#### Abstract

We study a forager-exploiter model with generalized logistic sources in a smooth bounded domain with homogeneous Neumann boundary conditions. A new boundedness criterion is developed to prove the global existence and boundedness of the solution. Under some conditions on the logistic degradation rates, the classical solution exists globally and remain bounded in the high dimensions. Moreover, the large time behavior of the obtained solution is investigated in the case of the nutrient supply is a positive constant or has fast decaying property.

Keywords: Forager-exploiter model; Chemotaxis; Logistic sources; Boundedness; Stabilization.

## 1 Introduction

We consider the forager-exploiter system with generalized logistic sources

$$
\begin{cases}u_{t}=\Delta u-\chi \nabla \cdot(u \nabla w)+a_{1} u-b_{1} u^{\alpha}, & x \in \Omega, t>0  \tag{1.1}\\ v_{t}=\Delta v-\xi \nabla \cdot(v \nabla u)+a_{2} v-b_{2} v^{\beta}, & x \in \Omega, t>0 \\ w_{t}=\Delta w-(u+v) w-\mu w+r, & x \in \Omega, t>0 \\ \frac{\partial u}{\partial \nu}=\frac{\partial v}{\partial \nu}=\frac{\partial w}{\partial \nu}=0, & x \in \partial \Omega, t>0 \\ u(x, 0)=u_{0}(x), v(x, 0)=v_{0}(x), w(x, 0)=w_{0}(x), & x \in \Omega\end{cases}
$$

where $\Omega$ is a bounded domain in $\mathbb{R}^{N}$ with smooth boundary $\partial \Omega, \frac{\partial}{\partial \nu}$ denotes the homogeneous Neumann boundary condition, and $\chi, \xi, \mu$ are positive constants. We use $u, v$ and $w$ to denote population densities of the forager, exploiter and nutrient, respectively. This model include two basic settings. Firstly, the forager and exploiter pursuit nutrient as their common food. Secondly, except the random diffusions, the forager move towards the increasing nutrient gradient direction (corresponding to the first taxis dynamic: $-\nabla \cdot(u \nabla w)$ ), while the exploiter follows the forager to find nutrients (corresponding to the second taxis mechanism: $-\nabla \cdot(v \nabla u)$ ). It has been indicated in [18, 25] that, as a doubly cross-diffusive parabolic system, (1.1) possess more complex dynamics than the single-taxis model. Although problem (1.1) has attracted many attentions recently, only a few results are available. The mathematical results are summarized as follows:

Without kinetic source terms: $a_{1}=a_{2}=b_{1}=b_{2}=0$. The classical solution exists globally and remain bounded in one space dimension ([19]). Whereas, in the high dimensions, smallness conditions on the initial data and production rate or weak taxis effects are required to

[^0]ensure the global solvability of (1.1) ([23]). This differs from the chemotaxis-consumption or prey taxis model whose global solvability in two dimensional case is well-known ( $[10,20]$ ). Even for the generalized solutions, the global existence relies on some smallness conditions on the initial data $w_{0}$ and production rate of $w$. In [6, 14], it is found that the full saturation or limited saturation can exclude blow up phenomenon. For the study of the forager-exploiter model with singular sensitivities, nonlinear resource consumption or proliferation, please refer to [5, 13, 15].

With generalized logistic source: $a_{1}, a_{2}, b_{1}, b_{2}>0$. In [4], the global generalized solutions are obtained in two dimensional setting provided $\alpha>\sqrt{2}+1$ and $\min \{\alpha, \beta\}>(\alpha+1) /(\alpha-1)$, and the eventual smoothness of the generalized solution after some waiting time are provided under some more restrict conditions. When $2 \leq \alpha<3$ and $\beta \geq 3 \alpha /(2 \alpha-3)$ or $\alpha, \beta \geq 3$, the global existence and boundedness of the classical solution in two dimensional setting are obtained in [23]. Later on, the recent work [26] claims that $2 \leq \alpha<3, \beta \geq 3$ suffices to ensure the global boundedness of the solution. It is noted that these results only hold in two dimensional setting, and the conditions for $\alpha, \beta$ seem too strong and may be far from optimal. Moreover, no results on the global solvability of (1.1) with $a_{1}, a_{2}, b_{1}, b_{2}>0$ in high dimensions $(N>2)$ are available. This manuscript has two motivations. The first one is to establish the global solvability of (1.1) in the high dimensions $(N>2)$ and relax the conditions in two dimensional case. The other one is to establish the large time behavior of the solutions obtained.

Before stating the main results, we give basic assumptions for the initial data and nutrient supply $r$. The initial data $u_{0}, v_{0}, w_{0}$ satisfy

$$
u_{0}, v_{0}, w_{0} \in W^{2, \infty}(\Omega), u_{0}, v_{0}, w_{0} \geq 0, \not \equiv 0 \quad \text { on } \bar{\Omega}, \quad \text { and } \quad \frac{\partial u_{0}}{\partial \nu}=\frac{\partial v_{0}}{\partial \nu}=\frac{\partial w_{0}}{\partial \nu}=0 \text { on } \partial \Omega
$$

The production rate function $r$ is nonnegative and satisfies

$$
\begin{equation*}
r \in C^{1}(\bar{\Omega} \times[0, \infty)) \cap L^{\infty}(\Omega \times(0, \infty)) \tag{1.2}
\end{equation*}
$$

We can hence denote

$$
\begin{equation*}
r_{*}:=\|r\|_{L^{\infty}(\Omega \times(0, \infty))} \tag{1.3}
\end{equation*}
$$

Throughout this article, we always set $a_{1}, a_{2}, b_{1}, b_{2}>0$. The first result concerns the global solvability of (1.1) in high dimensions (i.e., $N>2$ ).

Theorem 1.1. Let $N>2$. Suppose that $\alpha, \beta>\frac{N}{2}+1$. Then the problem (1.1) admits a unique nonnegative and global solution $(u, v, w) \in\left(C^{2,1}(\bar{\Omega} \times(0, \infty))\right)^{3}$ which is bounded in $\bar{\Omega} \times(0, \infty)$.

In two dimensional setting, we have
Theorem 1.2. Let $N=2$ and $\alpha \geq 2$ with $\beta>2$. Then there exists a solution $(u, v, w) \in\left(C^{2,1}(\bar{\Omega} \times\right.$ $(0, \infty)))^{3}$ solving (1.1) uniquely and remain bounded in $\bar{\Omega} \times(0, \infty)$.

We remark that, Theorem 1.1 gives the first result of global solvability of forager-exploiter model with generalized logistic sources in high dimensions, and Theorem 1.2 improves the previous results in [23, 26]. The proofs of Theorem 1.1 and Theorem 1.2 are based on a boundedness criterion in Proposition 3.1. This criterion is different from the known one in [3]. We use the nutrient-taxis
model as an example to see the difference of these two criteria. Dropping $v$ and its equation, system (1.1) becomes a nutrient-taxis model

$$
\begin{cases}u_{t}=\Delta u-\chi \nabla \cdot(u \nabla w)+a_{1} u-b_{1} u^{\alpha}, & x \in \Omega, \quad t>0,  \tag{1.4}\\ w_{t}=\Delta w-u w-\mu w+r, & x \in \Omega, \quad t>0, \\ \frac{\partial u}{\partial \nu}=\frac{\partial w}{\partial \nu}=0, & x \in \partial \Omega, t>0, \\ u(x, 0)=u_{0}(x), w(x, 0)=w_{0}(x), & x \in \Omega .\end{cases}
$$

The boundedness criterion in [3, Lemma 3.2] says that, the local solution of system (1.4) exists globally and remain bounded provided the $L^{p}$ regularity of $u$ with $p>\frac{N}{2}$ is uniformly bounded. Whereas, our boundedness criterion says that the condition can be replaced by the space-time $L^{p}$ regularity of $u$ with $p>\frac{N}{2}+1$.

For the Keller-Segel chemotaxis model, the classical logistic source can prevent blow-up in two space dimension ([17, 27]). Is this still true for (1.1)? Unfortunately, the conclusion in Theorem 1.2 holds for $\alpha=2$ and $\beta>2$. For the case $\beta=2$, we have to leave this problem in the future.

We next investigate the large time behavior of the solution obtained in the above theorems and see how the taxis mechanisms and logistic damping rates affect the large time behavior. Clearly, the nutrient supply $r$ is critical for the large time behavior of $w$. We shall consider two cases:

- Fast decaying resupply of nutrient, i.e.,

$$
\begin{equation*}
\int_{0}^{\infty} \int_{\Omega} r(x, t) \mathrm{d} x \mathrm{~d} t<\infty \tag{1.5}
\end{equation*}
$$

- $r$ is a positive constant.

We define

$$
\bar{u}=\left(\frac{a_{1}}{b_{1}}\right)^{\frac{1}{\alpha-1}}, \quad \bar{v}=\left(\frac{a_{2}}{b_{2}}\right)^{\frac{1}{\beta-1}}
$$

and

$$
\bar{w}=\frac{r}{\bar{u}+\bar{v}+\mu} \text { if } r \text { is a positive constant. }
$$

In the case that $r$ has fast decaying property, without any additional restrictions on the parameters, we show the large time behavior.

Theorem 1.3. Let $\alpha, \beta>\frac{N}{2}+1$ when $N>2$, and $\alpha \geq 2$ with $\beta>2$ when $N=2$. Suppose that $r$ satisfies (1.2) and (1.5). Then

$$
\|u(\cdot, t)-\bar{u}\|_{L^{\infty}(\Omega)}+\|v(\cdot, t)-\bar{v}\|_{L^{\infty}(\Omega)}+\|w(\cdot, t)\|_{L^{\infty}(\Omega)} \rightarrow 0 \text { as } t \rightarrow \infty .
$$

Furthermore, if r satisfies (1.2) and

$$
\int_{\Omega} r(\cdot, t) \leq K e^{-\delta t} \text { for all } t>0
$$

for some $K, \delta>0$, then there exist $\lambda, C>0$ such that

$$
\|u(\cdot, t)-\bar{u}\|_{L^{\infty}(\Omega)}+\|v(\cdot, t)-\bar{v}\|_{L^{\infty}(\Omega)}+\|w(\cdot, t)\|_{L^{\infty}(\Omega)} \leq C e^{-\lambda t} \text { for all } t>0 .
$$

If $r$ is a positive constant, the large time behavior reads as follows.
Theorem 1.4. Let $\alpha, \beta>\frac{N}{2}+1$ when $N>2$, and $\alpha \geq 2$ with $\beta>2$ when $N=2$. Assume that $r$ is a positive constant. Then there exist $\tilde{\chi}, \tilde{\xi}, \tilde{b}_{1}, \tilde{b}_{2}>0$ such that, once either

$$
\chi<\tilde{\chi}
$$

or

$$
b_{1}>\tilde{b}_{1} \text { and } b_{2}>\tilde{b}_{2}
$$

or

$$
b_{1}>\tilde{b}_{1} \quad \text { and } \quad \xi<\tilde{\xi}
$$

one has

$$
\|u(\cdot, t)-\bar{u}\|_{L^{\infty}(\Omega)}+\|v(\cdot, t)-\bar{v}\|_{L^{\infty}(\Omega)}+\|w(\cdot, t)-\bar{w}\|_{L^{\infty}(\Omega)} \leq C e^{-\lambda t} \quad \text { for all } t>0
$$

for some $C, \lambda>0$.
The above theorem shows that, the solution will eventually reach a co-existence homogeneous steady state provided that $\chi$ is small enough, or the logistic damping rates $b_{1}$ and $b_{2}$ are sufficiently large, or the logistic damping rate $b_{1}$ is large and $\xi$ is small enough. It seems a little surprising that the large time behavior holds for small $\chi$, without any small condition for $\xi$.

## 2 Existence and uniqueness of local solutions, some preliminaries

The following lemma asserts the local-in-time existence of the classical solutions to (1.1).
Lemma 2.1. Let $N \geq 1$ and $\alpha, \beta>1$. Then there exist $T_{\max } \in(0, \infty]$ and nonnegative functions

$$
u, v, w \in \bigcap_{q>n} C^{0}\left(\left[0, T_{\max }\right) ; W^{1, q}(\Omega)\right) \cap C^{2,1}\left(\bar{\Omega} \times\left(0, T_{\max }\right)\right)
$$

which solves (1.1) in $\left(0, T_{\max }\right)$ in the classical sense. Moreover, if $T_{\max }<\infty$, then

$$
\limsup _{t \rightarrow T_{\max }}\left(\|u(\cdot, t)\|_{W^{1, p}(\Omega)}+\|v(\cdot, t)\|_{W^{1, p}(\Omega)}+\|w(\cdot, t)\|_{W^{1, p}(\Omega)}\right)=\infty \quad \text { for all } p>n
$$

Proof. The local existence of the classical solution can be obtained by using Amann's theory, and the nonnegativity of the solution is deduced by the maximum principle (cf. [19, Lemma 2.1]).

We set from now on that $\tau=\min \left\{\frac{T_{\max }}{2}, 1\right\}$ and $\tilde{T}_{\max }=T_{\max }-\tau$. The following gives the $L^{\infty}$ bound for $w$ and some basic regularities for $u$ and $v$.

Lemma 2.2. Let $N \geq 1, \alpha, \beta>1$ and $M=\left\|w_{0}\right\|_{L^{\infty}(\Omega)}+\frac{r_{*}}{\mu}$. Then

$$
\begin{equation*}
\|w(\cdot, t)\|_{L^{\infty}(\Omega)} \leq M \quad \text { for } \quad \text { all } t \in\left(0, T_{\max }\right) \tag{2.1}
\end{equation*}
$$

and

$$
\begin{equation*}
\int_{\Omega} u \leq M_{1} \text { and } \int_{\Omega} v \leq M_{2} \text { for all } t \in\left(0, T_{\max }\right) \tag{2.2}
\end{equation*}
$$

where $M_{1}=\int_{\Omega} u_{0}+|\Omega|\left(\frac{a_{1}}{b_{1}}\right)^{\frac{1}{\alpha-1}}$ and $M_{2}=\int_{\Omega} v_{0}+|\Omega|\left(\frac{a_{2}}{b_{2}}\right)^{\frac{1}{\beta-1}}$. Moreover, there exist $C=$ $C\left(|\Omega|, \int_{\Omega} u_{0}, a_{1}, \alpha\right)>0$ and $C^{\prime}=C^{\prime}\left(|\Omega|, \int_{\Omega} v_{0}, a_{2}, \beta\right)>0$ such that

$$
\begin{equation*}
\int_{t}^{t+\tau} \int_{\Omega} u^{\alpha} \leq C b_{1}^{-1}\left(b_{1}^{-\frac{1}{\alpha-1}}+1\right) \quad \text { and } \int_{t}^{t+\tau} \int_{\Omega} v^{\beta} \leq C^{\prime} b_{2}^{-1}\left(b_{2}^{-\frac{1}{\beta-1}}+1\right) \quad \text { for all } t \in\left(0, \tilde{T}_{\max }\right) \tag{2.3}
\end{equation*}
$$

Proof. The inequality (2.1) has been proven in [19, Lemma 2.2].
A simple use of Hölder's inequality provides $|\Omega|^{1-\alpha}\left(\int_{\Omega} u\right)^{\alpha} \leq \int_{\Omega} u^{\alpha}$. We then integrate the first equation in (1.1) over $\Omega$ to get

$$
\begin{align*}
\frac{d}{d t} \int_{\Omega} u & =a_{1} \int_{\Omega} u-b_{1} \int_{\Omega} u^{\alpha} \\
& \leq a_{1} \int_{\Omega} u-b_{1}|\Omega|^{1-\alpha}\left(\int_{\Omega} u\right)^{\alpha} \quad \text { for all } t \in\left(0, T_{\max }\right) \tag{2.4}
\end{align*}
$$

which implies

$$
\begin{equation*}
\int_{\Omega} u \leq \int_{\Omega} u_{0}+|\Omega|\left(\frac{a_{1}}{b_{1}}\right)^{\frac{1}{\alpha-1}} \quad \text { for all } t \in\left(0, T_{\max }\right) \tag{2.5}
\end{equation*}
$$

Integrating (2.4) upon $(t, t+\tau)$ for $t \in\left(0, \tilde{T}_{\max }\right)$, and using (2.5), we have

$$
\int_{t}^{t+\tau} \int_{\Omega} u^{\alpha} \leq C_{1} b_{1}^{-1}\left(b_{1}^{-\frac{1}{\alpha-1}}+1\right) \quad \text { for all } t \in\left(0, \tilde{T}_{\max }\right)
$$

for some $C_{1}=C_{1}\left(|\Omega|, \int_{\Omega} u_{0}, a_{1}, \alpha\right)>0$. We thus obtain the regularity properties for $u$ in (2.2) and (2.3). The statements for $v$ in (2.2) and (2.3) can be derived by the same way.

The following lemma claims that, once we get the uniform boundedness of $u$ (resp. $v$ ), the estimation of $\nabla u($ resp. $\nabla v)$ relies on $\Delta w, \nabla w($ resp. $\Delta u, \nabla u)$.

Lemma 2.3. Let $N \geq 1$ and $\alpha, \beta>1$.
(i) Suppose that $\|u(\cdot, t)\|_{L^{\infty}(\Omega)} \leq k_{1}$ for all $t \in\left(0, T_{\max }\right)$. Then for $p>1$, there exists $C=$ $C\left(N, p,|\Omega|, k_{1}, a_{1}, \chi\right)>0$ such that

$$
\begin{equation*}
\frac{d}{d t} \int_{\Omega}|\nabla u|^{2 p}+\int_{\Omega}|\nabla u|^{2 p} \leq C\left(\int_{\Omega}|\nabla w|^{2(p+1)}+\int_{\Omega}|\Delta w|^{p+1}+1\right) \quad \text { for all } t \in\left(0, T_{\max }\right) \tag{2.6}
\end{equation*}
$$

(ii) Suppose that $\|v(\cdot, t)\|_{L^{\infty}(\Omega)} \leq k_{2}$ for all $t \in\left(0, T_{\max }\right)$. Then for $p>1$, there exists $C_{*}=$ $C_{*}\left(N, p,|\Omega|, k_{2}, a_{2}, \xi\right)>0$ such that

$$
\begin{equation*}
\frac{d}{d t} \int_{\Omega}|\nabla v|^{2 p}+\int_{\Omega}|\nabla v|^{2 p} \leq C_{*}\left(\int_{\Omega}|\nabla u|^{2(p+1)}+\int_{\Omega}|\Delta u|^{p+1}+1\right) \quad \text { for all } t \in\left(0, T_{\max }\right) \tag{2.7}
\end{equation*}
$$

Proof. By direct computations (cf. [23]), we have

$$
\begin{align*}
& \frac{1}{2 p} \frac{d}{d t} \int_{\Omega}|\nabla u|^{2 p}+\int_{\Omega}|\nabla u|^{2 p} \\
= & \int_{\Omega}|\nabla u|^{2(p-1)} \nabla u \cdot \nabla u_{t}+\int_{\Omega}|\nabla u|^{2 p} \\
= & \int_{\Omega}|\nabla u|^{2(p-1)} \nabla u \cdot \nabla\left(\Delta u-\chi \nabla \cdot(u \nabla w)+a_{1} u-b_{1} u^{\alpha}\right)+\int_{\Omega}|\nabla u|^{2 p} \\
\leq & \int_{\Omega}|\nabla u|^{2(p-1)} \nabla u \cdot \nabla \Delta u+\chi \int_{\Omega} \nabla \cdot\left(|\nabla u|^{2(p-1)} \nabla u\right)(\nabla \cdot(u \nabla w))+\left(a_{1}+1\right) \int_{\Omega}|\nabla u|^{2 p} \\
= & I(t)+J(t)+\left(a_{1}+1\right) \int_{\Omega}|\nabla u|^{2 p} \quad \text { for all } t \in\left(0, T_{\max }\right) . \tag{2.8}
\end{align*}
$$

Following the derivation of [23, (3.21)], one can find $C_{1}=C_{1}\left(N, p,|\Omega|, k_{1}, \chi\right)>0$ fulfilling

$$
\begin{align*}
& \frac{1}{2 p} \frac{d}{d t} \int_{\Omega}|\nabla u|^{2 p}+\int_{\Omega}|\nabla u|^{2 p}+\frac{1}{16} \int_{\Omega}|\nabla u|^{2(p-1)}\left|D^{2} u\right|^{2} \\
\leq & C_{1} \int_{\Omega}|\nabla w|^{2(p+1)}+C_{1} \int_{\Omega}|\Delta w|^{p+1}+\left(C_{1}+a_{1}\right) \int_{\Omega}|\nabla u|^{2 p} \quad \text { for all } t \in\left(0, T_{\max }\right) . \tag{2.9}
\end{align*}
$$

We use the third term in the left hand side of (2.9) to absorb $\left(C_{1}+a_{1}\right) \int_{\Omega}|\nabla u|^{2 p}(\mathrm{cf}$. [23, (3.22)]), it then arrives at

$$
\begin{aligned}
& \frac{1}{2 p} \frac{d}{d t} \int_{\Omega}|\nabla u|^{2 p}+\int_{\Omega}|\nabla u|^{2 p} \\
\leq & C_{2} \int_{\Omega}|\nabla w|^{2(p+1)}+C_{2} \int_{\Omega}|\Delta w|^{p+1}+C_{2} \quad \text { for all } t \in\left(0, T_{\max }\right)
\end{aligned}
$$

for some $C_{2}=C_{2}\left(N, p,|\Omega|, k_{1}, a_{1}, \chi\right)>0$. The deduction of (2.7) is similar.
We then construct a relationship between $\nabla w$ and $u, v$.
Lemma 2.4. Let $N \geq 1$. For $p \geq 1$, one can find $C=C\left(N, p,|\Omega|,\left\|w_{0}\right\|_{L^{\infty}(\Omega)}, r_{*}, \mu\right)>0$ such that

$$
\begin{equation*}
\frac{d}{d t} \int_{\Omega}|\nabla w|^{2 p}+\mu \int_{\Omega}|\nabla w|^{2 p} \leq C \int_{\Omega} u^{p+1}+C \int_{\Omega} v^{p+1}+C \quad \text { for all } t \in\left(0, T_{\max }\right) \tag{2.10}
\end{equation*}
$$

Proof. By straightforward computations, we have

$$
\begin{align*}
& \frac{1}{2 p} \frac{d}{d t} \int_{\Omega}|\nabla w|^{2 p}+\mu \int_{\Omega}|\nabla w|^{2 p} \\
= & \int_{\Omega}|\nabla w|^{2(p-1)} \nabla w \cdot \nabla w_{t}+\mu \int_{\Omega}|\nabla w|^{2 p} \\
= & \int_{\Omega}|\nabla w|^{2(p-1)} \nabla w \cdot \nabla(\Delta w-(u+v) w-\mu w+r)+\mu \int_{\Omega}|\nabla w|^{2 p} \\
= & \int_{\Omega}|\nabla w|^{2(p-1)} \nabla w \cdot \nabla \Delta w-\int_{\Omega}|\nabla w|^{2(p-1)} \nabla w \cdot \nabla(u w)-\int_{\Omega}|\nabla w|^{2(p-1)} \nabla w \cdot \nabla(v w) \\
& +\int_{\Omega}|\nabla w|^{2(p-1)} \nabla w \cdot \nabla r \\
= & I_{1}(t)+I_{2}(t)+I_{3}(t)+I_{4}(t) \quad \text { for all } t \in\left(0, T_{\max }\right) . \tag{2.11}
\end{align*}
$$

In view of [12, Lemma 2.2] and (2.1), there holds

$$
\begin{equation*}
\int_{\Omega}|\nabla w|^{2(p+1)} \leq 2\left(N+4 p^{2}\right)\|w\|_{L^{\infty}(\Omega)}^{2} \int_{\Omega}|\nabla w|^{2(p-1)}\left|D^{2} w\right|^{2} \leq \tilde{k} \int_{\Omega}|\nabla w|^{2(p-1)}\left|D^{2} w\right|^{2} \tag{2.12}
\end{equation*}
$$

for all $t \in\left(0, T_{\max }\right)$ with $\tilde{k}:=2\left(N+4 p^{2}\right) M^{2}$ where $M$ is given by Lemma 2.2 ,
Recalling (2.1), similar to the derivation of [23, (3.15)] (or [23, (4.14)]), by adjusting some parameters, one can find $C_{1}=C_{1}\left(N, p,|\Omega|,\left\|w_{0}\right\|_{L^{\infty}(\Omega)}, r_{*}, \mu\right)>0$ such that, for all $t \in\left(0, T_{\max }\right)$,

$$
\begin{equation*}
I_{1}(t) \leq-\frac{3}{4} \int_{\Omega}|\nabla w|^{2(p-1)}\left|D^{2} w\right|^{2}-\left.\left.\frac{p-1}{4} \int_{\Omega}|\nabla w|^{2(p-2)}|\nabla| \nabla w\right|^{2}\right|^{2}+C_{1} \tag{2.13}
\end{equation*}
$$

Using integration by parts, Young's inequality, (2.12) and the known inequality: $|\Delta w| \leq \sqrt{N}\left|D^{2} w\right|$, the second term on the right hand side of (2.11) can be estimated as:

$$
\begin{align*}
I_{2}(t)= & -\int_{\Omega}|\nabla w|^{2(p-1)} \nabla w \cdot \nabla(u w) \\
= & (p-1) \int_{\Omega} u w|\nabla w|^{2(p-2)} \nabla|\nabla w|^{2} \cdot \nabla w+\int_{\Omega} u w|\nabla w|^{2(p-1)} \Delta w \\
\leq & \left.\left.M(p-1) \int_{\Omega} u|\nabla w|^{2(p-2)}|\nabla| \nabla w\right|^{2}| | \nabla w\left|+M \sqrt{N} \int_{\Omega} u\right| \nabla w\right|^{2(p-1)}\left|D^{2} w\right| \\
\leq & \left.\left.\frac{p-1}{16} \int_{\Omega}|\nabla w|^{2(p-2)}|\nabla| \nabla w\right|^{2}\right|^{2}+\frac{1}{8} \int_{\Omega}|\nabla w|^{2(p-1)}\left|D^{2} w\right|^{2} \\
& +M^{2}(4(p-1)+2 N) \int_{\Omega} u^{2}|\nabla w|^{2(p-1)} \\
\leq & \left.\left.\frac{p-1}{16} \int_{\Omega}|\nabla w|^{2(p-2)}|\nabla| \nabla w\right|^{2}\right|^{2}+\frac{1}{8} \int_{\Omega}|\nabla w|^{2(p-1)}\left|D^{2} w\right|^{2} \\
& +\frac{1}{8 \tilde{k}} \int_{\Omega}|\nabla w|^{2(p+1)}+C_{2} \int_{\Omega} u^{p+1} \\
\leq & \left.\left.\frac{p-1}{16} \int_{\Omega}|\nabla w|^{2(p-2)}|\nabla| \nabla w\right|^{2}\right|^{2}+\frac{1}{4} \int_{\Omega}|\nabla w|^{2(p-1)}\left|D^{2} w\right|^{2}+C_{2} \int_{\Omega} u^{p+1} \tag{2.14}
\end{align*}
$$

for some $C_{2}=C_{2}\left(N, p,\left\|w_{0}\right\|_{L^{\infty}(\Omega)}, r_{*}, \mu\right)>0$. Similarly, $I_{3}$ can be estimated as:

$$
\begin{align*}
I_{3}(t) & =-\int_{\Omega}|\nabla w|^{2(p-1)} \nabla w \cdot \nabla(v w) \\
& \leq\left.\left.\frac{p-1}{16} \int_{\Omega}|\nabla w|^{2(p-2)}|\nabla| \nabla w\right|^{2}\right|^{2}+\frac{1}{4} \int_{\Omega}|\nabla w|^{2(p-1)}\left|D^{2} w\right|^{2}+C_{2} \int_{\Omega} v^{p+1} \tag{2.15}
\end{align*}
$$

For the last term $I_{4}$, similar to the deduction of (2.14), we find

$$
\begin{align*}
I_{4}(t) & =\int_{\Omega}|\nabla w|^{2(p-1)} \nabla w \cdot \nabla r \\
& =-(p-1) \int_{\Omega} r|\nabla w|^{2(p-2)} \nabla|\nabla w|^{2} \cdot \nabla w-\int_{\Omega} r|\nabla w|^{2(p-1)} \Delta w \\
& \leq\left.\left. r_{*}(p-1) \int_{\Omega}|\nabla w|^{2(p-2)}|\nabla| \nabla w\right|^{2}| | \nabla w\left|-r_{*} \sqrt{N} \int_{\Omega}\right| \nabla w\right|^{2(p-1)}\left|D^{2} w\right| \\
& \leq\left.\left.\frac{p-1}{16} \int_{\Omega}|\nabla w|^{2(p-2)}|\nabla| \nabla w\right|^{2}\right|^{2}+\frac{1}{8} \int_{\Omega}|\nabla w|^{2(p-1)}\left|D^{2} w\right|^{2}+r_{*}^{2}(4(p-1)+2 N) \int_{\Omega}|\nabla w|^{2(p-1)} \\
& \leq\left.\left.\frac{p-1}{16} \int_{\Omega}|\nabla w|^{2(p-2)}|\nabla| \nabla w\right|^{2}\right|^{2}+\frac{1}{8} \int_{\Omega}|\nabla w|^{2(p-1)}\left|D^{2} w\right|^{2}+\frac{1}{8 \tilde{k}} \int_{\Omega}|\nabla w|^{2(p+1)}+C_{3} \\
& \leq\left.\left.\frac{p-1}{16} \int_{\Omega}|\nabla w|^{2(p-2)}|\nabla| \nabla w\right|^{2}\right|^{2}+\frac{1}{4} \int_{\Omega}|\nabla w|^{2(p-1)}\left|D^{2} w\right|^{2}+C_{3} \tag{2.16}
\end{align*}
$$

for all $t \in\left(0, T_{\max }\right)$ for some $C_{3}=C_{3}\left(N, p,\left\|w_{0}\right\|_{L^{\infty}(\Omega)}, r_{*}, \mu\right)>0$. Plugging (2.13), (2.14)-(2.16) into (2.11), one can find $C_{4}=C_{4}\left(N, p,|\Omega|,\left\|w_{0}\right\|_{L^{\infty}(\Omega)}, r_{*}, \mu\right)>0$ such that

$$
\frac{1}{2 p} \frac{d}{d t} \int_{\Omega}|\nabla w|^{2 p}+\mu \int_{\Omega}|\nabla w|^{2 p} \leq C_{4} \int_{\Omega} u^{p+1}+C_{4} \int_{\Omega} v^{p+1}+C_{4} \quad \text { for all } t \in\left(0, T_{\max }\right) .
$$

This completes the proof.
We collect an important lemma from [23, 16, 4].

Lemma 2.5. Let $N \geq 1, T>0$ and $\theta=\min \left\{1, \frac{T}{2}\right\}$. Suppose that for some $p>1$ and $K, H>0$,

$$
\begin{equation*}
\int_{t}^{t+\theta} \int_{\Omega}|f|^{p} \leq K \quad \text { and } \quad \int_{t}^{t+\theta} \int_{\Omega}|z|^{p} \leq H \quad \text { for all } t \in(0, T-\theta) \tag{2.17}
\end{equation*}
$$

and $z \in C^{2,1}(\bar{\Omega} \times(0, T))$ solves

$$
\begin{cases}z_{t}=\Delta z+f(x, t), & x \in \Omega, \quad 0<t<T, \\ \frac{\partial z}{\partial \nu}=0, & x \in \partial \Omega, 0<t<T, \\ z(x, 0)=z_{0}(x), & x \in \Omega,\end{cases}
$$

where $z_{0} \in W^{2, \infty}(\Omega)$ with $z_{0} \geq 0$ and $\frac{\partial z_{0}}{\partial \nu}=0$ on $\partial \Omega$. Then, there is $C>0$ fulfilling

$$
\begin{equation*}
\int_{t}^{t+\theta}\left\|z_{t}\right\|_{L^{p}(\Omega)}^{p}+\int_{t}^{t+\theta}\|z\|_{W^{2, p}(\Omega)}^{p} \leq C\left(\left\|z_{0}\right\|_{W^{2, p}(\Omega)}^{p}+K+H\right) \quad \text { for all } t \in(0, T-\theta) \tag{2.18}
\end{equation*}
$$

Especially, one can find $C_{*}>0$ such that

$$
\int_{t}^{t+\theta} \int_{\Omega}|\Delta z|^{p} \leq C\left(\left\|z_{0}\right\|_{W^{2, p}(\Omega)}^{p}+K+H\right) \quad \text { for all } t \in(0, T-\theta)
$$

Proof. We used the ideas in [4, 16] to show this lemma. The proof will be split into two cases.
Case I: $T \leq 2$. It is easy to see that $\theta=T / 2$, i.e., $T=2 \theta$. Then, we use the maximal Sobolev regularity properties of the Neumann heat semigroup $\left(e^{t \Delta}\right)_{t \geq 0}(9)$ and the first inequality in (2.17) to get $C_{1}>0$ fulfilling

$$
\begin{align*}
& \int_{0}^{2 \theta}\left\|z_{t}\right\|_{L^{p}(\Omega)}^{p}+\int_{0}^{2 \theta}\|z\|_{W^{2, p}(\Omega)}^{p} \\
\leq & C_{1}\left\|z_{0}\right\|_{W^{2, p}(\Omega)}^{p}+C_{1} \int_{0}^{2 \theta}\|f\|_{L^{p}(\Omega)}^{p} \\
\leq & C_{1}\left\|z_{0}\right\|_{W^{2, p}(\Omega)}^{p}+2 C_{1} K . \tag{2.19}
\end{align*}
$$

Thus, we get (2.18) directly.
Case II: $T>2$. Clearly, we have $\theta=1$. Hence, (2.18) can be rewritten as

$$
\begin{equation*}
\int_{t}^{t+1}\left\|z_{t}\right\|_{L^{p}(\Omega)}^{p}+\int_{t}^{t+1}\|z\|_{W^{2, p}(\Omega)}^{p} \leq C\left(\left\|z_{0}\right\|_{W^{2, p}(\Omega)}^{p}+K+H\right) \quad \text { for all } t \in(0, T-1) . \tag{2.20}
\end{equation*}
$$

Let $\rho \in C^{\infty}(\mathbb{R})$ be an increasing function satisfying

$$
0 \leq \rho \leq 1 \text { in } \mathbb{R}, \quad \rho \equiv 0 \text { in }(-\infty, 0], \quad \rho \equiv 1 \text { in }(1, \infty) .
$$

It is easy to see that $\left\|\rho^{\prime}\right\|_{L^{\infty}(\mathbb{R})}=\left\|\rho^{\prime}\right\|_{L^{\infty}([0,1])}$. For arbitrary fixed $\sigma \in(0, T-2)$, we define $\rho_{\sigma}(t)=$ $\rho(t-\sigma)$. Then, $\rho_{\sigma} \in[0,1]$ and $\left\|\rho_{\sigma}^{\prime}\right\|_{L^{\infty}(\mathbb{R})}=\left\|\rho^{\prime}\right\|_{L^{\infty}(\mathbb{R})}=\left\|\rho^{\prime}\right\|_{L^{\infty}([0,1])}$. By direct computations, $\rho_{\sigma} z$ solves

$$
\begin{cases}\left(\rho_{\sigma} z\right)_{t}=\Delta\left(\rho_{\sigma} z\right)+\rho_{\sigma}^{\prime} z+\rho_{\sigma} f(x, t), & x \in \Omega, \quad t \in(\sigma, T) \\ \frac{\partial\left(\rho_{\rho} z\right)}{\partial \nu}=0, & x \in \partial \Omega, t \in(\sigma, T) \\ \left(\rho_{\sigma} z\right)(x, \sigma)=0, & x \in \Omega .\end{cases}
$$

Making use of the maximal Sobolev regularity properties of the Neumann heat semigroup $\left(e^{t \Delta}\right)_{t \geq 0}$ ([9]), there exist $C_{2}>0$ such that

$$
\int_{\sigma}^{\sigma+2}\left\|\left(\rho_{\sigma} z\right)_{t}\right\|_{L^{p}(\Omega)}^{p}+\int_{\sigma}^{\sigma+2}\left\|\rho_{\sigma} z\right\|_{W^{2, p}(\Omega)}^{p} \leq C_{2} \int_{\sigma}^{\sigma+2}\left\|\rho_{\sigma}^{\prime} z+\rho_{\sigma} f\right\|_{L^{p}(\Omega)}^{p} \quad \text { for all } \sigma \in(0, T-2)
$$

Thanks to (2.17) and the boundedness properties of $\rho_{\sigma}$, we have from the above inequality that

$$
\begin{aligned}
& \int_{\sigma}^{\sigma+2}\left\|\left(\rho_{\sigma} z\right)_{t}\right\|_{L^{p}(\Omega)}^{p}+\int_{\sigma}^{\sigma+2}\left\|\rho_{\sigma} z\right\|_{W^{2, p}(\Omega)}^{p} \\
\leq & C_{2}\left\|\rho_{\sigma}^{\prime}\right\|_{L^{\infty}(\mathbb{R})} \int_{\sigma}^{\sigma+2}\|z\|_{L^{p}(\Omega)}^{p}+C_{2} \int_{\sigma}^{\sigma+2}\|f\|_{L^{p}(\Omega)}^{p} \\
\leq & C_{3}(K+H) \quad \text { for all } \sigma \in(0, T-2),
\end{aligned}
$$

which combined with $\rho_{\sigma}=1$ in $(\sigma+1, \sigma+2)$ implies

$$
\int_{\sigma+1}^{\sigma+2}\left\|z_{t}\right\|_{L^{p}(\Omega)}^{p}+\int_{\sigma+1}^{\sigma+2}\|z\|_{W^{2, p}(\Omega)}^{p} \leq C_{3}(K+H) \quad \text { for all } \sigma \in(0, T-2)
$$

i.e.,

$$
\int_{t}^{t+1}\left\|z_{t}\right\|_{L^{p}(\Omega)}^{p}+\int_{t}^{t+1}\|z\|_{W^{2, p}(\Omega)}^{p} \leq C_{3}(K+H) \quad \text { for all } t \in(1, T-1)
$$

For $t \in(0,1]$, we have $(2.20)$ from $(2.19)$ with $\theta=1$. So, we get $(2.18)$ in the case of $T_{\max }>2$. The proof is finished.

Before ending this section, we recall from [23] a generalized version of Gronwall's inequality.
Lemma 2.6. Let $c, k>0$. Assume that for some $\hat{T} \in(0, \infty]$ and $\hat{\tau}=\min \left\{1, \frac{\hat{T}}{2}\right\}$, the nonnegative functions $y \in C([0, \hat{T})) \cap C^{1}((0, \hat{T})), z \in L_{l o c}^{1}([0, \hat{T}))$ and satisfy

$$
\begin{aligned}
& y^{\prime}(t)+c y(t) \leq z(t), \quad t \in(0, \hat{T}) \\
& \int_{t}^{t+\hat{\tau}} z(s) \mathrm{d} s \leq k, \quad t \in(0, \hat{T}-\hat{\tau})
\end{aligned}
$$

Then

$$
y(t) \leq y(0)+2 k+\frac{k}{c}, \quad t \in(0, \hat{T})
$$

## 3 A criteria governing boundedness of solutions

It is known that, the uniform-in-time $L^{\infty}$ boundedness of $u$ can be ensured by (2.2) and $L^{p}$ regularity of $\nabla w$ with $p>N$. And, Lemma 2.4 and Lemma 2.6 tell us that, we can use the spacetime integral property of $u, v$ to estimate the $L^{p}$ regularity of $\nabla w$. Hence, we obtain the uniform boundedness of $u$ provided suitable space-time regularity for $u$ and $v$. The upper bound for $u$ in the coming lemma is independent of $\chi, \xi, b_{1}, b_{2}$, which is critical for the construction of the global stability of the positive equilibrium.

Lemma 3.1. Let $N \geq 2$ and $\alpha, \beta>1$. Suppose that there exist $\bar{p}, \bar{q}>\frac{N}{2}+1$ and $K_{1}, K_{2}>0$ such that

$$
\begin{equation*}
\int_{t}^{t+\tau} \int_{\Omega} u^{\bar{q}} \leq K_{1} \text { and } \int_{t}^{t+\tau} \int_{\Omega} v^{\bar{p}} \leq K_{2} \quad \text { for all } t \in\left(0, \tilde{T}_{\text {max }}\right) . \tag{3.1}
\end{equation*}
$$

Then, there exist $C>0, \theta>1$ and $\eta=: \min \{\bar{p}, \bar{q}\}>\frac{N}{2}+1$ independent of $\chi, \xi, b_{1}, b_{2}, K_{1}, K_{2}$ fulfilling

$$
\begin{equation*}
\|\nabla w(\cdot, t)\|_{L^{2(\eta-1)}(\Omega)} \leq C\left(K_{1}+K_{2}+1\right) \quad \text { for all } t \in\left(0, T_{\max }\right) \tag{3.2}
\end{equation*}
$$

and

$$
\begin{equation*}
\|u(\cdot, t)\|_{L^{\infty}(\Omega)} \leq C\left(b_{1}^{-\frac{1}{\alpha-1}}+1\right)+C \chi^{\theta} M_{1}\left(K_{1}+K_{2}+1\right)^{\theta} \quad \text { for all } t \in\left(0, T_{\max }\right) . \tag{3.3}
\end{equation*}
$$

Proof. We use $C_{i}$ to denote the general constants appeared in the proof, which are independent of $t$ and $\chi, \xi, b_{1}, b_{2}, K_{1}, K_{2}$. Let $\kappa:=2(\eta-1)$. Clearly, $\kappa>N$. We have from (3.1) that

$$
\int_{t}^{t+\tau}\left(\int_{\Omega}\left(u^{\eta}+v^{\eta}\right)+1\right) \leq C_{1}\left(K_{1}+K_{2}+1\right) \quad \text { for all } t \in\left(0, \tilde{T}_{\max }\right)
$$

for some $C_{1}>0$. By Lemma 2.4, there are $C_{2}, C_{3}>0$ such that

$$
\frac{d}{d t} \int_{\Omega}|\nabla w|^{\kappa}+C_{2} \int_{\Omega}|\nabla w|^{\kappa} \leq C_{3}\left(\int_{\Omega}\left(u^{\eta}+v^{\eta}\right)+1\right) \quad \text { for all } t \in\left(0, T_{\max }\right)
$$

Then, in light of Lemma 2.6, we get

$$
\begin{align*}
\int_{\Omega}|\nabla w|^{\kappa} & \leq \int_{\Omega}\left|\nabla w_{0}\right|^{\kappa}+\left(2+\frac{1}{C_{2}}\right) C_{1} C_{3}\left(K_{1}+K_{2}+1\right) \\
& \leq C_{4}\left(K_{1}+K_{2}+1\right) \quad \text { for all } t \in\left(0, T_{\max }\right) \tag{3.4}
\end{align*}
$$

where $C_{4}=\int_{\Omega}\left|\nabla w_{0}\right|^{\kappa}+\left(2+\frac{1}{C_{2}}\right) C_{1} C_{3}+1$. We thus get (3.2). Since $C_{4}>1$ and $K_{1}+K_{2}+1>1$, we have from (3.4) that

$$
\begin{equation*}
\|\nabla w(\cdot, t)\|_{L^{\kappa}(\Omega)} \leq C_{4}\left(K_{1}+K_{2}+1\right) \quad \text { for all } t \in\left(0, T_{\max }\right) \tag{3.5}
\end{equation*}
$$

Let us take $N<q<\kappa$ and set $\theta:=\frac{\kappa q}{\kappa-q}>N$. We denote

$$
H(T)=\sup _{t \in(0, T)}\|u(\cdot, t)\|_{\infty}<\infty \text { for } T \in\left(0, T_{\max }\right)
$$

On the basis of a variation-of-constants representation of $u$ and the known regularized properties of $\left(e^{t \Delta}\right)_{t \geq 0}([8,24])$, one can find $\lambda_{1}, C_{5}>0$ such that

$$
\begin{align*}
\|u(\cdot, t)\|_{\infty} \leq & \left\|u_{0}\right\|_{L^{\infty}(\Omega)}+\chi \int_{0}^{t}\left\|e^{(t-s) \Delta} \nabla \cdot(u \nabla w)\right\|_{L^{\infty}(\Omega)} \mathrm{d} s+\int_{0}^{t}\left\|e^{(t-s) \Delta}\left(a_{1} u-b_{1} u^{\alpha}\right)\right\|_{L^{\infty}(\Omega)} \mathrm{d} s \\
\leq & \left\|u_{0}\right\|_{L^{\infty}(\Omega)}+\chi \int_{0}^{t}\left\|e^{(t-s) \Delta} \nabla \cdot(u \nabla w)\right\|_{L^{\infty}(\Omega)} \mathrm{d} s+\int_{0}^{t}\left\|e^{(t-s) \Delta}\left(a_{1} u-b_{1} u^{\alpha}\right)_{+}\right\|_{L^{\infty}(\Omega)} \mathrm{d} s \\
\leq & C_{5}+C_{5} \chi \int_{0}^{t}\left(1+(t-s)^{-\frac{1}{2}-\frac{N}{2 q}}\right) e^{-\lambda_{1}(t-s)}\|u \nabla w\|_{L^{q}(\Omega)} \mathrm{d} s \\
& +\int_{0}^{t}\left\|e^{(t-s) \Delta}\left(a_{1} u-b_{1} u^{\alpha}\right)_{+}\right\|_{L^{\infty}(\Omega)} \mathrm{d} s \quad \text { for all } t \in(0, T) . \tag{3.6}
\end{align*}
$$

Making use of Hölder's inequality, (3.5) and the first inequality in (2.2), we infer that, for all $t \in(0, T)$,

$$
\begin{align*}
\|u \nabla w\|_{L^{q}(\Omega)} \leq\|u\|_{\theta}\|\nabla w\|_{L^{\kappa}(\Omega)} & =\left(\int_{\Omega} u^{\theta}\right)^{\frac{1}{\theta}}\|\nabla w\|_{L^{\kappa}(\Omega)} \\
& \leq\left(\int_{\Omega} u\right)^{\frac{1}{\theta}} H^{\frac{\theta-1}{\theta}}(T)\|\nabla w\|_{L^{\kappa}(\Omega)} \\
& \leq C_{4} M_{1}^{\frac{1}{\theta}}\left(K_{1}+K_{2}+1\right) H^{\frac{\theta-1}{\theta}}(T) \tag{3.7}
\end{align*}
$$

Letting $f(u)=a_{1} u-b_{1} u^{\alpha}$, there exists $C_{6}>0$ such that

$$
\left(a_{1} u-b_{1} u^{\alpha}\right)_{+} \leq f\left(\left(\frac{a_{1}}{b_{1} \alpha}\right)^{\frac{1}{\alpha-1}}\right) \leq C_{6} b_{1}^{-\frac{1}{\alpha-1}} .
$$

In conjunction with the known regularized properties of $\left(e^{t \Delta}\right)_{t \geq 0}([24])$, this shows that

$$
\begin{align*}
& \int_{0}^{t}\left\|e^{(t-s) \Delta}\left(a_{1} u-b_{1} u^{\alpha}\right)_{+}\right\|_{L^{\infty}(\Omega)} \mathrm{d} s \\
\leq & C_{7} \int_{0}^{t} e^{-\lambda_{1}(t-s)}\left\|\left(a_{1} u-b_{1} u^{\alpha}\right)_{+}\right\|_{L^{\infty}(\Omega)} \mathrm{d} s \\
\leq & C_{8} b_{1}^{-\frac{1}{\alpha-1}} \quad \text { for all } t \in\left(0, T_{\text {max }}\right) \tag{3.8}
\end{align*}
$$

for some $C_{7}, C_{8}>0$. Inserting (3.7) and (3.8) into (3.6) yields that, for some $C_{9}>0$,

$$
\begin{aligned}
\|u(\cdot, t)\|_{\infty} \leq & C_{9}\left(b_{1}^{-\frac{1}{\alpha-1}}+1\right) \\
& +C_{9} \chi M_{1}^{\frac{1}{\theta}}\left(K_{1}+K_{2}+1\right) H^{\frac{\theta-1}{\theta}}(T) \int_{0}^{t}\left(1+(t-s)^{-\frac{1}{2}-\frac{N}{2 q}}\right) e^{-\lambda_{1}(t-s)} \mathrm{d} s, \\
\leq & C_{9}\left(b_{1}^{-\frac{1}{\alpha-1}}+1\right)+C_{10} \chi M_{1}^{\frac{1}{\theta}}\left(K_{1}+K_{2}+1\right) H^{\frac{\theta-1}{\theta}}(T) \quad \text { for all } t \in(0, T),
\end{aligned}
$$

which implies

$$
H(T) \leq C_{9}\left(b_{1}^{-\frac{1}{\alpha-1}}+1\right)+C_{10} \chi M_{1}^{\frac{1}{\theta}}\left(K_{1}+K_{2}+1\right) H^{\frac{\theta-1}{\theta}}(T) \quad \text { for all } T \in\left(0, T_{\max }\right) .
$$

Hence, thanks to Young's inequality, we have

$$
H(T) \leq C_{11}\left(b_{1}^{-\frac{1}{\alpha-1}}+1\right)+C_{11} \chi^{\theta} M_{1}\left(K_{1}+K_{2}+1\right)^{\theta}
$$

for all $T \in\left(0, T_{\max }\right)$. This combined with the definition of $H(T)$ finishes the proof.
We proceed to derive the uniform-in-time $L^{\infty}$ boundedness of $v$. Similar to the situation of $u$, the boundedness of $v$ relies on $\nabla u$. Since we have obtained the $L^{\infty}$ boundedness of $u$, Lemma 2.3(i) can be applied to estimate $\nabla u$. To achieve this, we need to establish the space-time $L^{p}$ integral property of $\Delta w$ which is ensured by the Sobolev maximal regularity asserted in Lemma 2.5.

Lemma 3.2. Let $N \geq 2$ and $\alpha, \beta>1$. Assume that for some $\bar{p}, \bar{q}>\frac{N}{2}+1$, there exist $K_{1}, K_{2}>0$ fulfiling

$$
\int_{t}^{t+\tau} \int_{\Omega} u^{\bar{q}} \leq K_{1} \quad \text { for all } t \in\left(0, \tilde{T}_{\max }\right)
$$

and

$$
\begin{equation*}
\int_{t}^{t+\tau} \int_{\Omega} v^{\bar{p}} \leq K_{2} \quad \text { for all } t \in\left(0, \tilde{T}_{\max }\right) \tag{3.9}
\end{equation*}
$$

Then there exists $C>0$ such that

$$
\begin{equation*}
\int_{\Omega}|\nabla u|^{2(\bar{p}-1)} \leq C \quad \text { for all } t \in\left(0, T_{\max }\right) \tag{3.10}
\end{equation*}
$$

and

$$
\begin{equation*}
\|v(\cdot, t)\|_{L^{\infty}(\Omega)} \leq C \quad \text { for all } t \in\left(0, T_{\max }\right) \tag{3.11}
\end{equation*}
$$

Proof. Let $f(x, t):=-(u+v) w-\mu w+r$. By (1.3), (2.1), (3.3) and (3.9), there exists $C_{1}>0$ such that

$$
\begin{equation*}
\int_{t}^{t+\tau} \int_{\Omega}|f|^{\bar{p}} \leq C_{1} \quad \text { for all } t \in\left(0, \tilde{T}_{\max }\right) \tag{3.12}
\end{equation*}
$$

It follows from (1.1) that $w$ satisfies

$$
\begin{cases}w_{t}=\Delta w+f(x, t), & x \in \Omega, \quad t>0  \tag{3.13}\\ \frac{\partial w}{\partial \nu}=0, & x \in \partial \Omega, t>0 \\ w(x, 0)=w_{0}(x), & x \in \Omega\end{cases}
$$

Thanks to (2.1) and (3.12), we apply Lemma 2.5 to (3.13) to find $C_{2}>0$ such that

$$
\begin{equation*}
\int_{t}^{t+\tau} \int_{\Omega}|\Delta w|^{\bar{p}} \leq C_{2} \quad \text { for all } t \in\left(0, \tilde{T}_{\max }\right) \tag{3.14}
\end{equation*}
$$

It follows from (3.3) and Lemma 2.3(i) that

$$
\begin{equation*}
\frac{d}{d t} \int_{\Omega}|\nabla u|^{2(\bar{p}-1)}+\int_{\Omega}|\nabla u|^{2(\bar{p}-1)} \leq C_{3}\left(\int_{\Omega}|\nabla w|^{2 \bar{p}}+\int_{\Omega}|\Delta w|^{\bar{p}}+1\right) \quad \text { for all } t \in\left(0, T_{\max }\right),( \tag{3.15}
\end{equation*}
$$

where $C_{3}>0$. In view of the Gagliardo-Nirenberg inequality and (2.1), there are $C_{4}, C_{5}>0$ such that

$$
\begin{aligned}
\int_{\Omega}|\nabla w|^{2 \bar{p}} & =\|\nabla w\|_{L^{2 \bar{p}}(\Omega)}^{2 \bar{p}} \\
& \leq C_{4}\|\Delta w\|_{L^{\bar{p}}(\Omega)}^{\bar{p}}\|w\|_{L^{\infty}(\Omega)}^{\bar{p}}+C_{4}\|w\|_{L^{\infty}(\Omega)}^{2 \bar{p}} \\
& \leq C_{5} \int_{\Omega}|\Delta w|^{\bar{p}}+C_{5}
\end{aligned}
$$

Inserting this into (3.15) yields $C_{6}>0$ fulfilling

$$
\begin{equation*}
\frac{d}{d t} \int_{\Omega}|\nabla u|^{2(\bar{p}-1)}+\int_{\Omega}|\nabla u|^{2(\bar{p}-1)} \leq C_{6} \int_{\Omega}|\Delta w|^{\bar{p}}+C_{6} \quad \text { for all } t \in\left(0, T_{\max }\right) \tag{3.16}
\end{equation*}
$$

By using (3.16), (3.14) and Lemma [2.6, there exists $C_{7}>0$ such that

$$
\begin{equation*}
\int_{\Omega}|\nabla u|^{2(\bar{p}-1)} \leq C_{7} \quad \text { for all } t \in\left(0, T_{\max }\right) \tag{3.17}
\end{equation*}
$$

We thus obtain (3.10).
It follows from $\bar{p}>\frac{N}{2}+1$ that $\hat{p}:=2(\bar{p}-1)>N$. By (3.17), there is $C_{8}>0$ such that

$$
\begin{equation*}
\int_{\Omega}|\nabla u|^{\hat{p}} \leq C_{8} \quad \text { for all } t \in\left(0, T_{\max }\right) \tag{3.18}
\end{equation*}
$$

By standard arguments paralleled to Lemma 3.1, one can deduce (3.11) by using (3.18) and (2.2).

The following provides a criterion for the global existence and boundedness of the solution.
Proposition 3.1. Let $N \geq 2$ and $\alpha, \beta>1$. Suppose that there exist $\bar{p}, \bar{q}>\frac{N}{2}+1$ and $K_{1}, K_{2}>0$ fulfiling

$$
\int_{t}^{t+\tau} \int_{\Omega} u^{\bar{q}} \leq K_{1} \quad \text { for all } t \in\left(0, \tilde{T}_{\max }\right)
$$

and

$$
\int_{t}^{t+\tau} \int_{\Omega} v^{\bar{p}} \leq K_{2} \quad \text { for all } t \in\left(0, \tilde{T}_{\max }\right) .
$$

Then $T_{\text {max }}=\infty$, and there exist $\theta \in(0,1)$ and $C>0$ fulfilling

$$
\begin{align*}
& \|u\|_{C^{2+\theta, 1+\frac{\theta}{2}}(\bar{\Omega} \times[t, t+1])}+\|v\|_{C^{2+\theta, 1+\frac{\theta}{2}}(\bar{\Omega} \times[t, t+1])} \\
& \quad+\|w\|_{C^{2+\theta, 1+\frac{\theta}{2}(\bar{\Omega} \times[t, t+1])}} \leq C \quad \text { for all } t \in(0, \infty) . \tag{3.19}
\end{align*}
$$

Proof. Let us take $p>\frac{N}{2}$ throughout this proof. Thanks to (3.3) and (3.11), we can use Lemma 2.4 and Gronwall's inequality to find $C_{1}>0$ fulfilling

$$
\begin{equation*}
\int_{\Omega}|\nabla w|^{2(p+2)} \leq C_{1} \quad \text { for all } t \in\left(0, T_{\max }\right) \tag{3.20}
\end{equation*}
$$

Again by (3.3) and (3.11), similar to the derivation of (3.14), there is $C_{2}>0$ such that

$$
\begin{equation*}
\int_{t}^{t+\tau} \int_{\Omega}|\Delta w|^{p+2} \leq C_{2} \quad \text { for all } t \in\left(0, \tilde{T}_{\max }\right) \tag{3.21}
\end{equation*}
$$

Based on (3.3), (3.20) and (3.21), we apply Lemma 2.3(i) and Lemma 2.6 to get $C_{3}>0$ fulfilling

$$
\begin{equation*}
\int_{\Omega}|\nabla u|^{2(p+1)} \leq C_{3} \quad \text { for all } t \in\left(0, \tilde{T}_{\max }\right) \tag{3.22}
\end{equation*}
$$

Rewriting the equation of $u$ in (1.1) as

$$
\begin{cases}u_{t}=\Delta u+F(x, t), & x \in \Omega, \quad t \in\left(0, T_{m}\right), \\ \frac{\partial u}{\partial \nu}=0, & x \in \partial \Omega, \quad t \in\left(0, T_{m}\right), \\ u(x, 0)=u_{0}, & x \in \Omega,\end{cases}
$$

where $F(x, t)=-\chi(\nabla u \cdot \nabla w+u \Delta w)+a_{1} u-b_{1} u^{\alpha}$. Making use of Young's inequality, (3.3), (3.20), (3.21) and (3.22), there exists $C_{4}>0$ fulfilling

$$
\int_{t}^{t+\tau} \int_{\Omega}|F(x, s)|^{p+1} \mathrm{~d} x \mathrm{~d} s \leq C_{4} \quad \text { for all } t \in\left(0, \tilde{T}_{\max }\right)
$$

This combined with (3.3) enables us to apply Lemma 2.5 to get $C_{5}>0$ such that

$$
\begin{equation*}
\int_{t}^{t+\tau} \int_{\Omega}|\Delta u|^{p+1} \leq C_{5} \quad \text { for all } t \in\left(0, \tilde{T}_{\max }\right) \tag{3.23}
\end{equation*}
$$

With (3.11) at hand, we use Lemma 2.3(ii) to get $C_{6}>0$ such that

$$
\frac{d}{d t} \int_{\Omega}|\nabla v|^{2 p}+\int_{\Omega}|\nabla v|^{2 p} \leq C_{6}\left(\int_{\Omega}|\nabla u|^{2(p+1)}+\int_{\Omega}|\Delta u|^{p+1}+1\right) \quad \text { for all } t \in\left(0, T_{\max }\right) .
$$

Then, by (3.22), (3.23) and Lemma 2.6, we have

$$
\begin{equation*}
\int_{\Omega}|\nabla v(\cdot, t)|^{2 p} \leq C_{7} \quad \text { for all } t \in\left(0, T_{\max }\right) \tag{3.24}
\end{equation*}
$$

for $C_{7}>0$.
From (2.1), (3.3), (3.11), (3.2), (3.22) and (3.24), one can find $q>N$ and $C_{8}>0$ such that

$$
\begin{equation*}
\|u(\cdot, t)\|_{W^{1, q}(\Omega)}+\|v(\cdot, t)\|_{W^{1, q}(\Omega)}+\|w(\cdot, t)\|_{W^{1, q}(\Omega)} \leq C_{8} \quad \text { for all } t \in\left(0, T_{\max }\right) \tag{3.25}
\end{equation*}
$$

This deduces that $T_{\max }=\infty$ due to Lemma (2.1). Based on (3.25), the regularities in (3.19) can be derived by a standard reasoning involving the known parabolic regularity theory in [11] (cf. [21, Theorem 2.1]).

Remark 3.1. By some minor changes, it can be shown that the criterion in Proposition 3.1 also holds for the cases that (i) $a_{1}=b_{1}=0$ and $b_{2}>0$ with $\beta>1$, (ii) $a_{2}=b_{2}=0$ and $b_{1}>0$ and $\alpha>1$, (iii) $a_{i}=b_{i}=0$ for $i=1,2$.

## 4 Boundedness for the forager-exploiter model with logistic sources

Proof of Theorem 1.1. Since $\alpha, \beta>\frac{N}{2}+1$, the conditions of Proposition 3.1 are satisfied according to (2.3). Hence, we can get Theorem 1.1 from Proposition 3.1.

The following lemma shows that one can improve the space-time regularity of $u$ provided $\alpha \geq 2$ and $\beta \geq 2$ in two dimensional setting. We also establish an explicit upper bound so that it can be used in the stability arguments.

Lemma 4.1. Let $N=2$. Suppose that $\alpha \geq 2, \beta \geq 2$. Then there exists $C>0$ independent of $\chi, \xi, b_{1}, b_{2}$ such that

$$
\begin{equation*}
\int_{t}^{t+\tau} \int_{\Omega} u^{3} \leq C\left(M_{1} \mathcal{H}_{1}\left(\mathcal{H}_{1}+\mathcal{H}_{2}\right) e^{C\left(\chi^{2}+M_{1}^{4}+1\right)\left(\mathcal{H}_{1}+\mathcal{H}_{2}\right)}+M_{1}^{3}\right) \quad \text { for all } t \in\left(0, \tilde{T}_{\text {max }}\right), \tag{4.1}
\end{equation*}
$$

where $\mathcal{H}_{1}=b_{1}^{-1}\left(b_{1}^{-\frac{1}{\alpha-1}}+1\right)+1$ and $\mathcal{H}_{2}=b_{2}^{-1}\left(b_{2}^{-\frac{1}{\beta-1}}+1\right)+1$.
Proof. The derivation of (4.1) follows the ideas of [1, Lemma 2.5] and [23, Lemma 4.1]. However, to see how $\chi, \xi, b_{1}, b_{2}$ influence the upper bound of $\int_{t}^{t+\tau} \int_{\Omega} u^{3}$, delicate analysis will be processed in the following. Keeping in mind that $\mathcal{H}_{1}, \mathcal{H}_{2}>1$. Let $f(x, t)=-(u+v) w-\mu w+r$. For the simplicity, we set

$$
\Sigma:=\left\{|\Omega|, \int_{\Omega} u_{0}, \int_{\Omega} u_{0}^{2}, \int_{\Omega} v_{0},\left\|w_{0}\right\|_{W^{2, \infty}(\Omega)}, a_{1}, a_{2}, \alpha, \beta, r_{*}, \mu\right\}
$$

By (2.3) with $\alpha, \beta \geq 2$, there exists $C_{1}=C_{1}\left(|\Omega|, \int_{\Omega} u_{0}, \int_{\Omega} v_{0}, a_{1}, a_{2}, \alpha, \beta\right)>0$ such that

$$
\begin{equation*}
\int_{t}^{t+\tau} \int_{\Omega} u^{2} \leq C_{1} \mathcal{H}_{1} \text { and } \int_{t}^{t+\tau} \int_{\Omega} v^{2} \leq C_{1} \mathcal{H}_{2} \quad \text { for all } t \in\left(0, \tilde{T}_{\text {max }}\right) . \tag{4.2}
\end{equation*}
$$

We deduce from (1.3), (2.1) and (4.2) that

$$
\int_{t}^{t+\tau} \int_{\Omega}|f|^{2} \leq C_{2}\left(\mathcal{H}_{1}+\mathcal{H}_{2}\right), \quad t \in\left(0, \tilde{T}_{\max }\right)
$$

for some $C_{2}=C_{2}(\Sigma)>0$. Recalling (2.1), an application of Lemma 2.5 yields $C_{3}=C_{3}(\Sigma)>0$ such that

$$
\begin{equation*}
\int_{t}^{t+\tau} \int_{\Omega}|\Delta w|^{2} \leq C_{3}\left(\mathcal{H}_{1}+\mathcal{H}_{2}\right) \quad \text { for all } t \in\left(0, \tilde{T}_{\text {max }}\right) \tag{4.3}
\end{equation*}
$$

Testing the first equation of (1.1) by $u$ and using (2.2), the Gagliardo-Nirenberg inequality and Young's inequality, one can find $C_{4}, C_{5}>0$ depending upon $\Sigma$ fulfilling (cf. [23, Lemma 4.1])

$$
\begin{aligned}
& \frac{d}{d t} \int_{\Omega} u^{2}+2 \int_{\Omega}|\nabla u|^{2} \\
\leq & \chi C_{4}\left(\|\nabla u\|_{2}\|u\|_{2}+M_{1}^{2}\right)\|\Delta w\|_{2}+2 a_{1} \int_{\Omega} u^{2} \\
\leq & \|\nabla u\|_{2}^{2}+C_{5}\left(\chi^{2}+M_{1}^{4}+1\right)\left(\|u\|_{2}^{2}\|\Delta w\|_{2}^{2}+\|u\|_{2}^{2}+\|\Delta w\|_{2}^{2}+1\right) \quad \text { for all } t \in\left(0, T_{\max }\right),
\end{aligned}
$$

i.e.,

$$
\begin{equation*}
z^{\prime}(t)+\int_{\Omega}|\nabla u|^{2} \leq C_{5}\left(\chi^{2}+M_{1}^{4}+1\right) z(t) h(t) \quad \text { for all } t \in\left(0, T_{\max }\right), \tag{4.4}
\end{equation*}
$$

where

$$
z(t)=\int_{\Omega}|u(\cdot, t)|^{2}+1, \quad h(t)=\int_{\Omega}|\Delta w(\cdot, t)|^{2}+1 .
$$

We next claim that, there is $C_{*}=C_{*}(\Sigma)>0$ such that

$$
\begin{equation*}
z(t)=\int_{\Omega}|u(\cdot, t)|^{2}+1 \leq C_{*} \mathcal{H}_{1} e^{C_{*}\left(\chi^{2}+M_{1}^{4}+1\right)\left(\mathcal{H}_{1}+\mathcal{H}_{2}\right)} \quad \text { for all } t \in\left(0, T_{\text {max }}\right) . \tag{4.5}
\end{equation*}
$$

For any $0 \leq \tilde{t} \leq t<T_{\max }$, we have from (4.4) that

$$
\begin{equation*}
z(t) \leq z(\tilde{t}) e^{C_{5}\left(\chi^{2}+M_{1}^{4}+1\right) \int_{\tilde{t}}^{t} h(s) \mathrm{d} s} . \tag{4.6}
\end{equation*}
$$

By (4.6) and (4.3), there is $C_{6}=C_{6}(\Sigma)>0$ such that

$$
\begin{equation*}
z(t) \leq z(0) e^{C_{5}\left(\chi^{2}+M_{1}^{4}+1\right) \int_{0}^{t} h(s) \mathrm{d} s} \leq C_{6} e^{C_{6}\left(\chi^{2}+M_{1}^{4}+1\right)\left(\mathcal{H}_{1}+\mathcal{H}_{2}\right)} \text { for } t \in[0, \tau] . \tag{4.7}
\end{equation*}
$$

If $T_{\max }<2$, then $T_{\max }=2 \tau$ by the definition of $\tau$. Thanks to (4.6), (4.3) and (4.7), one can find $C_{7}=C_{7}(\Sigma)>0$ fulfilling

$$
z(t) \leq z(\tau) e^{C_{5}\left(\chi^{2}+M_{1}^{4}+1\right) \int_{\tau}^{t} h(s) \mathrm{d} s} \leq C_{7} e^{C_{7}\left(\chi^{2}+M_{1}^{4}+1\right)\left(\mathcal{H}_{1}+\mathcal{H}_{2}\right)} \text { for } t \in\left(\tau, T_{\max }\right) .
$$

This combined with (4.7) gives $C_{8}=C_{8}(\Sigma)>0$ such that

$$
\begin{equation*}
z(t)=\int_{\Omega}|u(\cdot, t)|^{2}+1 \leq C_{8} e^{C_{8}\left(\chi^{2}+M_{1}^{4}+1\right)\left(\mathcal{H}_{1}+\mathcal{H}_{2}\right)} \quad \text { for all } t \in\left(0, T_{\max }\right) . \tag{4.8}
\end{equation*}
$$

We thus obtain (4.5) due to $\mathcal{H}_{1}>1$.
When $T_{\max } \geq 2$, we have $\tau=1$. For $t \in\left(1, T_{\max }\right)$, by the known mean value theorem and (4.2), there exists $t_{0} \in[t-1, t]$ such that

$$
z\left(t_{0}\right)=\int_{\Omega} u^{2}\left(\cdot, t_{0}\right)+1 \leq C_{1} \mathcal{H}_{1}+1 \leq\left(C_{1}+1\right) \mathcal{H}_{1}
$$

Making use of (4.3), we have

$$
\begin{aligned}
\int_{t_{0}}^{t} h(s) \mathrm{d} s=\int_{t_{0}}^{t}\left(\int_{\Omega}|\Delta w|^{2} \mathrm{~d} x+1\right) \mathrm{d} s & \leq \int_{t-1}^{t}\left(\int_{\Omega}|\Delta w|^{2} \mathrm{~d} x+1\right) \mathrm{d} s \\
& \leq C_{3}\left(\mathcal{H}_{1}+\mathcal{H}_{2}\right)+1 \leq\left(C_{3}+1\right)\left(\mathcal{H}_{1}+\mathcal{H}_{2}\right)
\end{aligned}
$$

Hence, we have from (4.6) that

$$
z(t) \leq z\left(t_{0}\right) e^{C_{5}\left(\chi^{2}+M_{1}^{4}+1\right) \int_{t_{0}}^{t} h(s) d s} \leq C_{9} \mathcal{H}_{1} e^{C_{9}\left(\chi^{2}+M_{1}^{4}+1\right)\left(\mathcal{H}_{1}+\mathcal{H}_{2}\right)} \quad \text { for all } 1<t<T_{\max } .
$$

for some $C_{9}=C_{9}(\Sigma)>0$. In conjunction with (4.7), this shows (4.5).
Inserting (4.5) into (4.4) yields

$$
\frac{d}{d t} \int_{\Omega} u^{2}+\int_{\Omega}|\nabla u|^{2} \leq C_{*} \mathcal{H}_{1} e^{C_{*}\left(\chi^{2}+M_{1}^{4}+1\right)\left(\mathcal{H}_{1}+\mathcal{H}_{2}\right)}\left(\int_{\Omega}|\Delta w|^{2}+1\right) \quad \text { for all } t \in\left(0, T_{\max }\right),
$$

which by an integration upon $(t, t+\tau)$ for $t \in\left(0, T_{\max }-\tau\right)$ implies that, for all $t \in\left(0, \tilde{T}_{\text {max }}\right)$,

$$
\int_{t}^{t+\tau} \int_{\Omega}|\nabla u|^{2} \leq \int_{\Omega} u^{2}(\cdot, t)+C_{*} \mathcal{H}_{1} e^{C_{*}\left(\chi^{2}+M_{1}^{4}+1\right)\left(\mathcal{H}_{1}+\mathcal{H}_{2}\right)}\left(\int_{t}^{t+\tau} \int_{\Omega}|\Delta w|^{2}+1\right) .
$$

By means of (4.3) and (4.5) again, one can find $C_{10}=C_{10}(\Sigma)>0$ such that

$$
\begin{equation*}
\int_{t}^{t+\tau} \int_{\Omega}|\nabla u|^{2} \leq C_{10} \mathcal{H}_{1}\left(\mathcal{H}_{1}+\mathcal{H}_{2}\right) e^{C_{10}\left(\chi^{2}+M_{1}^{4}+1\right)\left(\mathcal{H}_{1}+\mathcal{H}_{2}\right)} \quad \text { for all } t \in\left(0, T_{\max }\right) . \tag{4.9}
\end{equation*}
$$

By the Gagliardo-Nirenberg inequality, we obtain from (2.2) that

$$
\begin{aligned}
\|u\|_{L^{3}(\Omega)}^{3} & \leq C_{11}\left(\|\nabla u\|_{L^{2}(\Omega)}^{2}\|u\|_{L^{1}(\Omega)}+\|u\|_{L^{1}(\Omega)}^{3}\right) \\
& \leq C_{11}\left(M_{1}\|\nabla u\|_{L^{2}(\Omega)}^{2}+M_{1}^{3}\right) \quad \text { for all } t \in\left(0, T_{\max }\right)
\end{aligned}
$$

for some $C_{11}=C_{11}(\Sigma)>0$. This combined with (4.9) provides

$$
\int_{t}^{t+\tau} \int_{\Omega} u^{3} \leq C_{11}\left(C_{10} M_{1} \mathcal{H}_{1}\left(\mathcal{H}_{1}+\mathcal{H}_{2}\right) e^{C_{10}\left(\chi^{2}+M_{1}^{4}+1\right)\left(\mathcal{H}_{1}+\mathcal{H}_{2}\right)}+M_{1}^{3}\right) \quad \text { for all } t \in\left(0, \tilde{T}_{\text {max }}\right)
$$

This shows (4.1). The proof is end.
Proof of Theorem 1.2. From (4.1) and the second inequality in (2.3) with $\beta>2$, it is easy to see that the conditions of Proposition 3.1 are satisfied for $N=2$. Then, we get Theorem 1.2 from Proposition 3.1.

## 5 Large time behavior of the solution

The following explicit $L^{\infty}$-boundedness of $u$ plays an important role in the stability analysis in the case that $r$ is a positive constant.

Lemma 5.1. (i) Let $N>2$ and $\alpha, \beta>\frac{N}{2}+1$. Then there exist $C>0$ and $\theta>1$ independent of $\chi, \xi, b_{1}, b_{2}$ such that

$$
M_{u}:=C\left(\chi^{\theta}+1\right)\left(b_{1}^{-\frac{1}{\alpha-1}}+1\right)\left(b_{1}^{-1}\left(b_{1}^{-\frac{1}{\alpha-1}}+1\right)+b_{2}^{-1}\left(b_{2}^{-\frac{1}{\beta-1}}+1\right)+1\right)^{\theta}
$$

satisfying

$$
\begin{equation*}
\|u(\cdot, t)\|_{L^{\infty}(\Omega)} \leq M_{u} \quad \text { for all } t \in(0, \infty) \tag{5.1}
\end{equation*}
$$

(ii) Let $N=2$ and $\alpha \geq 2$ with $\beta>2$. Then there exist $C>0$ and $\theta>1$ independent of $\chi, \xi, b_{1}, b_{2}$ such that

$$
M_{u}:=C\left(b_{1}^{-\frac{1}{\alpha-1}}+1\right)+C \chi^{\theta} M_{1}\left(M_{1} \mathcal{H}_{1}\left(\mathcal{H}_{1}+\mathcal{H}_{2}\right) e^{C\left(\chi^{2}+M_{1}^{4}+1\right)\left(\mathcal{H}_{1}+\mathcal{H}_{2}\right)}+M_{1}^{3}+\mathcal{H}_{2}\right)^{\theta}
$$

fulfilling (5.1), where $\mathcal{H}_{1}=b_{1}^{-1}\left(b_{1}^{-\frac{1}{\alpha-1}}+1\right)+1$ and $\mathcal{H}_{2}=b_{2}^{-1}\left(b_{2}^{-\frac{1}{\beta-1}}+1\right)+1$.
Proof. For $N>2$, we combine (2.2), (2.3) with (3.3) to infer that

$$
\|u(\cdot, t)\|_{L^{\infty}(\Omega)} \leq C\left(\chi^{\theta}+1\right)\left(b_{1}^{-\frac{1}{\alpha-1}}+1\right)\left(b_{1}^{-1}\left(b_{1}^{-\frac{1}{\alpha-1}}+1\right)+b_{2}^{-1}\left(b_{2}^{-\frac{1}{\beta-1}}+1\right)+1\right)^{\theta}
$$

for some $C>0, \theta>1$. This shows (5.1).
For $N=2$, we use (2.2), (4.1), the second inequality in (2.3) and (3.3) to get (5.1).
The following lemma provides an inequality which does not require any additional restrictions for $r$.

Lemma 5.2. Let $N \geq 2$ and

$$
\begin{equation*}
\alpha, \beta>\frac{N}{2} \text { when } N>2 ; \quad \alpha \geq 2, \beta>2 \text { for } N=2 \text {. } \tag{5.2}
\end{equation*}
$$

Then,

$$
\begin{align*}
& \frac{d}{d t}\left\{\int_{\Omega}\left(u-\bar{u}-\bar{u} \ln \frac{u}{\bar{u}}\right)+\frac{\bar{u}}{\xi^{2} \bar{v} M_{u}^{2}} \int_{\Omega}\left(v-\bar{v}-\bar{v} \ln \frac{v}{\bar{v}}\right)\right\} \\
\leq & \frac{\chi^{2} \bar{u}}{2} \int_{\Omega}|\nabla w|^{2}-b_{1} \bar{u}^{\alpha-2} \int_{\Omega}(u-\bar{u})^{2}-\frac{b_{2} \bar{u} \bar{v}^{\beta-3}}{\xi^{2} M_{u}^{2}} \int_{\Omega}(v-\bar{v})^{2} \quad \text { for all } t \in(0, \infty) . \tag{5.3}
\end{align*}
$$

Proof. By standard calculations,

$$
\begin{align*}
& \frac{d}{d t} \int_{\Omega}\left(u-\bar{u}-\bar{u} \ln \frac{u}{\bar{u}}\right) \\
= & -\bar{u} \int_{\Omega} \frac{|\nabla u|^{2}}{u^{2}}-\chi \bar{u} \int_{\Omega} \frac{\nabla u \cdot \nabla w}{u}-b_{1} \int_{\Omega}(u-\bar{u})\left(u^{\alpha-1}-\bar{u}^{\alpha-1}\right) \\
\leq & -\frac{\bar{u}}{2} \int_{\Omega} \frac{|\nabla u|^{2}}{u^{2}}+\frac{\chi^{2} \bar{u}}{2} \int_{\Omega}|\nabla w|^{2}-b_{1} \bar{u}^{\alpha-2} \int_{\Omega}(u-\bar{u})^{2} \\
\leq & -\frac{\bar{u}}{2 M_{u}^{2}} \int_{\Omega}|\nabla u|^{2}+\frac{\chi^{2} \bar{u}}{2} \int_{\Omega}|\nabla w|^{2}-b_{1} \bar{u}^{\alpha-2} \int_{\Omega}(u-\bar{u})^{2}, \tag{5.4}
\end{align*}
$$

where we have used Young's inequality, (5.1) and a basic inequality (cf. [7, (4.14)]). Similarly,

$$
\begin{align*}
& \frac{d}{d t} \int_{\Omega}\left(v-\bar{v}-\bar{v} \ln \frac{v}{\bar{v}}\right) \\
\leq & -\frac{\bar{v}}{2} \int_{\Omega} \frac{|\nabla v|^{2}}{v^{2}}+\frac{\xi^{2} \bar{v}}{2} \int_{\Omega}|\nabla u|^{2}-b_{2} \bar{v}^{\beta-2} \int_{\Omega}(v-\bar{v})^{2} \\
\leq & \frac{\xi^{2} \bar{v}}{2} \int_{\Omega}|\nabla u|^{2}-b_{2} \bar{v}^{\beta-2} \int_{\Omega}(v-\bar{v})^{2} . \tag{5.5}
\end{align*}
$$

Multiplying (5.5) by $\frac{\bar{u}}{\xi^{2} \bar{v} M_{u}^{2}}$ and adding the obtained result to (5.4), we get

$$
\begin{aligned}
& \frac{d}{d t}\left\{\int_{\Omega}\left(u-\bar{u}-\bar{u} \ln \frac{u}{\bar{u}}\right)+\frac{\bar{u}}{\xi^{2} \bar{v} M_{u}^{2}} \int_{\Omega}\left(v-\bar{v}-\bar{v} \ln \frac{v}{\bar{v}}\right)\right\} \\
\leq & \frac{\chi^{2} \bar{u}}{2} \int_{\Omega}|\nabla w|^{2}-b_{1} \bar{u}^{\alpha-2} \int_{\Omega}(u-\bar{u})^{2}-\frac{b_{2} \bar{u} \bar{v}^{\beta-3}}{\xi^{2} M_{u}^{2}} \int_{\Omega}(v-\bar{v})^{2} .
\end{aligned}
$$

This shows (5.3).

### 5.1 Global stability of $(\bar{u}, \bar{v}, 0)$

With fast decaying property (1.5), the large time behavior of the solution reads as follows.
Lemma 5.3. Suppose that (1.2) and (1.5) hold as well as

$$
\alpha, \beta>\frac{N}{2} \text { when } N>2 ; \quad \alpha \geq 2, \beta>2 \text { for } N=2 .
$$

Then,

$$
\begin{equation*}
\|u(\cdot, t)-\bar{u}\|_{L^{\infty}(\Omega)}+\|v(\cdot, t)-\bar{v}\|_{L^{\infty}(\Omega)}+\|w(\cdot, t)\|_{L^{\infty}(\Omega)} \rightarrow 0 \quad \text { as } \quad t \rightarrow \infty . \tag{5.6}
\end{equation*}
$$

Proof. Using (2.1), it is easy to get

$$
\begin{align*}
\frac{1}{2} \frac{d}{d t} \int_{\Omega} w^{2} & =-\int_{\Omega}|\nabla w|^{2}-\int_{\Omega}(u+v) w^{2}-\mu \int_{\Omega} w^{2}+\int_{\Omega} r w \\
& \leq-\int_{\Omega}|\nabla w|^{2}-\mu \int_{\Omega} w^{2}+M \int_{\Omega} r \quad \text { for all } t \in(0, \infty) . \tag{5.7}
\end{align*}
$$

Multiplying (5.7) by $\frac{\chi^{2} \bar{u}}{2}$ and adding the obtained result to (5.3) to get

$$
\begin{align*}
& \frac{d}{d t}\left\{\int_{\Omega}\left(u-\bar{u}-\bar{u} \ln \frac{u}{\bar{u}}\right)+\frac{\bar{u}}{\xi^{2} \bar{v} M_{u}^{2}} \int_{\Omega}\left(v-\bar{v}-\bar{v} \ln \frac{v}{\bar{v}}\right)+\frac{\chi^{2} \bar{u}}{4} \int_{\Omega} w^{2}\right\} \\
\leq & -b_{1} \bar{u}^{\alpha-2} \int_{\Omega}(u-\bar{u})^{2}-\frac{b_{2} \bar{u} \bar{v}^{\beta-3}}{\xi^{2} M_{u}^{2}} \int_{\Omega}(v-\bar{v})^{2}-\frac{\chi^{2} \bar{u} \mu}{2} \int_{\Omega} w^{2}+\frac{\chi^{2} \bar{u} M}{2} \int_{\Omega} r \tag{5.8}
\end{align*}
$$

for all $t \in(0, \infty)$. Let

$$
\mathcal{E}(t):=\int_{\Omega}\left(u-\bar{u}-\bar{u} \ln \frac{u}{\bar{u}}\right)+\frac{\bar{u}}{\xi^{2} \bar{v} M_{u}^{2}} \int_{\Omega}\left(v-\bar{v}-\bar{v} \ln \frac{v}{\bar{v}}\right)+\frac{\chi^{2} \bar{u}}{4} \int_{\Omega} w^{2},
$$

and

$$
\mathcal{F}(t):=b_{1} \bar{u}^{\alpha-2} \int_{\Omega}(u-\bar{u})^{2}+\frac{b_{2} \bar{u} \bar{v}^{\beta-3}}{\xi^{2} M_{u}^{2}} \int_{\Omega}(v-\bar{v})^{2}+\frac{\chi^{2} \bar{u} \mu}{2} \int_{\Omega} w^{2} .
$$

Then it follows from (5.8) that

$$
\begin{equation*}
\mathcal{E}^{\prime}(t) \leq-\mathcal{F}(t)+\frac{\chi^{2} \bar{u} M}{2} \int_{\Omega} r \quad \text { for all } t \in(0, \infty) . \tag{5.9}
\end{equation*}
$$

Noting that $\mathcal{E}(t) \geq 0$ for any $t>0$, integrating (5.9) over $(1, \infty)$ and using (1.5), we have

$$
\int_{1}^{\infty} \mathcal{F}(t) \mathrm{d} t \leq \mathcal{E}(1)+\frac{\chi^{2} \bar{u} M}{2} \int_{1}^{\infty} \int_{\Omega} r<\infty .
$$

By the regularity of $(u, v, w)$ in (3.19), we know that $\mathcal{F}(t)$ is uniformly continuous in $[1, \infty)$. Making use of Barbalat's Lemma (cf. [1, [2]), it follows that $\mathcal{F}(t) \rightarrow 0$ as $t \rightarrow 0$, i.e.,

$$
\begin{equation*}
\int_{\Omega}(u(\cdot, t)-\bar{u})^{2}+\int_{\Omega}(v(\cdot, t)-\bar{v})^{2}+\int_{\Omega} w^{2} \rightarrow 0 \text { as } t \rightarrow 0 . \tag{5.10}
\end{equation*}
$$

Again by the regularities in (3.19), the $W^{1, \infty}(\Omega)$-norm of $(u, v, w)$ is bounded. Hence, we can apply the Gagliardo-Nirenberg inequality to get

$$
\begin{aligned}
\|u-\bar{u}\|_{L^{\infty}(\Omega)} & \leq C_{1}\|u-\bar{u}\|_{W^{1, \infty}(\Omega)}^{N /(N+2)}\|u-\bar{u}\|_{L^{2}(\Omega)}^{2 /(N+2)} \\
& \leq C_{2}\|u-\bar{u}\|_{L^{2}(\Omega)}^{2 /(N+2)} \quad \text { for all } t \in(0, \infty)
\end{aligned}
$$

for some $C_{1}, C_{2}>0$. This combined with (5.10) gives the $L^{\infty}$ convergence statement of $u$ in (5.6). By the same arguments, one can get the convergence statements of $v$ and $w$. The proof is finished.

Lemma 5.4. Let $\alpha, \beta>\frac{N}{2}+1$ for $N>2$ and $\alpha \geq 2, \beta>2$ for $N=2$. Suppose that $r$ satisfies (1.2) and

$$
\begin{equation*}
\int_{\Omega} r(\cdot, t) \leq K e^{-\lambda t} \quad \text { for all } t>0 \tag{5.11}
\end{equation*}
$$

for some $K, \lambda>0$. Then, there exist $\kappa, C>0$ such that

$$
\begin{equation*}
\|u(\cdot, t)-\bar{u}\|_{L^{\infty}(\Omega)}+\|v(\cdot, t)-\bar{v}\|_{L^{\infty}(\Omega)}+\|w(\cdot, t)\|_{L^{\infty}(\Omega)} \leq C e^{-\kappa t} \quad \text { for all } t>0 . \tag{5.12}
\end{equation*}
$$

Proof. The following formula for $f(x)=x-a \ln x$ with $a>0$ is a consequence deduced by using L'Hôpital's rule

$$
\lim _{x \rightarrow a} \frac{f(x)-f(a)}{(x-a)^{2}}=\lim _{x \rightarrow a} \frac{f^{\prime}(x)}{2(x-a)}=\frac{1}{2 a} .
$$

Recalling (5.6), there is $t_{0}>0$ such that, for all $t>t_{0}$,

$$
\begin{align*}
& \frac{1}{4 \bar{u}} \int_{\Omega}(u-\bar{u})^{2} \leq \int_{\Omega}\left(u-\bar{u}-\bar{u} \ln \frac{u}{\bar{u}}\right) \leq \frac{1}{\bar{u}} \int_{\Omega}(u-\bar{u})^{2}  \tag{5.13}\\
& \frac{1}{4 \bar{u}} \int_{\Omega}(v-\bar{v})^{2} \leq \int_{\Omega}\left(v-\bar{v}-\bar{v} \ln \frac{v}{\bar{v}}\right) \leq \frac{1}{\bar{v}} \int_{\Omega}(v-\bar{v})^{2} \tag{5.14}
\end{align*}
$$

Thanks to the right inequalities in (5.13) and (5.14), one can find $C_{1}>0$ fulfilling

$$
\mathcal{E}(t) \leq \frac{1}{C_{1}} \mathcal{F}(t) \quad \text { for all } t>t_{0}
$$

where $\mathcal{E}(t)$ and $\mathcal{F}(t)$ are given in the proof of Lemma 5.3. Plugging this into (5.9) gives

$$
\mathcal{E}^{\prime}(t) \leq-\mathcal{F}(t)+\frac{\chi^{2} \bar{u} M}{2} \int_{\Omega} r \leq-C_{1} \mathcal{E}(t)+\frac{\chi^{2} \bar{u} M}{2} \int_{\Omega} r \quad \text { for all } t>t_{0}
$$

Hence, we have from this that

$$
\begin{align*}
\mathcal{E}(t) & \leq e^{-C_{1}\left(t-t_{0}\right)} \mathcal{E}\left(t_{0}\right)+\frac{\chi^{2} \bar{u} M}{2} e^{-C_{1} t} \int_{t_{0}}^{t}\left(e^{C_{1} s} \int_{\Omega} r(x, s) \mathrm{d} x\right) \mathrm{d} s \\
& \leq \mathcal{E}\left(t_{0}\right) e^{C_{1} t_{0}} e^{-C_{1} t}+\frac{K \chi^{2} \bar{u} M}{2} e^{-C_{1} t} \int_{t_{0}}^{t} e^{\left(C_{1}-\lambda\right) s} \mathrm{~d} s \\
& \leq C_{2} e^{-\theta_{1} t} \quad \text { for all } t>t_{0} \tag{5.15}
\end{align*}
$$

for some $C_{2}, \theta_{1}>0$ where we used (5.11). According to the left inequalities in (5.13) and (5.14), we use (5.15) to find $C_{3}>0$ fulfilling

$$
\mathcal{F}(t) \leq C_{3} e^{-\theta_{1} t}
$$

which implies

$$
\int_{\Omega}(u-\bar{u})^{2}+\int_{\Omega}(v-\bar{v})^{2}+\int_{\Omega} w^{2} \leq C_{4} e^{-\theta_{1} t} \quad \text { for all } t>t_{0}
$$

for some $C_{4}>0$. Again by the uniform $W^{1, \infty}(\Omega)$-boundedness of $(u, v, w)$ and the GagliardoNirenberg inequality, we infer (5.12).

Proof of Theorem 1.3. We combine Lemma 5.3 and Lemma 5.4 to get the desired conclusion.

### 5.2 Global stability of $(\bar{u}, \bar{v}, \bar{w})$

Lemma 5.5. Let $r$ be a positive constant and suppose that (5.2) holds. Then there exist $\tilde{\chi}, \tilde{\xi}, \tilde{b}_{1}, \tilde{b}_{2}>0$ such that, once either $\chi<\tilde{\chi}$ or $b_{1}>\tilde{b}_{1}$ and $b_{2}>\tilde{b}_{2}$ or $b_{1}>\tilde{b}_{1}$ and $\xi<\tilde{\xi}$, one has

$$
\begin{equation*}
\|u(\cdot, t)-\bar{u}\|_{L^{\infty}(\Omega)}+\|v(\cdot, t)-\bar{v}\|_{L^{\infty}(\Omega)}+\|w(\cdot, t)-\bar{w}\|_{L^{\infty}(\Omega)} \rightarrow 0 \text { as } t \rightarrow \infty . \tag{5.16}
\end{equation*}
$$

Proof. First of all, we claim that

$$
\begin{equation*}
b_{1} \bar{u}^{\alpha-2}-\frac{\chi^{2} \bar{u} M^{3}}{2 r}>0 \text { and } \frac{b_{2} \bar{u} \bar{u}^{\beta-3}}{\xi^{2} M_{u}^{2}}-\frac{\chi^{2} \bar{u} M^{3}}{2 r}>0 \tag{5.17}
\end{equation*}
$$

holds for small $\chi$ or large $b_{1}$ and $b_{2}$ or large $b_{1}$ and small $\xi$. Since the discussion of case $N=2$ is same with the case $N>2$, we only get the arguments of $N>2$. We recall from Lemma 5.1(i) that

$$
M_{u}:=C_{1}\left(\chi^{\theta}+1\right)\left(b_{1}^{-\frac{1}{\alpha-1}}+1\right)\left(b_{1}^{-1}\left(b_{1}^{-\frac{1}{\alpha-1}}+1\right)+b_{2}^{-1}\left(b_{2}^{-\frac{1}{\beta-1}}+1\right)+1\right)^{\theta}
$$

for some $C_{1}>0, \theta>1$ independent of $\chi, \xi, b_{1}, b_{2}$. Inserting this into (5.17) and using the definitions of $\bar{u}$ and $\bar{v}$, one can find $C_{2}, C_{3}, C_{4}, C_{5}>0$ independent of $\chi, \xi, b_{1}, b_{2}$ such that (5.17) can be written as

$$
\begin{equation*}
C_{2} b_{1}^{\frac{1}{\alpha-1}}-C_{3} \chi^{2} b_{1}^{-\frac{1}{\alpha-1}}>0 \tag{5.18}
\end{equation*}
$$

and

$$
\begin{equation*}
\frac{C_{4} b_{1}^{-\frac{1}{\alpha-1}} b_{2}^{\frac{2}{\beta-1}}}{\xi^{2}\left(\chi^{\theta}+1\right)\left(b_{1}^{-\frac{1}{\alpha-1}}+1\right)\left(b_{1}^{-1}\left(b_{1}^{-\frac{1}{\alpha-1}}+1\right)+b_{2}^{-1}\left(b_{2}^{-\frac{1}{\beta-1}}+1\right)+1\right)^{\theta}}-C_{5} \chi^{2} b_{1}^{-\frac{1}{\alpha-1}}>0 \tag{5.19}
\end{equation*}
$$

The inequalities (5.18) and (5.19) can be satisfied in the following three cases:

- Small $\chi$ : There is $\tilde{\chi}=\tilde{\chi}\left(\xi, b_{1}, b_{2}\right)>0$ such that (5.18) and (5.19) hold for $\chi<\tilde{\chi}$.
- Large $b_{1}$ and $b_{2}$ : There exist $\tilde{b}_{1}=\tilde{b}_{1}(\chi)>0$ and $\tilde{b}_{2}=\tilde{b}_{2}\left(\chi, \xi, b_{1}\right)>0$ such that (5.18) and (5.19) hold for $b_{1}>\tilde{b}_{1}$ and $b_{2}>\tilde{b}_{2}$.
- Large $b_{1}$ and small $\xi$ : One can find $\tilde{b}_{1}=\tilde{b}_{1}(\chi)>0$ and $\tilde{\xi}>0$ depending on $\chi, b_{1}, b_{2}$ such that (5.18) and (5.19) hold for $b_{1}>\tilde{b}_{1}$ and $\xi<\tilde{\xi}$.

Therefore, (5.17) holds under the conditions of this lemma.
By honest computations, we have

$$
\begin{align*}
& \frac{d}{d t} \int_{\Omega}\left(w-\bar{w}-\bar{w} \ln \frac{w}{\bar{w}}\right) \\
&=-\bar{w} \int_{\Omega} \frac{|\nabla w|^{2}}{w^{2}}+\int_{\Omega}(w-\bar{w})\left(-(u+v)-\mu+\frac{r}{w}\right) \\
& \leq-\frac{\bar{w}}{M^{2}} \int_{\Omega}|\nabla w|^{2}+\int_{\Omega}(w-\bar{w})\left[(\bar{u}-u)+(\bar{v}-v)+\frac{r(\bar{w}-w)}{\bar{w} w}\right] \\
& \leq-\frac{\bar{w}}{M^{2}} \int_{\Omega}|\nabla w|^{2}-\int_{\Omega}(u-\bar{u})(w-\bar{w})-\int_{\Omega}(v-\bar{v})(w-\bar{w})-\int_{\Omega} \frac{r}{\bar{w} w}(w-\bar{w})^{2} \\
& \leq-\frac{\bar{w}}{M^{2}} \int_{\Omega}|\nabla w|^{2}-\int_{\Omega}(u-\bar{u})(w-\bar{w})-\int_{\Omega}(v-\bar{v})(w-\bar{w})-\frac{r}{\bar{w} M} \int_{\Omega}(w-\bar{w})^{2} \\
& \leq-\frac{\bar{w}}{M^{2}} \int_{\Omega}|\nabla w|^{2}+\frac{\bar{w} M}{r} \int_{\Omega}(u-\bar{u})^{2}+\frac{\bar{w} M}{r} \int_{\Omega}(v-\bar{v})^{2}-\frac{r}{2 \bar{w} M} \int_{\Omega}(w-\bar{w})^{2} \tag{5.20}
\end{align*}
$$

for all $t \in(0, \infty)$. We multiply (5.20) with $\frac{\chi^{2} \bar{u} M^{2}}{2 \bar{w}}$ and add the obtained result to (5.3) to eliminate $\int_{\Omega}|\nabla w|^{2}$, i.e.,

$$
\begin{align*}
& \frac{d}{d t}\left\{\int_{\Omega}\left(u-\bar{u}-\bar{u} \ln \frac{u}{\bar{u}}\right)+\frac{\bar{u}}{\xi^{2} \bar{v} M_{u}^{2}} \int_{\Omega}\left(v-\bar{v}-\bar{v} \ln \frac{v}{\bar{v}}\right)+\frac{\chi^{2} \bar{u} M^{2}}{2 \bar{w}} \int_{\Omega}\left(w-\bar{w}-\bar{w} \ln \frac{w}{\bar{w}}\right)\right\} \\
\leq & -\left(b_{1} \bar{u}^{\alpha-2}-\frac{\chi^{2} \bar{u} M^{3}}{2 r}\right) \int_{\Omega}(u-\bar{u})^{2}-\left(\frac{b_{2} \bar{u} \bar{v}^{\beta-3}}{\xi^{2} M_{u}^{2}}-\frac{\chi^{2} \bar{u} M^{3}}{2 r}\right) \int_{\Omega}(v-\bar{v})^{2} \\
& -\frac{r \chi^{2} \bar{u} M}{4 \bar{w}^{2}} \int_{\Omega}(w-\bar{w})^{2} \quad \text { for all } t \in(0, \infty) \tag{5.21}
\end{align*}
$$

where the coefficients in the right side are all positive according to (5.17). By letting

$$
\mathcal{E}_{1}(t)=\int_{\Omega}\left(u-\bar{u}-\bar{u} \ln \frac{u}{\bar{u}}\right)+\frac{\bar{u}}{\xi^{2} \bar{v} M_{u}^{2}} \int_{\Omega}\left(v-\bar{v}-\bar{v} \ln \frac{v}{\bar{v}}\right)+\frac{\chi^{2} \bar{u} M^{2}}{2 \bar{w}} \int_{\Omega}\left(w-\bar{w}-\bar{w} \ln \frac{w}{\bar{w}}\right)
$$

and

$$
\begin{aligned}
\mathcal{F}_{1}(t)= & \left(b_{1} \bar{u}^{\alpha-2}-\frac{\chi^{2} \bar{u} M^{3}}{2 r}\right) \int_{\Omega}(u-\bar{u})^{2}+\left(\frac{b_{2} \bar{u} \bar{v}^{\beta-3}}{\xi^{2} M_{u}^{2}}-\frac{\chi^{2} \bar{u} M^{3}}{2 r}\right) \int_{\Omega}(v-\bar{v})^{2} \\
& +\frac{r \chi^{2} \bar{u} M}{4 \bar{w}^{2}} \int_{\Omega}(w-\bar{w})^{2}
\end{aligned}
$$

we have from (5.21) that

$$
\begin{equation*}
\mathcal{E}_{1}^{\prime}(t) \leq-\mathcal{F}_{1}(t) \quad \text { for all } t \in(0, \infty) \tag{5.22}
\end{equation*}
$$

Clearly, $\mathcal{E}_{1}(t), \mathcal{F}_{1}(t) \geq 0$ for any $t>0$. Parallel to the arguments performed in Lemma 5.3, one can show (5.16).

Proof of Theorem 1.4, With (5.16) and (5.22) at hand, similar to the arguments in Lemma 5.4 (cf. [1, 21, 22]), one can easily show the conclusion.
