DECIDABILITY FOR THE THEORY OF MODULES OVER A PRÜFER DOMAIN

LORNA GREGORY

Abstract. In this paper we give elementary conditions completely characterising when the theory of modules of a Prüfer domain is decidable. Using these results, we show that the theory of modules of the ring of integer valued polynomials is decidable.

1. Introduction

In this article, we give a complete characterization of when the theory of modules of a recursive Prüfer domain is decidable.

Prüfer domains are a much studied class of rings, including many classically important rings and classes of rings. For example, they include Dedekind domains and hence rings of integers of number fields; Bézout domains and hence the ring of complex entire functions [Hel40, Thm. 9] and the ring of algebraic integers [Kap74, Thm. 102]; the ring of integer valued polynomials with rational coefficients [CC97, VI.1.7] and the real holomorphy ring of a formally real field [Bec82, 2.16].

Prüfer domains have provided a rich supply of rings for which the decidability of modules can be determined. The theory of modules of a ring $R$ is said to be decidable if there is an algorithm which decides whether a given first order sentence in the language of $R$-modules is true in all $R$-modules.

Date: July 13, 2021.
The first non-trivial example of a ring with decidable theory of modules was given by Szmielew, [Szm55], who showed that the theory of abelian groups (or equivalently \(\mathbb{Z}\)-modules) is decidable. This result was generalised by Eklof and Fischer, [EF72], to certain Dedekind domains, among them certain rings of integers, and they showed that, for a (recursive) field \(k\) with a splitting algorithm, the theory of \(k[x]\)-modules is decidable.

The most recent effort to understand decidability of theories of modules over Prüfer domains started with a paper, [PPT07], of Puninski, Puninskaya and Tofalori. They showed that a recursive valuation domain with dense archimedean value group has decidable theory of modules if and only if its set of units is recursive. Proving a conjecture in [PPT07], we show in [Gre15] that an arbitrary recursive valuation domain has decidable theory of modules if and only if the radical relation \(a \in \text{rad} bR\) is recursive.

The theory of modules of Bézout domains of the form \(D + XQ[X] \subseteq Q[X]\), where \(D\) is a principal ideal domain with field of fractions \(Q\), is shown in [PT14] to be decidable under certain reasonable effective conditions on \(D\). In particular, it is shown that \(\mathbb{Z} + XQ[X]\) has decidable theory of modules. The theory of modules of the ring of algebraic integers, along with some other Bézout domains with Krull dimension 1, is shown to have decidable theory of modules in [LTP17].

Work towards characterising when a general Prüfer domain has decidable theory of modules was started in the articles [GLPT18] and [GLT19], and is finished in the present one. We will describe the results of these articles whilst describing the main result of this article.

First a reminder of the setup for proving decidability results for theories of modules. Thanks to the Baur-Monk theorem, if \(R\) is a recursive ring then the theory of \(R\)-modules is decidable if and only if there exists an algorithm which, given \(\phi_1/\psi_1, \ldots, \phi_l/\psi_l\) pairs of pp-formulae and intervals \([n_1, m_1], \ldots, [n_l, m_l] \subseteq \mathbb{N}\) where \(n_i, m_i \in \mathbb{N} \cup \{\infty\}\), answers whether there exists an \(R\)-module \(M\) such that, for all \(1 \leq i \leq l\), \(|\phi(M)/\psi(M)| \in [n_i, m_i]\). The existence of an algorithm answering this question when \([n_i, m_i]\) are either \([1, 1]\) or \([1, \infty]\) is equivalent to the existence of an algorithm deciding whether one Ziegler basic open set is contained in a finite union of other Ziegler basic open sets (for the definition of the Ziegler spectrum see 2.1).

We characterise when the theory of modules of a Prüfer domain \(R\) is decidable in terms of the recursivity of three sets: DPR(\(R\)), EPP(\(R\)) and \(X(R)\). Each of these sets is a subset of \(R^4 \times \mathbb{N}_0^k\) for some \(n, k \in \mathbb{N}_0\). For the sets EPP(\(R\)) and \(X(R)\), we postpone their definitions to section 3 and in this introduction we instead give some indication of their meaning.

For any commutative ring \(R\), the set DPR(\(R\)) is defined as the set of \((a, b, c, d) \in R^4\) such that for all prime ideals \(p, q \prec R\) with \(p + q \neq R\), either \(a \in p, b \notin p, c \in q\) or \(d \notin q\). This set was introduced in [GLPT18] as a generalisation of the radical relation \(a \in \text{rad} bR\). For a recursive Bézout domain it is shown there that DPR(\(R\)) is recursive if and only if there is an algorithm deciding inclusions of Ziegler basic open sets. For recursive Prüfer domains, analogous sufficient conditions were given for there to exist an algorithm deciding inclusions of Ziegler basic open sets. Building heavily on those results, we extend the equivalence given in [GLPT18] for Bézout domains to all recursive Prüfer domains (see 3.8). As a consequence we get the following theorem.
Theorem. (See [3.9]) Let \( R \) be a recursive Prüfer domain such that \( R/m \) is infinite for all maximal ideals \( m \). The theory of \( R \)-modules is decidable if and only if \( \text{DPR}(R) \) is recursive.

For rings \( R \) with a pair of pp-formulae \( \varphi/\psi \) and an \( R \)-module \( M \) such that \(|\varphi(M)/\psi(M)|\) is finite but not equal to 1, in particular for commutative rings with finite non-zero modules, we need to do more than show that there is an algorithm deciding inclusions of Ziegler basic open sets.

For any ring \( R \), if the theory of \( R \)-modules is decidable then the theory of modules of size \( n \) is decidable uniformly in \( n \). In [3.19] we introduce a set \( \text{EPP}(R) \), whose recursivity, for a recursive Prüfer domain \( R \), is equivalent to the decidability of the theory of \( R \)-modules of size \( n \), uniformly in \( n \). This is proved in Theorem [7.6]. The main feature of \( \text{EPP}(R) \) is that it is often easier to check in examples that \( \text{EPP}(R) \) is recursive than it is to check that the theory of modules of size \( n \) is decidable uniformly in \( n \).

The set \( \text{EPP}(R) \) is a generalisation of \( \text{PP}(R) \), which is defined in [GLT19] and inspired by the characterisation of commutative von Neumann regular rings with decidable theories of modules given in [PPSS]. In [GLT19], for a recursive Bézout domain \( R \), under the condition that for each maximal ideal \( m \), \( R_m \) has dense value group, it is shown that the theory of \( R \)-modules is decidable if and only if \( \text{DPR}(R) \) and \( \text{PP}(R) \) are recursive. Building heavily on [GLT19], we show, that this result also holds for Prüfer domains.

Theorem [3.12]. Let \( R \) be a recursive Prüfer domain such that \( R_m \) has dense value group for all maximal ideals \( m \). The theory of \( R \)-modules is decidable if and only if \( \text{PP}(R) \) and \( \text{DPR}(R) \) is recursive.

It follows from this result that the theory of modules of a recursive Prüfer domain with dense value groups (or infinite residue fields) is decidable if and only if there is an algorithm deciding inclusions of Ziegler basic open sets and the theory of finite modules of size \( n \) is decidable uniformly in \( n \). The same result for commutative von Neumann regular rings easily follows from [PPSS]. This does not appear to be the case for arbitrary Prüfer domains.

The third set, \( X(R) \), captures information about finite Baur-Monk invariants of the, in some sense intrinsically infinite modules, \( R_p/I \) where \( p \prec R \) is a prime ideal and \( I < R_p \).

Main Theorem [11.1]. Let \( R \) be a recursive Prüfer domain. The theory of \( R \)-modules is decidable if and only if the sets \( \text{DPR}(R) \), \( \text{EPP}(R) \) and \( X(R) \) are recursive.

Our characterisation is such that it can be easily checked for concrete rings. We illustrate this in section [12] by using our main theorem to show that the ring of integer valued polynomials with rational coefficients, \( \text{Int}(\mathbb{Z}) \), has decidable theory of modules. In order to prove that \( \text{DPR}(\text{Int}(\mathbb{Z})) \), \( \text{EPP}(\text{Int}(\mathbb{Z})) \) and \( X(\text{Int}(\mathbb{Z})) \) are recursive, we use Ax's result, [Ax68, Thm 17], that the common theory of the \( p \)-adic valued fields \( \mathbb{Q}_p \) as \( p \) varies, is decidable.

Section 1 contains background material and simple preparations for the rest of the paper. Its main purpose is to make the article as accessible as possible. We postpone a guide to the proof and discussion of what happens in each section to subsection 2.3.
When it doesn’t complicate the proofs, we will state some of our intermediate results for arithmetical rings i.e. commutative rings whose localisations at prime ideals are valuation rings.

2. Preliminaries

Notation: In this article \( \mathbb{N} = \{1, 2, 3, \ldots\} \), \( \mathbb{N}_0 = \mathbb{N} \cup \{0\} \), \( \mathbb{N}_n = \{m \geq n\} \) for \( n \in \mathbb{N} \) and \( \mathbb{P} \) denotes the set of prime natural numbers. For a ring \( R \), let \( \text{Mod}-R \) denote the category of (right) modules.

2.1. Model theory of Modules. For general background on model theory of modules see \textsc{Pre88}.

Let \( R \) be a ring. Let \( \mathcal{L}_R := \{0, +, (r)_{r \in R}\} \) be the language of (right) \( R \)-modules and \( \mathcal{T}_R \) be the theory of (right) \( R \)-modules. A (right) pp-\( n \)-formula is a formula of the form

\[
\exists y_1, \ldots, y_l \bigwedge_{j=1}^m y_i r_{ij} + \sum_{i=1}^n x_i s_{ij} = 0
\]

where \( r_{ij}, s_{ij} \in R \). For \( a \in R \), we write \( a|x \) for the pp-1-formula \( \exists y \ x = ya \).

The solution set \( \varphi(M) \) of a pp-\( n \)-formula \( \varphi \) in an \( R \)-module \( M \) is a subgroup of \( M^n \). For \( \varphi, \psi \), pp-\( n \)-formulae and \( M \in \text{Mod}-R \), we will write \( \psi \leq_M \varphi \) to mean that \( \psi(M) \subseteq \varphi(M) \). We will write \( \psi \leq \varphi \) to mean that \( \psi \leq_M \varphi \) for all \( M \in \text{Mod}-R \). After identifying equivalent pp-\( n \)-formulae, the set of pp-\( n \)-formulae, pp\(_R^\# \), equipped with the order \( \leq \) is a lattice.

A **pp-\( m \)-pair** will simply mean a pair of pp-\( m \)-formulae and we will write \( \varphi/\psi \) for such pairs. We write \( \varphi/\psi(M) \) for the quotient group \( \varphi(M)/\varphi(M) \cap \psi(M) \). For every \( n \in \mathbb{N} \) and pp-pair \( \varphi/\psi \), there is a sentence, denoted \( |\varphi/\psi| \geq n \), in the language of (right) \( R \)-modules, which expresses, in every \( R \)-module \( M \), that \( \varphi/\psi(M) \) has at least \( n \) elements. We write \( |\varphi/\psi| = n \) for the sentence which expresses, in every \( R \)-module \( M \), that \( \varphi/\psi(M) \) has exactly \( n \) elements.

**Theorem 2.1** (Baur-Monk). Let \( R \) be a ring. Every sentence in \( \mathcal{L}_R \) is equivalent to a boolean combination of sentences of the form \( |\varphi/\psi| \geq n \) where \( \varphi/\psi \) is a pp-1-pair.

An embedding \( f : A \to B \) is **pure** if for all pp-1-formulae \( \varphi \) and \( m \in A \), \( f(m) \in \varphi(B) \) implies \( m \in \varphi(A) \). A module \( N \) is **pure-injective** if for every embedding \( f : A \to B \) and homomorphism \( g : A \to N \), there exists \( h : B \to N \) such that \( h \circ f = g \).

**Lemma 2.2.** \textsc{Pre88} 4.36] Let \( R \) be a ring. For all \( M \in \text{Mod}-R \), there exist indecomposable pure-injective modules \( N_i \in \text{Mod}-R \) for \( i \in I \) such that \( \oplus_{i \in I} N_i \) is elementary equivalent to \( M \).

We say a pure-embedding \( i : M \to N \) with \( N \) pure-injective is a **pure-injective hull** of \( M \) if for every other pure-embedding \( g : M \to K \) where \( K \) is pure-injective, there is a pure-embedding \( h : N \to K \) such that \( h \circ i = g \). The pure-injective hull of \( M \) is unique up to isomorphism over \( M \) and we will write \( H(M) \) for any module \( N \) such that the inclusion of \( M \) in \( N \) is a pure-injective hull of \( M \). Every module is a elementary substructure of its pure-injective hull \textsc{Pre88} 2.27]. So, in particular every module is elementary equivalent to its pure-injective hull.
The (right) Ziegler spectrum, denoted $Zg_R$, is a topological space whose points are isomorphism classes of indecomposable pure injective (right) modules and which has a basis of compact open sets given by

$$(\varphi/\psi) := \{N \in \text{pinj}_R \mid \varphi(N) \supseteq \varphi(N) \cap \psi(N)\}$$

where $\varphi/\psi$ range over pp-$1$-pairs.

For each $n \in \mathbb{N}$, Prest gave a lattice anti-isomorphism $D : \text{pp}_R^n \rightarrow \text{rpp}^n$ (see [Pre88, 8.21]). As is standard, we denote its inverse $\text{rpp}^n \rightarrow \text{pp}_R^n$ also by $D$. We don’t recall the full definition of $D$ here but instead note that for all $a \in R$, $Da|x$ is $ax = 0$ and $D(ax = 0)$ is $a|x$.

Herzog extended this duality to an isomorphism between the lattice of open sets of the right and left Ziegler spectra of a ring [Her93, 4.4], and, to a useful bijection between the complete theories of right and left $R$-modules.

The following proposition is direct consequence of [Her93, 6.6].

Proposition 2.3. Let $R$ be a ring. Let $n, m \in \mathbb{N}$ be such that $n \leq m$ and for $1 \leq i \leq m$, let $N_i \in \mathbb{N}$ and let $\varphi/\psi_i$ be a pp-pair. For

$$\chi := \bigwedge_{i=1}^{n} |\varphi/\psi_i| \land \bigwedge_{i=n+1}^{m} |\varphi/\psi_i| \geq N_i,$$

define

$$D\chi := \bigwedge_{i=1}^{n} |D\psi_i/D\varphi_i| = N_i \land \bigwedge_{i=n+1}^{m} |D\psi_i/D\varphi_i| \geq N_i.$$

There exists a right $R$-module satisfying $\chi$ if and only if there exits a left $R$-module satisfying $D\chi$.

A priori, duality may not appear particularly relevant to an article about commutative rings. However, its use significantly simplifies some of the proofs in this paper and, as in [Gre15], the fact that it exchanges formulae $xb = 0$ with $b|x$ allows us to reduce the number of calculations.

2.2. Decidability and recursive Prüfer domains.

A recursive ring is either a finite ring or a ring $R$ together with a bijection $\pi : \mathbb{N} \rightarrow R$ such that addition and multiplication in $R$ induce recursive functions on $\mathbb{N}$ via $\pi$.

Note that if $R$ is a ring and $\pi : \mathbb{N} \rightarrow R$ is a bijection then $T_R$ is recursively axiomatisable with respect to $\pi$ if and only if $R$ together with $\pi$ is a recursive ring.

When proving decidability results about theories of modules, it is common to work with an “effectively given” ring rather than just a recursive one. Usually, a ring of a particular type is called effectively given if $R$ is a recursive ring and the bijection $\pi$ satisfies some extra conditions which are equivalent, for that particular type of ring, to Prest’s condition $(D)$ holding (see [Pre88, pg 334]). Recall that a recursive ring satisfies condition $(D)$ if there is an algorithm which, given $\varphi, \psi \in \text{pp}_R^1$ answers whether $\psi \leq \varphi$. For example, a recursive valuation domain $V$ is said to be effectively given if the preimage under $\pi$ of the set of units of $V$ is recursive. A recursive Prüfer domain $R$ is said to be effectively given if the preimage under $\pi$ of the set of $(a, b) \in R^2$ such that $a \in bR$ is recursive.

Whether one works with recursive rings or effectively given ones is largely a matter of personal taste. For simplicity, we choose to work with recursive rings.
It was remarked in [GLT19], paragraph before 2.4, that the property that \( a \in bR \) is recursive is never used in [GLPT18] and [GLT19]. Moreover, see [GLT19, 2.4], if \( R \) is a recursive Prüfer domain and the set \( DPR(R) \subseteq R^4 \) is recursive then \( a \in bR \) is recursive. In particular, even though they are stated for effectively given Prüfer domains, all results in [GLPT18] and [GLT19] in fact hold for recursive Prüfer domains.

The next theorem is a well-known and easy to prove consequence of the Baur-Monk Theorem. Note that since \( T_R \) is recursively axiomatisable when \( R \) is recursive, given a sentence \( \chi \) in \( L_R \), we can always find, using a proof algorithm, a sentence \( \chi' \) as in the statement of the Baur-Monk theorem which is \( T_R \)-equivalent to \( \chi \).

**Theorem 2.4.** Let \( R \) be a recursive ring. The theory of \( R \)-modules is decidable if and only if there is an algorithm which, given a sentence \( \chi \) of the form

\[
\chi := \bigwedge_{i=1}^{n} |\varphi_i/\psi_i| = N_i \wedge \bigwedge_{i=n+1}^{m} |\varphi_i/\psi_i| \geq N_i,
\]

where \( N_i \in \mathbb{N} \) and \( \varphi_i/\psi_i \) is a pp-1-pair for \( 1 \leq i \leq m \), answers whether there exists an \( R \)-module satisfying \( \chi \).

**Remark 2.5.** Let \( R \) be a recursive ring. There is an algorithm deciding inclusions of Ziegler basic open sets if and only if there is an algorithm which, given a sentence \( \chi := \bigwedge_{i=1}^{n} |\varphi_i/\psi_i| \geq E_i \wedge \bigwedge_{j=1}^{m} |\sigma_j/\tau_j| = 1 \), where \( \varphi_i/\psi_i, \sigma_j/\tau_j \) are pp-1-pairs and \( E_i \in \mathbb{N} \) for \( 1 \leq i \leq n \) and \( 1 \leq j \leq m \), answers whether there exists an \( R \)-module satisfying \( \chi \).

**Proof.** There is a module satisfying \( \chi \) as in the statement if and only if for each \( 1 \leq i \leq n \), there exists an indecomposable pure-injective module \( N_i \) such that \( N_i \in (\varphi_i/\psi_i) \setminus \bigcup_{j=1}^{m} (\sigma_j/\tau_j) \). This is a standard argument. For the forward direction use 2.2. For the reverse, observe \( \bigoplus_{i=1}^{n} N_{E_i} \) satisfies \( \chi \). \( \square \)

**2.3. Arithmetical rings and Prüfer domains.** A commutative ring is arithmetical [1] if all its localisations at maximal ideals are valuation rings. Equivalently, [Jen66, Thm 1], a commutative ring \( R \) is arithmetical if its lattice of ideals is distributive. A Prüfer domain is an integral domain which is arithmetical.

The following is a consequence of [Tug03, 1.3].

**Lemma 2.6.** If \( R \) is an arithmetical ring then for all \( a, b \in R \), there exist \( \alpha, r, s \in R \) such that \( a\alpha = br \) and \( b(\alpha - 1) = as \).

Note that if \( R \) is a recursive arithmetical ring then there is an algorithm which, given \( a, b \in R \), finds \( \alpha, r, s \) satisfying the above equations. We will frequently use this fact without note.

An \( R \)-module is pp-uniserial if its lattice of pp-definable subgroups is totally ordered. Over a commutative ring all pp-definable subgroups are submodules. Thus, all uniserial modules over a commutative ring are pp-uniserial.

[1]This condition is often referred to as Prüfer in papers on Model Theory of Modules. However, algebraists tend to use the term Prüfer for the stronger condition that every regular ideal is invertible. To avoid confusion we choose the term with a unique definition.
The lattice of pp-1-formulae of a commutative ring is distributive if and only if it is arithmetical \cite[3.1]{EH95}. Thus, the following is a direct consequence of \cite[3.3]{Fu03}.

**Lemma 2.7.** Let $R$ be a commutative ring. All indecomposable pure-injective $R$-modules are pp-uniserial if and only if $R$ is arithmetical.

The endomorphism rings of indecomposable pure-injective modules are local \cite[4.3.43]{Pr09}. Therefore, if $R$ is a commutative ring and $N$ is an indecomposable pure-injective module then the set, $\text{Att}_N$, of $r \in R$ acting on $N$ non-bijectively form a prime ideal. Thus, if $N$ is an indecomposable pure-injective module over a commutative ring $R$ then $N$ may be equipped with the structure of an $R_{\text{Att}_N}$-module. Moreover, $N$ remains indecomposable and pure-injective as an $R_{\text{Att}_N}$-module. Conversely, if $N$ is an indecomposable pure-injective $R_p$-module for some prime ideal $p \lhd R$ then the restriction of $N$ to $R$ remains indecomposable and pure-injective.

The following lemma is now an easy consequence of the fact that indecomposable pure-injective modules over arithmetical rings are pp-uniserial (a proof appears in \cite[2.8]{GLT10}).

**Lemma 2.8.** Let $R$ be an arithmetical ring and $N$ an indecomposable pure-injective $R$-module. The sets

$$\text{Div}_N := \{ r \in R \mid Nr \not\subseteq N \},$$

$$\text{Ass}_N := \{ r \in R \mid \text{there exists } m \in N \setminus \{0\} \text{ such that } rm = 0 \}$$

and

$$\text{Att}_N := \text{Div}_N \cup \text{Ass}_N$$

are prime ideals.

**Lemma 2.9.** Let $R$ be an arithmetical ring and $M \in \text{Mod}-R$.

1. For all $\alpha \in R$, there exist $M_1, M_2 \in \text{Mod}-R$ such that $M_1 \oplus M_2 \cong M$, $|x^\alpha=0|_{x=0(M_1)} = 1$, $|x=x/\alpha|(M_1)| = 1$, $|x=(\alpha-1)x=0/(M_2)| = 1$ and $|x=x/(\alpha-1)|_{x=1}(M_2)| = 1$.

2. For all $a, b \in R$, there exist $M_1, M_2 \in M$ such that $M_1 \oplus M_2 \cong M$, $|ab|x=0(M_1)| = 1$ and $|x=0/\beta|(M_2)| = 1$.

**Proof.** (1) By 2.2 there exist indecomposable pure-injective $R$-modules $N_i$ for $i \in I$ such that $M \cong \bigoplus_{i \in I} N_i$. Since $\text{Att}_N$ is a proper ideal for each $N_i$, for all $i \in I$, either $\alpha \notin \text{Att}_N$ or $\alpha-1 \notin \text{Att}_N$. Let $I_\alpha$ be the set of $i \in I$ such that $\alpha \notin \text{Att}_N$ and let $I_{\alpha-1} = I \setminus I_\alpha$. So, for all $i \in I_{\alpha-1}$, $\alpha-1 \notin \text{Att}_N$. For each $\beta \in R$ and $N$ indecomposable pure-injective, $\beta \notin \text{Att}_N$ if and only if $|x=x/\beta|(N)| = 1$ and $|x=x/\beta|_{x=0}(M_1)| = 1$. Therefore $|x=x/\alpha|(\bigoplus_{i \in I_\alpha} N_i)| = 1$, $|x=(\alpha-1)x=0(\bigoplus_{i \in I_{\alpha-1}} N_i)| = 1$, and $|x=(\alpha-1)x=0(\bigoplus_{i \in I_{\alpha-1}} N_i)| = 1$.

(2) For any $L \in \text{Mod}-R$, $xb = 0 \geq L a|x$ if and only if $ab \in \text{ann}_R L$. So $|ab|x=0(L)| = 1$ if and only if $xb = 0 \geq L a|x$. Let $N$ be an indecomposable pure-injective $R$-module. By 2.7 either $xb = 0 \geq N a|x$ or $a|x \geq N xb = 0$. So either $|ab|x=0(N)| = 1$ or $|xb=0/a|x(N)| = 1$. The proof is now as in (1). \(\square\)

It is easy to see that if $R$ is a commutative ring, $p \lhd R$ a prime ideal and $M$ is an $R_p$-module then the restriction to $R$ of the pure-injective hull of $M$ as an $R_p$-module is equal to the pure-injective hull of $M$ as an $R$-module.

Recall that a module is called **uniserial** if its lattice of submodules form a chain.
Every indecomposable pure-injective $V$-module is the pure-injective hull of a module $J/I$ where $I \subseteq J \subseteq Q$ are submodules of $Q$.

So, in particular, over a valuation domain, all indecomposable pure-injective $R$-modules are pure-injective hulls of uniserial modules. It is not known if all indecomposable pure-injective modules over valuation rings are pure-injective hulls of uniserial modules (see [EH95 §4]).

Lemma 2.11. Let $R$ be a Prüfer domain. For any sentence $\chi \in \mathcal{L}_R$, there exists $M \in \text{Mod}-R$ such that $M \models \chi$ if and only if there exist $n \in \mathbb{N}$, prime ideals $p_i \triangleleft R$ and uniserial $R_{p_i}$-modules $U_i$ for $1 \leq i \leq n$ such that $\bigoplus_{i=1}^n U_i \models \chi$.

Proof. For any ring $R$, there exists $M \in \text{Mod}-R$ such that $M \models \chi$ if and only if there exist $n \in \mathbb{N}$ and indecomposable pure-injective $R$-modules $N_i$ for $1 \leq i \leq n$ such that $\bigoplus_{i=1}^n N_i \models \chi$. The result now follows from 2.10. \□

We will frequently use the following easy lemma.

Lemma 2.12. Let $V$ be a valuation domain, $\varphi$ a pp-1-formula and $U$ a uniserial $V$-module. If $|U/\varphi(U)|$ is finite but not equal to 1 then $U \cong V/I$ for some ideal $I \triangleleft V$.

Proof. Since $U$ is uniserial, so is $U/\varphi(U)$. Therefore, since $U/\varphi(U)$ is finite, there exists $u \in U$ such that $u + \varphi(U)$ generates $U/\varphi(U)$ as a $V$-module. Since $U/\varphi(U) \neq 0$, $uR \supseteq \varphi(U)$. Therefore $uR = U$. \□

We finish this subsection by reviewing material about ideals of valuation domains.

For any commutative ring $R$, $r \in R$ and ideal $I \triangleleft R$, define

$$(I : r) := \{a \in R \mid ar \in I\}.$$

Note that $(I : r)$ is an ideal of $R$.

Definition 2.13. For $V$ a valuation domain and $I \triangleleft R$ a proper ideal, define $I^\# := \bigcup_{a \notin I} (I : a)$. By convention, we define $V^\#$ to be the unique maximal ideal of $V$.

Note that this definition agrees with the definition given in [FS01 ChII §4], that is, for $I \neq 0$, $r \in I^\#$ if and only if $rI \subseteq I$.

Lemma 2.14. Let $V$ be a valuation domain.

(i) For any ideal $I \triangleleft V$, $I^\#$ is a prime ideal.

(ii) If $p \triangleleft V$ is a prime ideal then $p^\# = p$.

(iii) If $I \triangleleft V$ and $a \in V \setminus \{0\}$ then $(aI)^\# = I^\#$.

(iv) If $I \triangleleft V$ and $V/I$ is finite then $I^\#$ is the unique maximal ideal of $V$.

Proof. The first 3 statements are in [FS01 II.4]. We prove (iv). If $I = V$ then the statement follows directly from the definition. Otherwise, $I \subseteq I^\#$ and hence $V/I^\#$ is also finite. Since $V/I^\#$ is a finite integral domain, it is a field. Therefore $I^\#$ is maximal. \□

Lemma 2.15. Let $R$ be a Prüfer domain, $p \triangleleft R$ a prime ideal and $I \triangleleft R_p$. Then, for all $\delta, \gamma, \gamma \in R$.

(1) $|x^{\delta} = 0/x = 0(R_p/I)| = 1$ if and only if $\delta \notin I^\#$ or $I = R_p$, and,

(2) $|x = x/\gamma|_x(R_p/I)| = 1$ if and only if $\gamma \notin p$ or $I = R_p$. 

Proof. (1) For any $\delta \in R$, $|x^\delta y/|_{x=0}(R_p/I)| = 1$ if and only if $(I : \delta) \subseteq I$. Now $(I : \delta) \subseteq I$ if and only if $I = R_p$, or, for all $a \notin I$, $\delta a \notin I$. Therefore $|x^\delta y/|_{x=0}(R_p/I)| = 1$ if and only if $\delta \notin I^\#$ or $I = R_p$.

(2) For any $\gamma \in R$, $|x^{\gamma} y/|_{\gamma(R_p/I)| = 1$ if and only if $\gamma R_p + I = R_p$. This is true if and only if $\gamma \notin p$ or $I = R_p$. \hfill \square

Remark 2.16. Let $b \in R\setminus\{0\}$, $p \triangleleft R$ be a prime ideal and $I \triangleleft R_p$ be an ideal. If $R_p/I$ is finite then $|I/bI| = |R_p/bR_p|$. 

Proof. Since $b \neq 0$,

$$|R_p/I| \cdot |I/bI| = |R_p/bI| = |R_p/bR_p| \cdot |bR_p/bI| = |R_p/bR_p| \cdot |R_p/I|. $$

So, since $|R/I|$ is non-zero, $|I/bI| = |R_p/bR_p|$. \hfill \square

We will frequently use the following lemma which becomes particularly useful when $R$ is a valuation ring because then for all $r \in R$ and $I \triangleleft R$ either $r \in I$ or $rR \supseteq I$.

Lemma 2.17. Let $R$ be a commutative ring, $r \in R$ and $I \triangleleft R$. Then $rR \supseteq I$ if and only there exists $J \triangleleft R$ such that $I = rJ$.

Proof. The reverse direction is clear. For the forward direction, take $J = (I : r)$. \hfill \square

Lemma 2.18. Let $V$ be a valuation domain, $I, J \triangleleft V$ and $a \in R\setminus\{0\}$. Then $J \supseteq (I : a)$ if and only $aJ \supseteq I$ or $J = V$.

Proof. $(\Rightarrow)$ Suppose $J \supseteq (I : a)$. Since $V$ is a valuation domain, either $a \in I$ or $aV \supseteq I$. If $a \in I$ then $J \supseteq (I : a) = V$. So $J = V$. Suppose $aV \supseteq I$. Take $c \in I$. There exists $b \in V$ such that $ab = c$. So $b \in (I : a) \subseteq J$. Hence $c = ab \in aJ$ as required.

$(\Leftarrow)$ If $J = V$ then $J \supseteq (I : a)$. So, suppose $aJ \supseteq I$. Take $c \in (I : a)$. Then $ac \in I \supseteq aJ$. Since $a \neq 0$, $c \in J$. Therefore $J \supseteq (I : a)$. \hfill \square

2.4. Guide to the proof. The reverse direction of the main theorem is proved in §3. That is, we show that if $T_R$ is decidable then DPR$(R)$, EPP$(R)$ and $X(R)$ are recursive (see [GLPT18, 6.4] or 3.3, 3.18 and 3.22).

The proof of the forward direction of the main theorem has 3 principal ingredients.

(A) Consequences of DPR$(R)$, EPP$(R)$ and $X(R)$ being recursive. (§3 and §7)

(B) Syntactic reductions. (§4, §5 and §9)

(C) Semantic input. (§6, §8 and §10)

(A) In section 3 we introduce and analyse the sets DPR$(R)$, EPP$(R)$ and $X(R)$. These sets are chosen to be as simple as possible so that our theorem is as easy as possible to apply to concrete rings. For this reason, work needs to be done to obtain more elaborate consequences of them being recursive.

For each $n \in \mathbb{N}$, a set DPR$_n(R)$ was introduced in [GLPT18]. We show that, 3.7 for $R$ a recursive arithmetical ring, if DPR$(R)$ is recursive then the sets DPR$_n(R)$ are recursive (uniformly in $n$). Combining this with [GLPT18, 7.1], or more precisely its proof, we conclude that we can effectively decide inclusions of Ziegler basic open sets if and only if DPR$(R)$ is recursive.

In section 7 we investigate the consequences of EPP$(R)$ being recursive, and of EPP$(R)$ and the radical relation being recursive (which is deployed in section 8).
We show that for a recursive Prüfer domain the theory of $R$-modules of size $n$ is decidable uniformly in $n$ if and only if EPP($R$) is recursive.\footnote{The result is stated there only for Prüfer domains but the same proof implies the result for all arithmetical rings (see section 5).}

In the proof of the forward direction of the main theorem, the set $X(R)$ is only ever used in section 10.

(B) Given a sentence $\chi$ as in (1) (from 2.4) we often produce a finite set $S$ of tuples of sentences $(\chi_1, \ldots, \chi_n)$ with each $\chi_i$ having a “better” form than $\chi$ such that there exists $M \models \chi$ if and only if there exist $(\chi_1, \ldots, \chi_n) \in S$ and modules $M_i$ for $1 \leq i \leq n$ with $M_i \models \chi_i$. This is roughly what happens in the proof of \cite{GLT19} 4.1. Section 4 introduces two important formalisms (and ideas) which used in combination are key to the proof. Essentially they allow us to “automate” some reductions similar to those in the proof of \cite{GLPT18} 4.1 which in this article become too complicated to perform entirely by hand.

It is shown in \cite{GLT19} 4.1 that for arithmetical rings it is enough to consider sentences like (1) where the pp-pairs involved are of the form $d[x=0]$ or $x^b=0/c|x$. Section 5 uses the formalisms in section 4 to show that it is enough to consider sentences like (1) where at most one conjunct of the form $|d[x=0]| = D$ or $|d[x=0]| \geq D$ with $D \geq 2$ occurs and where at most one conjunct of the form $|x^b=0/c|x| = G$ or $|x^b=0/c|x| \geq G$ with $G \geq 2$ and $b, c \neq 0$ occurs.

In section 9 a notion of complexity, called the extended signature, is put on the set $W$ of sentences as in (1) as reduced to in section 5. The set of extended signatures is equipped with an artinian partial order. The reduction processes in section 9 terminate at expressions whose extended signatures are not reducible. Some of the sentences which are not reducible are of a form for which we can answer whether there exists a module satisfying them, because there is an algorithm deciding inclusions of Ziegler basic open sets. The remaining sentences are of a particular simple form and we deal with them in section 10.

(C) In section 6, for pp-pairs $\psi/\phi$ of the form $d[x=0], x^b=0/c|x$ with $b, c \neq 0$ and $x^b=0/c|x$ with $c \neq 0$, we give a description of the umserial module $U$ over a valuation domain $V$, such that $\psi/\phi(U)$ is finite but non-zero. Unlike the descriptions of such modules in \cite{Gre13} and \cite{PP10}, the results we prove do not depend on whether the value group of $V$ is dense or not. We now describe how we use semantic input to deal with sentences as in (1) with a conjunct of the form $|d[x=0]| = D$, or of the form $|x^b=0/c|x| = G$ where $b, c \neq 0$.

For instance, if $d[x=0](U)$ is finite but non-zero then it is easy to show that $U \cong V/dI$ for some ideal $I \triangleleft V$. In view of 2.11, for $R$ a Prüfer domain, this means that for $\chi$ a sentence as in (1), $D \models \chi$ if and only if there exists $h \in \mathbb{N}$, prime ideals $p_i \triangleleft R$ and ideals $I_i \triangleleft R_{p_i}$, for $1 \leq i \leq h$, and, $M' \in \text{Mod-} R$ with $|d[x=0](M')| = 1$ such that $\bigoplus_{i=1}^{h} R_{p_i}/dI_i \oplus M' = D \triangleleft \chi$.

In section 8, we show that if EPP($R$) and the radical relation are recursive then there is an algorithm which given $D \in \mathbb{N}, d \in R \setminus \{0\}$ and a sentence $\Theta$ as in (1), answers whether there exists a direct sum $\bigoplus_{i=1}^{h} R_{p_i}/dI_i$ satisfying $|d[x=0]| = D \triangleleft \Theta$. This is used in 9.5 to produce sentences $\chi_1, \ldots, \chi_n$ as in (1) such that there exists an $R$-module satisfying $|d[x=0]| = D \triangleleft \chi$ if and only if there exists an $R$-module
satisfying $|d|x=0| = 1 \land \chi_i$ for some $1 \leq i \leq n$. The sentences $\chi_i$ are less complex than $\chi$ in a way precisely defined in section \[9\].

Similar, but slightly more complicated, reductions are made for pp-pairs of the form $x=b/c|x$ where $b,c \neq 0$.

For pp-pairs of the form $x=c|x$ we need to do something different. It is easy to see, \[6.3\], that if $U$ is a uniserial module over a valuation domain $V$ then $x=c|x(U)$ is finite but non-zero if and only if $U \cong V/cI$ for some $I \subset V$ or $U$ is finite and $c \in \text{ann}_R U$. However, it does not seem possible, in this case, to make a reduction as for $|d|x=0| = D$ and sums of modules of the form $R_p/dI$. This is the main reason that we need to make the syntactic reductions in section \[5\] and \[9\]. In particular, the set of sentences that are not reducible in the sense of section \[9\] contains only a small number of forms of sentences with a conjunct of the form $|x=c|x| = C$. These sentences are considered individually in section \[10\].

### 3. Recursive sets

In this section we consider the sets $\text{DPR}(R)$, $\text{EPP}(R)$ and $X(R)$. In each case, we show that if $T_R$ is decidable then they are recursive.

#### 3.1. The set $\text{DPR}(R)$.

In [GLPT18], a family of relations $\text{DPR}_n(R)$ were defined. Although not directly stated there, see [GLPT18 7.1], it was shown that, for $R$ a recursive Prüfer domain, if the sets $\text{DPR}_n(R)$ are recursive (uniformly in $n$) then there is an algorithm deciding inclusions of finite unions of Ziegler basic open sets. However, it was not known if this condition was necessary for the existence of such an algorithm, or even if the decidability of the theory of modules of Prüfer domain implied that $\text{DPR}_n(R)$ is recursive for any $n > 1$. It is a consequence of \[3.5\] that the existence of an algorithm deciding inclusions of finite unions of Ziegler basic open sets implies that the sets $\text{DPR}_n(R)$ are recursive (uniformly in $n$).

For a recursive Bézout domain, it was shown that if $\text{DPR}(R) := \text{DPR}_1(R)$ is recursive then there is an algorithm deciding inclusions of finite unions of Ziegler basic open sets. For Prüfer domains, it was not known if $\text{DPR}_1(R)$ being recursive is sufficient to imply that there is an algorithm deciding inclusions of finite unions of Ziegler basic open sets. We show, \[3.7\], that, for $R$ a Prüfer domain, $\text{DPR}_1(R)$ recursive implies $\text{DPR}_n(R)$ is recursive uniformly in $n$.

**Definition 3.1.** Let $R$ be a commutative ring.

- For each $l \in \mathbb{N}$, let $\text{DPR}_l(R)$ be the set of $2l+2$-tuples $(a,b_1,\ldots,b_l,c,d_1,\ldots,d_l) \in R^{2l+2}$ such that, for all prime ideals $p,q \subset R$ with $p + q \neq R$, either $a \in p$, $c \in q$, $b_i \notin p$ for some $1 \leq i \leq l$ or $d_i \notin q$ for some $1 \leq i \leq l$.
- Let $\text{DPR}_n(R)$ be the set of $4$-tuples $(a,B,c,D)$, where $a,c \in R$ and $B,D \subset R$ are finitely generated ideals, such that for all prime ideals $p,q \subset R$ with $p + q \neq R$, either $a \in p$, $c \in q$, $B \nsubseteq p$ or $D \nsubseteq q$.

Note that $(a,b_1,\ldots,b_l,c,d_1,\ldots,d_l) \in \text{DPR}_l(R)$ if and only if

\[
(a, \sum_{i=1}^l b_i c, \sum_{i=1}^l d_i R) \in \text{DPR}_n(R).
\]

\[3\] Recall $R$ recursive and $\text{DPR}(R)$ recursive imply $R$ is effectively given.
In the following lemma, for \( R \) a commutative ring, \( I \trianglelefteq R \) an ideal and \( X \subseteq \text{Spec}R \), let \( V(I) \) denote the closed set, in the Zariski topology, of prime ideals \( \mathfrak{p} \) such that \( \mathfrak{p} \supseteq I \) and \( \overline{X} \) the closure of \( X \) in the Zariski topology.

**Lemma 3.2.** Let \( R \) be a commutative ring, \( a \in R \) and \( B \trianglelefteq R \). Then
\[
\text{(rad} B : a) = \bigcap_{\mathfrak{p} \in \text{Spec}R, \mathfrak{p} \supseteq B, a \notin \mathfrak{p}} \mathfrak{p}.
\]
Hence,
\[
V((\text{rad} B : a)) = \overline{V(B) \setminus V(aR)}.
\]

**Proof.** Suppose \( r \in (\text{rad} B : a) \). Then \((ra)^n \in B \) for some \( n \in \mathbb{N} \). Let \( \mathfrak{p} \trianglelefteq R \) be a prime ideal with \( B \subseteq \mathfrak{p} \) and \( a \notin \mathfrak{p} \). Then \( r^n a^n = (ra)^n \in \mathfrak{p} \). Therefore \( r \in \mathfrak{p} \).

Conversely, suppose that \( r \notin (\text{rad} B : a) \) i.e. \((ra)^n \notin B \) for all \( n \in \mathbb{N} \). A standard argument using Zorn’s lemma produces a prime ideal \( \mathfrak{p} \trianglelefteq R \) such that \( \mathfrak{p} \supseteq B \) and \((ra)^n \notin \mathfrak{p} \) for all \( n \in \mathbb{N} \). Now \((ra)^n \notin \mathfrak{p} \) implies \( r \notin \mathfrak{p} \) and \( a \notin \mathfrak{p} \). So we have proved the first statement. For any \( X \subseteq \text{Spec}R \), \( V(\bigcap_{\mathfrak{p} \in X} \mathfrak{p}) = \overline{X} \). Therefore, the second statement follows from the first. \( \square \)

The following statement with \( \text{DPR}(R) := \text{DPR}_1(R) \) in place of \( \text{DPR}_\ast(R) \) is proved in [GLPT18, 6.3] for Prüfer domains. We use 3.2 to further extend it to all commutative rings.

**Proposition 3.3.** Let \( R \) be a commutative ring. The following are equivalent for \( a, c \in R \) and \( B, D \trianglelefteq R \) finitely generated.

1. \((a, B, c, D) \in \text{DPR}_\ast(R)\)
2. \(1 \in (\text{rad}(B) : a) + (\text{rad}(D) : c)\)

**Proof.** We prove this proposition topologically.

For all \( a, c \in R \) and \( B, D \trianglelefteq R \), \( 1 \in (\text{rad}(B) : a) + (\text{rad}(D) : c) \) if and only if \( V((\text{rad}(B) : a)) \cap V((\text{rad}(D) : c)) = \emptyset \). By 3.2, \( V((\text{rad}(B) : a)) = \overline{V(B) \setminus V(aR)} \) and \( V((\text{rad}(D) : c)) = \overline{V(D) \setminus V(cR)} \). Thus
\[
1 \in (\text{rad}(B) : a) + (\text{rad}(D) : c)
\]
iff and only if
\[
\overline{V(B) \setminus V(aR)} \cap \overline{V(D) \setminus V(cR)} = \emptyset.
\]
Now, by [DST19, 1.5.4 (i)],
\[
\overline{V(B) \setminus V(aR)} = \bigcup_{p \in V(B) \setminus V(aR)} V(p) \quad \text{and} \quad \overline{V(D) \setminus V(cR)} = \bigcup_{q \in V(D) \setminus V(cR)} V(q).
\]
So \( 1 \in (\text{rad}(B) : a) + (\text{rad}(D) : c) \) if and only if
\[
(\bigcup_{p \in V(B) \setminus V(aR)} V(p)) \cap (\bigcup_{q \in V(D) \setminus V(cR)} V(q)) = \emptyset.
\]
Now (1) holds if and only if for all prime ideals \( p, q \) such that \( a \notin p \), \( B \subseteq p \), \( c \notin q \) and \( D \subseteq q \), we have \( V(p) \cap V(q) = \emptyset \) (i.e. \( p + q = R \)). \( \square \)

We refer to the relation \( a \in \text{rad} bR \) as the **radical relation**.

**Remark 3.4.** Let \( R \) be a commutative ring. For \( a, b \in R \), \( a \in \text{rad} bR \) if and only if \( (a, b, a, b) \in \text{DPR}(R) \). In particular, if \( R \) is a recursive ring and \( \text{DPR}(R) \) is recursive then the radical relation is recursive.
For $R$ a commutative ring and $B,D \triangleleft R$ finitely generated ideals, let $xB = 0$ denote the pp-formula $\bigwedge_{i=1}^{n} x b_i = 0$ where $B = \bigoplus_{i=1}^{n} b_i R$ and let $D|x$ denote the pp-formula $\sum_{i=1}^{n} d_i x$ where $D = \bigoplus_{i=1}^{n} d_i R$. Note that, up to $T_R$ equivalence, these formulae don’t depend on the choice of generators of $B$ and $D$.

The following statement with $\text{DPR}_*(R)$ replaced by $\text{DPR}(R) = \text{DPR}_1(R)$ is proved in [GLPT18] 6.4 for Prüfer domains.

**Proposition 3.5.** Let $R$ be an arithmetical ring. The following are equivalent for $a,c \in R$ and $D \triangleleft R$ finitely generated ideals.

1. $(a,B,c,D) \in \text{DPR}_*(R)$
2. $(xB=0|D|x) \subseteq (xa=0|x=0) \cup (x=x|c|x)$

**Proof.** (1) $\Rightarrow$ (2): Suppose (1) holds. By [3.3] $1 \in (\text{rad}R : a) + (\text{rad}D : c)$. Hence there exist $u \in R$ and $n \in \mathbb{N}$ such that $(ua)^n \in B$ and $((u-1)c)^n \in D$.

Suppose $N \subseteq (xB=0|D|x)$. Take $m \in N$ such that $mb = 0$ for all $b \in B$ and $m \not\in ND$. So $mu^n a^n = 0$ and $m \not\in N(u-1)c^n$. Since $\text{Att}N$ is a proper ideal, either $u \not\in \text{Att}N$ or $u-1 \not\in \text{Att}N$. Suppose $u \not\in \text{Att}N$. Then $mu^n a^n = 0$ implies $ma^n = 0$ and hence $N \subseteq (xa=0|x=0) = (x=a/x=0)$ as required. Now suppose $u-1 \not\in \text{Att}N$. Then $N(u-1)c^n = Nc^n$ and hence $N \subseteq (x=c/x|c)$.

(2) $\Rightarrow$ (1): Suppose (2) holds. Note that if $(xB=0|D|x) \subseteq (xa=0|x=0) \cup (x=x|c|x)$ then, applying Herzog’s duality, $(xD=0|B|x) \subseteq (xc=0|x=0) \cup (x=x/a|x)$.

Suppose $p,q$ are prime ideals with $p+q \neq R$. Further, suppose that $a \not\in p$, $B \subseteq p$ and $D \subseteq q$. We need to show that $c \in q$.

Since $R$ is an arithmetical ring, either $p \supseteq q$ or $q \supseteq p$. Suppose $p \supseteq q$. Then, again since $R$ is an arithmetical ring, $R_p/qR_p$ is uniserial and its pure-injective hull $N := H(R_p/qR_p)$ is indecomposable. Since $D \subseteq q$, $xD = 0$ is equivalent to $x = x$ in $R_p/qR_p$ and hence in $N$. Since $B \subseteq p$, $B|x$ is not equivalent to $x = x$ in $R_p/qR_p$ and hence in $N$. Thus $N \subseteq (xD=0|B|x)$. Since $a \not\in p$, $N \not\subseteq (x=x/a|x)$ and hence $N \not\subseteq (xc=0|c=0)$. Therefore $c \not\in q$, for otherwise $xc = 0$ is equivalent to $x = 0$ in $N$. The argument when $q \supseteq p$ is very similar except this time $N := H(R_q/pR_q)$ and we use that $(xD=0|B|x) \subseteq (xc=0|x=0) \cup (x=x/a|x)$.

Thus, for $R$ an arithmetical ring, if there exists an algorithm deciding inclusions of finite unions of Ziegler basic open sets then $\text{DPR}_*(R)$ is recursive. Combining this with [GLPT18] 7.1 (and its proof) we get the following theorem.

**Theorem 3.6.** Let $R$ be a recursive Prüfer domain. There is an algorithm deciding inclusions of finite unions of Ziegler basic open sets if and only if $\text{DPR}_*(R)$ is recursive. Moreover, if $R/m$ is infinite for every maximal ideal $m \triangleleft R$ then $T_R$ is decidable if and only if $\text{DPR}_*(R)$ is recursive.

We finish off the work in [GLPT18] by showing that for $R$ a Prüfer domain, if $\text{DPR}(R)$ is recursive then $\text{DPR}_n(R)$ is recursive uniformly in $n$ (equivalently $\text{DPR}_*(R)$ is recursive).

**Proposition 3.7.** Let $R$ be a recursive arithmetical ring. If $\text{DPR}(R)$ is recursive then $\text{DPR}_n(R)$ is recursive uniformly in $n$.

**Proof.** Let $n \in \mathbb{N}$ and $a,c,b_1,\ldots,b_n,d_1,\ldots,d_n \in R$. Suppose that $\alpha,\beta,r_1,r_2,s_1,s_2 \in R$ are such that

$$b_1 \alpha = b_2 r_2, \quad b_2 (\alpha - 1) = b_1 r_1$$
LORNA GREGORY

Claim:

\[ d_1 \beta = d_2 s_2 \quad \text{and} \quad d_2 (\beta - 1) = d_1 s_1. \]

\[ (\star) \quad (a, c, b_1, \ldots, b_n, d_1, \ldots, d_n) \in \text{DPR}_n(R) \]

if and only if

(i) \((a\alpha, c\beta, b_2, \ldots, b_n, d_2, \ldots, d_n) \in \text{DPR}_{n-1}(R),\)

(ii) \((a\alpha, c(\beta - 1), b_2, \ldots, b_n, d_1, d_3, \ldots, d_n) \in \text{DPR}_{n-1}(R),\)

(iii) \((a(\alpha - 1), c\beta, b_1, \ldots, b_n, d_2, \ldots, d_n) \in \text{DPR}_{n-1}(R) \text{ and} \)

(iv) \((a(\alpha - 1), c(\beta - 1), b_1, b_3, \ldots, b_n, d_1, d_3, \ldots, d_n) \in \text{DPR}_{n-1}(R).\)

This claim plus the fact that we can always find appropriate \(\alpha, \beta, r_1, r_2, s_1, s_2 \in R\) implies the proposition.

To prove the forward direction, we show that \((\star)\) implies (i) and note that the remaining conditions (ii), (iii), (iv) are the same as (i) but with the roles of \(b_1\) and \(b_2\), and of \(\alpha\) and \(\alpha - 1\) interchanged (respectively of \(d_1\) and \(d_2\), and of \(\beta\) and \(\beta - 1\) interchanged).

Let \(p, q\) be prime ideals such that \(p + q \neq R\). Assuming \((\star)\), we need to show that \(a\alpha \in p, c\beta \in q, b_i \notin p\) for some \(2 \leq i \leq n\) or \(d_i \notin q\) for some \(2 \leq i \leq n\).

Now \((\star)\) implies \(a \in p, c \in q, b_i \notin p\) for some \(1 \leq i \leq n\) or \(d_i \notin q\) for some \(1 \leq i \leq n\). So the only problem is when \(b_1 \notin p\) or \(d_1 \notin q\). Suppose \(b_1 \notin p\). If \(a \in p\) then \(a \alpha \in p\) as required. So suppose further that \(a \notin p\). Then \(b_1 \notin p\) and hence \(b_2 \notin p\). So \(b_2 \notin p\) as required. The argument when \(d_1 \notin q\) is the same with the roles of \(b_1\) and \(d_1\), of \(b_2\) and \(d_2\), and of \(\alpha\) and \(\beta\) interchanged.

We now show that if \((\star)\) is not true then one of (i), (ii), (iii), (iv) is not true. If \((\star)\) is not true then there exist prime ideals \(p, q\) such that \(p + q \neq R\) and \(a \notin p, c \notin q, b_i \notin p\) for all \(1 \leq i \leq n\) and \(d_i \notin q\) for all \(1 \leq i \leq n\). For any proper ideal \(I\), either \(\alpha \notin I\) or \(\alpha - 1 \notin I\) (respectively \(\beta \notin I\) or \(\beta - 1 \notin I\)). Without loss of generality, we may assume that \(\alpha \notin p\) and \(\beta \notin q\). Hence \(a\alpha \notin p, c\beta \notin q, b_i \in p\) for all \(1 \leq i \leq n\) and \(d_i \in q\) for all \(1 \leq i \leq n\). So \((a\alpha, c\beta, b_2, \ldots, b_n, d_2, \ldots, d_n) \notin \text{DPR}_{n-1}(R)\) as required.

Combining this with the results in [GLPT][18] we get the following.

**Theorem 3.8.** Let \(R\) be a recursive Pr"ufer domain. There is an algorithm answering whether one Ziegler basic open set is contained in a finite union of others if and only if the relation \(\text{DPR}(R)\) is recursive.

**Corollary 3.9.** Let \(R\) be a recursive Pr"ufer domain. The relation \(\text{DPR}(R)\) is recursive if and only if there is an algorithm which, given a sentence

\[ \chi := \bigwedge_{i=1}^{n} |\varphi_i/\psi_i| \geq E_i \land \bigwedge_{j=1}^{m} |\tau_j/\tau_j| = 1, \]

where \(\varphi_i, \psi_i, \tau_j, \tau_j\) are pp-1-formulae and \(E_i \in \mathbb{N}\) for \(1 \leq i \leq n\) and \(1 \leq j \leq m\), answers whether there exists an \(R\)-module \(M\) with \(M \models \chi\). Moreover, if \(R/m\) is infinite for every maximal ideal \(m \triangleleft R\) then \(T_R\) is decidable if and only if \(\text{DPR}(R)\) is recursive.

**Proof.** The first statement follows from [3.8] and [2.5].

For any \(R\)-module \(M\) and pp-pair \(\varphi/\psi, \varphi/\psi(M)\) is an \(R\)-module. By [GLT][19] 3.1, if \(R/m\) is infinite for every maximal ideal \(m \triangleleft R\) then the only finite \(R\)-module
is the zero module. So, the second statement follows from the first by a standard argument using the Baur-Monk theorem. □

**Question 1.** It was shown in [Gre15 3.2] that, for any commutative ring $R$, if $T_R$ is recursive then the radical relation is recursive. For $R$ an arbitrary commutative ring, does $T_R$ decidable imply DPR($R$), or more generally DPR($R$), is recursive?

### 3.2. The sets PP($R$) and EPP($R$).

In [GLT19], a family of relations PP$_n$($R$) were introduced. It is shown, [GLT19 3.2], that if a recursive Prüfer domain has decidable theory of modules then PP$_n$($R$) is recursive uniformly in $n$. Conversely, it was shown if $R$ is a recursive Prüfer domain such that the value group of each localisation of $R$ at a maximal ideal is dense then if DPR$_n$($R$) and PP$_n$($R$) are recursive uniformly in $n$ then the theory of $R$-modules is recursive.

**Definition 3.10.** For $l \in \mathbb{N}$, let PP$_l$($R$) consist of the tuples $(p, n, c_1, \ldots, c_l, d) \in \mathbb{P} \times \mathbb{N} \times R_l$ such that there exist positive integers $s, k_1, \ldots, k_s$ and maximal ideals $m_1, \ldots, m_s$ of $R$ for which $n \in \text{Span}_{\mathbb{N}} \{k_1, \ldots, k_s\}$ and for $1 \leq i \leq s$

1. $|R/m_i| = p^{k_i}$,
2. $c_j \in m_i$ for $1 \leq j \leq l$,
3. $d \notin m_i$.

It is clear that for $R$ a Bézout domain, if PP$_1$($R$) is recursive then PP$_1$($R$) is recursive uniformly in $l$. This is because $(p, n, c_1, \ldots, c_l, d) \in$ PP$_1$($R$) if and only if $(p, n, \gcd(c_1, \ldots, c_l), d) \in$ PP$_1$($R$). However, with a bit more work one can show this is also true for Prüfer domains.

**Proposition 3.11.** Let $R$ be a recursive Prüfer domain. If PP$_1$($R$) is recursive then PP$_1$($R$) is recursive uniformly in $l$.

**Proof.** We skip this proof as it is very similar to the proof of [3.17] □

As a direct consequence of [GLT19 6.1], [GLT19 3.2], [GLPT18 6.4], [3.11] and [3.7] we get the following theorem.

**Theorem 3.12.** Let $R$ be a recursive Prüfer domain such that for all maximal ideals $m$, the value group of $R_m$ is dense. The theory of $R$-modules is decidable if and only if DPR($R$) and PP($R$) are recursive.

We generalise PP$_l$($R$) to EPP$_l$($R$) in order to deal with Prüfer domains with maximal ideals $m$ such that $R_m$ is a valuation domain with non-dense value group.

**Definition 3.13.** For $l \in \mathbb{N}$, let EPP$_l$($R$) consist of tuples

$$(p, n; a_1, \ldots, a_l; \gamma; e, m) \in \mathbb{P} \times \mathbb{N} \times R_l \times R \times R \times \mathbb{N}$$

such that there exist $h \in \mathbb{N}$ and, for $1 \leq i \leq h$, prime ideals $p_i \lhd R$ and ideals $I_i \lhd R_{p_i}$ such that $\gamma \notin p_i$ and $a_1, \ldots, a_l \in I_i$ for $1 \leq i \leq h$, $|\oplus_{i=1}^h R_{p_i}/I_i| = p^a$ and $|\oplus_{i=1}^h R_{p_i}/eR_{p_i}| = p^m$.

We say the sequence $(p_j, I_j)_{1 \leq j \leq h}$ witnesses $(p, n; a_1, \ldots, a_l; \gamma; e, m) \in$ EPP$_l$($R$). By convention, $(p, 0; a_1, \ldots, a_l; \gamma; e, 0) \in$ EPP$_l$($R$) and the empty sequence is a witness for it. We will often write EPP($R$) for EPP$_1$($R$).

---

[4] It was stated there for effectively given Prüfer domains. However, recall, if $R$ is a recursive Prüfer domain with DPR($R$) recursive then $R$ is effectively given.
Remark 3.14. We may replace prime ideals with maximal ideals in 3.13 without changing the definition since if \(|R_p/eR_p|\) is finite then either \(p\) is maximal or \(R_p = eR_p\) and if \(|R_p/I|\) is finite then either \(p\) is maximal or \(I = R_p\).

The relation \(\text{EPP}_1(R)\) is an extension of the relation \(\text{PP}_1(R)\).

Lemma 3.15. Let \(p \in \mathbb{P}, n \in \mathbb{N}\) and \(c_1, \ldots, c_n, d \in R\). Then \((p, n, c_1, \ldots, c_t, d) \in \text{PP}_1(R)\) if and only if \((p, n; c_1, \ldots, c_t; d; 1, 0) \in \text{EPP}_1(R)\).

Proof. Suppose \((p, n; c_1, \ldots, c_t; d) \in \text{PP}_1(R)\). Let \(s \in \mathbb{N}, k_1, \ldots, k_s \in \mathbb{N}\) and \(m_1, \ldots, m_s\) be as in the definition of \(\text{PP}_1(R)\). Let \(\lambda_1, \ldots, \lambda_s \in \mathbb{N}_0\) be such that \(n = \sum_{i=1}^{s} \lambda_i k_i\). Then \(c_j \in m_i\) for \(1 \leq j \leq l, d \notin m_i\), \(|\oplus_{i=1}^{s} (R_m/m, R_m)^{\lambda_i}| = p^n\) and \(|\oplus_{i=1}^{s} (R_m/1, R_m)^{\lambda_i}| = p^0\). So \((p, n; c_1, \ldots, c_t; d; 1, 0) \in \text{EPP}_1(R)\).

Suppose \((m_j, I_j)_{1 \leq j \leq s}\) witnesses \((p, n; c_1, \ldots, c_t; d; 1, 0) \in \text{EPP}_1(R)\). For \(1 \leq i \leq s\), let \(\lambda_i \in \mathbb{N}_0\) be such that \(|R_m/I_i| = |R/m_i|^{|\lambda_i|}\). If \(\lambda_i \neq 0\) then \(I_i \subseteq m_i R_m\), and so \(c_j \in m_i\) for \(1 \leq j \leq l\). For \(1 \leq i \leq s\), let \(k_i\) be such that \(|R/m_i| = p^{|\lambda_i|}\). Now \(n = \sum_{i=1}^{s} \lambda_i k_i\) and hence \((p, n; c_1, \ldots, c_t, d) \in \text{PP}_1(R)\). \(\square\)

If the value group of \(R_m\) is dense then, for all \(e \in R\), \(|R_m/eR_m|\) is either 1 or infinite. Moreover, \(|R_m/eR_m| = 1\) if and only if \(e \notin m\).

Remark 3.16. Let \(R\) be a Prüfer domain such that the value group of \(R_m\) is dense for all maximal ideals \(m\). Then \((p, n; a_1, \ldots, a_t; \gamma; e, m) \in \text{EPP}_1(R)\) if and only if \((p, n; a_1, \ldots, a_t; \gamma; e) \in \text{PP}_1(R)\) and \(m = 0\).

In particular, if \(R\) is a recursive Prüfer domain such that the value group of \(R_m\) is dense for all maximal ideals \(m\) then \(\text{EPP}_1(R)\) is recursive if and only if \(\text{PP}_1(R)\) is recursive.

Proposition 3.17. Let \(R\) be a recursive Prüfer domain. If \(\text{EPP}_1(R)\) is recursive then \(\text{EPP}_1(R)\) is recursive uniformly in \(t\).

Proof. We show that for all \(p \in \mathbb{P}, n, m \in \mathbb{N}_0, a_1, \ldots, a_t, \gamma, e \in R\), if \(\alpha, r, s \in R\) are such that \(a_1 \alpha = a_2 r\) and \(a_2 (\alpha - 1) = a_3 s\) then \((p, n; a_1, \ldots, a_t; \gamma; e, m) \in \text{EPP}_1(R)\) if and only if there exist \(n_1, n_2 \in \mathbb{N}_0\) and \(m_1, m_2 \in \mathbb{N}_0\) such that \(n + n_2 = n, m + n_2 = m, (p, n_1; a_2, \ldots, a_t; \gamma; e, m_1) \in \text{EPP}_{t-1}(R)\) and \((p, n_2, a_1, a_3, \ldots, a_t, \gamma; \alpha - 1; e, m_2) \in \text{EPP}_{t-1}(R)\). This is enough since we can always effectively find appropriate \(\alpha, r, s \in R\).

Suppose that \((p_j, I_j)_{1 \leq j \leq s}\) witnesses \((p, n; a_1, \ldots, a_t; \gamma; e, m) \in \text{EPP}_1(R)\). For all \(1 \leq j \leq s\), either \(\alpha \notin p_j\) or \(\alpha - 1 \notin p_j\). By reordering, we may assume that \(\alpha \notin p_j\) for \(1 \leq j \leq t\) and \(\alpha - 1 \notin p_j\) for \(t + 1 \leq j \leq s\). Let \(n_1 = \log_p |\oplus_{i=1}^{t} R_p/I_i|, n_2 = \log_p |\oplus_{i=t+1}^{s} R_p/eR_p|, m_1 = \log_p |\oplus_{i=1}^{t} R_p/eR_p|\) and \(m_2 = \log_p |\oplus_{i=t+1}^{s} R_p/eR_p|\). Now \(\gamma \notin p_j\) and \(a_2, \ldots, a_t \in I_j\) for \(1 \leq j \leq t\), \(|\oplus_{i=1}^{t} R_p/I_i| = p^{n_1}\) and \(|\oplus_{i=t+1}^{s} R_p/eR_p| = p^{m_2}\). So \((p, n; a_1, a_2, \ldots, a_t; \gamma; e, m_1) \in \text{EPP}_{t-1}(R)\) and \((p, n_2, a_1, a_3, \ldots, a_t, \gamma; \alpha - 1; e, m_2) \in \text{EPP}_{t-1}(R)\). Similarly, \((p, n_2, a_1, a_3, \ldots, a_t, \gamma; \alpha - 1; e, m_2) \in \text{EPP}_{t-1}(R)\).

Conversely, suppose that \((n_1, n_2, m_1, m_2) \in \mathbb{N}_0\) such that \(n_1 + n_2 = n, m_1 + m_2 = m, (p, n_1; a_2, \ldots, a_t; \gamma; e, m_1) \in \text{EPP}_{t-1}(R)\) and \((p, n_2, a_1, a_3, \ldots, a_t, \gamma; \alpha - 1; e, m_2) \in \text{EPP}_{t-1}(R)\). Let \((p_j, I_j)_{1 \leq j \leq t}\) witness \((p, n_1; a_2, \ldots, a_t; \gamma; e, m_1) \in \text{EPP}_{t-1}(R)\) and \((p_j, I_j)_{t+1 \leq j \leq s}\) witness \((p, n_2, a_1, a_3, \ldots, a_t, \gamma; \alpha - 1; e, m_2) \in \text{EPP}_{t-1}(R)\). Then

\[|\oplus_{i=1}^{t} R_p/I_i| = |\oplus_{i=1}^{t} R_p/I_i| \cdot |\oplus_{i=t+1}^{s} R_p/eR_p| = p^{n_1} p^{m_2} = p^n\]
We show that, for \( p, n, m \in \mathbb{N} \) and \( a, \gamma, e, R \in R \), let \( \Theta_{(p,n;\gamma;e,m)} \) be the \( \mathcal{L}_R \)-sentence

\[
|eR_p/\gamma x| = p^{2m+n} \wedge |x + eR_p/\gamma x| = p^m \wedge |x + eR_p/\gamma x| = 1 \wedge |e^2a|x + eR_p/\gamma x| = 1.
\]

We show that, for \( m, n \) not both zero, \( (p, n; a, \gamma; e, m) \in \text{EPP}_1(R) \) if and only if there is an \( R \)-module satisfying \( \Theta_{(p,n;\gamma;e,m)} \). Hence the lemma holds.

Suppose \( (p, n; a, \gamma; e, m) \in \text{EPP}_1(R) \). By definition, there exist prime ideals \( p_1, \ldots, p_s \triangleleft R \) and ideals \( I_1 \triangleleft R_{m_j} \) such that \( \gamma \notin p_j \) and \( a \in I_j \) for \( 1 \leq j \leq s \), \( |\bigoplus_{i=1}^s R_{p_i}/I_1| = p^n \) and \( |\bigoplus_{i=1}^s R_{p_i}/eR_p/\gamma x| = p^m \). Let \( M := \bigoplus_{i=1}^s R_{p_i}/e^2I_i \). Then \( M \) satisfies \( \Theta_{(p,n;\gamma;e,m)} \).

Conversely, suppose there exists an \( R \)-module \( M \) satisfying \( \Theta_{(p,n;\gamma;e,m)} \). Since \( M \) is finite and non-zero, there exist maximal ideals \( m_1, \ldots, m_s \triangleleft R \) and proper ideals \( J_1 \triangleleft R_{m_i} \) such that \( \bigoplus_{i=1}^s R_{m_i}/J_1 \cong M \). Since \( M \) satisfies \( \Theta_{(p,n;\gamma;e,m)} \), for \( 1 \leq i \leq s \), \( (J_i : e) \subseteq eR_{m_i} + J_i \).

By 2.18 either \( eR_{m_i} + J_i = R_{m_i} \), or \( J_i \subseteq e^2R_{m_i} + eJ_i \). So, either \( e \notin m_i \), \( J_i \subseteq e^2R_{m_i} \), or \( J_i \subseteq eJ_i \). So, for each \( 1 \leq i \leq s \), there exists \( I_i \triangleleft R_{m_i} \) with \( J_i = e^2I_i \).

Since \( |e^2a|x + eR_{m_i}/e^2I_i| = 1 \), \( a \in I_i \) and since \( |x + eR_{m_i}/e^2I_i| = 1 \), \( \gamma \notin m_i \). Therefore \( m_1, \ldots, m_s \) and \( I_1 \triangleleft R_{m_i} \) are such that \( a \in I_i \) and \( \gamma \notin m_i \) for \( 1 \leq i \leq s \), and \( |\bigoplus_{i=1}^s R_{m_i}/I_1| = p^n \) and \( |\bigoplus_{i=1}^s R_{m_i}/eR_{m_i}| = p^m \). Hence \( (p, n; a, \gamma; e, m) \in \text{EPP}_1(R) \).

The following corollary is a direct consequence of the proof of 3.18. We will later see, 7.6, that the converse also holds.

**Corollary 3.19.** If the theory of \( R \)-modules of size \( n \) is decidable uniformly in \( n \) then \( \text{EPP}_1(R) \) is recursive.

### 3.3. The set \( X(R) \)

**Definition 3.20.** Let \( X(R) \) be the set of \( (p, n; e, \gamma, a, \delta) \in \mathbb{P} \times \mathbb{N} \times (R \setminus \{0\}) \times R^3 \) such that there exist integers \( h \in \mathbb{N} \) and prime ideals \( p_1, \ldots, p_h \) such that \( |\bigoplus_{i=1}^h R_{p_i}/eR_{p_i}| = p^h \) and, for \( 1 \leq i \leq h \), \( \gamma \notin m_i \), and, there exists an ideal \( I_i \triangleleft R_{p_i} \) such that \( a \in I_i \) and \( \delta \notin (I_i)^\# \).

It is often easier to check that \( X(R) \) is recursive in concrete rings using the following reformulation.

**Remark 3.21.** Let \( (p, n; e, \gamma, a, \delta) \in \mathbb{P} \times \mathbb{N} \times (R \setminus \{0\}) \times R^3 \). Then \( (p, n; e, \gamma, a, \delta) \in X(R) \) if and only if there exist \( 1 \leq h \leq n \) and maximal ideals \( m_1, \ldots, m_h \) such that for \( 1 \leq i \leq h \)

1. \( \gamma \notin m_i \), and,
2. either \( \delta \notin m_i \), or, there exists a prime ideal \( q_i \subseteq m_i \) such that \( a \in q_i \) and \( \delta \notin q_i \).
First suppose that there exist ideals \( I \) and \( m \) such that \( \chi \) is a finite direct sum of modules \( U \) and \( R \). Since \( \Delta \) is a set and \( n \) is a proper ideal, \( R \) and \( m \) exist a finite direct sum of modules non-zero and finite, \( U \) and \( R \) of a uniserial module over \( R \). Therefore, if \( (p,n;e,\gamma,a,\delta) \in X(R) \) then set \( p_i := \mathbb{P} \), and \( q_i := (I_i)^\# \) if \( \delta \in \mathbb{P}_i \). Conversely, if the conditions in the statement hold for \( (p,n;e,\gamma,a,\delta) \) then set \( p_i := \mathbb{P} \) and \( I_i := R_{m_i} \) if \( \delta \notin \mathbb{P}_i \) and \( I_i := q_i \) otherwise. \( \square \)

**Proposition 3.22.** Let \( R \) be a Prüfer domain. If \( T_R \) is decidable then \( X(R) \) is recursive.

**Proof.** Let \( (p,n;e,\gamma,a,\delta) \in \mathbb{P} \times \mathbb{N} \times (\mathbb{P} \setminus \{0\}) \times \mathbb{R}^3 \). We show that \( (p,n;e,\gamma,a,\delta) \in X(R) \) if and only if there exists an \( R \)-modules satisfying

\[
\chi := |x=x/e| = p^n \land \left|x=e/0\right| = 1 \land \left|e=a|x/x=0\right| = 1 \land \left|x=x/\gamma|x=0\right| = 1
\]

First suppose that there exist \( h \in \mathbb{N} \) and prime ideals \( \mathbb{P}_1, \ldots, \mathbb{P}_n < R \) such that \( \bigoplus_{i=1}^h R_{p_i}/eR_{p_i} = p^n \) and for \( 1 \leq i \leq h \), \( \gamma \notin \mathbb{P}_i \), and, there exists an ideal \( I_i < R_{p_i} \) such that \( a \in I_i \) and \( \delta \notin (I_i)^\# \). Then \( \bigoplus_{i=1}^h R_{p_i}/e^2I_i = \chi \).

Conversely, suppose there exists an \( R \)-module satisfying \( \chi \). Then, \( \Box \) there exists a finite direct sum of modules \( U_i \) such that \( \bigoplus_{i=1}^h U_i = \chi \) and each \( U_i \) is the restriction to \( R \) of a uniserial module over \( R_{p_i} \) for some prime ideal \( \mathbb{P}_i < R \). We may assume that \( U_i/J_i \) is non-zero for each \( U_i \), and otherwise the direct sum with \( U_i \) omitted also satisfies \( \chi \). Since \( U_i \) is uniserial as an \( R_{p_i} \)-module and \( U_i/J_i \) is non-zero and finite, \( U_i \) is finitely generated over \( R_{p_i} \). Therefore \( U_i \cong R_{p_i}/J_i \) for some ideal \( J_i < R_{p_i} \). Since \( \left|x=e/0\right| = 1 \), \( (J_i : e) \subseteq J_i + eR_{p_i} \). So, as in \( \Box \), there exists \( I_i < R_{p_i} \) such that \( J_i = e^2I_i \).

Now, since \( \bigoplus_{i=1}^h U_i = \chi \), \( \bigoplus_{i=1}^h R_{p_i}/eR_{p_i} = p^n \), \( e^2a \in e^2I \) and hence \( a \in I \). Moreover, by \( \Box \) \( \gamma \notin \mathbb{P}_i \) and \( \delta \notin I_i^\# \). \( \square \)

4. **Formalisms**

The formalisms introduced in this section will be used throughout the paper to allow us to make reductions in complexity of certain sets of conditions later on.

4.1. **Sets of functions.**

Let \( \Delta \) be a set and \( \mathcal{E} \) a set of functions from \( \Delta \) to \( \mathbb{N} \cup \{\infty\} \) such that if \( f,g \in \mathcal{E} \) then \( f \cdot g \in \mathcal{E} \) and such that the function which has constant value 1 is in \( \mathcal{E} \). Let \( n \in \mathbb{N} \), \( X,Y \subseteq \Delta \) be finite sets and let \( f : X \to \mathbb{N} \) and \( g : Y \to \mathbb{N} \).

Define \( \Omega_{f,g,n} \) to be the set of all tuples of functions \( (f_1,\ldots,f_n,g_1,\ldots,g_n) \) where \( f_i : X \cup (Y \setminus Y_i) \to \mathbb{N} \) and \( g_i : Y_i \to \mathbb{N} \) are such that \( Y_i \subseteq Y \) and

- \( \prod_{i=1}^n f_i(x) = f(x) \) for all \( x \in X \),
- \( f_i(y) < g(y) \) for all \( y \in Y \setminus Y_i \),
- \( g_i(y) = g(y) \) for all \( y \in Y_i \), and
- for all \( y \in Y_i \),

\[
\left( \prod_{i \text{ with } y \in Y \setminus Y_i} f_i(y) \cdot \prod_{i \text{ with } y \in Y_i} g_i(y) \right) \geq g(y).
\]
The most important instance of this set up in this paper is when $\Delta$ is a set of pairs $\varphi/\psi$ of pp-1-formulae over a ring $R$ and $E$ is the set of $R$-modules $M$ viewed as functions on $\Delta$ by setting $M(\varphi/\psi) := |\varphi(M)/\psi(M)|$.

For $E_1, E_2$ sets of functions from $\Delta$ to $\mathbb{N} \cup \{\infty\}$, define $E_1 \cdot E_2$ to be the set of $f : \Delta \rightarrow \mathbb{N} \cup \{\infty\}$ such that there exist $f_1 \in E_1$ and $f_2 \in E_2$ such that $f = f_1 \cdot f_2$.

**Lemma 4.1.** Let $E = \prod_{i=1}^{n} E_i$, $X, Y \subseteq \Delta$ be finite sets and let $f : X \rightarrow \mathbb{N}$ and $g : Y \rightarrow \mathbb{N}$. There exists $h \in E$ such that $h(x) = f(x)$ for all $x \in X$ and $h(y) \geq g(y)$ for all $y \in Y$ if and only if for some $(f_1, \ldots, f_n, g_1, \ldots, g_n) \in \Omega_{f,g,n}$ there exist $h_i \in E_i$ for $1 \leq i \leq n$ such that $h_i(x) = f_i(x)$ for all $x \in X \cup \{Y \setminus Y_i\}$ and $h_i(y) \geq g_i(y)$ for all $y \in Y_i$.

**Proof.** Let $h \in E$ be such that $h(x) = f(x)$ for all $x \in X$ and $h(y) \geq g(y)$ for all $y \in Y$. Since $E = \prod_{i=1}^{n} E_i$, there exist $h_i \in E_i$ for $1 \leq i \leq n$ such that $\prod_{i=1}^{n} h_i(x) = h(x)$ for all $x \in \Delta$. For each $1 \leq i \leq n$, let $Y_i := \{y \mid h_i(y) \geq g(y)\}$, let $f_i(x) = h_i(x)$ for all $x \in X \cup \{Y \setminus Y_i\}$, and let $g_i(y) = g(y)$ for all $y \in Y_i$. By definition $\prod_{i=1}^{n} f_i(x) = \prod_{i=1}^{n} h_i(x) = h(x) = f(x)$ for all $x \in X$, $f_i(y) = h_i(y) < g(y)$ for all $y \in Y \setminus Y_i$, and $g_i(y) = g(y)$ for all $y \in Y_i$. Now if $y \in Y \setminus Y_i$ then $f_i(y) = h_i(y)$ and if $y \in Y_i$ then $g_i(y) = g(y)$. Therefore, for all $y \in Y$, either $y \in Y_i$ for some $1 \leq i \leq n$ and hence the 4th condition holds or $y \not\in Y_i$ for all $1 \leq i \leq n$ and so $g(y) \leq h(y) = \prod_{i=1}^{n} h_i(y) = \prod_{i=1}^{n} f_i(y)$. So $(f_1, \ldots, f_n, g_1, \ldots, g_n) \in \Omega_{f,g,n}$.

Conversely, suppose $h_1, \ldots, h_n : \Delta \rightarrow \mathbb{N}$ are such that there exists $(f_1, \ldots, f_n, g_1, \ldots, g_n) \in \Omega_{f,g,n}$ with $h_i(x) = f_i(x)$ for all $x \in X \cup \{Y \setminus Y_i\}$ and $h_i(y) \geq g_i(y)$ for all $y \in Y_i$. Define $h : \Delta \rightarrow \mathbb{N}$ by $h(x) = \prod_{i=1}^{n} h_i(x)$ for all $x \in \Delta$. Then $h(x) = f(x)$ for all $x \in X$ and $h(y) \geq g(y)$ for all $y \in Y$ as required. \hfill \Box

**Definition 4.2.** Let $X, Y \subseteq \Delta$ be finite sets and let $f : X \rightarrow \mathbb{N}$ and $g : Y \rightarrow \mathbb{N}$. Let $g := \max\{g(y) \mid y \in Y\}$. Define $\Theta_{f,g}$ to be the set of pairs of functions $(f', g')$ such that $f' : X \cup \{Y \setminus Y'\} \rightarrow \mathbb{N}$, $g' : Y' \rightarrow \mathbb{N}$, $f'(x) = f(x)$ for all $x \in X$, $g'(y) = g$ for all $y \in Y'$ and $g(y) \leq f'(y) < g$ for all $y \in Y \setminus Y'$.

**Remark 4.3.** A function $h \in E$ is such that $h(x) = f(x)$ for all $x \in X$ and $h(y) \geq g(y)$ for all $y \in Y$ if and only if there exists $(f', g') \in \Theta_{f,g}$ such that $h(x) = f'(x)$ for all $x \in X \cup \{Y \setminus Y'\}$ and $h(y) \geq g'(y)$ for all $y \in Y'$.

### 4.2. Lattices generated by conditions.

Let $W$ be an infinite set. Let $\mathbb{W}$ be the free bounded distributive lattice generated by $W$.[5] We use $\sqcup$ for the supremum in this lattice and $\sqcap$ for the infimum in this lattice. Any element of $\mathbb{W}$ may be expressed as $\bigcup_{i \in I} \bigcap_{j \in J_i} w_{ij}$ where $I$ and $J_i$ for $i \in I$ are finite sets and $w_{ij} \in W$. Moreover, for $v_k, w_{ij} \in W$,

$$\prod_{k \in K} v_k \leq \bigcup_{i \in I} \bigcap_{j \in J_i} w_{ij}$$

if and only if there exists $i \in I$ such that

$$\prod_{k \in K} v_k \leq \bigcap_{j \in J_i} w_{ij}$$

if and only if there exists $i \in I$ such that

$$\{v_k \mid k \in K\} \supseteq \{w_{ij} \mid j \in J_i\}.$$  

---

We make the convention that the empty infimum is the largest element \(\top\) and the empty supremum is the least element \(\bot\).

We call an expression of the form \(\bigcup_{i \in I} \bigcap_{j \in J} w_{ij}\), where \(w_{ij} \in W\), \textbf{irredundant} if for each \(i \in I\), \(w_{ij_1} = w_{ij_2}\) implies \(j_1 = j_2\) and the sets \(w_i := \{w_{ij} \mid j \in J\}\) for \(i \in I\) are pairwise incomparable by inclusion. If \(\bigcup_{i \in I} \bigcap_{j \in J} w_{ij}\) and \(\bigcup_{i \in I'} \bigcap_{j \in J} w'_{ij}\) are in irredundant form then \(\bigcup_{i \in I} \bigcap_{j \in J} w_{ij} = \bigcup_{i \in I'} \bigcap_{j \in J} w'_{ij}\) if and only if there exist bijections \(\sigma : I \to I'\) and \(\sigma_j : J_i \to J'_\sigma(i)\) for each \(i \in I\) such that \(w_{ij} = w'_{\sigma(i)\sigma_j(j)}\) for all \(i \in I\) and \(j \in J_i\).

Given a recursive presentation of \(W\) (i.e. a bijection with \(\mathbb{N}\)), this presentation of \(W\) gives rise to a recursive presentation of \(\mathcal{W}\) (i.e. a presentation where the inclusion of \(W\) in \(\mathcal{W}\) is recursive and \(\cup\) and \(\cap\) are recursive functions).

For any \(V \subseteq W\), define \(\mathcal{V}\) to be the filter generated by \(V\) in \(\mathcal{W}\). Note for \(w_{ij} \in W\), \(\bigcup_{i \in I} \bigcap_{j \in J} w_{ij} \in \mathcal{V}\) if and only if there exists \(i \in I\) such that \(w_{ij} \in V\) for all \(j \in J_i\). So, in particular \(\mathcal{V}\) is prime filter. It follows that \(V\) is a recursive subset of \(W\) if and only if \(\mathcal{V}\) is a recursive subset of \(\mathcal{W}\).

Suppose that \(\text{clx} : W \to \alpha\) where \(\alpha\) is a partially ordered set with the descending chain condition. Let \(\underline{w} \in \mathcal{W}\) and let \(\underline{w} = \bigcup_{i \in I} \bigcap_{j \in J_i} w_{ij}\) be in irredundant form. For \(\beta \in \alpha\), we write \(\text{clx} \underline{w} \leq \beta\) if \(w_{ij} \leq \beta\) for all \(i \in I\) and \(j \in J_i\) and \(\text{clx} \underline{w} < \beta\) if \(\text{clx} w_{ij} < \beta\) for all \(i \in I\) and \(j \in J_i\). Note that if \(\underline{w}\) is a lattice combination of elements \(w_i \in W\) for \(1 \leq i \leq n\) then \(\text{clx} \underline{w} \leq \beta\) (respectively \(\text{clx} \underline{w} < \beta\)) for \(1 \leq i \leq n\) implies \(\text{clx} w_i \leq \beta\) (respectively \(\text{clx} w_i < \beta\)).

\textbf{Remark 4.4.} Let \(W\) be an infinite recursively presented set and \(V \subseteq W\). Suppose that \(\alpha\) is an artinian recursive partially ordered set, \(\text{clx} : W \to \alpha\) is recursive and \(W_0 \subseteq W\) is recursive. Suppose that there is an algorithm which given \(w \notin W_0\) computes \(\underline{w} \in \mathcal{W}\) such that \(\text{clx} \underline{w} < \text{clx} w\) and such that \(\underline{w} \in V\) if and only if \(w \in \mathcal{V}\). Then \(V\) is a recursive subset of \(W\) if and only if \(V \cap W_0\) is a recursive subset of \(W\).

The precise choice of \(W\) and \(V\) varies throughout this article.

To illustrate how this setup is used, let \(R\) be a recursive ring. Let \(W\) be the set of \(\mathcal{L}_R\)-sentences

\[
\bigwedge_{\phi \in X} \vert x | \leq f(\phi) \land \bigwedge_{\phi \in Y} \vert y | \geq g(\phi)
\]

where \(X, Y\) are finite sets of pp-1-pairs, \(f : X \to \mathbb{N}\) and \(g : Y \to \mathbb{N}\). Let \(V\) be the set of \(w \in W\) such that there exists \(M \in \text{Mod-}R\) with \(M \models w\). Then, by \(\text{Def}\)

\(T_R\) is decidable if and only if \(V\) is recursive. Working with \(\mathcal{L}_R\) and \(\mathcal{V}\), rather than \(W\) and \(V\) directly, allows us to talk about more than one module at a time. For instance, for \(w_1, \ldots, w_n \in W\), the condition \(w_1 \sqcap \cdots \sqcap w_n \in \mathcal{V}\) says that there exist \(R\)-modules \(M_i \in \text{Mod-}R\) with \(M_i \models w_i\) for \(1 \leq i \leq n\)

\section{First syntactic reductions}

Recall that, for a recursive ring \(R\), in order to show that the theory of \(R\)-modules is decidable, it is enough to show that there is an algorithm which, given a sentence of the form

\[
\bigwedge_{i=1}^s \vert x_i \vert = F_i \land \bigwedge_{j=1}^t \vert y_j \vert \geq G_j
\]

\(\ast\)
where, for $1 \leq i \leq s$ and $1 \leq j \leq t$, $\varphi_i$, $\psi_i$, $\sigma_j$ and $\tau_j$ are pp-1-formulae and $F_i, G_j \in \mathbb{N}$, answers whether there exists an $R$-module satisfying it.

In [GLT19], it was shown that if $R$ is a recursive Pr" ufer domain then it is enough to consider sentences where the pairs of pp-1-formulae in $(\ast)$ are all of the form $d|x|_{x=0}$ and $xb=\emptyset/e|x$. The proof of this statement relies on [2.6, PT15 2.2] and the fact, by [2.2 and 2.7], that every $R$-module is elementary equivalent to a direct sum of pp-universal modules. This is also true for arithmetical rings, and so, although not stated in [GLT19], the result, with the same proof, also holds for arithmetical rings.

**Theorem 5.1.** [GLT19 4.1] Let $R$ be a recursive arithmetical ring. If there exists an algorithm which, given a sentence $\chi$, a sentence and $\varphi_i/\psi_i$, are pairs of pp-1-formulae of the form $d|x|_{x=0}$ and $xb=\emptyset/e|x$ for $1 \leq i \leq n$, answers whether there exists $M \in \text{Mod}-R$ satisfying $\chi$, then $T_R$ is decidable.

We call any conjunction of sentences of the form

$$|d|x|_{x=0}| = 1 \quad \text{or} \quad |xb=\emptyset/e|x| = 1$$

an auxiliary sentence.

**Convention:** In the sequel, we will use the symbol $\square$ as a variable denoting either $=$ or $\geq$ when talking about conjunctions of sentences like $|\varphi/\psi| \square N$. It will be useful for us to extend this notation so that $\square$ can also be the symbol $\emptyset$, where $\square$ being $\emptyset$ indicates that $|\varphi/\psi| \emptyset N$ is omitted from the conjunction. For instance, when $\square_1$ is $\emptyset$, the sentence $|d|x|_{x=0}| \square_1 D \land |xb=\emptyset/e|x| \square_2 E$ stands for $|xb=\emptyset/e|x| \square_2 E$.

In this section we improve [GLT19 4.1] to prove the following.

**Theorem 5.2.** Let $R$ be arithmetical ring. If there exists an algorithm which, given a sentence $\chi$ of the form

$$(\dagger) \quad |d|x|_{x=0}| \square_1 D \land |xb=\emptyset/e|x| \square_2 E \land \bigwedge_{i=1}^m |\varphi_i/\psi_i| = G_i \land \bigwedge_{i=m+1}^n |\varphi_i/\psi_i| \geq H_i \land \Xi,$$

where $\square_1, \square_2 \in \{\geq, =, \emptyset\}$, $d,c,b \in R \setminus \{0\}$, $D,E,G_i,H_i \in \mathbb{N}$, $\Xi$ is an auxiliary sentence and $\varphi_i/\psi_i$ are pairs of pp-1-formulae of the form $x=x/e|x$ and $xb=\emptyset/e|x$ for $1 \leq i \leq n$, answers whether there exists an $R$-module satisfying $\chi$, then $T_R$ is decidable.

**Definition 5.3.** Let $X, Y$ be finite subsets of pp-pairs of the form $d|x|_{x=0}$ or $xb=\emptyset/e|x$, $f : X \to \mathbb{N}$ and $g : Y \to \mathbb{N}$ functions. Define $\chi_{f,g}$ to be the sentence

$$\bigwedge_{\varphi/\psi \in X} |\varphi/\psi| = f(\varphi/\psi) \land \bigwedge_{\varphi/\psi \in Y} |\varphi/\psi| \geq g(\varphi/\psi).$$

For the rest of this section, let $W$ be the set of $\mathcal{L}_R$-sentences of the form $\chi_{f,g}$ and let $V$ be the set of $w \in W$ such that there exists $M \in \text{Mod}-R$ with $M \models w$. If $X$ and $Y$ are both empty then $\chi_{f,g}$ should be read as the true sentence.
Remark 5.4. Let \( \L \) be an auxiliary sentence. Moreover, for \( \forall \leq \) and \( \top \in \mathcal{W} \) we may always assume that \( w \) is of the form \( \chi_{f,g} \wedge \Xi \),

where \( f : X \to \mathbb{N}_2 \) and \( g : Y \to \mathbb{N}_2 \) with \( X, Y \) finite disjoint sets of pp-pairs of the form \( d|x|/x = 0 \) or \( x = 0/c| x \), and \( \Xi \) is an auxiliary sentence.

It is obvious that any \( \chi_{f,g} \in \mathcal{W} \) may be rewritten as \( \chi_{f',g} \wedge \Xi \) where \( f' : X' \to \mathbb{N}_2 \) and \( \Xi \) is an auxiliary sentence. Moreover, for \( \chi_{f,g} \wedge \Xi \in \mathcal{W} \), let \( Y' := \{ \varphi/\psi \mid g(\varphi/\psi) > 1 \} \) and \( g' := g|Y' \). Then \( \chi_{f,g} \wedge \Xi \in \mathcal{V} \) if and only if \( \chi_{f,g'} \wedge \Xi \in \mathcal{V} \). If \( \varphi/\psi \in X \cap Y \) and \( f(\varphi/\psi) < g(\varphi/\psi) \) then \( \mathcal{T}_R \models \neg \chi_{f,g} \). If \( f(\varphi/\psi) \geq g(\varphi/\psi) \) then \( \chi_{f,g} \wedge \Xi \in \mathcal{V} \) if and only if \( \chi_{f,g'} \wedge \Xi \in \mathcal{V} \) where \( g' := g|Y \setminus \{ \varphi/\psi \} \). So, given \( w \in \mathcal{W} \), we can effectively decide that \( w \notin \mathcal{V} \) or compute \( f, g \) and \( \Xi \) of the required form such that, \( \chi_{f,g} \wedge \Xi \leq \chi_{w,1} \wedge \Xi \leq \chi_{w,2} \wedge \Xi \), and, \( w \in \mathcal{V} \) if and only if \( \chi_{f,g} \wedge \Xi \in \mathcal{V} \).

Remark 5.5. Let \( X, Y \) be disjoint finite sets of pp-pairs of the form \( d|x|/x = 0 \) or \( x = 0/c| x \), \( f : X \to \mathbb{N} \) and \( g : Y \to \mathbb{N} \) functions, and \( \Xi \) an auxiliary sentence. For each \( 1 \leq j \leq n \), \( \vartheta_j \) be an auxiliary sentence. Suppose that for all \( M \in \text{Mod}-R \), there exist modules \( M_j \models \vartheta_j \) such that \( M \equiv \bigoplus_{j=1}^{n} M_j \). Then \( \chi_{f,g} \wedge \Xi \in \mathcal{V} \) if and only if

\[
\bigcup_{(\mathcal{T}, \mathcal{P}) \in \Omega_{f,g,n}} \prod_{j=1}^{n} \chi_{f,g_j} \wedge \vartheta_j \wedge \Xi \in \mathcal{V}.
\]

Moreover, for all \( (\mathcal{T}, \mathcal{P}) \in \Omega_{f,g,n} \), \( 1 \leq j \leq n \),

\[
\chi_{f,g_j} \wedge \vartheta_j \wedge \Xi \leq \chi_{f,g_j} \wedge \Xi \text{ and } \chi_{f,g_j} \wedge \vartheta_j \wedge \Xi \leq \chi_{f,g_j} \wedge \Xi.
\]

The next lemma is more precise than we will need in this section. However, we will need its full strength in section 9. The total order \( \prec \) on the set \( \{ \emptyset, =, \leq \} \) is defined as \( \emptyset \prec = \prec \leq \).

Lemma 5.6. Let \( \varphi/\psi, \varphi'/\psi', \sigma/\tau \) be pp-pairs, \( \square, \square' \in \{ =, \geq \} \), \( E, E' \in \mathbb{N}_2 \) and let \( \Sigma \) be an \( \mathcal{L}_R \)-sentence. Suppose that \( M \models \Sigma \) implies

\[
|\varphi/\psi(M)| = |\sigma/\tau(M)| \cdot |\varphi'/\psi'(M)|
\]

for all \( M \in \text{Mod}-R \).

There is an algorithm which, given \( \varphi/\psi, \varphi'/\psi', \sigma/\tau, \square, \square' \in \{ =, \geq \} \), \( E, E' \in \mathbb{N}_2 \) and \( \Sigma \) as above, either returns \( \Omega := \{ \bot \} \), in which case

\[
\mathcal{T}_R \models \neg(\Sigma \wedge |\varphi/\psi| \square E \wedge |\varphi'/\psi'| \square' E'),
\]
Suppose that there exist non-equal \(a, b\) \(w\)

Proof.

Case 1: \(\square\) and \(\square'\) are both \(-\).

Let \(\Omega := \{\bot\}\) if \(E'\) does not divide \(E\), otherwise \(\Omega := \{(E/E', E', =, =)\}\). Note \((E/E') \cdot E' = E < E \cdot E'\) because \(E' \geq 2\).

Case 2: \(\square\) is \(\geq\) and \(\square'\) is \(\geq\).

Let \(\Omega := \{(E/E', E', \geq, \geq)\}\). Note

\[
[E/E'] \cdot E' < (E/E' + 1) \cdot E = E + E' \leq E \cdot E'.
\]

Case 3: \(\square\) is \(\geq\) and \(\square'\) is \(=\).

Let \(X := \{D \in \mathbb{N} \mid D|E\text{ and } D \geq E'\}\). Define \(\Omega := \{\bot\}\) if \(X = \emptyset\) and \(\Omega := \{(E/D, D, =, =) \mid D \in X\}\). Note \((E/D) \cdot D = E \leq E \cdot E'\).

Case 4: \(\square\) and \(\square'\) are both \(\geq\).

If \(E' \geq E\) then let \(\Omega := \{(1, E', \geq, \geq)\}\). If \(E > E'\) then set

\[
\Omega := \{(E/D, D, =, =) \mid E > D \geq E'\} \cup \{(1, E, \geq, \geq)\}.
\]

Note that \(E' < E \cdot E', E < E \cdot E'\) and

\[
[E/D] \cdot D < (E/D + 1) \cdot D = E + D \leq E \cdot E'.
\]

The following remark is easy to prove. We record it here because we will use it frequently.

Remark 5.7. Let \(R\) be a commutative ring. For all \(a, b \in R\) and \(M \in \text{Mod-}R\),

\[
|a|x \bmod x = 0(M)| = |x = x/a + b|/x = 0(M)|
\]

and

\[
|x = 0|/x = 0(M)| = |a|x \bmod x = 0(M)|.
\]

Proposition 5.8. Let \(R\) be a recursive arithmetical ring. There is an algorithm which given \(w \in W\) with \(\text{clx}_1(w) > 1\) outputs \(w \in W\) such that \(\text{clx}_1(w) < \text{clx}_1(w), \text{clx}_2(w) \leq \text{clx}_2(w),\) and \(w \in V\) if and only if \(w \in \mathbb{N}\).

Proof. Let \(X, Y\) be disjoint finite sets of \(pp\)-pairs of the form \(d|x/x = 0\) and \(xb = 0/c|x\).

Let \(f : X \rightarrow \mathbb{N}_2\) and \(g : Y \rightarrow \mathbb{N}_2\) be functions, and let \(\Xi\) be an auxiliary sentence. Let \(w\) be

\[
\bigwedge_{\psi \in X} |\psi| = f(\psi) \land \bigwedge_{\psi \in Y} |\psi| \geq g(\psi) \land \Xi.
\]

Suppose that there exist non-equal \(a, b \in R\) such that \(a|x/x = 0, b|x/x = 0\in X \cup Y\) i.e. \(\text{clx}_1(w) > 1\). Let \(\alpha, r, s \in R\) be such that \(a = br\) and \(b(\alpha - 1) = as\). Define

1. \(\Sigma_1 := |x = x/a| = 1 \land |rb|x/x = 0| = 1,
2. \(\Sigma_2 := |x = x/a|x = 1 \land |zb = 0|/x = 1,
3. \(\Sigma_3 := |x = x/(\alpha - 1)| = 1 \land |as|x/x = 0| = 1,\) and
4. \(\Sigma_4 := |x = x/(\alpha - 1)| = 1 \land |xa = 0|/s|x = 1.|
It follows directly from 2.9 that, for any $M \in \text{Mod-}R$, there are $M_i \models \Sigma_i$ for $1 \leq i \leq 4$ such that $M \equiv M_1 \oplus M_2 \oplus M_3 \oplus M_4$. Therefore, by 5.5, $w \in V$ if and only if

$$\bigcup_{(f, g) \in \Omega_{f,g,4}} \bigcap_{i=1}^{4} \chi_{f_i, g_i} \land \Xi \land \Sigma_i \in \mathcal{V}.$$  

For each $(f, g) \in \Omega_{f,g,4}$ and $1 \leq i \leq 4$, it is enough to compute $w_i \in \mathcal{W}$ such that $\text{clx}_1(w_i) < \text{clx}_1(\chi_{f,g} \land \Xi)$, $\text{clx}_2(w_i) \leq \text{clx}_2(\chi_{f,g} \land \Xi)$ and $\chi_{f_i, g_i} \land \Xi \land \Sigma_i \in \mathcal{V}$ if and only if $w_i \in V$.

Fix $(f, g) \in \Omega_{f,g,4}$. For each $1 \leq i \leq 4$, let $X_i$ be the domain of $f_i$ and $Y_i$ be the domain of $g_i$.

**Case $i=1$:** Suppose $M \models \Sigma_1$. Then $M \alpha = M$ and hence $M a = M b r = 0$. Therefore, if $M \models \Sigma_1$ then $|a|x=x=0(M)| = 1$.

If $a|x=x=0 \in X_1$ and $f_1(a|x=x=0) = 1$ then $\text{clx}_1(\chi_{f_1, g_1} \land \Xi \land \Sigma_1) < \text{clx}_1(\chi_{f,g} \land \Xi)$ and, by 5.5, $\text{clx}_2(\chi_{f_1, g_1} \land \Xi \land \Sigma_1) \leq \text{clx}_2(\chi_{f,g} \land \Xi)$. So, $w_i := \chi_{f_1, g_1} \land \Xi \land \Sigma_1$ has the required properties.

If $a|x=x=0 \in X_1$ and $f_1(a|x=x=0) \neq 1$ then, by the first paragraph, $\chi_{f_1, g_1} \land \Xi \land \Sigma_1$ is not satisfied by any $R$-module. If $a|x=x=0 \notin X_1$ then $a|x=x=0 \in Y_1$ since $X \cup Y = X_1 \cup Y_1$. Moreover $g_1(a|x=x=0) = g(a|x=x=0)$. So $g_1(a|x=x=0) > 1$ and hence $\chi_{f_1, g_1} \land \Xi \land \Sigma_1$ is not satisfied by any $R$-module. In either case, set $w_i := \bot$. Then $w_i \in V$ if and only if $\chi_{f_1, g_1} \land \Xi \land \Sigma_1 \in \mathcal{V}$. By definition $\text{clx}_1(\bot) < \text{clx}_1(\chi_{f,g} \land \Xi)$ and $\text{clx}_2(\bot) \leq \text{clx}_2(\chi_{f,g} \land \Xi)$.

**Case $i=2$:** Suppose $M \models \Sigma_2$. Then $M a = M a a a = M b r$. So, since $x b = 0 \leq_M r|x$, by 5.7

$$|b|x=x=0(M)| = |b|x=br|x=0(M)| \cdot |br|x=x=0(M)| = |x=x=r|x|(M)| \cdot |a|x=x=0(M)|.$$  

Let $X' = X_2 \setminus \{a|x=x=0, b|x=x=0\}$ and $Y' = Y_2 \setminus \{a|x=x=0, b|x=x=0\}$. Let $\Box, \Diamond \in \{=, \geq\}$ and $A, B$ be such that $\chi_{f_2, g_2} \land \Xi \land \Sigma_2$ is

$$|a|x=x=0|A \land |b|x=x=0|B \land \bigwedge_{\varphi \in X'} |\varphi| = f_2(\varphi) \land \bigwedge_{\varphi \in Y'} |\varphi| \geq g_2(\varphi) \land \Xi \land \Sigma_2.$$  

By 5.6, there is an algorithm which either returns $\Omega := \{\bot\}$, in which case

$$T_R \models \neg \Sigma_2 \land |a|x=x=0|A \land |b|x=x=0|B,$$

or, a set $\Omega \subseteq \mathbb{N}^2 \times \{=, \geq\}$ such that

$$\Sigma_2 \land |a|x=x=0|A \land |b|x=x=0|B$$

is equivalent, with respect to $T_R$, to

$$\bigcup_{(D_1, D_2, \Box, \Diamond) \in \Omega} \Sigma_2 \land |x=x=r|x|D_1 \land |a|x=x=0|D_2.$$  

If $\Omega := \{\bot\}$ then $\chi_{f_2, g_2} \land \Xi \land \Sigma_2 \in \mathcal{V}$ if and only if $\bot \in \mathcal{V}$. By definition $\text{clx}_1(\bot) < \text{clx}_1(\chi_{f,g} \land \Xi)$ and $\text{clx}_2(\bot) \leq \text{clx}_2(\chi_{f,g} \land \Xi)$. Otherwise, for each $(D_1, D_2, \Box, \Diamond) \in \Omega$, let $u_i(D_1, D_2, \Box, \Diamond) \in \Omega$ be

$$|x=x=r|x|D_1 \land |a|x=x=0|D_2 \land \bigwedge_{\varphi \in X'} |\varphi| = f_2(\varphi) \land \bigwedge_{\varphi \in Y'} |\varphi| \geq g_2(\varphi) \land \Xi \land \Sigma_2.$$
Then \( \chi_{f_2,g_2} \wedge \Xi \wedge \Sigma_2 \) is equivalent to
\[
\bigvee_{(D_1,D_2,\Box_1,\Box_2) \in \Omega} u(D_1,D_2,\Box_1,\Box_2)
\]
with respect to \( T_R \). Therefore \( \chi_{f_2,g_2} \wedge \Xi \wedge \Sigma_2 \in V \) if and only if
\[
\bigcup_{(D_1,D_2,\Box_1,\Box_2) \in \Omega} u(D_1,D_2,\Box_1,\Box_2) \in V.
\]
Moreover,
\[
\text{clx}_1(u(D_1,D_2,\Box_1,\Box_2)) \leq 1 + (\text{clx}_1(\chi_{f_2,g_2} \wedge \Xi \wedge \Sigma_2) - 2) < \text{clx}_1(\chi_{f_2,g_2} \wedge \Xi \wedge \Sigma_2)
\]
and \( \text{clx}_2(u(D_1,D_2,\Box_1,\Box_2)) = \text{clx}_2(\chi_{f_2,g_2} \wedge \Xi \wedge \Sigma_2) \). So we are done, since, by 5.5, \( \text{clx}_1(\chi_{f_2,g_2} \wedge \Xi \wedge \Sigma_2) \leq \text{clx}_1(\chi_{f,g} \wedge \Xi) \) and \( \text{clx}_2(\chi_{f_2,g_2} \wedge \Xi \wedge \Sigma_2) \leq \text{clx}_2(\chi_{f,g} \wedge \Xi) \).

We now start work on showing that there exists an algorithm which given \( w \in W \) with \( \text{clx}_2 w > 1 \) outputs \( w \in \mathcal{W} \) such that \( w \in V \) if and only if \( w \in \mathcal{V} \) and \( \text{clx}_1(w) < \text{clx}_2(w) \). This uses the same ideas as for \( \text{clx}_1 \) but is significantly more complicated.

**Lemma 5.9.** Let \( R \) be an arithmetical ring and let \( b,c,b',c' \in R \). Let \( \alpha,u,u', \beta,\beta',s,s',r,r',\delta,\delta',\lambda,\lambda',\mu,\mu' \in R \) be such that
\[
\begin{align*}
ca &= c'u, & c'(\alpha - 1) &= cu' \\
u\beta &= br, & b'(\beta - 1) &= us, & u'\beta' &= br', & b(\beta' - 1) &= u's' \\
b\delta &= s\lambda, & s(\delta - 1) &= b\mu, & b\delta' &= s'\lambda', & s'(\delta' - 1) &= b'\mu'.
\end{align*}
\]
Define the sentences \( \Lambda_i \) and \( \Lambda'_i \) for \( 1 \leq i \leq 6 \) and \( P_i \) and \( P'_i \) for \( 4 \leq i \leq 6 \) to be the conjunction of sentences labeling the edges in the path from the root of the tree in Figure 1 to the leaf of the tree with that sentence as label.

Every \( R \)-module is elementarily equivalent to an \( R \)-module of the form
\[
(\bigoplus_{i=1}^6 M_i \oplus \bigoplus_{i=4}^6 N_i) \oplus (\bigoplus_{i=1}^6 M'_i \oplus \bigoplus_{i=4}^6 N'_i)
\]
where \( M_i \models \Lambda_i \) and \( M'_i \models \Lambda'_i \) for \( 1 \leq i \leq 6 \) and \( N_i \models P_i \) and \( N'_i \models P'_i \) for \( 4 \leq i \leq 6 \).

Moreover, for all \( M \in \text{Mod-}R \),
\[
(i) \ M \models \Lambda_1 \text{ implies } c \in \text{ann}_R M \text{ and hence } |x^{b=0}/c|_i x(M)| = |x^{b=0}/x=0(M)|,
(ii) \ M \models \Lambda_2 \text{ implies } |x^{b=0}/c'|_i x(M)| = 1,
(iii) \ M \models \Lambda_3 \text{ implies } b' \in \text{ann}_R M \text{ and hence } |x^{b'=0}/c'|_i x(M)| = |x=x/c'|_i x(M)|,
(iv) \ M \models \Lambda_4 \text{ implies } |x^{b'=0}/c'|_i x(M)| = 1,
(v) \ M \models \Lambda_5 \text{ implies } b \in \text{ann}_R M \text{ and hence } |x^{b=0}/c|_i x(M)| = |x=x/c|_i x(M)|,
(vi) \ M \models \Lambda_6 \text{ implies } |x^{b=0}/c|_i x(M)| = |x^{b=0}/c'|_i x(M)| \cdot |x\lambda=0/x=0(M)|,
(vii) \ M \models P_4 \text{ implies } |x^{b=0}/c|_i x(M)| = 1,
(viii) \ M \models P_5 \text{ implies } b' \in \text{ann}_R M \text{ and hence } |x^{b'=0}/c'|_i x(M)| = |x=x/c'|_i x(M)| \text{, and}
(ix) \ M \models P_6 \text{ implies } |x^{b'=0}/c'|_i x(M)| = |x^{b=0}/c|_i x(M)| \cdot |x\mu=0/x=0(M)|.
\]
Similarly, the symmetry of figure 1, gives 9 conditions for \( \Lambda'_i \) and \( P'_i \), where \( c,b \) and \( c',b' \) are interchanged and \( \lambda,\mu \) are replaced by \( \lambda',\mu' \), respectively.
Figure 1
Proof: There are two edges coming out of each node of the tree in Figure 1. In each instance the two edges are either
\( (1) \ |x=x/γ|x|=1 \) for some \( γ \in R \),
\( (2) \ |xγ=0/x|=1 \) and \( |x(γ−1)=0/x|=1 \) for some \( γ \in R \), or
\( (3) \ |xβ=0/β|x|=1 \) and \( |xα=0/α|x|=1 \).
By [2.3], in each (1), (2) and (3), for all modules \( M \in \text{Mod-R} \), there exist \( M_1 \) satisfying the first sentence and \( M_2 \) satisfying the second sentence such that \( M \cong M_1 \oplus M_2 \). The first claim follows from this fact.

For any \( M \in \text{Mod-R} \), \( α \not\in \text{DivM} \) implies \( c|x \) is equivalent to \( c'u|x \) in \( M \) because \( cα = c'u \).

(i) Suppose \( M \models Λ_1 \). Since \( |c'u|x=0(M)| = 1 \), \( Mc = Mc'u = 0 \). So \( c \in \text{ann}_RM \).

(ii) Suppose \( M \models Λ_2 \). Then \( β \not\in \text{AssM} \) and so, since \( uβ = br \), \( xb'r = 0 \) is equivalent to \( xu = 0 \) in \( M \). Since \( xu = 0 \leq x \in M \), we conclude
\( xb' = 0 \leq x \in M \), \( xb'r = 0 \leq xu = 0 \leq x \in M \).

(iii) Suppose \( M \models Λ_3 \). Then \( β − 1 \not\in \text{AssM} \) and so, since \( b'(β − 1) = us \), \( xb' = 0 \) is equivalent to \( xus = 0 \) in \( M \). Since \( |xus|x=0(M)| = 1 \), \( us \in \text{ann}_RM \) and hence \( b' \in \text{ann}_RM \).

Claim: If \( M \models |x=x'/u|x|=1 \land |xu=0|x|=1 \land |x(β−1)=0/x|=1 \land |x=0/|x|=1 \)
then \( |xb'=0|x|=1 \). Suppose \( f(m) := m'c'u \) for some \( m' \in M \). Then \( (m−m'c)u = 0 \). Since \( |xus|x=0|x|=1 \), \( m−m'c \in c'|x| \) and hence \( m \in c'|x| \). Therefore \( \ker f = c'|x| \). So we have proved the claim.

We now prove the statements about modules satisfying \( Λ_4, Λ_5, Λ_6 \). The statements for modules satisfying \( P_4, P_5 \) and \( P_6 \) follow similarly.

(iv) Suppose \( M \models Λ_4 \). Then \( |x=0|x=0(M)| = 1 \) and by the claim \( |xb'=0|x=0(M)| = |x=0|x=0(M)| \).

(v) Suppose \( M \models Λ_5 \). Since \( b \not\in \text{AssM} \), \( xb = 0 \) is equivalent to \( x=0 \) in \( M \). Since \( |x|x=0(M)| = 1 \), \( sl \in \text{ann}_RM \) and hence \( b \in \text{ann}_RM \).

(vi) Suppose \( M \models Λ_6 \). Since \( b \not\in \text{AssM} \), \( xb = 0 \) is equivalent to \( x=0 \) in \( M \). Since \( xs = 0 \geq x \in M \),
\( |xb=0|x=0(M)| = |x=0|x=0(M)| \).

By [5.7], \( |x|x=0|M| = |x|x=0|M| \). So, since \( |x|x=0|M| = 1 \),
\( |xb=0|x=0(M)| = |x|=0|x=0(M)| \). Therefore \( \ker f = c'|x| \). So we have proved the claim.

Proposition 5.10. There is an algorithm which, given \( w \in W \) with \( \text{clx}_2(w) > 1 \), outputs \( w' \in W \) such that \( \text{clx}_2(w') < \text{clx}_2(w) \), \( \text{clx}_1(w') \leq \text{clx}_1(w) \), and, \( w \in W \) if and only if \( w' \in W \).

Proof. We start with a special case. Let \( b, c, b', c' \in R\setminus\{0\} \). Let \( P_6, P_7, Λ_6, Λ_7 \) be as in [5.9]. Let \( Σ_1 := |c|/x = 0 \), \( Σ_2 := |b|x = 0 \), \( Σ_3 := |c'|/x = 0 \), \( Σ_4 := |b|x = 0 \), \( Σ_5 := |c'|/x = 0 \), \( Σ_6 := |b'|/x = 0 \), \( Σ_7 := Λ_6 \), \( Σ_8 := P_6 \), \( Σ_9 := Λ_6 \) and \( Σ_{10} := P_7 \).
Fix $1 \leq i \leq 4$ or $7 \leq i \leq 10$. Suppose $w$ is 

$$|x^{b=0/c}|E \land |x^{b'=0/c'}|E' \land \chi_{f,g} \land \Sigma_i \land \Xi.$$ 

**Case i=1:** Let $w'$ be 

$$|x^{b=0/c}|E \land |x^{b'=0/c'}|E' \land \chi_{f,g} \land \Sigma_i \land \Xi.$$ 

Then $\text{clx}_1 w' = \text{clx}_1 w$ and $\text{clx}_2 w' < \text{clx}_2 w$. Since $T_R \models w \leftrightarrow w'$, we get $w \in V$ if and only if $w' \in V$.

**Case i=2,3,4:** The same argument as for $i = 1$ works.

**Case i=7:** By [5.9], if $M \models \Sigma_7 = \Lambda_6$ then 

$$|x^{b=0/c}|(M) = |x^{b=0/c}(M)| \cdot |x^{\lambda=0/x=0}(M)|.$$ 

By [5.6] there is an algorithm which either returns $\Omega := \bot$, in which case 

$$T_R \models \neg(|x^{b=0/c}|E \land |x^{b'=0/c'}|E'),$$

or, a set $\Omega \subseteq \mathbb{N}^2 \times \{\subseteq, \supseteq\}^2$ such that 

$$\Sigma_7 \land |x^{b=0/c}|E \land |x^{b'=0/c'}|E' \land \chi_{f,g} \land \Sigma_7 \land \Xi$$

is equivalent, with respect to $T_R$, to 

$$\bigvee_{(D_1, D_2, \Box_1, \Box_2) \in \Omega} \Sigma_7 \land |x^{\lambda=0/x=0}|D_1 \land |x^{b'=0/c'}|D_2 \land \chi_{f,g} \land \Sigma_7 \land \Xi.$$ 

If $\Omega := \{ \bot \}$ then $w \in V$ if and only if $\bot \in \mathcal{V}$ and by definition $\text{clx}_1 \bot \subseteq \text{clx}_1 w$ and $\text{clx}_2 \bot < \text{clx}_2 w$. Otherwise, 

$$|x^{b=0/c}|E \land |x^{b'=0/c'}|E' \land \chi_{f,g} \land \Sigma_7 \land \Xi$$

is equivalent to 

$$\bigvee_{(D_1, D_2, \Box_1, \Box_2) \in \Omega} |x^{\lambda=0/x=0}|D_1 \land |x^{b'=0/c'}|D_2 \land \chi_{f,g} \land \Sigma_7 \land \Xi.$$ 

For each $(D_1, D_2, \Box_1, \Box_2) \in \Omega$, let 

$$w_{(D_1, D_2, \Box_1, \Box_2)} := |x^{\lambda=0/x=0}|D_1 \land |x^{b'=0/c'}|D_2 \land \chi_{f,g} \land \Sigma_7 \land \Xi.$$ 

So $w \in V$ if and only if 

$$\bigcup_{(D_1, D_2, \Box_1, \Box_2) \in \Omega} w_{(D_1, D_2, \Box_1, \Box_2)} \in \mathcal{V}.$$ 

For all $(D_1, D_2, \Box_1, \Box_2) \in \Omega$, $\text{clx}_1 w_{(D_1, D_2, \Box_1, \Box_2)} = \text{clx}_1 w$ and $\text{clx}_2 w_{(D_1, D_2, \Box_1, \Box_2)} < \text{clx}_2 w$.

**Case i=8,9,10:** The same argument as for $i = 7$ works.

We now deal with the general case. Let 

$$w := \bigwedge_{\varphi \in X} |\varphi| = f(\varphi) \land \bigwedge_{\varphi \in Y} |\varphi| \geq g(\varphi) \land \Xi \in W$$

where $X,Y$ are disjoint finite sets of pp-pairs of the form $d|x/x = 0$ and $xb = 0/c|x$, $f : X \rightarrow \mathbb{N}_2$, $g : Y \rightarrow \mathbb{N}_2$ and $\Xi$ is an auxiliary sentence.

Suppose that $xb=0/c|x, xb'=0/c'|x \in X \cup Y$ are distinct pp-pairs. Let $\Omega \subseteq \Omega_{f,g,\Xi}$ such that $(\overline{f}, \overline{g}) \in \Omega$ if and only if $xb=0/c|x \in X_5$, $xb'=0/c'|x \in X_6$, $f_5(xb=0/c|x) = 1$, and $f_6(xb'=0/c'|x) = 1$. 

Thus the set of \( w \) such that \( \text{cl} x \leq \text{cl} w \) that there exists an algorithm which given \( w \).

Proof of 5.2.

By 5.1, in order to show that \( x \leq w \) in \( \Omega \), and 1 \( i \leq 10 \), let

\[
\bigcup_{\mathcal{F}, \mathcal{G} \in \Omega} \bigcap_{i=1}^{10} \bigcup_{\phi, \psi \in X} \left[ \phi \leq \psi \right] = f_i(\phi/\psi) \land \bigcup_{\psi \in Y} \left[ \psi \leq \phi \right] = g_i(\phi/\psi) \land \Sigma_i \land \Xi \in \mathcal{V}.
\]

For each \((\mathcal{F}, \mathcal{G}) \in \Omega \) and \( 1 \leq i \leq 10 \), let

\[
w_{i, \mathcal{F}, \mathcal{G}} := \bigcup_{\phi, \psi \in X} \left[ \phi \leq \psi \right] = f_i(\phi/\psi) \land \bigcup_{\psi \in Y} \left[ \psi \leq \phi \right] = g_i(\phi/\psi) \land \Sigma_i \land \Xi.
\]

By definition of \( \Omega_{f,g,10} \), for each \( 1 \leq i \leq 10 \), \( \text{cl} x w_{i, \mathcal{F}, \mathcal{G}} \leq \text{cl} x w_{i, \mathcal{F}, \mathcal{G}} \leq \text{cl} x w_{i, \mathcal{F}, \mathcal{G}} \leq \text{cl} x w_{i, \mathcal{F}, \mathcal{G}} \).

By assumption \( x^b = 0/\phi \in X \) and \( f(x^b = 0/\phi) > 1 \) or \( x^b = 0/\phi \in Y \) and \( g(x^b = 0/\phi) > 1 \). So, since \( x^b = 0/\phi \in X \) and \( f(x^b = 0/\phi) > 1 \), for each \((\mathcal{F}, \mathcal{G}) \in \Omega_{f,g,10} \), \( \text{cl} x w_{i, \mathcal{F}, \mathcal{G}} \leq \text{cl} x w_{i, \mathcal{F}, \mathcal{G}} \).

Replacing \( x^b = 0/\phi \) by \( x^b = 0/\phi \), the same argument gives \( \text{cl} x w_{i, \mathcal{F}, \mathcal{G}} \leq \text{cl} x w_{i, \mathcal{F}, \mathcal{G}} \).

If \( 1 \leq i \leq 4 \) or \( 7 \leq i \leq 10 \), then \( w_{i, \mathcal{F}, \mathcal{G}} \) is of the form of the special case considered at the beginning of the proof. Thus we may replace each \( w_{i, \mathcal{F}, \mathcal{G}} \) by a lattice combination of \( U \) such that \( \text{cl} x w \leq \text{cl} x w \) and, either \( \text{cl} x w \leq \text{cl} x w \) or \( \text{cl} x w \leq \text{cl} x w \).

\[\square\]

Proof of 5.4.

By 5.1, in order to show that \( T_R \) is decidable, it is enough to show that there exists an algorithm which given \( w \in W \) answers whether \( w \in V \) or not. By assumption, the set of \( w \) with \( \text{cl} x w \leq 1 \) and \( \text{cl} x w \leq 1 \) is recursive.

Thus the set of \( w \in V \) with \( \text{cl} x w \leq 1 \) and \( \text{cl} x w \leq 1 \) is recursive.

Since \( N_0 \) is artinian as an order, iteratively applying 5.8 and 5.10 gives an algorithm which given \( w \in W \) with either \( \text{cl} x w \geq 1 \) or \( \text{cl} x w \geq 1 \) outputs \( w \in W \) such that \( \text{cl} x w \leq \text{cl} x w \leq 1 \), and, \( w \in V \) if and only if \( w \in V \).

6. Uniserial modules with finite invariants sentences

Descriptions of the uniserial (and hence indecomposable pure-injective) modules, \( U \), over a valuation domain which have \( \phi/\psi \) finite but non-zero for a given pp-pair \( \phi/\psi \) are given for valuation domains with dense value groups in [PPT07] and for valuation domains with non-dense value groups in [Gre15]. However, we need a uniform description that works for both valuation domains with dense and non-dense value groups. This is done in Lemmas 6.1, 6.2, 6.3, and 6.4, and used in section 9. The rest of the section is about these modules in preparation for sections 7, 8, and 10.

Lemma 6.1. Let \( V \) be a valuation domain. If \( d \in V \) and \( U \) is a uniserial \( V \)-module such that \( d \times x = 0(U) = Ud \) is finite and non-zero then \( U \cong V/\text{ann} U \) for some \( I \in V \) and \( Ud \cong V/\text{ann} U \).

Proof. For any module \( M \), \( d = x/xd = 0(M) \). Thus if \( d \times x = 0(U) \cong x/xd = 0(U) \) is finite but not equal to the zero module then, by 2.12, \( U \cong V/J \) for some ideal \( J < V \). Since \( Ud \neq 0 \), \( d \notin J \) and therefore \( dV \supseteq J \). So there exists \( I < V \) such that \( dI = J \).

Note that in the assumptions of the second clause of the next lemma we are not excluding that \( I = V \) or consequently that \( xd = 0 \) or \( x(I/bcV) = 0 \).

Lemma 6.2. Let \( V \) be a valuation domain and \( b, c \in V \setminus \{0\} \). If \( U \) is a uniserial \( V \)-module such that \( b, c \notin \text{ann} U \) and \( x = 0/xc \) is finite but non-zero then there exists \( I < V \) with \( b, c \in I \) such that \( U \cong I/bcV \) and \( x = 0/xc(U) \cong V/I \).
Conversely, if $0 \neq I \triangleleft V$ is an ideal and $b, c \in I \backslash \{0\}$ then $x^{b=0}/c_{x}z(I/beV) \cong V/I$.

Proof. Let $Q$ be the field of fractions of $V$. By [Zie84, pg 168], for any non-zero uniserial module $U$, there exist submodules $K \subseteq J \subseteq Q$ such that $U \cong J/K$. Now $b, c \not\in \text{ann}_{R} J/K$ imply $(K : b) \subseteq J$ and $cJ \supseteq K$ respectively. Therefore, since $x^{b=0}/c_{x}z(J/K) = 0$, $x^{0}/c_{x}z(J/K) = (K : b)/cJ \cong cJ$. Since $K/cbJ$ is a non-zero finite uniserial module, it has the form $V/I$ for some proper ideal $I \triangleleft V$. Therefore $K = \lambda V$ for some $\lambda \in Q \backslash \{0\}$ and $\lambda^{-1}cbJ = I$. Thus $J/K \cong I/beV$ as required.

Let $0 \neq I \triangleleft V$ be an ideal and $b, c \in I \backslash \{0\}$. Then $x^{b=0}/c_{x}z(I/beV) = cV/cI \cong V/I$. □

Lemma 6.3. Let $V$ be a valuation domain and $c \in V$. If $U$ is a uniserial $V$-module such that $x^{s/r}_{c}z(U)$ is finite but non-zero then $U \cong V/K$ for some ideal $K \triangleleft R$. Moreover, if $x^{s/r}_{c}z(U)$ is finite but non-zero then either $U \cong V/cI$ for some $I \triangleleft V$ and $V/cV \cong x^{s/r}_{c}z(U)$, or, $c \in \text{ann}_{R}U$ and $U \cong x^{s/r}_{c}z(U)$.

Proof. The first claim is a consequence of 2.12. If $c \in K$ then $c \in \text{ann}_{R}V/K$. If $c \not\in K$ then $cV \supseteq K$ and hence there exists $I \triangleleft V$ such that $K = cI$. □

We avoid dealing directly with uniserial $V$-modules $U$ such that $x^{b=0}/c_{x}z(0(U))$ is finite but non-zero by using duality.

6.1. $(p, I) \models (r, a, \gamma, \delta)$.

Definition 6.4. Let $r, a, \gamma, \delta \in R$, $p \triangleleft R$ a prime ideal and $I \triangleleft R_{p}$ an ideal. We write $(p, I) \models (r, a, \gamma, \delta)$ if $rR_{p} \supseteq I$, $a \in I$, $\gamma \not\in p$ and $\delta \not\in I^{#}$.

The task of this subsection is to show that given an auxiliary sentence $\Xi$ and $\lambda \in R \backslash \{0\}$, we can compute $(r_{i}, r_{i}a_{i}, \gamma_{i}, \delta_{i})$ for $1 \leq i \leq n$ such that for any prime ideal $p \triangleleft R$ and ideal $I \triangleleft R_{p}$, $R_{p}/\lambda I \models \Xi$ if and only if $(p, I) \models (r_{i}, r_{i}a_{i}, \gamma_{i}, \delta_{i})$ for some $1 \leq i \leq n$. However, in 10.5 we will need the $(r_{i}, r_{i}a_{i}, \gamma_{i}, \delta_{i})$ that we compute to interact well with the duality defined in [23].

Remark 6.5. Let $r, a, \gamma, \delta, \alpha \in R$. For all prime ideals $p \triangleleft R$ and ideals $I \triangleleft R_{p}$, $(p, I) \models (r, a, \gamma, \delta)$ if and only if $(p, I) \models (r, a, \gamma, \alpha, \delta)$ or $(p, I) \models (r, a, \gamma, (\alpha - 1), \delta(\alpha - 1))$.

Proof. This is true because for all prime ideals $p \triangleleft R$, either $\alpha \notin p$ or $\alpha - 1 \notin p$. □

Lemma 6.6. Let $R$ be a Prüfer domain and $b, c, d \in R$ with $b \not\in 0$. Let $p \triangleleft R$ be a prime ideal and $I \triangleleft R_{p}$ be an ideal.

1. Then $|xb = 0/c_{x}z(R_{p}/I)| = 1$ if and only if $b \notin I^{#}$, $c \notin p$, $bcR_{p} \supseteq I$ or $1 \in I$.

2. Then $|d|x = 0(R_{p}/I)| = 1$ if and only if $d \in I$.

Proof. (1) For any ideal $I \triangleleft R_{p}$, $|xb = 0/c_{x}z(R_{p}/I)| = 1$ if and only if $cR_{p} + I \supseteq (I : b)$. Since $R_{p}$ is a valuation ring, $cR_{p} + I \supseteq (I : b)$ if and only if $I \supseteq (I : b)$ or $cR_{p} \supseteq (I : b)$. So it is enough to note that $I \supseteq (I : b)$ if and only if $b \notin I^{#}$ or $1 \in I$, and, $cR_{p} \supseteq (I : b)$ if and only if $bcR_{p} \supseteq I$ or $c \notin p$. (2) is obvious.

Lemma 6.7. Given $(r, a, \gamma, \delta), (r', a', \gamma', \delta') \in R^{4}$ we can compute $n \in N$ and $(r_{i}, a_{i}, \gamma_{i}, \delta_{i}) \in R^{4}$ for $1 \leq i \leq n$ such that $(p, I) \models (r, a, \gamma, \delta)$ and $(p, I) \models (r', a', \gamma', \delta')$.
if and only if 

\((p, I) \models (r_i, a_i, \gamma_i, \delta_i)\)

for some \(1 \leq i \leq n\), and,

\((p, I) \models (r, a, \delta, \gamma)\) and \((p, I) \models (r', a', \delta', \gamma')\)

if and only if 

\((p, I) \models (r, a_i, \delta_i, \gamma_i)\)

for some \(1 \leq i \leq n\).

**Proof.** Let \(\alpha, u_1, u_2, \beta, v_1, v_2 \in R\) be such that \(\alpha = r'u_1, r'(\alpha - 1) = ru_2, a\beta = a'v_1\) and \(a'(\beta - 1) = av_2\). Then one verifies easily that

\((p, I) \models (r, a, \alpha, \delta)\) and \((p, I) \models (r', a', \alpha', \delta')\)

if and only if \((p, I) \models (r, a', \alpha\beta\gamma', \alpha\beta\delta\delta'), (p, I) \models (r, a, \alpha(\beta - 1)\gamma\gamma', \alpha(\beta - 1)\delta\delta'),\)

\((p, I) \models (r', a', \alpha - 1)\beta\gamma', (\alpha - 1)\beta\delta\delta')\) or \((p, I) \models (r', a, (\alpha - 1)\beta\gamma', (\alpha - 1)(\beta - 1)\delta\delta')\).

\(\square\)

**Lemma 6.8.** Given \((r, a, \gamma, \delta) \in R^4\) and \(\lambda \in R \setminus \{0\}\), we can compute \(n \in \mathbb{N}\) and \((r_j, a_j, \gamma_j, \delta_j)\) for \(1 \leq j \leq n\) such that, for all prime ideals \(p \triangleleft R\) and ideals \(I \triangleleft R_p\),

- \((p, \lambda I) \models (r, a, \gamma, \delta)\) if and only if \((p, I) \models (r_j, a_j, \gamma_j, \delta_j)\) for some \(1 \leq j \leq n\) and
- \((p, \lambda I) \models (r, a, \delta, \gamma)\) if and only if \((p, I) \models (r_j, a_j, \delta_j, \gamma_j)\) for some \(1 \leq j \leq n\).

**Proof.** Let \(u, v, \beta', \gamma' \in R\) be such that \(ru = r'u, r'(\alpha - 1) = ru\gamma\beta\gamma'\) and \(\lambda(\beta - 1) = av\gamma\beta\gamma'.\) By \[6.5\], \((p, \lambda I) \models (r, a, \gamma, \delta)\) if and only if \((p, \lambda I) \models (r, a, \gamma, \delta)\) if and only if \((p, I) \models (r, a, \gamma, \delta, \alpha\beta\gamma', \alpha\beta\delta\delta'), (p, I) \models (r, a, \alpha(\beta - 1)\gamma\gamma', \alpha(\beta - 1)\delta\delta'),\)

\((p, I) \models (r', a', \alpha - 1)\beta\gamma', (\alpha - 1)(\beta - 1)\delta\delta')\) or \((p, I) \models (r', a, (\alpha - 1)(\beta - 1)\gamma\gamma', (\alpha - 1)(\beta - 1)\delta\delta').\) \(\square\)

**Lemma 6.9.** Given \((r, a, \gamma, \delta) \in R^4\), we can compute \(n \in \mathbb{N}\) and \((r_j, a_j, \gamma_j, \delta_j)\) for \(1 \leq j \leq n\) such that for all prime ideals \(p \triangleleft R\) and ideals \(I \triangleleft R_p\),

- \((p, I) \models (r, a, \gamma, \delta)\) if and only if \((p, I) \models (r_j, a_j, \gamma_j, \delta_j)\) for some \(1 \leq j \leq n\) and
- \((p, I) \models (r, a, \delta, \gamma)\) if and only if \((p, I) \models (r_j, a_j, \delta_j, \gamma_j)\) for some \(1 \leq j \leq n\).

**Proof.** If \(a = 0\) then \((r, a, \gamma, \delta) = (r, 0, \gamma, \delta)\) is already of the required form. So suppose \(a \neq 0\).

Let \(\alpha, u, v \in R\) be such that \(\alpha = ru\) and \(r(\alpha - 1) = uv\). By \[6.5\] \((p, I) \models (r, a, \gamma, \delta)\) if and only if \((p, I) \models (r', a', \gamma', \delta')\) if and only if \((p, I) \models (r, a, \gamma, \delta)\) if and only if \((p, I) \models (r, a, \gamma, \delta, \alpha\beta\gamma', \alpha\beta\delta\delta'),\)

\((p, I) \models (r, a, \alpha(\beta - 1)\gamma\gamma', \alpha(\beta - 1)\delta\delta'),\) or \((p, I) \models (r, a, (\alpha - 1)(\beta - 1)\gamma\gamma', (\alpha - 1)(\beta - 1)\delta\delta').\) Now, since \(a \neq 0\), \(av \triangleleft R\) and \(a \in I\) if and only if \(v \notin p, aR_p \triangleleft I\) and \(a \in I\). So \((p, I) \models (av, a, \gamma(\alpha - 1), \delta(\alpha - 1))\) if and only if \((p, I) \models (a, a, \gamma av, \delta av).\)
Therefore \((p, I) \models (r, a, \gamma, \delta)\) if and only if \((p, I) \models (r, rv, \gamma \alpha, \delta \alpha)\) or \((p, I) \models (a, a, \gamma (\alpha - 1)v, \delta (\alpha - 1)v)\). The same argument shows that \((p, I) \models (r, a, \delta, \gamma)\) if and only if \((p, I) \models (r, rv, \delta \alpha, \gamma \alpha)\) or \((p, I) \models (a, a, \delta (\alpha - 1)v, \gamma (\alpha - 1)v)\).

**Proposition 6.10.** Given an auxiliary sentence \(\Xi\) and \(\lambda \in R \setminus \{0\}\), we can compute \(n \in \mathbb{N}\) and for \(1 \leq j \leq n\), \((r_j, r_j a_j, \gamma_j, \delta_j) \in R^4\) such that, for all prime ideals \(p < R\) and ideals \(I < R_p\),

- \((p, I) \models (r_j, r_j a_j, \gamma_j, \delta_j)\) for some \(1 \leq j \leq n\) if and only if \(R_p/\lambda I \models \Xi\), and
- \((p, I) \models (r_j, r_j a_j, \gamma_j, \delta_j)\) for some \(1 \leq j \leq n\) if and only if \(R_p/\lambda I \models D\Xi\).

**Proof.** Let \(\Xi\) be the sentence

\[
\bigwedge_{i=1}^{l'} |d_i|x_i=0| = 1 \land \bigwedge_{i=1}^{l} |x_i|=0/|c_i| = 1.
\]

Using 2.15 and 6.6, we can compute \(n_i \in \mathbb{N}\) for \(1 \leq i \leq l\) and \(s_{ij}, b_{ij}, g_{ij}, h_{ij} \in R\) for \(1 \leq i \leq l\) and \(1 \leq j \leq n_i\) such that for all prime ideals \(p < R\) and ideals \(I < R_p\),

- \(R_p/I \models \Xi\) if and only if \((p, I) \models \bigwedge_{i=1}^{l} \bigvee_{j=1}^{n_i} (s_{ij}, b_{ij}, g_{ij}, h_{ij})\), and
- \(R_p/I \models D\Xi\) if and only if \((p, I) \models \bigwedge_{i=1}^{l} \bigvee_{j=1}^{n_i} (s_{ij}, b_{ij}, h_{ij}, g_{ij})\).

Therefore, for all prime ideals \(p < R\) and ideals \(I < R_p\),

- \(R_p/I \models \Xi\) if and only if

\[
(p, I) \models \bigvee_{\sigma; \{1, \ldots, l\} \rightarrow \mathbb{N}} \bigwedge_{\sigma(i) \leq n_i} \bigvee_{i=1}^{l} (s_{i \sigma(i)}, b_{i \sigma(i)}, g_{i \sigma(i)}, h_{i \sigma(i)})\]

- \(R_p/I \models D\Xi\) if and only if

\[
(p, I) \models \bigvee_{\sigma; \{1, \ldots, l\} \rightarrow \mathbb{N}} \bigwedge_{\sigma(i) \leq n_i} \bigvee_{i=1}^{l} (s_{i \sigma(i)}, b_{i \sigma(i)}, h_{i \sigma(i)}, g_{i \sigma(i)})\]

We can use 6.7 to replace the conjunction \(\bigwedge_{i=1}^{l} (s_{i \sigma(i)}, b_{i \sigma(i)}, g_{i \sigma(i)}, h_{i \sigma(i)})\) for each \(\sigma\), by a disjunction to produce and \((s'_{\sigma k}, b'_{\sigma k}, g'_{\sigma k}, h'_{\sigma k})\) for \(1 \leq k \leq m_\sigma\) such that

- \(R_p/I \models \Xi\) if and only if \((p, I) \models (s'_{\sigma k}, b'_{\sigma k}, g'_{\sigma k}, h'_{\sigma k})\) for some \(1 \leq k \leq m_\sigma\), and
- \(R_p/I \models D\Xi\) if and only if \((p, I) \models (s'_{\sigma k}, b'_{\sigma k}, g'_{\sigma k}, h'_{\sigma k})\) for some \(1 \leq k \leq m_\sigma\).

Applying 6.8 to each \((s'_{\sigma k}, b'_{\sigma k}, g'_{\sigma k}, h'_{\sigma k})\), we compute \((r_j', a_j', \gamma_j', \delta_j')\) for \(1 \leq j \leq m\) such that

- \(R_p/\lambda I \models \Xi\) if and only if \((p, I) \models (r_j', a_j', \gamma_j', \delta_j')\) for some \(1 \leq j \leq m\), and
- \(R_p/\lambda I \models D\Xi\) if and only if \((p, I) \models (r_j', a_j', \delta_j', \gamma_j')\) for some \(1 \leq j \leq m\).

Finally, applying 6.9 to each \((r_j', a_j', \gamma_j', \delta_j')\), we can compute \((r_i, r_i a_i, \gamma_i, \delta_i)\) for \(1 \leq i \leq n\) such that

- \(R_p/\lambda I \models \Xi\) if and only if \((p, I) \models (r_i, r_i a_i, \gamma_i, \delta_i)\) for some \(1 \leq i \leq n\), and
- \(R_p/\lambda I \models D\Xi\) if and only if \((p, I) \models (r_i, r_i a_i, \delta_i, \gamma_i)\) for some \(1 \leq i \leq n\).
6.2. Simplification of $\psi(R_p/\lambda I)$ and $\psi(I/\lambda R_p)$.

The results of this subsection will be used in sections 7 and 8. In this subsection, we no longer need to worry about stability under duality.

Remark 6.11. Let $a, b \in R$ and $\alpha, u, v \in R$ be such that $\alpha = bu$ and $b(\alpha - 1) = av$.

For prime ideals $p \triangleleft R$ and ideals $I \triangleleft R_p$,

- $a \in bI$ if and only if $(p,I) = (1, u, \alpha, 1)$ or $(p,I) = (1, 1, v(\alpha - 1), 1)$, and,
- $d \nmid bI$ if and only if $(p,I) = (u, 0, \alpha, 1)$ or $(p,I) = (1, 0, \alpha - 1, 1)$.

Lemma 6.12. Let $R$ be a recursive Prüfer domain and $\lambda \in R\setminus\{0\}$.

(a) Given $d \in R$, we can compute finite sets $S_1, S_2, S_3 \subseteq R^d$, $\rho : \bigcup_{i=1}^{3} S_i \to \{1, 2, 3\}$ and $s : \bigcup_{i=1}^{3} S_i \to R$ such that for all $q \in \bigcup_{i=1}^{3} S_i$, $q \in S_{\rho(q)}$, and, for all prime ideals $p \triangleleft R$ and ideals $I \triangleleft R_p$, there exists $q \in \bigcup_{i=1}^{3} S_i$ such that $(p,I) \models q$, and

$$|d|x=0(R_p/\lambda I)| := \begin{cases} |R_p/(s(q)I)|, & \text{if } (p,I) \models q \text{ and } \rho(q) = 1; \\ |s(q)R_p/I|, & \text{if } (p,I) \models q \text{ and } \rho(q) = 2; \\ 1, & \text{if } (p,I) \models q \text{ and } \rho(q) = 3. \end{cases}$$

Furthermore, if $(p,I) \models q$ for some $q \in \bigcup_{i=1}^{3} S_i$ and $\rho(q) = 2$ then $s(q)R_p \supseteq I$.

(b) Given $b, c \in R$, we can compute finite sets $S_1, \ldots, S_5 \subseteq R^4$, $\rho : \bigcup_{i=1}^{5} S_i \to \{1, 2, 3, 4, 5\}$ and $s : \bigcup_{i=1}^{5} S_i \to R$ such that for all $q \in \bigcup_{i=1}^{5} S_i$, $q \in S_{\rho(q)}$, and, for all prime ideals $p \triangleleft R$ and ideals $I \triangleleft R_p$, there exists $q \in \bigcup_{i=1}^{5} S_i$ such that $(p,I) \models q$, and

$$|xb=0/c|x(R_p/\lambda I)| := \begin{cases} |R_p/\lambda I|, & \text{if } (p,I) \models q \text{ and } \rho(q) = 1; \\ |R_p/cR_p|, & \text{if } (p,I) \models q \text{ and } \rho(q) = 2; \\ |I/bI|, & \text{if } (p,I) \models q \text{ and } \rho(q) = 3; \\ |I/s(q)R_p|, & \text{if } (p,I) \models q \text{ and } \rho(q) = 4; \\ 1, & \text{if } (p,I) \models q \text{ and } \rho(q) = 5. \end{cases}$$

Furthermore, if $(p,I) \models q$ for some $q \in \bigcup_{i=1}^{5} S_i$ and $\rho(q) = 5$ then $s(q) \in I$.

Moreover, if $b = 0$ then we may assume that $S_3 = S_4 = S_5 = \emptyset$.

Proof. (a) If $d = 0$ then $d|x=x=0(N) = 0$ for all $R$-modules $N$. So set $S_1 = S_2 = \emptyset$ and $S_3 := \{(1,0,1,1)\}$.

Suppose $d \neq 0$. Let $\alpha, u, v \in R$ be such that $d\alpha = \lambda u$ and $\lambda(\alpha - 1) = dv$.

- If $(p,I) \models q_1 := (1,0,\alpha - 1,1)$ then $|d|x=x=0(R_p/\lambda I)| = |dR_p/dvI| = |R_p/vI|$.

- If $(p,I) \models q_2 := (u,0,\alpha,1)$ then by definition $uR_p \supseteq I$, and,

$$|d|x=x=0(R_p/\lambda I)| = |\lambda uR_p/\lambda I| = |uR_p/I|.$$
First suppose \( b = 0 \). If \( c \in \lambda I \) then \(|x^{b=0/c|x}(R_p/\lambda I)| = |R_p/\lambda I|\), and, if \( cR_p \supseteq \lambda I \) then \(|x^{b=0/c|x}(R_p/\lambda I)| = |R_p/cR_p|\). We can use (6.11) to compute finite sets \( S_1, S_2 \subseteq R^4 \) such that for all prime ideals \( p < R \) and ideals \( I < R_p \), there exists \( q \in S_1 \) such that \( (p, I) \models q \) if and only if \( c \in \lambda I \), and, there exists \( q \in S_2 \) such that \( (p, I) \models q \) if and only if \( cR_p \supseteq \lambda I \). Set \( S_3 = S_4 = S_5 = \emptyset \).

Now suppose \( b \neq 0 \). If \( bR_p \supseteq \lambda I \) then

\[
\frac{(|\lambda I : b) + cR_p}{cR_p + b\lambda I} = \frac{|\lambda I + bcR_p|}{bcR_p + b\lambda I}.
\]

So

\[
|x^{b=0/c|x}(R_p/\lambda I)| := \begin{cases}
|R_p/\lambda I|, & \text{if } b, c \in \lambda I; \\
|R_p/cR_p|, & \text{if } b \in \lambda I \text{ and } cR_p \supseteq \lambda I; \\
|I/b\lambda|, & \text{if } bR_p \supseteq \lambda I \text{ and } c \in \lambda I; \\
1, & \text{if } bcR_p \supseteq \lambda I; \\
|\lambda I/bcR_p|, & \text{if } bR_p \supseteq \lambda I, cR_p \supseteq \lambda I \text{ and } bc \in \lambda I.
\end{cases}
\]

Therefore it is enough to compute:

- \( S_1 \) such that \( b, c \in \lambda I \) if and only if there exists \( q \in S_1 \) such that \((p, I) \models q\).
- \( S_2 \) such that \( b \in \lambda I \) and \( cR_p \supseteq \lambda I \) if and only if there exists \( q \in S_2 \) such that \((p, I) \models q\).
- \( S_3 \) such that \( bR_p \supseteq \lambda I \) and \( c \in \lambda I \) if and only if there exists \( q \in S_3 \) such that \((p, I) \models q\).
- \( S_4 \) such that \( bcR_p \supseteq \lambda I \) if and only if there exists \( q \in S_4 \) such that \((p, I) \models q\).
- \( S_5 \) and for each \( q \in S_5 \), \( s_q \in R \) such that \( bR_p \supseteq \lambda I, cR_p \supseteq \lambda I \) and \( bc \in \lambda I \) if and only if there exists \( q \in S_5 \) such that \((p, I) \models q\) and such that, in this situation \(|x^{b=0/c|x}(R_p/\lambda I)| = |I/s_qR_p|\).

It is easy to compute \( S_1, \ldots, S_4 \) using (6.11) and (6.7).

Let \( e, r, s \) be such that \( bce = 0 \) and \( \lambda(e - 1) = bcr \). By (6.11) \( bce \in \lambda I \) if and only if \((p, I) \models (1, s, e, 1) \) or \((p, I) \models (1, 1, r(e - 1), 1) \). If \( bR_p \supseteq \lambda I, cR_p \supseteq \lambda I \) and \((p, I) \models (1, s, e, 1) \) then

\[
|x^{b=0/c|x}(R_p/\lambda I)| = |\lambda I/bcR_p| = |I/sR_p|.
\]

Use (6.11) and (6.7) to compute \( S_5 \) such that \((p, I) \models q\) for some \( q \in S_5 \) if and only if \( bR_p \supseteq \lambda I, cR_p \supseteq \lambda I \) and \((p, I) \models (1, s, e, 1) \).

If \((p, I) \models (1, 1, r(e - 1), 1) \) then \( I = R_p \) and

\[
|x^{b=0/c|x}(R_p/\lambda I)| = |\lambda I/bcR_p| = |I/1R_p|.
\]

Let \( S_6 := \{(1, 1, r(e - 1), 1)\} \) and let \( S_6 := S_5 \cup S_6 \). Set \( s(q) := s \) if \( q \in S_6 \) and \( s(q) := 1 \) otherwise. Note that in both cases, by definition, \( s(q) \in I \).

**Proposition 6.13.** Let \( R \) be a recursive Prüfer domain, \( \lambda \in R \setminus \{0\} \) and \( Z \) a finite subset of \( pp \)-pairs of the form \( x^{b=0/c|x} \) and \( d|x=0 \). Let

\[
T_Z := \{\mu : Z \to \{1, \ldots, 5\} \mid \text{ for all } d|x=0 \in Z \mu(d|x=0) \leq 3\}.
\]

We can compute \( S_Z \) a finite subset of \( R^4 \), \( \rho_Z : S_Z \to T_Z \) and \( s_Z : S_Z \times Z \to R \) such that for all prime ideals \( p < R \) and ideals \( I < R_p \),

(a) there exists \( q \in S_Z \) such that \((p, I) \models q\),

(b) \((1)\) if \( \rho_Z(q)(d|x=0) = 1 \) then \( d|x=0(R_p/\lambda I) = |R_p/s_Z(q, d|x=0)0|I| \),

\((2)\) if \( \rho_Z(q)(d|x=0) = 2 \) then \( d|x=0(R_p/\lambda I) = |s_Z(q, d|x=0)0R_p/I| \).
Lemma 6.14. \( \rho \in S \) if \( \rho \in S \) and \( \rho \in S \) are as in the statement. We construct \( S' \), \( \rho \)'s, and \( S' \) for \( Z' = Z \cup \{x/\psi\} \).

Suppose that \( \psi/\psi \) is either of the form \( d_{x-x=0} \) or \( d_{x-x=0} \) and \( \psi/\psi \not\in Z \). Let \( S_1, \ldots, S_5, s : \bigcup_{i=1}^5 S_i \rightarrow R \) and \( p : \bigcup_{i=1}^5 S_i \rightarrow \{1, \ldots, 5\} \) as in 6.12 (1) or (2), as appropriate (if \( \psi/\psi \) is of the form \( d_{x-x=0} \) then set \( S_5 = S_5 = \emptyset \)). By 6.7, for each \( q \in S_2 \) and \( p \in S_1 \) we can compute a finite set \( S_{q,p,i} \subseteq R^4 \) such that for all prime ideals \( p \triangleleft R \) and ideals \( I \triangleleft R_p \), if \( p, I \models \psi \) and \( \rho \models \psi \) then \( s_{\rho}(q, x-b=0/\psi) \subseteq I \). Moreover, if \( b = 0 \) then we may assume \( s_{\rho}(q, x-b=0/\psi) \subseteq \{1, 2\} \) for all \( q \in S_2 \).

Proof. We prove the proposition iteratively. Let \( \lambda \in R \setminus \{0\} \) and \( Z \) be a finite set of pp-pairs of the form \( \psi \) or \( d_{x-x=0} \). If \( |Z| = 1 \) then 6.12 gives the required result. Suppose that \( S_2, \rho \) and \( s \) are as in the statement. We construct \( S_2' \), \( \rho \)'s, and \( s \) for \( Z' = Z \cup \{x/\psi\} \).

For all prime ideals \( p \triangleleft R \) and ideals \( I \triangleleft R_p \), by assumption, there exists \( q \in S_2 \) such that \( p, I \models \psi \) and, by 6.12, there exists \( 1 \leq i \leq 5 \) such that \( p, I \models \psi \) for some \( q' \in S_i \). Therefore, \( p, I \models \psi \) for some \( q'' \in S_{q,i} \). (So (a) holds for \( Z_2' \).

Define \( \rho_2' : S_2' \rightarrow T_2' \) by setting

\[
\rho_2'(q')(\sigma/\tau) := \begin{cases} \min \{\rho_2(q)(\sigma/\tau) : q' \in S_q\}, & \text{if } \sigma/\tau \in Z; \\ \min \{1 \leq i \leq 5 : q' \in S_{p,i} \text{ for some } q \in S_2\}, & \text{if } \sigma/\tau \not\in \psi \}. 
\end{cases}
\]

For \( \psi/\psi \in Z \), set \( s_{\rho}(q', \sigma/\tau) \) to be \( s_q(q', \sigma/\tau) \) for some \( q \in S_2 \) where \( q' \in S_q \) and \( \rho_2'(q')(\sigma/\tau) = \rho_2(q)(\sigma/\tau) \). For \( q' \in S_{q,\psi} \), set \( s_{\rho}(q', \sigma/\psi) \) to be \( s_{\rho}(p, \sigma/\psi) \) for some \( p \in S_j \) where \( j = \rho_2(q')(\psi/\psi) \) and \( q' \in S_{q,p,j} \).

Now, for \( \psi/\psi \in Z \), properties (b) or (c), as appropriate, are inherited from those properties holding for \( \rho_2 \) and \( s \) for \( \psi/\psi \) properties (b) or (c), as appropriate, are inherited from \( \rho \) and \( s \).

Lemma 6.14. Let \( R \) be a recursive Prüfer domain and \( \lambda \in R \setminus \{0\} \).

(a) Given \( b, c \in R \), we can compute finite sets \( S_1, \ldots, S_6 \subseteq R^4 \), \( \rho : \bigcup_{i=1}^6 S_i \rightarrow \{1, \ldots, 6\} \) and \( s : \bigcup_{i=1}^6 S_i \rightarrow R \) such that for all \( q \in \bigcup_{i=1}^6 S_i \), \( q \in S_{\rho}(q) \), for all prime ideals \( p \triangleleft R \) and ideals \( I \triangleleft R_p \) with \( \lambda \in I \), there exists \( q \in \bigcup_{i=1}^6 S_i \) such that \( p, I \models q \) and,

\[
|x-b=0/\psi(I/\lambda R_p)| := \begin{cases} |I/\lambda R_p|, & \text{if } (p, I) \models q \text{ and } \rho(q) = 1; \\ |I/I/\psi|, & \text{if } (p, I) \models q \text{ and } \rho(q) = 2; \\ |R_p/bR_p|, & \text{if } (p, I) \models q \text{ and } \rho(q) = 3; \\ 1, & \text{if } (p, I) \models q \text{ and } \rho(q) = 4; \\ |s(q)R_p/I|, & \text{if } (p, I) \models q \text{ and } \rho(q) = 5; \\ |R_p/s(q)|, & \text{if } (p, I) \models q \text{ and } \rho(q) = 6. 
\end{cases}
\]

Furthermore, if \( \rho(q) = 5 \) and \( (p, I) \models q \) then \( s(q)R_p \supseteq I \).
(b) Given \( d \in R \), we can compute finite sets \( S_1, S_2 \subseteq R^4 \), \( \rho : \bigcup_{i=1}^{2} S_i \rightarrow \{1, 2\} \) and \( s : \bigcup_{i=1}^{2} S_i \rightarrow R \) such that for all \( q \in \bigcup_{i=1}^{2} S_i \), \( q \in S_{\rho(q)} \), for all prime ideals \( p \triangleleft R \) and ideals \( I \triangleleft R_p \) with \( \lambda \in I \), there exists \( q \in \bigcup_{i=1}^{2} S_i \) such that \( (p, I) \models q \), and,

\[
|d^2/|s=0(I/\lambda R_p)| := \begin{cases} 
|I/s(q)R_p|, & \text{if } (p, I) \models q \text{ and } \rho(q) = 1; \\
0, & \text{if } (p, I) \models q \text{ and } \rho(q) = 2.
\end{cases}
\]

Furthermore, if \( \rho(q) = 1 \) and \( (p, I) \models q \) then \( s(q) \in I \).

Proof. (a) Let \( \alpha, r, s \in R \) be such that \( \lambda \alpha = bcr \) and \( bc(\alpha - 1) = \lambda s \).

Claim: If \( \lambda \in I \) then

\[
|x^b=0/c|z(I/\lambda R_p)| := \begin{cases} 
|I/\lambda R_p|, & \text{if } (1) bI \subseteq \lambda R_p \text{ and } cI \subseteq \lambda R_p; \\
|I/cI|, & \text{if } (2) bI \subseteq \lambda R_p \text{ and } \lambda \in cI; \\
|R_p/bR_p|, & \text{if } (3) b \notin cI \text{ and } \lambda \subseteq \lambda R_p; \\
r, & \text{if } (4) \lambda \in bI, \lambda \in cI, r \in I \text{ and } \alpha \notin p; \\
r|R_p/I|, & \text{if } (5) \lambda \in bI, \lambda \in cI, r R_p \supseteq I \text{ and } \alpha \notin p; \\
r|I/sR_p|, & \text{if } (6) \lambda \in bI, \lambda \in cI \text{ and } \alpha - 1 \notin p.
\end{cases}
\]

Note that

\[
|x^b=0/c|z(I/\lambda R_p)| = \frac{|(\lambda R_p : b) \cap I + cI|}{cI + \lambda R_p}.
\]

For all \( a \in R, a \in \operatorname{ann}_R I/\lambda R_p \) if and only if \( aI \subseteq \lambda R_p \). Therefore the equalities for conditions (1) and (2) hold. If \( \lambda \in bI \subseteq bR_p \), then \( b \neq 0 \) since \( \lambda 
eq 0 \) and \( (\lambda R_p : b) \cap I/\lambda R_p \cong R_p/bR_p \). So the equality for condition (3) holds.

When proving the equalities for (4), (5) and (6), we may assume \( b \neq 0 \) and \( c \neq 0 \) since \( \lambda 
eq 0 \), \( \lambda \in cI \) and \( \lambda \in bI \). Moreover,

\[
|x^b=0/c|z(I/\lambda R_p)| = \frac{|(\lambda R_p : b) \cap I + cI|}{cI + \lambda R_p}.
\]

If \( \alpha \notin p \) and \( r \in I \) then \( \lambda \in bcI \). So the equality for condition (4) holds.

Suppose condition (5) holds. Then \( \alpha \notin p \) implies \( \lambda R_p = bcr R_p \). Since \( r R_p \supseteq I \),

\[
|x^b=0/c|z(R_p/\lambda I)| = \frac{|R_p/I|}{cI + \lambda R_p}.
\]

So the equality for condition (5) holds.

Suppose condition (6) holds. Then \( \alpha - 1 \notin p \), \( bcI = \lambda sI \). So \( \lambda R_p + bcI/bcI \cong R_p/sI \). So the equality for condition (6) holds. So we have proved the claim.

Given a finite set of conditions of the form \( \beta \notin p, a \in \lambda I \text{ or } a R_p \cong \lambda I \), using 6.7 and 6.11 we can compute a finite set \( S \subseteq R^4 \) such that \( (p, I) \) satisfies these conditions if and only if \( (p, I) \models q \) for some \( q \in S \). So for each conditions (i) for \( 1 \leq i \leq 6 \) in the claim, we can compute \( S_i \subseteq R^4 \) such that \( (p, I) \) satisfies (i) and \( \lambda \in I \) if and only if there exists \( q \in S_i \) with \( (p, I) \models q \). Moreover, it is easy to see that, for all prime ideals \( p \triangleleft R \) and ideals \( I \triangleleft R_p \), there exists \( 1 \leq i \leq 6 \) such that \( (p, I) \) satisfies (i). Let \( \rho : \bigcup_{i=1}^{6} S_i \rightarrow \{1, \ldots, 6\} \) be such that \( q \in S_{\rho(q)} \). Finally, set \( s(q) = 1 \) if \( \rho(q) \leq 4 \), \( s(q) = r \) if \( \rho(q) = 5 \) and \( s(q) = s \) if \( \rho(q) = 6 \).

(b) The case \( d = 0 \) is done as in 6.12. Suppose \( d \neq 0 \). Let \( \alpha, r, s \in R \) be such that \( d \alpha = \lambda r \) and \( \lambda(\alpha - 1) = ds \). If either \( \alpha \notin p \) or, \( \alpha - 1 \notin p \) and \( s R_p \supseteq I \) then \( d I \subseteq \lambda R_p \). If \( \alpha - 1 \notin p \) and \( s \in I \) then \( ds R_p = \lambda R_p \subseteq dI \). Since \( d \neq 0 \),

\[
dI/ds R_p \cong I/sR_p.
\]

Therefore

\[
|d^2/x=0(I/\lambda R_p)| = \left| \frac{dI + \lambda R_p}{\lambda R_p} \right| = \begin{cases} 
1, & \text{if } (p, I) \models (1, 0, \alpha, 1); \\
1, & \text{if } (p, I) \models (s, 0, \alpha - 1, 1); \\
|1/s R_p|, & \text{if } (p, I) \models (1, s, \alpha - 1, 1).
\end{cases}
\]

It is now clear how to define, \( S_1, S_2, \rho \) and \( s \).
Proposition 6.15. Let \( R \) be a recursive Prüfer domain, \( \lambda \in R \setminus \{0\} \) and \( Z \) a finite subset of \( \mu(p) \)-pairs of the form \( x^b = 0/\lambda x \) and \( d/z = 0 \). Let
\[
T_2 := \{ \mu : Z \to \{1, \ldots, 6\} \mid \mu(d/z = 0) \leq 2 \}.
\]
We can compute \( S_Z \) a finite subset of \( R^4 \), \( \rho_z : S_Z \to T_2 \) and \( s_z : S_Z \times Z \to R \) such that, for all prime ideals \( p < R \) and ideals \( I < R_p \) with \( \lambda \in I \), if \( (p, I) \models q \) for some \( q \in S_Z \) then \( \lambda \in I \), and, if \( \lambda \in I \) then

(a) there exists \( q \in S_Z \) such that \( (p, I) \models q \),
(b) \((1) \) if \( \rho_z(q)(d/z = 0) = 1 \) then \( \mu(d/z = 0) = |I/s_Z(q, d/z = 0)R_m| \)
(c) \((2) \) if \( \rho_z(q)(d/z = 0) = 2 \) then \( \mu(d/z = 0) = |I/\lambda R_p| \)
\(\begin{align*}
(1) & \text{ if } \rho_z(q)(x^b = 0/\lambda x) = 1 \text{ then } x^b = 0/\lambda x (I/\lambda R_p) = |I/\lambda R_p| \\
(2) & \text{ if } \rho_z(q)(x^b = 0/\lambda x) = 2 \text{ then } x^b = 0/\lambda x (I/\lambda R_p) = |I/\lambda R_p| \\
(3) & \text{ if } \rho_z(q)(x^b = 0/\lambda x) = 3 \text{ then } x^b = 0/\lambda x (I/\lambda R_p) = |R_p/bR_p| \\
(4) & \text{ if } \rho_z(q)(x^b = 0/\lambda x) = 4 \text{ then } x^b = 0/\lambda x (I/\lambda R_p) = 1 \\
(5) & \text{ if } \rho_z(q)(x^b = 0/\lambda x) = 5 \text{ then } x^b = 0/\lambda x (I/\lambda R_p) = |s_Z(q, x^b = 0/\lambda x) R_p/| \\
(6) & \text{ if } \rho_z(q)(x^b = 0/\lambda x) = 6 \text{ then } x^b = 0/\lambda x (I/\lambda R_p) = |R_p/s_Z(q, x^b = 0/\lambda x)|
\end{align*}\)

Furthermore, for all prime ideals \( p < R \) and ideals \( I < R_p \), if \( \rho_z(q)(d/z = 0) = 1 \) and \( \rho_z(q)(x^b = 0/\lambda x) = 2 \) then \( s_Z(q, d/z = 0) \subseteq I \) and, if \( \rho_z(q)(x^b = 0/\lambda x) = 3 \) and \( \rho_z(q)(x^b = 0/\lambda x) = 1 \)

\(\begin{align*}
\text{Proof. This can be proved similarly to } 6.10 \text{ and } 6.11 \text{ by replacing } 6.12 \text{ by } 6.13 \text{. The extra condition that } (p, I) \models q \text{ for some } q \in S_Z \text{ implies } \lambda \in I \text{ can be incorporated using } 6.7 \text{, since } (p, I) \models (1, \lambda, 1, 1) \text{ if and only if } \lambda \in I. \quad \square
\end{align*}\)

7. Finite modules

In this section we investigate the consequences of \( EPP(R) \) being recursive, and of \( \mu(p) \) and the radical relation being recursive. In particular, we show that for a recursive Prüfer domain the theory of \( R \)-modules of size \( n \) is decidable uniformly in \( n \) if and only if \( EPP(R) \) is recursive.

Observe that finite modules over a Prüfer domain \( R \) are finite direct sums of modules of the form \( R_p/I \) where \( p < R \) is a prime ideal and \( I < R_p \) is an ideal. There are many ways of seeing this. If \( M \) is finite then \( M \) is pure-injective. So, by 2.2 and 2.10 there exist prime ideals \( p_i < R \) and uniserial \( R_{p_i} \)-modules \( U_i \) such that \( M \) is elementary equivalent, and hence isomorphic, to \( \bigoplus_{i=1}^n U_i \). The desired result now follows from 2.12.

Let \( W \) be the set of tuples \((f, g, \pi, \gamma)\) where

(i) \( f : X \to \mathbb{N} \) where \( X := X_0 \cup \{\ast\}, X_0 \) is a finite subset of \( R \) and \( \ast \notin R \),
(ii) \( g : Y \to \mathbb{N} \) where \( Y \) is a finite subset of \( R \),
(iii) \( \pi := (a_1, \ldots, a_m) \) is a finite tuple of elements of \( R \) and \( \gamma \in R \).

Let \( V \) be the set of \((f, g, \pi, \gamma) \in W \) such that, for some \( h \in \mathbb{N} \) and for \( 1 \leq i \leq h \), there exist a prime ideal \( p_i \) and an ideal \( I_i < R_{p_i} \), such that \( a_j \in I_i \) for \( 1 \leq j \leq m \) and \( 1 \leq i \leq h, \gamma \notin p_i \),

\[
\begin{align*}
|\bigoplus_{i=1}^h R_{p_i}/I_i| &= f(\ast), \\
|\bigoplus_{i=1}^h R_{p_i}/eR_{p_i}| &= f(e) \quad \text{for } e \in X_0 \\
\end{align*}
\]

and

\[
|\bigoplus_{i=1}^h R_{p_i}/eR_{p_i}| \geq g(e) \quad \text{for } e \in Y.
\]
We write $(p, I)_1 \leq s \models (f, g, \pi, \gamma)$. By convention, $\emptyset \models (f, g, \pi, \gamma)$ if $f(e) = 1$ for all $e \in X$ and $g(e) = 1$ for all $e \in Y$ and in this situation, $(f, g, \pi, \gamma) \in V$.

As in \[4.2\] $\mathbb{W}$ will denote bounded distributive lattice generated by $W$ and $\mathbb{V}$ will denote the (prime) filter in $\mathbb{W}$ generated by $V$.

Let $W_0$ be the subset of elements of the form $(f, \emptyset, \pi, \gamma)$ with $|X_0| \leq 1$ and let $W_1$ be the subset of elements of the form $(f, \emptyset, \pi, \gamma)$ where, in both cases, $\emptyset$ denotes the function from the empty set to $N$. Let $\mathbb{W}_0$, respectively $\mathbb{W}_1$, denote the lattice generated by $W_0 \cup \{\top, \bot\}$ in $\mathbb{W}$, respectively the lattice generated by $W_1 \cup \{\top, \bot\}$ in $\mathbb{W}$.

**Lemma 7.1.** Let $R$ be a recursive Prüfer domain. There is an algorithm which given $w \in W_1$ returns $u \in \mathbb{W}_0$, such that $w \in \mathbb{V}$ if and only if $u \in \mathbb{V}$.

**Proof.** Define $\text{clx}(f, \emptyset, \pi, \gamma) := (|X_0|, \prod_{e \in X_0} f(e))$ and order $\mathbb{N}_0 \times \mathbb{N}$ lexicographically. For any $w \in W_1$ with $|X_0| > 1$, we show how to compute $u \in \mathbb{W}_1$, such that $\text{clx}_w < \text{clx}_w$ and $w \in \mathbb{V}$ if and only if $u \in \mathbb{V}$. Since the lexicographic order on $\mathbb{N}_0 \times \mathbb{N}$ is artinian, this is sufficient to prove the lemma.

Take $e_1, e_2 \in X_0$ unequal. Let $\alpha, \gamma, \gamma, s \in R$ be such that $e_1 \alpha = e_2 \gamma$ and $e_2 (\alpha - 1) = e_1 s$. Let $\Omega$ be the set of pairs of functions $(f_1, f_2)$ such that $f_1 : X \cup \{r\} \to N$, $f_2 : X \cup \{s\} \to N$ and

1. $f_1(e) f_2(e) = f(e)$ for all $e \in X$,
2. $f_1(e_1) = f_1(e_2) f(r)$, and
3. $f_2(e_2) = f_2(e_1) f(s)$.

Let $y$ be

\[
\bigsqcup_{(f_1, e_1) \in \Omega} (f_1|_{(X \cup \{r\}) \setminus \{e_1\}}, \emptyset, \pi, \gamma \alpha) \cap (f_2|_{(X \cup \{s\}) \setminus \{e_2\}}, \emptyset, \pi, \gamma (\alpha - 1))
\]

Claim: $w \in \mathbb{V}$ if and only if $y \in \mathbb{V}$

For all prime ideals $p < R$, $\alpha \notin p$ implies $e_1 R_p = e_1 \alpha R_p = e_2 r R_p$ and $\alpha - 1 \notin p$ implies $e_2 R_p = e_2 (\alpha - 1) R_p = e_1 s R_p$. So, $\alpha \notin p$ implies

\[
|R_p/e_1 R_p| = |R_p/e_2 R_p| \cdot |R_p/r R_p|
\]

and $\alpha - 1 \notin p$ implies

\[
|R_p/e_2 R_p| = |R_p/e_1 R_p| \cdot |R_p/s R_p|.
\]

Suppose that $p_i < R$ is a prime ideal and $I_i < R_{p_i}$ is an ideal for $1 \leq i \leq h$ such that $(p_i, I_i)_1 \leq s \models (f, \emptyset, \pi, \gamma)$. By reordering, we may assume that $\alpha \notin p_i$ for $1 \leq i \leq h'$ and $\alpha - 1 \notin p_i$ for $h' + 1 \leq i \leq h$. Let $f_1(\ast) := \bigoplus_{i=1}^{h'} R_{p_i}/I_i$ and $f_2(\ast) := \bigoplus_{i=h'+1}^{h} R_{p_i}/I_i$. For each $e \in X_0 \cup \{r\}$, let $f_1(e) = \bigoplus_{i=1}^{h'} R_{p_i/e R_{p_i}}$ and
for each $e \in X_0 \cup \{s\}$, let $f_2(e) = |\oplus_{i=h'+1}^{h''} R_{p_i}/eR_{p_i}|$. It follows from the first paragraph of the proof of this claim that $(f_1, f_2) \in \Omega$.

If $f_1(e_2) \neq 1$ then

$$(p_i, I_i)_{1 \leq i \leq h'} \models (f_1|_{X \cup \{r\}}\setminus \{e_1\}, \emptyset, \alpha)$$

and if $f_2(e_1) \neq 1$ then

$$(p_i, I_i)_{h'+1 \leq i \leq h} \models (f_2|_{X \cup \{r\}}\setminus \{e_2\}, \emptyset, \alpha(\alpha - 1)).$$

By definition, if $f_1(e_2) = 1$, then $e_2 \notin p_i$ for $1 \leq i \leq h'$ and if $f_2(e_1) = 1$ then $e_1 \notin p_i$ for $h'+1 \leq i \leq h$.

So if $f_1(e_2) = 1$ then

$$(p_i, I_i)_{1 \leq i \leq h'} \models (f_1|_{X \setminus \{e_2\}}, \emptyset, \alpha, e_2\gamma)$$

and if $f_2(e_1) = 1$ then

$$(p_i, I_i)_{h'+1 \leq i \leq h} \models (f_2|_{X \setminus \{e_1\}}, \emptyset, e_1\gamma(\alpha - 1)).$$

So we have shown that if $w \in V$ then one of the components of the join defining $\underline{u}$ is in $V$ and hence $\underline{u} \in V$.

Conversely, take $(f_1, f_2) \in \Omega$. Suppose $f_1(e_2) \neq 1$ and

$$(p_i, I_i)_{1 \leq i \leq h'} \models (f_1|_{X \cup \{r\}}\setminus \{e_1\}, \emptyset, \alpha)$$

Since $\alpha \notin p_i$ for $1 \leq i \leq h'$,

$$\left|\left(\oplus_{i=1}^{h'} R_{p_i}/e_1 R_{p_i}\right)\right| = \left|\left(\oplus_{i=1}^{h'} R_{p_i}/e_2 R_{p_i}\right)\right| \cdot \left|\left(\oplus_{i=1}^{h'} R_{p_i}/e R_{p_i}\right)\right| = f_1(e_2) \cdot f_1(r) = f_1(e_1)$$

by definition of $\Omega$. So $(p_i, I_i)_{1 \leq i \leq h'} \models (f_1, \emptyset, \alpha, \gamma)$.

Suppose that $f_2(e_1) = 1$ and

$$(p_i, I_i)_{1 \leq i \leq h''} \models (f_2|_{X \setminus \{e_1\}}, \emptyset, e_1\gamma(\alpha - 1)).$$

Then

$$(p_i, J_i)_{1 \leq i \leq h''} \models (f_2, \emptyset, \gamma)$$

because $e_1 \notin q_i$ for $1 \leq i \leq h''$ implies

$$\left|\left(\oplus_{i=1}^{h''} R_{q_i}/e_1 R_{q_i}\right)\right| = 1 = f_1(e_1).$$

So, setting $p_i := q_i-h'$ and $I_i := I_i-h'$ for $h'+1 \leq i \leq h'' + h' = h$,

$$(p_i, I_i)_{1 \leq i \leq h} \models (f, \emptyset, \gamma)$$

because $f_1(e_2) f_2(e) = f(e)$ for all $e \in X$. We leave the case $f_1(e_2) \neq 1$ and $f_2(e_1) \neq 1$, the case $f_1(e_2) = 1$ and $f_2(e_1) \neq 1$ and the case $f_1(e_2) = f_2(e_2) = 1$ to the reader.

**Claim:** $\text{cl}xu < \text{cl}xw$

We show that each of the components, $u'$, of the lattice combination defining $\underline{u}$ have $\text{cl}xu' < \text{cl}xw$. We only consider the components involving $f_1$; the result for those involving $f_2$ follows similarly.

If $f_1(e_2) = 1$ then $\text{cl}x(f_1|_{X \setminus \{e_2\}}, \emptyset, e_2\gamma\alpha) < \text{cl}xw$ since $|X_0| > |X_0\setminus\{e_2\}|$. If $f_1(e_2) > 1$ then

$$\frac{f_1(r)}{f(e_1)} = \frac{f_1(e_2) f_1(r)}{f_1(e_2) f(e_1)} = \frac{f_1(e_1)}{f_1(e_2) f(e_1)} < 1$$

since $f_1(e_1)/f(e_1) \leq 1$. So

$$f_1(r) \cdot \prod_{x \in X_0 \setminus \{e_1\}} f_1(x) \leq f_1(r) \cdot \prod_{x \in X_0 \setminus \{e_1\}} f(x) = \frac{f_1(r)}{f(e_1)} \cdot \prod_{x \in X_0 \setminus \{e_1\}} f(x) < \prod_{x \in X_0} f(x).$$
Therefore \(\text{clx}(f_1|_{X \cup \{r\}}) \setminus \{e_1\}, \emptyset, \pi, \gamma) < \text{clx}(w).\)

**Lemma 7.2.** Let \(R\) be a recursive Prüfer domain. If \(\text{EPP}(R)\) is recursive then there is an algorithm which given \(w \in W_1\) answers whether \(w \in V\) or not.

**Proof.** Let \(w = (f, \emptyset, \pi, \gamma)\) and suppose that \(X_0 = \{e\}\) i.e. \(w \in W_0\). Let \(P\) be the set of prime divisors of \(f(e) \cdot f(e)\). If \(P\) is empty then \(f(e) = 1\) and \(w \in V\). Otherwise, for each \(p \in P\), let \(n_p \in \mathbb{N}_0\) and \(m_p \in \mathbb{N}_0\) be such that \(f(e) = \prod_{p \in P} p^{n_p}\) and \(f(e) = \prod_{p \in P} p^{m_p}\). For any prime ideal \(p < R\), \(e \in R\) and ideal \(I < R_p\), if \(|R_p/eR_p|\) (respectively \(|R_p/I|\)) is finite then it is a power of \(|R/p|\). Thus a prime power. Hence \(w \in V\) if and only if \((p, n_p; \pi; \gamma; e, m_p) \in \text{EPP}_*(R)\) for all \(p \in P\).

If \(w \in W_1\) then by [7.1] we can compute \(w \in W_0\) such that \(w \in V\) if and only if \(\bar{w} \in \mathbb{V}\). Therefore, by the previous paragraph there is an algorithm which, given \(w \in W_1\) answers whether \(w \in V\) or not.

**Corollary 7.3.** Let \(R\) be a recursive Prüfer domain with \(\text{EPP}(R)\) recursive. There is an algorithm which given \(r, a, \gamma, \delta \in R\), \(n \in \mathbb{N}, e_j \in R\) for \(1 \leq j \leq n, N \in \mathbb{N}\) and \(N_j \in \mathbb{N}\) for \(1 \leq j \leq n\), answers whether there exist \(h \in N_0\), prime ideals \(p_i < R\) and ideals \(I_i < R_p\) for \(1 \leq i \leq h\) such that

\[
\begin{align*}
(1) & \quad (p_i, I_i) \models (r, a, \gamma, \delta) \text{ for } 1 \leq i \leq h, \\
(2) & \quad \oplus_{i=1}^{h} R/p_i/I_i = N, \text{ and} \\
(3) & \quad \oplus_{i=1}^{n_j} R/p_i/e_j R_p = N_j \text{ for } 1 \leq j \leq n.
\end{align*}
\]

**Proof.** Applying [6.9] we may reduce to the case where \(a = ra'\). We may also assume \(r \neq 0\) since \((p, I) \models (0, b', \gamma, \delta)\) implies \(I = 0\) and hence \(|R_p/I| = |R_p|\) which is infinite.

For any prime ideal \(p < R\) and ideal \(I < R_p\), \((p, I) \models (r, ra', \gamma, \delta)\) if and only if there exists \(J < R_p\) such that \(I = rJ\) and \((p, J) \models (1, a', \gamma, \delta)\). Note that, because \(R\) is a domain, \(|R_p/rJ| = |R_p|/|R_p/rR_p|\).

Therefore, there exist \(h \in N_0\), prime ideals \(p_i < R\) and ideals \(I_i < R_p\) for \(1 \leq i \leq h\) satisfying (1), (2) and (3) if and only if there exist \(N', N'' \in \mathbb{N}\) with \(N' \cdot N'' = N\), \(h \in N_0\), prime ideals \(p_i < R\) and ideals \(J_i < R_p\) for \(1 \leq i \leq h\) such that

\[
\begin{align*}
(\text{a}) & \quad (p_i, J_i) \models (1, a', \gamma, \delta) \text{ for } 1 \leq i \leq h, \\
(\text{b}) & \quad \oplus_{i=1}^{h} R/p_i/J_i = N', \text{ and} \\
(\text{c}) & \quad \oplus_{i=1}^{h} R/p_i/e_j R_p = N'' \text{ for } 1 \leq j \leq n.
\end{align*}
\]

By [7.2] there is an algorithm which answers whether there exist \(h \in N_0\), prime ideals \(p_i < R\) and ideals \(J_i < R_p\) for \(1 \leq i \leq h\) satisfying (a),(b) and (c).

**Proposition 7.4.** Let \(R\) be a recursive Prüfer domain such that \(\text{EPP}(R)\) and the radical relation are recursive. There is an algorithm which, given \((f, g, \pi, \gamma) \in W\), answers whether there exist \(h \in N_0\), prime ideals \(p_i \subset R\) and ideals \(I_i < R_p\) for \(1 \leq i \leq h\) such that \((p_i, I_i)_{1 \leq i \leq h} \models (f, g, \pi, \gamma).

**Proof.** Suppose \((f, g, \pi, \gamma) \in W\).

**Case** \(Y = \emptyset\): This is [7.2].

**Case** \(|Y| = 1\): Suppose that \(X_0 := \{e_1, \ldots, e_n\}\) and \(Y := \{e\}\).

If \(\gamma \bigcap_{j=1}^{n} e_j \notin \text{rad}R\) then there exists a prime ideal \(p\) such that \(e_j \notin p\) for \(1 \leq j \leq n\), \(\gamma \notin p\) and \(e \in p\). Then \(|R_p/e_j R_p| = 1\) for \(1 \leq j \leq n\) and \(|R_p/eR_p| > 1\).

So \((p_i, I_i)_{i=1}^{h} \models (f, \emptyset, \pi, \gamma)\) if and only if \((p_i, I_i)_{i=1}^{h+g(e)} \models (f, g, \pi, \gamma)\) where \(p_i := p\).
and $I_i := R_{p_i}$ for $h < i \leq g(e)$. So $(f, g, \bar{\alpha}, \gamma) \in V$ if and only if $(f, \emptyset, \bar{\alpha}, \gamma) \in V$. So we are now in the situation of case $Y = \emptyset$.

If $\gamma \prod_{j=1}^{n} e_j \in r a d R$ then there exist $l \in \mathbb{N}$ and $r \in R$ such that $(\gamma \prod_{j=1}^{n} e_j)^l = er$. Thus, for all prime ideals $p$ with $\gamma \notin p$, $|R_p/eR_p| \leq \prod_{j=1}^{n} |R_p/e_j R_p|^l$. Therefore $(p, f, g, \bar{\alpha}, \gamma)$ if and only if there exists $f' : X \cup \{e\} \to \mathbb{N}$ such that $f'(x) = f(x)$ for all $x \in X$ and $g(e) \leq f'(e) \leq \prod_{j=1}^{n} f(e_j)^l$ and $(p, I) = (f', \emptyset, \bar{\alpha}, \gamma)$. Since the set of $f'$ is finite and computable, we are now in the situation of case $Y = \emptyset$.

Case $|Y| \geq 2$: We show how to reduce to the situation where $|Y| \leq 1$. By 4.3 we may assume that $g$ is a constant function. Take $e_1, e_2 \in Y$ non-equal. Let $\alpha, r, s \in R$ be such that $e_1 \alpha = e_2 r$ and $e_2 (\alpha - 1) = e_1 s$. Since for all prime ideals $p \triangleleft R$, either $\alpha \notin p$ or $\alpha - 1 \notin p$, by 4.3 $(f, g, \bar{\alpha}, \gamma) \in V$ if and only if

$$\bigcup_{(f_1, f_2, g_1, g_2) \in \Omega_{f,g}} (f_1, g_1, \bar{\alpha}, \alpha \gamma) \cap (f_2, g_2, \bar{\alpha}, (\alpha - 1) \gamma) \in \mathbb{V}.$$

Note that if $g$ is constant then $g_1$ and $g_2$ are constant for all $(f_1, f_2, g_1, g_2) \in \Omega_{f,g}$.

For each $(f_1, f_2, g_1, g_2) \in \Omega_{f,g}$, either $|Y_1| < |Y|$ or $e_1, e_2 \in Y_1$. In the first case we are done. In the second, $(f_1, g_1, \bar{\alpha}, \alpha \gamma) \in V$ if and only if $(f_1, g_1|_{Y_1 \setminus \{e_1\}}, \bar{\alpha}, \alpha \gamma) \in V$. This is because, for all prime ideals $p$ with $\alpha \notin p$, $|R_p/e_1 R_p| \geq |R_p/e_2 R_p|$ and hence if $|R_p/e_2 R_p| \geq g_1(e_2)$ then $|R_p/e_1 R_p| \geq g_1(e_2) = g_1(e_1)$. So we may replace $(f_1, g_1, \bar{\alpha}, \alpha \gamma)$ by $(f_1, g_1|_{Y_1 \setminus \{e_1\}}, \bar{\alpha}, \alpha \gamma)$. A similar argument shows that either $|Y_2| < |Y|$ or we can replace $(f_2, g_2, \bar{\alpha}, (\alpha - 1) \gamma)$ by $(f_2, g_2|_{Y_1 \setminus \{e_1\}}, \bar{\alpha}, (\alpha - 1) \gamma)$.

Corollary 7.5. Let $R$ be a recursive Prüfer domain with the radical relation and EPP$(R)$ recursive. There is an algorithm which given $r, a, \alpha, \beta, \delta \in R$, $n, n' \in \mathbb{N}$, $e_j \in R$ for $1 \leq j \leq n$, $a_j' \in R$ for $1 \leq j \leq n'$, $N \in \mathbb{N}$, $N_j \in \mathbb{N}$ for $1 \leq j \leq n' \prime$, answers whether there exist $h \in \mathbb{N}_0$, prime ideals $p_i \triangleleft R$, and ideals $I_i \triangleleft R_{p_i}$ for $1 \leq i \leq h$ such that

(1) $(p_i, I_i) = (r, a, \alpha, \beta, \delta)$ for $1 \leq i \leq h$,
(2) $\oplus_{i=1}^{h} R_{p_i}/I_i = N$,
(3) $\oplus_{i=1}^{h} R_{p_i}/e_j R_{p_i} = N_j$ for $1 \leq j \leq n'$, and
(4) $\oplus_{i=1}^{h} R_{p_i}/e_j R_{p_i} = N_j'$ for $1 \leq j \leq n'$.

Proof. The proof is as in [7.3] but we use [7.4] in place of [7.2].

Theorem 7.6. Let $R$ be a recursive Prüfer domain. The theory of $R$-modules of size $n$ is decidable uniformly in $n$ if and only if EPP$(R)$ is recursive.

Proof. The forward direction is [3.19].

Standard arguments using the Baur-Monk theorem and the fact that $T_R$ is recursively axiomatisable imply that the theory of $R$-modules of size $n$ is decidable uniformly in $n$ if and only if there is an algorithm which, given $N \in \mathbb{N}$, pairs of pp-1-formulae $\varphi_i/\psi_i$ and $A_i \in \mathbb{N}$ for $1 \leq i \leq m$, answers whether there exists $M \in \text{Mod-}R$ such that satisfying

$$(*) \quad |x = x/0| = N \land \bigwedge_{i=1}^{m} |\varphi_i/\psi_i| = A_i.$$

Unfortunately, we can’t directly apply the statement of [GLT19, 4.1] to reduce to the case that the pp-pairs $\varphi_i/\psi_i$ are of the form $d|x/0 = 0$ or $x = 0/\psi_i$. However,
the proof of [GLT19 4.1] can be easily modified to allow us to do this. Roughly speaking, starting with a sentence $\chi$ of the form

\[
\bigwedge_{i=1}^l |\varphi_i/\psi_i| = A_i \land \bigwedge_{i=t+1}^m |\varphi_i/\psi_i| \geq A_i
\]

where $A_i \in \mathbb{N}$ and $\varphi_i/\psi_i$ is an arbitrary pp-pair for $1 \leq i \leq m$, each step of the proof of [GLT19 4.1] produces a finite set $S$ of finite tuples of sentences $(\chi_1, \ldots, \chi_k)$ as in (1), but with the form of the pp-pairs involved progressively improved, such that the $R$-module $\psi_1$ satisfying $\chi$ if and only there exist $(\chi_1, \ldots, \chi_k) \in S$ and $R$-modules $M_i \in \text{Mod-R}$ with $M_i \models \chi_i$ for $1 \leq i \leq k$. In order to adapt the proof to our situation, the reader just needs to note that, for each of the steps of the proof of [GLT19 4.1], if the initial sentence $\chi$ is as in (1), then the sentences $\chi_i$ in the finite tuples $(\chi_1, \ldots, \chi_k) \in S$ are of the same form as in (1).

Let $N \in \mathbb{N}$, $Z$ be a finite set of pp-pairs of the form $d|x/x=0$ and $x=b/\langle c|x$, and $f : Z \to \mathbb{N}$. Let $\chi$ be the sentence

\[
|x=x/x=0| = N \land \bigwedge_{\varphi/\psi \in Z} |\varphi/\psi| = f(\varphi/\psi).
\]

Recall that every finite module over a Prüfer domain is isomorphic to a direct sum of modules of the form $R_p/I$ for some prime ideal $p < R$ and ideal $I < R_p$.

Let $S_Z, \rho_Z$ and $s_Z$ be as in [13] with $\lambda := 1$. Enumerate $S_Z := \{q_1, \ldots, q_m\}$ and let $q_i := (r_i, r_ia_i, \gamma_i, \delta_i)$. By definition, for all prime ideals $p < R$ and ideals $I < R_p$ there exists $1 \leq i \leq m$ such that $(p, I) \models q_i$. Therefore, there exists $M \in \text{Mod-R}$ satisfying $\chi$ if and only if there exist $N_i \in \mathbb{N}$ and $f_i : Z \to \mathbb{N}$ for $1 \leq i \leq m$ such that $N = \prod_{i=1}^m N_i$, for all $\varphi/\psi \in Z$, $f(\varphi/\psi) = \prod_{i=1}^m f_i(\varphi/\psi)$ and there exist $h_i \in \mathbb{N}_0$, prime ideals $p_{ij} < R$ and ideals $I_{ij} < R_{p_{ij}}$ for $1 \leq j \leq h_i$ such that

(a) $(p_{ij}, I_{ij}) \models q_i$ for $1 \leq j \leq h_i$ and

(b) $h_j \prod_{j=1}^h R_{p_{ij}}/I_{ij} \models |x=x/x=0| = N_i \land \bigwedge_{\varphi/\psi \in Z} |\varphi/\psi| = f_i(\varphi/\psi).

Fix $1 \leq i \leq m$, $N_i \in \mathbb{N}$ and $f_i$ as above. If $r_i \neq 0$ and $(p, I) \models (r_i, r_ia_i, \gamma_i, \delta_i)$ then $R_p/I = R_p$, which is not finite. Hence, (a) and (b) holds if and only if $h_i = 0$, $N_i = 1$ and $f_i(\varphi/\psi) = 1$ for all $\varphi/\psi \in Z$. So, we may assume that $r_i \neq 0$. Note, by (1) if $R_p/I$ is finite then $I^\# = p$. So, $(p, I) \models (r_i, r_ia_i, \gamma_i, \delta_i)$ if and only if $I = r_iJ$ for some $J < R_p$, $a \in J$, $\gamma \notin p$ and $\delta \notin p$.

Therefore $h_i \in \mathbb{N}_0$, $p_{ij} < R$ and $I_{ij} < R_{p_{ij}}$ for $1 \leq j \leq h_i$ satisfy (a) and (b) if and only if for each $1 \leq j \leq h_i$, there exists $I_{ij} < R_{p_{ij}}$ such that $I_{ij} = r_iJ_{ij}$, $a \in J_{ij}$, $\gamma \delta \notin p$, $\bigoplus_{j=1}^{h_i} R_{p_{ij}}/I_{ij} = N_i$, and, for all $d|x/x=0 \in Z$,

(1) if $\rho_Z(q_i)(d|x/x=0) = 1$ then $\bigoplus_{j=1}^{h_i} R_{p_{ij}}/R_{p_{ij}}(d|x/x=0)R_{p_{ij}} = f_i(d|x/x=0) \cdot N_i^{-1}

(2) if $\rho_Z(q_i)(d|x/x=0) = 2$ then $\bigoplus_{j=1}^{h_i} R_{p_{ij}}/R_{p_{ij}}(d|x/x=0)R_{p_{ij}} = f_i(d|x/x=0) \cdot N_i

(3) if $\rho_Z(q_i)(d|x/x=0) = 3$ then $f_i(d|x/x=0) = 1

and for all $x=b/\langle c|x \in Z$,

(1) if $\rho_Z(q_i)(x=b/\langle c|x) = 1$ then $f_i(x=b/c|x) = N_i

(2) if $\rho_Z(q_i)(x=b/\langle c|x) = 2$ then $\bigoplus_{j=1}^{h_i} R_{p_{ij}}/cR_{p_{ij}} = f_i(x=b/\langle c|x)$
(3) if $\rho_Z(q_i)(xb=0/c|x) = 3$ then $\left| \bigoplus_{j=1}^{b_1} I_{ij} / bI_{ij} \right| = f_i(xb=0/c|x)$

(4) if $\rho_Z(q_i)(xb=0/c|x) = 4$ then $f_i(xb=0/c|x) = 1$

(5) if $\rho_Z(q_i)(xb=0/c|x) = 5$ then $\left| \bigoplus_{j=1}^{b_1} R_{p_{ij}} / sZ(q_i)(xb=0/c|x) R_{p_{ij}} \right| = f_i(xb=0/c|x) \cdot N_i$.

Since $R_{p_{ij}} / I_{ij}$ is finite, by 2.16 if $b \neq 0$ then $|I_{ij}/bI_{ij}| = |R_{p_{ij}}/bR_{p_{ij}}|$. By definition, $\rho_Z(xb=0/c|x) = 3$ implies $b \neq 0$. So (3) in the second list of conditions may be replaced by

(3') if $\rho_Z(q_i)(xb=0/c|x) = 3$ then $\left| \bigoplus_{j=1}^{b_1} R_{p_{ij}} / bR_{p_{ij}} \right| = f_i(xb=0/c|x)$.

Finally, the condition that $\bigoplus_{j=1}^{b_1} R_{p_{ij}} / I_{ij} = N_i$ can be replaced by the condition that there exist $N_i' N_i'' \in N$ such that $N_i = N_i' N_i''$, $\bigoplus_{j=1}^{b_1} R_{p_{ij}} / r_i R_{p_{ij}} = N_i'$ and $\bigoplus_{j=1}^{b_1} R_{p_{ij}} / J_{ij} = N_i''$. The proof can now be finished using 7.3. □

8. REMOVING $|d/x=0| = D$ AND $|xb=0/c|x| = G$.

This section uses results from sections 6 and 7. For $d \in R \setminus \{0\}$, respectively $b, c \in R \setminus \{0\}$, we show that there is an algorithm answering whether there exists a sum of modules $\bigoplus_{i=1}^{b_1} R_{p_i}/dI_i$, respectively $\bigoplus_{i=1}^{b_1} I_i/bcR_{p_i}$, satisfying a sentence as in 5.1 under the assumption that one of the conjuncts is $|d/x=0| = D$, respectively $|xb=0/c|x| = G$. These results will be used in section 10 to eliminate expressions of the form $|d/x=0| = D$ and $|xb=0/c|x| = G$, where $D, G \geq 2$.

**Proposition 8.1.** Let $R$ be a recursive Prüfer domain such that EPP($R$) and the radical relation are recursive. There exists an algorithm which, given a sentence $\chi$ of the form

$$
|d/x=0| = D \land \bigwedge_{\varphi/\psi \in X} |\varphi/\psi| = f(\varphi/\psi) \land \bigwedge_{\varphi/\psi \in Y} |\varphi/\psi| \geq g(\varphi/\psi),
$$

where $d \in R \setminus \{0\}$, $D \in \mathbb{N}$, $f : X \to \mathbb{N}$, $g : Y \to \mathbb{N}$ and $X, Y$ are disjoint finite sets of pp-pairs of the form $xb=0/c|x|$ and $a|x=0$, answers whether there exist $h \in \mathbb{N}_0$, prime ideals $p \not< R$ and ideals $I_i \not< R_p$, for $1 \leq i \leq h$ such that $\bigoplus_{i=1}^{b_1} R_{p_i}/dI_i \models \chi$.

**Proof.** Let $Z := X \cup Y$ and let $S_Z, \rho_Z$ and $s_Z$ be as in 6.13 with $\lambda := d$. Enumerate $S_Z := \{q_1, \ldots, q_m\}$ and let $q_i := (r_i, r_{ai}, \gamma_i, \delta_i)$. By definition, for all prime ideals $p \not< R$ and ideals $I \not< R_p$, there exists $1 \leq i \leq m$ such that $(p, I) \models q_i$.

Therefore, there exist $h \in \mathbb{N}_0$, prime ideals $p_i \not< R$ and ideals $I_i \not< R_{p_i}$, for $1 \leq i \leq h$ such that $\bigoplus_{i=1}^{b_1} R_{p_i}/dI_i \models \chi$ if and only if there exist $D_i \in \mathbb{N}$ for $1 \leq i \leq m$ such that $\prod_{i=1}^{m} D_i = D$, $(\overline{f}, \overline{g}) \in \Omega_{f,g,m}$ and, for $1 \leq i \leq m$, $h_i \in \mathbb{N}_0$, prime ideals $p_{ij} \not< R$ and ideals $I_{ij} \not< R_{p_{ij}}$ such that, for $1 \leq i \leq m$,

(a) $p_{ij}, I_{ij}) \models q_i$ for $1 \leq j \leq h_i$

(b) $\bigoplus_{j=1}^{b_1} R_{p_{ij}}/dI_{ij}$ satisfies

$$
|d/x=0| = D_i \land \bigwedge_{\varphi/\psi \in X_i} |\varphi/\psi| = f_i(\varphi/\psi) \land \bigwedge_{\varphi/\psi \in Y_i} |\varphi/\psi| \geq g_i(\varphi/\psi).
$$

Fix $1 \leq i \leq m$, $D_i \in \mathbb{N}$ and $(\overline{f}, \overline{g}) \in \Omega_{f,g,m}$ as above. Note that

$$
|d/x=0(\bigoplus_{j=1}^{b_1} R_{p_{ij}}/dI_{ij})| = D_i \text{ if and only if } \left| \bigoplus_{j=1}^{b_1} R_{p_{ij}} / I_{ij} \right| = D_i.
$$
So, exactly as in [7.6] we may assume \( r_i \neq 0 \) for 1 \( \leq i \leq m \). Moreover, by [2.14(iv)] \( I_{ij}^\# = p_{ij} \).

Now \( h_i \in \mathbb{N}_0, p_{ij} \triangleleft R \) and \( I_{ij} \triangleleft R_{p_{ij}} \) for 1 \( \leq j \leq h_i \) satisfy (a), if and only if for 1 \( \leq j \leq h_i \), there exists \( J_{ij} \triangleleft R_{p_{ij}} \) such that \( I_{ij} = r_iJ_{ij}, a_i \in J_{ij}, \gamma_i \notin p_{ij} \) and \( \delta_i \notin I_{ij}^\# = I_{ij}^\# = p_{ij} \).

Now \( h_i \in \mathbb{N}_0, p_{ij} \triangleleft R \) and \( I_{ij} \triangleleft R_{p_{ij}} \) with \( I_{ij} := r_iJ_{ij} \) for 1 \( \leq j \leq h_i \) satisfy (b), if and only if there exist \( D_i', D_i'' \in \mathbb{N} \) with \( D_i' D_i'' = D_i \) such that

\[
\begin{align*}
\left| \oplus_{j=1}^{h_i} R_{p_{ij}} / J_{ij} \right| &= D_i' \quad \text{and} \quad \left| \oplus_{j=1}^{h_i} R_{p_{ij}} / r_iR_{p_{ij}} \right| = D_i'',
\end{align*}
\]

for all \( x^b=0/_{c|x} \in X_i \) (respectively \( x^b=0/_{c|x} \in Y_i \)),

1. if \( \rho Z(q_i)(x^b=0/_{c|x}) = 1 \) then \( f_i(x^b=0/_{c|x}) = D_i \) (respectively \( D_i \geq g_i(x^b=0/_{c|x}) \))
2. if \( \rho Z(q_i)(x^b=0/_{c|x}) = 2 \) then \( \left| \oplus_{j=1}^{h_i} R_{p_{ij}} / cR_{p_{ij}} \right| \geq g_i(x^b=0/_{c|x}) \)
3. if \( \rho Z(q_i)(x^b=0/_{c|x}) = 3 \) then \( \left| \oplus_{j=1}^{h_i} R_{p_{ij}} / bR_{p_{ij}} \right| \geq g_i(x^b=0/_{c|x}) \)
4. if \( \rho Z(q_i)(x^b=0/_{c|x}) = 4 \) then \( f_i(x^b=0/_{c|x}) = 1 \) (respectively \( g_i(x^b=0/_{c|x}) = 1 \))
5. if \( \rho Z(q_i)(x^b=0/_{c|x}) = 5 \) then \( \left| \oplus_{j=1}^{h_i} R_{p_{ij}} / sZ(q_i, x^b=0/_{c|x}) R_{p_{ij}} \right| \geq g_i(x^b=0/_{c|x}) \cdot D_i \)

and for all \( a|x/x=0 \in X_i \) (respectively \( a|x/x=0 \in Y_i \)),

1. if \( \rho Z(q_i)(a|x/x=0) = 1 \) then \( \left| \oplus_{j=1}^{h_i} R_{p_{ij}} / sZ(q_i, a|x/x=0) R_{p_{ij}} \right| = f_i(a|x/x=0) \cdot D_i^{-1} \)
2. if \( \rho Z(q_i)(a|x/x=0) = 2 \) then \( \left| \oplus_{j=1}^{h_i} R_{p_{ij}} / sZ(q_i, a|x/x=0) R_{p_{ij}} \right| = g_i(a|x/x=0) \cdot D_i \)

Proposition 8.2. Let \( R \) be a recursive Prüfer domain such that EPP\((R)\) and the radical relation are recursive. There exists an algorithm which, given a sentence \( \chi \) of the form

\[
|\begin{align*}
|x^b=0/_{c|x} &= G \land \bigwedge_{\psi/\varphi \in X} |\varphi/\psi| = f(\varphi/\psi) \land \bigwedge_{\psi/\varphi \in Y} |\varphi/\psi| \geq g(\varphi/\psi),
\end{align*}\]

where \( b, c \in R \setminus \{0\}, G \in \mathbb{N}, f : X \to \mathbb{N}, g : Y \to \mathbb{N} \) and \( X, Y \) are disjoint finite sets of pp-pairs of the form \( x^b=0/_{c|x} \) and \( d|x/x=0 \), answers whether there exist \( h \in \mathbb{N}_0 \), prime ideals \( p_i \triangleleft R \) and ideals \( I \triangleleft R_{p_i} \) with \( b, c \in I_i \) for 1 \( \leq i \leq h \) such that \( \oplus_{i=1}^{h} I_i / bcR_{p_i} \models \chi \).

Proof. The proof, which we leave to the reader, is very similar to [8.1] except we use [6.15] in place of [6.13] and the fact that \( |\begin{align*}
|x^b=0/_{c|x}(I/_{bcR_{p_i}}) &= |R_{p_i}/I| \in place of |d|x/x=0(R_{p_i}/I)| = |R_{p_i}/I|. \)
9. Further syntactic reductions

In this section we continue work of section 5 to improve the form of the conjunction in 5.1. Some of these reductions use results in sections 7 and 8 which only apply to Prüfer domains (i.e. they do not apply to arbitrary arithmetical rings).

Let $W$ be the set of $L_R$-sentences of the form

\[
(\dagger) \quad |d/x=0| \sqcap_1 D \land |x=b=0|c|x| \sqcap_2 E \land \bigwedge_{\varphi/\psi \in X} |\varphi/\psi| = f(\varphi/\psi) \land \bigwedge_{\varphi/\psi \in Y} |\varphi/\psi| \geq g(\varphi/\psi) \land \Xi
\]

where $\sqcap_1, \sqcap_2 \in \{\geq, =, \emptyset\}$, $d, c, b \in R \setminus \{0\}$, $D, E \in \mathbb{N}$, $f : X \to \mathbb{N}$, $g : Y \to \mathbb{N}$, $X, Y$ are finite subsets of pp-pairs of the form $x=b=0|c|x$, and $\Xi$ an auxiliary sentence.

Let $V$ be the set of $w \in W$ such that there exists an $R$-module which satisfies $w$.

**Definition 9.1.** Let $w \in W$ be as in $(\dagger)$. Define

\[
z_1 := \{|x=b=0|/x=0| X \mid f(x=b=0|/x=0) > 1\},
\]

\[
z_2 := \{|x=b=0|/x=0| Y \mid g(x=b=0|/x=0) > 1\},
\]

\[
z_3 := \{|x=x/|c|x| X \mid f(x=x/|c|x) > 1\}, \quad \text{and}
\]

\[
z_4 := \{|x=x/|c|x| Y \mid g(x=x/|c|x) > 1\}.
\]

The short signature is defined to be the tuple $(\sqcap_1, \sqcap_2)$ and the extended signature, $\text{exsig} w$, is defined to be the tuple $((\sqcap_1, \sqcap_2), (z_1, z_2), (z_3, z_4))$.

We equip the set $\{\geq, =, \emptyset\}$ with a total order $\succ$ by putting $\geq \succ = \succ \emptyset$. We partially order the set of short signatures $\{\geq, =, \emptyset\}^2$ by setting $(\sqcap_1, \sqcap_2) \geq (\sqcap_1', \sqcap_2')$ whenever $\sqcap_1 \succeq \sqcap_1'$ and $\sqcap_2 \succeq \sqcap_2'$. Finally, we partially order on the set of extended signatures by setting

\[
((\sqcap_1, \sqcap_2), (z_1, z_2), (z_3, z_4)) \geq ((\sqcap_1', \sqcap_2'), (z_1', z_2'), (z_3', z_4'))
\]

if and only if $(\sqcap_1, \sqcap_2) > (\sqcap_1', \sqcap_2')$ or $(\sqcap_1, \sqcap_2) = (\sqcap_1', \sqcap_2')$ and

- $z_1 + z_2 > z_1' + z_2'$ or $z_1 + z_2 = z_1' + z_2'$ and $z_2 \geq z_2'$, and
- $z_3 + z_4 > z_3' + z_4'$ or $z_3 + z_4 = z_3' + z_4'$ and $z_4 \geq z_4'$.

We now present various algorithms which, given $w \in W$ of a particular form, output $w' \in W$ such that $w \in V$ if and only if $w' \in V$, and $\text{exsig} w < \text{exsig} w'$. By convention, we give both $\top \in W$ and $\bot \in W$ extended signature $((\emptyset, \emptyset), (0, 0), (0, 0))$.

**Remark 9.2.** The order on the set of extended signatures is artinian.

As in 5.1 given $w \in W$, we may always assume that $w$ is of the form

\[
\chi_{f, g} \land \Xi
\]

where $X, Y$ are disjoint finite sets of pp-pairs of the form $d/x=0$ or $x=b=0|c|x$, $f : X \to \mathbb{N}_2$, $g : Y \to \mathbb{N}_2$ and $\Xi$ is an auxiliary sentence.

**Remark 9.3.** If $w \in W$ has extended signature $((\sqcap_1, \sqcap_2), (z_1, z_2), (z_3, z_4))$ then $Dw$ has extended signature $((\sqcap_1, \sqcap_2), (z_3, z_4), (z_1, z_2))$ where $D$ denotes the duality defined in 2.3.

**Remark 9.4.** Let $X, Y$ be disjoint finite subsets of pp-pairs, $f : X \to \mathbb{N}_2$, $g : Y \to \mathbb{N}_2$ and $\Xi$ an auxiliary sentence be such that

\[
\chi_{f, g} \land \Xi = \bigwedge_{\varphi/\psi \in X} |\varphi/\psi| = f(\varphi/\psi) \land \bigwedge_{\varphi/\psi \in Y} |\varphi/\psi| \geq g(\varphi/\psi) \land \Xi \in W.
\]
Then, for each \((f_1, \ldots, f_n, g_1, \ldots, g_n) \in \Omega_{f,g,n}\) and \(1 \leq i \leq n\),

\[
\chi_{f,g_i} \land \Xi = \bigwedge_{\psi \in \chi_{f,g_i}} |\psi/\psi| = f_i(\psi/\psi) \land \bigwedge_{\psi \in \chi_{f,g_i}} |\psi/\psi| \geq g_i(\psi/\psi) \land \Xi \in W,
\]

and, \(\text{exsig} \chi_{f,g} \land \Xi \leq \text{exsig} \chi_{f,g} \land \Xi\). Moreover, for each \((\bar{f}, \bar{g}) \in \Omega_{f,g,n}\) and \(1 \leq i \leq n\), either \(X = X_i\) and \(Y = Y_i\), or, \(\text{exsig} \chi_{f,g} \land \Xi < \chi_{f,g} \land \Xi\).

Proof. Fix \((\bar{f}, \bar{g}) \in \Omega_{f,g,n}\) and \(1 \leq i \leq n\). Let \(((\sqcap^2_1, \sqcap^2_2), (z_1, z_2), (z_3, z_4))\) be the extended signature of \(\chi_{f,g} \land \Xi\) and \(((\sqcap'_1, \sqcap'_2), (z'_1, z'_2), (z'_3, z'_4))\) the extended signature of \(\chi_{f,g} \land \Xi\). Note that since \(X\) and \(Y\) are disjoint, so are \(X_i = X \cup (Y\setminus Y_i)\) and \(Y_i\).

That the short signature of \(\chi_{f,g_i}\) is less than the extended signature of \(\chi_{f,g}\) follows from the fact that \(Y_i \subseteq Y\) and \(X_i = X \cup (Y\setminus Y_i)\).

We show that \(z_1 + z_2 \geq z'_1 + z'_2\) and \(z_2 \geq z'_2\). By definition, \(z_1 + z_2\) is the number of \(x = x/c|x \in X \cup Y\) and \(z_2\) the number of \(x = x/c|x \in Y\). Since \(g_i(x = x/c|x) = \frac{g_i(x = x/c|x)}{g_i(x = x/c|x)} > 1\) for all \(x = x/c|x \in Y_i\), we see that \(z'_2\) is the number of \(x = x/c|x \in Y_i\).

So \(z'_2 \leq z_2\) because \(Y_i \subseteq Y\). Since \(X\) and \(Y\) are disjoint, so are \(X_i = X \cup (Y\setminus Y_i)\) and \(Y_i\). Therefore \(z'_1 + z'_2\) is equal to the number of \(x = x/c|x \in X_i \cup Y_i = X \cup Y\) with \(x = x/c|x \in Y_i\) or \(x = x/c|x \in X_i\) and \(f_i(x = x/c|x) > 1\). Since \(X \cup Y = X_i \cup Y_i\), \(z_1 + z_2 \geq z'_1 + z'_2\). A similar argument shows that \(z_3 + z_4 \geq z'_3 + z'_4\) and \(z_4 \geq z'_4\).

So the extended signature of \(\chi_{f,g}\) is less than the extended signature of \(\chi_{f,g_i}\).

We now prove the moreover. Since \(X, Y\) are disjoint, \(X \neq X_i\) if and only if \(Y \neq Y_i\). Suppose \(X \neq X_i\). Then there exists \(\psi/\psi \in Y \setminus Y_i\). By assumption, \(g(\psi/\psi) > 1\).

If \(\psi/\psi\) is \(d|x/x = 0\) then the short signature of \(\chi_{f,g}\) is \((\geq, \sqcap)\) and the short signature of \(\chi_{f,g_i}\) is \((=, \sqcap')\) or \((\emptyset, \sqcap)\), and, by what we have already proved, \(\sqcap' \leq \sqcap\). So the short signature of \(\chi_{f,g_i}\) is strictly less than the short signature of \(\chi_{f,g}\). The case of \(xb = 0/c|x\) for \(b, c \neq 0\) is similar.

If \(\psi/\psi\) is \(x = x/c|x\) then

\[
|\{x = x/c'|x \in Y_i \mid g_i(x = x/c'|x) > 1\}| < |\{x = x/c'|x \in Y\}|.
\]

So \(\text{exsig} \chi_{f,g_i} < \text{exsig} \chi_{f,g}\). The case of \(\psi/\psi\) equal to \(xb = 0/x = 0\) is similar. \(\square\)

9.1. Reducing the short signature.

**Proposition 9.5.** Let \(R\) be a recursive Prüfer domain with EPP\((R)\) recursive. There is an algorithm which given \(w \in W\) with short signature \((=, \sqcap)\) or \((\emptyset, =)\), for some \(\emptyset \in \{\emptyset, =, \geq\}\), outputs \(w' \in W\) such that \(w \in V\) if and only if \(w' \in V\), and, \(w'\) is a lattice combination of elements \(w' \in W\) such that the short signature of \(w'\) is strictly less than the short signature of \(w\).

Proof. Suppose \(w\) has short signature \((=, \sqcap)\). Then \(w\) is of the form

\[
|d|x/x = 0| = D \land \chi_{f,g} \land \Xi
\]

where \(d \in R \setminus \{0\}\), \(D \in \mathbb{N}_2\), \(f : X \to \mathbb{N}_2\), \(g : Y \to \mathbb{N}_2\), \(X\) and \(Y\) are disjoint finite subsets of \(\{x = x/c'|x, xb' = 0/x = 0 \mid c', b' \in R\} \cup \{xb = 0/c|x\}\) for some \(b, c \in R \setminus \{0\}\), and \(\Xi\) is an auxiliary sentence.

If \(M \models w\) then, by \([2.11]\) and \([6.1]\) there exist \(h \in \mathbb{N}\), prime ideals \(p_i < R\) and ideals \(I_i < R_{p_i}\), for \(1 \leq i \leq h\) and \(M' \in \text{Mod-}R\) such that \(M \equiv M' \oplus \bigoplus_{i=1}^{h} R_{p_i}/dI_i\) and \(|d|x/x = 0(M')| = 1\).
Thus there exists $M \in \text{Mod-}R$ such that $M \models w$ if and only if there exist $(f_1, f_2, g_1, g_2) \in \Omega_{f,g,2}$, $h \in \mathbb{N}$, prime ideals $p_i \triangleleft R$ and $I_i \triangleleft R_{p_i}$ for $1 \leq i \leq h$, such that $\bigoplus_{i=1}^{h}R_{p_i}/dI_i$ satisfies

$$w_{(f_1,f_2,g_1,g_2)} := |d|x/x = 0| = D \land \chi_{f_1,g_1} \land \Xi$$

and $M'$ which satisfies

$$w'_{(f_1,f_2,g_1,g_2)} := |d|x/x = 0| = 1 \land \chi_{f_2,g_2} \land \Xi.$$ 

Let $\Omega \subseteq \Omega_{f,g,2}$ be the set of $(f_1, f_2, g_1, g_2) \in \Omega_{f,g,2}$, such that there exist $h \in \mathbb{N}_0$, prime ideals $p_i \triangleleft R$ and $I_i \triangleleft R_{p_i}$ for $1 \leq i \leq h$, such that $\bigoplus_{i=1}^{h}R_{p_i}/dI_i$ satisfies $w_{(f_1,f_2,g_1,g_2)}$. So $w \in V$ if and only if

$$w := \bigcup_{(f_1,f_2,g_1,g_2) \in \Omega} w'_{(f_1,f_2,g_1,g_2)} \in V.$$ 

By [8.1] given $w$, we can compute $\Omega$, and, so, we can compute $w$. The short signature of each $w'_{(f_1,f_2,g_1,g_2)}$ is $(\emptyset, \Box')$ for some $\Box' \in \{\emptyset, =, \leq\}$ and, by [9.4] $\Box \geq \Box'$. So $(\Box, =) > (\emptyset, \Box')$ as required.

Suppose $w$ has short signature $(\Box, =)$. Then $w$ is

$$|xb = 0/c|x| = E \land \chi_{f,g} \land \Xi$$

where $b, c \in R \setminus \{0\}$, $E \in \mathbb{N}_2$, $f : X \to \mathbb{N}_2$, $g : Y \to \mathbb{N}_2$, $X$ and $Y$ are disjoint finite subsets of $\{x = x/c|x, xb' = 0/x = 0 | c', b' \in R\} \cup \{d|x/x = 0\}$ for some $d \in R \setminus \{0\}$, and $\Xi$ is an auxiliary sentence.

If $M \models w$ then, by [2.11] and [6.2], there exist $M_1, M_2, M' \in \text{Mod-}R$ such that $b \in \text{ann}_R M_1$, $c \in \text{ann}_R M_2$ and $|xb = 0/c|x(M')| = 1$ and there exist $h \in \mathbb{N}_0$, prime ideals $p_i$ and ideals $I_i \triangleleft R_{p_i}$ for $1 \leq i \leq h$ such that $b, c \in I_i$ and

$$\bigoplus_{i=1}^{h} I_i/bcR_{p_i} \cup M_1 \cup M_2 \cup M' \models w.$$ 

Therefore, $w \in V$ if and only if there exist $E_1, E_2, E_4 \in \mathbb{N}$ with $E_1 E_2 E_4 = E$ and $(\overline{f}_1, \overline{g}) \in \Omega_{f,g,4}$ such that

$$w_{1,E_1,f_1,g_1} := |x = x/c|x = E_1 \land \chi_{f_1,g_1} \land \Xi \land |b|x/x = 0| = 1 \in V,$$

$$w_{2,E_2,f_2,g_2} := |xb = 0/x = 0| = E_2 \land \chi_{f_2,g_2} \land \Xi \land |c|x/x = 0| = 1 \in V,$$

$$w_{3,f_3,g_3} := \chi_{f_3,g_3} \land \Xi \land |xb = 0/c|x| = 1 \in V$$

and there exist $h \in \mathbb{N}_0$, prime ideals $p_i$ and ideals $I_i \triangleleft R_{p_i}$ for $1 \leq i \leq h$ such that $b, c \in I_i$ and

$$\bigoplus_{i=1}^{h} I_i/bcR_{p_i} \models |xb = 0/c|x| = E_4 \land \chi_{f_4,g_4} \land \Xi.$$

Let $\mathcal{H}$ be the set of $((E_1, E_2, (\overline{f}_1, \overline{g})) \in \mathbb{N}_2 \times \Omega_{f,g,4}$ such that there exists $E_4$ with $E_1 E_2 E_4 = E$ and there exist $h \in \mathbb{N}_0$, prime ideals $p_i$ and ideals $I_i \triangleleft R_{p_i}$ for $1 \leq i \leq h$ such that $b, c \in I_i$ and

$$\bigoplus_{i=1}^{h} I_i/bcR_{p_i} \models |xb = 0/c|x| = E_4 \land \chi_{f_4,g_4} \land \Xi.$$ 

Then $w \in V$ if and only if

$$w := \bigcup_{(E_1, E_2, (\overline{f}_1, \overline{g})) \in \mathcal{H}} w_{1,E_1,f_1,g_1} \cap w_{2,E_2,f_2,g_2} \cap w_{3,f_3,g_3} \in V.$$ 

By [8.2] given $w$, we can compute $\mathcal{H}$ and so we can compute $w$.

Now if $w$ has short signature $(\Box, =)$ then $w_{1,E_1,f_1,g_1}, w_{2,E_2,f_2,g_2}$ and $w_{3,f_3,g_3}$ have short signature $(\Box', \emptyset)$ and by [9.4] $\Box' \geq \Box$. So $(\Box', \emptyset) < (\Box, =)$, as required. □
Lemma 9.6. Let \( R \) be an arithmetical ring. Let \( c, d \in R \) and \( D \in \mathbb{N} \). For all \( C \in \mathbb{N}_2 \),

\[
T_R \models \left| x^{D-1}d=0/c|x \right| = 1 \land |d|x/x=0| \geq D \land |x=x/c|x| = C
\]

\[
\leftrightarrow \left| x^{D-1}d=0/c|x \right| = 1 \land |x=x/c|x| = C
\]

and

\[
T_R \models \left| c^{D}d|x/x=0| = 1 \land |d|x/x=0| \geq D \land |x=x/c|x| = C
\]

\[
\leftrightarrow \bigvee_{D \leq E \leq C^D} |d|x/x=0| = E \land |x=x/c|x| = C.
\]

Proof. Suppose \( M \models \left| x^{D-1}d=0/c|x \right| = 1 \). Then \( xc^i d = 0 \leq_M c|x \) for \( 0 \leq i \leq D - 1 \).

So, by 5.7 for \( 0 \leq i \leq D - 1 \),

\[
|c^i|d/x^i+1d|x(M)| = |x=x/c|x(M)|.
\]

Hence

\[
|d|x/x=0(M)| = |x=x/c|x(M)|^D |c^{D}d|x/x=0(M)|.
\]

Therefore, if \( C \geq 2 \) then

\[
T_R \models \left| x^{D-1}d=0/c|x \right| = 1 \land |d|x/x=0| \geq D \land |x=x/c|x| = C
\]

\[
\leftrightarrow \left| x^{D-1}d=0/c|x \right| = 1 \land |x=x/c|x| = C.
\]

Now suppose that \( c^{D}d \in \text{ann}_R M \). Then \( c^{D}d|x \) is equivalent to \( x = 0 \) in \( M \).

Therefore, by 5.7

\[
|d|x/c^{D}d|x(M)| = |x=x/c^{D}d|x+xd=0(M)| \leq |x=x/c^{D}d|x(M)| \leq |x=x/c|x|^D.
\]

Hence

\[
T_R \models \left| c^{D}d|x/x = 0| = 1 \land |d|x/x = 0| \geq D \land |x=x/c|x| = C
\]

\[
\leftrightarrow \bigvee_{D \leq E \leq C^D} |d|x/x = 0| = E \land |x=x/c|x| = C. \quad \Box
\]

Proposition 9.7. Let \( R \) be a recursive arithmetical ring. There is an algorithm, which given \( w \in W \) with extended signature \(((\geq,\square), (z_1, z_2), (z_3, z_4))\) with \( z_1 \geq 1 \) or \( z_3 \geq 1 \), returns \( w \in W \) such that \( w \in V \) if and only if \( w \in V \), and, \( \text{exsig } w < \text{exsig } w \).

Proof. Suppose \( w := \chi_{f,g} \land \Xi \in W \), where \( f : X \to \mathbb{N}_2 \), \( g : Y \to \mathbb{N}_2 \), \( X,Y \) are disjoint finite sets of appropriate pp-pairs and \( \Xi \) is an auxiliary sentence, has extended signature \(((\geq,\square), (z_1, z_2), (z_3, z_4))\) with \( z_1 \geq 1 \). Then \( d|x/x=0 \in Y \) for some \( d \in R \setminus \{0\} \) and \( x=x/c|x \in X \) for some \( c \in R \). Let \( D = g(x=x/c|x) \).

Then, by 2.9 \( w \in V \) if and only if

\[
\bigcup \{ \chi_{f_1,g_1} \land |x^{D-1}d=0/c|x| = 1 \land \Xi \} \cap \{ \chi_{f_2,g_2} \land |c^{D}d|x/x=0| = 1 \land \Xi \} \in V.
\]

For each \((\overline{f},\overline{g}) \in \Omega_{f,g,2}\), we define \( w_{\overline{f},\overline{g}}, w'_{\overline{f},\overline{g}} \in W \) such that

\[
\text{exsig } w_{\overline{f},\overline{g}}, \text{exsig } w'_{\overline{f},\overline{g}} < \text{exsig } w,
\]

\( w_{\overline{f},\overline{g}} \in V \) if and only if \( \chi_{f_1,g_1} \land |x^{D-1}d=0/c|x| = 1 \land \Xi \in V \), and,

\( w'_{\overline{f},\overline{g}} \in V \) if and only if \( \chi_{f_2,g_2} \land |c^{D}d|x/x=0| = 1 \land \Xi \in V \).
Once we have done this, the proof is complete since then

\[ w := \bigcup_{(g,k) \in \Omega_{f,g,2}} w_{g,k} \]

has the properties required by the statement.

If \( \text{exsig } \chi_{f,g,1} < \text{exsig } \chi_{f,g} \) then set \( w_{g,k} := \chi_{f,g,1} \land |x^{D-1}d=0/c|x| = 1 \land \Xi \). Otherwise, by \( 9.4 \) \( X = X_1 \) and \( Y = Y_1 \). Further, \( f_1(x^{d'/c}|x|) > 1 \) and, by definition of \( \Omega_{f,g,2}, g_1(d'/x|) = g(d|x|) = D \). Let \( Y'_1 := Y_1 \backslash \{d|x|=0\} \) and \( g'_1 := g_1|Y'_1 \).

Then, by \( 9.6 \)

\[ \chi_{f,g,1} \land |x^{D-1}d=0/c|x| = 1 \land \Xi \in V \]

if and only if

\[ w_{g,k} := \chi_{f,g,1} \land |x^{D-1}d=0/c|x| = 1 \land \Xi \in V. \]

Moreover, \( w_{g,k} \) has short signature \((\emptyset, \Box)\), where, by \( 9.4 \) \( \Box' \leq \Box \). Therefore \( \text{exsig } w_{g,k} \) because \((\emptyset, \Box) < (\emptyset, \Box)\).

If \( \text{exsig } \chi_{f,g,2} < \text{exsig } \chi_{f,g} \) then let \( w_{g,k} := \chi_{f,g,2} \land |c^Dd|x=0| = 1 \land \Xi \). Otherwise, by \( 9.4 \) \( X = X_1 \) and \( Y = Y_1 \). Further, \( f_2(x^{d|x|}) > 1 \) and, by definition of \( \Omega_{f,g,2}, g_2(d'/x|) = D \).

Let \( X'_2 := X_2 \backslash \{x^{d'/c}|x|\} \) and \( Y'_2 := Y_2 \backslash \{d|x|=0\} \). Let \( f'_2 := f_2|X'_2 \), \( g'_2 := g_2|Y'_2 \) and \( C := f_2(x^{d|x|}) \). Then \( \chi_{f,g,2} \land |c^Dd|x=0| = 1 \land \Xi \) is

\[ |d|x|=0| \geq D \land |x^{d|x|}| = C \land \chi_{f,g,2} \land \Xi \land |c^Dd|x=0| = 1. \]

Let

\[ w_{g,k} := \bigcup_{D \leq E \leq CD} |d|x=0| = E \land |x^{d|x|}| = C \land \chi_{f,g,2} \land |c^Dd|x=0| = 1 \land \Xi. \]

By \( 9.6 \) \( w_{g,k} \in \mathbb{V} \) if and only if \( \chi_{f,g,2} \land |c^Dd|x=0| = 1 \land \Xi \in V \). The short signature of each component of the join defining \( w_{g,k} \) is \((=, \Box)\), where, by \( 9.4 \) \( \Box' \leq \Box \). Therefore \( \text{exsig } w_{g,k} \) because \((=, \Box') < (\geq, \Box)\).

Suppose \( w \in W \) has extended signature \((\geq, \Box), (z_1, z_2), (z_3, z_4) \) with \( z_3 \geq 1 \). Then \( Dw \) has extended signature \((\geq, \Box), (z_3, z_4), (z_1, z_2) \). By the previous case, we can compute \( w \), a lattice combination of elements of \( W \) with extended signatures strictly less than \( Dw \) such that \( Dw \in V \) if and only if \( w \in V \). Now \( w \in V \) if and only if \( Dw \in V \) and \( \text{exsig } Dw < \text{exsig } w \).

\[ \square \]

**Lemma 9.8.** Let \( R \) be a Prüfer domain. Let \( a, b, c \in R \) and \( E, C \in \mathbb{N}_2 \). Suppose that \( r, s, a \in R \) are such that \( ca = ar \) and \( a(\alpha - 1) = cs \). Define

(1) \( \Sigma_1 \) to be the formula \( |x|^{s-a}_{a-1}|x| = 1 \)
(2) \( \Sigma_2 \) to be the formula \( |x|^{s-a}_{a-1}|x| = 1 \land |a|^{s-a}_{a-1}|x| = 1 \)
(3) \( \Sigma_3 \) to be the formula \( |x|^{s-a}_{a-1}|x| = 1 \land |x=0/a|x| = 1 \land |r|^{s-a}_{a-1}|x| = 1 \)
(4) \( \Sigma_4 \) to be the formula \( |x|^{s-a}_{a-1}|x| = 1 \land |x=0/a|x| = 1 \land |x=0/r|x| = 1 \land |x=0/c|x| = 1 \).

Then for all \( M \in \text{Mod-}R \) there exist \( M_1, \ldots, M_4 \in \text{Mod-}R \) such that \( M_i = \Sigma_i \) for \( 1 \leq i \leq 4 \) and \( M = M_1 \oplus \cdots \oplus M_4 \).

(i) If \( i \in \{1, 4\} \) and \( C < E \) then

\[ T_R := \neg(\Sigma_i \land |x|=a|x| = C \land |x=0/c|x| \geq E), \]
and if $i \in \{1, 4\}$ and $E \leq C$ then

$$T_R \models \Sigma_1 \land |x=x/a|x| = C \land |xb=0/c|x| \geq E \leftrightarrow \bigvee_{E \leq E' \leq C} \Sigma_1 \land |x=x/a|x| = C \land |xb=0/c|x| = E'. $$

(ii) In $T_R$ the following equivalence holds.

$$\Sigma_2 \land |x=x/a|x| = C \land |xb=0/c|x| \geq E \leftrightarrow \Sigma_2 \land |x=x/a|x| = C \land |xb=0/x| \geq E$$

(iii) In $T_R$ the following equivalence holds.

$$\Sigma_3 \land |x=x/a|x| = C \land |xb=0/c|x| \geq E \leftrightarrow \Sigma_3 \land |x=x/a|x| = C \land |xb=0/r|x| \geq \lceil E/C \rceil$$

Proof. The first claim follows from 2.9

(i) Suppose $M \models \Sigma_1$. Then

$$|x = x/a|x(M)| = |x = x/cs|x(M)| \geq |xb = 0/c|x(M)|.$$ 

Suppose $M \models \Sigma_4$. Then

$$|r|/x/ar|x(M)| = |x = x/xr = 0 + a|x(M)| = |x = x/a|x(M)|$$

because $|xr = 0/a|x(M)| = 1$ and hence $xr = 0 \leq_M a|x$. So

$$|xb = 0/c|x(M)| = |xb = 0/0r|x(M)| \leq |r|x/ar|x(M)| = |x = x/a|x(M)|.$$ 

The first equality holds because $|x = x/a|x(M)| = 1$ and the inequality holds because $|xb = 0/r|x| = 1$ and hence $xb = 0 \leq_M r|x$. Therefore, if $M \models \Sigma_i$ for $i \in \{1, 4\}$ then

$$|xb = 0/c|x(M)| \leq |x = x/a|x(M)|.$$ 

The first claim follows from this.

(ii) Suppose $M \models \Sigma_2$. Then $c|x$ is equivalent to $ar|x$ in $M$ and $ar|x$ is equivalent to $x = 0$ in $M$. So $|xb = 0/c|x(M)| = |xb = 0/x = 0(M)|$.

(iii) Suppose $M \models \Sigma_3$. Then

$$|xb = 0/c|x(M)| = |xb = 0/ar|x(M)| = |xb = 0/r|x(M)| \cdot |r|x/ar|x(M)|.$$ 

Since $|xr = 0/a|x(M)| = 1$, by 5.7, $|r|x/ar|x(M)| = |x = x/a|x(M)|$. The claim now follows.

Proposition 9.9. Let $R$ be a recursive Prüfer domain. There is algorithm which given $w \in W$ with extended signature $((\Box, \geq), (z_1, z_2), (z_3, z_4))$ with $z_1 \geq 1$ or $z_3 \geq 1$ outputs $w \in W$ such that $w \in V$ if and only if $w \in V$ and $\text{exsig } w < \text{exsig } w$.

Proof. For $w \in W$ as in [1], define $\text{deg } w = E$. Given $w \in W$ with extended signature $((\Box, \geq), (z_1, z_2), (z_3, z_4))$ with $z_1 \geq 1$, we will show how to compute $w \in W$, a lattice combination of $w' \in W$, such that for each $w'$, either $\text{exsig } w' < \text{exsig } w$ or $\text{exsig } w' = \text{exsig } w$ and $\text{deg } w' < \text{deg } w$, and, such that $w \in V$ if and only if $w \in V$. Since $\text{deg}$ takes values in $\mathbb{N}$, by iterating this process we will eventually compute $w \in W$ such that $\text{exsig } w < \text{exsig } w$.

Suppose $w := \chi_{f,g} \land \Xi \in W$, where $f : X \to \mathbb{N}_2, g : Y \to \mathbb{N}_2, X, Y$ are disjoint finite sets of appropriate pp-pairs and $\Xi$ is an auxiliary sentence, has extended signature $((\Box, \geq), (z_1, z_2), (z_3, z_4))$ with $z_1 \geq 1$. Since $w$ has extended signature $((\Box, \geq), (z_1, z_2), (z_3, z_4))$ with $z_1 \geq 1$, there exist $x=x/a|x \in X$ and $xb=0/c|x \in Y$. 

Let $\Sigma_1, \Sigma_2, \Sigma_3, \Sigma_4$ be as in 9.8 Then $w \in V$ if and only if

$$\bigcup_{(f, g) \in \Omega_{f, g, 4}} \bigcap_{i=1}^{4} \chi_{f_i, g_i} \land \Xi \land \Sigma_i \in V.$$  

We show that for each $(f, g) \in \Omega_{f, g, 4}$, either the extended signature of $\chi_{f_i, g_i} \land \Xi$ is strictly less than the extended signature of $\chi_{f, g} \land \Xi$ or we will show that we can compute $\overline{w_i(\overline{(f, g)})} \in \overline{W}$ such that $\overline{w_i(\overline{(f, g)})}$ is a lattice combination of $w' \in W$ with either $\text{exsig } w' < \text{exsig } w$, or, $\text{exsig } w' \leq \text{exsig } w$ and $\deg w' < w$.

Fix $(f, g) \in \Omega_{f, g, 4}$ and $1 \leq i \leq 4$. By 9.4 $\text{exsig } \chi_{f_i, g_i} \land \Xi < \text{exsig } \chi_{f, g} \land \Xi$ unless $X_i = Y$ and $Y_i = Y$. Moreover, if $f_i(x = x/a|x) = 1$ then $\text{exsig } \chi_{f_i, g_i} \land \Xi < \text{exsig } \chi_{f, g} \land \Xi$. So we may assume $X_i = X$, $Y_i = Y$ and $f_i(x = x/a|x) > 1$.

Let $X' := X \setminus \{x = x/a|x\}$, $Y' := Y \setminus \{x = x/a|x\}$, $f_i' := f_i|_{X'}$, $g_i' := g_i|_{Y'}$, $C := f_i(x = x/a|x)$ and $E := g_i(x = x/a|x) = \sum(x = b/\ell|x)$. Then $\chi_{f_i, g_i} \land \Xi$ is

$$|x = x/a|x| = C \land |x = b/\ell|x| \geq E \land \chi_{f_i', g_i'} \land \Xi \in V.$$  

**Case $i = 1$ or $i = 4$:** If $f_1(x = x/a|x) < g_1(x = b/\ell|x)$ then, by 9.8

$$T_R \models \neg(\chi_{f_1, g_1} \land \Xi \land \Sigma_i).$$

So set $w_i(\overline{(f, g)}) := \bot$.

Suppose $f_1(x = x/a|x) \geq g_1(x = b/\ell|x)$. Then, by 9.8

$$|x = x/a|x| = C \land |x = b/\ell|x| \geq E \land \chi_{f_1', g_1'} \land \Xi \in V.$$  

if and only

$$w_i(\overline{(f, g)}) := \bigcup_{E \leq E' \leq C} |x = x/a|x| = C \land |x = b/\ell|x| = E' \land \chi_{f_1', g_1'} \land \Xi \land \Sigma_i \in V.$$  

So we are done since the short signatures of the components of the join defining $w_i(\overline{(f, g)})$ are $(\overline{\emptyset}, =)$ where, by 9.4 $\overline{\emptyset} \leq \overline{\emptyset}$.

**Case $i = 2$:** By 9.8

$$|x = x/a|x| = C \land |x = b/\ell|x| \geq E \land \chi_{f_2', g_2'} \land \Xi \land \Sigma_2 \in V$$  

if and only

$$w_i(\overline{(f, g)}) := |x = x/a|x| = C \land |x = b/\ell|x| \geq E \land \chi_{f_2', g_2'} \land \Xi \land \Sigma_2 \in V.$$  

So we are done since the short signature of $w_i(\overline{(f, g)})$ is $(\overline{\emptyset}, \emptyset)$ where, by 9.4 $\overline{\emptyset} \leq \overline{\emptyset}$.

**Case $i = 3$:** By 9.8

$$|x = x/a|x| = C \land |x = b/\ell|x| \geq E \land \chi_{f_2', g_2'} \land \Xi \land \Sigma_2 \in V$$  

if and only

$$w_i(\overline{(f, g)}) := |x = x/a|x| = C \land |x = b/\ell|x| \geq |E/C| \land \chi_{f_2', g_2'} \land \Xi \land \Sigma_3 \in V.$$  

Since $|E/C| < E$, we have $\deg w_i(\overline{(f, g)}) < E = \deg \chi_{f, g} \land \Xi$.

So we have proved the lemma for the case $z_1 \geq 1$. Suppose $w \in W$ has extended signature $((\overline{\emptyset}, \emptyset), (z_1, z_2), (z_3, z_4))$ with $z_3 \geq 1$. Then $Dw$ has extended signature $((\overline{\emptyset}, \emptyset), (z_3, z_4), (z_1, z_2))$. So by the version of the lemma just proved, we can compute $w \in W$ with $\text{exsig } w < \text{exsig } Dw$ such that $Dw \in V$ if and only if $w \in V$. Now, $w \in V$ if and only if $Dw \in V$ and $\text{exsig } Dw < \text{exsig } w$, as required. \qed
9.2. Reducing the extended signature.

Lemma 9.10. Let $a, b \in R$ and $A, B \in \mathbb{N}_2$. Suppose that $r, s, x, \alpha \in R$ are such that $a \alpha = b r$ and $b(\alpha - 1) = a s$. Define

1. $\Sigma_1$ to be the sentence $|x=xa/a| = 1 \land |rb|x/x=0 = 1 \land |bx|^{x=0}/|b|x = 1$,
2. $\Sigma_2$ to be the sentence $|x=xa/a| = 1 \land |rb|x/x=0 = 1 \land |bx|^{x=0}/|b|x = 1$,
3. $\Sigma_3$ to be the sentence $|x=xa/a| = 1 \land |rb|x/x=0 = 1 \land |bx|^{x=0}/|b|x = 1$,
4. $\Sigma_4$ to be the sentence $|x=xA/a| = 1 \land |xb|x/x=0 = 1 \land |xa|^{x=0}/|a|x = 1$,
5. $\Sigma_5$ to be the sentence $|x=xA/a| = 1 \land |xb|x/x=0 = 1 \land |xa|^{x=0}/|a|x = 1$, and
6. $\Sigma_6$ to be the sentence $|x=xA/a| = 1 \land |xb|x/x=0 = 1$.

Then, for all $M \in \text{Mod}-R$, there exist $M_i \in \text{Mod}-R$ for $1 \leq i \leq 6$ such that $M \equiv \bigoplus_{i=1}^6 M_i$ and for $1 \leq i \leq 6$, $M_i \models \Sigma_i$.

Moreover, there is an algorithm which, given $a, b, r, s, x, \alpha, A, B$ as above, $1 \leq i \leq 6$ and $\Box, \Box' \in \{=, \geq\}$, either returns $\perp$, in which case,

$$T_R \models \neg((|x=xa/a| \Box A \land |x=xb/b|x \Box'B \land \Sigma_i)$$
or returns $n \in \mathbb{N}$ and $\sigma_1, \ldots, \sigma_n$ such that

$$T_R \models |x=xa/a|x \Box A \land |x=xb/b|x \Box'B \land \Sigma_i \leftrightarrow \bigwedge_{j=1}^n (\sigma_j \land \Sigma_i)$$

and each $\sigma_i$ is either of the form $|x=xa/a|x \Box A' \land |x=xb/b|x \Box'B'$, where $\Box_j, \Box'_j \in \{\Box, =, \geq\}$, $\bigwedge_j \Box_j \geq \Box$, $\bigwedge_j \Box'_j \leq \Box'$, $a', b' \in R$, $A', B' \in \mathbb{N}$ and $A'B' < AB$ or of the form $|x=xa/a|x \Box A' \land |x=xb/b|x \Box'B' \land |x=x=0|= N$, where $\bigwedge_j \Box_j, \Box'_j \in \{=, \geq\}$, $a', b' \in R$ and $A', B', N \in \mathbb{N}$.

Proof. Note that $T_R \models |x=xa/a|x = 1 \land |rb|x/x=0 = 1 \rightarrow (a|x \leftrightarrow x = 0)$.

Case 1: $\Sigma \in \{\Sigma_1, \Sigma_2\}$ and $\Box = =$. In this case, $|x=xa/a|x \Box A \land |x=xb/b|x \Box'B \land \Sigma$ is equivalent to $|x=x=0|= A \land |x=xb/b|x \Box'B \land \Sigma$ as required.

Case 2: $\Sigma \in \{\Sigma_1, \Sigma_2\}$ and $\Box$ is $\geq$ and $B \geq A$.

In this case $|x=xa/a|x \Box A \land |x=xb/b|x \Box'B \land \Sigma$ is equivalent to $|x=xb/b|x \Box'B \land \Sigma$.

Case 3: $\Sigma = \Sigma_1$, $\Box$ is $\geq$ and $\Box'$ is $\geq$.

If $bA \in \text{ann}_R M$ and $|x=xb/b|x(M) = B$ then $B \leq |M| \leq B^A$. Thus $|x=xa/a|x \geq A \land |x=xb/b|x = B \land \Sigma_1$ is equivalent to

$$\bigvee_{B^A \geq A \geq \geq A} |x=x=0|= A' \land |x=xb/b|x \geq B \land \Sigma_1$$

Case 4: $\Sigma = \Sigma_2$, $\Box$ is $\geq$ and $\Box'$ is $\geq$.

Suppose $M$ satisfies $|xb^{i=0}/|b|x| = 1$. Then $|bx^{i=1}/|b|x(M)| = |x=xb/x||a|x(M)|$ for $i \geq A - 1$. So $|x=xb/x||a|x(M)| = |x=xb/x||a|x(M)|$. Thus if $|x=xb/x||a|x(M)| \geq 2$ then $|M| \geq A$. Therefore $|x=xa/a|x \geq A \land |x=xb/b|x = 2 \land \Sigma_2$ is equivalent to $|x=xb/b|x = B \land \Sigma_2$.

Case 5: $\Sigma \in \{\Sigma_1, \Sigma_2\}$ and $\Box$ is $\geq$ and $B < A$.

If $\Box'$ is $\geq$ then $|x=xa/a|x \geq A \land |x=xb/b|x \geq B \land \Sigma$.
is equivalent to

\[(|x=x_{/b}|_a) ≥ A \lor \bigvee_{B ≤ B' < A} |x=x_{/b}|_a ≤ A \land |x=x_{/b}|_a = B' \land μ \]

So we may reduce to the case where \(\square'\) is \(=\) and hence to either case 3 or 4 at the expense of replacing \(B\) by \(B'\) with \(B ≤ B' < A\). This is not a problem since in case 3 we show that \(σ_j\) has the form \(|x=x_{/a}|_a \lor \square_j A' \land |x=x_{/4}|_a \lor \square_j B' \land |x=x_{/0}|_a = N\) i.e. there is no restriction on \(A'\) or \(B'\) and in case 4 we show that \(|x=x_{/a}|_a ≥ A \land |x=x_{/b}|_a = B' \land Σ_2\) is equivalent to \(|x=x_{/b}|_a = B' \land Σ_2\) and \(B' ≤ A\).

Case 6: \(Σ = Σ_3\).

Suppose that \(M\) satisfies \(Σ_3\). Then \(a|x\) is equivalent to \(br|x\) in \(M\) and

\[|x=x_{/br}|_a(M) = |x=x_{/b}|_a(M) \cdot |x=x_{/r}|_a(M)\]

So, in this case, the result now follows from 5.6.

The remaining cases follow from the cases we have already covered by exchanging the roles of \(a\) and \(a - 1\), \(a\) and \(b\), \(r\) and \(s\), and \(A\) and \(B\).

Proposition 9.11. Let \(R\) be a recursive Prüfer domain. There is an algorithm which, given \(w ∈ \mathbb{W}\) with extended signature \(((\square, \square), (z_1, z_2), (z_3, z_4))\) with \(z_1 + z_2 > 1\) or \(z_3 + z_4 > 1\), outputs \(w ∈ \mathbb{W}\) such that \(w ∈ \mathbb{V}\) if and only if \(w ∈ \mathbb{V}\) and \(\text{exsig} w = \text{exsig} w\).

Proof. For \(w ∈ \mathbb{W}\), as in [7], define

\[\deg_1 w := \prod_{x=x_{/c}} f(x_{/c}) \cdot \prod_{x=x_{/c}} g(x_{/c}).\]

Given \(w ∈ \mathbb{W}\) with extended signature \(((\square, \square), (z_1, z_2), (z_3, z_4))\) with \(z_1 + z_2 > 1\), we will show how to compute \(w ∈ \mathbb{W}\), a lattice combination of \(w' ∈ \mathbb{W}\), such that \(w ∈ \mathbb{V}\) if and only if \(w ∈ \mathbb{V}\) and such that for each \(w'\), either \(\text{exsig} w' = \text{exsig} w\), or \(\text{exsig} w' ≤ \text{exsig} w\) and \(\deg_1 w' < \deg_1 w\). Since \(\deg_1\) is finite in \(\mathbb{N}\), and \(\text{exsig} w\) is a lattice combination of \(w' ∈ \mathbb{W}\) such that \(\text{exsig} w' < \text{exsig} w\).

We start with a special case. Let \(a, b, α, r, s ∈ \mathbb{R}\) be such that \(αx = br\) and \(b(α - 1) = as\). Let \(Σ_i\), for \(1 ≤ i ≤ 6\), be as in [9.10]. Suppose that, for some \(1 ≤ i ≤ 6\), \(w\) is

\[|x=x_{/a}|_a \lor \square A \land |x=x_{/b}|_a \lor \square' B \land χ_{f,g} \land Σ_i \land Ξ \land W\]

where \(A, B ∈ \mathbb{N}_2\), \(\square, \square' ∈ \{=, ≥\}\), \(X \lor Y\) are finite sets of appropriate pp-pairs, \(f : X → \mathbb{N}\), \(g : Y → \mathbb{N}\) and \(Ξ\) is an auxiliary sentence.

We will compute \(u = [\prod_{j=1}^n u_j] \cdot \prod_{x=x_{/c}} f(x_{/c}) \cdot \prod_{x=x_{/c}} g(x_{/c})\) such that for each \(1 ≤ j ≤ n\), either \(\text{exsig} u_j < \text{exsig} w\) or \(\text{exsig} u_j ≤ \text{exsig} w\) and \(\deg_1 u_j < \deg_1 w\).

If the algorithm from [9.10] returns \(⊥\), then

\[T_R ≡ \neg((|x=x_{/a}|_a \lor \square A \land |x=x_{/b}|_a \lor \square' B \land χ_{f,g} \land Σ_i \land Ξ)).\]

In this case, set \(u := \bot\). Otherwise, let \(σ_1, ..., σ_n\) be, as in [9.10], such that

\[T_R ≡ \prod_{j=1}^n (σ_j \land Σ_i)\]
Therefore

\[ T_R = \{ x = x/a | x \in A \land x = x/b | x \in \square_{j} B \land \chi_{f,g} \land \Sigma_i \land \Xi \leftrightarrow \bigvee_{j=1}^{n} (\sigma_j \land \chi_{f,g} \land \Sigma_i \land \Xi) \} \]

So \( w \in V \) if and only if

\[ \bigcup_{j=1}^{n} (\sigma_j \land \chi_{f,g} \land \Sigma_i \land \Xi) \in V. \]

If \( \sigma_j \) is of the form

\[ |x = x/a'|x | \square_j A' \land |x = x/b'|x | \square_j B', \]

where \( \square_j, \square_j' \in \{ =, \geq \}, a', b' \in R \) and \( A', B' \in \mathbb{N} \) then \( \sigma_j \land \chi_{f,g} \land \Sigma_i \land \Xi \) is a sentence about an \( R \)-module of fixed finite size. So, since EPP(\( R \)) is recursive, by \( \text{7.6} \) we can effectively decide whether \( \sigma_j \land \chi_{f,g} \land \Sigma_i \land \Xi \) holds in some \( R \)-module. Set \( u_j := T \) if \( \sigma_j \land \chi_{f,g} \land \Sigma_i \land \Xi \) is true in some \( R \)-module and \( u_j := \bot \) otherwise. Finally, if \( \sigma_j \) is of the form

\[ |x = x/a'|x | \square_j A' \land |x = x/b'|x | \square_j B', \]

where \( \square_j, \square_j' \in \{ 0, =, \geq \}, a', b' \in R \) and \( A', B' \in \mathbb{N} \) with \( \square_j \leq \square, \square_j' \leq \square' \) and \( A'B' < AB \) then set \( u_j := \sigma_j \land \chi_{f,g} \land \Sigma_i \land \Xi \). The condition that \( \square_j \leq \square \) and \( \square_j' \leq \square' \) ensures that \( \text{exsig} u_j \leq \text{exsig} w \). The condition that \( A'B' < AB \) implies that \( \deg \sigma_i u_j < \deg \sigma_i w \). So \( w \in V \) if and only if \( u := \bigcup_{j=1}^{n} u_j \in V \) and \( \deg \sigma_i u_j < \deg \sigma_i w \) for \( 1 \leq j \leq n \) as required.

We now consider the general case. Suppose

\[ w := \chi_{f,g} \land \Xi, \]

where \( X \) and \( Y \) are disjoint finite sets of appropriate pp-pairs, \( f : X \rightarrow \mathbb{N}_2 \), \( g : Y \rightarrow \mathbb{N}_2 \) and \( \Xi \) is an auxiliary sentence, has extended signature \([ (\square_1, \square_2), (z_1, z_2), (z_3, z_4) ] \) with \( z_1 + z_2 > 1 \). There exist \( a, b \in R \) with \( a \neq b \) such that \( x = x/a | x, x = x/b | x \in X \cup Y \).

Then \( w \in V \) if and only if

\[ \bigcup_{(j, i) \in \Omega_{f,g}} \bigcap_{i=1}^{6} \Sigma_i \land \chi_{f_i,g_i} \land \Xi \in V. \]

Claim: For all \( (j, i) \in \Omega_{f,g} \) and \( 1 \leq i \leq 6 \), either

\[ \text{exsig} \Sigma_i \land \chi_{f_i,g_i} \land \Xi < \text{exsig} \chi_{f,g} \land \Xi, \] or, \( \deg \Sigma_i \land \chi_{f_i,g_i} \land \Xi < \deg \chi_{f,g}. \]

or, \( X_i = X, Y_i = Y \), \( f_i(x = x/c | x) = f(x = x/c | x) \) for all \( x = x/c | x \in X \) and \( g_i(x = x/c | x) = g(x = x/c | x) \) for all \( x = x/c | x \in Y \).

By \( \text{9.3} \) if \( X_i \neq X \) or \( Y_i \neq Y \) then the extended signature of \( \chi_{f_i,g_i} \) is strictly less that the extended signature of \( \chi_{f,g} \). So suppose that \( X = X_i, Y = Y_i \). By definition, \( g(x = x/c | x) = g_i(x = x/c | x) \) for all \( x = x/c | x \in Y = Y_i \) and \( f_i(x = x/c | x) \leq f(x = x/c | x) \) for all \( x = x/c | x \in X = X_i \). So, if \( f_i(x = x/c | x) < f(x = x/c | x) \) for some \( x = x/c | x \in X_i \), then \( \deg \Sigma_i \land \chi_{f_i,g_i} \land \Xi < \deg \chi_{f,g} \). So we have proved the claim.

Therefore for each \( (j, i) \in \Omega_{f,g} \) and \( 1 \leq i \leq 6 \), either \( \text{exsig} \Sigma_i \land \chi_{f_i,g_i} \land \Xi < \text{exsig} \chi_{f,g} \land \Xi, \) or \( \deg \Sigma_i \land \chi_{f_i,g_i} \land \Xi < \deg \chi_{f,g} \) or \( \chi_{f_i,g_i} \land \Sigma_i \land \Xi \) is of the form of the special case. Since, by \( \text{9.4} \) we always have \( \text{exsig} \Sigma_i \land \chi_{f_i,g_i} \land \Xi \leq \text{exsig} \chi_{f,g} \land \Xi \), we are done.
The version of the lemma with $z_3 + z_4 > 1$ follows from the one we have just proved by applying duality as in [9.9]. □

Say $w \in W$ is reducible if $w$ has
- short signature $(=, \sqsubseteq)$ or $(\sqsubseteq, =)$, or
- extended signature $((\geq, \sqsubseteq), (z_1, z_2), (z_3, z_4))$ with $z_1 \geq 1$ or $z_3 \geq 1$, or
- extended signature $((\sqsubseteq, \sqsubset'), (z_1, z_2), (z_3, z_4))$ with $z_1 + z_2 > 1$ or $z_3 + z_4 > 1$.

**Remark 9.12.** If $w \in W$ is reducible then $w$ is of the form required by one of the lemmas 9.3, 9.7, 9.9 or 9.11.

Thus $w \in W$ is not reducible if and only if $w$ has extended signature
- $(0, 0, (z_1, z_2), (z_3, z_4))$ with $(z_1, z_2), (z_3, z_4) \in \{(1, 0), (0, 1), (0, 0)\}$ or
- $((\sqsubseteq, \sqsubset'), (z_1, z_2), (z_3, z_4))$ with $(\sqsubseteq, \sqsubset') \in \{(\geq, \emptyset), (\emptyset, \geq), (\geq, \emptyset), (\emptyset, 0)\}$ and $(z_1, z_2), (z_3, z_4) \in \{(0, 1), (0, 0)\}$.

The next remark follows directly from 3.9.

**Remark 9.13.** Let $R$ be a Prüfer domain. There is an algorithm which, given $w \in W$ with extended signature $((\sqsubseteq, \sqsubset), (z_1, z_2), (z_3, z_4))$ with $(\sqsubseteq, \sqsubset) \in \{(\geq, \emptyset), (\emptyset, \geq), (\geq, \emptyset), (\emptyset, 0)\}$ and $(z_1, z_2), (z_3, z_4) \in \{(0, 1), (0, 0)\}$, answers whether $w \in W$ or not.

10. Algorithms for sentences which are not reducible

**Lemma 10.1.** Let $R$ be a recursive Prüfer domain with $X(R)$ recursive. There is an algorithm which, given $\lambda \in R$, $C \in \mathbb{N}$ and $(r, ra, \gamma, \delta) \in R^4$, answers whether there exist $h \in \mathbb{N}_0$, prime ideals $p_i < R$ and ideals $I_i < R_{p_i}$, for $1 \leq i \leq h$ such that $(p_i, I_i) \models (r, ra, \gamma, \delta)$ and $\left| \bigoplus_{i=1}^{h} R_{p_i}/\lambda R_{p_i} \right| = C$.

**Proof.** If $C = 1$ then there is nothing to prove, so suppose that $C \neq 1$. Let $p_1, \ldots, p_r \in \mathbb{P}$ be distinct primes and $n_1, \ldots, n_l \in \mathbb{N}$ be such that $C = \prod_{j=1}^{l} n_j^{n_j}$. For each prime ideal $p < R$, if $|R_{p}/\lambda R_{p}|$ is finite then it is a prime power. Therefore, there exist prime ideals $p_i < R$ and ideals $I_i < R_{p_i}$, for $1 \leq i \leq h$ such that $(p_i, I_i) \models (r, ra, \gamma, \delta)$ and $\left| \bigoplus_{i=1}^{h} R_{p_i}/\lambda R_{p_i} \right| = C$ if and only if for each $1 \leq j \leq l$, there exist $h_j \in \mathbb{N}_0$, prime ideals $p_{ij} < R$ and ideals $I_{ij} < R_{p_{ij}}$, for $1 \leq i \leq h_j$ such that $(p_{ij}, I_{ij}) \models (r, ra, \gamma, \delta)$ and $\left| \bigoplus_{i=1}^{h_j} R_{p_{ij}}/\lambda R_{p_{ij}} \right| = p^{n_j}$. Thus we may reduce to the case that $C = p^n$ for some $p \in \mathbb{P}$ and $n \in \mathbb{N}$.

We consider the cases $r = 0$ and $r \neq 0$ separately.

**Case** $r = 0$: For $p < R$ prime and $I < R_{p}$, $(p, I) \models (0, 0, \gamma, \delta)$ if and only if $I = 0$, $\gamma \notin p$ and $\delta \neq 0$. So, there exist $h \in \mathbb{N}_0$, prime ideals $p_i < R$ and ideals $I_i < R_{p_i}$, for $1 \leq i \leq h$ such that $(p_i, I_i) \models (0, 0, \gamma, \delta)$ and $\left| \bigoplus_{i=1}^{h} R_{p_i}/\lambda R_{p_i} \right| = p^n$ if and only if $(p, n; \lambda, \gamma, 0, 1) \in X(R)$ and $\delta \neq 0$.

**Case** $r \neq 0$: If $r \neq 0$ then $(p, I) \models (r, ra, \gamma, \delta)$ if and only if $I = rJ$ for some $J < R_{p}$ and $(p, J) \models (1, a, \gamma, \delta)$. So, there exist $h \in \mathbb{N}_0$, prime ideals $p_i < R$ and ideals $I_i < R_{p_i}$, for $1 \leq i \leq h$ such that $(p_i, I_i) \models (r, ra, \gamma, \delta)$ and $\left| \bigoplus_{i=1}^{h} R_{p_i}/\lambda R_{p_i} \right| = p^n$ if and only if there exist $h \in \mathbb{N}_0$, prime ideals $p_i < R$ and ideals $I_i < R_{p_i}$, for $1 \leq i \leq h$ such that $(p_i, I_i) \models (1, a, \gamma, \delta)$ and $\left| \bigoplus_{i=1}^{h} R_{p_i}/\lambda R_{p_i} \right| = p^n$. The last statement is equivalent to $(p, n; \lambda, \gamma, a, \delta) \in X(R)$. □
Proposition 10.2. Let $R$ be a recursive Prüfer domain with $\text{EPP}(R)$ and $X(R)$ recursive. There is an algorithm which, given $c \in R$, $C \in \mathbb{N}$ and $\Xi$ an auxiliary sentence, answers whether there exists $M \in \text{Mod-}R$ such that

$$M \models |x=c/x| = C \land \Xi.$$ 

Proof. Let $\chi$ be the sentence $|x=c/x| = C \land \Xi$. By Corollary 10.3, there exists $M \models \chi$ if and only if there exist prime ideals $p_i \triangleleft R$ and uniserial $R_{p_i}$-modules $U_i$ for $1 \leq i \leq l$ such that $\bigoplus_{i=1}^l U_i \models \chi$. Moreover, we may assume that $U_i/U_i c \neq 0$ for all $1 \leq i \leq l$. By 6.3, there exists $M$ such that $\bigoplus_{i=1}^l U_i \models \chi$. Thus, there exists $M$, and only if there exist $A, B \in \mathbb{N}$ with $AB = C$, $F \in \text{Mod-}R$ such that

$$F \models |x=c/x=0| = A \land |c|x=0 = 1 \land \Xi$$

and $h \in \mathbb{N}_0$, prime ideals $p_i \triangleleft R$ and ideals $I_i \triangleleft R_{p_i}$ for $1 \leq i \leq h$ such that $|\bigoplus_{i=1}^h R_{p_i}/cR_{p_i}| = B$ and $R_{p_i}/cI_i \models \Xi$ for $1 \leq i \leq h$. So, since $\text{EPP}(R)$ is recursive, by 7.6, it is enough to show that there is an algorithm which answers whether there exist $h \in \mathbb{N}_0$, prime ideals $p_i \triangleleft R$ and ideals $I_i \triangleleft R_{p_i}$ for $1 \leq i \leq h$ such that $|\bigoplus_{i=1}^h R_{p_i}/cR_{p_i}| = B$ and $R_{p_i}/cI_i \models \Xi$ for $1 \leq i \leq h$.

By Corollary 10.3, we can compute $(r_j, r_j a_j, \gamma_j, \delta_j)$ for $1 \leq j \leq n$ such that $(p, I) \models (r_j, r_j a_j, \gamma_j, \delta_j)$ for some $1 \leq j \leq n$ if and only if $R_{p_j}/cI_j \models \Xi$. Thus there exist $h \in \mathbb{N}_0$, prime ideals $p_i \triangleleft R$ and ideals $I_i \triangleleft R_{p_i}$ for $1 \leq i \leq h$ such that $|\bigoplus_{i=1}^h R_{p_i}/cR_{p_i}| = B$ and $R_{p_i}/cI_i \models \Xi$ for $1 \leq i \leq h$ if and only if there exist $B_j \in \mathbb{N}$ for $1 \leq j \leq n$ such that $B = \prod_{j=1}^n B_j$ and for $1 \leq j \leq n$, there exist $h_j \in \mathbb{N}_0$, prime ideals $p_{ij} \triangleleft R$ and ideals $I_{ij} \triangleleft R_{p_{ij}}$ for $1 \leq i \leq h_j$ such that $|\bigoplus_{i=1}^h R_{p_{ij}}/cR_{p_{ij}}| = B_j$ and $(p_{ij}, I_{ij}) \models (r_j, r_j a_j, \gamma_j, \delta_j)$ for $1 \leq i \leq h_j$. The result now follows from 10.1. □

Corollary 10.3. Let $R$ be a recursive Prüfer domain with $\text{EPP}(R)$ and $X(R)$ recursive. There is an algorithm which, given $b \in R$, $B \in \mathbb{N}$ and $\Xi$ an auxiliary sentence, answers whether there exists $M \in \text{Mod-}R$ such that

$$M \models |x=b/0| = B \land \Xi.$$ 

Proof. Apply 2.3 to 10.2. □

Proposition 10.4. Let $R$ be a recursive Prüfer domain with $\text{EPP}(R)$ and $X(R)$ recursive. There is an algorithm which, given $c, b \in R$, $C, B \in \mathbb{N}$ and $\Xi$ an auxiliary sentence, answers whether there exists $M \in \text{Mod-}R$ such that

$$M \models |x=c/x| = C \land |x=0/b| = B \land \Xi.$$ 

Proof. For $\alpha \in R$, we write $\alpha \notin \text{Att}$ for the sentence $|x=0/x=0| = 1 \land |x=c/x| = 1$. Recall, 2.9, that for all $M \in \text{Mod-}R$, there are $M_1, M_2 \in \text{Mod-}R$ such that $M = M_1 \oplus M_2$, $M_1$ satisfies $\alpha \notin \text{Att}$ and $M_2$ satisfies $\alpha - 1 \notin \text{Att}$.

Let $\alpha, u, v \in R$ be such that $\alpha u = b u$ and $b(\alpha - 1) = cv$. There exists an $R$-module which satisfies $|x=c/x| = C \land |x=0/b| = B \land \Xi$ if and only if there exist $C_1, C_2, B_1, B_2 \in \mathbb{N}$ with $C = C_1 C_2$ and $B = B_1 B_2$ and there exists an $R$-module satisfying

$$|x=c/bu| = C_1 \land |x=0/b| = B_1 \land \alpha \notin \text{Att} \land \Xi$$

and an $R$-module satisfying

$$|x=c/x| = C_2 \land |x=0/cv=0| = B_2 \land (\alpha - 1) \notin \text{Att} \land \Xi.$$
By 2.3 there exists an $R$-module satisfying
\[ |x=x/c| = C_2 \land |x=c/0| = B_2 \land \alpha \notin \text{Att} \land \Xi \]
if and only if there exists an $R$-module satisfying
\[ |x=c/0| = C_2 \land |x=x/c| = B_2 \land \alpha \notin \text{Att} \land D\Xi. \]

Thus, in order to prove the proposition, it is enough to show that there is an algorithm which, given $b, u \in R, C, B \in \mathbb{N}$ and $\Xi$ an auxiliary sentence, answers whether there exists an $R$-module satisfying the sentence $\chi$ defined as
\[ |x=x/bu| = C \land |xb=0/x=0| = B \land \Xi. \]

We may assume that $bu \neq 0$, for otherwise $\chi$ is a sentence about an $R$-module of fixed finite size and since EPP$(R)$ is recursive, we can decide whether there exist $R$-modules satisfying such sentences.

By 2.11 and 6.3 there exists an $R$-module satisfying $\chi$ if and only if there exists $F \in \text{Mod-}R$ with $bu \in \text{ann}_RF, h \in \mathbb{N}_0$, prime ideals $p_i \prec R$ and ideals $I_i \prec R_p$, for $1 \leq i \leq h$ and $M \in \text{Mod-}R$ with $Mbu = M$ such that $F \oplus \bigoplus_{i=1}^h R_{p_i}/buI_i \oplus M$ satisfies $\chi$. Now, this happens if and only if there exist $C_1, C_2 \in \mathbb{N}$ and $B_1, B_2, B_3 \in \mathbb{N}$ with $C = C_1C_2$ and $B = B_1B_2B_3$ such that
\[ F \models |x=x/bu| = C_1 \land |xb=0/bu| = B_1 \land |bu/x=0| = 1 \land \Xi, \]
\[ \bigoplus_{i=1}^h R_{p_i}/buI_i \models |x=x/bu| = C_2 \land |xb=0/bu| = B_2 \land \Xi, \]
and
\[ M \models |xb=0/bu| = B_3 \land |x=x/bu| = 1 \land \Xi. \]

In view of 7.6 and 10.3 it is therefore enough to show that there is an algorithm which answers whether there exists $h \in \mathbb{N}_0$, prime ideals $p_i \prec R$ and ideals $I_i \prec R_{p_i}$, for $1 \leq i \leq h$ such that
\[ \bigoplus_{i=1}^h R_{p_i}/buI_i \models |x=x/bu| = C_2 \land |xb=0/bu| = B_2 \land \Xi. \]

By 6.10 we can compute $n \in \mathbb{N}$ and $(r_j, r_j a_j, \gamma_j, \delta_j)$ for $1 \leq j \leq n$ such that $R_{p_i}/buI_i \models \Xi$ if and only if $(p, I) \models (r_j, r_j a_j, \gamma_j, \delta_j)$ for some $1 \leq j \leq n$. It is therefore enough to show that there is an algorithm which, given $(r, r a, \gamma, \delta), b, u \in R$ and $C, B \in \mathbb{N}$, answers whether there exist $h \in \mathbb{N}_0$, prime ideals $p_i$ for $1 \leq i \leq h$ and ideals $I_i \prec R_{p_i}$ for $1 \leq i \leq h$ such that $(p_i, I_i) \models (r, r a, \gamma, \delta)$ and
\[ \bigoplus_{i=1}^h R_{p_i}/buI_i \models |x=x/bu| = C \land |xb=0/bu| = B. \]

Case $r = 0$: In this case $(p, I) \models (r, r a, \gamma, \delta)$ implies $I = 0$. Moreover $(p, 0) \models (r, r a, \gamma, \delta)$ if and only if $r \notin p$ and $\delta \neq 0$. Thus, there exist prime ideals $p_i$ for $1 \leq i \leq h$ such that $(p_i, 0) \models (r, r a, \gamma, \delta)$ and $\bigoplus_{i=1}^h R_{p_i} \models |x=x/buI| = C \land |xb=0/bu| = B$ if and only if $\delta \neq 0$. $B = 1$ and there exist prime ideals $p_i$ for $1 \leq i \leq h$ such that $\gamma \notin p_i$ and $\bigoplus_{i=1}^h R_{p_i}/buR_{p_i} \models C$. Such an algorithm exists since EPP$(R)$ is recursive.

Case $r \neq 0$: For all prime ideals $p$ and ideals $I \prec R_p$, since $bu \neq 0$,
\[ |xb=0/bu| = 0(R_{p}/buI) = |buI : b/bu| = |I/bu|. \]

Now, if $|I/bu| = 0$ then $I = \lambda R_p$ for some $\lambda \neq 0$ and $|I/bu| = R_p/bR_p$. Since $b \neq 0$, $|I/bu| = 1$ if and only if $b \notin I^\#$.

Therefore, there exist prime ideals $p_i$ and ideals $I_i \prec R_{p_i}$ for $1 \leq i \leq h$ such that $\bigoplus_{i=1}^h R_{p_i}/buI_i \models |x=x/bu| = C \land |xb=0/bu| = B \land \Xi$ if and only if there exist $C', C'' \in \mathbb{N}$ with $C'C'' = C$ such that the following conditions hold.
(i) There exist prime ideals \( p_i \triangleleft R \) and \( \lambda_i \in R \setminus \{0\} \) for \( 1 \leq i \leq h \) such that
\[
(p_i, \lambda_i R_{p_i}) \models (r, ra, \gamma, \delta), \quad \left\langle \bigoplus_{i=1}^{h} R_{p_i}/buR_{p_i} \right\rangle = C' \quad \text{and} \quad \left\langle \bigoplus_{i=1}^{h} R_{p_i}/bR_{p_i} \right\rangle = B.
\]
(ii) There exist prime ideals \( p_i \triangleleft R \) and ideals \( I_i \triangleleft R_{p_i} \) for \( 1 \leq i \leq h \) such that
\[
(p_i, I_i) \models (r, ra, \gamma, \delta) \quad \text{and} \quad \left\langle \bigoplus_{i=1}^{h} R_{p_i}/buR_{p_i} \right\rangle = C''.
\]

Note that, if \((p, \lambda R_p) \models (r, ra, \gamma, \delta)\) then \((p, rR_p) \models (r, ra, \gamma, \delta)\). Since \((rR_p)\# = pR_p\), \((p, rR_p) \models (r, ra, \gamma, \delta)\) if and only if \(\gamma \delta \notin p\). So (i) holds if and only if there exist prime ideals \( p_i \) for \( 1 \leq i \leq h' \) such that \(\gamma \delta \notin p_i\) and
\[
\left\langle \bigoplus_{i=1}^{h'} R_{p_i}/bR_{p_i} \right\rangle = C'
\]
and
\[
\left\langle \bigoplus_{i=1}^{h'} R_{p_i}/buR_{p_i} \right\rangle = B.
\]
So, since EPP\((R)\) is recursive, by 7.2 there is an algorithm which answers whether (i) holds or not.

By 10.1 since \(X(R)\) is recursive, there is an algorithm which answers whether (ii) holds or not.

\[\square\]

The rest of this section is spent proving the following proposition.

**Proposition 10.5.** Let \( R \) be a recursive Prüfer domain with EPP\((R)\) and DPR\((R)\) recursive. There is an algorithm which, given \( c, b \in R, C, B \in \mathbb{N} \) and \( \Xi \) an auxiliary sentence, answers whether there exists \( M \in \text{Mod-}R \) such that
\[
M \models |x=r=0/c=1| = C \land |x=b=0/|z=0| \geq B \land \Xi.
\]

We could choose the module in the following definition uniquely. For instance, one can show that when \( q \supseteq p \) the uniserial module \([qR_q : \lambda pR_q]/qR_q\) has the required theory where \([qR_q : \lambda pR_q]\) is the set of elements \( a \in Q\), the fraction field of \( R\), such that \( aqR_q \subseteq qR_q\). However, we are only ever interested in modules up to elementary equivalence.

**Definition 10.6.** For \( \lambda \in R \setminus \{0\}\) and prime ideals \( p, q \triangleleft R \), let \( M(p, q, \lambda) \) be \( R_p/\lambda qR_q \) if \( p \supseteq q \) and a module with theory dual, in the sense of [Her93, 6.6], to the theory of \( R_q/\lambda pR_q \) if \( q \supseteq p \).

**Lemma 10.7.** Suppose that \( \lambda, a, \gamma, \delta \in R \) with \( \lambda \neq 0 \) are such that if \((p, I) \models (\lambda, a, \gamma, \delta)\) then \( R_p/I \models \Xi \) and if \((p, I) \models (\lambda, \lambda a, \delta, \gamma)\) then \( R_p/I \models D\Xi\). Then \( \gamma \notin p, \delta \notin q \) and \( a \in p \cap q \) implies \( M(p, q, \lambda) \models \Xi\).

**Proof.** Let \((\lambda, \lambda a, \gamma, \delta)\) be such that if \((p, I) \models (\lambda, a, \gamma, \delta)\) then \( R_p/I \models \Xi \) and if \((p, I) \models (\lambda, \lambda a, \delta, \gamma)\) then \( R_p/I \models D\Xi\).

Suppose that \( \gamma \notin p, \delta \notin q \) and \( a \in p \cap q \). If \( p \supseteq q \) then \((p, \lambda qR_q) \models (\lambda, \lambda a, \gamma, \delta)\). So \( M(p, q, \lambda) \models \Xi\). Now suppose that \( q \supseteq p \). Then \((q, \lambda pR_q) \models (\lambda, \lambda a, \delta, \gamma)\). So \( R_q/\lambda pR_q \models D\Xi\). Hence, by definition, \( M(p, q, \lambda) \models \Xi\).

**Lemma 10.8.** Let \( R \) be a recursive Prüfer domain with EPP\((R)\) recursive. There is an algorithm which, given \( r, c \in R \setminus \{0\}\), \( a, b, \gamma, \delta \in R \) and \( A, B, C \in \mathbb{N} \), answers whether there exist \( h \in \mathbb{N}_0\), prime ideals \( p_i \triangleleft R \) and ideals \( I_i \triangleleft R_{p_i} \) for \( 1 \leq i \leq h \) such that \((p_i, I_i) \models (1, a, \gamma, \delta), \left\langle \bigoplus_{i=1}^{h} R_{p_i}/I_i \right\rangle = A \) and
\[
\left\langle \bigoplus_{i=1}^{h} R_{p_i}/cI_i \right\rangle = |x=r=0/c=1| = C \land |x=b=0/|z=0| \geq B.
\]

**Proof.** Let \( p \triangleleft R \) be a prime ideal and \( I \triangleleft R_p \) be an ideal. Then \( a \in I_i \) if and only if \( rca \in rcI_i \). So \( a \in I_i \) if and only if \( |rca|/z=0(R_p/rcI_i)| = 1 \). If \( R_p/rcI_i \neq 0 \) then \( \gamma \notin p \) if and only if \( |x=r/|z|=1 \) and, \( \delta \notin I^# \) if and only if \( |x=b=0/|z|=0| = 1 \). Note that
\[
|rca|/z=0(\bigoplus_{i=1}^{h} R_{p_i}/rcI_i) = \left\langle \bigoplus_{i=1}^{h} R_{p_i}/I_i \right\rangle.
\]
Therefore, there exist $h \in \mathbb{N}_0$, prime ideals $p_i < R$ and ideals $I_i < R_p$, for $1 \leq i \leq h$ as in the statement if and only if there exist $h \in \mathbb{N}_0$, prime ideals $p_i < R$ and ideals $I_i < R_p$ for $1 \leq i \leq h$ such that $\bigoplus_{i=1}^h R_p/rcI_i$ satisfies

$$\chi := \{r^e x/x=0 = A \wedge |x=x/c|x| = C \wedge |x^b=0/x=0| \geq B \wedge |rcx/x=0| = 1 \wedge |x=x/\gamma|x| = 1 \wedge |x^b=0/x=0| = 1.$$

By (8.1), there is an algorithm answering whether there exists $\bigoplus_{i=1}^h R_p/rcI_i$ satisfying $\chi$.

**Proposition 10.9.** Let $R$ be a recursive Prüfer domain with EPP($R$), DPR($R$) and $X(R)$ recursive. There is an algorithm which, given $C,B \in \mathbb{N}, c,b \in R$ with $c \neq 0$ and $a,\gamma,\delta \in R$ with $r \neq 0$, answers whether there exists $M \in Mod-R$ satisfying

$$|x=x/c|x| = C \wedge |x^b=0/x=0| \geq B,$$

such that $M$ is a direct sum of

- modules of the form $R_p/rcI$ where $p$ is prime, $I < R_p$ is an ideal and $(p,I) \models (1,a,\gamma,\delta)$, and,
- modules of the form $M(p,q,r)$ where $p,q < R$ are prime ideals such that $p+q \neq R$, $c\gamma \notin p$, $\delta \notin q$, $a \in p$ and $a \in q$.

**Proof.** Recall that, if DPR($R$) is recursive then so is DPR$_2(R)$.

**Case 1:** $(c\gamma,\delta,a,a,a,b) \notin$ DPR$_2(R)$

There exist prime ideals $p,q$ with $p+q \neq R$ such that $c\gamma \notin p$, $\delta \notin q$, $a \in p$ and $a,b \in q$. So, $|x=x/c|x|(M(p,q,r))| = 1$, since $c \notin p$ and, $|x^b=0/x=0(M(p,q,r))| > 1$, since $b \in q$.

Therefore, there exists $M \in Mod-R$ as in the statement if and only if there exists $h \in \mathbb{N}_0$, prime ideals $p_i < R$ and ideals $l_i < R_p$, such that $(p,I,i) \models (1,a,\gamma,\delta)$ for $1 \leq i \leq h$ and such that

$$|\bigoplus_{i=1}^h R_p/iR_p| = |x=x/c|x|(\bigoplus_{i=1}^h R_p/rcI_i)| = C.$$

Since $X(R)$ is recursive, we are done by (10.1).

**Case 2:** $(c\gamma,\delta,a,a,a,b) \in$ DPR$_2(R)$

Then $|x^b=0/x=0(M(p,q,r))| = 1$ and $|x=x/c|x|(M(p,q,r))| = 1$ for all primes $p,q$ such that $p+q \neq R$, $c\gamma \notin p$, $\delta \notin q$, $a \in p$ and $a \in q$.

By (3.3), there exist $n \in \mathbb{N}$, $\epsilon,t,s_1,s_2 \in R$ such that

$$(c\gamma)^n = at \text{ and } ((\epsilon-1)\delta)^n = as_1 + bs_2.$$  

For all prime ideals $p < R$, either $c \notin p$ or $\epsilon - 1 \notin p$. Thus $(p,I) \models (1,a,\gamma,\delta)$ if and only if $(p,I) \models (1,a,c\gamma,\delta)$ or $(p,I) \models (1,a,(\epsilon-1)\gamma,\delta)$.

Therefore, it is enough to be able to effectively answer whether there exist $C_1,C_2,B_1,B_2 \in \mathbb{N}$ with $C_1 \cdot C_2 = C$, $B_1 \cdot B_2 = B$ and $B_1,B_2 \leq B$, such that

1. there is a sum of modules of the form $R_p/rcI$ where $(p,I) \models (1,a,c\gamma,\delta)$ which satisfy $|x=x/c|x| = C_1 \wedge |x^b=0/x=0| \geq B_1$, and
2. there is a sum of modules of the form $R_p/rcI$ where $(p,I) \models (1,a,(\epsilon-1)\gamma,\delta)$ which satisfy $|x=x/c|x| = C_2 \wedge |x^b=0/x=0| \geq B_2$.

Suppose that $(p,I) \models (1,a,c\gamma,\delta)$ and $|x=x/c|x|(R_p/rcI)| \leq C_1$. Then

$$|R_p/I| \leq |R_p/atR_p| = |R_p/(c\gamma)^nR_p| = |R_p/c^nR_p| \leq |R_p/cR_p|^n.$$
because \( a \in I \) and \( \gamma \notin p \). So, \(|R_p/cR_p| = |x=x/c|x(R_p/rcI)| \leq C_1 \) implies \(|R_p/I| \leq C_1 \). Therefore, there exists a sum of modules as in (1) if and only if there is \( A \leq C_1 \) such that there exist \( h \in \mathbb{N}_0 \), prime ideals \( p_i < R \) and ideals \( I_i \ll R_p \), for \( 1 \leq i \leq h \) with \( (p_i,I_i) = (1,a,\epsilon_\gamma,\delta) \), \( \bigoplus_{i=1}^h R_p/R_p \), \( |x=x/c|x| = C_1 \cap |x=b/0|x=0| \geq B_1 \).

By \( \text{[10.8]} \) and \( \text{[8.1]} \) there is an algorithm which answers this question.

Suppose that \( (p,I) = (1,a,\epsilon-1)\gamma,\delta \). Since \( a \in I \), either \( a \notin p \) and \( I = R_p \), or \( a \in I^\# \). If \( a \in I^\# \) then, since \( (\epsilon-1)\delta \notin I^\# \), \( bs_2 = ((\epsilon-1)\delta)^n - a \delta \notin I^\# \). So \( b \notin I^\# \) and hence \( |x=b/0|x=0(R_p/rcI)| = 1 \).

Thus, there exists a sum of modules as required in (2) if and only if there exist \( C_2' \), \( C_2' \in \mathbb{N} \) with \( C_2 = C_2'C_2' \) such that

(i) there exist \( h \in \mathbb{N}_0 \), prime ideals \( p_i < R \) and ideals \( I_i \ll R_p \), for \( 1 \leq i \leq h \) such that \( (p_i,I_i) = (1,a,\epsilon-1)\delta\beta,\gamma \) and \( \bigoplus_{i=1}^h R_p/R_p \), \( |x=x/c|x| = C_2' \), and

(ii) there exist \( h \in \mathbb{N}_0 \) and prime ideals \( p_i < R \) for \( 1 \leq i \leq h \) such that \( a \notin p_i \), \( \gamma \notin p_i \), \( \delta \notin p_i \) and \( \bigoplus_{i=1}^h R_p/R_p \), \( |x=x/c|x| = C_2'' \cap |x=b/0|x=0| \geq B_2 \).

Since for \( p < R \) prime and \( I \ll R_p \), \( |x=x/c|x(R_p/rcI)| = |R_p/cR_p| \), by \( \text{[10.1]} \) there is an algorithm which answers whether (i) holds.

To conclude the proof we need to show that we can effectively answer whether (ii) holds or not. Let \( a,\alpha,\nu \in R \) be such that \( ba = rc\alpha \) and \( rc(\alpha-1) = bv \). If \( \alpha \notin p \) then

\[
|x=x/c|x(R_p/cR_p)| = |R_p/cR_p| \quad \text{and} \quad |x=b/0|x=0(R_p/cR_p)| = |R_p/cR_p|.
\]

If \( \alpha \neq 1 \notin p \) then

\[
|x=x/c|x(R_p/cR_p)| = |R_p/cR_p| \quad \text{and} \quad |x=b/0|x=0(R_p/cR_p)| = |R_p/cR_p|.
\]

Since for all prime ideals \( p < R \), either \( a \notin p \) or \( \alpha \neq 1 \notin p \), by \( \text{[7.3]} \) there is an algorithm which answers whether (ii) holds or not.

**Lemma 10.10.** Let \( R \) be a recursive Prüfer domain with \( \text{EPP}(R) \) and \( \text{DPR}(R) \) recursive. There is an algorithm which, given \( b,c,\gamma \in R \) and \( B,C \in \mathbb{N} \), answers whether there exist \( h \in \mathbb{N}_0 \) and prime ideals \( p_i < R \) with \( \gamma \notin p_i \) for \( 1 \leq i \leq h \) such that

\[
\bigoplus_{i=1}^h R_p \Vert |x=x/c|x| = C \cap |x=b/0|x=0| \geq B.
\]

**Proof.** We split the proof into 3 cases. Let \( \chi \) be the sentence

\[
|x=x/c|x| = C \cap |x=b/0|x=0| \geq B.
\]

**Case** \( b \neq 0 \): Then \(|x=b/0|x=0(R_p)| = 1 \) for all prime ideals \( p < R \). So \( \bigoplus_{i=1}^h R_p \Vert |x=x/c|x| = \chi \) if and only if \( B = 1 \) and \( \bigoplus_{i=1}^h R_p/cR_p \Vert = C \). Since \( \text{EPP}(R) \) is recursive, we are done by \( \text{[7.3]} \).

**Case** \( b = 0 \) and \( C > 1 \): Then \(|x=b/0|x=0(R_p)| = 1 \) implies \(|x=b/0|x=0(R_p/cR_p)| = C \). So \( \bigoplus_{i=1}^h R_p/cR_p \Vert = C > 1 \) implies \(|x=b/0|x=0(R_p/cR_p)| = C \). So, since \( \text{EPP}(R) \) is recursive, we are done by \( \text{[7.3]} \).
Case $b = 0$ and $C = 1$: If $B = 1$ then the zero module satisfies $\chi$ i.e. $h = 0$. Otherwise, if $\oplus_{i=1}^{n} R_{p_i} \models \chi$ and $\gamma \notin p_i$ for $1 \leq i \leq h$ then $h \geq 1$ and $\gamma \notin p_i$ for all $1 \leq i \leq h$. So there exists a prime ideal $p < R$ such that $\gamma c \notin p$. Conversely, if $p < R$ is a prime ideal such that $\gamma c \notin p$ then $R_p \models \chi$. There exists a prime ideal $p < R$ such that $\gamma c \notin p$ if and only if $(\gamma c, 1, 0, 0) \notin DPR(R)$. 

Proof of Proposition 10.3. We may assume that $c \neq 0$ since if $c = 0$ then $|x=x/|c|| = C \wedge |x=b=0/x=0| \geq B \wedge \Xi$ is a statement about an $R$-module of a fixed finite size and in this case we know such an algorithm exists, by 7.6, since EPP($|c|/c$) is recursive.

By 6.10 we can compute $n \in \mathbb{N}$ and $(r_j, r_ja_j, \gamma_j, \delta_j) \in R^n$ for $1 \leq j \leq n$ such that $R_p/cI \models \Xi$ if and only if $(p, I) \models (r_j, r_ja_j, \gamma_j, \delta_j)$ for some $1 \leq j \leq n$ and such that $R_p/cI \models D\Xi$ if and only if $(p, I) \models (r_j, r_ja_j, \delta_j, \gamma_j)$ for some $1 \leq j \leq n$.

Claim: There exists $M \in \text{Mod-R}$ such that

$$M \models |x=x/|c|| = C \wedge |x=b=0/x=0| \geq B \wedge \Xi$$

if and only if there exist $C_j \in \mathbb{N}$ for $0 \leq j \leq n$ and $B_j \in \mathbb{N}$, $B_j \leq B$ for $0 \leq j \leq n+1$ with $\prod_{j=0}^{n} C_j = C$ and $\prod_{j=0}^{n+1} B_j \geq B$, satisfying the following conditions.

(1) There exists $F \in \text{Mod-R}$ such that

$$F \models |x=x/|x=0| = C_0 \wedge |x=b=0/x=0| \geq B_0 \wedge |c|x/x=0| = 1 \wedge \Xi.$$  

(2) There exists $M' \in \text{Mod-R}$ such that

$$M' \models |x=x/|c|| = 1 \wedge |x=b=0/x=0| \geq B_{n+1} \wedge \Xi.$$  

(3) For $1 \leq j \leq n$,

(a) if $r_j = 0$ then there exist $h_j \in \mathbb{N}_0$ and prime ideals $p_{ij} < R$ for $1 \leq i \leq h_j$ such that $\gamma_j \notin p_{ij}$, $\delta_j \neq 0$ and

$$M_j := \bigoplus_{i=1}^{h_j} R_{p_{ij}} \models |x=x/|c|| = C_j \wedge |x=b=0/x=0| \geq B_j,$$

and

(b) if $r_j \neq 0$ then there exist $h_j, k_j \in \mathbb{N}_0$, prime ideals $p_j, q_j, p_{ij} < R$ and ideals $I_{ij} < R_{p_{ij}}$ for $1 \leq i \leq h_j$ such that $(p_{ij}, I_{ij}) \models (1, a_j, \gamma_j, \delta_j)$ for $1 \leq i \leq h_j$, $\gamma_j \notin p_j$, $\delta_j \notin q_j$, $a \in p_j$, $a \in q_j$, and

$$M_j := (p_j, q_j, r_j)_{k_j} \oplus \bigoplus_{i=1}^{h_j} R_{p_{ij}}/r_j c I_{ij} \models |x=x/|c|| = C_j \wedge |x=b=0/x=0| \geq B_j.$$  

Proof of claim. ($\Rightarrow$) By 6.3 if $U$ is a uniserial module with $x=x/|c||U|$ finite but non-zero then either $c \in \text{ann}_R U$ or $U \cong R_p/cI$ for some prime ideal $p < R$ and ideal $I < R_p$. Therefore, by 2.11 there exists

$$M \models |x=x/|c|| = C \wedge |x=b=0/x=0| \geq B \wedge \Xi$$

if and only if there exists $F \in \text{Mod-R}$ with $c \in \text{ann}_R F$, prime ideals $p_i < R$ and ideals $I_i < R_{p_i}$ for $1 \leq i \leq h$ and $M' \in \text{Mod-R}$ with $|x=x/|c|| (M') = 1$ such that

$$F \oplus M' \oplus \bigoplus_{i=1}^{h} R_{p_i}/c I_i \models |x=x/|c|| = C \wedge |x=b=0/x=0| \geq B \wedge \Xi.$$ 

Since $R_p/cI \models \Xi$ if and only if $(p, J) \models (r_j, r_ja_j, \gamma_j, \delta_j)$ for some $1 \leq j \leq n$, we may rewrite $\bigoplus_{i=1}^{h} R_{p_i}/c I_i$ as $\bigoplus_{j=1}^{n} \oplus_{i=1}^{h_j} R_{p_{ij}}/c I_{ij}$ where $(p_{ij}, J_{ij}) \models (r_j, r_ja_j, \gamma_j, \delta_j)$ for $1 \leq j \leq n$ and $1 \leq i \leq h_j$. 

If \( r_j = 0 \) then \((p_{ij}, J_{ij}) \models (r_j, r_j a_j, \gamma_j, \delta_j)\) if and only if \( J_{ij} = 0, \delta_j \neq 0 \) and 
\( \gamma_j \notin p_{ij} \). If \( r_j \neq 0 \) then \((p_{ij}, J_{ij}) \models (r_j, r_j a_j, \gamma_j, \delta_j)\) if and only if there exists 
\( I_{ij} \subset R_{ij} \) such that \( I_{ij} = r_{ij}J_{ij} \) and \((p_{ij}, I_{ij}) \models (1, a_j, \gamma_j, \delta_j)\).

Let \( C_0 := \{x = x/c| (F)\} = |F| \) and \( B_0 := \min\{|x^b = 0|_0(F), B\} \). Let \( B_{n+1} := \min\{|x^b = 0|(M')|, B\} \). If \( r_j = 0 \) then let \( C_j := \{x = x/c| (\oplus_{i=1}^{k} R_{p_{ij}})|, B_j := \min\{|x^b = 0|_0((\oplus_{i=1}^{k} R_{p_{ij}})|, B_j := \min\{|x^b = 0|_0((\oplus_{i=1}^{k} R_{p_{ij}})/r_j c I_{ij})|, B\} \). If \( r_j \neq 0 \) then let \( C_j := \{x = x/c| (\oplus_{i=1}^{k} R_{p_{ij}})|, B_j := \min\{|x^b = 0|_0((\oplus_{i=1}^{k} R_{p_{ij}})/r_j c I_{ij})|, B\} \). Now, setting \( k_j = 0 \) for \( 1 \leq j \leq n \), we are done.

(\(\Leftarrow\)) Fix \( 1 \leq j \leq n \). Suppose \( r_j = 0 \). Then \((p_{ij}, 0) \models (r_j, r_j a_j, \gamma_j, \delta_j)\) for each \( 1 \leq i \leq h_j \) and hence \( R_{p_{ij}} \models \Xi \). Suppose \( r_j \neq 0 \). Then \((p_{ij}, r_j I_{ij}) \models (r_j, r_j a_j, \gamma_j, \delta_j)\) for each \( 1 \leq i \leq h_j \) and hence \( R_{p_{ij}}/r_j c I_{ij} \models \Xi \).

By \ref{10.7}, \( \gamma_j \notin p_{ij}, \delta_j \notin q_{ij}, a \in p_{ij} \) and \( a \in q_{ij} \) implies that \( M(p_{ij}, q_{ij}, r_j) \models \Xi \). Thus
\[
F \oplus M' \oplus \bigoplus_{j=1}^{n} M_j \models \Xi.
\]

Therefore
\[
F \oplus M' \oplus \bigoplus_{j=1}^{n} M_j \models \{x = x/c|_{x} = \prod_{j=0}^{n} C_{i} \wedge |x^b = 0|_0 \geq \prod_{j=0}^{n+1} B_{i} \wedge \Xi.
\]

Since \( C = \prod_{j=0}^{n} C_{i} \) and \( \prod_{j=0}^{n+1} B_{i} \geq B \), we are done.

Since the set of \( C_j \in \mathbb{N} \) for \( 0 \leq j \leq n \) and \( B_j \in \mathbb{N} \) for \( 0 \leq j \leq n + 1 \) satisfying (1) is finite, it is enough to show that for fixed \( C_j \in \mathbb{N} \) for \( 0 \leq j \leq n \) and \( B_j \in \mathbb{N} \) for \( 0 \leq j \leq n + 1 \), there are algorithms answering whether (2), (3) and (4) hold. By \ref{7.6} since \( EPP(R) \) is recursive, there is an algorithm which answers whether (2) holds. By \ref{3.9} since \( DPR(R) \) is recursive there is an algorithm which answers whether (3) holds. Since \( DPR(R) \), \( EPP(R) \) and \( X(R) \) are recursive, by \ref{10.9} if \( r_j \neq 0 \) then there is an algorithm which answers whether (b) holds. Since \( DPR(R) \) and \( EPP(R) \) are recursive, by \ref{10.10} if \( r_j = 0 \) then there is an algorithm which answers whether (a) holds.

\[\square\]

11. The main theorem

**Theorem 11.1.** Let \( R \) be a Prüfer domain. The theory of \( R \)-modules is decidable if and only if \( DPR(R) \), \( EPP(R) \) and \( X(R) \) are recursive.

**Proof.** The forward direction follows from \textit{Gleitner, Parimala, Tsfasman, and Vostokov} \ref{6.4}, or \ref{3.5}, \ref{3.18} and \ref{3.22}.

By \ref{5.2} in order to show that \( T_R \) is decidable, it is enough to show that there is an algorithm which, given a sentence \( \chi \) of the form
\[
|d|x/x = 0| \square_1 D \wedge |x^b = 0/c|x| \square_2 E \wedge \chi_{f,g} \wedge \Xi,
\]
where \( \square_1, \square_2 \in \{\geq, =, 0\} \), \( d, c, b \in R \{0\}, D, E \in \mathbb{N}, f : X \to \mathbb{N}, g : Y \to \mathbb{N}, X, Y \) are finite sets of pp-1-pairs of the form \( x^b = 0/x = 0 \) or \( x = x/c|_{x} \) and \( \Xi \) is an auxiliary sentence, answers whether there exists an \( R \)-module which satisfies \( \chi \) or not.

Let \( W \) and \( V \) be as in \ref{9}. By \ref{9.5} \ref{9.9} \ref{9.11} there is an algorithm which given \( w \in W \) reducible, returns \( w \in W \) such that \( w \in V \) if and only if \( w \in V \), and, \textit{exsig} \( w < \text{exsig} w \). Since the set of extended signatures is artinian, it is enough to show that there is an algorithm which, given \( w \in W \) not reducible, answers
whether \( w \in V \) or not. By [9.13] and the statement just before that, it is enough to show that there is an algorithm which, given \( w \in W \) with extended signature in
\[
S := \{((\emptyset, \emptyset), (z_1, z_2), (z_3, z_4)) \mid z_1 + z_2 \leq 1 \text{ and } z_3 + z_4 \leq 1\},
\]
answers whether \( w \in V \) or not. Now, \( w \in V \) if and only if \( Dw \in V \). So, by 9.3 we can reduce \( S \) further to
\[
S := \{((\emptyset, \emptyset), (1, 0)), ((\emptyset, \emptyset), (1, 0)), (0, 0)), ((\emptyset, \emptyset), (1, 0), (0, 1))\}.
\]
By 9.13 10.2 10.4 and 10.5 such an algorithm exists. \( \square \)

## 12. Integer-valued polynomials

We use our main theorem, [11.1] to show that the theory of modules over the ring of integer-valued polynomials with rational valued coefficients, \( \text{Int}(\mathbb{Z}) \), is decidable.

First we fix some notation: For all \( p \in \mathbb{P} \), \( \mathbb{Z}(p) \) denotes \( \mathbb{Z} \) localised at the ideal generated by \( p \), \( \mathbb{Q}_p \) denote the field of \( p \)-adic numbers, \( v_p : \mathbb{Q}_p \to \mathbb{Z} \cup \{\infty\} \) denotes the \( p \)-adic valuation on \( \mathbb{Q}_p \), and \( \mathbb{Z}_p \) denote the \( p \)-adic integers.

The ring \( \text{Int}(\mathbb{Z}) \) is the subring of \( \mathbb{Q}[x] \) consisting of all polynomials \( a \in \mathbb{Q}[x] \) such that \( a(\mathbb{Z}) \subseteq \mathbb{Z} \). Recall, [CC97] I.1.1., that the polynomials
\[
\binom{x}{n} := \frac{x(x-1)\ldots(x-(n-1))}{n!}
\]
are a basis for \( \text{Int}(\mathbb{Z}) \) as a \( \mathbb{Z} \)-module. This readily gives us a recursive presentation of \( \text{Int}(\mathbb{Z}) \). The ring \( \text{Int}(\mathbb{Z}) \) is a Prüfer domain [CC97] VI.1.7.

Note, [CC97] I.2.1., that, for all \( p \in \mathbb{P} \), if \( f \in \mathbb{Q}[x] \) and \( f(\mathbb{Z}) \subseteq \mathbb{Z} \) then \( f(\mathbb{Z}(p)) \subseteq \mathbb{Z}(p) \). Further, for any \( p \in \mathbb{P} \), by continuity of polynomials over \( \mathbb{Q}_p \), \( f(\mathbb{Z}(p)) \subseteq \mathbb{Z}(p) \) implies \( f(\mathbb{Z}_p) \subseteq \mathbb{Z}_p \).

The prime spectrum of \( \text{Int}(\mathbb{Z}) \) is described in [CC97] V.2.7. We recall the information we need.

- For any \( p \in \mathbb{P} \), the prime ideals of \( \text{Int}(\mathbb{Z}) \) containing \( p \) are in bijective correspondence with the elements of \( \mathbb{Z}_p \) by mapping \( \alpha \in \mathbb{Z}_p \) to
\[
\mathfrak{m}_{p, \alpha} := \{ f \in \text{Int}(\mathbb{Z}) \mid f(\alpha) \in p\mathbb{Z}_p \}.
\]
The prime ideals \( \mathfrak{m}_{p, \alpha} \) are exactly the maximal ideals of \( \text{Int}(\mathbb{Z}) \) and the quotient \( \text{Int}(\mathbb{Z}) / \mathfrak{m}_{p, \alpha} \) has size \( p \).

- The non-zero prime ideals \( \mathfrak{p} \) of \( \text{Int}(\mathbb{Z}) \) such that \( \mathbb{Z} \cap \mathfrak{p} = \{0\} \) are in bijective correspondence with the monic irreducible polynomials \( q \in \mathbb{Q}[x] \) via the mapping
\[
q \mapsto \mathfrak{p}_q := q\mathbb{Q}[x] \cap \text{Int}(\mathbb{Z}).
\]
Note that \( \mathfrak{p}_q \subseteq \mathfrak{m}_{p, \alpha} \) if and only if \( q(\alpha) = 0 \) in \( \mathbb{Q}_p \).

It will sometimes be useful to have some alternate notation for the non-maximal prime ideals. For \( \alpha \in \mathbb{Z}_p \), let
\[
\mathfrak{p}_\alpha := \begin{cases} \mathfrak{p}_q, & \text{if } \alpha \text{ is algebraic and } q \in \mathbb{Z}[x] \text{ is its monic minimal polynomial;} \\ \{0\}, & \text{if } \alpha \text{ is transcendental.} \end{cases}
\]
This notation has the disadvantage that \( \mathfrak{p}_\alpha = \mathfrak{p}_\beta \) does not imply \( \alpha = \beta \). However, it allows us to work with \( \alpha \in \mathbb{Z}_p \) algebraic and transcendental uniformly in the following ways: Firstly, for \( a \in \text{Int}(\mathbb{Z}) \) and \( \alpha \in \mathbb{Z}_p \), \( \mathfrak{p}_\alpha \) if and only if \( a(\alpha) = 0 \).
Secondly, for \( q \prec R \) a prime ideal and \( \alpha \in \widehat{\mathbb{Z}}_p \), \( q \subseteq m_{p, \alpha} \) if and only if \( q = m_{p, \alpha} \), \( q = p_0 \) or \( q = \{0\} \)

By [11,1] we need to show that \( \text{DPR}(\text{Int}(\mathbb{Z})) \), \( \text{EPP}(\text{Int}(\mathbb{Z})) \) and \( \mathcal{X}(\text{Int}(\mathbb{Z})) \) are recursive. In order to do this, we will use the fact, [Ax68 Thm 17], that the common theory \( T_{\text{adic}} \) of the valued fields \( \mathbb{Q}_p \), as \( p \) varies, is decidable. We shall work in a two-sorted language \( \mathcal{L}_{\text{val}} \) of valued fields with a sort for the field \( K \), a sort \( \Gamma \) for the value group extended by \( \infty \) and a function symbol \( v : K \to \Gamma \) which will be interpreted as \( v_p \) in each \( \mathbb{Q}_p \). For convenience, we add a constant symbol 1 to the value group sort \( \Gamma \), which for each valued field \( \mathbb{Q}_p \) will be interpreted as the least strictly positive element of the value group.

Let \( \mathcal{L}_{\text{val}}^0 \) be the set of sentences in \( \mathcal{L}_{\text{val}} \). The sets

\[
T_{\text{adic}} := \{ \varphi \in \mathcal{L}_{\text{val}}^0 \mid \text{for all } p \in \mathbb{P}, \mathbb{Q}_p \models \varphi \}
\]

and

\[
\{ \varphi \in \mathcal{L}_{\text{val}}^0 \mid \text{there exists } p \in \mathbb{P} \text{ such that } \mathbb{Q}_p \models \varphi \}
\]

are recursive. Hence, since \( \mathbb{Q}_p \models \varphi \) if and only if \( \mathbb{Q}_q \models v(p) = 0 \lor \varphi \) for all \( q \in \mathbb{P} \), the set

\[
\{(p, \varphi) \in \mathbb{P} \times \mathcal{L}_{\text{val}}^0 \mid \mathbb{Q}_p \models \varphi \}
\]

is recursive.

**Proposition 12.1.** The set \( \text{DPR}(\text{Int}(\mathbb{Z})) \) is recursive.

**Proof.** Let \( a, b, c, d \in \text{Int}(\mathbb{Z}) \). Then \( (a, b, c, d) \in \text{DPR}(\text{Int}(\mathbb{Z})) \) if and only if

1. for all \( p \in \mathbb{P} \) and \( \alpha \in \widehat{\mathbb{Z}}_p \), \( a \in m_{p, \alpha}, b \notin m_{p, \alpha}, c \in m_{p, \alpha} \) or \( d \notin m_{p, \alpha} \);
2. for all \( p \in \mathbb{P} \) and \( \alpha \in \widehat{\mathbb{Z}}_p \), \( a \in m_{p, \alpha}, b \notin m_{p, \alpha}, c \in p_0 \) or \( d \notin p_0 \);
3. for all \( p \in \mathbb{P} \) and \( \alpha \in \widehat{\mathbb{Z}}_p \), \( a \in m_{p, \alpha}, b \notin m_{p, \alpha}, c = 0 \) or \( d \neq 0 \);
4. for all \( p \in \mathbb{P} \) and \( \alpha \in \widehat{\mathbb{Z}}_p \), \( a \in p_0, b \notin p_0, c \in m_{p, \alpha} \) or \( d \notin m_{p, \alpha} \);
5. for all \( p \in \mathbb{P} \) and \( \alpha \in \widehat{\mathbb{Z}}_p \), \( a = 0, b \neq 0, c \in m_{p, \alpha} \) or \( d \notin m_{p, \alpha} \);
6. for all \( q \in \mathbb{Q}[x] \) irreducible and monic, \( a \in p_q, b \notin p_q, c \in p_q \) or \( d \notin p_q \);
7. for all \( q \in \mathbb{Q}[x] \) irreducible and monic, \( a \in p_q, b \notin p_q, c = 0 \) or \( d \neq 0 \);
8. for all \( q \in \mathbb{Q}[x] \) irreducible and monic, \( a = 0, b \neq 0, c \in p_q \) or \( d \notin p_q \); and
9. \( a = 0 \) or \( b = 0 \) or \( c = 0 \) or \( d \neq 0 \).

Define \( \chi_1, \chi_2, \chi_3, \chi_4, \chi_5 \in \mathcal{L}_{\text{val}}^0 \) to be

\[
\chi_1 := \forall x \ (v(x) < 0 \lor v(a(x)) \geq 1 \lor v(b(x)) = 0 \lor v(c(x)) \geq 1 \lor v(d(x)) = 0),
\]

\[
\chi_2 := \forall x \ (v(x) < 0 \lor v(a(x)) \geq 1 \lor v(b(x)) = 0 \lor c(x) = \lor d(x) \neq 0),
\]

\[
\chi_3 := \forall x \ (v(x) < 0 \lor v(a(x)) \geq 1 \lor v(b(x)) = 0),
\]

\[
\chi_4 := \forall x \ (v(x) < 0 \lor a(x) = 0 \lor b(x) \neq 0 \lor v(c(x)) \geq 1 \lor v(d(x)) = 0),
\]

and

\[
\chi_5 := \forall x \ (v(x) < 0 \lor v(c(x)) \geq 1 \lor v(d(x)) = 0).
\]

**Claim:** \( (a, b, c, d) \in \text{DPR}(\text{Int}(\mathbb{Z})) \) if and only if

(i) \( \chi_1, \chi_2, \chi_4 \in T_{\text{adic}} \),
(ii) either \( c = 0, d \neq 0 \) or \( \chi_3 \in T_{\text{adic}} \),
(iii) either \( a = 0, b \neq 0 \) or \( \chi_5 \in T_{\text{adic}} \),
(iv) \( ac \in \text{rad}_{\mathbb{Q}[x]}(bQ[x] + dQ[x]) \),
(v) \( ac \in \text{rad}_{\mathbb{Q}[x]}(bQ[x]) \) or \( c = 0 \) or \( d \neq 0 \),
(vi) either \( c = 0, d \neq 0 \) or \( c \in \text{rad}_{\mathbb{Q}[x]}(dQ[x]) \), and
(vii) either \( a = 0, b \neq 0, c = 0 \) or \( d \neq 0 \).

Recall that \( a \in \mathfrak{m}_{p,\alpha} \) if and only if \( v_p(a(\alpha)) \geq 1 \) and \( a \in \mathfrak{p}_\alpha \) if and only if \( a(\alpha) = 0 \).

So, for \( j \in \{1, 2, 4\} \), (j) holds if and only if \( \chi_j \in T_{\text{adic}} \), (3) holds if and only if \( \chi_3 \in T_{\text{adic}} \), \( c = 0 \) and \( d \neq 0 \) and, and (5) holds if and only if \( \chi_5 \in T_{\text{adic}}, a = 0 \) and \( b \neq 0 \).

The statement that, for all \( p \) such that \( p = 0 \) or \( p = p_q \) with \( q \in \mathbb{Q}[x] \) monic irreducible,

\[
a \in p \lor c \in p \lor b \notin p \lor d \notin p
\]

is equivalent to \( ac \in \text{rad}_{\mathbb{Q}[x]}(bQ[x] + dQ[x]) \). So (6) and (9) hold if and only if (iv) holds. Similarly, (7) and (9) holds if and only if (v) holds and, (8) and (9) holds if and only if (vi) holds. Finally (9) holds if and only if (vii) holds. So the claim holds.

Since \( T_{\text{adic}} \) is decidable, we can effectively decide whether (i), (ii) and (iii) hold. If \( a, b_1, b_2 \in \mathbb{Q}[x] \) then \( a \in \text{rad}_{\mathbb{Q}[x]}(b_1Q[x] + b_2Q[x]) \) if and only if for all \( q \in \mathbb{Q}[x] \) irreducible, \( q \) divides \( b_1 \) and \( q \) divides \( b_2 \) implies \( q \) divides \( a \). Since \( \mathbb{Q} \) has a splitting algorithm, there is an algorithm which, given \( a, b_1, b_2 \in \mathbb{Q}[x] \), decides whether \( a \in \text{rad}_{\mathbb{Q}[x]}(b_1Q[x] + b_2Q[x]) \). Therefore, we can effectively decide whether (iv)-(vii) holds. It is obvious that we can effectively decide whether (vii) holds. \( \Box \)

In order to analyse \( \text{EPP}(\text{Int}(\mathbb{Z})) \), we need to understand the valuation overrings of \( \text{Int}(\mathbb{Z}) \). For \( p \in \mathbb{P} \), let \( v_p : \mathbb{Q}_p \to \mathbb{Z} \cup \{\infty\} \) denote the standard valuation on \( \mathbb{Q}_p \).

- For each \( p \in \mathbb{P} \) and \( \alpha \in \widehat{\mathbb{Z}}_p \) transcendental, define \( v_{p,\alpha} : \mathbb{Q}(x) \to \mathbb{Z} \cup \{\infty\} \) by setting \( v_{p,\alpha}(f/g) = v_p(f(\alpha)/g(\alpha)) \).
- For each \( p \in \mathbb{P} \) and \( \alpha \in \widehat{\mathbb{Z}}_p \) algebraic with monic minimal polynomial \( q \in \mathbb{Z}[x] \), define \( v_{p,\alpha} : \mathbb{Q}(x) \to \mathbb{Z} \cup \{\infty\} \) by setting \( v_{p,\alpha}(h) = (k, v_p(f(\alpha)/g(\alpha))) \) where \( h = q^k \cdot f/g, f(\alpha) \neq 0 \) and \( g(\alpha) \neq 0 \).

By [CC97 VI.1.9], \( \text{Int}(\mathbb{Z})_{\mathfrak{m}_{p,\alpha}} \) is the valuation ring of \( v_{p,\alpha} \).

Let \( e \in \text{Int}(\mathbb{Z}) \) and \( N \in \mathbb{N}_0 \).

- For \( p \in \mathbb{P} \) and \( \alpha \in \widehat{\mathbb{Z}}_p \) transcendental, \( v_{p,\alpha}(e) = v_p(e(\alpha)) = N \) if and only if
  \[
  |\text{Int}(\mathbb{Z})_{\mathfrak{m}_{p,\alpha}}/e\text{Int}(\mathbb{Z})_{\mathfrak{m}_{p,\alpha}}| = p^N.
  \]
- For \( p \in \mathbb{P} \) and \( \alpha \in \widehat{\mathbb{Z}}_p \) algebraic, \( v_{p,\alpha}(e(\alpha)) = N \) if and only if \( v_{p,\alpha}(e) = (0, N) \)
  if and only if
  \[
  |\text{Int}(\mathbb{Z})_{\mathfrak{m}_{p,\alpha}}/e\text{Int}(\mathbb{Z})_{\mathfrak{m}_{p,\alpha}}| = p^N.
  \]

**Proposition 12.2.** The set \( \text{EPP}(\text{Int}(\mathbb{Z})) \) is recursive.

**Proof.** **Claim:** \( (p, M; a; \gamma; e, N) \in \text{EPP}_1(\text{Int}(\mathbb{Z})) \) if and only if there exist \( h \in \{1, \ldots, N + M\} \), \( N_i, M_i \in \mathbb{N}_0 \) for \( 1 \leq i \leq h \) with \( \sum_{i=1}^h N_i = N \) and \( \sum_{i=1}^h M_i = M \) such that for each \( 1 \leq i \leq h \),

\[
Q_p \models \exists x \ v(x) \geq 0 \land v(e(x)) = N_i \land v(a(x)) \geq M_i \land v(\gamma(x)) = 0.
\]

Suppose \( (p, M; a; \gamma; e, N) \in \text{EPP}_1(\text{Int}(\mathbb{Z})) \). There exists \( \alpha_1, \ldots, \alpha_h \) and \( l_1, \ldots, l_h \in \mathbb{N}_0 \) such that \( \gamma \notin \mathfrak{m}_{p,\alpha_i}, a \in \mathfrak{m}_{p,\alpha_i}^l \),

\[
p^{\sum_{i=1}^h l_i} = \prod_{i=1}^h |\text{Int}(\mathbb{Z})_{\mathfrak{m}_{p,\alpha_i}}/\mathfrak{m}_{p,\alpha_i}^{l_i}| = p^M
\]
and

\[ p^{\sum_{i=1}^{h} v_p(e(\alpha_i))} = \prod_{i=1}^{h} |\text{Int}(\mathbb{Z})_{m_{p,\alpha_i}}/\epsilon\text{Int}(\mathbb{Z})_{m_{p,\alpha_i}}| = p^N. \]

We may assume that \( h \leq N + M \) since the size of the set of \( 1 \leq i \leq h \) such that\( v_p(e(\alpha_i)) > 0 \) or \( i \geq 0 \) is at most \( N + M \). Set \( N_i := v_p(e(\alpha_i)) \) and \( M_i := i \).

Then \( N = \sum_{i=1}^{h} N_i \) and \( M = \sum_{i=1}^{h} M_i \). Since \( a \in m_{p,\alpha_i}^M \), \( v_p(a(\alpha_i)) \geq M_i \) and since \( \gamma \notin m_{p,\alpha_i} \), \( v_p(\gamma(\alpha_i)) = 0 \) as required.

Conversely, suppose that there exist \( h \in \{1, \ldots, N + M\}, N_i, M_i \in N_0 \) for \( 1 \leq i \leq h \) with \( \sum_{i=1}^{h} N_i = N \) and \( \sum_{i=1}^{h} M_i = M \) such that for each \( 1 \leq i \leq h \),

\[ \exists x \ v(e(x)) = N_i \land v(a(x)) \geq M_i \land v(\gamma(x)) = 0 \]

holds in \( \mathbb{Q}_p \).

Let \( \alpha_i \) witness the truth of the sentence for each \( 1 \leq i \leq h \). Set \( p_i := m_{p,\alpha_i} \) for \( 1 \leq i \leq h \) and \( I_i := m_{p,\alpha_i}^M \). Then \( v_p(a(\alpha_i)) \geq M_i \) implies \( a \in m_{p,\alpha_i}^M \). Since \( v_p(\gamma(\alpha_i)) = 0 \), \( \gamma \notin m_{p,\alpha_i} \) and \( v_p(e(\alpha_i)) = N_i \) implies

\[ |\text{Int}(\mathbb{Z})_{m_{p,\alpha_i}}/\epsilon\text{Int}(\mathbb{Z})_{m_{p,\alpha_i}}| = p^{N_i}. \]

So \((p, M; a; \gamma; e, N) \in \text{EPP}(\text{Int}(\mathbb{Z}))\) as required.

The proposition now follows from the claim since the set of \((p, \varphi) \in P \times \mathcal{L}_0^{\text{val}}\) such that \( \mathbb{Q}_p \models \varphi \) is recursive.

\[ \square \]

**Proposition 12.3.** The set \( X(\text{Int}(\mathbb{Z})) \) is recursive.

**Proof.** Claim: \((p, n; e, \gamma, a, \delta) \in X(R)\) if and only if there exist \( h \in \{0, \ldots, n\} \) and \( \alpha_i \in \mathbb{Z}_p \) for \( 1 \leq i \leq h \) such that \( \sum_{i=1}^{h} v_p(e(\alpha_i)) = n \), \( v_p(\gamma(\alpha_i)) = 0 \) and either

\begin{enumerate}[(i)]
  \item \( v_p(\delta(\alpha_i)) = 0 \),
  \item \( a(\alpha_i) = 0 \) and \( \delta(\alpha_i) \neq 0 \), or
  \item \( a = 0 \) and \( \delta \neq 0 \).
\end{enumerate}

Recall, \[3.21\] \((p, n; e, \gamma, a, \delta) \in X(R)\) if and only if there exist \( h \in \mathbb{N} \) and maximal ideals \( m_{p,\alpha_i} \) for \( 1 \leq i \leq h \) such that

\[ p^{\sum_{i=1}^{h} v_p(e(\alpha_i))} = |\mathbb{Z}_p/\epsilon\mathbb{Z}_p| = p^n, \]

\( \gamma \notin m_{p,\alpha_i} \), and for each \( 1 \leq i \leq h \), either \( \delta \notin m_{p,\alpha_i} \) or there exists \( q_i \) a prime ideal such that \( q_i \subseteq m_{p,\alpha_i} \), \( a \in q_i \), and \( \delta \notin q_i \).

If \( q \) is a prime ideal strictly contained in \( m_{p,\alpha} \) then \( q = p_\alpha \) or \( q = \{0\} \). Thus there exists \( q \subseteq m_{p,\alpha} \) such that \( a \in q \) and \( \delta \notin q \) if and only if \( a(\alpha) = 0 \) and \( \delta(\alpha) \neq 0 \), or, \( a = 0 \) and \( \delta \neq 0 \). For \( \alpha \in \mathbb{Z}_p \), \( \gamma \notin m_{p,\alpha} \) if and only if \( v_p(\gamma(\alpha)) = 0 \).

Therefore \((p, n; e, \gamma, a, \delta) \in X(R)\) if and only if there exist \( h \in \mathbb{N} \) and maximal ideals \( m_{p,\alpha_i} \) for \( 1 \leq i \leq h \) such that \( n = \sum_{i=1}^{h} v_p(e(\alpha_i)) \), \( \gamma \notin m_{p,\alpha_i} \), and for each \( 1 \leq i \leq h \), either \( v_p(\delta(\alpha_i)) = 0 \), or, \( a(\alpha) = 0 \) and \( \delta(\alpha) \neq 0 \), or, \( a = 0 \) and \( \delta \neq 0 \). So we have proved the claim.

The right hand side of the claim can be written as a sentence \( \varphi \in \mathcal{L}_0^{\text{val}} \) so that \( \mathbb{Q}_p \models \varphi \) if and only if \((p, n; \lambda, \gamma, a, \delta) \in X(R)\). By convention \((p, 0; \lambda, \gamma, a, \delta) \in X(R)\) for all \( p, \lambda, \gamma, a, \delta \). So, since the set of \((p, \varphi) \in P \times \mathcal{L}_0^{\text{val}}\) such that \( \mathbb{Q}_p \models \varphi \) is recursive, we are done.

\[ \square \]

**Theorem 12.4.** The theory of modules of the ring of integer valued polynomials is decidable.

**Proof.** This follows from 11.1, 12.1, 12.2 and 12.3. \[ \square \]
