# AUTOMORPHISMS OF HYPER-REINHARDT FREE SPECTRAHEDRA 

SCOTT MCCULLOUGH

#### Abstract

The free automorphisms of a class of Reinhardt free spectrahedra are trivial.

## 1. Introduction

1.1. Prologue. An overarching conjecture, verified in a rather generic sense, is that automorphisms of free spectrahedra have a very specific transfer function like realization that is highly algebraic in nature. See, for instance, [HKMV20]. A natural class of free spectrahedra not covered by prior results are those with circular symmetry. Here we verify the conjecture for those free spectrahedra that satisfy a strong Reinhardt condition. The approach is new. It hinges on considering the subgroup of the automorphism group generated by a given automorphisms and those inherent in the Reinhardt condition. In the remainder of this introduction we state the main result and then expand somewhat on the context and prior results, after first introducing the needed background material.
1.2. Free spectrahedra. Fix a positive integer g . For positive integers $n$, let $M_{n}(\mathbb{C})$ denote the set of $n \times n$ matrices and $M_{n}(\mathbb{C})^{\mathrm{g}}$ the set of g -tuples $X=\left(X_{1}, \ldots, X_{\mathrm{g}}\right)$ with entries $X_{j}$ from $M_{n}(\mathbb{C})$. Let $M(\mathbb{C})^{\mathrm{g}}$ denote the sequence $\left(M_{n}(\mathbb{C})^{\mathrm{g}}\right)_{n}$.

Given a positive integer $d$ and a tuple $B \in M_{d}(\mathbb{C})^{\mathrm{g}}$, let $\Lambda_{B}(x)$ denote the linear (matrix) polynomial,

$$
\Lambda_{B}(x)=\sum_{j=1}^{\mathrm{g}} B_{j} x_{j} .
$$

The polynomial $\Lambda_{B}$ naturally evaluates at an $X \in M(\mathbb{C})^{\mathrm{g}}$ using the (Kronecker) tensor product as

$$
\Lambda_{B}(X)=\sum_{j=1}^{\mathrm{g}} B_{j} \otimes X_{j} .
$$

[^0]The tensor product of an $s \times s$ matrix $S$ and a $t \times t$ matrix $T$ can also be interpreted as follows. On the algebraic tensor product $H=\mathbb{C}^{s} \otimes \mathbb{C}^{t}$, the formula

$$
\left\langle\sum x_{j} \otimes g_{j}, \sum y_{k} \otimes h_{k}\right\rangle=\sum_{j, k}\left\langle x_{j}, y_{k}\right\rangle\left\langle g_{j}, h_{k}\right\rangle
$$

defines an inner product on $H$ and we view $H$ as the resulting (st-dimensional) Hilbert space. The tensor product of $S$ and $T$ is determined by linearity and

$$
(S \otimes T)(x \otimes h)=S h \otimes T h
$$

From this description of the tensor product it follows readily that $(S \otimes T)^{*}=S^{*} \otimes T^{*}$. Thus,

$$
\Lambda_{B}(X)^{*}=\Lambda_{B^{*}}\left(X^{*}\right)=\sum_{j=1}^{\mathrm{g}} B_{j}^{*} \otimes X_{j}^{*}
$$

Define $L_{B}$ by

$$
L_{B}(X)=I_{d} \otimes I+\Lambda_{B}(X)+\Lambda_{B}(X)^{*}
$$

From the discussion above, it follows that $L_{B}(X)$ is selfadjoint: $L_{B}(X)^{*}=L_{B}(X)$. We refer the reader to [HJ13] for further information about the tensor product of matrices.

For a square matrix $T$ the notation $T \succ 0$ (resp. $T \succeq 0$ ) indicates $T$ is positive definite (resp. positive semidefinite). Let, for positive integers $n$,

$$
\mathfrak{P}_{B}[n]=\left\{X \in M_{n}(\mathbb{C})^{\mathrm{g}}: L_{B}(X) \succ 0\right\}
$$

The set $\mathfrak{P}_{B}[1]$ is a spectrahedron and the sequence of sets $\mathfrak{P}_{B}=\left(\mathfrak{P}_{B}[n]\right)_{n=1}^{\infty}$ is a free spectrahedron. As short hand,

$$
\mathfrak{P}_{B}=\left\{X \in M(\mathbb{C})^{\mathrm{g}}: L_{B}(X) \succ 0\right\} .
$$

Spectrahedra and free spectrahedra occur in a number of areas of mathematics and its applications. For instance, spectrahedra are basic objects in semidefinite programming and convex optimization; free spectrahedra are connected to operator systems and spaces and complete positivity. Spectrahedra, both free and not, arise in certain engineering applications. For further details see the discussion in Subsection 1.5 and [HKMV20, BPT13, dOH06, dOHMP09, WSV12, SIG97] and the references therein.

Free spectrahedra are free sets in the following sense: (i) if $X \in \mathfrak{P}_{B}[n]$ and $Y \in \mathfrak{P}_{B}[m]$, then

$$
X \oplus Y=\left(X_{1} \oplus Y_{1}, \ldots, X_{\mathrm{g}} \oplus Y_{\mathrm{g}}\right) \in \mathfrak{P}[n+m]
$$

where

$$
X_{j} \oplus Y_{j}=\left(\begin{array}{cc}
X_{j} & 0 \\
0 & Y_{j}
\end{array}\right)
$$

and (ii) if $X \in \mathfrak{P}_{B}[n]$ and $U \in M_{n}(\mathbb{C})$ is unitary, then

$$
U^{*} X U=\left(U^{*} X_{1} U, \ldots, U^{*} X_{\mathrm{g}} U\right)
$$

is in $\mathfrak{P}_{B}[n]$.
1.3. Free maps. A free map $f: \mathfrak{P}_{B} \rightarrow \mathfrak{P}_{C}$ between free spectrahedra is a sequence $f=$ $(f[n])$, where $f[n]: \mathfrak{P}_{B}[n] \rightarrow \mathfrak{P}_{C}[n]$, that satisfies: (i) if $X \in \mathfrak{P}_{B}[n]$ and $Y \in \mathfrak{P}_{B}[m]$, then

$$
f[n+m](X \oplus Y)=f[n](X) \oplus f[m](Y) ;
$$

and (ii) if $X \in \mathfrak{P}_{B}[n]$ and $U$ is an $n \times n$ unitary matrix, then

$$
f[n]\left(U^{*} X U\right)=U^{*} f[n](X) U
$$

It is customary to write $f$ in place of $f[n]$.
The free map $f: \mathfrak{P}_{B} \rightarrow \mathfrak{P}_{C}$ is analytic if each $f[n]$ is analytic; and $f$ is free bianalytic if $f$ is analytic and has a free analytic inverse, $f^{-1}: \mathfrak{P}_{C} \rightarrow \mathfrak{P}_{B}$. In the case $C=B$, a free bianalytic map is a free automorphism. We will often just say $f$ is bianalytic or an automorphism, dropping the adjective free (and also analytic). Motivations for studying free bianalytic maps between free spectrahedra stem from connections with matrix inequalities that arise in systems engineering [dOHMP09, dOH06] and by analogy with rigidity theory in several complex variables. Free bianalytic maps can also be viewed as nonlinear completely positive maps. We expand upon these themes in Section 1.5 below.

For a comprehensive treatment of free maps see [KVV14].
1.4. Hyper-Reinhardt free spectrahedra. We now introduce the central object of this paper. Fix positive integers $d_{1}, \ldots, d_{\mathfrak{g}+1}$ with $d=\sum d_{j}$ and norm one matrices $C_{1}, \ldots, C_{\mathrm{g}}$, where $C_{j}$ has size $d_{j} \times d_{j+1}$. Let $A_{j}$ denote the $(\mathrm{g}+1) \times(\mathrm{g}+1)$ block matrix with $(j, j+1)$ entry $C_{j}$ and all other entries 0 . Thus each $A_{j}$ is of size $d \times d$ and the $(k, \ell)$ block of $A_{j}$ has size $d_{k} \times d_{\ell}$. Such a tuple $A$ is now fixed for the remainder of this paper. The case $\mathrm{g}=2$ was treated in the article [MT+].

Let $\mathbb{T}$ denote the unit circle in the complex plane $\mathbb{C}$. A domain $D \subseteq \mathbb{C}^{g}$ is circular if $x \in D$ and $\gamma \in \mathbb{T}$ implies $\gamma x \in D$. The domain $D$ is Reinhardt if it satisfies the stronger condition: if $x \in D$ and $\gamma=\left(x_{1}, \ldots, x_{\mathrm{g}}\right) \in \mathbb{T}^{\mathrm{g}}$, then

$$
\left(\gamma_{1} x_{1}, \ldots, \gamma_{\mathrm{g}} x_{\mathrm{g}}\right) \in D
$$

The Reinhardt domain $D$ is complete if $z \in D$ and $w \in \mathbb{C}^{\mathrm{g}}$ and $\left|w_{j}\right| \leq\left|z_{j}\right|$ for each $j$, then $w \in D$. Reinhardt domains are fundamental in the theory of functions of several complex variables, in part because complete Reinhardt domains are the convergence domains of power series. See [JP08] for more on Reinhardt domains.

The free spectrahedron $\mathfrak{P}_{A}$ is Reinhardt in the sense that, given $\gamma \in \mathbb{T}^{\mathrm{g}}$, the map $\varphi_{\gamma}: M(\mathbb{C})^{\mathrm{g}} \rightarrow M(\mathbb{C})^{\mathrm{g}}$ given by

$$
\varphi_{\gamma}(X)=\gamma \cdot X:=\left(\gamma_{1} X_{1}, \ldots, \gamma_{\mathrm{g}} X_{\mathrm{g}}\right)
$$

evidently restricts to an automorphism of $\mathfrak{P}_{A}$. We refer $\varphi_{\gamma}$ as a trivial automorphism and, because as explained by Lemma 4.3, $\mathfrak{P}_{A}$ satisfies a stronger Reinhardt condition, we call $\mathfrak{P}_{A}$ a hyper-Reinhardt free spectrahedron.

The free polydisc in g-variables is the free set

$$
\mathscr{F}^{\mathrm{g}}=\left\{X \in M(\mathbb{C})^{\mathrm{g}}:\left\|X_{j}\right\|<1\right\} .
$$

It is easily seen to be a hyper-Reinhardt free spectrahedron. Because the $C_{j}$ have norm one, $\mathfrak{P}_{A} \subseteq \mathscr{F} \mathrm{~g}$. The free polydisc $\mathscr{F}^{\mathrm{g}}$ has a rich automorphism group [Pop10, MT16]. Properly interpreted, it is the same as that of the polydisc $\mathbb{D}^{\mathrm{g}}$, where $\mathbb{D}$ is the unit disc in the complex plane.

Given $\mathfrak{I} \subseteq\{1,2, \ldots, \mathrm{~g}\}$, define $\pi_{\mathfrak{J}}: M(\mathbb{C})^{\mathrm{g}} \rightarrow M(\mathbb{C})^{\mathrm{g}}$ by

$$
\pi_{\mathfrak{I}}(T)_{j}= \begin{cases}T_{j} & \text { if } j \notin \mathfrak{I} \\ 0 & \text { if } j \in \mathfrak{I}\end{cases}
$$

It is immediate that if $T \in \mathfrak{P}_{A}$, then $\pi_{\mathfrak{I}}(T) \in \mathfrak{P}_{A}$. As a definition, $\mathfrak{P}_{A}$ contains a polydisc as a distinguished summand if there exists $\varnothing \neq \mathfrak{I} \subseteq\{1,2, \ldots, \mathrm{~g}\}$ such that, for $T \in M(\mathbb{C})^{\mathfrak{g}}$, if $\left\|T_{j}\right\|<1$ for $j \in \mathfrak{I}$ and $\pi_{\mathfrak{I}}(T) \in \mathfrak{P}_{A}$, then $T \in \mathfrak{P}_{A}$. If $\mathfrak{P}_{A}$ contains the polydisc in $\mathrm{h} \leq \mathrm{g}$ variables as a distinguished summand, then the automorphism group of $\mathfrak{P}_{A}$ contains a copy of the automorphism group of $\mathscr{F}^{\mathrm{h}}$ and is thus rather large.

Similarly, $\mathfrak{P}_{A}$ is a coordinate direct sum if there exists a $1 \leq \nu<\mathrm{g}$ such that $T \in M(\mathbb{C})^{\mathrm{g}}$ is an element of $\mathfrak{P}_{A}$ if and only both $\pi_{\mathfrak{J}}(T) \in \mathfrak{P}_{A}$ and $\pi_{\mathfrak{\mathfrak { I }}}(T) \in \mathfrak{P}_{A}$, where $\mathfrak{I}=\{1,2, \ldots, \nu\}$ and $\widetilde{\mathfrak{I}}$ is the complement of $\mathfrak{I}$ in $\{1,2, \ldots, \mathrm{~g}\}$. The condition $\mathfrak{P}_{A}$ does not contain a coordinate direct summand is a natural condition that rules out permutations of the variables as an automorphism.

Theorem 1.1 below is the main result of this article.
Theorem 1.1. Suppose $\varphi$ is an automorphism of $\mathfrak{P}_{A}$.
(i) If $\mathfrak{P}_{A}$ does not contain a polydisc as a distinguished summand, then $\varphi(0)=0$;
(ii) If $\varphi(0)=0$, then there exists a $\gamma \in \mathbb{T}^{\mathbb{g}}$ and a permutation $\pi$ of $\{1,2, \ldots, \mathrm{~g}\}$ such that $\varphi_{j}(x)=\gamma_{j} x_{\pi(j)} ;$
(iii) If $\varphi(0)=0$ and $\mathfrak{P}_{A}$ is not a coordinate direct sum, then $\varphi$ is trivial.

The proof of Theorem 1.1 occupies the body of this paper.

Corollary 1.2. If $\mathfrak{P}_{A}$ is neither a polydisc nor a direct sum of free spectrahedra, then the automorphisms of $\mathfrak{P}_{A}$ are trivial.

The case of $\mathrm{g}=2$ of Corollary 1.2 is one of the principle results in $[\mathrm{MT}+]$, though the proof here diverges materially from that in $[M T+]$.

Proof. If $\mathfrak{P}_{A}$ is not a direct sum, then it does not contain a polydisc as a proper distinguished summand. By assumption $\mathfrak{P}_{A}$ is not a polydisc. Hence $\mathfrak{P}_{A}$ does not contain a polydisc as a distinguished summand and therefore, by Theorem 1.1 item (i) its automorphisms send 0 to 0. An application of Theorem 1.1 item (iii) now says the automorphisms of $\mathfrak{P}_{A}$ are trivial, since, by assumption, $\mathfrak{P}_{A}$ does not a coordinate direct sum.
1.5. Context and prior results. This section expands upon context and prior results mentioned earlier in this introduction.
1.5.1. Spectraballs, circular symmetry and prior results. Given a tuple $E=\left(E_{1}, \ldots, E_{\mathrm{g}}\right)$ of $k \times \ell$ (not necessarily square) matrices, let

$$
B_{j}=\left(\begin{array}{cc}
0 & E_{j} \\
0 & 0
\end{array}\right)
$$

The spectrahedron $\mathfrak{P}_{B}$, where $B \in M_{k+\ell}(\mathbb{C})^{\mathrm{g}}$ is, by definition, a spectraball. It is routine to see that a tuple $X \in M(\mathbb{C})^{\mathrm{g}}$ is in $\mathfrak{P}_{B}$ if and only if $\left\|\Lambda_{E}(X)\right\|<1$. We mention two special cases. One is the free polydisc $\mathscr{F}^{\mathrm{g}}$

$$
\mathscr{F}^{\mathrm{g}}=\left\{X \in M(\mathbb{C})^{\mathrm{g}}:\left\|X_{j}\right\|<1\right\}
$$

in g variables introduced earlier. The other is the free $\mathrm{g} \times \mathrm{h}$ matrix ball,

$$
\mathscr{M}^{\mathrm{g} \times \mathrm{h}}=\left\{X=\left(X_{j, k} \mathrm{~g}_{j, k=1}^{\mathrm{g}, \mathrm{~h}}: X_{j, k} \in M(\mathbb{C}) .\|X\|<1\right\} .\right.
$$

In each case, the automorphisms at the scalar level - those of $\mathscr{F}^{\mathrm{g}}[1]$ and $\mathscr{M}^{\mathrm{g} \times \mathrm{h}}[1]$ - naturally extend to free automorphisms and every free automorphism arises this way. See for instance [Pop10, MT16]. In particular, automorphisms of $\mathscr{F}^{\mathrm{g}}$ are composites of permutation of the coordinates with Möbius maps of the unit disc in each coordinate.

More generally, the results of [AHKM18, HKMV20] characterize bianalytic maps between free spectrahedra $\mathfrak{P}_{B}$ and $\mathfrak{P}_{C}$ under certain generic irreducibility hypotheses on the tuples $B$ and $C$. They also characterize bianalytic maps between spectraballs absent any additional hypotheses. A canonical class of free spectrahedra not covered by these results are those with circular symmetry.

From [HKM12], if two circular free spectrahedra $\mathfrak{P}_{A}$ and $\mathfrak{P}_{B}$ are bianalytic, then they are linearly equivalent. Thus, in this case, there is an automorphism that sends 0 to 0 . In
the other direction, and as a version of the corresponding classical Caratheodory-Cartan-Kaup-Wu (CCKW) Theorem from several complex variables, an automorphism of a circular free spectrahedron that sends 0 to 0 is a (free) linear map [HKM11]. As a conjecture, an automorphism of a circular free spectrahedron that does not contain a spectraball as a direct summand must send 0 to 0 and is therefore linear.

### 1.5.2. Complete positivity. Given $C \in M_{d}(\mathbb{C})^{\mathrm{g}}$, let

$$
\mathcal{S}_{C}=\operatorname{span}\left\{I, C_{1}, \ldots, C_{\mathbf{g}}, C_{1}^{*}, \ldots, C_{\mathrm{g}}^{*}\right\} \subseteq M_{d}(\mathbb{C})
$$

In particular, $\mathcal{S}_{C}$ is an operator system. Given free spectrahedra $\mathfrak{P}_{A}$ and $\mathfrak{P}_{B}$ (both in g variables), a $\mathrm{g} \times \mathrm{g}$ matrix $M$ (linear map) induces a completely positive map $M: \mathfrak{P}_{A} \rightarrow \mathfrak{P}_{B}$ if and only if $X \in \mathfrak{P}_{A}$ implies $M X=\left(Y_{1}, \ldots, Y_{\mathrm{g}}\right) \in \mathfrak{P}_{B}$, where

$$
Y_{j}=\sum_{k} M_{j, k} X_{k},
$$

as shown, for instance, in [EHKM17]. Thus $M$ is a bijection from $\mathfrak{P}_{A}$ to $\mathfrak{P}_{B}$ if and only if $M$ is completely isometric. By analogy, free bianalytic maps between free spectrahedra can be viewed as non-linear complete isometries.
1.5.3. Automorphism groups and change of variables. Of course understanding the automorphism group of a free spectrahedron has its own intrinsic interest. Moreover, as described in [HM09], free semialgebraic sets, those described by (matrix-valued) polynomial inequalities in the sense of positive semidefiniteness, appear canonically in certain systems engineering problems. A related problem is to map, if possible, a general free semialgebraic set $S$ bianalytically to a free specrahedron $\mathfrak{P}_{A}$. Another free bianaltyic map from $S$ to say $\mathfrak{P}_{B}$ induces an automorphism of $\mathfrak{P}_{A}$. Thus understanding the automorphism group of $\mathfrak{P}_{A}$ sheds some light on those free semialgebraic sets that are binaltyically equivalent to the convex set $\mathfrak{P}_{A}$.

## 2. Carathéodory Interpolation Preliminaries

In this section consequence of, and results related to, Carathéodory interpolation needed in the sequel are collected for easy reference. We begin with the following well known lemma.

Lemma 2.1. Given $c_{0}, c_{1} \in \mathbb{C}$, let

$$
X=\left(\begin{array}{cc}
c_{0} & c_{1} \\
0 & c_{0}
\end{array}\right)
$$

(i) $\|X\|=1$ if and only $0=1-\left|c_{0}\right|^{2}-\left|c_{1}\right|$, and hence there is $a \theta \in \mathbb{R}$ such that $c_{1}=e^{i \theta}\left(\left|c_{0}\right|^{2}-1\right) ;$
(ii) $\|X\|<1$ if and only if $0<1-\left|c_{0}\right|^{2}-\left|c_{1}\right|$.

Further, in the first case, the kernel of $I-X X^{*}$ is spanned by the vector

$$
v=\binom{1}{-e^{-i \theta} c_{0}}
$$

Proof. The matrix $X$ has norm 1 if and only if $I-X X^{*}$ is positive semidefinite with a kernel. In particular, either $\left|c_{0}\right|=1$ and $c_{1}=0$; or $\left|c_{0}\right|<1$ and the determinant, namely $1-\left|c_{0}\right|^{2}-\left|c_{1}\right|$, of $I-X X^{*}$ is 0 proving item (i). Similarly, $X$ has norm strictly less than 1 if and only if $\left|c_{0}\right|<1$ and the determinant of $I-X X^{*}$ is strictly positive. Direct computation verifies that $v$ is in the kernel of $I-X X^{*}$ in the case that $X$ has norm 1.

One view of Carathéodory interpolation is as follows. Let $\mathcal{S}$ denote the shift operator on $H^{2}(\mathbb{D})$, the Hilbert-Hardy space of the unit disc. Given a positive integer $n$ and $c_{0}, c_{1}, \ldots, c_{n} \in \mathbb{C}$, does there exist a sequence $c_{n+1}, c_{n+2}, \cdots \in \mathbb{C}$ such that the operator

$$
\sum_{j=0}^{\infty} c_{j} \mathcal{S}^{j}
$$

has norm at most one. It turns out the answer is yes if and only if the evident necessary condition that, letting $\mathcal{T}^{*}$ denote the restriction of $\mathcal{S}^{*}$ to the span of $\left\{1, z, \ldots, z^{n}\right\}$, the matrix

$$
g(\mathcal{T})=\sum_{j=0}^{n} c_{j} \mathcal{T}^{j}
$$

has norm at most one. In particular, one can construct the $c_{n+j}$ one step at a time. Moreover, in the extreme case when $g(\mathcal{T})$ has norm 1 there is only one solution of the interpolation problem. Lemma 2.1 above is connected with the case $n=1$. In Lemma 2.2 below the shift $\mathcal{S}$ is replaced by a weighted shift.

Lemma 2.2. Suppose
(i) $n \geq 2$;
(ii) $c_{0}, \ldots, c_{n} \in \mathbb{C}$ and $\left|c_{0}\right|<1$;
(iii) $\theta \in \mathbb{R}$ and $c_{1}=e^{i \theta}\left(\left|c_{0}\right|^{2}-1\right)$.

Let $\lambda_{1}=1$, fix $\lambda_{2}, \ldots, \lambda_{n} \in \mathbb{C} \backslash\{0\}$ and let $S=\left(S_{j, k}\right)_{j, k=1}^{n+1}$ denote the $(n+1) \times(n+1)$ matrix with $S_{j, j+1}=\lambda_{j}$ for $1 \leq j \leq n$ and $S_{j, k}=0$ otherwise. Thus the nonzero entries of $S$ are exactly on the first super diagonal. Let

$$
T=\sum_{j=0}^{n} c_{j} S^{j} \in M_{n+1}(\mathbb{C})
$$

The following conditions are equivalent.
(i) the matrix $T$ has norm at most 1 ;
(ii) $c_{j}=e^{i \theta}\left(e^{i \theta} c_{0}^{*}\right)^{j-1}\left(\left|c_{0}\right|^{2}-1\right)$ and $\left|\lambda_{j}\right| \leq 1$ for $j \geq 1$;
(iii) $T$ has norm 1 .

Moreover, in this case, letting $P$ denote the $(n+1) \times(n+1)$ matrix with $P_{1, n+1}=1$ and $P_{j, k}=0$ otherwise, if $\mu \in \mathbb{C}$ and $T+\mu P$ is a contraction (has norm at most 1 ), then $\mu=0$.

Proof. First note, for each $1 \leq j \leq n$, that

$$
X_{j}:=\left(\begin{array}{cc}
T_{j, j} & T_{j, j+1} \\
T_{j+1, j} & T_{j+1, j+1}
\end{array}\right)=\left(\begin{array}{cc}
c_{0} & \lambda_{j} c_{1} \\
0 & c_{0}
\end{array}\right) .
$$

Observe that $X_{1}$ is the matrix $X$ from Lemma 2.1 and in particular has norm 1. Hence $T$ has norm at least one and is thus a contraction if and only if it has norm one. Further, if $T$ is a contraction, then each $X_{j}$ is a contraction and hence, by Lemma 2.1, $\left|\lambda_{j}\right| \leq 1$.

Suppose now the norm of $T$ is one and write $T$ as

$$
T=\left(\begin{array}{cc}
X & Y \\
0 & Z
\end{array}\right)
$$

where $X=X_{1}$. Using Lemma 2.1 and its notation, since $T$ is a contraction and $\left\|X^{*} v\right\|=\|v\|$,

$$
\|v\|^{2} \geq\left\|T^{*}\binom{v}{0}\right\|^{2}=\left\|\binom{X^{*} v}{Y^{*} v}\right\|^{2}=\|v\|^{2}+\left\|Y^{*} v\right\|^{2}
$$

Thus the columns of $Y$ are orthogonal to $v$ and are thus multiples of

$$
w=\binom{e^{i \theta} c_{0}^{*}}{1} .
$$

On the other hand, $y_{k}$, the $k$-th column of $Y$ is given by

$$
y_{k}=\lambda_{1} \cdots \lambda_{k}\binom{c_{k}}{c_{k-1}}
$$

for $1 \leq k \leq n$. Using the assumption that the $\lambda_{j}$ are non-zero and $y_{k+1}=\mu_{k+1} w$ for some $\mu_{k+1} \in \mathbb{C}$ it follows

$$
\binom{c_{k+1}}{c_{k}}=c_{k}\binom{e^{i \theta} c_{0}^{*}}{1} .
$$

Thus, $c_{k+1}=e^{i \theta} c_{0}^{*} c_{k}$. In particular, $c_{2}=e^{2 i \theta} c_{0}^{*}\left(\left|c_{0}\right|^{2}-1\right)$ and by induction, $c_{k}=e^{i k \theta}\left(c_{0}^{*}\right)^{k-1}\left(\left|c_{0}\right|^{2}-\right.$ 1).

To prove the converse, suppose $\left|\lambda_{j}\right| \leq 1$ and $c_{j}=e^{i j \theta} c_{0}^{*(j-1)}\left(\left|c_{0}\right|^{2}-1\right)$. In particular, $S$ is a contraction and

$$
f(z)=\frac{c_{0}-e^{i \theta} z}{1-c_{0}^{*} e^{i \theta} z}=\sum_{j=0}^{\infty} c_{j} z^{j}
$$

is an automorphism of $\mathbb{D}$. Hence $T=f(S)$ is a contraction.
Finally suppose $T=f(S)$ and $T+\mu P$ is a contraction. The argument above, with $T+\mu P$ in place of $T$, shows $y_{n}+\mu e$ is orthogonal to the vector $v$ from Lemma 2.1, where $e \in \mathbb{C}^{2}$ is the vector with first entry 1 and second entry 0 . Since $y_{n}$ is orthogonal to $v$, it follows that $\mu e$ is orthogonal to $v$. Hence $\mu=0$ and the proof is complete.

## 3. The Affine Linear Terms

Suppose $\varphi: \mathfrak{P}_{A} \rightarrow \mathfrak{P}_{A}$ is bianalytic,

$$
\varphi=\left(\begin{array}{lll}
\varphi_{1} & \cdots & \varphi_{\mathrm{g}}
\end{array}\right)
$$

Let $b_{j}=\varphi_{j}(0)$.
The coordinate functions $\varphi_{j}$ of $\varphi$ have power series expansions,

$$
\varphi_{j}=b_{j}+\sum_{k=1}^{\mathrm{g}} \ell_{j, k} x_{k}+h_{j}(x)
$$

that converge in some neighborhood of 0 and for all nilpotent tuples, where $h_{j}(x)$ consists of terms of order two and higher. For notational purposes, let

$$
\begin{equation*}
\mathscr{L}=\left(\ell_{j, k}\right)_{j, k=1}^{\mathrm{g}} . \tag{3.1}
\end{equation*}
$$

Since $\varphi$ is bianalytic, $\mathscr{L}$ is invertible.
For integers $N \geq 2$, let $\mathscr{W}_{N}$ denote the words in $\left\{x_{1}, \ldots, x_{\mathrm{g}}\right\}$ of length between 2 and $N$. Let $\mathscr{W}_{N}^{j}$ denote the words in $\mathscr{W}_{N}$ not of the form $x_{j}^{n}\left(\right.$ for $2 \leq n \leq N$ ). Let $\mathscr{W}^{j}$ denote the union (over $N \geq 2$ ) of the $\mathscr{W}_{N}^{j}$ and let $\mathfrak{H}^{j}$ denote power series of the form

$$
\mathfrak{h}(x)=\sum_{\alpha \in \mathscr{W}^{j}} a_{\alpha} x^{\alpha} .
$$

Let $\left\{\delta_{1}, \ldots, \delta_{\mathrm{g}}\right\}$ denote the standard orthonormal basis for $\mathbb{C}^{\mathrm{g}}$. Given $p \in \mathbb{D}$, let

$$
\mathfrak{m}_{p}(z)=\frac{p+z}{1+p^{*} z}
$$

Proposition 3.1 below is the main results of this section.
Proposition 3.1. There exists a permutation $\pi$ of $\{1,2, \ldots, \mathrm{~g}\}$ and a tuple $\theta=\left(\theta_{1}, \ldots, \theta_{\mathrm{g}}\right) \in$ $\mathbb{R}^{\mathrm{g}}$ such that, for each $1 \leq j \leq \mathrm{g}$,

$$
\varphi_{j}\left(\delta_{\pi(j)} z\right)=\mathfrak{m}_{b_{j}}\left(e^{i \theta_{j}} z\right)=\frac{b_{j}+e^{i \theta_{j}} z}{1+b_{j}^{*} e^{i \theta_{j}} z}=e^{i \theta_{j}} \mathfrak{m}_{e^{-i \theta_{j}} b_{j}}(z)
$$

More generally, with $k=\pi(j)$, there exists an $\mathfrak{h}_{k} \in \mathfrak{H}^{k}$ such that

$$
\varphi_{j}(x)=\mathfrak{m}_{b_{j}}\left(e^{i \theta_{j}} x_{k}\right)+\mathfrak{h}_{k}(x) .
$$

In particular, there exists $a_{\alpha}^{k} \in \mathbb{C}$ such that if $T$ is nilpotent of order $N+1$, then

$$
\begin{equation*}
\varphi_{j}(T)=\mathfrak{m}_{b_{j}}\left(e^{i \theta_{j}} T_{k}\right)+\mathfrak{h}_{k}(T)=\mathfrak{m}_{b_{j}}\left(e^{i \theta_{j}} T_{k}\right)+\sum_{\alpha \in \mathscr{W}_{N}^{k}} a_{\alpha}^{k} T^{\alpha} . \tag{3.2}
\end{equation*}
$$

We refer to $\pi$ as the permutation associated to $\varphi$.
Before proving Proposition 3.1, we pause to prove item (ii) of Theorem 1.1, stated as Proposition 3.2 below.

Proposition 3.2. If $\varphi(0)=0$, then there exists $\gamma \in \mathbb{T}^{g}$ and permutation $\pi$ such that $\varphi_{j}(x)=\gamma_{j} x_{\pi(j)}$.

Proof. Let $\pi$ denote the permutation from Proposition 3.2. Since $\varphi$ is an automorphism of a circular domain that maps 0 to 0 it is linear by [HKM11, Theorem 4.4]. On the other hand, by Proposition 3.1, $\varphi_{j}(x)=e^{i \theta_{j}} x_{k}+\mathfrak{h}_{k}(x)$, where $k=\pi(j)$. Linearity forces $\mathfrak{h}_{k}=0$ completing the proof.

The proof of Proposition 3.1 is broken down into several lemmas.
Lemma 3.3. There is a permutation $\pi$ of $\{1, \ldots, \mathrm{~g}\}$ and a tuple $\theta \in \mathbb{R}^{\mathrm{g}}$ such that, for tuples $T=\left(T_{1}, \ldots, T_{\mathrm{g}}\right)$ nilpotent of order 2 ,

$$
\varphi_{j}(T)=b_{j}+e^{i \theta_{j}}\left(\left|b_{j}\right|^{2}-1\right) T_{\pi(j)}
$$

Before proving Lemma 3.3, we first establish Lemma 3.4 below. Recall equation (3.1).
Lemma 3.4. There is a permutation $\pi$ of $\{1, \ldots, \mathrm{~g}\}$ such that $\ell_{j, k} \neq 0$ if and only if $k=\pi(j)$. In particular, for tuples $T=\left(T_{1}, \ldots, T_{\mathrm{g}}\right)$ nilpotent of order 2 ,

$$
\varphi_{j}(T)=b_{j}+\ell_{j, \pi(j)} T_{\pi(j)}
$$

Thus $\mathscr{L}$ has exactly one nonzero entry in each row and column.

The proof of Lemma 3.4 in turn uses the following elementary linear algebra lemma included here for completeness.

Lemma 3.5. Suppose $R$ and $Q$ are self-adjoint $n \times n$ matrices and $\gamma \in \mathbb{C}^{n}$. If $R \pm Q \succeq 0$ and $R \gamma=0$, then $Q \gamma=0$.

Proof. It is immediate that $\langle Q \gamma, \gamma\rangle=0$. For $\lambda \in \mathbb{C}$ and $\delta \in \mathbb{C}^{n}$, the inequality

$$
0 \leq\langle(R+Q)(\gamma+\lambda \delta), \gamma+\lambda \delta\rangle=|\lambda|^{2}\langle(R+Q) \delta, \delta\rangle+\lambda\langle Q \gamma, \delta\rangle+\lambda^{*}\langle Q \delta, \gamma\rangle
$$

implies $\langle Q \gamma, \delta\rangle=0$ and hence $Q \gamma=0$.

For $t \in \mathbb{C}^{\mathrm{g}}$, define $\mathrm{T}=\left(\mathrm{T}_{1}, \ldots, \mathrm{~T}_{\mathrm{g}}\right)=\mathrm{T}(t)=\mathrm{T}\left(t_{1}, \ldots, t_{\mathrm{g}}\right)$ by $\mathrm{T}_{j}=t_{j} S$, where

$$
S=\left(\begin{array}{ll}
0 & 1  \tag{3.3}\\
0 & 0
\end{array}\right)
$$

Recall the definition of $\mathscr{L}$ from equation (3.1) and let $B=I+\Lambda_{A}(b)+\Lambda_{A}(b)^{*}$. Since since $\varphi(\mathrm{T}(t))$ is affine linear in $t$,

$$
\begin{equation*}
\varphi(\mathrm{T}(t))=b+\mathrm{T}(\mathscr{L} t) \tag{3.4}
\end{equation*}
$$

it follows that

$$
L_{A}(\varphi(\mathrm{~T}(t)))=B+\Lambda_{A}(\mathrm{~T}(\mathscr{L} t))+\Lambda_{A}(\mathrm{~T}(\mathscr{L} t))^{*}
$$

and if $s, t \in \mathbb{C}^{\mathrm{g}}$, then

$$
L_{A}(\varphi(\mathrm{~T}(t+s)))=L_{A}(\varphi(\mathrm{~T}(t)))+\Lambda_{A}(\mathrm{~T}(\mathscr{L} s))+\Lambda_{A}(\mathrm{~T}(\mathscr{L} s))^{*}
$$

Lemma 3.6. If $t \in \mathbb{C}^{\mathrm{g}}$ and $\left|t_{j}\right| \leq 1$ for all $j$, then $\mathrm{T}(t)$ is in the closure of $\mathfrak{P}_{A}$. If in addition, there is an $1 \leq m \leq \mathrm{g}$ such that $\left|t_{m}\right|=1$, then $\mathrm{T}(t)$ is in the boundary of $\mathfrak{P}_{A}$.

Given $1 \leq m \leq \mathrm{g}$, if $s \in \mathbb{C}^{\mathrm{g}}$ satisfies $s_{m}=0$ and $\left|s_{j}\right| \leq 1$ for all $j$, then $\varphi\left(\mathrm{T}\left(\delta_{m}\right)\right)$ and $\varphi\left(\mathrm{T}\left(\delta_{m}+s\right)\right)$ are in the boundary of $\mathfrak{P}_{A}$. Equivalently,
(a) $R:=L_{A}\left(\varphi\left(\mathrm{~T}\left(\delta_{m}\right)\right)\right) ;$ and
(b) $L_{A}\left(\varphi\left(\mathrm{~T}\left(\delta_{m} \pm s\right)\right)\right)$
are positive semidefinite with non-trivial kernel. In particular, there is a vector $0 \neq \gamma$ such that $R \gamma=0$.

Moreover,

$$
\begin{equation*}
L_{A}\left(\varphi\left(\mathrm{~T}\left(\delta_{m} \pm s\right)\right)\right)=R \pm Q(s) \tag{3.5}
\end{equation*}
$$

where

$$
Q(s)=\Lambda_{A}(\mathrm{~T}(\mathscr{L} s))+\Lambda_{A}(\mathrm{~T}(\mathscr{L} s))^{*}
$$

Finally, $Q(s) \gamma=0$.

Proof. The first statements about $\mathrm{T}(t)$ are evident.
By the first part of the lemma, $\mathrm{T}\left(\delta_{m}\right)$ and $\mathrm{T}\left(\delta_{m} \pm s\right)$ are in the boundary of $\mathfrak{P}_{A}$ and hence so are there images under $\varphi$.

Proving equation (3.5) is straightforward based upon equation (3.4). The last statement follows from equation (3.5). and Lemma 3.5.

Proof of Lemma 3.4. Recall, $\left\{\delta_{1}, \ldots, \delta_{\mathrm{g}}\right\}$ is the standard orthonormal basis for $\mathbb{C}^{\mathrm{g}}$. Let $H_{j}$ denote the orthogonal complement of $\delta_{j}$ and suppose, for each $1 \leq k \leq \mathrm{g}$, there is a $1 \leq$ $\pi(k) \leq \mathrm{g}$ such that $\mathscr{L} H_{k} \subseteq H_{\pi(k)}$. Since $\mathscr{L}$ is invertible, it follows that $\mathscr{L} H_{k}=H_{\pi(k)}$ and $\pi(k) \neq \pi(j)$ for $j \neq k$. In particular, $\pi$ is a permutation. Moreover, for each $1 \leq j \leq \mathrm{g}$, using $\mathscr{L}$ is invertible gives

$$
\mathscr{L}\left[\delta_{j}\right]=\mathscr{L} \cap_{k \neq j} H_{k}=\cap_{k \neq j} \mathscr{L} H_{k}=\cap_{k \neq j} H_{\pi(k)}=\left[\delta_{\pi(j)}\right],
$$

where $[x]$ denotes the span of a vector $x \in \mathbb{C}^{g}$. Thus, for $j$ fixed, $\ell_{j, k} \neq 0$ if and only if $k=\pi(j)$ and the conclusion of the lemma holds.

Now suppose there is an $1 \leq m \leq \mathrm{g}$ such that $\mathscr{L} H_{m} \nsubseteq H_{k}$ for each $k$. It follows that $\operatorname{dim}\left[\mathscr{L} H_{m}\right] \cap H_{k}<\operatorname{dim} H_{k}=\mathrm{g}-1$ and consequently $\cup_{k=1}^{\mathrm{g}}\left[\mathscr{L} H_{m}\right] \cap H_{k} \subsetneq \mathscr{L} H_{m}$. Thus there exists an $s \in H_{m} \subseteq \mathbb{C}^{g}$ such that each entry of $\mathscr{L} s$ is non-zero. By scaling $s$, we assume the entries of $s$ have absolute value at most one. Applying Lemma 3.6 (and using its notation), fix a (non-zero) vector $\gamma$ in the kernel of $R$ so that $Q(s) \gamma=0$.

Expressing $\gamma=\oplus_{j=1}^{\mathrm{g}+1} \gamma_{j}$ and

$$
\begin{equation*}
\gamma_{j}=\binom{\gamma_{j, 1}}{\gamma_{j, 2}} \in \mathbb{C}^{d_{j}} \oplus \mathbb{C}^{d_{j}} \tag{3.6}
\end{equation*}
$$

and setting $\sigma=\mathscr{L} s$, the condition $Q(s) \gamma=0$ implies $0=\sigma_{j} C_{j} \gamma_{j+1,2}$ and $0=\sigma_{j}^{*} C_{j}^{*} \gamma_{j, 1}$ for $1 \leq j \leq \mathrm{g}$. Thus,

$$
\begin{equation*}
C_{j}^{*} \gamma_{j, 1}=0=C_{j} \gamma_{j+1,2}, \tag{3.7}
\end{equation*}
$$

since $\sigma_{j} \neq 0$. In particular, $C_{\mathrm{g}}^{*} \gamma_{\mathrm{g}, 1}=0$.
Since $R \gamma=0$,

$$
b_{\mathrm{g}}^{*} C_{\mathrm{g}}^{*} \gamma_{\mathrm{g}, 1}+\gamma_{\mathrm{g}+1,1}=0
$$

and it follows that $\gamma_{\mathrm{g}+1,1}=0$.
Arguing by induction, suppose $\gamma_{\mathrm{g}+1,1}, \ldots, \gamma_{k+1,1}$ are all 0 for some $2 \leq k \leq \mathrm{g}$. The equality $R \gamma=0$ implies

$$
\begin{equation*}
0=b_{k-1}^{*} C_{k-1}^{*} \gamma_{k-1,1}+\gamma_{k, 1}+b_{k} C_{k} \gamma_{k+1,1}+\ell_{k, m} C_{k} \gamma_{k+1,2} \tag{3.8}
\end{equation*}
$$

It follows from equations (3.7) and (3.8) and the induction hypothesis that $\gamma_{k, 1}=0$. Hence $\gamma_{k, 1}=0$ for all $2 \leq k \leq \mathrm{g}+1$. Finally, from $\gamma_{1,1}+b_{1} C_{1} \gamma_{2,1}=0$ it follows that $\gamma_{1,1}=0$. A similar argument starting from

$$
0=\gamma_{1,2}+b_{1} C_{1} \gamma_{2,2}
$$

shows $\gamma_{k, 2}=0$ for each $1 \leq k \leq g+1$ too. We have now reached the contradiction $\gamma=0$, completing the proof.

Proof of Lemma 3.3. Let $\pi$ denote the permutation of Lemma 3.4. Thus, for each $1 \leq j \leq \mathrm{g}$ and each tuple $T$ nilpotent of order two,

$$
\varphi_{j}(T)=b_{j}+\ell_{j, \pi(j)} T_{\pi(j)}
$$

Fix $1 \leq m \leq \mathrm{g}$ and let $v=\pi^{-1}(m)$. In particular, $\pi(v)=m$. Let $s \in \mathbb{C}^{\mathrm{g}}$ denote the tuple with $s_{a}=1$ for $a \neq m$ and $s_{m}=0$. Using Lemma 3.6 and its notation, there is a non-zero vector $\gamma$ such that $R \gamma=0$ and $Q(s) \gamma=0$. In this case,

$$
Q(s)=\sum_{j \neq v} \ell_{j, \pi(j)} A_{j} \otimes S+\left[\sum_{j \neq v} \ell_{j, \pi(j)} A_{j} \otimes S\right]^{*}
$$

where $S$ is given in equation (3.3).
With $\gamma=\oplus_{j=1}^{\mathrm{g}+1} \gamma_{j}$ and $\gamma_{j}$ as in equation (3.6) like before, the condition $Q(s) \gamma=0$ (and $\left.\ell_{j, \pi(j)} \neq 0\right)$ implies, for $j \neq v$,

$$
\begin{equation*}
C_{j}^{*} \gamma_{j, 1}=0=C_{j} \gamma_{j+1,2} . \tag{3.9}
\end{equation*}
$$

As in the proof of Lemma 3.4, $R \gamma=0$ implies $\gamma_{\mathrm{g}+1,1}+b_{\mathrm{g}}^{*} C_{\mathrm{g}}^{*} \gamma_{g, 1}=0$ and also $\gamma_{1,2}+b_{1} C_{1} \gamma_{2,2}=0$. Assuming $v<\mathrm{g}$, it follows that $\gamma_{\mathrm{g}+1,1}=0$. Another application of $R \gamma=0$ gives

$$
b_{\mathrm{g}-1}^{*} C_{\mathrm{g}-1}^{*} \gamma_{\mathrm{g}-1,1}+\gamma_{\mathrm{g}, 1}+b_{\mathrm{g}} C_{\mathrm{g}} \gamma_{\mathrm{g}+1,1}+\ell_{\mathrm{g}, \pi(\mathrm{~g})} C_{\mathrm{g}} \gamma_{\mathrm{g}+1,2}=0
$$

Thus, if $v<\mathrm{g}-1$, then, in view of equation (3.9) and using the already established $\gamma_{\mathrm{g}+1,1}=0$, it follows that $\gamma_{\mathrm{g}, 1}=0$. By induction, $\gamma_{j, 1}=0$ for $v+2 \leq j$. A similar argument shows $\gamma_{j, 2}=0$ for $j \leq v-1$. On the other hand, $R \gamma=0$ gives

$$
\begin{align*}
& 0=b_{v-1}^{*} C_{v-1}^{*} \gamma_{v-1,1}+\gamma_{v, 1}+b_{v} C_{v} \gamma_{v+1,1}+\ell_{v, m} C_{v+1} \gamma_{v+1,2} \\
& 0=\ell_{v-1, m} C_{v-1}^{*} \gamma_{v-1,1}+b_{v-1}^{*} C_{v-1}^{*} \gamma_{v-1,2}+\gamma_{v, 2}+b_{v} C_{v} \gamma_{v+1,2}  \tag{3.10}\\
& 0=b_{v}^{*} C_{v}^{*} \gamma_{v, 1}+\gamma_{v+1,1}+b_{v+1} C_{v+1} \gamma_{v+2,1}+\ell_{v+1, m} C_{v+1} \gamma_{v+2,2} \\
& 0=\ell_{v, m}^{*} C_{v}^{*} \gamma_{v, 1}+b_{v}^{*} C_{v}^{*} \gamma_{v, 2}+\gamma_{v+1,2}+b_{v+1} C_{v+1} \gamma_{v+2,2} .
\end{align*}
$$

Combining equations (3.9), (3.10) and $\gamma_{v-1,2}=0=\gamma_{v+2,1}$, it follows that

$$
\begin{aligned}
& 0=\gamma_{v, 1}+b_{v} C_{v} \gamma_{v+1,1}+\ell_{v, m} C_{v} \gamma_{v+1,2} \\
& 0=\gamma_{v, 2}+b_{v} C_{v} \gamma_{v+1,2} \\
& 0=b_{v}^{*} C_{v}^{*} \gamma_{v, 1}+\gamma_{v+1,1} \\
& 0=\ell_{v, m}^{*} C_{v}^{*} \gamma_{v, 1}+b_{v}^{*} C_{v}^{*} \gamma_{v, 2}+\gamma_{v+1,2}
\end{aligned}
$$

Thus,

$$
0=\left(\begin{array}{cc}
I & \varphi_{v}\left(T\left(\delta_{m}\right)\right) \otimes C_{v} \\
\varphi_{v}\left(T\left(\delta_{m}\right)\right)^{*} \otimes C_{v}^{*} & I
\end{array}\right)\left(\begin{array}{c}
\gamma_{v, 1} \\
\gamma_{v, 2} \\
\gamma_{v+1,1} \\
\gamma_{v+1,2}
\end{array}\right)
$$

and hence

$$
\varphi_{v}\left(T\left(\delta_{m}\right)\right)=\left(\begin{array}{cc}
b_{v} & \ell_{v, m} \\
0 & b_{v}
\end{array}\right)
$$

has norm one or $\gamma_{a, b}=0$ for $a=v, v+1$ and $b=1,2$. In the second case, $L_{A}\left(c I_{2}\right) \gamma=0$, where $c \in \mathbb{C}^{\mathrm{g}}$ is the tuple with $c_{j}=b_{j}$ for $j \neq v$ and $c_{v}=0$. Thus $c$ is in the boundary of $\mathfrak{P}_{A}[1]$. On the other hand, since $b$ is not in this boundary of $\mathfrak{P}_{A}[1]$, it is easy to see that neither is $c$, a contradiction. In the first case, from Lemma 2.1, $\ell_{v, m}=e^{i \theta_{v}}\left(\left|b_{v}\right|^{2}-1\right)$, for some $\theta_{v} \in \mathbb{R}$ and the proof is complete.

Proof of Proposition 3.1. By Lemma 3.3, there is a permutation $\pi$ of $\{1, \ldots, \mathrm{~g}\}$ such that, for tuples $T=\left(T_{1}, \ldots, T_{\mathrm{g}}\right)$ nilpotent of order 2 and $1 \leq j \leq \mathrm{g}$,

$$
\varphi_{j}(T)=b_{j}+e^{i \theta_{j}}\left(\left|b_{j}\right|^{2}-1\right) T_{\pi(j)},
$$

for some $\theta_{j} \in \mathbb{R}$. Hence, with $k=\pi(j)$, for words $\alpha$ of length at least two, there exists $a_{\alpha}^{k} \in \mathbb{C}$ such that for a tuple $T$ nilpotent of order $N+1 \geq 2$,

$$
\varphi_{j}(T)=b_{j}+e^{i \theta_{j}}\left(\left|b_{j}\right|^{2}-1\right) T_{\pi(j)}+\sum_{\alpha \in \mathscr{W}_{N}} a_{\alpha}^{k} T^{\alpha} .
$$

For $N \in \mathbb{N}^{+}$, let $R$ denote the $(N+1) \times(N+1)$ matrix with $R_{j, j+1}=1$ for $1 \leq j \leq N$ and $R_{j, k}=0$ otherwise. Let $k=\pi(j)$. The tuple $Y=\delta_{k} R$ is nilpotent of order $N+1$ and is in the boundary of $\mathfrak{P}_{A}$ and hence so is $\varphi(Y)$. In particular,

$$
\varphi_{j}(Y)=b_{j}+e^{i \theta_{j}}\left(\left|b_{j}\right|^{2}-1\right) R+\sum_{n=2}^{N} a_{x_{k}^{n}}^{k} R^{n}
$$

is a contraction. By Lemma 2.2, $a_{x_{k}^{n}}^{k}=e^{i n \theta_{j}}\left(b_{j}^{*}\right)^{n-1}\left(\left|b_{j}\right|^{2}-1\right)$. Hence equation (3.2) holds for $T$ nilpotent of order $N+1$ and the remainder of the proposition follows.

## 4. The Higher Order Terms

We continue to work with a fixed automorphism $\varphi$ of $\mathfrak{P}_{A}$, with $b=\varphi(0)$. In particular, there exists a permutation $\pi$ and a tuple $\theta \in \mathbb{R}^{\mathrm{g}}$ such that the conclusion of Proposition 3.1 holds. Let

$$
\begin{equation*}
\mathfrak{g}_{j}(z)=e^{i \theta_{j}} \mathfrak{m}_{e^{-i \theta_{j}} b_{j}}(z)=\mathfrak{m}_{b_{j}}\left(e^{i \theta_{j}} z\right)=b_{j}+e^{i \theta_{j}}\left(1-\left|b_{j}\right|^{2}\right) z+\ldots \tag{4.1}
\end{equation*}
$$

Let $\mathfrak{Z}^{+} \subseteq\{1,2, \ldots, \mathrm{~g}\}$ denote those indices $k$ such that, for each each $\epsilon>0$, the matrix $L_{A}\left(\delta_{k}+\epsilon \delta_{k+1}\right)$ is not positive semidefinite; let $\mathfrak{Z}^{-}$denote those indices $k$ such that, for each each $\epsilon>0$, the matrix $L_{A}\left(\delta_{k}+\epsilon \delta_{k-1}\right)$ is not positive semidefinite; and let $\mathfrak{Z}=\mathfrak{Z}^{+} \cup \mathfrak{Z}^{-}$. Let $\mathfrak{N}$ denote the complement of $\mathfrak{Z}$. It is straight forward consequence of convexity that $\mathfrak{N}$ is the set of those indices $j$ for which there exists an $\epsilon>0$ such that $L_{A}\left(\epsilon \delta_{k-1}+\delta_{k}+\epsilon \delta_{k+1}\right) \succeq 0$, (in the case that $k=1$ or $k=\mathrm{g}$ we interpret this condition in the natural way).

The following alternate criteria for membership in the sets $\mathfrak{Z}^{ \pm}$will often be used without comment.

Lemma 4.1. For a tuple $T \in M_{n}(\mathbb{C})^{\mathrm{g}}$, if $L_{A}(T) \succeq 0$, then for each $j$,

$$
T_{j}^{*} T_{j} \otimes C_{j}^{*} C_{j}+T_{j+1} T_{j+1}^{*} \otimes C_{j+1} C_{j+1}^{*} \succeq 0
$$

An index $j$ is in $\mathfrak{Z}^{+}$if and only if, for each $\epsilon>0$,

$$
C_{j}^{*} C_{j}+\epsilon C_{j+1} C_{j+1}^{*} \npreceq I .
$$

Likewise $j \in \mathfrak{Z}^{-}$if and only if for each $\epsilon>0, \epsilon C_{j-1}^{*} C_{j-1}+C_{j} C_{j}^{*} \npreceq I$.
The proof uses several times the Schur complement criteria for positive definiteness of a $2 \times 2$ block selfadjoint matrix

$$
M=\left(\begin{array}{cc}
A & B \\
B^{*} & D
\end{array}\right)
$$

Namely, if $A$ is positive definite, them $M$ is positive semidefinite if and only if the Schur complement of $M$ (with respect to the $(1,1)$ block entry),

$$
S=D-B^{*} A^{-1} B
$$

is positive semidefinite.
Proof. If $L_{A}(T) \succeq 0$, then

$$
Z=\left(\begin{array}{ccc}
I & T_{j} \otimes C_{j} & 0 \\
T_{j}^{*} \otimes C_{j}^{*} & I & \epsilon T_{j+1} \otimes C_{j+1} \\
0 & \epsilon T_{j+1}^{*} \otimes C_{j+1}^{*} & I
\end{array}\right) \succeq 0
$$

if and only if the Schur complement of $Z$ with respect to the $(1,1)$ entry,

$$
S=\left(\begin{array}{cc}
I-T_{j}^{*} T_{j} \otimes C_{j}^{*} C_{j} & T_{j+1} \otimes C_{j+1} \\
T_{j+1}^{*} \otimes C_{j+1}^{*} & I
\end{array}\right)
$$

is positive semidefinite if and only if the Schur complement of $S$ with respect to its $(2,2)$ entry,

$$
I-T_{j}^{*} T_{j} \otimes C_{j}^{*} C_{j}-T_{j+1} T_{j+1}^{*} \otimes C_{j+1} C_{j+1}^{*}
$$

is positive semidefinite. Equivalently, $T_{j}^{*} T_{j} \otimes C_{j}^{*} C_{j}+T_{j+1} T_{j+1}^{*} \otimes C_{j+1} C_{j+1}^{*} \preceq I$.
Observe $L_{A}\left(\delta_{j}+\epsilon \delta_{j+1}\right) \succeq 0$ if and only if

$$
\left(\begin{array}{ccc}
I & C_{j} & 0 \\
C_{j}^{*} & I & \epsilon C_{j+1} \\
0 & \epsilon C_{j+1}^{*} & I
\end{array}\right)
$$

By the argument above it follow that $L_{A}\left(\delta_{j}+\epsilon \delta_{j+1}\right) \succeq 0$ if and only if $C_{j}^{*} C_{j}+\epsilon^{2} C_{j+1} C_{j+1}^{*} \preceq$ $I$.

For notational convenience, let $k=\pi(j)$. From Proposition 3.1, there exists $\mathfrak{h}_{k} \in \mathfrak{H}^{j}$ such that

$$
\varphi_{j}(x)=\mathfrak{g}_{j}\left(x_{k}\right)+\mathfrak{h}_{k}(x)
$$

where $\mathfrak{g}_{j}$ is given in equation (4.1).
Lemma 4.2. Fix $1 \leq j \leq \mathrm{g}$ and let $k=\pi(j)$.
(i) If $k \in \mathfrak{N}$, then $\mathfrak{h}_{k}=0$.
(ii) In any case, $\mathfrak{h}_{k}(T)=0$ whenever $T_{k-1}=0=T_{k+1}$.

Lemma 4.2 is a preliminary version of Proposition 4.10, the main result of this section. Before proving Lemma 4.2, we collect a couple of lemmas related to the hyper-Reinhardt nature of $\mathfrak{P}_{A}$.
4.1. The hyper-Reinhardt condition. Given $T \in M(\mathbb{C})^{\mathrm{g}}$, note

$$
L_{A}(T)=\left(\begin{array}{ccccccc}
I & C_{1} \otimes T_{1} & 0 & 0 & \ldots & 0 & 0 \\
C_{1}^{*} \otimes T_{1}^{*} & I & C_{2} \otimes T_{2} & 0 & \ldots & 0 & 0 \\
0 & C_{2}^{*} \otimes T_{2}^{*} & I & C_{3} \otimes T_{3} & \ldots & 0 & 0 \\
0 & 0 & C_{3}^{*} \otimes T_{3}^{*} & I & \ldots & 0 & 0 \\
\vdots & \vdots & \vdots & \vdots & \ldots & \vdots & \\
0 & 0 & 0 & 0 & \ldots & I & C_{\mathrm{g}} \otimes T_{\mathrm{g}} \\
0 & 0 & 0 & 0 & \ldots & C_{\mathrm{g}}^{*} \otimes T_{\mathrm{g}}^{*} & I
\end{array}\right) .
$$

Given tuples $T \in M_{n}(\mathbb{C})^{\mathrm{g}}$ and $W=\left(W_{0}, \ldots, W_{\mathrm{g}}\right) \in M_{n}(\mathbb{C})^{\mathrm{g}+1}$, let

$$
\begin{equation*}
W \circ T:=\left(W_{0}^{*} T_{1} W_{1}, W_{1}^{*} T_{2} W_{2}, \ldots, W_{\mathrm{g}-1}^{*} T_{\mathrm{g}} W_{\mathrm{g}}\right) \tag{4.2}
\end{equation*}
$$

Lemma 4.3. If $T \in \mathfrak{P}_{A}[n]$ and $W \in M_{n}(\mathbb{C})^{\mathfrak{g}+1}$ is a tuple of unitary matrices, then $W \circ T$ is also in $\mathfrak{P}_{A}$.

Remark 4.4. A natural question is whether a free spectrahedra $\mathfrak{P}_{B} \subseteq M(\mathbb{C})^{\mathrm{g}}$ is hyperReinhardt if and only if for each $n$, each $X \in \mathfrak{P}_{B}[n]$ and tuple $W=\left(W_{0}, \ldots, W_{\mathrm{g}}\right) \in M_{n}(\mathbb{C})^{\mathrm{g}+1}$ of unitary matrices

$$
W \circ X=\left(W_{0}^{*} X_{1} W_{1}, \ldots, W_{\mathrm{g}-1}^{*} X_{\mathrm{g}} W_{\mathrm{g}}\right) \in \mathfrak{P}_{A}
$$

Proof of Lemma 4.3. Letting $D_{W}$ denote the block diagonal $(\mathrm{g}+1) \times(\mathrm{g}+1)$ with $(j+1, j+1)$ entry $I \otimes W_{j}$ for $0 \leq j \leq \mathrm{g}$,

$$
D_{W}^{*} L_{A}(T) D_{W}=L_{A}(W \circ T)
$$

Lemma 4.5. If $\lambda \in \mathfrak{P}_{A}[1]$, and $X \in M_{n}(\mathbb{C})^{\mathrm{g}}$ is a tuple of contractions, then $\lambda \cdot X=$ $\left(\lambda_{1} X_{1}, \ldots, \lambda_{\mathrm{g}} X_{\mathrm{g}}\right) \in \mathfrak{P}_{A}[n]$.

Proof. Given a tuple $U \in M_{n}(\mathbb{C})^{\mathrm{g}}$ of unitary matrices, let $W_{0}=I$ and $W_{j}=U_{1} U_{2} \ldots U_{j}$ and let $\Lambda=\lambda I_{n}$. Observe that $\Lambda \circ W=\lambda \cdot U$. Thus

$$
L_{A}(\Lambda \circ W)=L_{A}(\lambda \cdot U)
$$

and consequently, by Lemma $4.3, \lambda \cdot U \in \mathfrak{P}_{A}$.
By the Russo-Dye Theorem, there is an $n$ and unitary tuples $U^{j} \in M_{n}(\mathbb{C})^{\mathrm{g}}$ for $1 \leq j \leq n$ such that

$$
X=\frac{1}{n} \sum_{\ell=1}^{n} U^{\ell}, \quad X_{j}=\frac{1}{n} \sum_{\ell=1}^{n} U_{j}^{\ell}
$$

Thus

$$
L_{A}(\lambda \cdot X)=\frac{1}{n} \sum_{j=1}^{n} L_{A}\left(\lambda \cdot U^{j}\right) \succ 0
$$

and it follows that $\lambda \cdot X \in \mathfrak{P}_{A}$.
We will also need the following variation of Lemma 4.5.
Lemma 4.6. Fix $\mathcal{I} \subseteq\{1,2, \ldots, \mathrm{~g}\}$ and $\lambda_{j} \geq 0$ for $j \in \mathcal{I}$. If $Y \in \mathfrak{P}_{A}[n]$ and $Y_{j}=0$ for $j \in \mathcal{I}$ implies $Y^{\lambda}$ defined by

$$
Y_{j}^{\lambda}= \begin{cases}\lambda_{j} I_{n} & \text { if } j \in \mathcal{I} \\ Y_{j} & \text { if } j \notin \mathcal{I}\end{cases}
$$

is in $\mathfrak{P}_{A}$, then, if $Y \in \mathfrak{P}_{A}$ and $Y_{j}=0$ for $j \in \mathcal{I}$ and $\left\|T_{j}\right\| \leq 1$ for $j \in \mathcal{I}$, then the tuple

$$
Z= \begin{cases}\lambda_{j} T_{j} & \text { if } j \in \mathcal{I} \\ Y_{j} & \text { if } j \notin \mathcal{I}\end{cases}
$$

is in $\mathfrak{P}_{A}$.

Proof. Given a tuple $W=\left(W_{0}, W_{1}, \ldots, W_{\mathrm{g}}\right)$ of $n \times n$ unitary matrices, the tuple $W^{*} \circ Y \in \mathfrak{P}_{A}$ and $\left(W^{*} \circ Y\right)_{j}=0$ for $j \in \mathcal{I}$. Hence the tuple $\left(W^{*} \circ Y\right)^{\lambda}$ is in $\mathfrak{P}_{A}$ and therefore so is

$$
W \circ\left(W^{*} \circ Y\right)^{\lambda}= \begin{cases}\lambda_{j} W_{j}^{*} W_{j+1} & \text { if } j \in \mathcal{I} \\ Y_{j} & \text { if } j \notin \mathcal{I}\end{cases}
$$

An application of the Russo-Dye lemma as in the proof of Lemma 4.3 completes the proof.
Lemma 4.7. Fix $1 \leq k \leq g$. If there is an $\epsilon>0$ such that both $L_{A}\left(\epsilon \delta_{k-1}+\delta_{k}\right) \succeq 0$ and $L_{A}\left(\delta_{k}+\epsilon \delta_{k+1}\right) \succeq 0$, then there is an $\eta>0$ such that if $T \in M_{n}(\mathbb{C})^{g}$ satisfies $\left\|T_{k}\right\| \leq 1$ and $\left\|T_{j}\right\| \leq \eta$ for $j \neq k$, then $T$ is in the closure of $\mathfrak{P}_{A}[n]$. If, in addition, $\left\|T_{k}\right\|=1$, then $T$ is in the boundary of $\mathfrak{P}_{A}[n]$.

Similarly, if just $L_{A}\left(\delta_{k}+\epsilon \delta_{k+1}\right) \succeq 0$, then there is an $\eta>0$ such that if $\left\|T_{k}\right\| \leq 1$, $T_{k-1}=0$ and $\left\|T_{j}\right\|<\eta$ for $j \neq k$, then $T$ is in the closure of $\mathfrak{P}_{A}[n]$.

Proof. Observe that there is a $\sigma>0$ such that $L_{A}\left(\delta_{k}+\sigma \sum_{j \neq k, k+1, k-1} \delta_{j}\right) \succeq 0$. Equivalently $\delta_{k}+\sigma \sum_{j \neq k, k+1, k-1} \delta_{j}$ is in the closure of $\mathfrak{P}_{A}$. By convexity, the average of $\delta_{k}+\sigma \sum_{j \neq k, k+1, k-1} \delta_{j}$ and $\delta_{k}+\epsilon \delta_{k+1}$ and $\delta_{k}+\epsilon \delta_{k-1}$ is also in $\mathfrak{P}_{A}$. Thus, there is an $\eta>0$ such that $L_{A}\left(\delta_{k}+\right.$ $\left.\eta \sum_{j \neq k} \delta_{j}\right) \succeq 0$. From here an application of Lemma 4.5, with $X_{k}=T_{k}$ and $X_{j}=\frac{T_{j}}{\eta}$ for $j \neq k$ establishes the first part of the lemma.

To prove the second part of the lemma, note that there is an $\eta>0$ such that $L_{A}\left(\delta_{k}+\right.$ $\left.\eta \sum_{k-1 \neq j \neq k} \delta_{j}\right) \succeq 0$ and argue as above.
4.2. Proof of Lemma 4.2. Let $k=\pi(j)$. From Proposition 3.1, there exists $\mathfrak{h}_{k} \in \mathfrak{H}^{j}$ such that

$$
\varphi_{j}(x)=\mathfrak{g}_{j}\left(x_{k}\right)+\mathfrak{h}_{k}(x)
$$

where $\mathfrak{g}_{k}$ is given in equation (4.1).
Now suppose $k \in \mathfrak{N}$. We argue by induction on $N$ that the result of item (i) of Lemma 4.2 holds when evaluating $\varphi_{j}$ at a tuple $T$ that is nilpotent of order $N$. That is, $\mathfrak{h}_{k}(T)=0$ if $T$ is nilpotent of order $N$. Equivalently, when writing

$$
\mathfrak{h}_{k}(x)=\sum_{\alpha \in \mathscr{W}^{j}} c_{\alpha} x^{\alpha},
$$

we have $c_{\alpha}=0$ whenever $|\alpha|<N$. The case of $N=2$ follows from Lemma 3.3. Now suppose the result is true for an $N \geq 2$. Let $T_{k}$ denote the $(N+1) \times(N+1)$ matrix with $\lambda_{k, 1}=1$ in the $(1,2)$ entry; $\lambda_{k, u} \in \mathbb{C} \backslash\{0\}$ in the $(u, u+1)$ entry for $u \geq 2$ and 0 elsewhere. Similarly, for $\ell \neq k$, let $T_{\ell}$ denote the $(N+1) \times(N+1)$ matrix with $\lambda_{\ell, u} \in \mathbb{C}$ in the $(u, u+1)$ entry for $1 \leq u \leq N$ and 0 elsewhere. The tuple $T=T(\lambda)$ thus depends (linearly) on the $\lambda_{\ell, u} \in \mathbb{C}$ for
$1 \leq \ell \leq \mathrm{g}$ and $1 \leq u \leq N$ and $(\ell, u) \neq(k, 1)$. Given such a $\lambda$ and a word $\alpha=x_{j_{1}} x_{j_{2}} \cdots x_{j_{N}}$, let

$$
\lambda^{\alpha}=\lambda_{j_{1}, 1} \lambda_{j_{2}, 2} \cdots \lambda_{j_{N}, N}
$$

and note that any $\lambda_{j, u}$ appears at most once in this product. Hence, if $c_{\alpha} \in \mathbb{C}$ and

$$
\sum_{|\alpha|=N} c_{\alpha} \lambda^{\alpha}=0,
$$

for $\lambda$ an open set of such $\lambda$ (with $\lambda_{k, 1}=1$ ), then $c_{\alpha}=0$ for all $\alpha$.
In the case of item (i), there is an open neighborhood $U$ of 0 in $\mathbb{C}^{N g-1}$ such that for $\lambda \in U$, the tuple $T(\lambda)$ is in the boundary of $\mathfrak{P}_{A}$ by Lemma 4.7. Let $M(\lambda)=\varphi_{j}(T(\lambda))$. By the induction hypothesis, and using notation from equation (3.2),

$$
M(\lambda)=\mathfrak{g}_{j}\left(T_{k}(\lambda)\right)+\sum_{|\alpha|=N, \alpha \neq x_{k}^{N}} a_{\alpha}^{k} T^{\alpha}(\lambda)
$$

Since, for $|\alpha|=N$, the matrix $T^{\alpha}$ is 0 except for its upper right entry. When $\lambda_{k, j} \neq 0$, Lemma 2.2 implies

$$
\sum_{|\alpha|=N, \alpha \neq x_{k}^{N}} a_{\alpha}^{k} T^{\alpha}=0
$$

On the other hand, letting $P$ denote the matrix with 1 in the upper right entry and 0 elsewhere,

$$
\sum_{|\alpha|=N, \alpha \neq x_{k}^{N}} a_{\alpha}^{k} T^{\alpha}=\sum a_{\alpha}^{k} \lambda^{\alpha} P .
$$

Hence $a_{\alpha}^{k}=0$ for each $\alpha \in \mathscr{W}_{N}^{k}$. Thus $\varphi_{j}(T)=\mathfrak{g}_{j}(T)$, completing the induction argument in the setting of item (i).

We now drop the $k \in \mathfrak{N}$ assumption and proceeds as above, but with $\lambda_{k-1, u}=0=\lambda_{k+1, u}$ for each $u$. The conclusion in this setting becomes: if $\alpha$ is a word that does not include either $x_{k-1}$ and $x_{k+1}\left(\right.$ and $\left.\alpha \neq x_{k}^{N}\right)$, then $c_{\alpha}=0$. Hence if $T \in \mathfrak{P}_{A}$ and $T_{k-1}=0=T_{k+1}$, then $\mathfrak{h}_{k}(T)=0$.
4.3. The sets $\mathfrak{N}$ and $\mathfrak{Z}$. This subsection develops criteria for membership in the sets $\mathfrak{N}$ and $\mathfrak{Z}$, where

$$
\begin{equation*}
\mathfrak{Z}=\left\{j: L\left(\delta_{j}+\epsilon \delta_{j+1} \nsucceq 0, \quad L\left(\epsilon \delta_{j-1}+\delta_{j}\right) \nsucceq 0, \quad \text { for all } \epsilon>0\right\}\right. \tag{4.3}
\end{equation*}
$$

and $\mathfrak{N}=\{1,2, \ldots, \mathrm{~g}\} \backslash \mathfrak{Z}$.
Lemma 4.8. Fix $1 \leq j<g$ and let $k=\pi(j)$ and $\ell=\pi(j+1)$. If $L_{A}\left(\delta_{j}+\delta_{j+1}\right)$ is not positive semidefinite, then either $\ell=k-1$ or $\ell=k+1$.

Proof. Arguing the contrapositive, suppose $\ell \neq k+1$ and $\ell \neq k-1$. By Lemma 4.2 item (ii), $\varphi_{j}\left(x \delta_{k}+w \delta_{\ell}\right)=\mathfrak{g}_{j}(x)$ and $\varphi_{j+1}\left(x \delta_{k}+w \delta_{\ell}\right)=\mathfrak{g}_{j+1}(w)$, in the latter case since $\ell=\pi(j+1)$ and $k \neq \ell+1$ and $k \neq \ell-1$. On the other hand $t\left(\delta_{k}+\delta_{\ell}\right)$ is in $\mathfrak{P}_{A}$ for $0<t<1$ and hence so is $\varphi\left(t\left(\delta_{k}+\delta_{\ell}\right)\right)$. In particular,

$$
\left(\begin{array}{ccc}
I & \mathfrak{g}_{b_{j}}(t) \otimes C_{j} & 0  \tag{4.4}\\
\mathfrak{g}_{b_{j}}(t)^{*} \otimes C_{j}^{*} & I & \mathfrak{g}_{b_{j+1}}(t) \otimes C_{j+1} \\
0 & \mathfrak{g}_{b_{j+1}}(t)^{*} \otimes C_{j+1}^{*} & I
\end{array}\right) \succeq 0
$$

Because $\mathfrak{g}_{b_{j}}$ and $\mathfrak{g}_{b_{j+1}}$ extend continuously across the boundary of the unit disc, it follows that the inequality of equation (4.4) holds for $t=1$. Since $\mathfrak{g}_{b_{j}}(1)$ and $\mathfrak{g}_{b_{j+1}}(1)$ both have modulus 1 , it follows that $L_{A}\left(\delta_{j}+\delta_{j+1}\right) \succeq 0$ and the proof is complete.

Lemma 4.9. Fix $1 \leq j \leq \mathrm{g}$ and let $k=\pi(j)$.
(a) If $j \in \mathfrak{Z}^{+}$, then
(i) $\pi(j+1)=k+1$
(ii) $b_{j}=0=b_{j+1}$; and
(iii) $k \in \mathfrak{Z}^{+}$.
(b) If $j \in \mathfrak{Z}^{-}$, then
(i) $\pi(j-1)=k-1$;
(ii) $b_{j}=0=b_{j-1}$; and
(iii) $k \in \mathfrak{Z}^{-}$.

Proof. Suppose $j \in \mathfrak{Z}^{+}$. Thus, for each $\epsilon>0$, the matrix $L_{A}\left(\delta_{j}+\epsilon \delta_{j+1}\right)$ is not positive semidefinite. In particular, if $\epsilon>0$, then

$$
C_{j}^{*} C_{j}+\epsilon^{2} C_{j+1} C_{j+1}^{*} \npreceq I,
$$

by Lemma 4.1.
Choose

$$
T_{k}=S=\left(\begin{array}{ll}
0 & 1 \\
0 & 0
\end{array}\right)
$$

and $T_{a}=0$ otherwise. Thus $T$ is in the boundary of $\mathfrak{P}_{A}$, the matrix $\varphi_{j}(T)=\mathfrak{g}_{j}\left(T_{k}\right)$ has norm one and there is a scalar $e_{j+1}$ such that

$$
\varphi_{j+1}(T)=b_{j+1} I_{2}+e_{j+1} T_{\pi(j+1)}=b_{j+1} I
$$

On the other hand, $L_{A}(\varphi(T)) \succeq 0$ implies, by Lemma 4.1,

$$
\varphi_{j}(T)^{*} \varphi_{j}(T) \otimes C_{j}^{*} C_{j}+\left|b_{j+1}\right|^{2} C_{j+1} C_{j+1}^{*} \preceq I,
$$

and thus $b_{j+1}=0$ by Lemma 4.1, proving half of item (aii).

From Lemma 4.8, $\ell=k-1$ or $\ell=k+1$. Arguing by contradiction, suppose $\ell=k-1$. In this case, let $T_{a}=0$ for $k-1 \neq a \neq k$ and

$$
T_{k}=\left(\begin{array}{ccc}
0 & 1 & 0 \\
0 & 0 & 0 \\
0 & 0 & 0
\end{array}\right), \quad T_{k-1}=\left(\begin{array}{ccc}
0 & 0 & 0 \\
0 & 0 & 1 \\
0 & 0 & 0
\end{array}\right)
$$

Thus $T$ is in the boundary of $\mathfrak{P}_{A}$ and hence so is $\varphi(T)$. The only word in $T$ of length two or longer that is not 0 is $T_{k} T_{k-1}$. Hence, letting $e_{j}=e^{i \theta_{j}}\left(\left|b_{j}\right|^{2}-1\right)$ and $e_{j+1}=e^{i \theta_{j+1}}$,

$$
\begin{gathered}
\varphi_{j}(T)=\mathfrak{g}_{j}\left(T_{k}\right)+\alpha T_{k} T_{k-1}=b_{j}+e_{j} T_{k}+\alpha T_{k} T_{k-1}=\left(\begin{array}{ccc}
b_{j} & e_{j} & \alpha \\
0 & b_{j} & 0 \\
0 & 0 & b_{j}
\end{array}\right) \\
\varphi_{j+1}(T)=\mathfrak{g}_{j+1}\left(T_{k-1}\right)+\beta T_{k} T_{k-1}=e_{j+1} T_{k-1}+\beta T_{k} T_{k-1}=\left(\begin{array}{ccc}
0 & 0 & \beta \\
0 & 0 & e_{j+1} \\
0 & 0 & 0
\end{array}\right),
\end{gathered}
$$

for some $\alpha, \beta \in \mathbb{C}$. From Lemma 2.2, $\alpha=0=\beta$. By Lemma 2.1 there exists a unit vector $\gamma \in \mathbb{C}^{3}$ such that $\left\|\varphi_{j}(T) \gamma\right\|=1$ and $\gamma_{2} \neq 0$ but $\gamma_{3}=0$. Since $\left|e_{j+1}\right|=1$ and $\gamma_{2} \neq 0$, it follows that $\varphi_{j+1}(T)^{*} \gamma \neq 0$. Since $L_{A}(\varphi(T)) \succeq 0$,

$$
\left(\begin{array}{ccc}
I & \varphi_{j}(T) \otimes C_{j} & 0 \\
\varphi_{j}(T)^{*} \otimes C_{j}^{*} & I & \varphi_{j+1}(T) \otimes C_{j+1} \\
0 & \varphi_{j+1}(T)^{*} \otimes C_{j+1}^{*} & I
\end{array}\right) \succeq 0
$$

and hence, by Lemma 4.1,

$$
I \succeq\left\|\varphi_{j}(T) \gamma\right\|^{2} C_{j}^{*} C_{j}+\left\|\varphi_{j+1}(T)^{*} \gamma\right\|^{2} C_{j+1} C_{j+1}^{*}=C_{j}^{*} C_{j}+\left\|\varphi_{j+1}(T)^{*} \gamma\right\|^{2} C_{j+1} C_{j+1}^{*}
$$

Lemma 4.1 now gives the contradiction $\varphi_{j+1}(T)^{*} \gamma=0$. Thus $\ell=k+1$, proving item (ai).
Next choose $T_{k}=S=T_{k+1}$ and $T_{a}=0$ otherwise, where $S$ is given in equation (3.3). Hence $T$ is in the boundary of $\mathfrak{P}_{A}$ and thus so is $\varphi(T)$. Letting $X=\varphi_{j}(T)$ and $Y=\varphi_{j+1}(T)$, it follows that

$$
X^{*} X \otimes C_{j}^{*} C_{j}+Y Y^{*} \otimes C_{j+1} C_{j+1}^{*} \preceq I
$$

Letting $\gamma$ denote a unit vector with $X^{*} X \gamma=\gamma$, we find $Y^{*} \gamma=0$. Since $b_{j+1}=0$,

$$
Y=\left(\begin{array}{cc}
0 & e_{j+1} \\
0 & 0
\end{array}\right)
$$

where $\left|e_{j+1}\right|=1$. It follows that the first component of $\gamma$ is zero and thus $b_{j}=0$, and the proof of item (aii) is complete.

To prove item (aiii), suppose, by way of contradiction, there is an $\epsilon>0$ such that $L_{A}\left(\delta_{k}+\epsilon \delta_{k+1}\right) \succeq 0$. The tuple $T$ defined by $T_{a}=0$ for $k \neq a \neq k+1$ and

$$
T_{k}=\left(\begin{array}{ccc}
0 & 1 & 0 \\
0 & 0 & 1 \\
0 & 0 & 0
\end{array}\right), \quad T_{k+1}=\left(\begin{array}{ccc}
0 & 1 & 0 \\
0 & 0 & \epsilon \\
0 & 0 & 0
\end{array}\right)
$$

is in the boundary of $\mathfrak{P}_{A}$. Thus $\varphi(T)$ is in the boundary of $\mathfrak{P}_{A}$. Since $b_{j}=0$,

$$
X=\varphi_{j}(T) e^{i \theta_{j}} T_{k}+\mathfrak{h}_{k}(T)=\left(\begin{array}{ccc}
0 & e^{i \theta_{j}} & y \\
0 & 0 & e^{i \theta_{j}} \\
0 & 0 & 0
\end{array}\right)
$$

for some $y$. Since $\varphi_{j}(T)$ is a contraction, $y=0$. Similarly, since $b_{j+1}=0$,

$$
Y=\varphi_{j+1}(T)=\left(\begin{array}{ccc}
0 & e^{i \theta_{j+1}} & 0 \\
0 & 0 & \epsilon e^{i \theta_{j+1}} \\
0 & 0 & 0
\end{array}\right)
$$

Since $L_{A}(\varphi(T)) \succeq 0$, an application of Lemma 4.1 gives

$$
X^{*} X \otimes C_{j}^{*} C_{j}+Y Y^{*} \otimes C_{j+1} C_{j+1}^{*} \preceq I
$$

from which it follows that

$$
C_{j}^{*} C_{j}+\epsilon^{2} C_{j+1} C_{j+1}^{*} \preceq I .
$$

Equivalently $L_{A}\left(\delta_{j}+\epsilon \delta_{j+1}\right) \succeq 0$, a contradiction that completes the proof of item (a).
Item (b) is proved similarly.
4.4. Summary. The following proposition records the key findings from this section.

Proposition 4.10. The sets $\mathfrak{N}$ and $\mathfrak{Z}$ partition $\{1,2, \ldots, \mathrm{~g}\}$.
If $\varphi$ is an automorphism of $\mathfrak{P}_{A}$, then there is a permutation $\pi$ of $\{1,2, \ldots, \mathrm{~g}\}$ and $a$ tuple $\theta \in \mathbb{R}^{\mathrm{g}}$, such that
(i) the sets $\mathfrak{N}, \mathfrak{Z}, \mathfrak{Z}^{+}, \mathfrak{Z}^{-}$are invariant under $\pi$;
(ii) if $j \in \mathfrak{Z}$ and $k=\pi(j)$, then there exists $\mathfrak{h}_{k} \in \mathfrak{H}^{k}$ such that

$$
\begin{equation*}
\varphi_{j}(x)=e^{i \theta_{j}} x_{\pi(j)}+\mathfrak{h}_{k}(x), \tag{4.5}
\end{equation*}
$$

and moreover, $\mathfrak{h}_{k}(T)=0$ when $T_{k-1}=0=T_{k+1}$;
(iii) if $j \in \mathfrak{N}$ and $k=\pi(j)$, then there is an automorphism $\mathfrak{g}_{j}$ of $\mathbb{D}$ such that

$$
\begin{equation*}
\varphi_{j}(x)=\mathfrak{m}_{b_{j}}\left(e^{i \theta_{j}} x_{k}\right)=\mathfrak{g}_{j}\left(x_{k}\right)=\frac{b_{j}+e^{i \theta_{j}} x_{k}}{1+b_{j}^{*} e^{i \theta_{j}} x_{k}} \tag{4.6}
\end{equation*}
$$

where $b_{j}=\varphi_{j}(0)$.

Proof. By definition, $\mathfrak{N}$ and $\mathfrak{Z}$ partition.
Part of the conclusion of Lemma 4.9 is that $\mathfrak{Z}^{+}$and $\mathfrak{Z}^{-}$are invariant under $\pi$, from which it follows that $\mathfrak{Z}$ and $\mathfrak{N}$ are also invariant.

If $j \in \mathfrak{Z}$ then, by Lemma 4.9, $\varphi_{j}(0)=0$ and thus, from Lemma 4.2 item (ii), there is a $\theta_{j} \in \mathbb{R}$ and $\mathfrak{h}_{k} \in \mathfrak{H}^{k}$ such that equation (4.5) holds.

Finally, if $j \in \mathfrak{N}$, then equation (4.6) holds by Lemma 4.2 item (i).

## 5. Normalized Automorphisms and Compositions

Recall that $\mathfrak{Z}, \mathfrak{N} \subseteq\{1,2, \ldots, \mathrm{~g}\}$ (see equation (4.3)) depend only on $\mathfrak{P}_{A}$ and are thus independent of any particular automorphism of $\mathfrak{P}_{A}$.

Suppose $\psi$ is an automorphism of $\mathfrak{P}_{A}$ with associated permutation $\kappa$. In particular the conclusions of Proposition 4.10 hold. We say that $\psi$ is a normalized automorphism if
(i) $c_{j}=\psi_{j}(0) \geq 0$; for each $j$;
(ii) for $j \in \mathfrak{Z}$ and $k=\kappa(j)$,

$$
\psi_{j}(x)=\gamma_{j} x_{k}+\mathfrak{h}_{k}(x)
$$

where $\mathfrak{h}_{k} \in \mathfrak{H}^{k}$ and $\gamma_{j} \in \mathbb{T}$;
(iii) for $j \in \mathfrak{N}$ and $k=\kappa(j)$,

$$
\psi_{j}(x)=\mathfrak{m}_{c_{j}}\left(x_{k}\right):=\frac{c_{j}+x_{k}}{1+c_{j} x_{k}} .
$$

Lemma 5.1. If $\varphi$ is an automorphism of $\mathfrak{P}_{A}$ with associated permutation $\pi$, then there is a normalized automorphism $\psi$ of $\mathfrak{P}_{A}$ with associated permutation $\pi$ such that $\psi_{j}(0)=\left|\varphi_{j}(0)\right|$ for each $j$.

Proof. Let $b_{j}=\varphi_{j}(0)$. From Proposition 4.10, there is a permutation $\pi$ and a tuple $\theta \in \mathbb{R}^{\mathrm{g}}$ such that, for $j \in \mathfrak{Z}$,

$$
\varphi_{j}(x)=e^{i \theta_{j}} x_{k}+\mathfrak{h}_{k}(x) ;
$$

and, for $j \in \mathfrak{N}$,

$$
\varphi_{j}(x)=\mathfrak{m}_{b_{j}}\left(e^{i \theta_{j}} x_{\pi(j)}\right)
$$

Let $\gamma_{j}=1$ if $b_{j}=0$ and $\gamma_{j}=\frac{b_{j}^{*}}{\left|b_{j}\right|}$ otherwise. Let $\rho: \mathfrak{P}_{A} \rightarrow \mathfrak{P}_{A}$ denote the trivial automorphism

$$
\rho(x)=\gamma \cdot x
$$

Let $\alpha_{k}=e^{-i \theta_{\pi^{-1}(k)}} \gamma_{\pi^{-1}(k)}^{*}$ and $\tau: \mathfrak{P}_{A} \rightarrow \mathfrak{P}_{A}$ denote the trivial automorphism defined by

$$
\tau(x)=\alpha \cdot x
$$

Finally, let $\psi: \mathfrak{P}_{A} \rightarrow \mathfrak{P}_{A}$ denote the automorphism $\psi=\rho \circ \varphi \circ \tau$ and note the conclusion of the lemma is satisfied with $\kappa=\pi$. Indeed, with $k=\pi(j)$, if $j \in \mathfrak{N}$, then,

$$
\begin{aligned}
& \psi_{j}(x)= \gamma_{j} \varphi_{j}(\alpha \cdot x)=\gamma_{j} \mathfrak{m}_{b_{j}}\left(e^{i \theta_{j}}(\alpha \cdot x)_{k}\right) \\
&= \gamma_{j} \mathfrak{m}_{b_{j}}\left(\gamma_{j}^{*} x_{k}\right)=\gamma_{j} \frac{b_{j}+\gamma_{j}^{*} x_{k}}{1+\left|b_{j}\right| x_{k}} \\
&=\frac{\left|b_{j}\right|+x_{k}}{1+\left|b_{j}\right| x_{k}}=\mathfrak{m}_{\left|b_{j}\right|}\left(x_{k}\right) .
\end{aligned}
$$

Hence item (iii) holds and moreover $\psi_{j}(0)=\left|b_{j}\right| \geq 0$.
If instead $j \in \mathfrak{Z}$, then, since $\psi$ is an automorphism, then item (ii) holds by item (ii) of Proposition 4.10. Further $\psi_{j}(0)=0$ and hence item (i) holds.

Lemma 5.2. Suppose $\varphi$ and $\widetilde{\varphi}$ are automorphisms of $\mathfrak{P}_{A}$ with associated permutations $\pi$ and $\widetilde{\pi}$. Let $\psi$ denote the automorphism $\widetilde{\varphi} \circ \varphi$ and let $\tau$ be its associated permutation. If $j \in \mathfrak{N}$, then $\tau(j)=\pi(\widetilde{\pi}(j))$ and moreover, with $\widetilde{\varphi}_{j}(x)=\widetilde{g}_{j}\left(x_{\widetilde{\pi}(j)}\right)$ and $\varphi_{\widetilde{\pi}(j)}(x)=\mathfrak{g}_{\widetilde{\pi}(j)}\left(x_{\pi(\widetilde{\pi}(j)}\right)$, we have $\psi_{j}(x)=\widetilde{g_{j}} \circ \mathfrak{g}_{\tilde{\pi}(j)}\left(x_{\tau(j)}\right)$.

Proof. Let $\widetilde{b}=\widetilde{\varphi}(0)$ and $b=\varphi(0)$. Given $j \in \mathfrak{N}$, it follows that $\pi(j) \in \mathfrak{N}$ and $\pi(\widetilde{\pi}(j)) \in \mathfrak{N}$ by Proposition 4.10. From item (i) of Lemma 4.2, there exists functions $g_{j}$ and $\widetilde{g}_{j}$ as well as $\mathfrak{g}_{\widetilde{\pi}(j)}$ of one variable such that $\widetilde{\varphi}_{j}(x)=\widetilde{g}_{j}\left(x_{\widetilde{\pi}(j)}\right)$ and $\psi_{j}(x)=g_{j}\left(x_{\tau(j)}\right)$ as well as $\varphi_{\widetilde{\pi}(j)}(x)=$ $\mathfrak{g}_{\tilde{\pi}(j)}\left(x_{\pi(\widetilde{\pi}(j)}\right)$. Hence

$$
g_{j}\left(x_{\tau(j)}\right)=\psi_{j}(x)=\widetilde{\varphi}_{j}(\varphi(x))=\widetilde{g}_{j}\left(\varphi_{\tilde{\pi}^{(j)}}(x)\right)=\widetilde{g}_{j}\left(\mathfrak{g}_{\widetilde{\pi}(j)}\left(x_{\pi(\widetilde{\pi}(j)}\right)\right)=\widetilde{g}_{j} \circ \mathfrak{g}_{\widetilde{\pi}(j)}\left(x_{\pi(\widetilde{\pi}(j))}\right) .
$$

It follows that $\tau(j)=\pi(\widetilde{\pi}(j))$ and $g_{j}(y)=\widetilde{g_{j}} \circ \mathfrak{g}_{\widetilde{\pi}(j)}(y)$.
Given an automorphism $\varphi$ of $\mathfrak{P}_{A}$, let

$$
\left.\mathcal{F}_{\varphi}=\left\{j: \varphi_{j}(0) \neq 0\right\}\right)
$$

and note that $\mathcal{F}_{\varphi} \subseteq \mathfrak{N}$ by Proposition 4.10.
Lemma 5.3. If $\varphi$ and $\widetilde{\varphi}$ are normalized automorphisms of $\mathfrak{P}_{A}$ with associated permutations $\pi$ and $\widetilde{\pi}$ respectively, then $\psi=\widetilde{\varphi} \circ \varphi$ is a normalized automorphism of $\mathfrak{P}_{A}$ and moreover, $\mathcal{F}_{\psi}=\mathcal{F}_{\widetilde{\varphi}} \cup \widetilde{\pi}^{-1}\left(\mathcal{F}_{\varphi}\right)$.

Proof. Let $\tau$ denote the permutation associated with $\psi$. By Lemma $5.2 \tau=\pi \circ \widetilde{\pi}$ on $\mathfrak{N}$. Let $\widetilde{b}=\widetilde{\varphi}(0)$ and $b=\varphi(0)$. By assumption $\widetilde{b}_{j}, b_{j} \geq 0$.

Suppose $j \in \mathfrak{N}$. From Proposition $4.10, \tau(j), \widetilde{\pi}(j), \pi(j) \in \mathfrak{N}$ and

$$
\psi_{j}(x)=\widetilde{\varphi}_{j}(\varphi(x))=\mathfrak{m}_{\widetilde{b_{j}}}\left(\varphi_{\widetilde{\pi}(j)}(x)\right)=\mathfrak{m}_{\widetilde{b_{j}}}\left(\mathfrak{m}_{b_{\tilde{\pi}(j)}}\left(x_{\tau(j)}\right)\right)=\mathfrak{m}_{c_{j}}\left(x_{\tau(j)}\right),
$$

where $c_{j}=\left(\widetilde{b_{j}}+b_{\widetilde{\pi}(j)}\right)\left(1+\widetilde{b_{j}} b_{\widetilde{\pi}(j)}\right)^{-1} \geq 0$. In particular, $\psi_{j}(0) \geq 0$. Moreover, $\psi_{j}(0)>0$ if and only either $\widetilde{b}_{j}>0$ or $b_{\widetilde{\pi}(j)}>0$. Hence, if $j \in \mathfrak{N}$, then $j \in \mathcal{F}_{\psi}$ if and only if either $j \in \mathcal{F}_{\widetilde{\varphi}}$ or $\widetilde{\pi}(j) \in \mathcal{F}_{\varphi}$. On the other hand, if $j \notin \mathfrak{N}$, then $\widetilde{\pi}(j) \notin \mathfrak{N}$ and therefore $j \notin \mathcal{F}_{\psi} \cup \mathcal{F}_{\widetilde{\varphi}}$ and $\tilde{\pi}(j) \notin \mathcal{F}_{\varphi}$. Hence, $\mathcal{F}_{\psi}=\mathcal{F}_{\widetilde{\varphi}} \cup \tilde{\pi}^{-1}\left(\mathcal{F}_{\varphi}\right)$.

Given a self map $f$ of a set $X$ and a positive integer $n$, let $f^{(n)}$ denote the composition of $f$ with itself $n$-times.

Lemma 5.4. If $\varphi$ is a normalized automorphism of $\mathfrak{P}_{A}$, then there is a positive integer $n$ such that $\psi=\varphi^{(n)}$ is a normalized automorphism of $\mathfrak{P}_{A}$ such that, for each positive integer $m$,
(a) the permutation associated to $\psi^{(m)}$ is the identity on $\mathfrak{N}$;
(b) $\mathcal{F}_{\varphi} \subseteq \mathcal{F}_{\psi}=\mathcal{F}_{\psi^{(m)}}$; and
(c) both $\mathcal{F}_{\psi}$ and $\widetilde{\mathcal{F}}_{\psi}$ are invariant for the permutations associated to $\psi^{(m)}$.

Proof. By Lemma 5.3, for each positive integer $p$ we have $\varphi^{(p)}$ is a normalized automorphism of $\mathfrak{P}_{A}$ and

$$
\mathcal{F}_{\varphi} \subseteq \mathcal{F}_{\varphi^{(2)}} \subseteq \mathcal{F}_{\varphi^{(3)}} \subseteq \cdots
$$

Hence, there is $N$ such that $\mathcal{F}_{\varphi^{(p)}}=\mathcal{F}_{\varphi^{(N)}}$ for all $p \geq N$.
Let $\sigma$ denote the permutation associated to $\varphi^{(N)}$. By Proposition 4.10, $\mathfrak{N}$ is invariant under $\sigma$. Let $\rho=\left.\sigma\right|_{\mathfrak{N}}: \mathfrak{N} \rightarrow \mathfrak{N}$. There is an $\ell \geq 1$ such that $\rho^{(\ell)}$ is the identity. Let $n=N \ell$ and let $\psi=\varphi^{(N \ell)}$. Let $\pi$ denote the permutation associated to $\psi$. By Lemma 5.2, $\pi=\sigma^{(\ell)}$ and in particular $\pi$ is the identity on $\mathfrak{N}$. Similar reasoning shows $\pi^{(m)}$ is the permutation associated with $\psi^{(m)}$ and that $\pi^{(m)}$ is the identity on $\mathfrak{N}$ proving item a. Item (b) follows Lemma 5.2.

To prove item (c) note that, since $\pi$ is the identity on $\mathfrak{N}$ and $\mathcal{F}_{\psi} \subseteq \mathfrak{N}$, it follows that $\pi$ is the identity on $\mathcal{F}_{\psi}$ and thus both $\mathcal{F}_{\psi}$ and (therefore) its complement are invariant for $\pi$.

## 6. The Case of the Identity Permutation

In this section, we fix an automorphism $\psi$ of $\mathfrak{P}_{A}$ with associated permutation $\pi$ satisfying the conclusion of Proposition 5.4 and assume $\mathcal{F}_{\psi} \neq \varnothing$. (In particular, $\mathfrak{N} \neq \varnothing$ by Proposition 4.10.) Thus $\psi$ is a normalized automorphism, $\pi$ is the identity on $\mathfrak{N}$ and $\mathcal{F}_{\psi^{(m)}}=\mathcal{F}_{\psi} \neq \varnothing$ for all positive integers $m$. For notational convenience, let $\mathcal{F}=\mathcal{F}_{\psi}$. The permutation $\pi$ is the identity on $\mathcal{F}$ and both $\mathcal{F}$ and $\widetilde{\mathcal{F}}$ are invariant for $\pi$. Let $b=\psi(0)$. Thus $b_{j}=\psi_{j}(0) \geq 0$ for all $j$ and $b_{j}>0$ if and only if $j \in \mathcal{F}$.
6.1. Two auxiliary Reinhardt spectrahedra. Let

$$
M_{n}(\mathbb{C})^{\mathcal{F}}=\left\{X=\left(X_{j}\right)_{j \in \mathcal{F}}: X_{j} \in M_{n}(\mathbb{C})\right\}
$$

Similarly, let

$$
M_{n}(\mathbb{C})^{\tilde{\mathcal{F}}}=\left\{Y=\left(Y_{j}\right)_{j \in \widetilde{\mathcal{F}}}: Y_{j} \in M_{n}(\mathbb{C})\right\}
$$

Given $X \in M_{n}(\mathbb{C})^{\mathcal{F}}$ and $Y \in M_{n}(\mathbb{C})^{\widetilde{\mathcal{F}}}$, let $T=(X, Y) \in M_{n}(\mathbb{C})^{g}$ denote the tuple with $T_{j}=X_{j}$ for $j \in \mathcal{F}$ and $T_{j}=Y_{j}$ for $j \in \widetilde{\mathcal{F}}$.

Let $\hat{b}=\left(b_{j} I_{n}\right)_{j \in \mathcal{F}} \in M_{n}(\mathbb{C})^{\mathcal{F}}$. (Thus the $n$ is understood from context.) Similarly, let $\hat{0}=\left(0 I_{n}\right)_{j \in \mathcal{F}}$. With these notations, let

$$
\begin{aligned}
\mathfrak{P}_{A}^{\mathcal{F}} & =\left\{Y \in M(\mathbb{C})^{\tilde{\mathcal{F}}}:(\hat{0}, Y) \in \mathfrak{P}_{A}\right\} \\
\mathfrak{E}_{A}^{\mathcal{F}} & =\left\{Y \in M(\mathbb{C})^{\widetilde{\mathcal{F}}}:(\hat{b}, Y) \in \mathfrak{P}_{A}\right\} .
\end{aligned}
$$

Since $\mathfrak{P}_{A}$ is Reinhardt, it immediately follows that $\mathfrak{E}_{A}^{\mathcal{F}}$ is a subset of $\mathfrak{P}_{A}^{\mathcal{F}}$.
Lemma 6.1. Both $\mathfrak{P}_{A}^{\mathcal{F}}$ and $\mathfrak{E}_{A}^{\mathcal{F}}$ are Reinhardt free spectrahedra in $\mathrm{g}-|\mathcal{F}|$ variables.
Proof. That both domains are Reinhardt is immediate. It is also evident that $(\hat{0}, Y) \in \mathfrak{P}_{A}$ if and only if

$$
I+\sum_{j \in \widetilde{\mathcal{F}}} A_{j} \otimes Y_{j}+\sum_{j \in \widetilde{\mathcal{F}}} A_{j}^{*} \otimes Y_{j}^{*} \succ 0
$$

and hence $\mathfrak{P}_{A}^{\mathcal{F}}$ is a free spectrahedron.
Let

$$
P=I+\sum_{j \in \mathcal{F}} A_{j} b_{j}+\sum_{j \in \mathcal{F}} A_{j}^{*} b_{j}^{*},
$$

and note $Y \in \mathfrak{E}_{A}^{\mathcal{F}}$ if and only if $(\hat{b}, Y) \in \mathfrak{P}_{A}$ if and only if

$$
P \otimes I+\sum_{j \notin \mathcal{F}} A_{j} \otimes Y_{j}+\sum_{j \notin \mathcal{F}} A_{j}^{*} \otimes Y_{j}^{*} \succ 0 .
$$

For $j \in \widetilde{\mathcal{F}}$, let $B_{j}=P^{-\frac{1}{2}} A_{j} P^{-\frac{1}{2}}$ and observe $Y \in \mathfrak{E}_{A}^{\mathcal{F}}$ if and only if

$$
I+\sum_{j \notin \mathcal{F}} B_{j} \otimes Y_{j}+\sum_{j \notin \mathcal{F}} B_{j}^{*} \otimes Y_{j}^{*} \succ 0 .
$$

Hence $\mathfrak{E}_{A}^{\mathcal{F}}$ is a free spectrahedron too.
6.2. Two auxiliary automorphisms. Given $Y \in \mathfrak{P}_{A}^{\mathcal{F}}$, let $T=(\hat{0}, Y) \in \mathfrak{P}_{A}$ and define

$$
\psi^{\mathcal{F}}(Y)=\left(\psi_{j}(T)\right)_{j \in \tilde{\mathcal{F}}}
$$

If $j \in \mathcal{F}$, then, since $\pi$ is the identity on $\mathcal{F}$; the automorphism $\psi$ is normalized; and $j \in \mathfrak{N}$,

$$
\psi_{j}(T)=\mathfrak{m}_{b_{j}}\left(T_{\pi(j)}\right)=\mathfrak{m}_{b_{j}}\left(T_{j}\right)=\mathfrak{m}_{b_{j}}(0)=b_{j} .
$$

Thus

$$
\psi(T)=\psi((\hat{0}, Y))=\left(\hat{b}, \psi^{\mathcal{F}}(Y)\right) \in \mathfrak{P}_{A} .
$$

It follows that $\psi^{\mathcal{F}}(Y) \in \mathfrak{E}_{A}^{\mathcal{F}}$ and thus $\psi^{\mathcal{F}}$ determines a free mapping $\psi^{\mathcal{F}}: \mathfrak{P}_{A}^{\mathcal{F}} \rightarrow \mathfrak{E}_{A}^{\mathcal{F}}$.
Lemma 6.2. The mapping $\psi^{\mathcal{F}}: \mathfrak{P}_{A}^{\mathcal{F}} \rightarrow \mathfrak{E}_{A}^{\mathcal{F}}$ is bianalytic.
Proof. Evidently $\psi^{\mathcal{F}}$ is analytic and one-one. It remains to show it is onto. To this end, let $Z \in \mathfrak{E}_{A}^{\mathcal{F}}$ be given. Thus $(\hat{b}, Z) \in \mathfrak{P}_{A}$. Since $\psi$ is onto, there is a $T \in \mathfrak{P}_{A}$ such that $\psi(T)=(\hat{b}, Z)$. For $j \in \mathcal{F} \subseteq \mathfrak{N}$,

$$
b_{j} I=\psi_{j}(T)=\mathfrak{m}_{b_{j}}\left(T_{j}\right)=\left(b_{j}+T_{j}\right)\left(I+b_{j} T_{j}\right)^{-1}
$$

and hence $T_{j}=0$. Thus, setting $Y_{j}=T_{j}$ for $j \in \widetilde{\mathcal{F}}$, it follows that $T=(\hat{0}, Y)$, so that $Y \in \mathfrak{P}_{A}^{\mathcal{F}}$, and $\psi((\hat{0}, Y))=(\hat{b}, Z)$. Hence $Y \in \mathfrak{P}_{A}^{\mathcal{F}}$ and $\psi^{\mathcal{F}}(Y)=Z$.

Lemma 6.3. For each $j \notin \mathcal{F}$ there exists $\gamma_{j} \in \mathbb{T}$ such that,

$$
\psi_{j}(\hat{0}, Y)=\gamma_{j} Y_{\pi(j)},
$$

for all $Y \in \mathfrak{P}_{A}^{\mathcal{F}}$. In particular, for each $Y \in \mathfrak{P}_{A}^{\mathcal{F}}$ and $j \notin \mathcal{F}$,

$$
\psi_{j}^{\mathcal{F}}(Y)=\gamma_{j} Y_{\pi(j)} .
$$

Proof. The mapping $\psi^{\mathcal{F}}: \mathfrak{P}_{A}^{\mathcal{F}} \rightarrow \mathfrak{E}_{A}^{\mathcal{F}}$ is bianalytic by Lemma 6.2. Moreover, $\psi^{\mathcal{F}}(0)=0$ since $b_{k}=0$ for $k \in \widetilde{\mathcal{F}}$. Since, both $\mathfrak{P}_{A}^{\mathcal{F}}$ and $\mathfrak{E}_{A}^{\mathcal{F}}$ are circular free spectrahedra (Lemma 6.1) and since $\psi^{\mathcal{F}}(0)=0$, it follows from [HKM11, Theorem 4.4] that $\psi^{\mathcal{F}}$ is linear.

Now suppose $j \in \mathfrak{Z}$. Since $\psi$ is normalized, there exists $\gamma_{j} \in \mathbb{T}$ and $\mathfrak{h}_{\pi(j)} \in \mathfrak{H}^{\pi(j)}$ such that

$$
\psi_{j}(x)=\gamma_{j} x_{\pi(j)}+\mathfrak{h}_{\pi(j)}(x) .
$$

Thus, for $Y \in \mathfrak{P}_{A}^{\mathcal{F}}$,

$$
\psi_{j}^{F}(Y)=\psi_{j}(\hat{0}, Y)=\gamma_{j} Y_{\pi(j)}+\mathfrak{h}_{\pi(j)}(\hat{0}, Y)
$$

By linearity, it follows that $\mathfrak{h}_{\pi(j)}(\hat{0}, Y)=0$ for $Y \in \mathfrak{P}_{A}^{\mathcal{F}}$ and hence $\psi_{j}^{\mathcal{F}}(Y)=\gamma_{j} Y_{\pi(j)}$.
If $j \in \mathfrak{N} \cap \tilde{\mathcal{F}}$ and $Y \in \mathfrak{P}_{A}^{\mathcal{F}}$, then $\psi_{j}^{\mathcal{F}}(Y)=\mathfrak{m}_{b_{j}}\left(Y_{j}\right)=\mathfrak{m}_{0}\left(Y_{j}\right)=Y_{j}$, since $\pi$ is the identity on $\mathfrak{N}$.

Let $\iota$ denote the inclusion of $\mathfrak{E}^{\mathcal{F}}$ into $\mathfrak{P}_{A}^{\mathcal{F}}$ and $\phi^{\mathcal{F}}=\iota \circ \psi^{\mathcal{F}}: \mathfrak{P}_{A}^{\mathcal{F}} \rightarrow \mathfrak{P}_{A}^{\mathcal{F}}$.

Lemma 6.4. The mapping $\phi^{\mathcal{F}}: \mathfrak{P}_{A}^{\mathcal{F}} \rightarrow \mathfrak{P}_{A}^{\mathcal{F}}$ is bianalytic, and, for $j \notin \mathcal{F}$, there exists $\gamma_{j} \in \mathbb{T}$ such that

$$
\phi_{j}^{\mathcal{F}}(T)=\gamma_{j} T_{\pi(j)}
$$

Proof. For notational ease, let $\phi=\phi^{\mathcal{F}}$. Since both $\iota$ and $\psi^{\mathcal{F}}$ are free analytic and injective, so is $\phi$. It remains to prove $\phi$ is onto.

For each $j \notin \mathcal{F}$, there exist $\gamma_{j} \in \mathbb{T}$ such that, if $Y \in \mathfrak{P}_{A}^{\mathcal{F}}$, then

$$
\phi_{j}(Y)=\psi_{j}^{\mathcal{F}}(Y)=\gamma_{j} Y_{\pi(j)}
$$

by Lemma 6.3. Since, by Lemma 5.4, $\widetilde{\mathcal{F}}$ is invariant for $\pi$, there is a positive integer $n$ such that $\pi^{(n)}$ is the identity on $\widetilde{\mathcal{F}}(\pi$ was already the identity on $\mathcal{N} \supseteq \mathcal{F})$. Thus, for $j \notin \mathcal{F}$, there exists $\delta_{j} \in \mathbb{T}$ such that

$$
\phi_{j}^{(n)}(Y)=\delta_{j} Y_{j} .
$$

Since the mapping $Y \mapsto \delta \cdot Y$, where $(\delta \cdot Y)_{j}=\delta_{j} Y_{j}$, is an automorphism of $\mathfrak{P}_{A}$ (Lemma 6.1) it follows that $\phi^{(n)}$ is onto and thus so is $\phi$.
6.3. How to spot a polydisc. Recall the notation $(X, Y) \in \mathfrak{P}_{A}$ from the first paragraph of subsection 6.1. Given $Y \in M_{n}(\mathbb{C})^{\mathcal{F}}$ and $\lambda \in \mathbb{C}$, let $Y^{\lambda}=\left(\mathfrak{I}^{\lambda}, Y\right) \in M_{n}(\mathbb{C})^{\mathrm{g}}$, where $\mathfrak{I}_{j}^{\lambda}=\lambda I_{n}$ for $j \in \mathcal{F}$.

Lemma 6.5. If $Y^{\lambda} \in \mathfrak{P}_{A}^{\mathcal{F}}$ for each $0 \leq \lambda<1$ and $Y \in \mathfrak{P}_{A}^{\mathcal{F}}$, then $\mathfrak{P}_{A}$ contains a polydisc as a distinguished summand.

Proof. Let $T=(X, Y)$ such that $(\hat{0}, Y) \in \mathfrak{P}_{A}$ and $\left\|X_{j}\right\| \leq 1$ for $j \in \mathcal{F}$ be given. Thus $Y \in \mathfrak{P}_{A}^{\mathcal{F}}$. Given $0 \leq \lambda<1$, by assumption $Y^{\lambda} \in \mathfrak{P}_{A}$. An application of Lemma 4.6 implies $(\lambda X, Y) \in \mathfrak{P}_{A}$.

## 7. Proof of Theorem 1.1

It remains to prove items (i) and (iii) of Theorem 1.1, since item (ii) was already established as Proposition 3.2.

### 7.1. Proof of item (i).

Proposition 7.1. If $\mathfrak{P}_{A}$ does not contain a polydisc as a distinguished summand and if $\varphi$ is an automorphism of $\mathfrak{P}_{A}$, then $\varphi(0)=0$.

Proof. Arguing the contrapositive, suppose there is an automorphism of $\varphi$ with $\varphi(0) \neq 0$. By Lemma 5.1, we may assume $\varphi$ is normalized. By Lemma 5.4, there is an automorphism $\psi$ satisfying the conclusion of Lemma 4.10 and such that $\varnothing \neq \mathcal{F}_{\varphi} \subseteq \mathcal{F}_{\psi}$. In particular, for
each positive integer $m$, the automorphism $\psi^{(m)}$ is normalized; its associated permutation is the identity on $\mathfrak{N}$; and $\varnothing \neq \mathcal{F}_{\varphi} \subseteq \mathcal{F}_{\psi}=\mathcal{F}_{\psi^{(m)}}$.

For notational ease, let $\mathcal{F}=\mathcal{F}_{\psi}$. Fix $j \in \mathcal{F}$. Since $\psi$ is normalized; $j \in \mathfrak{N}$; and the permutation associated to $\psi$ is the identity on $\mathfrak{N}$,

$$
\psi_{j}(x)=\mathfrak{m}_{b_{j}}\left(x_{j}\right)=\frac{b_{j}+x_{j}}{1+b_{j} x_{j}}
$$

with $b_{j}>0$. Now suppose $m$ is a positive integer and $\psi_{j}^{(m)}(0)=\mathfrak{m}_{b_{j}}^{(m)}(0)$. Since the permutation associated to both $\psi^{(m)}$ and $\psi$ is the identity on $\mathfrak{N}$, an application of Lemma 5.2 gives

$$
\psi_{j}^{(m+1)}(0)=\psi_{j}\left(\psi^{(m)}(0)\right)=\mathfrak{m}_{b_{j}}\left(\varphi_{j}^{(m)}(0)\right)=\mathfrak{m}_{b_{j}}\left(\mathfrak{m}_{b_{j}}^{(m)}(0)\right) .
$$

Thus, by induction, $\varphi_{j}^{(m)}(0)=\mathfrak{m}_{b_{j}}^{(m)}(0)$ for all $m$.
It is easily seen that the sequence $\left(\mathfrak{m}_{b_{j}}^{(m)}(0)\right)_{m}$ converges to 1 . (It is an increasing sequence from $(0,1)$ that cannot converge to an $L<1$.) Hence, given $0<\lambda<1$, there is an $m$ such that

$$
\psi_{j}^{(m)}(0) \geq \lambda
$$

for each $j \in \mathcal{F}$. Let $\rho=\psi^{(m)}$. In particular, $\rho$ is a normalized automorphism, the permutation $\kappa$ associated to $\rho$ is the identity on $\mathfrak{N} \supseteq \mathcal{F}$ and $\mathcal{F}_{\rho}=\mathcal{F} \neq \varnothing$.

By Lemma 6.4, given $Y \in \mathfrak{P}_{A}^{\mathcal{F}}$, there exists a $Z \in \mathfrak{P}_{A}^{\mathcal{F}}$ such that $\rho^{\mathcal{F}}(Z)=Y$. It follows that

$$
\rho(\hat{0}, Z)=\left(\hat{c}, \rho^{\mathcal{F}}(Z)\right)=(\hat{c}, Y),
$$

where $c_{j}=\rho_{j}(0) \geq \lambda$ for $j \in \mathcal{F}$. In particular, $\left(\mathfrak{I}^{\lambda}, Y\right) \in \mathfrak{P}_{A}$, where $\mathfrak{I}^{\lambda}$ is defined at the outset of Subsection 6.3. Thus, by Lemma 6.5, $\mathfrak{P}_{A}$ contains a polydisc as a distinguished summand.
7.2. Proof of item (iii). Item (iii) of Theorem 1.1 follows from Proposition 7.2 below.

Proposition 7.2. If there exists non-identity permutation $\rho$ of $\{1,2, \ldots, \mathrm{~g}\}$ such that the mapping $\psi_{j}(x)=x_{\rho(j)}$ is an automorphism of $\mathfrak{P}_{A}$, then $\mathfrak{P}_{A}$ is a coordinate direct sum.

Before proving Proposition 7.2, we present two lemmas. Let $\left\{\mathrm{e}_{1}, \mathrm{e}_{2}\right\}$ denote the standard basis for $\mathbb{C}^{2}$. Thus $\mathrm{e}_{j} \mathrm{e}_{k}^{*}$ are the usual matrix units for $M_{2}(\mathbb{C})$.

Lemma 7.3. Fix $1 \leq \mu \leq \mathrm{g}-1$ and let $X \in M_{n}(\mathbb{C})^{\mathrm{g}}$ be given. If $\left(X_{1}, \ldots, X_{\mu}, 0, \ldots, 0\right)$, and $\left(0, \ldots, 0, X_{\mu+1}, \ldots, X_{\mathrm{g}}\right)$ are both in $\mathfrak{P}_{A}$ and if $\ell_{j} \in\{1,2\}$ for $j>\mu+1$, then the tuple $Z$ defined by
(a) $Z_{j}=\mathrm{e}_{1} \mathrm{e}_{1}^{*} \otimes X_{j}$ for $1 \leq j<\mu$;
(b) $Z_{\mu}=\mathrm{e}_{1} \mathrm{e}_{2}^{*} \otimes X_{\mu}$;
(c) $Z_{\mu+1}=\mathrm{e}_{1} \mathrm{e}_{1}^{*} \otimes X_{\mu+1}$;
(d) $Z_{j}=\mathrm{e}_{\ell_{j}} \mathrm{e}_{\ell_{j}}^{*} \otimes X_{j}$ for $j>\mu+1$,
is in $\mathfrak{P}_{A}$.
Proof. Let
(a) $Y_{\mu}=\mathrm{e}_{1} \mathrm{e}_{1}^{*} \otimes X_{\mu}$;
(b) $Y_{\mu+1}=\mathrm{e}_{2} \mathrm{e}_{2}^{*} \otimes X_{\mu+1}$; and
(c) $Y_{j}=I_{2} \otimes X_{j}$ for $\mu+1 \neq j \neq \mu$.

By hypothesis, the matrices

$$
L_{s, t}\left(\begin{array}{ccccccc}
I & C_{s} \otimes X_{s} & 0 & 0 & \ldots & 0 & 0 \\
C_{s}^{*} \otimes T_{1}^{*} & I & C_{s+1} \otimes X_{s+1} & 0 & \ldots & 0 & 0 \\
0 & C_{s+1}^{*} \otimes X_{s+1}^{*} & I & C_{s+2} \otimes X_{s+2} & \ldots & 0 & 0 \\
0 & 0 & C_{s+2}^{*} \otimes X_{s+2}^{*} & I & \ldots & 0 & 0 \\
\vdots & \vdots & \vdots & \vdots & \ldots & \vdots & \\
0 & 0 & 0 & 0 & \ldots & I & C_{t} \otimes T_{t} \\
0 & 0 & 0 & 0 & \ldots & C_{t}^{*} \otimes T_{t}^{*} & I
\end{array}\right)
$$

are positive semidefinite for $(s, t) \in\left\{(1, \mu),(\mu+1, \mathrm{~g}),(\mu+2, \mathrm{~g})\right.$. Since $L_{A}(Y)$ is a direct sum of these matrices with an identity matrix (of an appropriate size), $L_{A}(Y) \succeq 0$. Equivalently, $Y \in \mathfrak{P}_{A}$.

Let

$$
W_{j}=\left(\begin{array}{ll}
0 & I \\
I & 0
\end{array}\right)
$$

for $j \geq \mu$ and $W_{j}=I$ for $0 \leq j<\mu$ and observe that, in the notation of equation (4.2),
(i) $(W \circ Y)_{\mu}=\mathrm{e}_{1} \mathrm{e}_{2}^{*} \otimes X_{\mu}$;
(ii) $(W \circ Y)_{\mu+1}=\mathrm{e}_{1} \mathrm{e}_{1}^{*} \otimes X_{\mu+1}$; and
(iii) $(W \circ Y)_{j}=I_{2} \otimes Y_{j}$ otherwise.

By Lemma 4.3, $W \circ Y \in \mathfrak{P}_{A}$, from which it readily follows that $Z \in \mathfrak{P}_{A}$.
Lemma 7.4. Fix $2 \leq \nu \leq \mathrm{g}$. Given a tuple $T \in M(\mathbb{C})^{\mathrm{g}}$, if the tuple $Z_{j}$ defined by
(i) $Z_{j}=\mathrm{e}_{1} \mathrm{e}_{1}^{*} \otimes T_{j}$ for $j<\nu$;
(ii) $Z_{\nu}=\mathrm{e}_{1} \mathrm{e}_{2}^{*} \otimes T_{\nu}$ for $j=\nu$; and
(iii) $Z_{j}=\mathrm{e}_{2} \mathrm{e}_{2}^{*} \otimes T_{j}$ for $j>\nu$
is in $\mathfrak{P}_{A}$, then $T \in \mathfrak{P}_{A}$.
Proof. The proof of this lemma is similar to that of Lemma 7.3 and is omitted.
Proof of Proposition 7.2. Let $\mu$ denote the first index $\mu$ such that $\rho^{-1}(\mu+1)<\rho^{-1}(\mu)$. Such an index must exist since $\rho$ is not the identity permutation. Hence $\rho^{-1}(\mu)>\rho^{-1}(\mu-1)>$ $\cdots>\rho^{-1}(1)$; in particular $\rho^{-1}(j)<\rho^{-1}(\mu)$ for $j<\mu$.

Let $X \in M_{n}(\mathbb{C})^{\mathrm{g}}$ be given and suppose $\left(X_{1}, \ldots, X_{\mu}, 0, \ldots, 0\right)$, and $\left(0, \ldots, 0, X_{\mu+1}, \ldots, X_{\mathrm{g}}\right)$ are both in $\mathfrak{P}_{A}$. Define a tuple $Z$ as follows:

$$
Z_{j}= \begin{cases}\mathrm{e}_{1} \mathrm{e}_{2}^{*} \otimes X_{\mu} & \text { for } j=\mu \\ \mathrm{e}_{1} \mathrm{e}_{1}^{*} \otimes X_{j} & \text { for } \rho^{-1}(j)<\rho^{-1}(\mu) \\ \mathrm{e}_{2} \mathrm{e}_{2}^{*} \otimes X_{j} & \text { for } \rho^{-1}(j)>\rho^{-1}(\mu)\end{cases}
$$

Let $\nu=\rho^{-1}(\mu)$. Since $\rho^{-1}(j)<\nu$ for $j<\mu$ and $j=\mu+1$, Lemma 7.3 implies $Z \in \mathfrak{P}_{A}$. Thus $S=\psi(Z) \in \mathfrak{P}_{A}$ and $S_{k}=Z_{\rho(k)}$. If $k<\nu$ and $k=\rho^{-1}(j)$, then $S_{k}=Z_{j}=\mathrm{e}_{1} \mathrm{e}_{1}^{*} \otimes X_{j}$. If $k>\nu$ and $k=\rho^{-1}(j)$, then $S_{k}=Z_{j}=\mathrm{e}_{2} \mathrm{e}_{2}^{*} \otimes X_{j}$. Finally, if $k=\nu$, then $S_{k}=Z_{\rho(k)}=Z_{\mu}=$ $\mathrm{e}_{1} \mathrm{e}_{2}^{*} \otimes X_{\mu}$. An application of Lemma 7.4 implies the tuple $T$ with $T_{k}=X_{\rho(k)}$ is in $\mathfrak{P}_{A}$; that is $\psi(X) \in \mathfrak{P}_{A}$. Hence $\psi^{-1}(\psi(X))=X \in \mathfrak{P}_{A}$. Thus $\mathfrak{P}_{A}$ is a coordinate direct sum.
