# IDEAL STRUCTURE OF $C^{*}$-ALGEBRAS OF SINGLY GENERATED DYNAMICAL SYSTEMS 

TAKESHI KATSURA

#### Abstract

In this paper, we show that the set of all ideals of the $C^{*}$-algebras of a singly generated dynamical system corresponds bijectively to the set of all subsets of the product of the space of the system and the circle satisfying three conditions.

## 0. Introduction

In the theory of $C^{*}$-algebras, it is very important yet very difficult to list all ideals of a given $C^{*}$-algebra. In this paper, we list all ideals of a $C^{*}$-algebra of a singly generated dynamical system in terms of subsets of a certain space.

In [R], Renault introduces the notion of a singly generated dynamical system (SGDS) and associates a $C^{*}$-algebra with it. In [K1], the author introduces the notion of a topological graph and associates a $C^{*}$-algebra with it. In [K2], the author shows that an SGDS can be considered as a topological graph and their $C^{*}$ algebras coincide. Conversely in [K4] every $C^{*}$-algebra of a topological graph is a $C^{*}$-algebra of some SGDS (see also [Y] and [KL). Thus the class of $C^{*}$-algebras of SGDSs is fairly large. Although in [R] spaces in SGDSs are assumed to be second countable, there is no such restriction in [K1]. In this paper, spaces are not assumed to be second countable, and hence the associated $C^{*}$-algebras are not necessarily separable.

The purpose of this paper is to investigate the ideal structure of $C^{*}$-algebras of SGDSs. Since we do not assume second countability, it is almost impossible to list primitive ideals of the associated $C^{*}$-algebra in terms of points of the space. Instead in this paper, we list all ideals directly in terms of subsets of the product of the space and the circle (Theorem 7.8). The investigation here may be useful to describe the topology of primitive ideal space when the space is second countable (cf. [SW]).

This paper is organized as follows. In Section 1, we introduce SGDSs and their $C^{*}$-algebras. To define a $C^{*}$-algebra of an SGDS, we do not use groupoids as in [R], but use a definition similar to [K1]. We examine the structure of a $C^{*}$-algebra of an SGDS which we need later. In Section 2, we construct lots of irreducible representations of a $C^{*}$-algebra of an SGDS. In Section 3, we associate a subset of a space to each ideal, and an ideal to each subset. Then, we list all gauge-invariant ideals in terms of invariant subsets (Proposition 3.11). In Section 4, we list all prime ideals, and show that the set of primitive ideals constructed in Section 2 is sufficiently large (Corollary 4.19). In Section 5, we associate a subset of the product of a space and the circle to each ideal, and an ideal to each subset. We show that ideals of the $C^{*}$-algebra of an SGDS correspond injectively to a subset of the product of a

[^0]space and the circle (Proposition 5.5). In Section 6, we show that this subset is an admissible set which is defined in Definition 5.7 (Proposition 6.8). In Section 7, we show that the set of all ideals of the $C^{*}$-algebra of an SGDS corresponds bijectively to the set of all admissible sets (Theorem 7.8).

We try to make this paper self-contained as well as possible. However, in Section4 we need two kinds of uniqueness theorems for $C^{*}$-algebras of topological graphs which are quoted in Appendix A.

## 1. Singly generated dynamical systems

Definition 1.1. A pair $\Sigma=(X, \sigma)$ is a singly generated dynamical system (in short SGDS) if $X$ is a locally compact space and $\sigma$ is a local homeomorphism from an open subset $U$ of $X$ to $X$.

It should be emphasized that $X$ is not necessarily second countable. Throughout this paper, $\Sigma=(X, \sigma)$ means an SGDS. We denote by $\mathbb{N}:=\{0,1,2, \ldots\}$ the set of natural numbers.

Definition 1.2. We define a decreasing sequence $\left\{U_{n}\right\}_{n \in \mathbb{N}}$ of open subsets of $X$ by $U_{0}=X, U_{1}=U$ and $U_{n+1}=\left\{x \in U_{n} \mid \sigma^{n}(x) \in U\right\}$.

The open set $U_{n}$ is the domain of $\sigma^{n}$, and $\sigma^{n}: U_{n} \rightarrow X$ is a local homeomorphism.
Definition 1.3. For $\xi, \eta \in C_{c}(U)$, we define $\langle\xi, \eta\rangle \in C_{c}(X)$ by

$$
\langle\xi, \eta\rangle(x)=\sum_{\sigma(y)=x} \bar{\xi}(y) \eta(y)
$$

for $x \in X$, where $\bar{\xi} \in C_{c}(U)$ is defined by $\bar{\xi}(y)=\overline{\xi(y)}$ for $y \in U$.
In the expression above, we implicitly assume that $y$ is in $U$. We use this convention. Namely if we write $\sigma^{n}(x)=\cdots$, we assume $x \in U_{n}$. The fact that $\langle\xi, \eta\rangle$ is in $C_{c}(X)$ can be shown by using the fact that $\sigma$ is a local homeomorphism (see [K1, Lemma 1.5]).

Definition 1.4. The $C^{*}$-algebra $C^{*}(\Sigma)$ of an $\operatorname{SGDS} \Sigma=(X, \sigma)$ is the universal $C^{*}$-algebra generated by the images of a $*$-homomorphism $t^{0}: C_{0}(X) \rightarrow C^{*}(\Sigma)$ and a linear map $t^{1}: C_{c}(U) \rightarrow C^{*}(\Sigma)$ satisfying
(i) $t^{1}(\xi)^{*} t^{1}(\eta)=t^{0}(\langle\xi, \eta\rangle)$ for $\xi, \eta \in C_{c}(U)$,
(ii) $t^{1}(\xi) t^{1}(\eta)^{*}=t^{0}(\xi \bar{\eta})$ for $\xi, \eta \in C_{c}(V)$ where $V \subset U$ is an open subset on which $\sigma$ is injective.
We call the pair $\left(t^{0}, t^{1}\right)$ in Definition 1.4 the universal pair for $C^{*}(\Sigma)$. Hereafter, we investigate properties of the universal pair $\left(t^{0}, t^{1}\right)$ for $C^{*}(\Sigma)$. For $f \in C_{0}(X)$ and $\xi \in C_{c}(U)$, we have $t^{1}(\xi) t^{0}(f)=t^{1}(\xi(f \circ \sigma))$ because one can see $d^{*} d=0$ for $d=t^{1}(\xi) t^{0}(f)-t^{1}(\xi(f \circ \sigma))$ by the computation

$$
\begin{aligned}
t^{1}(\eta)^{*}\left(t^{1}(\xi) t^{0}(f)-t^{1}(\xi(f \circ \sigma))\right) & =t^{0}(\langle\eta, \xi\rangle) t^{0}(f)-t^{0}(\langle\eta, \xi(f \circ \sigma)\rangle) \\
& =t^{0}(\langle\eta, \xi\rangle f-\langle\eta, \xi(f \circ \sigma)\rangle)=0
\end{aligned}
$$

for arbitrary $\eta \in C_{c}(U)$. For $f \in C_{0}(X)$ and $\xi \in C_{c}(U)$, we have $t^{0}(f) t^{1}(\xi)=t^{1}(f \xi)$. To see this, first we may assume $\xi \in C_{c}(V)$ where $V \subset U$ is an open subset on which $\sigma$ is injective by the partition of unity because the fact that $\sigma$ is locally homeomorphic implies that the set of such $V$ covers $U$. Now for arbitrary $\eta \in C_{c}(V)$, we have

$$
\left(t^{0}(f) t^{1}(\xi)-t^{1}(f \xi)\right) t^{1}(\eta)^{*}=t^{0}(f) t^{0}(\xi \bar{\eta})-t^{0}(f \xi \bar{\eta})=0
$$

Therefore we get $d d^{*}=0$ for $d=t^{0}(f) t^{1}(\xi)-t^{1}(f \xi)$. We have shown that $t^{0}(f) t^{1}(\xi)=t^{1}(f \xi)$ for all $f \in C_{0}(X)$ and $\xi \in C_{c}(U)$. Finally we see that for $f \in C_{c}(U)$ there exist $\xi_{1}, \ldots, \xi_{n}, \eta_{1}, \ldots, \eta_{n} \in C_{c}(U)$ such that

$$
t^{0}(f)=\sum_{k=1}^{n} t^{1}\left(\xi_{k}\right) t^{1}\left(\eta_{k}\right)^{*}
$$

By the partition of unity, there exist $f_{k} \in C_{c}\left(V_{k}\right)$ for $k=1, \ldots, n$ such that $f=$ $\sum_{k=1}^{n} f_{k}$ where $V_{k} \subset U$ is an open subset on which $\sigma$ is injective for $k=1, \ldots, n$. Then for $k=1, \ldots, n$ one can find $\xi_{k}, \eta_{k} \in C_{c}\left(V_{k}\right)$ such that $\xi_{k} \overline{\eta_{k}}=f_{k}$ (for example one can take $\eta_{k}=\left|f_{k}\right|^{1 / 2}$ ). Then we have

$$
t^{0}(f)=\sum_{k=1}^{n} t^{0}\left(f_{k}\right)=\sum_{k=1}^{n} t^{1}\left(\xi_{k}\right) t^{1}\left(\eta_{k}\right)^{*}
$$

From these computation, one can see that the $C^{*}$-algebra $C^{*}(\Sigma)$ is the $C^{*}$-algebra of the topological graph $E=(X, U, \sigma, \iota)$, where $\iota: U \rightarrow X$ is the embedding, as defined in [K1, Definition 2.10]. Thus by [K2, Proposition 10.9], the $C^{*}$-algebra $C^{*}(\Sigma)$ is isomorphic to the $C^{*}$-algebra defined in [R] when $X$ is second countable.

We try to make this paper self-contained as well as possible. We quote results in [K1] which is used to prove the main theorem (Theorem 7.8) only in Appendix A. We know that both $t^{0}$ and $t^{1}$ are injective by [K1, Proposition 3.7]. This fact is reproved in Lemma 2.8.

Definition 1.5. Let $n \in \mathbb{N}$. For $\xi, \eta \in C_{c}\left(U_{n}\right)$, we define $\langle\xi, \eta\rangle_{n} \in C_{c}(X)$ by

$$
\langle\xi, \eta\rangle_{n}(x)=\sum_{\sigma^{n}(y)=x} \bar{\xi}(y) \eta(y)
$$

for $x \in X$.
Note that $\langle\xi, \eta\rangle_{0}=\bar{\xi} \eta$ for $\xi, \eta \in C_{c}(X)$, and $\langle\xi, \eta\rangle_{1}=\langle\xi, \eta\rangle$ for $\xi, \eta \in C_{c}(U)$.
Lemma 1.6. Let $n, m \in \mathbb{N}$. For $\xi_{1}, \eta_{1} \in C_{c}\left(U_{n}\right)$ and $\xi_{2}, \eta_{2} \in C_{c}\left(U_{m}\right)$, define $\xi, \eta \in C_{c}\left(U_{n+m}\right)$ by $\xi(x)=\xi_{1}(x) \xi_{2}\left(\sigma^{n}(x)\right)$ and $\eta(x)=\eta_{1}(x) \eta_{2}\left(\sigma^{n}(x)\right)$ for $x \in U_{n+m}$. Then we have

$$
\left\langle\xi_{2},\left\langle\xi_{1}, \eta_{1}\right\rangle_{n} \eta_{2}\right\rangle_{m}=\langle\xi, \eta\rangle_{n+m}
$$

Proof. For $x \in X$, we have

$$
\begin{aligned}
\left\langle\xi_{2},\left\langle\xi_{1}, \eta_{1}\right\rangle_{n} \eta_{2}\right\rangle_{m}(x) & =\sum_{\sigma^{m}(y)=x} \overline{\xi_{2}}(y)\left\langle\xi_{1}, \eta_{1}\right\rangle_{n}(y) \eta_{2}(y) \\
& =\sum_{\sigma^{m}(y)=x} \overline{\xi_{2}}(y)\left(\sum_{\sigma^{n}(z)=y} \overline{\xi_{1}}(z) \eta_{1}(z)\right) \eta_{2}(y) \\
& =\sum_{\sigma^{m}(y)=x} \sum_{\sigma^{n}(z)=y} \overline{\xi_{2}}\left(\sigma^{n}(z)\right) \overline{\xi_{1}}(z) \eta_{1}(z) \eta_{2}\left(\sigma^{n}(z)\right) \\
& =\sum_{\sigma^{n+m}(z)=x} \bar{\xi}(z) \eta(z) \\
& =\langle\xi, \eta\rangle_{n+m}(x)
\end{aligned}
$$

Lemma 1.7. Let $n \in \mathbb{N}$. For $\xi_{1}, \ldots, \xi_{n}, \eta_{1}, \ldots, \eta_{n} \in C_{c}(U)$, define $\xi, \eta \in C_{c}\left(U_{n}\right)$ by

$$
\begin{aligned}
& \xi(x)=\xi_{1}(x) \xi_{2}(\sigma(x)) \cdots \xi_{n}\left(\sigma^{n-1}(x)\right) \\
& \eta(x)=\eta_{1}(x) \eta_{2}(\sigma(x)) \cdots \eta_{n}\left(\sigma^{n-1}(x)\right)
\end{aligned}
$$

for $x \in U_{n}$. Then we have

$$
\left\langle\xi_{n},\left\langle\xi_{n-1}, \cdots,\left\langle\xi_{2},\left\langle\xi_{1}, \eta_{1}\right\rangle \eta_{2}\right\rangle \cdots \eta_{n-1}\right\rangle \eta_{n}\right\rangle=\langle\xi, \eta\rangle_{n}
$$

Proof. Apply Lemma $1.6(n-1)$ times.
Lemma 1.8. Let $n \in \mathbb{N}$. For $\xi_{1}, \ldots, \xi_{n}, \eta_{1}, \ldots, \eta_{n} \in C_{c}(U)$, we have

$$
\begin{aligned}
\left(t^{1}\left(\xi_{1}\right) t^{1}\left(\xi_{2}\right) \cdots t^{1}\left(\xi_{n}\right)\right)^{*} & \left(t^{1}\left(\eta_{1}\right) t^{1}\left(\eta_{2}\right) \cdots t^{1}\left(\eta_{n}\right)\right) \\
& =t^{0}\left(\left\langle\xi_{n},\left\langle\xi_{n-1}, \cdots,\left\langle\xi_{2},\left\langle\xi_{1}, \eta_{1}\right\rangle \eta_{2}\right\rangle \cdots \eta_{n-1}\right\rangle \eta_{n}\right\rangle\right)
\end{aligned}
$$

Proof. This follows from direct computation.
Lemma 1.9. Let $n, m \in \mathbb{N}$. For $\xi \in C_{c}\left(U_{n+m}\right)$, there exist $\xi_{1} \in C_{c}\left(U_{n}\right)$ and $\xi_{2} \in C_{c}\left(U_{m}\right)$ such that $\xi(x)=\xi_{1}(x) \xi_{2}\left(\sigma^{n}(x)\right)$ for $x \in U_{n+m}$.

Proof. Take $\xi_{1}=\xi$, and choose $\xi_{2} \in C_{c}\left(U_{m}\right)$ which is 1 on the compact set $\sigma^{n}(C) \subset$ $U_{m}$ where $C \subset U_{n+m}$ is the compact support of $\xi$.
Lemma 1.10. Let $n \in \mathbb{N}$. For $\xi \in C_{c}\left(U_{n}\right)$, there exist $\xi_{1}, \xi_{2}, \ldots, \xi_{n} \in C_{c}(U)$ such that $\xi(x)=\xi_{1}(x) \xi_{2}(\sigma(x)) \cdots \xi_{n}\left(\sigma^{n-1}(x)\right)$ for $x \in U_{n}$.

Proof. Apply Lemma $1.9(n-1)$ times.
For each integer $n \geq 2$, we define a linear map $t^{n}: C_{c}\left(U_{n}\right) \rightarrow C^{*}(\Sigma)$. Take $\xi \in C_{c}\left(U_{n}\right)$. Take $\xi_{1}, \ldots, \xi_{n} \in C_{c}(U)$ such that

$$
\xi(x)=\xi_{1}(x) \xi_{2}(\sigma(x)) \cdots \xi_{n}\left(\sigma^{n-1}(x)\right)
$$

for all $x \in U_{n}$. Such functions exist by Lemma 1.10. We set $t^{n}(\xi)=t^{1}\left(\xi_{1}\right) t^{1}\left(\xi_{2}\right) \cdots t^{1}\left(\xi_{n}\right)$. This definition is well-defined because Lemma 1.7 and Lemma 1.8 imply $d^{*} d=0$ for the difference $d$ of two definitions. By the same reason, we see that $t^{n}$ is linear. We also see the following.
Lemma 1.11. For $\xi, \eta \in C_{c}\left(U_{n}\right)$, we have $t^{n}(\xi)^{*} t^{n}(\eta)=t^{0}\left(\langle\xi, \eta\rangle_{n}\right)$.
Proof. This follows from Lemma 1.7 and Lemma 1.8.

Lemma 1.12. Let $n, m \in \mathbb{N}$. For $\xi_{1} \in C_{c}\left(U_{n}\right)$ and $\xi_{2} \in C_{c}\left(U_{m}\right)$, define $\xi \in$ $C_{c}\left(U_{n+m}\right)$ by $\xi(x)=\xi_{1}(x) \xi_{2}\left(\sigma^{n}(x)\right)$ for $x \in U_{n+m}$. Then we have

$$
t^{n}\left(\xi_{1}\right) t^{m}\left(\xi_{2}\right)=t^{n+m}(\xi)
$$

Proof. When $n \geq 1$ and $m \geq 1$, this follows from the definition of $t^{n}$. When $n=0$ or $m=0$, this follows from a similar computation as the one after Definition 1.4.

Lemma 1.13. Let $n, m \in \mathbb{N}$. For $\xi \in C_{c}\left(U_{n}\right)$ and $\eta \in C_{c}\left(U_{n+m}\right) \subset C_{c}\left(U_{n}\right)$, we have

$$
t^{n}(\xi)^{*} t^{n+m}(\eta)=t^{m}\left(\langle\xi, \eta\rangle_{n}\right)
$$

Proof. By Lemma 1.9, choose $\eta_{1} \in C_{c}\left(U_{n}\right)$ and $\eta_{2} \in C_{c}\left(U_{m}\right)$ such that $\eta(x)=$ $\eta_{1}(x) \eta_{2}\left(\sigma^{n}(x)\right)$ for $x \in U_{n+m}$. By Lemma 1.12 and Lemma 1.11, we have

$$
\begin{aligned}
t^{n}(\xi)^{*} t^{n+m}(\eta) & =t^{n}(\xi)^{*} t^{n}\left(\eta_{1}\right) t^{m}\left(\eta_{2}\right)=t^{0}\left(\left\langle\xi, \eta_{1}\right\rangle_{n}\right) t^{m}\left(\eta_{2}\right) \\
& =t^{m}\left(\left\langle\xi, \eta_{1}\right\rangle_{n} \eta_{2}\right)=t^{m}\left(\left\langle\xi, \eta_{1}\left(\eta_{2} \circ \sigma^{n}\right)\right\rangle_{n}\right)=t^{m}\left(\langle\xi, \eta\rangle_{n}\right)
\end{aligned}
$$

Lemma 1.14. The $C^{*}$-algebra $C^{*}(\Sigma)$ is the closure of the linear span of the set

$$
\left\{t^{n}(\xi) t^{m}(\eta)^{*} \mid n, m \in \mathbb{N}, \xi \in C_{c}\left(U_{n}\right), \eta \in C_{c}\left(U_{m}\right)\right\}
$$

Proof. By Lemma 1.12 and Lemma 1.13, the set above is closed under multiplication. This set contains the images of $t^{0}$ and $t^{1}$. Hence the closure of the linear span of the set is $C^{*}(\Sigma)$.

## 2. Irreducible representations of $C^{*}(\Sigma)$

Take an SGDS $\Sigma=(X, \sigma)$. In this section, we construct irreducible representations $\pi_{x_{0}, \gamma}$ of the $C^{*}$-algebra $C^{*}(\Sigma)$.
Definition 2.1. For $x_{0} \in X$, we define the orbit of $x_{0}$ by

$$
\operatorname{Orb}\left(x_{0}\right)=\left\{x \in X \mid \sigma^{n}(x)=\sigma^{m}\left(x_{0}\right) \text { for some } n, m \in \mathbb{N}\right\}
$$

Note that for $x \in \operatorname{Orb}\left(x_{0}\right)$ we have $\operatorname{Orb}(x)=\operatorname{Orb}\left(x_{0}\right)$. Hence two orbits $\operatorname{Orb}(x)$ and $\operatorname{Orb}(y)$ are either same or disjoint.
Definition 2.2. For $x_{0} \in X$, let $H_{x_{0}}$ be the Hilbert space whose complete orthonormal system is given by $\left\{\delta_{x}\right\}_{x \in \operatorname{Orb}\left(x_{0}\right)}$. The inner product of $H_{x_{0}}$ is denoted by $\langle\cdot, \cdot\rangle_{x_{0}}$ which is linear in the second variable.
Definition 2.3. For $\left(x_{0}, \gamma_{0}\right) \in X \times \mathbb{T}$, we define two maps $t_{\left(x_{0}, \gamma_{0}\right)}^{0}: C_{0}(X) \rightarrow B\left(H_{x_{0}}\right)$ and $t_{\left(x_{0}, \gamma_{0}\right)}^{1}: C_{c}(U) \rightarrow B\left(H_{x_{0}}\right)$ by

$$
t_{\left(x_{0}, \gamma_{0}\right)}^{0}(f) \delta_{x}=f(x) \delta_{x}, \quad t_{\left(x_{0}, \gamma_{0}\right)}^{1}(\xi) \delta_{x}=\gamma_{0} \sum_{\sigma(y)=x} \xi(y) \delta_{y},
$$

for $x \in \operatorname{Orb}\left(x_{0}\right)$.
Take $\left(x_{0}, \gamma_{0}\right) \in X \times \mathbb{T}$ and fix it for a while. It is routine to check that $t_{\left(x_{0}, \gamma_{0}\right)}^{0}$ is a well-defined $*$-homomorphism and $t_{\left(x_{0}, \gamma_{0}\right)}^{1}$ is a well-defined linear map.
Lemma 2.4. For $\xi \in C_{c}(U)$ and $y \in \operatorname{Orb}\left(x_{0}\right)$, we have

$$
t_{\left(x_{0}, \gamma_{0}\right)}^{1}(\xi)^{*} \delta_{y}= \begin{cases}\gamma_{0}^{-1} \bar{\xi}(y) \delta_{\sigma(y)} & \text { if } y \in U \\ 0 & \text { otherwise }\end{cases}
$$

Proof. For $x, y \in \operatorname{Orb}\left(x_{0}\right)$, we have

$$
\begin{aligned}
\left\langle\delta_{x}, t_{\left(x_{0}, \gamma_{0}\right)}^{1}(\xi)^{*} \delta_{y}\right\rangle_{x_{0}} & =\left\langle t_{\left(x_{0}, \gamma_{0}\right)}^{1}(\xi) \delta_{x}, \delta_{y}\right\rangle_{x_{0}} \\
& =\left\langle\gamma_{0} \sum_{\sigma\left(y^{\prime}\right)=x} \xi\left(y^{\prime}\right) \delta_{y^{\prime}}, \delta_{y}\right\rangle_{x_{0}} \\
& =\sum_{\sigma\left(y^{\prime}\right)=x} \gamma_{0}^{-1} \overline{\xi\left(y^{\prime}\right)}\left\langle\delta_{y^{\prime}}, \delta_{y}\right\rangle_{x_{0}} \\
& = \begin{cases}\gamma_{0}^{-1} \bar{\xi}(y) & \text { if } x=\sigma(y), \\
0 & \text { otherwise } .\end{cases}
\end{aligned}
$$

This completes the proof.
Proposition 2.5. The pair $\left(t_{\left(x_{0}, \gamma_{0}\right)}^{0}, t_{\left(x_{0}, \gamma_{0}\right)}^{1}\right)$ satisfies (i) and (ii) in Definition 1.4.
Proof. Take $\xi, \eta \in C_{c}(U)$. For $x \in \operatorname{Orb}\left(x_{0}\right)$, we have

$$
\begin{aligned}
t_{\left(x_{0}, \gamma_{0}\right)}^{1}(\xi)^{*} t_{\left(x_{0}, \gamma_{0}\right)}^{1}(\eta) \delta_{x} & =t_{\left(x_{0}, \gamma_{0}\right)}^{1}(\xi)^{*}\left(\gamma_{0} \sum_{\sigma(y)=x} \eta(y) \delta_{y}\right) \\
& =\gamma_{0} \sum_{\sigma(y)=x} \eta(y) t_{\left(x_{0}, \gamma_{0}\right)}^{1}(\xi)^{*} \delta_{y} \\
& =\gamma_{0} \sum_{\sigma(y)=x} \eta(y) \gamma_{0}^{-1} \bar{\xi}(y) \delta_{\sigma(y)} \\
& =\sum_{\sigma(y)=x} \bar{\xi}(y) \eta(y) \delta_{x} \\
& =\langle\xi, \eta\rangle(x) \delta_{x}
\end{aligned}
$$

by Lemma 2.4. This shows $t_{\left(x_{0}, \gamma_{0}\right)}^{1}(\xi)^{*} t_{\left(x_{0}, \gamma_{0}\right)}^{1}(\eta)=t_{\left(x_{0}, \gamma_{0}\right)}^{0}(\langle\xi, \eta\rangle)$. Now take an open subset $V \subset U$ on which $\sigma$ is injective, and take $\xi, \eta \in C_{c}(V)$. For $y \in \operatorname{Orb}\left(x_{0}\right) \cap V$, we have

$$
\begin{aligned}
t_{\left(x_{0}, \gamma_{0}\right)}^{1}(\xi) t_{\left(x_{0}, \gamma_{0}\right)}^{1}(\eta)^{*} \delta_{y} & =t_{\left(x_{0}, \gamma_{0}\right)}^{1}(\xi)\left(\gamma_{0}^{-1} \bar{\eta}(y) \delta_{\sigma(y)}\right) \\
& =\gamma_{0}^{-1} \bar{\eta}(y) \gamma_{0} \sum_{\sigma\left(y^{\prime}\right)=\sigma(y)} \xi\left(y^{\prime}\right) \delta_{y^{\prime}} \\
& =\bar{\eta}(y) \xi(y) \delta_{y}
\end{aligned}
$$

by Lemma 2.4. For $y \in \operatorname{Orb}\left(x_{0}\right) \backslash V$, the same equation holds because the both sides become 0 . Hence we get $t_{\left(x_{0}, \gamma_{0}\right)}^{1}(\xi) t_{\left(x_{0}, \gamma_{0}\right)}^{1}(\eta)^{*}=t_{\left(x_{0}, \gamma_{0}\right)}^{0}(\xi \bar{\eta})$.

Definition 2.6. We denote by $\pi_{\left(x_{0}, \gamma_{0}\right)}: C^{*}(\Sigma) \rightarrow B\left(H_{x_{0}}\right)$ the $*$-homomorphism induced by the pair $\left(t_{\left(x_{0}, \gamma_{0}\right)}^{0}, t_{\left(x_{0}, \gamma_{0}\right)}^{1}\right)$.

Definition 2.7. For $\left(x_{0}, \gamma_{0}\right) \in X \times \mathbb{T}$, we set $P_{\left(x_{0}, \gamma_{0}\right)}=\operatorname{ker} \pi_{\left(x_{0}, \gamma_{0}\right)}$.
Lemma 2.8. Let $\left(t^{0}, t^{1}\right)$ be the universal pair for $C^{*}(\Sigma)$. Then both $t^{0}$ and $t^{1}$ are injective.

Proof. For each $x \in X$, we have ker $t_{(x, 1)}^{0}=C_{0}(X \backslash \overline{\operatorname{Orb}(x)})$. Since $t_{(x, 1)}^{0}=\pi_{(x, 1)} \circ t^{0}$, we have $\operatorname{ker} t^{0} \subset \operatorname{ker} t_{(x, 1)}^{0}$. Hence we have

$$
\operatorname{ker} t^{0} \subset \bigcap_{x \in X} \operatorname{ker} t_{(x, 1)}^{0}=\bigcap_{x \in X} C_{0}(X \backslash \overline{\operatorname{Orb}(x)})=0
$$

This shows that $t^{0}$ is injective. Take $\xi \in C_{c}(U)$ with $t^{1}(\xi)=0$. Then we have $t^{0}(\langle\xi, \xi\rangle)=t^{1}(\xi)^{*} t^{1}(\xi)=0$. Since $t^{0}$ is injective, we have $\langle\xi, \xi\rangle=0$. This shows $\xi=0$. Therefore $t^{1}$ is injective.

We are going to see that the representation $\pi_{\left(x_{0}, \gamma_{0}\right)}$ is irreducible, and hence $P_{\left(x_{0}, \gamma_{0}\right)}$ is a primitive ideal of $C^{*}(\Sigma)$.

Lemma 2.9. For $n \in \mathbb{N}, \xi \in C_{0}\left(U_{n}\right)$ and $x \in \operatorname{Orb}\left(x_{0}\right)$, we have

$$
\begin{aligned}
\pi_{\left(x_{0}, \gamma_{0}\right)}\left(t^{n}(\xi)\right) \delta_{x} & =\gamma_{0}^{n} \sum_{\sigma^{n}(y)=x} \xi(y) \delta_{y} \\
\pi_{\left(x_{0}, \gamma_{0}\right)}\left(t^{n}(\xi)\right)^{*} \delta_{x} & = \begin{cases}\gamma_{0}^{-n} \bar{\xi}(x) \delta_{\sigma^{n}(x)} & \text { if } x \in U_{n} \\
0 & \text { otherwise }\end{cases}
\end{aligned}
$$

Proof. By Lemma 1.10, we can choose $\xi_{1}, \ldots, \xi_{n} \in C_{c}(U)$ such that

$$
\xi(x)=\xi_{1}(x) \xi_{2}(\sigma(x)) \cdots \xi_{n}\left(\sigma^{n-1}(x)\right)
$$

for all $x \in U_{n}$. Then we have

$$
\begin{aligned}
& \pi_{\left(x_{0}, \gamma_{0}\right)}\left(t^{n}(\xi)\right) \delta_{x}=\pi_{\left(x_{0}, \gamma_{0}\right)}\left(t^{1}\left(\xi_{1}\right) t^{1}\left(\xi_{2}\right) \ldots t^{1}\left(\xi_{n-1}\right) t^{1}\left(\xi_{n}\right)\right) \delta_{x} \\
&=\pi_{\left(x_{0}, \gamma_{0}\right)}\left(t^{1}\left(\xi_{1}\right) t^{1}\left(\xi_{2}\right) \ldots t^{1}\left(\xi_{n-1}\right)\right) \gamma_{0} \sum_{\sigma\left(y_{1}\right)=x} \xi_{n}\left(y_{1}\right) \delta_{y_{1}} \\
&=\pi_{\left(x_{0}, \gamma_{0}\right)}\left(t^{1}\left(\xi_{1}\right) \ldots t^{1}\left(\xi_{n-2}\right)\right) \gamma_{0}^{2} \sum_{\sigma\left(y_{1}\right)=x} \xi_{n}\left(y_{1}\right) \sum_{\sigma\left(y_{2}\right)=y_{1}} \xi_{n-1}\left(y_{2}\right) \delta_{y_{2}} \\
&=\pi_{\left(x_{0}, \gamma_{0}\right)}\left(t^{1}\left(\xi_{1}\right) \ldots t^{1}\left(\xi_{n-2}\right)\right) \gamma_{0}^{2} \sum_{\sigma^{2}\left(y_{2}\right)=x} \xi_{n-1}\left(y_{2}\right) \xi_{n}\left(\sigma\left(y_{2}\right)\right) \delta_{y_{2}} \\
& \vdots \\
&=\pi_{\left(x_{0}, \gamma_{0}\right)}\left(t^{1}\left(\xi_{1}\right)\right) \gamma_{0}^{n-1} \sum_{\sigma^{n-1}\left(y_{n-1}\right)=x} \xi_{2}\left(y_{n-1}\right) \xi_{3}\left(\sigma\left(y_{n-1}\right)\right) \cdots \\
& \cdots \xi_{n-1}\left(\sigma^{n-3}\left(y_{n-1}\right)\right) \xi_{n}\left(\sigma^{n-2}\left(y_{n-1}\right)\right) \delta_{y_{n-1}} \\
&=\gamma_{0}^{n} \sum_{\sigma^{n}(y)=x} \xi(y) \delta_{y} .
\end{aligned}
$$

From this equation, we can compute $\pi_{\left(x_{0}, \gamma_{0}\right)}\left(t^{n}(\xi)\right)^{*} \delta_{x}$ in a similar way to the proof of Lemma 2.4 .

Proposition 2.10. For $\left(x_{0}, \gamma_{0}\right) \in X \times \mathbb{T}$, the representation $\pi_{\left(x_{0}, \gamma_{0}\right)}: C^{*}(\Sigma) \rightarrow$ $B\left(H_{x_{0}}\right)$ is irreducible.

Proof. Let $\left\{e_{x, y}\right\}_{x, y \in \operatorname{Orb}\left(x_{0}\right)}$ be the matrix units of $B\left(H_{x_{0}}\right)$. Namely $e_{x, y} \in B\left(H_{x_{0}}\right)$ satisfies

$$
e_{x, y} \delta_{z}= \begin{cases}\delta_{x} & \text { if } z=y \\ 0 & \text { otherwise }\end{cases}
$$

for $z \in \operatorname{Orb}\left(x_{0}\right)$. For all $x \in \operatorname{Orb}\left(x_{0}\right)$, it is standard to see that $e_{x, x}$ is in the weak closure of $\pi_{\left(x_{0}, \gamma_{0}\right)}\left(t^{0}\left(C_{0}(X)\right)\right)=t_{\left(x_{0}, \gamma_{0}\right)}^{0}\left(C_{0}(X)\right) \subset B\left(H_{x_{0}}\right)$. Take $x \in \operatorname{Orb}\left(x_{0}\right)$ with $x \in U$. Take $\xi \in C_{0}(U)$ with $\xi(x)=\gamma_{0}^{-1}$. Then we have $e_{x, x} t_{\left(x_{0}, \gamma_{0}\right)}^{1}(\xi)=e_{x, \sigma(x)}$. Hence $e_{x, \sigma(x)}$ is in the weak closure of $\pi_{\left(x_{0}, \gamma_{0}\right)}\left(C^{*}(\Sigma)\right)$ for all $x \in \operatorname{Orb}\left(x_{0}\right)$ with $x \in U$. Take $x, y \in \operatorname{Orb}\left(x_{0}\right)$. Then there exist $n, m \in \mathbb{N}$ with $\sigma^{n}(x)=\sigma^{m}(y)$. We have that

$$
\begin{aligned}
e_{x, y} & =e_{x, \sigma^{n}(x)}\left(e_{y, \sigma^{m}(y)}\right)^{*} \\
& =e_{x, x} e_{x, \sigma(x)} e_{\sigma(x), \sigma^{2}(x)} \ldots e_{\sigma^{n-1}(x), \sigma^{n}(x)}\left(e_{y, y} e_{y, \sigma(y)} e_{\sigma(y), \sigma^{2}(y)} \ldots e_{\sigma^{m-1}(y), \sigma^{m}(y)}\right)^{*}
\end{aligned}
$$

is in the weak closure of $\pi_{\left(x_{0}, \gamma_{0}\right)}\left(C^{*}(\Sigma)\right)$. Hence the weak closure of $\pi_{\left(x_{0}, \gamma_{0}\right)}\left(C^{*}(\Sigma)\right)$. is whole $B\left(H_{x_{0}}\right)$.
Corollary 2.11. For $\left(x_{0}, \gamma_{0}\right) \in X \times \mathbb{T}$, the ideal $P_{\left(x_{0}, \gamma_{0}\right)}$ is primitive.
Lemma 2.12. For $x \in U$ and $\gamma \in \mathbb{T}$, we have $P_{(x, \gamma)}=P_{(\sigma(x), \gamma)}$.
Proof. Since $\operatorname{Orb}(x)=\operatorname{Orb}(\sigma(x))$, we have $\pi_{(x, \gamma)}=\pi_{(\sigma(x), \gamma)}$. Hence $P_{(x, \gamma)}=P_{(\sigma(x), \gamma)}$.

Definition 2.13. Let $x \in X$. If there exist $k, n \in \mathbb{N}$ with $n \geq 1$ such that $\sigma^{k+n}(x)=$ $\sigma^{k}(x)$, then we say that $x$ is periodic, and define its period $p(x)$ to be the smallest positive integer $n$ satisfying $\sigma^{k+n}(x)=\sigma^{k}(x)$ for some $k$. We also denote $l(x)$ be the smallest natural number $k$ satisfying $\sigma^{k+p(x)}(x)=\sigma^{k}(x)$. A point $x$ which is not periodic is said to be aperiodic. We set $p(x)=l(x)=\infty$ for an aperiodic point $x$.

It is fairly easy to see, but worth remarking, that we have $\sigma^{k}(x)=\sigma^{l}(x)$ for $k, l \in \mathbb{N}$ with $k>l$ if and only if $l \geq l(x)$ and $k-l \in p(x) \mathbb{N}$.

Lemma 2.14. For an aperiodic point $x_{0} \in X$, we have $P_{\left(x_{0}, \gamma\right)}=P_{\left(x_{0}, 1\right)}$ for all $\gamma \in \mathbb{T}$.
Proof. If $x_{0} \in X$ is aperiodic, we can define a map $c: \operatorname{Orb}\left(x_{0}\right) \rightarrow \mathbb{Z}$ such that $c\left(x_{0}\right)=0$ and $c(\sigma(x))=c(x)-1$ for $x \in U$. We define a unitary $u_{\gamma} \in B\left(H_{x_{0}}\right)$ by $u_{\gamma} \delta_{x}=\gamma^{c(x)} \delta_{x}$ for $x \in \operatorname{Orb}\left(x_{0}\right)$. It is not difficult to check that

$$
\begin{aligned}
u_{\gamma} t_{\left(x_{0}, 1\right)}^{0}(f) u_{\gamma}^{*} & =t_{\left(x_{0}, 1\right)}^{0}(f)=t_{\left(x_{0}, \gamma\right)}^{0}(f) \\
u_{\gamma} t_{\left(x_{0}, 1\right)}^{1}(\xi) u_{\gamma}^{*} & =\gamma t_{\left(x_{0}, 1\right)}^{1}(\xi)=t_{\left(x_{0}, \gamma\right)}^{1}(\xi)
\end{aligned}
$$

for $f \in C_{0}(X)$ and $\xi \in C_{c}(U)$. Hence two representation $\pi_{\left(x_{0}, \gamma\right)}$ and $\pi_{\left(x_{0}, 1\right)}$ are unitarily equivalent. This shows $P_{\left(x_{0}, \gamma\right)}=P_{\left(x_{0}, 1\right)}$.

We denote the elements of $\mathbb{Z} / n \mathbb{Z}$ by $\{0,1, \ldots, n-1\}$, and sometimes consider them as elements in $\mathbb{Z}$.

Lemma 2.15. For a periodic point $x_{0} \in X$ with period $n$, we have $P_{\left(x_{0}, \gamma\right)}=P_{\left(x_{0}, \mu\right)}$ if $\gamma^{n}=\mu^{n}$.

Proof. Similarly as in the proof of Lemma [2.14, we can define a map $c: \operatorname{Orb}\left(x_{0}\right) \rightarrow$ $\mathbb{Z} / n \mathbb{Z}$ such that $c\left(x_{0}\right)=0$ and $c(\sigma(x))=c(x)-1$ for $x \in U$. Set $\lambda:=\gamma \bar{\mu} \in \mathbb{T}$. We have $\lambda^{n}=1$. Hence we can define $u_{\lambda} \in B\left(H_{x_{0}}\right)$ by $u_{\lambda} \delta_{x}=\lambda^{c(x)} \delta_{x}$ for $x \in \operatorname{Orb}\left(x_{0}\right)$.

Similarly as in the proof of Lemma [2.14, two representations $\pi_{\left(x_{0}, \gamma\right)}$ and $\pi_{\left(x_{0}, \mu\right)}$ are unitarily equivalent by the unitary $u_{\lambda}$. Hence we obtain $P_{\left(x_{0}, \gamma\right)}=P_{\left(x_{0}, \mu\right)}$.
Definition 2.16. For an integer $n \geq 2$, we denote by $\zeta_{n}=e^{2 \pi i / n}$ the $n$-th root of unity.

Lemma 2.17. Let $x_{0} \in X$ be a periodic point with period $n$. If $x_{0}$ is isolated in $\operatorname{Orb}\left(x_{0}\right)$, then for $\gamma, \mu \in \mathbb{T}, P_{\left(x_{0}, \gamma\right)}=P_{\left(x_{0}, \mu\right)}$ if and only if $\gamma^{n}=\mu^{n}$.
Proof. Let $\Lambda=\left\{\sigma^{l\left(x_{0}\right)}\left(x_{0}\right), \ldots, \sigma^{l\left(x_{0}\right)+n-1}\left(x_{0}\right)\right\}$. Since $\sigma$ is a local homeomorphism, if $x_{0}$ is isolated in $\operatorname{Orb}\left(x_{0}\right)$ we can find an open subset $V$ of $X$ such that $V \cap$ $\operatorname{Orb}\left(x_{0}\right)=\Lambda$. Hence there exists $\xi \in C_{c}(U)$ such that $\xi(x)=1$ for $x \in \Lambda$ and $\xi(x)=0$ for $x \in \operatorname{Orb}\left(x_{0}\right) \backslash \Lambda$. For each $\gamma \in \mathbb{T}$, non-zero elements of the spectrum of $t_{\left(x_{0}, \gamma\right)}^{1}(\xi) \in B\left(H_{x_{0}}\right)$ are $\gamma, \gamma \zeta_{n}, \ldots, \gamma \zeta_{n}^{n-1}$. Hence those of the image of $t^{1}(\xi)$ via the natural surjection $C^{*}(\Sigma) \rightarrow C^{*}(\Sigma) / P_{\left(x_{0}, \gamma\right)}$ are also $\gamma, \gamma \zeta_{n}, \ldots, \gamma \zeta_{n}^{n-1}$. This shows that if $P_{\left(x_{0}, \gamma\right)}=P_{\left(x_{0}, \mu\right)}$ then $\gamma^{n}=\mu^{n}$. The converse follows from Lemma 2.15,

Remark 2.18. We will see in Proposition 4.10 that for a periodic point $x_{0} \in X$ such that $x_{0}$ is not isolated in $\operatorname{Orb}\left(x_{0}\right)$, we have $P_{\left(x_{0}, \gamma\right)}=P_{\left(x_{0}, 1\right)}$ for all $\gamma \in \mathbb{T}$.

Remark 2.19. We will see in Remark 4.17 that if $X$ is second countable $P_{(x, \gamma)}$ 's are whole primitive ideal. (See [SW] for the case $U=X$.) In general, there is a primitive ideal which is not in the form $P_{(x, \gamma)}$ (see [K3, Example 13.2]).

It is probably impossible to list all primitive ideals in terms of elements of $X$ and $\mathbb{T}$. However it is possible to list all prime ideals in terms of subsets of $X$ and $\mathbb{T}$. From next section, we will do this. This will show that the set $\left\{P_{(x, \gamma)}\right\}$ is sufficiently large (Corollary 4.19).

## 3. GAUGE INVARIANT IDEALS AND $\sigma$-INVARIANT SETS

Definition 3.1. A subset $X^{\prime}$ of $X$ is said to be $\sigma$-invariant when $x \in X^{\prime}$ if and only if $\sigma(x) \in X^{\prime}$ for all $x \in U$.

An ideal $I$ of $C^{*}(\Sigma)$ is said to be gauge-invariant if $\beta_{z}(I)=I$ for all $z \in \mathbb{T}$ where $\beta$ is the gauge action defined in Appendix A. We will see in Proposition 3.11 that the set of gauge-invariant ideals corresponds bijectively to the set of closed $\sigma$-invariant subsets of $X$.

Definition 3.2. For an ideal $I$ of $C^{*}(\Sigma)$, we define a closed set $X_{I}$ of $X$ by $t^{0}\left(C_{0}(X \backslash\right.$ $\left.\left.X_{I}\right)\right)=t^{0}\left(C_{0}(X)\right) \cap I$.

The following lemma is easy to see from the definition.
Lemma 3.3. For two ideals $I_{1}, I_{2}$ of $C^{*}(\Sigma)$, we have $X_{I_{1} \cap I_{2}}=X_{I_{1}} \cup X_{I_{2}}$. If $I_{1} \subset I_{2}$, then $X_{I_{1}} \supset X_{I_{2}}$.
Proposition 3.4. For an ideal $I$ of $C^{*}(\Sigma)$, the closed set $X_{I}$ is $\sigma$-invariant.
Proof. Take $x \in U$. Suppose $x \notin X_{I}$. Choose an open subset $V$ such that $x \in$ $V \subset U, V \cap X_{I}=\emptyset$ and $\sigma$ is injective on $V$. Take $\xi \in C_{c}(V)$ with $\xi(x)=1$. Then $\xi \bar{\xi} \in C_{0}\left(X \backslash X_{I}\right)$. Hence $t^{1}(\xi) t^{1}(\xi)^{*}=t^{0}(\xi \bar{\xi}) \in I$. This implies $t^{0}(\langle\xi, \xi\rangle)=$ $t^{1}(\xi)^{*} t^{1}(\xi) \in I$. Hence $\langle\xi, \xi\rangle \in C_{0}\left(X \backslash X_{I}\right)$. Since $\langle\xi, \xi\rangle(\sigma(x))=|\xi(x)|^{2}=1$, we
have $\sigma(x) \notin X_{I}$. Now suppose $\sigma(x) \notin X_{I}$. Choose an open subset $V$ such that $x \in V \subset U, V \cap \sigma^{-1}\left(X_{I}\right)=\emptyset$ and $\sigma$ is injective on $V$. Take $\xi \in C_{c}(V)$ with $\xi(x)=1$. Then $\langle\xi, \xi\rangle \in C_{0}\left(X \backslash X_{I}\right)$. Hence $t^{1}(\xi)^{*} t^{1}(\xi)=t^{0}(\langle\xi, \xi\rangle) \in I$. This implies $t^{0}(\xi \bar{\xi})=t^{1}(\xi) t^{1}(\xi)^{*} \in I$. Hence $\xi \bar{\xi} \in C_{0}\left(X \backslash X_{I}\right)$. Since $\xi \bar{\xi}(x)=|\xi(x)|^{2}=1$, we have $x \notin X_{I}$. Thus we have shown that $x \in X_{I}$ if and only if $\sigma(x) \in X_{I}$.

Take a closed $\sigma$-invariant subset $X^{\prime}$ of $X$. We define an $\operatorname{SGDS} \Sigma^{\prime}=\left(X^{\prime}, \sigma^{\prime}\right)$ where $\sigma^{\prime}$ is a restriction of $\sigma$ on $U^{\prime}:=X^{\prime} \cap U$. Let $\left(t^{\prime 0}, t^{\prime 1}\right)$ be the universal pair for $C^{*}\left(\Sigma^{\prime}\right)$. We have the following.

Lemma 3.5. There exists a surjection $\Phi: C^{*}(\Sigma) \rightarrow C^{*}\left(\Sigma^{\prime}\right)$ such that $\Phi\left(t^{0}(f)\right)=$ $t^{\prime 0}\left(\left.f\right|_{X^{\prime}}\right)$ and $\Phi\left(t^{1}(\xi)\right)=t^{\prime 1}\left(\left.\xi\right|_{U^{\prime}}\right)$.
Proof. It suffices to see that the pair of maps $C_{0}(X) \ni f \mapsto t^{\prime 0}\left(\left.f\right|_{X^{\prime}}\right) \in C^{*}\left(\Sigma^{\prime}\right)$ and $C_{c}(U) \ni \xi \mapsto t^{\prime 1}\left(\left.\xi\right|_{U^{\prime}}\right) \in C^{*}\left(\Sigma^{\prime}\right)$ satisfy (i) and (ii) in Definition 1.4 for $\Sigma$. This follows from the fact that $t^{\prime 0}$ and $t^{\prime 1}$ satisfy (i) and (ii) in Definition 1.4 for $\Sigma^{\prime}$.

Definition 3.6. For a closed $\sigma$-invariant subset $X^{\prime}$ of $X$, let $I_{X^{\prime}}$ be the kernel of the surjection $\Phi: C^{*}(\Sigma) \rightarrow C^{*}\left(\Sigma^{\prime}\right)$ in Lemma 3.5,
Proposition 3.7. For a closed $\sigma$-invariant subset $X^{\prime}$ of $X$, we have $X_{I_{X^{\prime}}}=X^{\prime}$.
Proof. This follows from the fact that the kernel of $\Phi \circ t^{0}$ in Lemma 3.5 is $C_{0}(X \backslash$ $X^{\prime}$ ).

Lemma 3.8. For a closed $\sigma$-invariant subset $X^{\prime}$ of $X$, the ideal $I_{X^{\prime}}$ is gaugeinvariant.

Proof. This follows from the fact that the surjection $\Phi: C^{*}(\Sigma) \rightarrow C^{*}\left(\Sigma^{\prime}\right)$ in Lemma 3.5 commutes with the gauge actions.
Lemma 3.9. For an ideal $I$ of $C^{*}(\Sigma)$, we have $I_{X_{I}} \subset I$.
Proof. Takes an deal $I$ of $C^{*}(\Sigma)$, and denote the natural surjection by $\pi: C^{*}(\Sigma) \rightarrow$ $C^{*}(\Sigma) / I$. We set $\Sigma_{I}:=\left(X_{I}, \sigma_{I}\right)$ where $\sigma_{I}$ is the restriction of $\sigma$ to $U_{I}:=U \cap X_{I}$. By the definition of $X_{I}$, we can define a $*$-homomorphism $t^{\prime 0}: C_{0}\left(X_{I}\right) \rightarrow C^{*}(\Sigma) / I$ such that $t^{\prime 0}\left(\left.f\right|_{X_{I}}\right)=\pi\left(t^{0}(f)\right)$ for all $f \in C_{0}(X)$. We can also define a linear map $t^{\prime 1}: C_{c}\left(U_{I}\right) \rightarrow C^{*}(\Sigma) / I$ such that $t^{\prime 1}\left(\left.\xi\right|_{U_{I}}\right)=\pi\left(t^{1}(\xi)\right)$ for all $\xi \in C_{c}(U)$ because for $\eta \in C_{c}(U)$ with $\left.\eta\right|_{U_{I}}=0$ we have $\langle\eta, \eta\rangle \in C_{0}\left(X \backslash X_{I}\right)$ and hence $t^{1}(\eta) \in I$. The pair $\left(t^{\prime 0}, t^{\prime 1}\right)$ satisfies (i) and (ii) in Definition 1.4 for $\Sigma_{I}$. Hence we get a $*$-homomorphism $\Psi: C^{*}\left(\Sigma_{I}\right) \rightarrow C^{*}(\Sigma) / I$ with $\pi=\Psi \circ \Phi_{I}$ where $\Phi_{I}: C^{*}(\Sigma) \rightarrow C^{*}\left(\Sigma_{I}\right)$ is the surjection whose kernel is $I_{X_{I}}$. Hence we get $I_{X_{I}} \subset I$.

Proposition 3.10. For an ideal $I$ of $C^{*}(\Sigma)$, we have $I_{X_{I}}=I$ if and only if $I$ is gauge-invariant.

Proof. The "only if" part follows from Lemma 3.8, Let $I$ be a gauge-invariant ideal $I$ of $C^{*}(\Sigma)$. Then we can define an action of $\mathbb{T}$ on $C^{*}(\Sigma) / I$ so that the natural surjection $\pi: C^{*}(\Sigma) \rightarrow C^{*}(\Sigma) / I$ becomes equivariant. Then the map $\Psi: C^{*}\left(\Sigma_{I}\right) \rightarrow$ $C^{*}(\Sigma) / I$ in the proof of Lemma 3.9 becomes also equivariant. The map $\Psi$ is injective on $t^{0}\left(C_{0}\left(X_{I}\right)\right)$ by the definition of $X_{I}$. Hence by Proposition A. $1 \Psi$ is injective. Therefore we have $I_{X_{I}}=I$.

Proposition 3.11. Through the maps $I \mapsto X_{I}$ and $X^{\prime} \mapsto I_{X^{\prime}}$, the set of gaugeinvariant ideals corresponds bijectively to the set of closed $\sigma$-invariant subsets of $X$.

Proof. This follows from Proposition 3.7 and Proposition 3.10 .
Now we have the following.
Lemma 3.12. For closed $\sigma$-invariant subsets $X_{1}$ and $X_{2}$ of $X$, we have $I_{X_{1} \cup X_{2}}=$ $I_{X_{1}} \cap I_{X_{2}}$. If $X_{1} \subset X_{2}$, then $I_{X_{1}} \supset I_{X_{2}}$.
Proof. By Lemma 3.3 and Proposition 3.7, we have

$$
X_{I_{X_{1}} \cap I_{X_{2}}}=X_{I_{X_{1}}} \cup X_{I_{X_{2}}}=X_{1} \cup X_{2}
$$

Since $I_{X_{1}} \cap I_{X_{2}}$ is gauge-invariant, we have

$$
I_{X_{1}} \cap I_{X_{2}}=I_{X_{I_{X_{1}} \cap I_{X_{2}}}}=I_{X_{1} \cup X_{2}}
$$

by Proposition 3.10. If $X_{1} \subset X_{2}$, then $X_{2}=X_{1} \cup X_{2}$. Hence we have $I_{X_{2}}=I_{X_{1} \cup X_{2}}=$ $I_{X_{1}} \cap I_{X_{2}}$. This shows $I_{X_{1}} \supset I_{X_{2}}$.
Definition 3.13. For a closed $\sigma$-invariant set $X^{\prime}$, we say $X^{\prime}$ is essentially free if the SGDS $\Sigma^{\prime}=\left(X^{\prime},\left.\sigma\right|_{U \cap X^{\prime}}\right)$ is essentially free as defined in Definition A.2,
Proposition 3.14. For an ideal I of $C^{*}(\Sigma)$, if $X_{I}$ is essentially free then we have $I_{X_{I}}=I$.

Proof. The proof goes similarly as in Proposition 3.10 using Proposition A. 3 instead of Proposition A.1.

## 4. Prime ideals

An ideal $I$ of a $C^{*}$-algebra $A$ is said to be prime if $I \neq A$ and for two ideals $I_{1}, I_{2}$ of a $C^{*}$-algebra $A$ with $I_{1} \cap I_{2} \subset I$ we have either $I_{1} \subset I$ or $I_{2} \subset I$. A primitive ideal is prime [B, II.6.1.11]. The converse is true when $X$ is second countable (cf. [B, II.6.5.15]), but not true in general (see [K3, Example 13.3] and [K4, Theorem 5.4]).

Definition 4.1. A closed $\sigma$-invariant set $X$ is said to be irreducible if it is nonempty and we have either $X=X_{1}$ or $X=X_{2}$ for two closed $\sigma$-invariant sets $X_{1}, X_{2}$ satisfying $X=X_{1} \cup X_{2}$.
Proposition 4.2. If an ideal $I$ of $C^{*}(\Sigma)$ is prime, then $X_{I}$ is irreducible.
Proof. If $X_{I}=\emptyset$, then $I=A$ which contradicts that $I$ is prime. Hence $X_{I} \neq \emptyset$. Take two closed $\sigma$-invariant sets $X_{1}, X_{2}$ satisfying $X_{I}=X_{1} \cup X_{2}$. Then

$$
I_{X_{1}} \cap I_{X_{2}}=I_{X_{1} \cup X_{2}}=I_{X_{I}} \subset I
$$

by Lemma 3.12 and Lemma 3.9. Since $I$ is prime, we have either $I_{X_{1}} \subset I$ or $I_{X_{2}} \subset I$. When $I_{X_{1}} \subset I$, we have $X_{I} \subset X_{I_{X_{1}}}=X_{1} \subset X_{I}$ by Lemma 3.3 and Proposition 3.7, and hence $X_{1}=X_{I}$. Similarly we have $X_{2}=X_{I}$ when $I_{X_{2}} \subset I$. Thus $X_{I}$ is irreducible.

Proposition 4.3. For $(x, \gamma) \in X \times \mathbb{T}$, we have $X_{P_{(x, \gamma)}}=\overline{\operatorname{Orb}(x)}$.
Proof. This follows from $\operatorname{ker} t_{(x, \gamma)}^{0}=C_{0}(X \backslash \overline{\operatorname{Orb}(x)})$.

Proposition 4.4. For $x \in X, \overline{\operatorname{Orb}(x)}$ is an irreducible closed $\sigma$-invariant set.
Proof. This follows from Proposition 4.2 and Proposition 4.3. One can also show this directly as follows. Since $\operatorname{Orb}(x)$ is $\sigma$-invariant and since $\sigma$ is locally homeomorphic, $\overline{\operatorname{Orb}(x)}$ is closed and $\sigma$-invariant. Take two closed $\sigma$-invariant sets $X_{1}, X_{2}$ satisfying $\overline{\operatorname{Orb}(x)}=X_{1} \cup X_{2}$. Then either $x \in X_{1}$ or $x \in X_{2}$. When $x \in X_{1}$ we have $X_{1}=\overline{\operatorname{Orb}(x)}$, whereas when $x \in X_{2}$ we have $X_{2}=\overline{\operatorname{Orb}(x)}$. Thus $\overline{\operatorname{Orb}(x)}$ is irreducible.

Proposition 4.5. Let $X^{\prime}$ be an irreducible closed $\sigma$-invariant set. If $X^{\prime}$ is essentially free, then $I_{X^{\prime}}$ is prime.

Proof. Since $X^{\prime} \neq \emptyset$, we have $I_{X^{\prime}} \neq A$. Take ideals $I_{1}, I_{2}$ of $C^{*}(\Sigma)$ such that $I_{1} \cap I_{2} \subset I_{X^{\prime}}$. Then we have

$$
X_{I_{1}+I_{X^{\prime}}} \cup X_{I_{2}+I_{X^{\prime}}}=X_{\left(I_{1}+I_{X^{\prime}}\right) \cap\left(I_{2}+I_{X^{\prime}}\right)}=X_{I_{X^{\prime}}}=X^{\prime}
$$

by Lemma 3.3 and Proposition 3.7. Since $X^{\prime}$ is irreducible, either we have $X_{I_{1}+I_{X^{\prime}}}=$ $X^{\prime}$ or $X_{I_{2}+I_{X^{\prime}}}=X^{\prime}$. When $X_{I_{1}+I_{X^{\prime}}}=X^{\prime}$ we have $I_{1}+I_{X^{\prime}}=I_{X^{\prime}}$ by Proposition 3.14 because $X^{\prime}$ is essentially free. This shows $I_{1} \subset I_{X^{\prime}}$. Similarly, when $X_{I_{2}+I_{X^{\prime}}}=X^{\prime}$ we have $I_{2} \subset I_{X^{\prime}}$. Thus $I_{X^{\prime}}$ is prime.

From now on, we investigate which irreducible closed $\sigma$-invariant set $X^{\prime}$ becomes essentially free.

Definition 4.6. We set

$$
\mathrm{P}(\Sigma):=\{x \in X \mid l(x)=0, x \text { is isolated in } \operatorname{Orb}(x)\} .
$$

Definition 4.7. We denote by $\mathcal{A}(\Sigma)$ the set of all irreducible closed $\sigma$-invariant set which is not in the form $\overline{\operatorname{Orb}(x)}$ for $x \in \mathrm{P}(\Sigma)$.

Lemma 4.8. For $x \in \mathrm{P}(\Sigma)$, an irreducible closed $\sigma$-invariant $\overline{\operatorname{Orb}(x)}$ is not essentially free.

Proof. In the $\operatorname{SGDS} \Sigma^{\prime}=\left(X^{\prime},\left.\sigma\right|_{U \cap X^{\prime}}\right)$ where $X^{\prime}=\overline{\operatorname{Orb}(x)},\{x\}$ is an open subset and $l(x)=0$. Hence $\Sigma^{\prime}$ is not essentially free.

Proposition 4.9 (cf. [K3, Proposition 11.3]). For an irreducible closed $\sigma$-invariant set $X^{\prime}, X^{\prime}$ is essentially free if and only if $X^{\prime} \in \mathcal{A}(\Sigma)$
Proof. Take an irreducible closed $\sigma$-invariant set $X^{\prime}$. By Lemma 4.8, if $X^{\prime}$ is essentially free then $X^{\prime} \in \mathcal{A}(\Sigma)$. Suppose $X^{\prime}$ is not essentially free. Then there exists a non-empty open subset $V^{\prime}$ of $X^{\prime}$ such that $l(x)=0$ for all $x \in V^{\prime}$. By Baire's category theorem (see, for example, [T1, Proposition 2.2]), there exist a non-empty open subset $V \subset V^{\prime}$ of $X^{\prime}$ and $n \in \mathbb{N}$ such that $p(x)=n$ for all $x \in V$. Take $x \in V$ arbitrarily. We will show that $V=\left\{x, \sigma(x), \ldots, \sigma^{n-1}(x)\right\}$. To the contrary, suppose there exists $y \in V \backslash\left\{x, \sigma(x), \ldots, \sigma^{n-1}(x)\right\}$. Choose open subsets $W_{1}, W_{2}$ of $V$ such that $x \in W_{1}, y \in W_{2}$ and $W_{2} \cap \bigcup_{k=0}^{n-1} \sigma^{k}\left(W_{1}\right)=\emptyset$. Then $\bigcup_{k=0}^{\infty}\left(\sigma^{k}\right)^{-1}\left(W_{1}\right)$ is an open $\sigma$-invariant subset of $X^{\prime}$ because for $l=1,2, \ldots$ we have $\sigma^{l}\left(W_{1}\right) \subset\left(\sigma^{k}\right)^{-1}\left(W_{1}\right)$ for $k \in \mathbb{N}$ with $k+l \in n \mathbb{N}$. Hence $X_{1}:=X^{\prime} \backslash \bigcup_{k=0}^{\infty}\left(\sigma^{k}\right)^{-1}\left(W_{1}\right)$ is a closed $\sigma$-invariant subset of $X^{\prime}$ with $X_{1} \neq X^{\prime}$. Similarly, $X_{2}:=X^{\prime} \backslash \bigcup_{k=0}^{\infty}\left(\sigma^{k}\right)^{-1}\left(W_{2}\right)$ is a closed $\sigma$ invariant subset of $X^{\prime}$ with $X_{2} \neq X^{\prime}$. Since $X^{\prime}$ is irreducible, we have $X_{1} \cup X_{2} \neq X^{\prime}$.

Hence we have $\left(\sigma^{k_{0}}\right)^{-1}\left(W_{1}\right) \cap\left(\sigma^{l_{0}}\right)^{-1}\left(W_{2}\right) \neq \emptyset$ for some $k_{0}, l_{0} \in \mathbb{N}$. Thus we get $z \in X^{\prime}$ such that $\sigma^{k_{0}}(z) \in W_{1}$ and $\sigma^{l_{0}}(z) \in W_{2}$. Then for $m \in \mathbb{N}$ with $l_{0}+m n \geq k_{0}$, $\sigma^{l_{0}+m n}(z)$ is in $W_{2} \cap \bigcup_{k=0}^{n-1} \sigma^{k}\left(W_{1}\right)$ which is empty. This is a contradiction. Hence we have shown $V=\left\{x, \sigma(x), \ldots, \sigma^{n-1}(x)\right\}$. Since $V$ is open in $X^{\prime},\{x\}$ is open in $X^{\prime}$. Hence $x$ is isolated in $\operatorname{Orb}(x) \subset X^{\prime}$. This shows $x \in \mathrm{P}(\Sigma)$. Finally we show that $X^{\prime}=\overline{\operatorname{Orb}(x)}$. To do so, take $y \in X^{\prime}$. Take a neighborhood $W$ of $y$ arbitrarily. Then

$$
X_{1}:=X^{\prime} \backslash \bigcup_{k=0}^{\infty}\left(\sigma^{k}\right)^{-1}\left(\bigcup_{l=0}^{\infty} \sigma^{l}(W)\right)
$$

is a closed $\sigma$-invariant subset of $X^{\prime}$ with $X_{1} \neq X^{\prime}$. Since $\{x\}$ is open in $X^{\prime}, X_{2}=$ $X^{\prime} \backslash \operatorname{Orb}(x)$ is also a closed $\sigma$-invariant subset of $X^{\prime}$ with $X_{2} \neq X^{\prime}$. Since $X^{\prime}$ is irreducible, we have $X_{1} \cup X_{2} \neq X^{\prime}$. Hence we have

$$
\operatorname{Orb}(x) \cap \bigcup_{k=0}^{\infty}\left(\sigma^{k}\right)^{-1}\left(\bigcup_{l=0}^{\infty} \sigma^{l}(W)\right) \neq \emptyset
$$

Therefore there exists $x^{\prime} \in \operatorname{Orb}(x)$ and $k_{0}, l_{0} \in \mathbb{N}$ such that $\sigma^{k_{0}}\left(x^{\prime}\right) \in \sigma^{l_{0}}(W)$. Hence $W \cap \operatorname{Orb}(x) \neq \emptyset$. Since $W$ is arbitrary, we have $y \in \overline{\operatorname{Orb}(x)}$. Hence $X^{\prime}=\overline{\operatorname{Orb}(x)}$. This shows $X^{\prime} \notin \mathcal{A}(\Sigma)$.

Proposition 4.10. For a periodic point $x_{0} \in X$ such that $x_{0}$ is not isolated in $\operatorname{Orb}\left(x_{0}\right)$, we have $P_{\left(x_{0}, \gamma\right)}=P_{\left(x_{0}, 1\right)}$ for all $\gamma \in \mathbb{T}$.

Proof. If $x_{0}$ is not isolated in $\operatorname{Orb}\left(x_{0}\right)$, then $x$ is not isolated in $\operatorname{Orb}\left(x_{0}\right)$ for all $x \in \operatorname{Orb}\left(x_{0}\right)$ because $\sigma$ is locally homeomorphic. Hence $X^{\prime}:=\overline{\operatorname{Orb}\left(x_{0}\right)}$ has no isolated point. Thus we have $X^{\prime} \in \mathcal{A}(\Sigma)$. By Proposition 4.9, $X^{\prime}$ is essentially free. By Proposition 3.14 and Proposition 4.3, we have $P_{\left(x_{0}, \gamma\right)}=I_{X^{\prime}}=P_{\left(x_{0}, 1\right)}$ for all $\gamma \in \mathbb{T}$.

Take $x_{0} \in \mathrm{P}(\Sigma)$. We set $n_{0}:=p\left(x_{0}\right)$. We are going to show that prime ideals $I$ with $X_{I}=\overline{\operatorname{Orb}\left(x_{0}\right)}$ is parametrized as $P_{\left(x_{0}, e^{2 \pi i t}\right)}$ for $0 \leq t<1 / n_{0}$. Let us set $X^{\prime}:=\overline{\operatorname{Orb}\left(x_{0}\right)}$ and $X^{\prime \prime}:=\overline{\operatorname{Orb}\left(x_{0}\right)} \backslash \operatorname{Orb}\left(x_{0}\right)$ which is a closed $\sigma$-invariant subset of $X^{\prime}$.

Lemma 4.11 (cf. [K3, Lemma 11.10]). For an ideal I of $C^{*}(\Sigma)$, we have $X_{I}=X^{\prime}$ if and only if $I_{X^{\prime}} \subset I$ and $I_{X^{\prime \prime}} \not \subset I$.

Proof. Take an ideal $I$ of $C^{*}(\Sigma)$ with $X_{I}=X^{\prime}$. Then $I_{X^{\prime}}=I_{X_{I}} \subset I$ by Lemma 3.9, If $I_{X^{\prime \prime}} \subset I$ then we have $X_{I} \subset X_{I_{X^{\prime \prime}}}=X^{\prime \prime}$ by Proposition 3.7. This contradicts $X_{I}=X^{\prime}$. Thus we get $I_{X^{\prime \prime}} \not \subset I$.

Conversely, take an ideal $I$ of $C^{*}(\Sigma)$ with $I_{X^{\prime}} \subset I$ and $I_{X^{\prime \prime}} \not \subset I$. By Lemma 3.3 and Proposition [3.7, we have $X_{I} \subset X_{I_{X^{\prime}}}=X^{\prime}$. Suppose $x_{0} \notin X_{I}$. Then $X_{I} \subset X^{\prime \prime}$ since $X_{I}$ is $\sigma$-invariant. This shows $I_{X^{\prime \prime}} \subset I_{X_{I}} \subset I$ by Lemma 3.12 and Lemma 3.9, This contradicts $I_{X^{\prime \prime}} \not \subset I$. Hence we have $x_{0} \in X_{I}$. This shows $X^{\prime} \subset X_{I}$. Therefore we get $X_{I}=X^{\prime}$.

Let us set $\Sigma^{\prime}=\left(X^{\prime},\left.\sigma\right|_{U \cap X^{\prime}}\right)$. Then we have $C^{*}\left(\Sigma^{\prime}\right)=C^{*}(\Sigma) / I_{X^{\prime}}$ by the definition of $I_{X^{\prime}}$. Let $\left(t^{0}, t^{1}\right)$ be the universal pair for $C^{*}\left(\Sigma^{\prime}\right)$, and define $t^{n}$ as in Section 1.

Let us define $f_{0} \in C_{c}\left(U_{n_{0}}\right)$ by

$$
f_{0}(x)= \begin{cases}1 & x=x_{0} \\ 0 & x \neq x_{0}\end{cases}
$$

We set $p_{0}=t^{0}\left(f_{0}\right) \in C^{*}\left(\Sigma^{\prime}\right)$ and $u_{0}=t^{n_{0}}\left(f_{0}\right) \in C^{*}\left(\Sigma^{\prime}\right)$. Note that we have $u_{0}^{*} u_{0}=u_{0} u_{0}^{*}=p_{0}$.

Lemma 4.12 (cf. [K3, Lemma 11.12]). The corner $p_{0} C^{*}\left(\Sigma^{\prime}\right) p_{0}$ is the $C^{*}$-subalgebra $C^{*}\left(u_{0}\right)$ generated by $u_{0}$.

Proof. A corner $p_{0} C^{*}\left(\Sigma^{\prime}\right) p_{0}$ is a closure of a linear span of the set

$$
\left\{p_{0} t^{n}(\xi) t^{m}(\eta)^{*} p_{0} \mid n, m \in \mathbb{N}, \xi \in C_{c}\left(U_{n}\right), \eta \in C_{c}\left(U_{m}\right)\right\}
$$

by Lemma 1.14. For $n, m \in \mathbb{N}, \xi \in C_{c}\left(U_{n}\right), \eta \in C_{c}\left(U_{m}\right)$, the element $p_{0} t^{n}(\xi) t^{m}(\eta)^{*} p_{0}$ is $\alpha t^{n}\left(f_{0}\right) t^{m}\left(f_{0}\right)^{*}$ for some $\alpha \in \mathbb{C}$. We also have

$$
t^{n}\left(f_{0}\right) t^{m}\left(f_{0}\right)^{*}= \begin{cases}p_{0} & \text { if } n=m \\ u_{0}^{k} & \text { if } n-m=n_{0} k \text { for some } k=1,2, \ldots \\ \left(u_{0}^{k}\right)^{*} & \text { if } m-n=n_{0} k \text { for some } k=1,2, \ldots \\ 0 & \text { otherwise }\end{cases}
$$

Hence the corner $p_{0} C^{*}\left(\Sigma^{\prime}\right) p_{0}$ is $C^{*}\left(u_{0}\right)$.
Lemma 4.13. The corner $p_{0} C^{*}\left(\Sigma^{\prime}\right) p_{0}=C^{*}\left(u_{0}\right)$ is full in the ideal $I_{X^{\prime \prime}} / I_{X^{\prime}} \subset$ $C^{*}(\Sigma) / I_{X^{\prime}}=C^{*}\left(\Sigma^{\prime}\right)$.

Proof. Let $I$ be the ideal of $C^{*}\left(\Sigma^{\prime}\right)$ generated by $p_{0}$. Then $I$ is gauge-invariant. Consider $X_{I} \subset X^{\prime}$. Since $X_{I}$ does not contain $x_{0}$. we have $X_{I} \subset X^{\prime \prime}$. Therefore $I_{X^{\prime \prime}} \subset I_{X_{I}}=I$ by Lemma 3.12 and Proposition 3.10. Since $p_{0} \in I_{X^{\prime \prime}}$, we have $I \subset I_{X^{\prime \prime}}$. Hence we get $I=I_{X^{\prime \prime}}$.

The ideal $I_{X^{\prime \prime}}$ of $C^{*}\left(\Sigma^{\prime}\right)$ is equal to $I_{X^{\prime \prime}} / I_{X^{\prime}} \subset C^{*}(\Sigma) / I_{X^{\prime}}$ via the identification $C^{*}(\Sigma) / I_{X^{\prime}}=C^{*}\left(\Sigma^{\prime}\right)$. This completes the proof.

The following lemma should be known, but the author could not find it in the literature. A similar result on primitive ideals can be found, for example, in [B, II.6.5.4]

Lemma 4.14. Let $A$ be a $C^{*}$-algebra, and $I^{\prime}, I^{\prime \prime}$ be ideals of $A$ with $I^{\prime} \subset I^{\prime \prime}$. Then $I \mapsto\left(I \cap I^{\prime \prime}\right) / I^{\prime}$ is a bijection from the set of prime ideals $I$ of $A$ with $I^{\prime} \subset I$ and $I^{\prime \prime} \not \subset I$ to the set of prime ideals of $I^{\prime \prime} / I^{\prime}$.

Proof. We first show that $I \mapsto I \cap I^{\prime \prime}$ is a bijection from the set of prime ideals $I$ of $A$ with $I^{\prime \prime} \not \subset I$ to the set of prime ideals of $I^{\prime \prime}$. Take a prime ideal $I$ of $A$ with $I^{\prime \prime} \not \subset I$. We show that $I \cap I^{\prime \prime}$ is a prime ideal of $I^{\prime \prime}$ Since $I^{\prime \prime} \not \subset I$, we have $I \cap I^{\prime \prime} \neq I^{\prime \prime}$. Take ideals $I_{1}, I_{2}$ of $I^{\prime \prime}$ with $I_{1} \cap I_{2} \subset I \cap I^{\prime \prime}$. Then $I_{1}, I_{2}$ are ideals of $A$ with $I_{1} \cap I_{2} \subset I$. Since $I$ is prime, either $I_{1} \subset I$ or $I_{2} \subset I$ holds. Thus either $I_{1} \subset I \cap I^{\prime \prime}$ or $I_{2} \subset I \cap I^{\prime \prime}$ holds. This shows $I \cap I^{\prime \prime}$ is a prime ideal of $I^{\prime \prime}$. Next take two prime ideals $I_{1}, I_{2}$ of $A$ with $I^{\prime \prime} \not \subset I_{1}$ and $I^{\prime \prime} \not \subset I_{2}$. Suppose $I_{1} \cap I^{\prime \prime}=I_{2} \cap I^{\prime \prime}$ and we will show $I_{1}=I_{2}$. We have $I_{1} \supset I_{1} \cap I^{\prime \prime}=I_{2} \cap I^{\prime \prime}$. Since $I_{1}$ is prime and $I^{\prime \prime} \not \subset I_{1}$, we get $I_{2} \subset I_{1}$. Similarly
we get $I_{1} \subset I_{2}$. Thus $I_{1}=I_{2}$. This shows that the map $I \mapsto I \cap I^{\prime \prime}$ is injective. Now take a prime ideal $P$ of $I^{\prime \prime}$. Define $I \subset A$ by

$$
I:=\left\{a \in A \mid a b \in P \text { for all } b \in I^{\prime \prime}\right\} .
$$

Then $I$ is an ideal of $A$ satisfying $I \cap I^{\prime \prime}=P$. We will show $I$ is prime. Take two ideals $I_{1}, I_{2}$ of $A$ with $I_{1} \cap I_{2} \subset I$. Then two ideals $I_{1} \cap I^{\prime \prime}, I_{2} \cap I^{\prime \prime}$ of $I^{\prime \prime}$ satisfy $\left(I_{1} \cap I^{\prime \prime}\right) \cap\left(I_{2} \cap I^{\prime \prime}\right) \subset I \cap I^{\prime \prime}=P$. Since $P$ is a prime ideal of $I^{\prime \prime}$, we have either $I_{1} \cap I^{\prime \prime} \subset P$ or $I_{2} \cap I^{\prime \prime} \subset P$. When $I_{1} \cap I^{\prime \prime} \subset P$, we have $I_{1} \subset I$ by the definition of $I$. Similarly we have $I_{2} \subset I$ when $I_{2} \cap I^{\prime \prime} \subset P$. Thus we have shown that $I$ is prime. This shows that the map $I \mapsto I \cap I^{\prime \prime}$ is surjective. Therefore the map $I \mapsto I \cap I^{\prime \prime}$ is bijective. Hence the map $I \mapsto I \cap I^{\prime \prime}$ is a bijection from the set of prime ideals $I$ of $A$ with $I^{\prime} \subset I$ and $I^{\prime \prime} \not \subset I$ to the set of prime ideals $P$ of $I^{\prime \prime}$ with $I^{\prime} \subset P$.

It is well-known and clear that $P \mapsto P / I^{\prime}$ is a bijection from the set of prime ideals $P$ of $I^{\prime \prime}$ with $I^{\prime} \subset P$ to the set of prime ideals of $I^{\prime \prime} / I^{\prime}$. This completes the proof.

Proposition 4.15. The prime ideals $I$ with $X_{I}=\overline{\operatorname{Orb}\left(x_{0}\right)}$ is parametrized as $P_{\left(x_{0}, e^{2 \pi i t}\right)}$ for $0 \leq t<1 / n_{0}$.

Proof. Since $C^{*}\left(u_{0}\right)$ is hereditary and full in the ideal $I_{X^{\prime \prime}} / I_{X^{\prime}}$, the map $I \mapsto I \cap$ $C^{*}\left(u_{0}\right)$ induces the bijection from the set of all ideals of $I_{X^{\prime \prime}} / I_{X^{\prime}}$ to the one of $C^{*}\left(u_{0}\right)$ preserving the intersections and inclusion. Hence it induces the bijection between the set of prime ideals. Combine this with Lemma 4.11 and Lemma 4.14, we see that $I \mapsto I \cap C^{*}\left(u_{0}\right)$ induces the bijection from the set of prime ideals $I$ with $X_{I}=\overline{\operatorname{Orb}\left(x_{0}\right)}$ to the set of all prime ideals of $C^{*}\left(u_{0}\right)$. The prime ideals of $C^{*}\left(u_{0}\right)$ is parametrized as $Q_{z}$ for $z \in \mathbb{T}$, where $Q_{z}$ is the ideal generated by $p_{0}-z u_{0}$. Since we have $\pi_{\left(x_{0}, \gamma\right)}\left(u_{0}\right)=\gamma^{n_{0}} \pi_{\left(x_{0}, \gamma\right)}\left(p_{0}\right)$, we get $P_{\left(x_{0}, \gamma\right)} \cap C^{*}\left(u_{0}\right)=Q_{\gamma^{-n_{0}}}$. Hence we see that $P_{\left(x_{0}, e^{2 \pi i t}\right)}$ for $0 \leq t<1 / n_{0}$ is the parametrization of the prime ideals $I$ with $X_{I}=\overline{\operatorname{Orb}\left(x_{0}\right)}$.

Note that for $x_{0} \in \mathrm{P}(\Sigma)$ with $n_{0}=p\left(x_{0}\right)$, we have $P_{(x, \gamma)}=P_{(x, \mu)}$ if and only if $\gamma^{n_{0}}=\mu^{n_{0}}$ by Lemma 2.17.

Combine the discussion above, we get the following.
Theorem 4.16. The set of all prime ideals of $C^{*}(\Sigma)$ is

$$
\left\{I_{X^{\prime}} \mid X^{\prime} \in \mathcal{A}(\Sigma)\right\} \cup\left\{P_{\left(x, e^{2 \pi i t}\right)} \mid x \in \mathrm{P}(\Sigma), 0 \leq t<1 / p(x)\right\}
$$

Remark 4.17. One can show that when $X$ is second countable for $X^{\prime} \in \mathcal{A}(\Sigma)$ there exists $x \in X$ such that $X^{\prime}=\overline{\operatorname{Orb}(x)}$ (cf. [K3, Proposition 4.14]). Therefore when $X$ is second countable, $\left\{P_{(x, \gamma)}\right\}$ are all prime (primitive) ideals of $C^{*}(\Sigma)$.

Proposition 4.18. Every prime ideals of $C^{*}(\Sigma)$ is an intersection of primitive ideals in the form $P_{(x, \gamma)}$.
Proof. Take $X^{\prime} \in \mathcal{A}(\Sigma)$. We set $I=\bigcap_{x \in X^{\prime}, \gamma \in \mathbb{T}} P_{(x, \gamma)}$. Then $I$ is gauge-invariant. For $x \in X^{\prime}$ and $\gamma \in \mathbb{T}$, we have $X_{P_{(x, \gamma)}}=\overline{\operatorname{Orb}(x)} \subset X^{\prime}$. Hence $I_{X^{\prime}} \subset I_{X_{(x, \gamma)}} \subset P_{(x, \gamma)}$ by Lemma 3.12 and Lemma 3.9. Therefore we get $I_{X^{\prime}} \subset I$. For $x \in X^{\prime}$ and $\gamma \in \mathbb{T}, I \subset P_{(x, \gamma)}$ implies $X_{I} \supset X_{P_{(x, \gamma)}}=\overline{\operatorname{Orb}(x)}$. Hence we get $X_{I} \supset X^{\prime}$. By Proposition 3.10 and Lemma 3.12, we get $I=I_{X_{I}} \subset I_{X^{\prime}}$. Thus we have $I_{X^{\prime}}=I$.

Corollary 4.19. Every primitive ideals of $C^{*}(\Sigma)$ is an intersection of primitive ideals in the form $P_{(x, \gamma)}$.

$$
\text { 5. } Y_{I}, I_{Y} \text { and } I_{Y_{I}}=I
$$

Definition 5.1. For an ideal $I$ of $C^{*}(\Sigma)$, we define $Y_{I} \subset X \times \mathbb{T}$ by

$$
Y_{I}=\left\{(x, \gamma) \in X \times \mathbb{T} \mid I \subset P_{(x, \gamma)}\right\}
$$

Lemma 5.2. For two ideals $I_{1}, I_{2}$ of $C^{*}(\Sigma)$, we have $Y_{I_{1} \cap I_{2}}=Y_{I_{1}} \cup Y_{I_{2}}$. If $I_{1} \subset I_{2}$, we have $Y_{I_{1}} \supset Y_{I_{2}}$.
Proof. To show $Y_{I_{1} \cap I_{2}}=Y_{I_{1}} \cup Y_{I_{2}}$, it suffices to show for $(x, \gamma) \in X \times \mathbb{T}, I_{1} \cap I_{2} \subset P_{(x, \gamma)}$ if and only if $I_{1} \subset P_{(x, \gamma)}$ or $I_{2} \subset P_{(x, \gamma)}$. This follows from the fact that $P_{(x, \gamma)}$ is prime. The latter assertion is clear by definition.

Definition 5.3. For a subset $Y$ of $X \times \mathbb{T}$, we define an ideal $I_{Y}$ of $C^{*}(\Sigma)$ by

$$
I_{Y}=\bigcap_{(x, \gamma) \in Y} P_{(x, \gamma)} .
$$

Lemma 5.4. For two subsets $Y_{1}, Y_{2}$ of $X \times \mathbb{T}$, we have $I_{Y_{1} \cup Y_{2}}=I_{Y_{1}} \cap I_{Y_{2}}$. If $Y_{1} \subset Y_{2}$, we have $I_{Y_{1}} \supset I_{Y_{2}}$.
Proof. Clear by definition.
Proposition 5.5. For an ideal $I$ of $C^{*}(\Sigma)$, we have $I_{Y_{I}}=I$.
Proof. It is known that $I$ is the intersection of all primitive ideals of $C^{*}(\Sigma)$ containing $I$ ([B, II.6.5.3]). By Corollary 4.19, all primitive ideals of $C^{*}(\Sigma)$ are the intersection of ideals in the form $P_{(x, \gamma)}$. We are done.

Thus $I \mapsto Y_{I}$ is an injective map from the set of ideals of $C^{*}(\Sigma)$ to the set of subsets of $X \times \mathbb{T}$. We will determine the image of this map in order to get the complete description of ideals of $C^{*}(\Sigma)$.

Definition 5.6. Let $Y$ be a subset of $X \times \mathbb{T}$. For each $x \in X$, we set

$$
Y_{x}=\{\gamma \in \mathbb{T} \mid(x, \gamma) \in Y\} \subset \mathbb{T}
$$

Definition 5.7. We say a subset $Y$ of $X \times \mathbb{T}$ is said to be admissible if
(i) $Y$ is a closed subset of $X \times \mathbb{T}$ with respect to the product topology,
(ii) $Y_{x}=Y_{\sigma(x)}$ for all $x \in U$,
(iii) $Y_{x_{0}} \neq \emptyset, \mathbb{T}$ implies that $x_{0}$ is periodic, $\zeta_{p\left(x_{0}\right)} Y_{x_{0}}=Y_{x_{0}}$, and there exists a neighborhood $V$ of $x_{0}$ such that all $x \in V$ with $l(x) \neq l\left(x_{0}\right)$ satisfies $Y_{x}=\emptyset$.
6. $Y_{I}$ IS ADMISSIBLE

We will show that $Y_{I}$ is admissible for all ideal $I$ of $C^{*}(\Sigma)$ (Proposition 6.8).
For a periodic point $x_{0} \in X$ with $p:=p\left(x_{0}\right)$ and a positive integer $n$, we define a map $\sigma_{n}: \operatorname{Orb}\left(x_{0}\right) \times \mathbb{Z} / n \mathbb{Z} \rightarrow \operatorname{Orb}\left(x_{0}\right) \times \mathbb{Z} / n \mathbb{Z}$ as follows.

We set $y_{0}=\sigma^{l\left(x_{0}\right)+p-1}\left(x_{0}\right)$. We define $d: \operatorname{Orb}\left(x_{0}\right) \rightarrow\{0,1\}$ by $d(x)=0$ for $x \in \operatorname{Orb}\left(x_{0}\right) \backslash\left\{y_{0}\right\}$ and $d\left(y_{0}\right)=1$, and a map $\sigma_{n}: \operatorname{Orb}\left(x_{0}\right) \times \mathbb{Z} / n \mathbb{Z} \rightarrow \operatorname{Orb}\left(x_{0}\right) \times$ $\mathbb{Z} / n \mathbb{Z}$ by $\sigma_{n}(x, j)=(\sigma(x), j+d(x))$. Let $H_{x_{0}}^{(n)}$ be the Hilbert space whose complete orthonormal system is given by $\left\{\delta_{(x, j)}\right\}_{(x, j) \in \operatorname{Orb}\left(x_{0}\right) \times \mathbb{Z} / n \mathbb{Z}}$. In a similar way to define
representations $\pi_{\left(x_{0}, \gamma_{0}\right)}$, we can define a representation $\pi_{\left(x_{0}, \gamma_{0}\right)}^{(n)}: C^{*}(\Sigma) \rightarrow B\left(H_{x_{0}}^{(n)}\right)$ such that

$$
\begin{aligned}
& \pi_{\left(x_{0}, \gamma_{0}\right)}^{(n)}\left(t^{0}(f)\right) \delta_{(x, j)}=f(x) \delta_{(x, j)} \\
& \pi_{\left(x_{0}, \gamma_{0}\right)}^{(n)}\left(t^{1}(\xi)\right) \delta_{(x, j)}=\gamma_{0} \sum_{\sigma_{n}\left(\left(y, j^{\prime}\right)\right)=(x, j)} \xi(y) \delta_{\left(y, j^{\prime}\right)}=\gamma_{0} \sum_{\sigma(y)=x} \xi(y) \delta_{(y, j-d(y))} .
\end{aligned}
$$

By construction, we have $\pi_{\left(x_{0}, \gamma_{0}\right)}^{(1)}=\pi_{\left(x_{0}, \gamma_{0}\right)}$. We will see that $\pi_{\left(x_{0}, \gamma_{0}\right)}^{(n)}$ is not irreducible for $n \geq 2$ in Lemma 6.2. For $x \in \operatorname{Orb}\left(x_{0}\right)$, let $c(x) \in \mathbb{N}$ be the smallest natural number satisfying $\sigma^{c(x)}(x)=y_{0}$. We have $c(\sigma(x))=c(x)-1$ for $x \in \operatorname{Orb}\left(x_{0}\right) \backslash\left\{y_{0}\right\}$, and $c\left(\sigma\left(y_{0}\right)\right)=p-1=c\left(y_{0}\right)+p-1$. Hence we get $d(y) p=c(\sigma(y))-c(y)+1$ for all $y \in \operatorname{Orb}\left(x_{0}\right)$.

Lemma 6.1. For $k=0,1, \ldots, n-1$, the map $\iota_{k}: H_{x_{0}} \rightarrow H_{x_{0}}^{(n)}$ defined by

$$
\iota_{k}\left(\delta_{x}\right)=\frac{1}{\sqrt{n}} \sum_{j=0}^{n-1} \zeta_{n p}^{(j p-c(x)) k} \delta_{(x, j)}
$$

is an isometry satisfying $\iota_{k} \circ \pi_{\left(x_{0}, \zeta_{n}^{k} \gamma_{0}\right)}(a)=\pi_{\left(x_{0}, \gamma_{0}\right)}^{(n)}(a) \circ \iota_{k}$ for $a \in C^{*}(\Sigma)$.
Proof. Clearly $\iota_{k}$ is isometric. For every $f \in C_{0}(X)$ and $x \in \operatorname{Orb}\left(x_{0}\right)$, we have

$$
\iota_{k}\left(\pi_{\left(x_{0}, \zeta_{n p}^{k} \gamma_{0}\right)}\left(t^{0}(f)\right) \delta_{x}\right)=\iota_{k}\left(f(x) \delta_{x}\right)=f(x) \frac{1}{\sqrt{n}} \sum_{j=0}^{n-1} \zeta_{n p}^{(j p-c(x)) k} \delta_{(x, j)}
$$

and

$$
\begin{aligned}
\pi_{\left(x_{0}, \gamma_{0}\right)}^{(n)}\left(t^{0}(f)\right)\left(\iota_{k}\left(\delta_{x}\right)\right) & =\pi_{\left(x_{0}, \gamma_{0}\right)}^{(n)}\left(t^{0}(f)\right)\left(\frac{1}{\sqrt{n}} \sum_{j=0}^{n-1} \zeta_{n p}^{(j p-c(x)) k} \delta_{(x, j)}\right) \\
& =\frac{1}{\sqrt{n}} \sum_{j=0}^{n-1} \zeta_{n p}^{(j p-c(x)) k} f(x) \delta_{(x, j)}
\end{aligned}
$$

Hence $\iota_{k} \circ \pi_{\left(x_{0}, \zeta_{n p}^{k} \gamma_{0}\right)}(a)=\pi_{\left(x_{0}, \gamma_{0}\right)}^{(n)}(a) \circ \iota_{k}$ for $a \in t^{0}\left(C_{0}(X)\right)$. For every $\xi \in C_{c}(U)$ and $x \in \operatorname{Orb}\left(x_{0}\right)$, we have

$$
\begin{aligned}
\iota_{k}\left(\pi_{\left(x_{0}, \zeta_{n p}^{k} \gamma_{0}\right)}\left(t^{1}(\xi)\right) \delta_{x}\right) & =\iota_{k}\left(\zeta_{n p}^{k} \gamma_{0} \sum_{\sigma(y)=x} \xi(y) \delta_{y}\right) \\
& =\zeta_{n p}^{k} \gamma_{0} \sum_{\sigma(y)=x} \xi(y)\left(\frac{1}{\sqrt{n}} \sum_{j=0}^{n-1} \zeta_{n p}^{(j p-c(y)) k} \delta_{(y, j)}\right) \\
& =\frac{1}{\sqrt{n}} \gamma_{0} \sum_{\sigma(y)=x} \xi(y) \sum_{j=0}^{n-1} \zeta_{n p}^{(j p-c(y)+1) k} \delta_{(y, j)},
\end{aligned}
$$

and

$$
\begin{aligned}
\pi_{\left(x_{0}, \gamma_{0}\right)}^{(n)}\left(t^{1}(\xi)\right)\left(\iota_{k}\left(\delta_{x}\right)\right) & =\pi_{\left(x_{0}, \gamma_{0}\right)}^{(n)}\left(t^{1}(\xi)\right)\left(\frac{1}{\sqrt{n}} \sum_{j=0}^{n-1} \zeta_{n p}^{(j p-c(x)) k} \delta_{(x, j)}\right) \\
& =\frac{1}{\sqrt{n}} \sum_{j=0}^{n-1} \zeta_{n p}^{(j p-c(x)) k}\left(\gamma_{0} \sum_{\sigma(y)=x} \xi(y) \delta_{(y, j-d(y))}\right) \\
& =\frac{1}{\sqrt{n}} \gamma_{0} \sum_{\sigma(y)=x} \xi(y) \sum_{j=0}^{n-1} \zeta_{n p}^{(j p-c(x)) k} \delta_{(y, j-d(y))} \\
& =\frac{1}{\sqrt{n}} \gamma_{0} \sum_{\sigma(y)=x} \xi(y) \sum_{j=0}^{n-1} \zeta_{n p}^{((j+d(y)) p-c(x)) k} \delta_{(y, j)} \\
& =\frac{1}{\sqrt{n}} \gamma_{0} \sum_{\sigma(y)=x} \xi(y) \sum_{j=0}^{n-1} \zeta_{n p}^{(j p-c(y)+1) k} \delta_{(y, j)}
\end{aligned}
$$

where in the last equality we use the fact that $d(y) p=c(x)-c(y)+1$ for $y \in \operatorname{Orb}\left(x_{0}\right)$ with $\sigma(y)=x$. Hence $\iota_{k} \circ \pi_{\left(x_{0}, \zeta_{n_{p}}^{k} \gamma_{0}\right)}(a)=\pi_{\left(x_{0}, \gamma_{0}\right)}^{(n)}(a) \circ \iota_{k}$ for $a \in t^{1}\left(C_{c}(U)\right)$. Since $C^{*}(\Sigma)$ is generated by $t^{0}\left(C_{0}(X)\right) \cup t^{1}\left(C_{c}(U)\right)$, we have $\iota_{k} \circ \pi_{\left(x_{0}, \zeta_{n p}^{k} \gamma_{0}\right)}(a)=\pi_{\left(x_{0}, \gamma_{0}\right)}^{(n)}(a) \circ \iota_{k}$ for every $a \in C^{*}(\Sigma)$.

Lemma 6.2. The representation $\pi_{\left(x_{0}, \gamma_{0}\right)}^{(n)}$ is unitarily equivalent to $\bigoplus_{k=0}^{n-1} \pi_{\left(x_{0}, \zeta_{n p}^{k} \gamma_{0}\right)}$. Hence we have $\operatorname{ker} \pi_{\left(x_{0}, \gamma_{0}\right)}^{(n)}=\bigcap_{k=0}^{n-1} P_{\left(x_{0}, \zeta_{n p}^{k} \gamma_{0}\right)}$.

Proof. For $k=0,1, \ldots, n-1$, let $\iota_{k}$ be the isometies in Lemma 6.1. Then for each $x \in \operatorname{Orb}\left(x_{0}\right),\left\{\iota_{k}\left(\delta_{x}\right)\right\}_{k=0}^{n-1}$ are complete orthonormal system of the linear space spanned by $\left\{\delta_{(x, j)} \mid j \in \mathbb{Z} / n \mathbb{Z}\right\}$. Hence $\bigoplus_{k=0}^{n-1} \iota_{k}$ is a unitary from $\bigoplus_{k=0}^{n-1} H_{x_{0}}$ to $H_{x_{0}}^{(n)}$ which intertwines $\bigoplus_{k=0}^{n-1} \pi_{\left(x_{0}, \zeta_{n p}^{k} \gamma_{0}\right)}$ and $\pi_{\left(x_{0}, \gamma_{0}\right)}^{(n)}$. This completes the proof.

Note that Lemma2.15implies $P_{\left(x_{0}, \zeta_{n p}^{k} \gamma_{0}\right)}=P_{\left(x_{0}, \zeta_{n p}^{k+n} \gamma_{0}\right)}$. Hence we get ker $\pi_{\left(x_{0}, \gamma_{0}\right)}^{(n)}=$ $\bigcap_{k \in \mathbb{Z}} P_{\left(x_{0}, \zeta_{n p}^{k} \gamma_{0}\right)}$.

Lemma 6.3. Let $l, m \in \mathbb{N}$ with $m \geq 1$. Let $\left\{\left(x_{\lambda}, \gamma_{\lambda}\right)\right\}_{\lambda \in \Lambda}$ be a net in $X \times \mathbb{T}$ converges to $\left(x_{0}, \gamma_{0}\right)$ such that $l\left(x_{\lambda}\right)=l$ and $p\left(x_{\lambda}\right)=m$ for all $\lambda \in \Lambda$. Then we have the following.
(i) $l\left(x_{0}\right)=l$ and $p\left(x_{0}\right)=m / n$ for some $n \in \mathbb{N}$.
(ii) for each $(x, j) \in \operatorname{Orb}\left(x_{0}\right) \times \mathbb{Z} / n \mathbb{Z}$, there exist $\lambda_{(x, j)} \in \Lambda$ and $\varphi_{\lambda}(x, j) \in$ $\operatorname{Orb}\left(x_{\lambda}\right)$ for $\lambda \succeq \lambda_{(x, j)}$ satisfying

- $\lim _{\lambda} \varphi_{\lambda}(x, j)=x$ for all $(x, j)$,
- $\sigma\left(\varphi_{\lambda}(x, j)\right)=\varphi_{\lambda}\left(\sigma_{n}(x, j)\right)$ for all $(x, j)$ and all $\lambda$ with $\lambda \succeq \lambda_{(x, j)}$ and $\lambda \succeq \lambda_{\sigma_{n}(x, j)}$,
- for two distinct elements $(x, j),\left(x^{\prime}, j^{\prime}\right) \in \operatorname{Orb}\left(x_{0}\right) \times \mathbb{Z} / n \mathbb{Z}$, we have $\varphi_{\lambda}(x, j) \neq \varphi_{\lambda}\left(x^{\prime}, j^{\prime}\right)$ for sufficiently large $\lambda$.
(iii) $\bigcap_{\lambda} P_{\left(x_{\lambda}, \gamma_{\lambda}\right)} \subset \operatorname{ker} \pi_{\left(x_{0}, \gamma_{0}\right)}^{(n)}$.

Proof. (i) For each $\lambda$, we have $\sigma^{l+m}\left(x_{\lambda}\right)=\sigma^{l}\left(x_{\lambda}\right)$. Hence we get $\sigma^{l+m}\left(x_{0}\right)=\sigma^{l}\left(x_{0}\right)$. This implies that $x_{0}$ is a periodic point whose period $p\left(x_{0}\right)$ divides $m$. Thus we can find $n \in \mathbb{N}$ with $p\left(x_{0}\right)=m / n$. We clearly have $l\left(x_{0}\right) \leq l$. To drive a contradiction, assume $l\left(x_{0}\right)=k<l$. Then we have $\sigma^{k+m}\left(x_{0}\right)=\sigma^{k}\left(x_{0}\right)$. Since $\sigma^{l-k}$ is locally homeomorphic, there exists a neighborhood $V$ of $\sigma^{k+m}\left(x_{0}\right)=\sigma^{k}\left(x_{0}\right)$ such that $\sigma^{l-k}$ is injective on $V$. We can find $\lambda$ such that $\sigma^{k+m}\left(x_{\lambda}\right), \sigma^{k}\left(x_{\lambda}\right) \in V$. Since $k<l$, we have $\sigma^{k+m}\left(x_{\lambda}\right) \neq \sigma^{k}\left(x_{\lambda}\right)$. However, we have

$$
\sigma^{l-k}\left(\sigma^{k+m}\left(x_{\lambda}\right)\right)=\sigma^{l+m}\left(x_{\lambda}\right)=\sigma^{l}\left(x_{\lambda}\right)=\sigma^{l-k}\left(\sigma^{k}\left(x_{\lambda}\right)\right)
$$

This is a contradiction. Hence $l\left(x_{0}\right)=l$.
(ii) Let us set $p=p\left(x_{0}\right)$, and $x^{(i)}=\sigma^{l+i}\left(x_{0}\right)$ for $i=0, \ldots, p-1$. Take $(x, j) \in$ $\operatorname{Orb}\left(x_{0}\right) \times \mathbb{Z} / n \mathbb{Z}$. Let $k:=l(x)$ which is the smallest natural number with $\sigma^{k+p}(x)=$ $\sigma^{k}(x)$. Choose $i \in\{0,1, \ldots, p-1\}$ such that $\sigma^{k}(x)=x^{(i)}$. Choose a neighborhood $V$ of $x$ such that $\sigma^{k}$ is injective on $V$. Since $\sigma^{l+i+j p}\left(x_{0}\right)=x^{(i)}$, there exists $\lambda_{(x, j)} \in \Lambda$ such that we have $\sigma^{l+i+j p}\left(x_{\lambda}\right) \in \sigma^{k}(V)$ for all $\lambda \succeq \lambda_{(x, j)}$. For $\lambda \succeq \lambda_{(x, j)}$, define $\varphi_{\lambda}(x, j)$ to be the element in $V$ with $\sigma^{k}\left(\varphi_{\lambda}(x, j)\right)=\sigma^{l+i+j p}\left(x_{\lambda}\right)$. Since the restriction of $\sigma^{k}$ to $V$ is a homeomorphism and $\lim _{\lambda} \sigma^{l+i+j p}\left(x_{\lambda}\right)=\sigma^{l+i+j p}\left(x_{0}\right)=x^{(i)}$, we get $\lim _{\lambda} \varphi_{\lambda}(x, j)=x$. By construction, it is easy to see that $\sigma\left(\varphi_{\lambda}(x, j)\right)=\varphi_{\lambda}\left(\sigma_{n}(x, j)\right)$ for $(x, j) \in\left(\operatorname{Orb}\left(x_{0}\right) \backslash\left\{x^{(p-1)}\right\}\right) \times \mathbb{Z} / n \mathbb{Z}$ and $\lambda \in \Lambda$ with $\lambda \succeq \lambda_{(x, j)}$ and $\lambda \succeq$ $\lambda_{\sigma_{n}(x, j)}$. For $\left(x^{(p-1)}, j\right) \in \operatorname{Orb}\left(x_{0}\right) \times \mathbb{Z} / n \mathbb{Z}$, we have $\sigma_{n}\left(x^{(p-1)}, j\right)=\left(x^{(0)}, j+1\right)$. We get $\varphi_{\lambda}\left(x^{(p-1)}, j\right)=\sigma^{l+p-1+j p}\left(x_{\lambda}\right)$ and $\varphi_{\lambda}\left(x^{(0)}, j+1\right)=\sigma^{l+0+(j+1) p}\left(x_{\lambda}\right)$. Hence the equation $\sigma\left(\varphi_{\lambda}\left(x^{(p-1)}, j\right)\right)=\varphi_{\lambda}\left(\sigma_{n}\left(x^{(p-1)}, j\right)\right)$ is easy to see when $j \neq n-1$, and follows from the fact that $\sigma^{l+n p}\left(x_{\lambda}\right)=\sigma^{l}\left(x_{\lambda}\right)$ when $j=n-1$. Take two distinct elements $(x, j),\left(x^{\prime}, j^{\prime}\right) \in \operatorname{Orb}\left(x_{0}\right) \times \mathbb{Z} / n \mathbb{Z}$. If $x \neq x^{\prime}$, then $\varphi_{\lambda}(x, j) \neq \varphi_{\lambda}\left(x^{\prime}, j^{\prime}\right)$ for sufficiently large $\lambda$ because $\lim _{\lambda} \varphi_{\lambda}(x, j)=x$ and $\lim _{\lambda} \varphi_{\lambda}\left(x^{\prime}, j^{\prime}\right)=x^{\prime}$. If $x=x^{\prime}$, then $j \neq j^{\prime}$. Take $k:=l(x)$ and $i \in\{0,1, \ldots, p-1\}$ with $\sigma^{k}(x)=x^{(i)}$. For every $\lambda$ we have $\sigma^{l+i+j p}\left(x_{\lambda}\right) \neq \sigma^{l+i+j^{\prime} p}\left(x_{\lambda}\right)$ because $0<\left|j p-j^{\prime} p\right|<m$. Hence $\varphi_{\lambda}(x, j) \neq \varphi_{\lambda}\left(x^{\prime}, j^{\prime}\right)$ when they are defined because $\sigma^{k}\left(\varphi_{\lambda}(x, j)\right)=\sigma^{l+i+j p}\left(x_{\lambda}\right)$ and $\sigma^{k}\left(\varphi_{\lambda}\left(x^{\prime}, j^{\prime}\right)\right)=\sigma^{l+i+j^{\prime} p}\left(x_{\lambda}\right)$.
(iii) Take $(x, j),\left(x^{\prime}, j^{\prime}\right) \in \operatorname{Orb}\left(x_{0}\right) \times \mathbb{Z} / n \mathbb{Z}$. We will show that for all $a \in C^{*}(\Sigma)$ we have

$$
\lim _{\lambda}\left\langle\delta_{\varphi_{\lambda}\left(x^{\prime}, j^{\prime}\right)}, \pi_{\left(x_{\lambda}, \gamma_{\lambda}\right)}(a) \delta_{\varphi_{\lambda}(x, j)}\right\rangle_{x_{\lambda}}=\left\langle\delta_{\left(x^{\prime}, j^{\prime}\right)}, \pi_{\left(x_{0}, \gamma_{0}\right)}^{(n)}(a) \delta_{(x, j)}\right\rangle_{x_{0}}^{(n)},
$$

where $\langle\cdot, \cdot\rangle_{x_{0}}^{(n)}$ is the inner product of $H_{x_{0}}^{(n)}$ which is linear in the second variable. To do so, it suffices to assume that $a=\sum_{k=1}^{K} t^{n_{k}}\left(\xi_{k}\right) t^{m_{k}}\left(\eta_{k}\right)^{*} \in C^{*}(\Sigma)$ for some $K, n_{k}, m_{k} \in \mathbb{N}, \xi_{k} \in C_{c}\left(U_{n_{k}}\right)$ and $\eta_{k} \in C_{c}\left(U_{m_{k}}\right)$ for $k=1, \ldots, K$ by Lemma 1.14.

We can find $\lambda_{0} \in \Lambda$ such that

- $\lambda_{0} \succeq \lambda_{(x, j)}$ and $\lambda_{0} \succeq \lambda_{\left(x^{\prime}, j^{\prime}\right)}$,
- $\lambda_{0} \succeq \lambda_{\sigma_{n}^{m_{k}}(x, j)}$ and $\lambda_{0} \succeq \lambda_{\sigma_{n}^{n_{k}}\left(x^{\prime}, j^{\prime}\right)}$ for $k=1, \ldots, K$,
- $\varphi_{\lambda}$ is injective on $\left\{\sigma_{n}^{m_{k}}(x, j), \sigma_{n}^{n_{k}}\left(x^{\prime}, j^{\prime}\right) \mid k=1, \ldots, K\right\}$ for all $\lambda \succeq \lambda_{0}$.

For $\lambda \succeq \lambda_{0}$, we have

$$
\begin{aligned}
\pi_{\left(x_{\lambda}, \gamma_{\lambda}\right)}(a) \delta_{\varphi_{\lambda(x, j)}} & =\sum_{k=1}^{K} \pi_{\left(x_{\lambda}, \gamma_{\lambda}\right)}\left(t^{n_{k}}\left(\xi_{k}\right) t^{m_{k}}\left(\eta_{k}\right)^{*}\right) \delta_{\varphi_{\lambda}(x, j)} \\
& =\sum_{k=1}^{K} \pi_{\left(x_{\lambda}, \gamma_{\lambda}\right)}\left(t^{n_{k}}\left(\xi_{k}\right)\right)\left(\gamma_{\lambda}^{-m_{k}} \overline{\eta_{k}}\left(\varphi_{\lambda}(x, j)\right) \delta_{\left.\sigma^{m_{k}}\left(\varphi_{\lambda}(x, j)\right)\right)}\right) \\
& =\sum_{k=1}^{K} \sum_{\sigma^{n_{k}}(y)=\sigma^{m_{k}}\left(\varphi_{\lambda}(x, j)\right)} \gamma_{\lambda}^{n_{k}} \xi_{k}(y) \gamma_{\lambda}^{-m_{k}} \overline{\eta_{k}}\left(\varphi_{\lambda}(x, j)\right) \delta_{y}
\end{aligned}
$$

Hence we get

$$
\left\langle\delta_{\varphi_{\lambda}\left(x^{\prime}, j^{\prime}\right)}, \pi_{\left(x_{\lambda}, \gamma_{\lambda}\right)}(a) \delta_{\varphi_{\lambda}(x, j)}\right\rangle_{x_{\lambda}}=\sum_{k \in N_{\lambda}} \gamma_{\lambda}^{n_{k}-m_{k}} \xi_{k}\left(\varphi_{\lambda}\left(x^{\prime}, j^{\prime}\right)\right) \overline{\eta_{k}}\left(\varphi_{\lambda}(x, j)\right),
$$

where

$$
N_{\lambda}=\left\{k \in\{1, \ldots, K\} \mid \sigma^{n_{k}}\left(\varphi_{\lambda}\left(x^{\prime}, j^{\prime}\right)\right)=\sigma^{m_{k}}\left(\varphi_{\lambda}(x, j)\right)\right\} .
$$

Similarly, we get

$$
\left\langle\delta_{\left(x^{\prime}, j^{\prime}\right)}, \pi_{\left(x_{0}, \gamma_{0}\right)}^{(n)}(a) \delta_{(x, j)}\right\rangle_{x_{0}}^{(n)}=\sum_{k \in N_{0}} \gamma_{0}^{n_{k}-m_{k}} \xi_{k}\left(x^{\prime}\right) \overline{\eta_{k}}(x),
$$

where

$$
N_{0}=\left\{k \in\{1, \ldots, K\} \mid \sigma_{n}^{n_{k}}\left(x^{\prime}, j^{\prime}\right)=\sigma_{n}^{m_{k}}(x, j)\right\} .
$$

Since

$$
\sigma^{n_{k}}\left(\varphi_{\lambda}\left(x^{\prime}, j^{\prime}\right)\right)=\varphi_{\lambda}\left(\sigma_{n}^{n_{k}}\left(x^{\prime}, j^{\prime}\right)\right), \quad \sigma^{m_{k}}\left(\varphi_{\lambda}(x, j)\right)=\varphi_{\lambda}\left(\sigma_{n}^{m_{k}}(x, j)\right)
$$

and $\varphi_{\lambda}$ is injective on $\left\{\sigma_{n}^{m_{k}}(x, j), \sigma_{n}^{n_{k}}\left(x^{\prime}, j^{\prime}\right) \mid k=1, \ldots, K\right\}$, we have $N_{\lambda}=N_{0}$ for $\lambda \succeq \lambda_{0}$. Since $\lim _{\lambda} \varphi_{\lambda}(x, j)=x$ and $\lim _{\lambda} \varphi_{\lambda}\left(x^{\prime}, j^{\prime}\right)=x^{\prime}$, we have

$$
\lim _{\lambda}\left\langle\delta_{\varphi_{\lambda}\left(x^{\prime}, j^{\prime}\right)}, \pi_{\left(x_{\lambda}, \gamma_{\lambda}\right)}(a) \delta_{\varphi_{\lambda}(x, j)}\right\rangle_{x_{\lambda}}=\left\langle\delta_{\left(x^{\prime}, j^{\prime}\right)}, \pi_{\left(x_{0}, \gamma_{0}\right)}^{(n)}(a) \delta_{(x, j)}\right\rangle_{x_{0}}^{(n)} .
$$

Thus we get this equality for all $(x, j),\left(x^{\prime}, j^{\prime}\right) \in \operatorname{Orb}\left(x_{0}\right) \times \mathbb{Z} / n \mathbb{Z}$ and all $a \in C^{*}(\Sigma)$. Hence for $a \in \bigcap_{\lambda} P_{\left(x_{\lambda}, \gamma_{\lambda}\right)}$ we have $\pi_{\left(x_{0}, \gamma_{0}\right)}^{(n)}(a)=0$. We are done.

Corollary 6.4. Under the condition in Lemma 6.3, we have

$$
\bigcap_{\lambda} P_{\left(x_{\lambda}, \gamma_{\lambda}\right)} \subset P_{\left(x_{0}, \gamma_{0}\right)} .
$$

Proof. This follows from Lemma 6.3 (iii) and Lemma 6.2.
For a periodic point $x_{0} \in X$ with $p:=p\left(x_{0}\right)$, we define a representation $\pi_{\left(x_{0}, \gamma_{0}\right)}^{(\infty)}: C^{*}(\Sigma) \rightarrow$ $B\left(H_{x_{0}}^{(\infty)}\right)$ in a similar way to the definition of $\pi_{\left(x_{0}, \gamma_{0}\right)}^{(n)}$ where $H_{x_{0}}^{(\infty)}$ is the Hilbert space whose complete orthonormal system is given by $\left\{\delta_{(x, j)}\right\}_{(x, j) \in \operatorname{Orb}\left(x_{0}\right) \times \mathbb{Z}}$ using the map $\sigma_{\infty}: \operatorname{Orb}\left(x_{0}\right) \times \mathbb{Z} \rightarrow \operatorname{Orb}\left(x_{0}\right) \times \mathbb{Z}$ defined by $\sigma_{\infty}(x, j)=(\sigma(x), j+d(x))$. Let us define a probability space

$$
\left[1, \zeta_{p}\right)=\left\{e^{2 \pi i \theta / p} \mid 0 \leq \theta<1\right\}
$$

on which we consider the measure $d \gamma$ defined from the Lebesgue measure via the bijection $[0,1) \ni \theta \mapsto e^{2 \pi i \theta / p} \in\left[1, \zeta_{p}\right)$. The Hilbert space $L^{2}\left(\left[1, \zeta_{p}\right), H_{x_{0}}\right)$ of the all
$H_{x_{0}}$-valued second power integrable functions on $\left[1, \zeta_{p}\right)$ has spanned by the elements in the form $\eta \delta_{x}$ with $\eta \in L^{2}\left(\left[1, \zeta_{p}\right)\right)$ and $x \in \operatorname{Orb}\left(x_{0}\right)$. We define a representation $\pi_{\left(x_{0},\left[\gamma_{0}, \zeta_{p} \gamma_{0}\right)\right)}: C^{*}(\Sigma) \rightarrow B\left(L^{2}\left(\left[1, \zeta_{p}\right), H_{x_{0}}\right)\right)$ by

$$
\left(\pi_{\left(x_{0},\left[\gamma_{0}, \zeta_{p} \gamma_{0}\right)\right)}(a) \Psi\right)(\gamma)=\pi_{\left(x_{0}, \gamma \gamma_{0}\right)}(a) \Psi(\gamma) \in H_{x_{0}}
$$

for $\Psi \in L^{2}\left(\left[1, \zeta_{p}\right), H_{x_{0}}\right)$ and $\gamma \in\left[1, \zeta_{p}\right)$.
Lemma 6.5. The map $\iota: L^{2}\left(\left[1, \zeta_{p}\right), H_{x_{0}}\right) \rightarrow H_{x_{0}}^{(\infty)}$ defined by

$$
\iota\left(\eta \delta_{x}\right)=\sum_{j \in \mathbb{Z}}\left(\int_{\left[1, \zeta_{p}\right)} \gamma^{j p-c(x)} \eta(\gamma) d \gamma\right) \delta_{(x, j)}
$$

for $\eta \in L^{2}\left(\left[1, \zeta_{p}\right)\right)$ and $x \in \operatorname{Orb}\left(x_{0}\right)$ is a unitary satisfying $\iota \circ \pi_{\left(x_{0},\left[\gamma_{0}, \zeta_{p} \gamma_{0}\right)\right)}(a)=$ $\pi_{\left(x_{0}, \gamma_{0}\right)}^{(\infty)}(a) \circ \iota$ for $a \in C^{*}(\Sigma)$.

Proof. For each $x \in \operatorname{Orb}\left(x_{0}\right)$, the map $L^{2}\left(\left[1, \zeta_{p}\right)\right) \ni \eta(\cdot) \mapsto(\cdot)^{-c(x)} \eta(\cdot) \in L^{2}\left(\left[1, \zeta_{p}\right)\right)$ is a unitary. Since $\left[1, \zeta_{p}\right) \ni \gamma \rightarrow \gamma^{p} \in \mathbb{T}$ is an isomorphism between probability spaces, the natural isomorphism $L^{2}(\mathbb{T}) \cong \ell^{2}(\mathbb{Z})$ of the Fourier transform shows that the map

$$
L^{2}\left(\left[1, \zeta_{p}\right)\right) \ni \eta \mapsto \sum_{j \in \mathbb{Z}}\left(\int_{\left[1, \zeta_{p}\right)} \gamma^{j p-c(x)} \eta(\gamma) d \gamma\right) \delta_{(x, j)}
$$

is an isomorphism onto the Hilbert subspace spanned by $\left\{\delta_{(x, j)}\right\}_{j \in \mathbb{Z}}$. Thus $\iota$ is a unitary.

Take $\xi \in C_{c}(U), \eta \in L^{2}\left(\left[1, \zeta_{p}\right)\right)$ and $x \in \operatorname{Orb}\left(x_{0}\right)$. For each $\gamma \in\left[1, \zeta_{p}\right)$, we obtain

$$
\begin{aligned}
\left(\pi_{\left(x_{0},\left[\gamma_{0}, \zeta_{p} \gamma_{0}\right)\right)}\left(t^{1}(\xi)\right) \eta \delta_{x}\right)(\gamma) & =\pi_{\left(x_{0}, \gamma \gamma_{0}\right)}\left(t^{1}(\xi)\right)\left(\eta(\gamma) \delta_{x}\right) \\
& =\gamma \gamma_{0} \sum_{\sigma(y)=x} \xi(y) \eta(\gamma) \delta_{y}
\end{aligned}
$$

If we denote by $z \in L^{2}\left(\left[1, \zeta_{p}\right)\right)$ the identity function $\gamma \mapsto \gamma$, then we have

$$
\pi_{\left(x_{0},\left[\gamma_{0}, \zeta_{p} \gamma_{0}\right)\right)}\left(t^{1}(\xi)\right) \eta \delta_{x}=\gamma_{0} \sum_{\sigma(y)=x} \xi(y) \eta z \delta_{y} .
$$

Hence

$$
\begin{aligned}
\iota\left(\pi_{\left(x_{0},\left[\gamma_{0}, \zeta_{p} \gamma_{0}\right)\right)}\left(t^{1}(\xi)\right) \eta \delta_{x}\right) & =\iota\left(\gamma_{0} \sum_{\sigma(y)=x} \xi(y) \eta z \delta_{y}\right) \\
& =\gamma_{0} \sum_{\sigma(y)=x} \xi(y) \sum_{j \in \mathbb{Z}}\left(\int_{\left[1, \zeta_{p}\right)} \gamma^{j p-c(y)} \eta(\gamma) \gamma d \gamma\right) \delta_{(y, j)} \\
& =\gamma_{0} \sum_{\sigma(y)=x} \sum_{j \in \mathbb{Z}}\left(\int_{\left[1, \zeta_{p}\right)} \gamma^{j p-c(y)+1} \eta(\gamma) d \gamma\right) \xi(y) \delta_{(y, j)} .
\end{aligned}
$$

On the other hand, we get

$$
\begin{aligned}
\pi_{\left(x_{0}, \gamma_{0}\right)}^{(\infty)}\left(t^{1}(\xi)\right)\left(\iota\left(\eta \delta_{x}\right)\right) & =\pi_{\left(x_{0}, \gamma_{0}\right)}^{(\infty)}\left(t^{1}(\xi)\right)\left(\sum_{j \in \mathbb{Z}}\left(\int_{\left[1, \zeta_{p}\right)} \gamma^{j p-c(x)} \eta(\gamma) d \gamma\right) \delta_{(x, j)}\right) \\
& =\sum_{j \in \mathbb{Z}}\left(\int_{\left[1, \zeta_{p}\right)} \gamma^{j p-c(x)} \eta(\gamma) d \gamma\right) \gamma_{0} \sum_{\sigma(y)=x} \xi(y) \delta_{(y, j-d(y))} \\
& =\gamma_{0} \sum_{\sigma(y)=x} \sum_{j \in \mathbb{Z}}\left(\int_{\left[1, \zeta_{p}\right)} \gamma^{j p-c(x)} \eta(\gamma) d \gamma\right) \xi(y) \delta_{(y, j-d(y))} \\
& =\gamma_{0} \sum_{\sigma(y)=x} \sum_{j \in \mathbb{Z}}\left(\int_{\left[1, \zeta_{p}\right)} \gamma^{(j+d(y)) p-c(x)} \eta(\gamma) d \gamma\right) \xi(y) \delta_{(y, j)} \\
& =\gamma_{0} \sum_{\sigma(y)=x} \sum_{j \in \mathbb{Z}}\left(\int_{\left[1, \zeta_{p}\right)} \gamma^{j p-c(y)+1} \eta(\gamma) d \gamma\right) \xi(y) \delta_{(y, j)} .
\end{aligned}
$$

Hence we have $\iota \circ \pi_{\left(x_{0},\left[\gamma_{0}, \zeta_{p} \gamma_{0}\right)\right)}(a)=\pi_{\left(x_{0}, \gamma_{0}\right)}^{(\infty)}(a) \circ \iota$ for all $a \in t^{1}\left(C_{c}(U)\right)$. The proof of this equality for $a \in t^{0}\left(C_{0}(X)\right)$ is much easier. Therefore we get the equality for all $a \in C^{*}(\Sigma)$.

Corollary 6.6. We have $\operatorname{ker} \pi_{\left(x_{0}, \gamma_{0}\right)}^{(\infty)}=\bigcap_{\gamma \in \mathbb{T}} P_{\left(x_{0}, \gamma\right)}$.
Proof. By Lemma 6.5, we have

$$
\operatorname{ker} \pi_{\left(x_{0}, \gamma_{0}\right)}^{(\infty)}=\operatorname{ker} \pi_{\left(x_{0},\left[\gamma_{0}, \zeta_{p} \gamma_{0}\right)\right)}
$$

Since $\gamma \mapsto \pi_{\left(x_{0}, \gamma\right)}$ is pointwise norm continuous, we have

$$
\operatorname{ker} \pi_{\left(x_{0},\left[\gamma_{0}, \zeta_{p} \gamma_{0}\right)\right)}=\bigcap_{\gamma \in\left[\gamma_{0}, \zeta_{p} \gamma_{0}\right)} P_{\left(x_{0}, \gamma\right)} .
$$

By Lemma 2.15, we get

$$
\bigcap_{\gamma \in\left[\gamma_{0}, \zeta_{p} \gamma_{0}\right)} P_{\left(x_{0}, \gamma\right)}=\bigcap_{\gamma \in \mathbb{T}} P_{\left(x_{0}, \gamma\right)}
$$

This completes the proof.
As usual, we consider $\mathbb{N} \cup\{\infty\}$ as the one-point compactification of the discrete set $\mathbb{N}$.

Lemma 6.7. Let $\left\{\left(x_{\lambda}, \gamma_{\lambda}\right)\right\}_{\lambda \in \Lambda}$ be a net in $X \times \mathbb{T}$ converges to $\left(x_{0}, \gamma_{0}\right)$ such that $l\left(x_{\lambda}\right)+p\left(x_{\lambda}\right)$ converges to $\infty$. Then we have $\bigcap_{\lambda} P_{\left(x_{\lambda}, \gamma_{\lambda}\right)} \subset P_{\left(x_{0}, \gamma\right)}$ for all $\gamma \in \mathbb{T}$.
Proof. We divide the proof into two cases; the case that $x_{0}$ is periodic and the case that $x_{0}$ is aperiodic. In the both cases, the proofs go in a similar way to the proof of Lemma 6.3, and so we just sketch the proofs.

First consider the case that $x_{0}$ is periodic with period $p\left(x_{0}\right)=p$. We first show that for each $(x, j) \in \operatorname{Orb}\left(x_{0}\right) \times \mathbb{Z}$, there exist $\lambda_{(x, j)} \in \Lambda$ and $\varphi_{\lambda}(x, j) \in \operatorname{Orb}\left(x_{\lambda}\right)$ for $\lambda \succeq \lambda_{(x, j)}$ satisfying

- $\lim _{\lambda} \varphi_{\lambda}(x, j)=x$,
- $\sigma\left(\varphi_{\lambda}(x, j)\right)=\varphi_{\lambda}\left(\sigma_{\infty}(x, j)\right)$.
- for two distinct elements $(x, j),\left(x^{\prime}, j^{\prime}\right) \in \operatorname{Orb}\left(x_{0}\right) \times \mathbb{Z}$, we have $\varphi_{\lambda}(x, j) \neq$ $\varphi_{\lambda}\left(x^{\prime}, j^{\prime}\right)$ for sufficiently large $\lambda$.
We set $x_{0}^{\prime}:=\sigma^{l\left(x_{0}\right)}\left(x_{0}\right)$. For $\left(x_{0}^{\prime}, 0\right) \in \operatorname{Orb}\left(x_{0}\right) \times \mathbb{Z}$, we set $\varphi_{\lambda}\left(x_{0}^{\prime}, 0\right)=\sigma^{l\left(x_{0}\right)}\left(x_{\lambda}\right)$ for all $\lambda$. There exists $\lambda_{\left(x_{0}^{\prime}, 1\right)} \in \Lambda$ such that $\varphi_{\lambda}\left(x_{0}^{\prime}, 0\right) \in U$ for all $\lambda \succeq \lambda_{\left(x_{0}^{\prime}, 0\right)}$. Set $\varphi_{\lambda}\left(\sigma\left(x_{0}^{\prime}\right), 0\right)=\sigma\left(\varphi_{\lambda}\left(x_{0}^{\prime}, 0\right)\right)$ for all $\lambda \succeq \lambda_{\left(x_{0}^{\prime}, 0\right)}$. Similarly for $k=2,3, \ldots, p-1$ $\varphi_{\lambda}\left(\sigma^{k}\left(x_{0}^{\prime}\right), 0\right)=\sigma\left(\varphi_{\lambda}\left(\sigma^{k-1}\left(x_{0}^{\prime}\right), 0\right)\right)$ for sufficiently large $\lambda$. We also set for sufficiently large $\lambda, \varphi_{\lambda}\left(x_{0}^{\prime}, 1\right)=\sigma\left(\varphi_{\lambda}\left(\sigma^{p-1}\left(x_{0}^{\prime}\right), 0\right)\right)$ and $\varphi_{\lambda}\left(\sigma^{k}\left(x_{0}^{\prime}\right), 1\right)=\sigma\left(\varphi_{\lambda}\left(\sigma^{k-1}\left(x_{0}^{\prime}\right), 1\right)\right)$ for $k=1,2, \ldots, p-1$. For $j=2,3, \ldots$, we set for sufficiently large $\lambda, \varphi_{\lambda}\left(x_{0}^{\prime}, j\right)=$ $\sigma\left(\varphi_{\lambda}\left(\sigma^{p-1}\left(x_{0}^{\prime}\right), j-1\right)\right)$ and $\varphi_{\lambda}\left(\sigma^{k}\left(x_{0}^{\prime}\right), j\right)=\sigma\left(\varphi_{\lambda}\left(\sigma^{k-1}\left(x_{0}^{\prime}\right), j\right)\right)$ for $k=1,2, \ldots, p-1$. Next we choose a neighborhood $V$ of $x_{0}^{\prime}$ such that $\sigma^{p}$ is injective on $V$. We set $\lambda_{\left(x_{0}^{\prime},-1\right)} \in \Lambda$ such that $\varphi_{\lambda}\left(x_{0}^{\prime}, 0\right) \in \sigma^{p}(V)$ for all $\lambda \succeq \lambda_{\left(x_{0}^{\prime},-1\right)}$. We set $\varphi_{\lambda}\left(x_{0}^{\prime},-1\right) \in V$ such that $\sigma^{p}\left(\varphi_{\lambda}\left(x_{0}^{\prime},-1\right)\right)=\varphi_{\lambda}\left(x_{0}^{\prime}, 0\right)$ and set $\varphi_{\lambda}\left(\sigma^{k}\left(x_{0}^{\prime}\right),-1\right)=\sigma\left(\varphi_{\lambda}\left(\sigma^{k-1}\left(x_{0}^{\prime}\right),-1\right)\right)$ for $k=1,2, \ldots, p-1$. We set $\lambda_{\left(x_{0}^{\prime},-2\right)} \in \Lambda$ such that $\varphi_{\lambda}\left(x_{0}^{\prime},-1\right) \in \sigma^{p}(V)$ for all $\lambda \succeq \lambda_{\left(x_{0}^{\prime},-2\right)}$. We set $\varphi_{\lambda}\left(x_{0}^{\prime},-2\right) \in V$ such that $\sigma^{p}\left(\varphi_{\lambda}\left(x_{0}^{\prime},-2\right)\right)=\varphi_{\lambda}\left(x_{0}^{\prime},-1\right)$ and set $\varphi_{\lambda}\left(\sigma^{k}\left(x_{0}^{\prime}\right),-2\right)=\sigma\left(\varphi_{\lambda}\left(\sigma^{k-1}\left(x_{0}^{\prime}\right),-2\right)\right)$ for $k=1,2, \ldots, p-1$. For $j=3,4, \ldots$, we set $\lambda_{\left(x_{0}^{\prime},-j\right)} \in \Lambda$ such that $\varphi_{\lambda}\left(x_{0}^{\prime},-j+1\right) \in \sigma^{p}(V)$ for all $\lambda \succeq \lambda_{\left(x_{0}^{\prime},-j\right)}$. We set $\varphi_{\lambda}\left(x_{0}^{\prime},-j\right) \in V$ such that $\sigma^{p}\left(\varphi_{\lambda}\left(x_{0}^{\prime},-j\right)\right)=\varphi_{\lambda}\left(x_{0}^{\prime},-j+1\right)$ and set $\varphi_{\lambda}\left(\sigma^{k}\left(x_{0}^{\prime}\right),-j\right)=$ $\sigma\left(\varphi_{\lambda}\left(\sigma^{k-1}\left(x_{0}^{\prime}\right),-j\right)\right)$ for $k=1,2, \ldots, p-1$. We have defined $\varphi_{\lambda}(x, j)$ for all $(x, j) \in$ $\operatorname{Orb}\left(x_{0}\right) \times \mathbb{Z}$ with $l(x)=0$. For $(x, j) \in \operatorname{Orb}\left(x_{0}\right) \times \mathbb{Z}$ with $l(x) \geq 1$, we choose a neighborhood $V$ of $x$ such that $\sigma^{k}$ is injective on $V$ where $k:=l(x)$. We set $\lambda_{(x, j)} \in \Lambda$ such that $\varphi_{\lambda}\left(\sigma^{k}(x), j\right) \in \sigma^{k}(V)$ for all $\lambda \succeq \lambda_{(x, j)}$. We set $\varphi_{\lambda}(x, j) \in V$ such that $\sigma^{k}\left(\varphi_{\lambda}(x, j)\right)=\varphi_{\lambda}\left(\sigma^{k}(x), j\right)$. It is very similar as in the proof of Lemma 6.3 (ii) to check that $\varphi_{\lambda}(x, j)$ 's satisfy the desired conditions except the proof of the statement that for $x \in \operatorname{Orb}\left(x_{0}\right)$ and $j, j^{\prime} \in \mathbb{Z}$ with $j<j^{\prime}$, we have $\varphi_{\lambda}(x, j) \neq \varphi_{\lambda}\left(x, j^{\prime}\right)$ for sufficiently large $\lambda$. This follows from the fact that, we have

$$
\sigma^{l(x)+N}\left(\varphi_{\lambda}(x, j)\right)=\sigma^{N^{\prime}}\left(x_{\lambda}\right), \quad \sigma^{l(x)+N}\left(\varphi_{\lambda}\left(x, j^{\prime}\right)\right)=\sigma^{N^{\prime}+p\left(j^{\prime}-j\right)}\left(x_{\lambda}\right)
$$

for sufficiently large $N$ and some $N^{\prime}$. Since $l\left(x_{\lambda}\right)+p\left(x_{\lambda}\right)$ converges to $\infty$ we have $\sigma^{N^{\prime}}\left(x_{\lambda}\right) \neq \sigma^{N^{\prime}+p\left(j^{\prime}-j\right)}\left(x_{\lambda}\right)$ for sufficiently large $\lambda$. This shows $\varphi_{\lambda}(x, j) \neq \varphi_{\lambda}\left(x, j^{\prime}\right)$ for sufficiently large $\lambda$.

Now, in a similar to the proof of Lemma 6.3 (iii), we can show that for all $(x, j),\left(x^{\prime}, j^{\prime}\right) \in \operatorname{Orb}\left(x_{0}\right) \times \mathbb{Z}$ and all $a \in C^{*}(\Sigma)$, we get

$$
\lim _{\lambda}\left\langle\delta_{\varphi_{\lambda}\left(x^{\prime}, j^{\prime}\right)}, \pi_{\left(x_{\lambda}, \gamma_{\lambda}\right)}(a) \delta_{\varphi_{\lambda}(x, j)}\right\rangle_{x_{\lambda}}=\left\langle\delta_{\left(x^{\prime}, j^{\prime}\right)}, \pi_{\left(x_{0}, \gamma_{0}\right)}^{(\infty)}(a) \delta_{(x, j)}\right\rangle_{x_{0}}^{(\infty)}
$$

where $\langle\cdot, \cdot\rangle_{x_{0}}^{(\infty)}$ is the inner product of $H_{x_{0}}^{(\infty)}$. Hence we have $\bigcap_{\lambda} P_{\left(x_{\lambda}, \gamma_{\lambda}\right)} \subset \operatorname{ker} \pi_{\left(x_{0}, \gamma_{0}\right)}^{(\infty)}$. We finish the proof for the case that $x_{0}$ is periodic by Corollary 6.6.

For the case that $x_{0}$ is aperiodic, we can similarly construct $\varphi_{\lambda}(x) \in \operatorname{Orb}\left(x_{\lambda}\right)$ for $x \in \operatorname{Orb}\left(x_{0}\right)$ and sufficiently large $\lambda \in \Lambda$, so that we get

$$
\lim _{\lambda}\left\langle\delta_{\varphi_{\lambda}\left(x^{\prime}\right)}, \pi_{\left(x_{\lambda}, \gamma_{\lambda}\right)}(a) \delta_{\varphi_{\lambda}(x)}\right\rangle_{x_{\lambda}}=\left\langle\delta_{x^{\prime}}, \pi_{\left(x_{0}, \gamma_{0}\right)}(a) \delta_{x}\right\rangle_{x_{0}},
$$

for all $x, x^{\prime} \in \operatorname{Orb}\left(x_{0}\right)$ and all $a \in C^{*}(\Sigma)$. Hence we have $\bigcap_{\lambda} P_{\left(x_{\lambda}, \gamma_{\lambda}\right)} \subset P_{\left(x_{0}, \gamma_{0}\right)}$. Since $P_{\left(x_{0}, \gamma\right)}=P_{\left(x_{0}, \gamma_{0}\right)}$ for all $\gamma \in \mathbb{T}$ by Lemma [2.14, we finish the case that $x_{0}$ is aperiodic.

Proposition 6.8. For an ideal $I$, the set $Y_{I}$ is admissible.

Proof. Take a net $\left\{\left(x_{\lambda}, \gamma_{\lambda}\right)\right\}_{\lambda \in \Lambda}$ in $Y_{I}$ converges to $\left(x_{0}, \gamma_{0}\right) \in X \times \mathbb{T}$. By replacing the net to a subnet if necessary, we may assume that either $l\left(x_{\lambda}\right)$ and $p\left(x_{\lambda}\right)$ are finite and constant or $l\left(x_{\lambda}\right)+p\left(x_{\lambda}\right)$ converges $\infty$. When $l\left(x_{\lambda}\right)$ and $p\left(x_{\lambda}\right)$ are finite and constant, we have

$$
I \subset \bigcap_{\lambda} P_{\left(x_{\lambda}, \gamma_{\lambda}\right)} \subset P_{\left(x_{0}, \gamma_{0}\right)}
$$

by Corollary 6.4. When $l\left(x_{\lambda}\right)+p\left(x_{\lambda}\right)$ converges $\infty$, we have

$$
I \subset \bigcap_{\lambda} P_{\left(x_{\lambda}, \gamma_{\lambda}\right)} \subset P_{\left(x_{0}, \gamma_{0}\right)}
$$

by Lemma 6.7. Hence we get $\left(x_{0}, \gamma_{0}\right) \in Y_{I}$. This shows that $Y_{I}$ is closed. By Lemma 2.12, $Y_{I}$ satisfies the condition (ii) in Definition 5.7.

Take $x_{0} \in X$ with $\left(Y_{I}\right)_{x_{0}} \neq \emptyset, \mathbb{T}$. By Lemma 2.14, we see that $x_{0}$ is periodic, and by Lemma 2.15 we see that $\zeta_{p\left(x_{0}\right)}\left(Y_{I}\right)_{x_{0}}=\left(Y_{I}\right)_{x_{0}}$. To the contrary, suppose that for any neighborhood $V$ of $x_{0}$ we can find $x \in V$ with $l(x) \neq l\left(x_{0}\right)$ satisfying $\left(Y_{I}\right)_{x} \neq \emptyset$. Then we can find a net $\left\{\left(x_{\lambda}, \gamma_{\lambda}\right)\right\}_{\lambda \in \Lambda}$ in $Y_{I}$ with $l\left(x_{\lambda}\right) \neq l\left(x_{0}\right)$ which converges $\left(x_{0}, \gamma_{0}\right)$ for some $\gamma_{0} \in \mathbb{T}$. By taking a subnet if necessary, we may assume that either $l\left(x_{\lambda}\right)$ and $p\left(x_{\lambda}\right)$ are finite and constant or $l\left(x_{\lambda}\right)+p\left(x_{\lambda}\right)$ converges to $\infty$ . If $l\left(x_{\lambda}\right)$ and $p\left(x_{\lambda}\right)$ are finite and constant, then $l\left(x_{0}\right)=l\left(x_{\lambda}\right)$ by Lemma 6.3 (i). This is a contradiction. If $l\left(x_{\lambda}\right)+p\left(x_{\lambda}\right)$ converges to $\infty$ then we have $\left(Y_{I}\right)_{x_{0}}=\mathbb{T}$ by Lemma 6.7. This is also a contradiction. Therefore we can find a neighborhood $V$ of $x_{0}$ such that all $x \in V$ with $l(x) \neq l\left(x_{0}\right)$ satisfies $\left(Y_{I}\right)_{x}=\emptyset$. We have proved that $Y_{I}$ is admissible.

## 7. A PROOF of $Y_{I_{Y}}=Y$

Take an admissible subset $Y$ of $X \times \mathbb{T}$. In this section we will prove that $Y_{I_{Y}}=Y$. By definition, we have $Y_{I_{Y}} \supset Y$. Thus all we have to do is to prove the other inclusion $Y_{I_{Y}} \subset Y$. We set $X^{\prime}:=\left\{x \in X \mid Y_{x} \neq \emptyset\right\}$.

Lemma 7.1. The set $X^{\prime}$ is closed and $\sigma$-invariant.
Proof. The set $X^{\prime}$ is closed because $Y$ is closed and $\mathbb{T}$ is compact. By the condition (ii) in Definition 5.7, $X^{\prime}$ is $\sigma$-invariant.

Take $x_{0} \notin X^{\prime}$ and $\gamma_{0} \in \mathbb{T}$. We can find $f \in C_{0}(X)$ such that $f\left(x_{0}\right)=1$ and $f(x)=0$ for all $x \in X^{\prime}$. Then we have $t^{0}(f) \in I_{Y}$ because $\pi_{(x, \gamma)}\left(t^{0}(f)\right)=0$ for all $x \in X^{\prime}$ and all $\gamma \in \mathbb{T}$. However $t^{0}(f) \notin P_{\left(x_{0}, \gamma_{0}\right)}$ because $\pi_{\left(x_{0}, \gamma_{0}\right)}\left(t^{0}(f)\right) \delta_{x_{0}}=\delta_{x_{0}}$. This implies $\left(x_{0}, \gamma_{0}\right) \notin Y_{I_{Y}}$. Therefore we have $Y_{I_{Y}} \subset X^{\prime} \times \mathbb{T}$.

Take $\left(x_{0}, \gamma_{0}\right) \in\left(X^{\prime} \times \mathbb{T}\right) \backslash Y$, and we will show that $\left(x_{0}, \gamma_{0}\right) \notin Y_{I_{Y}}$ which is equivalent to $I_{Y} \not \subset P_{\left(x_{0}, \gamma_{0}\right)}$. To do so, it suffices to construct $a \in C^{*}(\Sigma)$ such that $\pi_{\left(x_{0}, \gamma_{0}\right)}(a) \neq 0$ and $\pi_{(x, \gamma)}(a)=0$ for all $(x, \gamma) \in Y$. Note that the representation $\pi_{\left(x_{0}, \gamma_{0}\right)}$ factors through the natural surjection $C^{*}(\Sigma) \rightarrow C^{*}\left(\Sigma^{\prime}\right)$ where $\Sigma^{\prime}=$ $\left(X^{\prime},\left.\sigma\right|_{U \cap X^{\prime}}\right)$. The induced representation of $C^{*}\left(\Sigma^{\prime}\right)$ can be denoted by the same notation $\pi_{\left(x_{0}, \gamma_{0}\right)}$ considered as $x_{0} \in X^{\prime}$. Similarly for each $(x, \gamma) \in Y$, the representation $\pi_{(x, \gamma)}: C^{*}(\Sigma) \rightarrow B\left(H_{x_{0}}\right)$ factors through the representation $\pi_{(x, \gamma)}: C^{*}\left(\Sigma^{\prime}\right) \rightarrow B\left(H_{x_{0}}\right)$ considered as $x \in X^{\prime}$. Hence to finish the proof it suffices to construct $a \in C^{*}\left(\Sigma^{\prime}\right)$ such that $\pi_{\left(x_{0}, \gamma_{0}\right)}(a) \neq 0$ and $\pi_{(x, \gamma)}(a)=0$ for all $(x, \gamma) \in Y$.

We have $Y_{x_{0}} \neq \emptyset, \mathbb{T}$. Hence by the condition (iii) in Definition 5.7. there exists an open neighborhood $V$ of $x_{0}$ such that $l(x)=l\left(x_{0}\right)$ for all $x \in X^{\prime} \cap V$. We set $x_{0}^{\prime}=\sigma^{l\left(x_{0}\right)}\left(x_{0}\right)$ which satisfies $l\left(x_{0}^{\prime}\right)=0$. Set $V^{\prime}=\sigma^{l\left(x_{0}\right)}(V) \cap X^{\prime}$ which is an open neighborhood of $x_{0}^{\prime} \in X^{\prime}$ such that all $x^{\prime} \in V^{\prime}$ satisfies $l\left(x^{\prime}\right)=0$. We have $\left(x_{0}^{\prime}, \gamma_{0}\right) \notin Y$ because $\left(x_{0}, \gamma_{0}\right) \notin Y$. Since $Y$ is closed, we can find an open neighborhood $W^{\prime}$ of $x_{0}^{\prime} \in X^{\prime}$ and an open neighborhood $Z$ of $\gamma_{0} \in \mathbb{T}$ such that $\left(W^{\prime} \times Z\right) \cap Y=\emptyset$. We may assume that $W^{\prime} \subset V^{\prime}$. For each $x \in W^{\prime}$, we have $Y_{x} \cap Z=\emptyset$ and $\zeta_{p(x)} Y_{x}=Y_{x}$. Hence $\sup _{x \in W^{\prime}} p(x)<\infty$. Thus we can find $N \in \mathbb{N}$ such that $\sigma^{N}(x)=x$ for all $x \in W^{\prime}$ (recall that $l(x)=0$ for $x \in W^{\prime}$ ). Let us set $W=\bigcup_{k=0}^{N-1} \sigma^{k}\left(W^{\prime}\right)$ which is an open subset of $X^{\prime}$ satisfying $\sigma(W)=W$, and we denote by $\sigma_{W}: W \rightarrow W$ the restriction of $\sigma$ to $W$, which is a homeomorphism satisfying $\sigma_{W}^{N}=\mathrm{id}_{W}$. By the condition (ii) in Definition5.7, we have $(W \times Z) \cap Y=\emptyset$.

For $f \in C_{0}(W)$ and a negative integer $n$, we define $t^{n}(f) \in C^{*}(\Sigma)$ by $t^{n}(f)=$ $t^{-n}\left(\bar{f} \circ \sigma_{W}^{-n}\right)^{*}$.
Lemma 7.2. Let $f \in C_{0}(W)$. For $(x, \gamma) \in X^{\prime} \times \mathbb{T}$, $y \in \operatorname{Orb}(x)$ and $n \in \mathbb{Z}$, we have

$$
\pi_{(x, \gamma)}\left(t^{n}(f)\right) \delta_{y}= \begin{cases}\gamma_{0}^{n} f\left(\sigma_{W}^{-n}(y)\right) \delta_{\sigma_{W}^{-n}(y)} & \text { if } y \in W \\ 0 & \text { otherwise }\end{cases}
$$

Proof. We first consider the case $n \geq 0$. By Lemma 2.9, we have

$$
\pi_{(x, \gamma)}\left(t^{n}(f)\right) \delta_{y}=\gamma_{0}^{n} \sum_{\sigma^{n}(z)=y} f(z) \delta_{z}
$$

We have $f(z) \neq 0$ only when $z \in W$. There exists $z \in W$ with $\sigma^{n}(z)=y$ only when $y \in W$, and in this case $z=\sigma_{W}^{-n}(y)$ is the only element in $W$ satisfying $\sigma^{n}(z)=y$. This proves the case $n \geq 0$. Next, we consider the case $n<0$. By Lemma 2.9, we have

$$
\pi_{(x, \gamma)}\left(t^{n}(f)\right) \delta_{y}=\pi_{(x, \gamma)}\left(t^{-n}\left(\bar{f} \circ \sigma_{W}^{-n}\right)^{*}\right) \delta_{y}= \begin{cases}\gamma_{0}^{n}\left(f \circ \sigma_{W}^{-n}\right)(y) \delta_{\sigma^{-n}(y)} & \text { if } y \in U_{n} \\ 0 & \text { otherwise }\end{cases}
$$

When $y \notin W$, we have $\left(f \circ \sigma_{W}^{-n}\right)(y)=0$. This proves the case $n<0$.
Choose $f \in C_{0}(W)$ with $f \geq 0$ and $f\left(x_{0}^{\prime}\right) \neq 0$ and set

$$
f_{0}=\frac{1}{n} \sum_{k=0}^{n-1} f \circ \sigma_{W}^{k}
$$

Then we have $f_{0} \geq 0, f_{0}\left(x_{0}^{\prime}\right) \neq 0$ and $f_{0} \circ \sigma_{W}=f_{0}$.
Take $(x, \gamma) \in X^{\prime} \times \mathbb{T}$ and $y \in \operatorname{Orb}(x)$ with $y \in W$. For $k=0,1, \ldots, p(y)-1$, we set $\xi_{y, k} \in H_{x}$ by

$$
\xi_{y, k}:=\frac{1}{\sqrt{p(y)}} \sum_{j=0}^{p(y)-1} \zeta_{p(y)}^{j k} \delta_{\sigma_{W}^{j}(y)}
$$

Then $\left\{\xi_{y, k}\right\}_{k=0}^{p(y)-1}$ is a basis of the span of $\left\{\delta_{\sigma_{W}^{k}(y)}\right\}_{k=0}^{p(y)-1}$.
In these situation, we have the following.
Lemma 7.3. For $k=0,1, \ldots, p(y)-1$ and $n \in \mathbb{Z}$, we have

$$
\pi_{(x, \gamma)}\left(t^{n}\left(f_{0}\right)\right) \xi_{y, k}=\left(\gamma \zeta_{p(y)}^{k}\right)^{n} f_{0}(y) \xi_{y, k}
$$

Proof. By Lemma 7.2, we have

$$
\begin{aligned}
\pi_{(x, \gamma)}\left(t^{n}\left(f_{0}\right)\right) \xi_{y, k} & =\frac{1}{\sqrt{p(y)}} \sum_{j=0}^{p(y)-1} \zeta_{p(y)}^{j k} \pi_{(x, \gamma)}\left(t^{n}\left(f_{0}\right)\right) \delta_{\sigma_{W}^{j}(y)} \\
& =\frac{1}{\sqrt{p(y)}} \sum_{j=0}^{p(y)-1} \zeta_{p(y)}^{j k} \gamma^{n}\left(f_{0} \circ \sigma_{W}^{-n}\right)\left(\sigma_{W}^{j}(y)\right) \delta_{\sigma_{W}^{-n}\left(\sigma_{W}^{j}(y)\right)} \\
& =\gamma^{n} \frac{1}{\sqrt{p(y)}} \sum_{j=0}^{p(y)-1} \zeta_{p(y)}^{j k} f_{0}(y) \delta_{\sigma_{W}^{j-n}(y)} \\
& =\gamma^{n} f_{0}(y) \frac{1}{\sqrt{p(y)}} \sum_{j=0}^{p(y)-1} \zeta_{p(y)}^{(j+n) k} \delta_{\sigma_{W}^{j}(y)} \\
& =\left(\gamma \zeta_{p(y)}^{k}\right)^{n} f_{0}(y) \xi_{y, k}
\end{aligned}
$$

Lemma 7.4. For a trigonometric polynomial $q(z)=\sum_{n=-N}^{N} \alpha_{n} z^{n}$, we set $q\left(f_{0}\right)=$ $\sum_{n=-N}^{N} \alpha_{n} t^{n}\left(f_{0}\right)$. Then for $k=0,1, \ldots, p(y)-1$, we have

$$
\pi_{(x, \gamma)}\left(q\left(f_{0}\right)\right) \xi_{y, k}=q\left(\gamma \zeta_{p(y)}^{k}\right) f_{0}(y) \xi_{y, k}
$$

Proof. This follows from Lemma 7.3,
Take $g \in C_{c}(Z) \subset \mathbb{C}(\mathbb{T})$ with $g\left(\gamma_{0}\right) \neq 0$. Choose a sequence $q_{1}, q_{2}, \ldots$ of trigonometric polynomials converging to $g$ uniformly on $\mathbb{T}$. We have the following.

Lemma 7.5. The sequence $q_{1}\left(f_{0}\right), q_{2}\left(f_{0}\right), \ldots$ converges to an element $a \in C^{*}\left(\Sigma^{\prime}\right)$. We also have

$$
\pi_{(x, \gamma)}(a) \xi_{y, k}=g\left(\gamma_{0} \zeta_{p(y)}^{k}\right) f_{0}(y) \xi_{y, k}
$$

for $(x, \gamma) \in X^{\prime} \times \mathbb{T}, y \in \operatorname{Orb}(x) \cap W$ and $k=0,1, \ldots, p(y)-1$.
Proof. Let $B=C^{*}\left(W, \sigma_{W}\right)=C_{0}(W) \rtimes_{\sigma_{W}} \mathbb{Z}$ be the universal $C^{*}$-algebra generated by the products of the elements in $C_{0}(W) \subset B$ and a unitary $u \in M(B)$ which satisfy $u f u^{*}=f \circ \sigma_{W}$ for $f \in C_{0}(W)$ where $M(B)$ is the multiplier algebra of $B$. By the universality, there exists a $*$-homomorphism $\iota: B \rightarrow C^{*}\left(\Sigma^{\prime}\right)$ such that $\iota(f)=t^{0}(f)$ and $\iota(f u)=t^{1}(f)$. (We know that $\iota$ is injective by Proposition A.1.) For $n \in \mathbb{N}$, we have $\iota\left(f_{0} u^{n}\right)=t^{n}\left(f_{0}\right)$. To see this for $n \geq 0$, choose $\xi_{1}, \ldots, \xi_{n} \in C_{c}(U)$ such that

$$
f_{0}(x)=\xi_{1}(x) \xi_{2}(\sigma(x)) \cdots \xi_{n}\left(\sigma^{n-1}(x)\right)
$$

for all $x \in U_{n}$ by Lemma 1.10, and compute

$$
\begin{aligned}
\iota\left(f_{0} u^{n}\right) & =\iota\left(\xi_{1}\left(\xi_{2} \circ \sigma\right) \cdots\left(\xi_{n} \circ \sigma^{n-1}\right) u^{n}\right) \\
& =\iota\left(\xi_{1} u \xi_{2} u \cdots \xi_{n-1} u \xi_{n} u\right) \\
& =\iota\left(\xi_{1} u\right) \iota\left(\xi_{2} u\right) \cdots \iota\left(\xi_{n-1} u\right) \iota\left(\xi_{n} u\right) \\
& =t_{1}\left(\xi_{1}\right) t_{1}\left(\xi_{2}\right) \cdots t_{1}\left(\xi_{n-1}\right) t_{1}\left(\xi_{n}\right) \\
& =t^{n}\left(f_{0}\right) .
\end{aligned}
$$

For $n \leq-1$, we also have $\iota\left(f_{0} u^{n}\right)=t^{n}\left(f_{0}\right)$ because

$$
\begin{aligned}
\iota\left(f_{0} u^{n}\right)=\iota\left(u^{-n} \overline{f_{0}}\right)^{*} & =\iota\left(\left(\overline{f_{0}} \circ \sigma_{W}^{-n}\right) u^{-n}\right)^{*} \\
& =t^{-n}\left(\overline{f_{0}} \circ \sigma_{W}^{-n}\right)^{*}=t^{n}\left(f_{0}\right)
\end{aligned}
$$

Thus for a trigonometric polynomial $q$, we have $\iota\left(f_{0} q(u)\right)=q\left(f_{0}\right)$. Since $\left(f_{0} q_{k}(u)\right)_{k}$ converges $f_{0} g(u)$ in $B,\left(q_{k}\left(f_{0}\right)\right)_{k}$ converges $\iota\left(f_{0} g(u)\right)$ in $C^{*}\left(\Sigma^{\prime}\right)$. Thus we get $a=$ $\iota\left(f_{0} g(u)\right)$. The last equation follows easily from Lemma 7.4.
Proposition 7.6. Let $a \in C^{*}\left(\Sigma^{\prime}\right)$ be as in Lemma 7.5. We have $\pi_{\left(x_{0}, \gamma_{0}\right)}(a) \neq 0$ and $\pi_{(x, \gamma)}(a)=0$ for all $(x, \gamma) \in Y$.
Proof. We have $\pi_{\left(x_{0}, \gamma_{0}\right)}(a) \neq 0$ because $\pi_{\left(x_{0}, \gamma_{0}\right)}(a) \xi_{x_{0}, 0}=g\left(\gamma_{0}\right) f_{0}\left(x_{0}\right) \xi_{x_{0}, 0} \neq 0$ by Lemma 7.5.

Take $(x, \gamma) \in Y$. Take $y \in \operatorname{Orb}(x)$. If $y \notin W$, then we can see $\pi_{(x, \gamma)}(a) \delta_{y}=0$ by Lemma 7.2. Suppose $y \in W$. By the condition (ii) in Definition 5.7, we have $(y, \gamma) \in Y$. By the condition (iii) in Definition [5.7, we have $\left(y, \zeta_{p(y)}^{k} \gamma\right) \in Y$ for $k=0,1, \ldots, p(y)-1$. Hence $\zeta_{p(y)}^{k} \gamma \notin Z$ for $k=0,1, \ldots, p(y)-1$. By Lemma 7.5 we have $\pi_{(x, \gamma)}(a) \xi_{y, k}=0$ for $k=0,1, \ldots, p(y)-1$. Hence we get $\pi_{(x, \gamma)}(a) \delta_{y}=0$. These show that $\pi_{(x, \gamma)}(a)=0$.

We have shown the following.
Proposition 7.7. For an admissible subset $Y$ of $X \times \mathbb{T}$, we have $Y_{I_{Y}}=Y$.
Theorem 7.8. The set of ideals of $C^{*}(\Sigma)$ corresponds bijectively to the set of all admissible subsets of $X \times \mathbb{T}$ via the maps $I \mapsto Y_{I}$ and $Y \mapsto I_{Y}$.
Proof. This follows from Proposition 5.5, Proposition 6.8 and Proposition 6.7.

## Appendix A. Uniqueness theorems

Let $\Sigma=(X, \sigma)$ be an SGDS. By the universality of $C^{*}(\Sigma)$, we have an action $\beta$ of the group $\mathbb{T}:=\{z \in \mathbb{C}| | z \mid=1\}$ on $C^{*}(\Sigma)$ so that for $z \in \mathbb{T}$ we have $\beta_{z}\left(t^{0}(f)\right)=t^{0}(f)$ for $f \in C_{0}(X)$ and $\beta_{z}\left(t^{1}(\xi)\right)=z t^{1}(\xi)$ for $\xi \in C_{c}(U)$. This action $\beta$ is called the gauge action (see [K1, Section 4]).
Proposition A.1. Let $A$ be a $C^{*}$-algebra. A *-homomorphism $\Phi: C^{*}(\Sigma) \rightarrow A$ is injective if $\Phi \circ t^{0}$ is injective and there exists an action of $\mathbb{T}$ on $A$ with which and the gauge action on $C^{*}(\Sigma), \Phi$ is equivariant.

Proof. This follows from [K1, Theorem 4.5].
Definition A. 2 (cf. [R, Definition 2.5]). An SGDS $\Sigma$ is said to be essentially free if the interior of the set $\{x \in X \mid l(x)=0\}$ is empty.

By Baire's category theorem, $\Sigma$ is essentially free if and only if the interior of the set $\left\{x \in X \mid \sigma^{n}(x)=x\right\}$ is empty for every positive integer $n$. Thus this definition coincides with [R, Definition 2.5].

Proposition A.3. Suppose an $S G D S \Sigma$ is essentially free. Let $A$ be a $C^{*}$-algebra. $A *$-homomorphism $\Phi: C^{*}(\Sigma) \rightarrow A$ is injective if $\Phi \circ t^{0}$ is injective
Proof. An SGDS $\Sigma$ is essentially free if and only if the associate topological graph $E=(X, U, \sigma, \iota)$ is topologically free in the sense of [K1, Definition 5.4]. Thus this proposition follows from [K1, Theorem 5.12].
