#### Abstract

Let $\mathfrak{A}$ and $\mathfrak{A}^{\prime}$ be two $C^{*}$-algebras with identities $I_{\mathfrak{A}}$ and $I_{\mathfrak{A}}$, respectively, and $P_{1}$ and $P_{2}=I_{\mathfrak{A}}-P_{1}$ nontrivial symmetric projections in $\mathfrak{A}$. In this paper we study the characterization of multiplicative *-Lie-type maps. In particular, if $\mathcal{M}$ is a factor von Neumann algebra then every complex scalar multiplication bijective unital multiplicative *-Lie-type map is $*$-isomorphism.

AMS 2010 Subject Classification: 47B48, 46L05.
Keywords: $C^{*}$-algebra, factor von Neumann algebras, multiplicative $*$-Lietype maps, $*$-isomorphism

## 1 Introduction and Preliminaries

The study of additivity of maps strongly attracts attention of mathematicians, so that the first quite surprising result is due to Martindale who imposed conditions on a ring such that multiplicative bijective maps are all additive [17]. Thenceforth, diverse works have been published considering different types of associative and non-associative algebras. Among them we can mention [9, 11, 12, 8, 13, 10, 14, 3]. In order to further develop the study of additivity of maps, the researches incorporated two new product into the theory, presented by Brešar and Fošner in [2, 15], where the definition is as follows: for $X, Y \in \Re$, where $\mathfrak{R}$ is a $*-$ ring, we denote by $X \bullet Y=X Y+Y X^{*}$ and $[X, Y]_{*}=X Y-Y X^{*}$ the $*$-Jordan product and the $*$-Lie product, respectively. In 4], the authors proved that a map $\Phi$ between two factor von Newmann algebras is a *-ring isomorphism if and only if $\Phi\left([X, Y]_{*}\right)=[\Phi(X), \Phi(Y)]_{*}$. In [7, Ferreira and Costa extended these new products and defined two other types of applications, named multiplicative *-Lie n-map and multiplicative *-Jordan n-map and proved that, under certain conditions, an application between $C^{*}$-algebras that is multiplicative *-Lie n-map and multiplicative $*$-Jordan n-map is a $*$-ring isomorphism. In the second paper of this series [6], Ferreira and Costa prove when a multiplicative $*$-Jordan n-map is a $*$-ring isomorphism. As a consequence of their main result, they provide an application on von Neumann algebras, factor von Neumann algebras and prime algebras. Furthermore, they generalize the Main Theorem in [5]. With this picture in mind, in this article we will discuss when a multiplicative $*$-Lie n-map is a $*$-isomorphism and, just as it was done in [6], we provide an application on von Neumann algebras, factor von Neumann algebras and prime algebras.

Let us define the following sequence of polynomials, as presented in [7]:

$$
p_{1_{*}}(x)=x \text { and } p_{n_{*}}\left(x_{1}, x_{2}, \ldots, x_{n}\right)=\left[p_{(n-1)_{*}}\left(x_{1}, x_{2}, \ldots, x_{n-1}\right), x_{n}\right]_{*},
$$

for all integers $n \geq 2$. Thus, $p_{2_{*}}\left(x_{1}, x_{2}\right)=\left[x_{1}, x_{2}\right]_{*}, p_{3_{*}}\left(x_{1}, x_{2}, x_{3}\right)=$ $\left[\left[x_{1}, x_{2}\right]_{*}, x_{3}\right]_{*}$, etc. Note that $p_{2_{*}}$ is the product introduced by Brešar and Fošner [2, 15]. Then, using the nomenclature introduced in [7] we have a new class of maps (not necessarily additive): given two rings $\mathfrak{R}$ and $\mathfrak{R}^{\prime}$, $\varphi: \mathfrak{R} \longrightarrow \mathfrak{R}^{\prime}$ is a multiplicative $*$-Lie $n$-map if

$$
\varphi\left(p_{n_{*}}\left(x_{1}, x_{2}, \ldots, x_{i}, \ldots, x_{n}\right)\right)=p_{n_{*}}\left(\varphi\left(x_{1}\right), \varphi\left(x_{2}\right), \ldots, \varphi\left(x_{i}\right), \ldots, \varphi\left(x_{n}\right)\right),
$$

where $n \geq 2$ is an integer. Multiplicative $*$-Lie 2-map, $*$-Lie 3-map and *-Lie $n$-map are collectively referred to as multiplicative $*$-Lie-type maps.

By a $C^{*}$-algebra we mean a complete normed complex algebra (say $\mathfrak{A}$ ) endowed with a conjugate-linear algebra involution $*$, satisfying $\left\|a^{*} a\right\|=$ $\|a\|^{2}$ for all $a \in \mathfrak{A}$. Moreover, a $C^{*}$-algebra is a prime $C^{*}$-algebra if $A \mathfrak{A} B=$ 0 for $A, B \in \mathfrak{A}$ implies either $A=0$ or $B=0$.

We find it convenient to invoke the noted Gelfand-Naimark theorem that state a $C^{*}$-algebra $\mathfrak{A}$ is $*$-isomorphic to a $C^{*}$-subalgebra $\mathfrak{D} \subset \mathcal{B}(\mathcal{H})$, where $\mathcal{H}$ is a Hilbert space. So from now on we shall consider elements of a $C^{*}$-algebra as operators.

Let be $P_{1}$ a nontrivial projection in $\mathfrak{A}$ and $P_{2}=I_{\mathfrak{A}}-P_{1}$ where $I_{\mathfrak{A}}$ is the identity of $\mathfrak{A}$. Then $\mathfrak{A}$ has a decomposition $\mathfrak{A}=\mathfrak{A}_{11} \oplus \mathfrak{A}_{12} \oplus \mathfrak{A}_{21} \oplus \mathfrak{A}_{22}$, where $\mathfrak{A}_{i j}=P_{i} \mathfrak{A} P_{j}(i, j=1,2)$.

## 2 Main theorem

In the following we shall prove a part of the main result of this paper.
Theorem 2.1. Let $\mathfrak{A}$ and $\mathfrak{A}^{\prime}$ be two $C^{*}$-algebras with identities $I_{\mathfrak{A}}$ and $I_{\mathfrak{A} \mathfrak{A}^{\prime}}$, respectively, and $P_{1}$ and $P_{2}=I_{\mathfrak{A}}-P_{1}$ nontrivial symmetric projections in $\mathfrak{A}$. Suppose that $\mathfrak{A}$ satisfies

$$
\text { (内) } \quad P_{j} \mathfrak{A} X=\{0\} \quad \text { implies } \quad X=0 \text {. }
$$

Even more, suppose that $\varphi: \mathfrak{A} \rightarrow \mathfrak{A}^{\prime}$ is a bijective unital map which satisfies

$$
(\bullet) \varphi\left(p_{n_{*}}(A, B, \Xi, \ldots, \Xi)\right)=p_{n_{*}}(\varphi(A), \varphi(B), \varphi(\Xi), \ldots, \varphi(\Xi)) \text {, }
$$

for all $A, B \in \mathfrak{A}$ and $\Xi \in\left\{P_{1}, P_{2}, I_{\mathfrak{A}}\right\}$. Then $\varphi$ is $*$-additive.
The following claims and lemmas have the same hypotheses as the Theorem 2.1 and we need them to prove the $*$-additivity of $\varphi$.

Claim 2.1. $*\left(\mathfrak{A}_{j k}\right) \subset \mathfrak{A}_{k j}$, for $j, k \in\{1,2\}$.
Proof. It follows from the symmetry of $P_{1}$ and $P_{2}$.
The next result can be found in [6] but for brevity we put the proof here

Claim 2.2. Let $X, Y$ and $H$ be in $\mathfrak{A}$ such that $\varphi(H)=\varphi(X)+\varphi(Y)$. Then, given $Z \in \mathfrak{A}$,

$$
\varphi\left(p_{n_{*}}(H, Z, \Xi, \ldots, \Xi)\right)=\varphi\left(p_{n_{*}}(X, Z, \Xi, \ldots, \Xi)\right)+\varphi\left(p_{n_{*}}(Y, Z, \Xi, \ldots, \Xi)\right)
$$

and

$$
\varphi\left(p_{n_{*}}(Z, H, \Xi, \ldots, \Xi)\right)=\varphi\left(p_{n_{*}}(Z, X, \Xi, \ldots, \Xi)\right)+\varphi\left(p_{n_{*}}(Z, Y, \Xi, \ldots \Xi)\right)
$$

for $\Xi \in\left\{P_{1}, P_{2}, I_{\mathfrak{A}}\right\}$.
Proof. Using the definition of $\varphi$ and multilinearity of $p_{n_{*}}$ we obtain

$$
\begin{aligned}
\varphi\left(p_{n_{*}}(H, Z, \Xi, \ldots, \Xi)\right) & =p_{n_{*}}(\varphi(H), \varphi(Z), \varphi(\Xi), \ldots, \varphi(\Xi)) \\
& =p_{n_{*}}(\varphi(X)+\varphi(Y), \varphi(Z), \varphi(\Xi), \ldots, \varphi(\Xi)) \\
& =p_{n_{*}}(\varphi(X), \varphi(Z), \varphi(\Xi), \ldots, \varphi(\Xi)) \\
& +p_{n_{*}}(\varphi(Y), \varphi(Z), \varphi(\Xi), \ldots, \varphi(\Xi)) \\
& =\varphi\left(p_{n_{*}}(X, Z, \Xi, \ldots, \Xi)\right) \\
& +\varphi\left(p_{n_{*}}(X, Z, \Xi, \ldots, \Xi)\right) .
\end{aligned}
$$

In a similar way we have

$$
\varphi\left(p_{n_{*}}(Z, H, \Xi, \ldots, \Xi)\right)=\varphi\left(p_{n_{*}}(Z, X, \Xi, \ldots, \Xi)\right)+\varphi\left(p_{n_{*}}(Z, Y, \Xi, \ldots, \Xi)\right)
$$

Claim 2.3. $\varphi(0)=0$.
Proof. Since $\varphi$ is surjective, there exists $X \in \mathfrak{A}$ such that $\varphi(X)=0$. Then, $\varphi(0)=\varphi\left(p_{n_{*}}\left(0, X, I_{\mathfrak{R}}, \ldots, I_{\mathfrak{R}}\right)\right)=p_{n_{*}}\left(\varphi(0), \varphi(X), I_{\mathfrak{A}^{\prime}}, \ldots, I_{\mathfrak{A} \mathfrak{l}^{\prime}}\right)=0$.

We follow with a sequence of lemmas that show the additivity of $\varphi$.
Lemma 2.1. For any $A_{11} \in \mathfrak{A}_{11}$ and $B_{22} \in \mathfrak{A}_{22}$, we have

$$
\varphi\left(A_{11}+B_{22}\right)=\varphi\left(A_{11}\right)+\varphi\left(B_{22}\right) .
$$

Proof. Since $\varphi$ is surjective, given $\varphi\left(A_{11}\right)+\varphi\left(B_{22}\right) \in \mathfrak{A}^{\prime}$ there exists $H \in \mathfrak{A}$ such that $\varphi(H)=\varphi\left(A_{11}\right)+\varphi\left(B_{22}\right)$, with $H=H_{11}+H_{12}+H_{21}+H_{22}$. Besides, by claims 2.2 and 2.3

$$
\varphi\left(p_{n_{*}}\left(P_{1}, H, P_{1}, \ldots, P_{1}\right)\right)=\varphi\left(p_{n_{*}}\left(P_{1}, A_{11}, P_{1}, \ldots, P_{1}\right)\right)+\varphi\left(p_{n_{*}}\left(P_{1}, B_{22}, P_{1}, \ldots, P_{1}\right)\right),
$$

that is,

$$
\varphi\left(-H_{21}+H_{21}^{*}\right)=\varphi(0)+\varphi(0)=0 .
$$

Then, by injectivity of $\varphi,-H_{21}+H_{21}^{*}=0$. Thus $H_{21}=0$. Moreover, $\varphi\left(p_{n_{*}}\left(P_{2}, H, P_{2}, \ldots, P_{2}\right)\right)=\varphi\left(p_{n_{*}}\left(P_{2}, A_{11}, P_{2}, \ldots, P_{2}\right)\right)+\varphi\left(p_{n_{*}}\left(P_{2}, B_{22}, P_{2}, \ldots, P_{2}\right)\right)$,
that is,

$$
\varphi\left(-H_{12}+H_{12}^{*}\right)=0 .
$$

Again, by injectivity of $\varphi$ we conclude that $H_{12}=0$.
Furthermore, given $D_{21} \in \mathfrak{A}_{21}$,

$$
\begin{aligned}
\varphi\left(p_{n_{*}}\left(D_{21}, H, P_{1}, \ldots, P_{1}\right)\right) & =\varphi\left(p_{n_{*}}\left(D_{21}, A_{11}, P_{1}, \ldots, P_{1}\right)\right) \\
& +\varphi\left(p_{n_{*}}\left(D_{21}, B_{22}, P_{1}, \ldots, P_{1}\right)\right)
\end{aligned}
$$

that is,

$$
\varphi\left(D_{21} H_{11}-\left(D_{21} H_{11}\right)^{*}\right)=\varphi\left(D_{21} A_{11}-\left(D_{21} A_{11}\right)^{*}\right) .
$$

Then we conclude, by injectivity of $\varphi$, that $D_{21} H_{11}-\left(D_{21} H_{11}\right)^{*}=D_{21} A_{11}-$ $\left(D_{21} A_{11}\right)^{*}$, that is, $D_{21}\left(H_{11}-A_{11}\right)=0$. Even more, $P_{2} \mathfrak{A}\left(H_{11}-A_{11}\right)=0$, which implies that $H_{11}=A_{11}$ by ( $\boldsymbol{\oplus}$ ).

Finally, given $D_{12} \in \mathfrak{A}_{12}$, a similar calculation gives us $H_{22}=B_{22}$. Therefore $H=A_{11}+B_{22}$.

Lemma 2.2. For any $A_{12} \in \mathfrak{A}_{12}$ and $B_{21} \in \mathfrak{A}_{21}$, we have $\varphi\left(A_{12}+B_{21}\right)=$ $\varphi\left(A_{12}\right)+\varphi\left(B_{21}\right)$.

Proof. Since $\varphi$ is surjective, given $\varphi\left(A_{12}\right)+\varphi\left(B_{21}\right) \in \mathfrak{A}^{\prime}$ there exists $H \in \mathfrak{A}$ such that $\varphi(H)=\varphi\left(A_{12}\right)+\varphi\left(B_{21}\right)$, with $H=H_{11}+H_{12}+H_{21}+H_{22}$. Now, by Claims 2.2 and 2.3

$$
\varphi\left(p_{n_{*}}\left(P_{1}, H, P_{1}, \ldots, P_{1}\right)\right)=\varphi\left(p_{n_{*}}\left(P_{1}, A_{12}, P_{1}, \ldots, P_{1}\right)\right)+\varphi\left(p_{n_{*}}\left(P_{1}, B_{21}, P_{1}, \ldots, P_{1}\right)\right),
$$

that is,

$$
\varphi\left(-H_{21}+H_{21}^{*}\right)=\varphi\left(-B_{21}+B_{21}^{*}\right) .
$$

Then, by injectivity of $\varphi,-H_{21}+H_{21}^{*}=-B_{21}+B_{21}^{*}$. Thus $H_{21}=B_{21}$. Moreover, $\varphi\left(p_{n_{*}}\left(P_{2}, H, P_{2}, \ldots, P_{2}\right)\right)=\varphi\left(p_{n_{*}}\left(P_{2}, A_{12}, P_{2}, \ldots, P_{2}\right)\right)+\varphi\left(p_{n_{*}}\left(P_{2}, B_{21}, P_{2}, \ldots, P_{2}\right)\right)$,
that is,

$$
\varphi\left(-H_{12}+H_{12}^{*}\right)=\varphi\left(-A_{12}+A_{12}^{*}\right) .
$$

Again, by injectivity of $\varphi$ we conclude that $H_{12}=A_{12}$.

Furthermore, given $D_{21} \in \mathfrak{A}_{21}$,

$$
\begin{aligned}
\varphi\left(D_{21} H_{11}-\left(D_{21} H_{11}\right)^{*}\right) & =\varphi\left(p_{n_{*}}\left(D_{21}, H, P_{1}, \ldots, P_{1}\right)\right) \\
& =\varphi\left(p_{n_{*}}\left(D_{21}, A_{12}, P_{1}, \ldots, P_{1}\right)\right) \\
& +\varphi\left(p_{n_{*}}\left(D_{21}, B_{21}, P_{1}, \ldots, P_{1}\right)\right)=0
\end{aligned}
$$

Then we conclude, by injectivity of $\varphi$, that $D_{21} H_{11}-\left(D_{21} H_{11}\right)^{*}=0$, that is, $D_{21} H_{11}=0$. Even more, $P_{2} \mathfrak{A} H_{11}=0$, which implies that $H_{11}=0$ by ( $\mathbf{~}$ )

Finally, given $D_{12} \in \mathfrak{A}_{12}$, a similar calculation gives us $H_{22}=0$. Therefore, we conclude that $H=A_{12}+B_{21}$.

Lemma 2.3. For any $A_{11} \in \mathfrak{A}_{11}, B_{12} \in \mathfrak{A}_{12}, C_{21} \in \mathfrak{A}_{21}$ and $D_{22} \in \mathfrak{A}_{22}$ we have

$$
\varphi\left(A_{11}+B_{12}+C_{21}+D_{22}\right)=\varphi\left(A_{11}\right)+\varphi\left(B_{12}\right)+\varphi\left(C_{21}\right)+\varphi\left(D_{22}\right)
$$

Proof. Since $\varphi$ is surjective, given $\varphi\left(A_{11}\right)+\varphi\left(B_{12}\right)+\varphi\left(C_{21}\right)+\varphi\left(D_{22}\right) \in \mathfrak{A}^{\prime}$ there exists $H \in \mathfrak{A}$ such that $\varphi(H)=\varphi\left(A_{11}\right)+\varphi\left(B_{12}\right)+\varphi\left(C_{21}\right)+\varphi\left(D_{22}\right)$, with $H=H_{11}+H_{12}+H_{21}+H_{22}$. Even more, by Lemmas 2.1 and 2.2
$\varphi(H)=\varphi\left(A_{11}\right)+\varphi\left(B_{12}\right)+\varphi\left(C_{21}\right)+\varphi\left(D_{22}\right)=\varphi\left(A_{11}+D_{22}\right)+\varphi\left(B_{12}+C_{21}\right)$.
Now, observing that $p_{n_{*}}\left(P_{1}, A_{11}+D_{22}, \ldots, P_{1}\right)=0=p_{n_{*}}\left(P_{1}, B_{12}, P_{1}, \ldots, P_{1}\right)$ and by Claims 2.2 and 2.3 we obtain

$$
\begin{aligned}
& \varphi\left(p_{n_{*}}\left(P_{1}, H, P_{1}, \ldots, P_{1}\right)\right) \\
& =\varphi\left(p_{n_{*}}\left(P_{1}, A_{11}+D_{22}, \ldots, P_{1}\right)\right)+\varphi\left(p_{n_{*}}\left(P_{1}, B_{12}+C_{21}, P_{1}, \ldots, P_{1}\right)\right) \\
& =\varphi\left(p_{n_{*}}\left(P_{1}, C_{21}, P_{1}, \ldots, P_{1}\right)\right)
\end{aligned}
$$

that is,

$$
\varphi\left(-H_{21}+H_{21}^{*}\right)=\varphi\left(-C_{21}+C_{21}^{*}\right)
$$

Then, by injectivity of $\varphi,-H_{21}+H_{21}^{*}=-C_{21}+C_{21}^{*}$. Thus $H_{21}=C_{21}$.
In a similar way, using $P_{2}$ rather than $P_{1}$ in the previous calculation, we conclude that $H_{12}=B_{12}$. Also, given $X_{21} \in \mathfrak{A}_{21}$,

$$
\begin{aligned}
& \varphi\left(p_{n_{*}}\left(X_{21}, H, P_{1}, \ldots, P_{1}\right)\right) \\
& =\varphi\left(p_{n_{*}}\left(X_{21}, A_{11}+D_{22}, \ldots, P_{1}\right)\right)+\varphi\left(p_{n_{*}}\left(X_{21}, B_{12}+C_{21}, P_{1}, \ldots, P_{1}\right)\right) \\
& =\varphi\left(p_{n_{*}}\left(X_{21}, A_{11}, P_{1}, \ldots, P_{1}\right)\right)
\end{aligned}
$$

since $p_{n_{*}}\left(X_{21}, B_{12}+C_{21}, P_{1}, \ldots, P_{1}\right)=0=p_{n_{*}}\left(X_{21}, D_{22}, \ldots, P_{1}\right)$. Again, by injectivity of $\varphi$ we conclude, by following the same strategy as in the proof of Lemma 2.1, that $H_{11}=A_{11}$. Now, using $P_{2}$ rather than $P_{1}$ and $X_{12}$ rather than $X_{21}$ in the previous calculation we obtain $H_{22}=D_{22}$. Therefore, $H=A_{11}+B_{12}+C_{21}+D_{22}$.

Lemma 2.4. For all $A_{j k}, B_{j k} \in \mathfrak{A}_{j k}$ we have $\varphi\left(A_{j k}+B_{j k}\right)=\varphi\left(A_{j k}\right)+$ $\varphi\left(B_{j k}\right)$ for $j \neq k$.

Proof. We shall prove the case $j=1$ and $k=2$, since the other case is done in a similar way. Since $\varphi$ is surjective, given $\varphi\left(A_{12}\right)+\varphi\left(B_{12}\right) \in \mathfrak{A}^{\prime}$ and $\varphi\left(-A_{12}^{*}\right)+\varphi\left(-B_{12}^{*}\right)$ there exist $H \in \mathfrak{A}$ and $T \in \mathfrak{A}$ such that $\varphi(H)=$ $\varphi\left(A_{12}\right)+\varphi\left(B_{12}\right)$ and $\varphi(T)=\varphi\left(-A_{12}^{*}\right)+\varphi\left(-B_{12}^{*}\right)$, with $H=H_{11}+H_{12}+$ $H_{21}+H_{22}$ and $T=T_{11}+T_{12}+T_{21}+T_{22}$.

Firstly, we show that $H \in \mathfrak{A}_{12}$ : by Claim [2.2]

$$
\begin{aligned}
\varphi\left(-H_{21}+H_{21}^{*}\right) & =\varphi\left(p_{n_{*}}\left(P_{1}, H, P_{1}, \ldots, P_{1}\right)\right) \\
& =\varphi\left(p_{n_{*}}\left(P_{1}, A_{12}, P_{1}, \ldots, P_{1}\right)\right)+\varphi\left(p_{n_{*}}\left(P_{1}, B_{12}, P_{1}, \ldots, P_{1}\right)\right)=0
\end{aligned}
$$

Then, by injectivity of $\varphi$ we obtain $H_{21}=0$. Also, given $D_{12} \in \mathfrak{A}_{12}$,

$$
\begin{aligned}
\varphi\left(D_{12} H_{22}-\left(D_{12} H_{22}\right)^{*}\right) & =\varphi\left(p_{n_{*}}\left(D_{12}, H, P_{2}, \ldots, P_{2}\right)\right) \\
& =\varphi\left(p_{n_{*}}\left(D_{12}, A_{12}, P_{2}, \ldots, P_{2}\right)\right) \\
& +\varphi\left(p_{n_{*}}\left(D_{12}, B_{12}, P_{2}, \ldots, P_{2}\right)\right)=0
\end{aligned}
$$

that is, $D_{12} H_{22}=0$, which implies that $H_{22}=0$ by ( $\left.\boldsymbol{(}\right)$. Now, using $D_{21} \in \mathfrak{A}_{21}$ rather than $D_{12}$ in the previous calculation, we conclude that $H_{11}=0$. Therefore, $H=H_{12} \in \mathfrak{A}_{12}$.

In a similar way, we obtain $T=T_{21} \in A_{21}$.
Finally, by Lemma 2.3

$$
\begin{aligned}
\varphi\left(A_{12}+B_{12}-A_{12}^{*}-B_{12}^{*}\right) & =\varphi\left(p_{n_{*}}\left(P_{1}+A_{12}, P_{2}+B_{12}, P_{2}, \ldots, P_{2}\right)\right) \\
& =p_{n_{*}}\left(\varphi\left(P_{1}+A_{12}\right), \varphi\left(P_{2}+B_{12}\right), \varphi\left(P_{2}\right), \ldots, \varphi\left(P_{2}\right)\right) \\
& =p_{n_{*}}\left(\varphi\left(P_{1}\right), \varphi\left(P_{2}\right), \varphi\left(P_{2}\right), \ldots, \varphi\left(P_{2}\right)\right) \\
& +p_{n_{*}}\left(\varphi\left(P_{1}\right), \varphi\left(B_{12}\right), \varphi\left(P_{2}\right), \ldots, \varphi\left(P_{2}\right)\right) \\
& +p_{n_{*}}\left(\varphi\left(A_{12}\right), \varphi\left(P_{2}\right), \varphi\left(P_{2}\right), \ldots, \varphi\left(P_{2}\right)\right) \\
& +p_{n_{*}}\left(\varphi\left(A_{12}\right), \varphi\left(B_{12}\right), \varphi\left(P_{2}\right), \ldots, \varphi\left(P_{2}\right)\right) \\
& =\varphi\left(p_{n_{*}}\left(P_{1}, P_{2}, P_{2}, \ldots, P_{2}\right)\right) \\
& +\varphi\left(p_{n_{*}}\left(P_{1}, B_{12}, P_{2}, \ldots, P_{2}\right)\right) \\
& +\varphi\left(p_{n_{*}}\left(A_{12}, P_{2}, P_{2}, \ldots, P_{2}\right)\right) \\
& +\varphi\left(p_{n_{*}}\left(A_{12}, B_{12}, P_{2}, \ldots, P_{2}\right)\right) \\
& =\varphi\left(A_{12}-A_{12}^{*}\right)+\varphi\left(B_{12}-B_{12}^{*}\right) \\
& =\varphi\left(A_{12}\right)+\varphi\left(B_{12}\right)+\varphi\left(-A_{12}^{*}\right)+\varphi\left(-B_{12}^{*}\right) \\
& =\varphi\left(H_{12}\right)+\varphi\left(T_{21}\right)=\varphi\left(H_{12}+T_{21}\right) .
\end{aligned}
$$

Since $\varphi$ is injective, we have $A_{12}+B_{12}-A_{12}^{*}-B_{12}^{*}=H_{12}+T_{21}$, i.e., $H=H_{12}=A_{12}+B_{12}$.

Lemma 2.5. For all $A_{j j}, B_{j j} \in \mathfrak{A}_{j j}$, we have $\varphi\left(A_{j j}+B_{j j}\right)=\varphi\left(A_{j j}\right)+$ $\varphi\left(B_{j j}\right)$ for $j \in\{1,2\}$.

Proof. We shall prove the case $j=1$, since the other case is done in a similar way. Since $\varphi$ is surjective, given $\varphi\left(A_{11}\right)+\varphi\left(B_{11}\right) \in \mathfrak{A}^{\prime}$ there exists $H \in \mathfrak{A}$ such that $\varphi(H)=\varphi\left(A_{11}\right)+\varphi\left(B_{11}\right)$, with $H=H_{11}+H_{12}+H_{21}+H_{22}$. Now, by claim 2.2

$$
\begin{aligned}
\varphi\left(-H_{21}+H_{21}^{*}\right) & =\varphi\left(p_{n_{*}}\left(P_{1}, H, P_{1}, \ldots, P_{1}\right)\right) \\
& =\varphi\left(p_{n_{*}}\left(P_{1}, A_{11}, P_{1}, \ldots, P_{1}\right)\right)+\varphi\left(p_{n_{*}}\left(P_{1}, B_{11}, P_{1}, \ldots, P_{1}\right)\right)=0 .
\end{aligned}
$$

Then, by injectivity of $\varphi$ we obtain $H_{21}=0$. Also,

$$
\begin{aligned}
\varphi\left(-H_{12}+H_{12}^{*}\right) & =\varphi\left(p_{n_{*}}\left(P_{2}, H, P_{2}, \ldots, P_{2}\right)\right) \\
& =\varphi\left(p_{n_{*}}\left(P_{2}, A_{11}, P_{2}, \ldots, P_{2}\right)\right)+\varphi\left(p_{n_{*}}\left(P_{2}, B_{11}, P_{2}, \ldots, P_{2}\right)\right)=0
\end{aligned}
$$

that is, $H_{12}=0$ by injectivity of $\varphi$. Moreover, given $D_{12} \in \mathfrak{A}_{12}$,

$$
\begin{aligned}
\varphi\left(D_{12} H_{22}-\left(D_{12} H_{22}\right)^{*}\right) & =\varphi\left(p_{n_{*}}\left(D_{12}, H, P_{2}, \ldots, P_{2}\right)\right) \\
& =\varphi\left(p_{n_{*}}\left(D_{12}, A_{11}, P_{2}, \ldots, P_{2}\right)\right) \\
& +\varphi\left(p_{n_{*}}\left(D_{12}, B_{11}, P_{2}, \ldots, P_{2}\right)\right)=0 .
\end{aligned}
$$

Then, by injectivity of $\varphi, D_{12} H_{22}=0$, which implies that $H_{22}=0$ by ( $\left.\boldsymbol{\oplus}\right)$. Finally, given $D_{21} \in \mathfrak{A}_{21}$, by Lemmas 2.3 and 2.4 we have

$$
\begin{aligned}
\varphi\left(D_{21} H_{11}-\left(D_{21} H_{11}\right)^{*}\right) & =\varphi\left(p_{n_{*}}\left(D_{21}, H, P_{1}, \ldots, P_{1}\right)\right) \\
& =\varphi\left(p_{n_{*}}\left(D_{21}, A_{11}, P_{1}, \ldots, P_{1}\right)\right) \\
& +\varphi\left(p_{n_{*}}\left(D_{21}, B_{11}, P_{1}, \ldots, P_{1}\right)\right) \\
& =\varphi\left(D_{21} A_{11}-\left(D_{21} A_{11}\right)^{*}\right) \\
& +\varphi\left(D_{21} B_{11}-\left(D_{21} B_{11}\right)^{*}\right) \\
& =\varphi\left(D_{21} A_{11}\right)+\varphi\left(-\left(D_{21} A_{11}\right)^{*}\right) \\
& +\varphi\left(D_{21} B_{11}\right)+\varphi\left(-\left(D_{21} B_{11}\right)^{*}\right) \\
& =\varphi\left(D_{21} A_{11}+D_{21} B_{11}\right) \\
& +\varphi\left(-\left(D_{21} A_{11}\right)^{*}-\left(D_{21} B_{11}\right)^{*}\right) \\
& =\varphi\left(D_{21}\left(A_{11}+B_{11}\right)-\left(A_{11}^{*}+B_{11}^{*}\right) D_{21}^{*}\right),
\end{aligned}
$$

that is, $D_{21} H_{11}-\left(D_{21} H_{11}\right)^{*}=D_{21}\left(A_{11}+B_{11}\right)-\left(A_{11}^{*}+B_{11}^{*}\right) D_{21}^{*}$, by injectivity of $\varphi$. Thus, $D_{21}\left(H_{11}-\left(A_{11}+B_{11}\right)\right)=0$, which implies that $H_{11}=A_{11}+B_{11}$ by ( $\boldsymbol{\oplus}$ ).

Now we are able to show that $\varphi$ is $*$-additive. Using Lemmas 2.3, 2.4 and 2.5 we have, for all $A, B \in \mathfrak{A}$,

$$
\begin{aligned}
\varphi(A+B) & =\varphi\left(A_{11}+A_{12}+A_{21}+A_{22}+B_{11}+B_{12}+B_{21}+B_{22}\right) \\
& =\varphi\left(A_{11}+B_{11}\right)+\varphi\left(A_{12}+B_{12}\right)+\varphi\left(A_{21}+B_{21}\right)+\varphi\left(A_{22}+B_{22}\right) \\
& =\varphi\left(A_{11}\right)+\varphi\left(B_{11}\right)+\varphi\left(A_{12}\right)+\varphi\left(B_{12}\right) \\
& +\varphi\left(A_{21}\right)+\varphi\left(B_{21}\right)+\varphi\left(A_{22}\right)+\varphi\left(B_{22}\right) \\
& =\varphi\left(A_{11}+A_{12}+A_{21}+A_{22}\right) \\
& +\varphi\left(B_{11}+B_{12}+B_{21}+B_{22}\right)=\varphi(A)+\varphi(B) .
\end{aligned}
$$

Besides, given $A \in \mathfrak{A}$, by additivity of $\varphi$

$$
\begin{aligned}
2^{n-2}\left(\varphi(A)-\varphi(A)^{*}\right) & =p_{n_{*}}\left(\varphi(A), I_{\mathfrak{A}^{\prime}}, \ldots, I_{\mathfrak{A}^{\prime}}\right)=\varphi\left(p_{n_{*}}\left(A, I_{\mathfrak{A}}, \ldots, I_{\mathfrak{A}}\right)\right) \\
& =\varphi\left(2^{n-2}\left(A-A^{*}\right)\right)=2^{n-2} \varphi\left(A-A^{*}\right)=2^{n-2}\left(\varphi(A)-\varphi\left(A^{*}\right)\right)
\end{aligned}
$$

and then we conclude that $\varphi\left(A^{*}\right)=\varphi(A)^{*}$. This completes the proof of Theorem 2.1.

Theorem 2.2. Let $\mathfrak{A}$ and $\mathfrak{A}^{\prime}$ be two $C^{*}$-algebras with identities $I_{\mathfrak{A}}$ and $I_{\mathfrak{A} \prime}$, respectively, and $P_{1}$ and $P_{2}=I_{\mathfrak{A}}-P_{1}$ nontrivial symmetric projections in $\mathfrak{A}$. Suppose that $\mathfrak{A}$ satisfies

$$
(\boldsymbol{\uparrow}) \quad P_{j} \mathfrak{A} X=\{0\} \quad \text { implies } \quad X=0
$$

Even more, suppose that $\varphi: \mathfrak{A} \rightarrow \mathfrak{A}^{\prime}$ is a complex scalar multiplication bijective unital map which satisfies

$$
(\boldsymbol{\&}) \quad \varphi\left(P_{j}\right) \mathfrak{A}^{\prime} Y=\{0\} \quad \text { implies } \quad Y=0
$$

and

$$
(\bullet) \varphi\left(p_{n_{*}}(A, B, \Xi, \ldots, \Xi)\right)=p_{n_{*}}(\varphi(A), \varphi(B), \varphi(\Xi), \ldots, \varphi(\Xi))
$$

for all $A, B \in \mathfrak{A}$ and $\Xi \in\left\{P_{1}, P_{2}, I_{\mathfrak{A}}\right\}$. Then $\varphi$ is $*$-isomorphism.
With this hypothesis, we have already proved that $\varphi$ is $*$-additive. It remains for us to show that $\varphi$ is multiplicative. In order to do that we will prove some more lemmas. Firstly, we observe that, for any $A \in \mathfrak{A}$,

Remark 2.1. Denoting by $\mathcal{R}(A)$ and $\mathcal{I}(A)$ the real part and imaginary part of $A \in \mathfrak{A}$, respectively, we have

$$
\begin{aligned}
\varphi\left(2^{n-1} \mathcal{R}(A)\right) & =\varphi\left(2^{n-2}\left(A+A^{*}\right)\right)=\varphi\left(p_{n_{*}}\left(i A,-i I_{\mathfrak{A}}, I_{\mathfrak{A}}, \ldots, I_{\mathfrak{A}}\right)\right) \\
& =p_{n_{*}}\left(i \varphi(A),-i \varphi\left(I_{\mathfrak{A}}\right), I_{\mathfrak{A}^{\prime}}, \ldots, I_{\mathfrak{A}^{\prime}}\right)=2^{n-2}\left(\varphi(A)+\varphi(A)^{*}\right) \\
& =2^{n-1} \mathcal{R}(\varphi(A))
\end{aligned}
$$

and

$$
\begin{aligned}
\varphi\left(2^{n-1} i \mathcal{I}(A)\right) & =\varphi\left(2^{n-2}\left(A-A^{*}\right)\right)=\varphi\left(p_{n_{*}}\left(A, I_{\mathfrak{A}}, \ldots, I_{\mathfrak{A}}\right)\right) \\
& =p_{n_{*}}\left(\varphi(A), I_{\mathfrak{A}}, \ldots, I_{\mathfrak{A}^{\prime}}\right)=2^{n-2}\left(\varphi(A)-\varphi(A)^{*}\right) \\
& =2^{n-1} i \mathcal{I}(\varphi(A))
\end{aligned}
$$

Even more,
Claim 2.4. $Q_{j}=\varphi\left(P_{j}\right)$ is a symmetric projection in $\mathfrak{A}^{\prime}$, with $j \in\{1,2\}$.
Proof. Since $\varphi$ is a complex scalar multiplication, it follows that

$$
\begin{aligned}
2^{n-1} i Q_{j} & =2^{n-1} i \varphi\left(P_{j}\right)=\varphi\left(2^{n-1} i P_{j}\right)=\varphi\left(p_{n_{*}}\left(i P_{j}, P_{j}, I_{\mathfrak{A}}, \ldots, I_{\mathfrak{A}}\right)\right) \\
& \left.=p_{n_{*}}\left(i \varphi\left(P_{j}\right), \varphi\left(P_{j}\right), I_{\mathfrak{A}^{\prime}}, \ldots, I_{\mathfrak{A}}\right)\right)=2^{n-1} i \varphi\left(P_{j}\right)^{2}=2^{n-1} i Q_{j}{ }^{2}
\end{aligned}
$$

Then we can conclude that $Q_{j}=Q_{j}{ }^{2}$. Moreover, since $P_{j}$ is a symmetric projection in $\mathfrak{A}$ we have that $p_{n_{*}}\left(P_{j}, I_{\mathfrak{A}}, \ldots, I_{\mathfrak{A}}\right)=0$. Besides,

$$
0=\varphi(0)=\varphi\left(p_{n_{*}}\left(P_{j}, I_{\mathfrak{A}}, \ldots, I_{\mathfrak{A}}\right)\right)=p_{n_{*}}\left(Q_{j}, I_{\mathfrak{A}^{\prime}}, \ldots, I_{\mathfrak{A}^{\prime}}\right) .
$$

Thus, $Q_{j}-Q_{j}{ }^{*}=0$, that is, $Q_{j}=Q_{j}{ }^{*}$.
Lemma 2.6. For all $A \in \mathfrak{A}, \varphi\left(P_{j} A\right)=\varphi\left(P_{j}\right) \varphi(A)$ and $\varphi\left(A P_{j}\right)=\varphi(A) \varphi\left(P_{j}\right)$.
Proof. Firstly, observe that

$$
p_{n_{*}}\left(i A, P_{j}, I_{\mathfrak{A}}, \ldots, I_{\mathfrak{A}}\right)=2^{n-2} i\left(A P_{j}+P_{j} A^{*}\right)
$$

and

$$
p_{n_{*}}\left(A, P_{j}, I_{\mathfrak{A}}, \ldots, I_{\mathfrak{A}}\right)=2^{n-2}\left(A P_{j}-P_{j} A^{*}\right)
$$

Still, by $(\bullet)$ and $*$-additivity of $\varphi$,

$$
\begin{aligned}
\varphi\left(2^{n-2} i\left(A P_{j}+P_{j} A^{*}\right)\right) & =\varphi\left(p_{n_{*}}\left(i A, P_{j}, I_{\mathfrak{A}}, \ldots, I_{\mathfrak{A}}\right)\right) \\
& =p_{n_{*}}\left(\varphi(i A), \varphi\left(P_{j}\right), I_{\mathfrak{A}}, \ldots, I_{\mathfrak{A}}\right) \\
& =2^{n-2} i\left(\varphi(A) \varphi\left(P_{j}\right)+\varphi\left(P_{j}\right) \varphi(A)^{*}\right)
\end{aligned}
$$

and

$$
\begin{aligned}
\varphi\left(2^{n-2}\left(A P_{j}-P_{j} A^{*}\right)\right) & =\varphi\left(p_{n_{*}}\left(A, P_{j}, I_{\mathfrak{A}}, \ldots, I_{\mathfrak{A}}\right)\right) \\
& =p_{n_{*}}\left(\varphi(A), \varphi\left(P_{j}\right), I_{\mathfrak{A}}, \ldots, I_{\mathfrak{A}}\right) \\
& =2^{n-2}\left(\varphi(A) \varphi\left(P_{j}\right)-\varphi\left(P_{j}\right) \varphi(A)^{*}\right) .
\end{aligned}
$$

Now, since $\varphi$ is $*$-additive, multiplying the second equality by $i$ and adding these two equations we obtain $\varphi\left(A P_{j}\right)=\varphi(A) \varphi\left(P_{j}\right)$. The second statement is obtained in a similar way.

Lemma 2.7. $\varphi\left(\mathfrak{A}_{j k}\right) \subset \mathfrak{A}_{j k}^{\prime}$.
Proof. Given $X \in \mathfrak{A}_{j k}$, we have $X=P_{j} X P_{k}$ and then, by Lemma [2.6, $\varphi(X)=\varphi\left(P_{j}\right) \varphi\left(X P_{k}\right)=\varphi\left(P_{j}\right) \varphi(X) \varphi\left(P_{k}\right) \in \mathfrak{A}_{j k}^{\prime}$.

Lemma 2.8. To $j \neq k$ :

- If $A_{j k} \in \mathfrak{A}_{j k}$ and $B_{k k} \in \mathfrak{A}_{k k}$ then $\varphi\left(A_{j k} B_{k k}\right)=\varphi\left(A_{j k}\right) \varphi\left(B_{k k}\right)$;
- If $A_{j j} \in \mathfrak{A}_{j j}$ and $B_{j k} \in \mathfrak{A}_{j k}$ then $\varphi\left(A_{j j} B_{j k}\right)=\varphi\left(A_{j j}\right) \varphi\left(B_{j k}\right)$;
- If $A_{j k} \in \mathfrak{A}_{j k}$ and $B_{k j} \in \mathfrak{A}_{k j}$ then $\varphi\left(A_{j k} B_{k j}\right)=\varphi\left(A_{j k}\right) \varphi\left(B_{k j}\right)$.

Proof. In order to prove the first statement, on the one hand, by Lemma 2.7

$$
\begin{aligned}
\varphi\left(A_{j k} B_{k k}\right)-\varphi\left(A_{j k} B_{k k}\right)^{*} & =\varphi\left(A_{j k} B_{k k}-\left(A_{j k} B_{k k}\right)^{*}\right) \\
& =\varphi\left(p_{n_{*}}\left(A_{j k}, B_{k k}, P_{k}, \ldots, P_{k}\right)\right) \\
& =p_{n_{*}}\left(\varphi\left(A_{j k}\right), \varphi\left(B_{k k}\right), Q_{k}, \ldots, Q_{k}\right) \\
& =\varphi\left(A_{j k}\right) \varphi\left(B_{k k}\right)-\left(\varphi\left(A_{j k}\right) \varphi\left(B_{k k}\right)\right)^{*}
\end{aligned}
$$

and then $\mathcal{I}\left(\varphi\left(A_{j k} B_{k k}\right)\right)=\mathcal{I}\left(\varphi\left(A_{j k}\right) \varphi\left(B_{k k}\right)\right)$. On the other hand, using $i A_{j k}$ rather than $A_{j k}$ we obtain $\mathcal{R}\left(\varphi\left(A_{j k} B_{k k}\right)\right)=\mathcal{R}\left(\varphi\left(A_{j k}\right) \varphi\left(B_{k k}\right)\right)$. It concludes that $\varphi\left(A_{j k} B_{k k}\right)=\varphi\left(A_{j k}\right) \varphi\left(B_{k k}\right)$.

The others statements are proved in a similar way.
Lemma 2.9. If $A_{j j}, B_{j j} \in \mathfrak{A}_{j j}$ then $\varphi\left(A_{j j} B_{j j}\right)=\varphi\left(A_{j j}\right) \varphi\left(B_{j j}\right)$.
Proof. Let $X_{k j}$ be an element of $\mathfrak{A}_{k j}$, with $j \neq k$. Using Lemma 2.8 we obtain
$\varphi\left(X_{k j}\right) \varphi\left(A_{j j} B_{j j}\right)=\varphi\left(X_{k j} A_{j j} B_{j j}\right)=\varphi\left(X_{k j} A_{j j}\right) \varphi\left(B_{j j}\right)=\varphi\left(X_{k j}\right) \varphi\left(A_{j j}\right) \varphi\left(B_{j j}\right)$,
that is,

$$
\varphi\left(X_{k j}\right)\left(\varphi\left(A_{j j} B_{j j}\right)-\varphi\left(A_{j j}\right) \varphi\left(B_{j j}\right)\right)=0 .
$$

Now, by Lemma 2.7, $\varphi\left(X_{k j}\right) \in \mathfrak{A}_{k j}^{\prime}$ as well as $\varphi\left(A_{j j} B_{j j}\right)$ and $\varphi\left(A_{j j}\right) \varphi\left(B_{j j}\right) \in$ $\mathfrak{A}_{j j}^{\prime}$. Then, $Q_{k} \mathfrak{A}^{\prime}\left(\varphi\left(A_{j j} B_{j j}\right)-\varphi\left(A_{j j}\right) \varphi\left(B_{j j}\right)\right)=0$, which implies that $\varphi\left(A_{j j} B_{j j}\right)=\varphi\left(A_{j j}\right) \varphi\left(B_{j j}\right)$ by (थ).

By additivity of $\varphi$ and Lemmas 2.8 and 2.9, it follows, for all $A, B \in \mathfrak{A}$, that $\varphi(A B)=\varphi(A) \varphi(B)$. It concludes the proof of Theorem [2.2.

## 3 Corollaries

Let us present some consequences of our main result. The first one provides the conjecture that appears in [7] to the case of multiplicative $*$-Lie-type maps:

Corollary 3.1. Let $\mathfrak{A}$ and $\mathfrak{A}^{\prime}$ be two $C^{*}$-algebras with identities $I_{\mathfrak{A}}$ and $I_{\mathfrak{A} \prime^{\prime}}$, respectively, and $P_{1}$ and $P_{2}=I_{\mathfrak{A}}-P_{1}$ nontrivial symmetric projections in $\mathfrak{A}$. Suppose that $\mathfrak{A}$ satisfies
( $\boldsymbol{\oplus}) \quad P_{j} \mathfrak{A} X=\{0\} \quad$ implies $\quad X=0$.

Even more, suppose that $\varphi: \mathfrak{A} \rightarrow \mathfrak{A}^{\prime}$ is a complex scalar multiplication bijective unital map which satisfies

$$
(\boldsymbol{\&}) \quad \varphi\left(P_{j}\right) \mathfrak{A}^{\prime} Y=\{0\} \quad \text { implies } \quad Y=0 \text {. }
$$

Then $\varphi: \mathfrak{A} \rightarrow \mathfrak{A}^{\prime}$ is a multiplicative $*$-Lie $n$-map if and only if $\varphi$ is a *-isomorphism.

Observing that prime $C^{*}$-algebras satisfy ( $\left.\boldsymbol{\oplus}\right),(\boldsymbol{\&})$ we have the following result:

Corollary 3.2. Let $\mathfrak{A}$ and $\mathfrak{A}^{\prime}$ be prime $C^{*}$-algebras with identities $I_{\mathfrak{A}}$ and $I_{\mathfrak{A}^{\prime}}$, respectively, and $P_{1}$ and $P_{2}=I_{\mathfrak{A}}-P_{1}$ nontrivial projections in $\mathfrak{A}$. Then a complex scalar multiplication $\varphi: \mathfrak{A} \rightarrow \mathfrak{A}^{\prime}$ is a bijective unital multiplicative *-Lie n-map if and only if $\varphi$ is a*-isomorphism.

A von Neumann algebra $\mathcal{M}$ is a weakly closed, self-adjoint algebra of operators on a Hilbert space $\mathcal{H}$ containing the identity operator $I$. As an application on von Neumann algebras we have the following:

Corollary 3.3. Let $\mathcal{M}$ be a von Neumann algebra without central summands of type $I_{1}$. Then a complex scalar multiplication $\varphi: \mathcal{M} \rightarrow \mathcal{M}$ is a bijective unital multiplicative $*$-Lie n-map if and only if $\varphi$ is $a *$-isomorphism.

Proof. Let $\mathcal{M}$ be a von Neumann algebra. It is shown in [1] and [16] that if a von Neumann algebra has no central summands of type $I_{1}$, then $\mathcal{M}$ satisfies the following assumption:

- $P_{j} \mathcal{M} X=\{0\} \Rightarrow X=0$.

Thus, by Theorem 2.2 the corollary is true.
To finish, $\mathcal{M}$ is a factor von Neumann algebra if its center only contains the scalar operators. It is well known that a factor von Neumann algebra is prime and then we have the following:

Corollary 3.4. Let $\mathcal{M}$ be a factor von Neumann algebra. Then a complex scalar multiplication $\varphi: \mathcal{M} \rightarrow \mathcal{M}$ is a bijective unital multiplicative $*$-Lie $n$-map if and only if $\varphi$ is $a *$-isomorphism.
