \neq 0$, which implies $H_0(z) \neq 0$.

If $v_1 = -\omega_1$ or $v_1 \neq \pm \omega_1$, using Lemma 2.2 on (2.15), we have $H_1 \equiv 0$, a contradiction. If $v_1 = 2\omega_1$, by Lemma 2.2, from (2.15), we have $A_1 \equiv 0$, a contradiction.

If $v_1 = \omega_1$, applying Lemma 2.2 on (2.15), we have

$$H_1(z)(2H_0(z) + a_1) + q(z)e^{Q_{t-1}(z)} \sum_{i=0}^{k} b_i H_0^{(n)}(z + c_i) = 0,$$

(2.16)

$$H_1^2(z) + q(z)e^{Q_{t-1}(z)} \sum_{i=0}^{k} b_i H_1(z + c_i) e^{\omega_1(z+c_i)^t} = 0,$$

(2.17)

$$P(z) - H_0(z)(H_0(z) + a_1) = 0.$$

(2.18)

Now, we show that $H_0(z)$ is a polynomial. If possible let, $H_0(z)$ is transcendental. Then from (2.18), we have

$$2T(r, H_0(z)) + S(r, H_0(z)) = T(r, P) = O(\log r),$$
Lemma 2.3 which yields a contradiction. In view of $\rho$ of Theorem 1.2(b) in [10], using Lemmas 2.3, 2.4, 2.6 we have
\[
\beta^2(z) + q(z) \sum_{i=0}^{k} b_i \beta(z + c_i) e^{Q_{t-1}(z+c_i) + \omega_1(z+c_i)^t - \omega_1 z^t} = 0, \tag{2.20}
\]
where $\beta(z + c_i)$ is a delay differential polynomial in $H_0(z)$ and $Q_{t-1}(z)$. Note that $\deg(\omega_1(z+c_i)^t - \omega_1 z^t) = t - 1$ and $\deg(Q_{t-1}(z+c_i) - Q_{t-1}(z)) \leq t - 2$. If $t \geq 2$, applying Lemma 2.3 on (2.20), we have $q(z) = 0$, a contradiction. Therefore, $t = 1$, i.e., $H_1(z)$ is a polynomial. Hence, $f(z)$ reduces to the form
\[
f(z) = H_0(z) + H_1(z) e^{\omega_1 z},
\]
where $H_0(z)$ and $H_1(z)$ are polynomials. So, $f \in \Gamma'$. \hfill \(\Box\)

3. Proofs of Theorems

Proof of Theorem 1.1 (i). Suppose that $f$ be a finite order non-vanishing entire solution of (1.8). Using Lemma 2.3 we have $f$ is transcendental. Otherwise, we will get $L(z, f) = 0$, which yields a contradiction. In view of Lemma 2.3 from (1.8), we get
\[
n T(r, f) + S(r, f) = m \left( r, f^n(z) + \sum_{i=1}^{n-1} a_i f^i(z) \right)
\]
\[
= m(r, P(z)) - q(z) e^{Q(z)} L(z, f)
\]
\[
= m(r, e^{Q(z)}) + m(r, L(z, f)) + O(1)
\]
\[
= m(r, e^{Q(z)}) + m \left( r, \frac{L(z, f)}{f(z)} \right) + m(r, f(z)) + O(1)
\]
\[
= T(r, e^{Q(z)}) + T(r, f(z)) + S(r, f)
\]
\[
\implies (n - 1) T(r, f) \leq T(r, e^{Q(z)}) + S(r, f). \tag{3.1}
\]
Therefore, for $n \geq 2$, $\rho(f) \leq \deg Q(z)$. If $\rho(f) < \deg Q(z)$, then comparing order of growth of (1.8), we get a contradiction. So, $\rho(f) = \deg Q(z)$. Now, from the definition of type, we have
\[
\tau(f) = \lim_{r \to \infty} \frac{T(r, f)}{\rho(f)} = \lim_{r \to \infty} \frac{T(r, f)}{\rho(Q(z))} \in (0, \infty),
\]
i.e., $f$ is of mean type. \hfill \(\Box\)

Proof of Theorem 1.1 (ii). First, we prove that if zero is a Borel exceptional value of $f(z)$, then we have $a_{n-1} = \cdots = a_1 = 0 \equiv P(z)$. Adopting the similar process as done in the proof of Theorem 1.2(b) in [10], using Lemmas 2.3, 2.4, 2.6 and replacing $f(z + c)$ by $L(z, f)$, we can prove our result. In this regards, only the equation (10) of [10] is replaced by the following lines
\[
N \left( r, \frac{1}{G(z)} \right) = N \left( r, \frac{1}{q(z) e^{Q(z)} L(z, f)} \right)
\]
\[
\leq N \left( r, \frac{1}{q(z)} \right) + N \left( r, \frac{1}{L(z, f)} \right) + S(r, f)
\]
\[
\leq (k + 1) N \left( r, \frac{1}{f(z)} \right) + S(r, f) = S(r, f).
\]
Next, we prove the converse part of Theorem 1.1 (iii). For this, using Lemmas 2.3, 2.6 and replacing \( f(z + c) \) by \( L(z, f) \), we proceed similar up to equation (17) in the proof of Theorem 1.2(c) in \([10]\). Here, the equations (15), (16) and (17) of \([10]\), respectively, will be

\[
T \left( r, \frac{L(z, f)}{f(z)} \right) = S(r, f),
\]

\[
\left( f(z) + \frac{a_{n-1}}{n-1} \right)^{n-1} = f^{n-1}(z) + \sum_{i=1}^{n-1} a_i f^{i-1}(z) = -q(z)e^{Q(z)} \frac{L(z, f)}{f(z)}
\]

and

\[
a_{i+1} = \frac{(n-1)!}{i!(n-1-i)!} \left( \frac{a_{n-1}}{n-1} \right)^{n-1-i}, \quad i = 0, 1, \ldots, n-2.
\]

**Case 1.** If there exists \( i_0 \in \{1, \ldots, n-1\} \) such that \( a_{i_0} = 0 \), then from (3.4), we have all \( a_i \) must be equal to zero for \( i = 1, 2, \ldots, n-1 \). Therefore, (3.3) becomes

\[
f(z)^{n-1} = -q(z)e^{Q(z)} \frac{L(z, f)}{f(z)}
\]

By using (3.2), for each \( \varepsilon > 0 \), we have

\[
(n-1)N \left( r, \frac{1}{f(z)} \right) = N \left( r, \frac{1}{q(z) \frac{L(z, f)}{f(z)}} \right)
\]

\[
\leq N \left( r, \frac{1}{q(z)} \right) + N \left( r, \frac{1}{\frac{L(z, f)}{f(z)}} \right) + S(r, f) = S(r, f).
\]

Therefore, \( \lambda(f) < \rho(f) \).

**Case 2.** If there exists no \( i_0 \in \{1, \ldots, n-1\} \) such that \( a_{i_0} = 0 \), then from (3.2) and (3.3), we have

\[
N \left( r, \frac{1}{f(z) + \frac{a_{n-1}}{n-1}} \right) \leq N \left( r, \frac{1}{q(z)} \right) + N \left( r, \frac{1}{\frac{L(z, f)}{f(z)}} \right) + S(r, f) = S(r, f).
\]

Using the second main theorem, we have

\[
T(r, f) \leq N \left( r, \frac{1}{f(z) + \frac{a_{n-1}}{n-1}} \right) + N \left( r, \frac{1}{f(z)} \right) + N(r, f(z))
\]

\[
= N \left( r, \frac{1}{f(z)} \right) + S(r, f)
\]

Therefore, \( \rho(f) \leq \lambda(f) \) but we know that \( \lambda(f) \leq \rho(f) \). Therefore, \( \lambda(f) = \rho(f) \).

**Proof of Theorem 1.1 (iii).** Suppose that \( f \) be a non-vanishing finite order entire solution of (1.8). Similar as Theorem 1.1 (i), \( f \) is transcendental.

First suppose that \( f \) belongs to \( T_0 \), which means that 0 is a Borel exceptional value of \( f \). Thus, from Theorem 1.1 (i), we have \( a_{n-1} = \cdots = a_1 = 0 = P(z) \).

Next, we suppose that \( P(z) \equiv 0 \) and there exists an \( i_0 \in \{1, \ldots, n-1\} \) such that \( a_{i_0} = 0 \). Then from the converse part of Theorem 1.1 (ii), we have all of the \( a_i (i = 1, \ldots, n-1) \) must be zero as well and \( \lambda(f) < \rho(f) \).

From Hadamard factorization theorem, we can see that

\[
f(z) = h(z)e^{\alpha(z)},
\]

where \( \alpha(z) \) is a polynomial and \( h(z) \) is the canonical product of zeros of \( f \) with \( \deg \alpha(z) = \rho(f) = \deg Q(z) = t \) and \( \rho(h) = \lambda(h) = \lambda(f) < \rho(f) \).
Substituting (3.5) in (1.8) with all $a_i = 0$, we have

$$h^n(z)e^{na(z)} + q(z)e^{Q(z)} + a(z) \left( \sum_{i=0}^{k} L_i(z, h) e^{\Delta_i \alpha(z)} \right) = 0, \tag{3.6}$$

where

$$L_i(z, h) = b_i \left[ h(z + c_i)M_k(\alpha'(z + c_i), \alpha''(z + c_i), \ldots, \alpha^{(k_i)}(z + c_i)) + h'(z + c_i)M_{k_i-1}(\alpha'(z + c_i), \alpha''(z + c_i), \ldots, \alpha^{(k_i-1)}(z + c_i)) + \cdots + h^{(k_i-1)}(z + c_i)M_1(\alpha'(z + c_i)) + h^{(k_i)}(z + c_i) \right].$$

Clearly, $\rho(L_i(z, h)) < t$. Rewriting (3.3), we have

$$h^n(z)e^{na_{t-1}(z)}e^{nu_t z^t} + q(z)e^{a_{t-1}(z)+Q_{t-1}(z)} \left( \sum_{i=0}^{k} L_i(z, h) e^{\Delta_i \alpha(z)} \right) e^{(u_t+v_1)z^t} = 0 \tag{3.7}$$

such that $\alpha(z) = u_t z^t + \alpha_{t-1}(z)$ and $Q(z) = v_t z^t + Q_{t-1}(z)$, where $u_t, v_t$ are non-zero constants and $\alpha_{t-1}(z), Q_{t-1}(z)$ are of degree $\leq t - 1$.

In view of Lemma 2.3, we can easily say that (3.7) is possible only when $(n-1)u_t = v_t$.

Therefore, (3.7) becomes

$$h^n(z) + q(z)e^{(1-n)a_{t-1}(z)+Q_{t-1}(z)} \left( \sum_{i=0}^{k} L_i(z, h) e^{\Delta_i \alpha(z)} \right) = 0. \tag{3.8}$$

Here, the following cases arise.

**Case 1:** Let $\rho(h) < t - 1 > 0$. If $\deg\{(1 - n)\alpha_{t-1}(z) + Q_{t-1}(z)\} = t - 1$, applying Lemma 2.2, we have $q(z) = 0$, a contradiction. If $\deg\{(1 - n)\alpha_{t-1}(z) + Q_{t-1}(z)\} < t - 1$, from $\deg\{\Delta_i \alpha(z)\} = t - 1$, by using Lemma 2.3 again we have $q(z) = 0$, a contradiction.

**Case 2:** Let $\rho(h) \geq t - 1 > \rho(h) - 1, t - 1 > 0$. By logarithmic derivative lemma [3 Corollary 2.5], for each $\varepsilon > 0$, we have

$$m \left( r, \frac{L_i(z, h)}{h(z)} \right) = O(r^{\rho(h)-1+\varepsilon}) + O(\log r). \tag{3.9}$$

Since, $h$ is entire, using (3.8) and (3.9), we have

$$T \left( r, \sum_{i=0}^{k} L_i(z, h) e^{\Delta_i \alpha(z)} \right) = m \left( r, \sum_{i=0}^{k} L_i(z, h) e^{\Delta_i \alpha(z)} \right) + \sum_{i=0}^{k} T \left( r, e^{\Delta_i \alpha(z)} \right) + O(r^{\rho(h)-1+\varepsilon}) + O(\log r). \tag{3.10}$$

Therefore, using (3.5) and (3.10), we obtain for each $\varepsilon > 0$

$$(n-1)N \left( r, \frac{1}{h(z)} \right) \leq N \left( r, \frac{1}{\sum_{i=0}^{k} L_i(z, h) e^{\Delta_i \alpha(z)}} \right) + O(\log r) \leq T \left( r, \sum_{i=0}^{k} L_i(z, h) e^{\Delta_i \alpha(z)} \right) + O(\log r) \leq \sum_{i=0}^{k} T \left( r, e^{\Delta_i \alpha(z)} \right) + O(r^{\rho(h)-1+\varepsilon}) + O(\log r). \tag{3.11}$$

Now, if $c_i = c_j$ for all $1 \leq i, j \leq k$, say, $c_i$, then (3.11) becomes

$$(n-1)N \left( r, \frac{1}{h(z)} \right) \leq T \left( r, e^{\Delta \alpha(z)} \right) + O(r^{\rho(h)-1+\varepsilon}) + O(\log r).$$
Thus, from the above equation, we have $\lambda(h) \leq t - 1$. But in this case, $\lambda(h) = \rho(f) \geq t - 1$.

Therefore, $\lambda(f) = \lambda(h) = t - 1 = \rho(f) - 1$.

If $t - 1 = 0$, we get $\rho(h) = \lambda(h) < \rho(f) = t = 1$. If $h(z)$ is transcendental, then $h(z)$ has infinitely many zeros. Now noting that $\Delta, \alpha(z)$ is of degree $t - 1$, from (3.11), we get $N(r, \frac{1}{h(z)}) = O(\log r)$, a contradiction. Therefore, $h(z)$ will be a polynomial. So, $f$ belongs to $\Gamma_0$.

**Case 3:** Let $\rho(h) \geq t$. Then from (3.11), we obtain $\lambda(h) < \rho(h)$, a contradiction. So, $h(z)$ will be a polynomial. Therefore, $f$ belongs to $\Gamma_0$.

**Proof of Theorem 1.1** (iv). Suppose that $f$ is a non-vanishing finite order entire solution of (1.8). Similarly, $f$ is transcendental. If possible let, $P(z) \not\equiv 0$. By the assumption, $\text{card}\{z : p(z) = p'(z) = p''(z) = 0\} \geq 1$ or $\text{card}\{z : p(z) = p'(z) = 0\} \geq 2$, where $p(z) = z^n + a_{n-1}z^{n-1} + \cdots + a_1z$, we mean that $p(z)$ has at least one zero with multiplicity at least three or at least 2 zeros with multiplicities at least two. In view of Lemma 2.3 and the second main theorem, we have

\[
\begin{align*}
n & T(r, f) = T(r, f^n(z) + a_{n-1}f^{n-1}(z) + \cdots + a_1f(z)) \\
& \leq \mathcal{N}\left(r, \frac{1}{f^n + a_{n-1}f^{n-1} + \cdots + a_1f - P(z)}\right) \\
& + \mathcal{N}\left(r, \frac{1}{f^n + a_{n-1}f^{n-1} + \cdots + a_1f}\right) + \mathcal{N}(r, f^n + a_{n-1}f^{n-1} + \cdots + a_1f) \\
& \leq \mathcal{N}\left(r, \frac{1}{q(z)L(z, f)}\right) + (n - 2) T(r, f) + S(r, f) \\
& \leq T(r, q(z)L(z, f)) + (n - 2) T(r, f) + S(r, f) \\
& \leq N(r, q(z)L(z, f)) + m(r, q(z)L(z, f)) + (n - 2) T(r, f) + S(r, f) \\
& \leq m\left(r, \frac{L(z, f)}{f(z)}\right) + m(r, f(z)) + (n - 2) T(r, f) + S(r, f) \\
& \leq T(r, f) + (n - 2) T(r, f) + S(r, f) \\
& \leq (n - 1) T(r, f) + S(r, f),
\end{align*}
\]

a contradiction. Therefore, $P(z) \equiv 0$.

Since, at least one $a_{i_0} = 0$ ($i_0 = 1, 2, \ldots, n - 1$), using Theorem 1.4 (iii), we have $f \in \Gamma_0$. Note that, since, $P(z) \equiv 0$ and at least one $a_{i_0} = 0$ ($i_0 = 1, 2, \ldots, n - 1$), from Theorem 1.4 (ii), we have all of $a_{i_j}$ (for $j = 1, \ldots, n - 1$) must be zero. Therefore $p(z)$ is of the form $z^n$, which implies $\text{card}\{z : p(z) = p'(z) = 0\} \geq 2$ is not possible.

**Proof of Theorem 1.1** (v). From Theorem 1.4 (i), we have $\rho(f) = \deg(Q(z))$. Using Lemmas 2.8, 2.10 we can prove the result.
