

# SOME RESULTS ON VARIABLE GAUSSIAN BESOV-LIPSCHITZ AND VARIABLE GAUSSIAN TRIEBEL-LIZORKIN SPACES.

EBNER PINEDA, LUZ RODRIGUEZ, AND WILFREDO O. URBINA

**ABSTRACT.** In a previous paper [6] two of the authors introduced and study Gaussian Besov-Lipschitz spaces  $B_{p,q}^\alpha(\gamma_d)$  and Gaussian Triebel-Lizorkin spaces  $F_{p,q}^\alpha(\gamma_d)$ . Now, in this paper we introduce the variable Gaussian Besov-Lipschitz spaces  $B_{p(\cdot),q(\cdot)}^\alpha(\gamma_d)$  and the variable Gaussian Triebel-Lizorkin spaces  $F_{p(\cdot),q(\cdot)}^\alpha(\gamma_d)$ , that is to say, Gaussian Besov-Lipschitz and Triebel-Lizorkin spaces with variable exponents, following [7] and [6] under certain additional regularity conditions on the exponents  $p(\cdot)$  and  $q(\cdot)$  introduced by Dalmasso and Scotto in [7]. Trivially, they include the Gaussian Besov-Lipschitz spaces  $B_{p,q}^\alpha(\gamma_d)$  and Gaussian Triebel-Lizorkin spaces  $F_{p,q}^\alpha(\gamma_d)$ . We consider some inclusion relations of those spaces and finally we also prove some interpolation results for them.

## 1. INTRODUCTION AND PRELIMINARIES

Let us consider the Gaussian measure

$$(1.1) \quad \gamma_d(dx) = \frac{e^{-\|x\|^2}}{\pi^{d/2}} dx, \quad x \in \mathbb{R}^d$$

on  $\mathbb{R}^d$  and the Ornstein-Uhlenbeck differential operator

$$(1.2) \quad L = \frac{1}{2} \Delta_x - \langle x, \nabla_x \rangle.$$

Let  $\nu = (\nu_1, \dots, \nu_d)$  be a multi-index such that  $\nu_i \geq 0, i = 1, \dots, d$ , let  $\nu! = \prod_{i=1}^d \nu_i!$ ,  $|\nu| = \sum_{i=1}^d \nu_i$ ,  $\partial_i = \frac{\partial}{\partial x_i}$ , for each  $1 \leq i \leq d$  and  $\partial^\nu = \partial_1^{\nu_1} \dots \partial_d^{\nu_d}$ .

Consider the normalized Hermite polynomials of order  $\nu$  in  $d$  variables,

$$(1.3) \quad h_\nu(x) = \frac{1}{(2^{|\nu|}\nu!)^{1/2}} \prod_{i=1}^d (-1)^{\nu_i} e^{x_i^2} \partial_i^{\nu_i} (e^{-x_i^2}).$$

The *Ornstein-Uhlenbeck semigroup* on  $\mathbb{R}^d$  is defined by

$$T_t f(x) = \frac{1}{(1 - e^{-2t})^{d/2}} \int_{\mathbb{R}^d} e^{-\frac{e^{-2t}(|x|^2+|y|^2)-2e^{-t}\langle x,y \rangle}{1-e^{-2t}}} f(y) \gamma_d(dy).$$

Using the *Bochner subordination formula*

$$(1.4) \quad e^{-\lambda} = \frac{1}{\sqrt{\pi}} \int_0^\infty \frac{e^{-u}}{\sqrt{u}} e^{-\lambda^2/4u} du,$$

---

2010 *Mathematics Subject Classification.* Primary 42B25, 42B35; Secondary 46E30, 47G10.

*Key words and phrases.* Hermite expansions, variable exponent, Besov-Lipschitz, Triebel-Lizorkin, Gaussian measure.

we introduce the *Poisson-Hermite semigroup* by

$$(1.5) \quad P_t f(x) = \frac{1}{\sqrt{\pi}} \int_0^\infty \frac{e^{-u}}{\sqrt{u}} T_{t^2/4u} f(x) du.$$

Now, taking the change of variables  $s = \frac{t^2}{4u}$ ,  $P_t f(x)$  can be written as

$$(1.6) \quad P_t f(x) = \int_0^\infty T_s f(x) \mu_t^{(1/2)}(ds),$$

where

$$\mu_t^{(1/2)}(ds) = \frac{t}{2\sqrt{\pi}} e^{-t^2/4s} s^{-3/2} ds,$$

is the *one-sided stable measure on  $(0, \infty)$  of order  $1/2$* .

It is easy to see that  $\mu_t^{(1/2)}$  is a probability measure on  $(0, \infty)$ .

It is well known, that the Hermite polynomials are eigenfunctions of the operator  $L$ ,

$$(1.7) \quad L h_\nu(x) = -|\nu| h_\nu(x).$$

In consequence

$$(1.8) \quad T_t h_\nu(x) = e^{-t|\nu|} h_\nu(x),$$

and

$$(1.9) \quad P_t h_\nu(x) = e^{-t\sqrt{|\nu|}} h_\nu(x),$$

i.e. the Hermite polynomials are also eigenfunctions of  $T_t$  and  $P_t$  for any  $t \geq 0$ , for more details, see [10].

Next, we present some technical results for the measure  $\mu_t^{(1/2)}$  needed in what follows. First, as  $\mu_t^{(1/2)}(ds) = \frac{t}{2\sqrt{\pi}} \frac{e^{-t^2/4s}}{s^{3/2}} ds = g(t, s) ds$ , for any  $k \in \mathbb{N}$ , we use the notation  $\frac{\partial^k}{\partial t^k} \mu_t^{(1/2)}(ds)$  for

$$(1.10) \quad \frac{\partial^k}{\partial t^k} \mu_t^{(1/2)}(ds) := \frac{\partial^k g(t, s)}{\partial t^k} ds.$$

**Lemma 1.1.** *Given  $k \in \mathbb{N}$*

$$(1.11) \quad \frac{\partial^k \mu_t^{(1/2)}}{\partial t^k}(ds) = \left( \sum_{i,j} a_{i,j} \frac{t^i}{s^j} \right) \mu_t^{(1/2)}(ds)$$

where  $\{a_{i,j}\}$  is a finite set of constants and the indexes  $i \in \mathbb{Z}$ ,  $j \in \mathbb{N}$  verifies the equation  $2j - i = k$ .

**Lemma 1.2.** *Given  $k \in \mathbb{N}$  and  $t > 0$*

$$\int_0^{+\infty} \frac{1}{s^k} \mu_t^{(1/2)}(ds) = \frac{C_k}{t^{2k}},$$

where  $C_k = \frac{2^{2k} \Gamma(k + \frac{1}{2})}{\pi^{\frac{1}{2}}}$ .

**Corollary 1.1.** *Given  $k \in \mathbb{N}$  and  $t > 0$*

$$(1.12) \quad \int_0^{+\infty} \left| \frac{\partial^k \mu_t^{(1/2)}}{\partial t^k} \right| (ds) \leq \frac{C_k}{t^k}.$$

On the other hand, by considering the *maximal function of the Ornstein-Uhlenbeck semigroup*

$$T^* f(x) = \sup_{t>0} |T_t f(x)|,$$

we obtain the inequality:

**Lemma 1.3.** *Let  $f \in L^1(\gamma_d)$ ,  $x \in \mathbb{R}^d$  and  $k \in \mathbb{N}$*

$$(1.13) \quad \left| \frac{\partial^k P_t f(x)}{\partial t^k} \right| \leq C_k T^* f(x) t^{-k}, \quad \forall t > 0.$$

For the proofs of these technical results, see [6] or [10].

Now, for completeness, we need some background on variable Lebesgue spaces with respect to a Borel measure  $\mu$ .

A  $\mu$ -measurable function  $p(\cdot) : \Omega \subset \mathbb{R}^d \rightarrow [1, \infty]$  is said to be an *exponent function*; the set of all the exponent functions will be denoted by  $\mathcal{P}(\Omega, \mu)$ . For  $E \subset \Omega$  we set

$$p_-(E) = \text{ess inf}_{x \in E} p(x) \text{ and } p_+(E) = \text{ess sup}_{x \in E} p(x).$$

$$\Omega_\infty = \{x \in \Omega : p(x) = \infty\}.$$

We use the abbreviations  $p_+ = p_+(\Omega)$  and  $p_- = p_-(\Omega)$ .

**Definition 1.1.** *Let  $E \subset \mathbb{R}^d$ . we say that  $p(\cdot) : E \rightarrow \mathbb{R}$  is locally log-Hölder continuous, denote by  $p(\cdot) \in LH_0(E)$ , if there exists a constant  $C_1 > 0$  such that*

$$|p(x) - p(y)| \leq \frac{C_1}{\log(e + \frac{1}{|x-y|})}$$

for all  $x, y \in E$ .

We say that  $p(\cdot)$  is log-Hölder continuous at infinity with base point at  $x_0 \in \mathbb{R}^d$ , and denote this by  $p(\cdot) \in LH_\infty(E)$ , if there exist constants  $p_\infty \in \mathbb{R}$  and  $C_2 > 0$  such that

$$|p(x) - p_\infty| \leq \frac{C_2}{\log(e + |x - x_0|)}$$

for all  $x \in E$ .

We say that  $p(\cdot)$  is log-Hölder continuous, and denote this by  $p(\cdot) \in LH(E)$  if both conditions are satisfied. The maximum,  $\max\{C_1, C_2\}$  is called the log-Hölder constant of  $p(\cdot)$ .

**Definition 1.2.** *Let  $E \subset \mathbb{R}^d$ , we say that  $p(\cdot) \in \mathcal{P}_d^{\log}(E)$ , if  $\frac{1}{p(\cdot)}$  is log-Hölder continuous and denote by  $C_{\log}(p)$  or  $C_{\log}$  the log-Hölder constant of  $\frac{1}{p(\cdot)}$ .*

**Definition 1.3.** Let  $\Omega \subset \mathbb{R}^d$  and  $p(\cdot) \in \mathcal{P}(\Omega, \mu)$ . For a  $\mu$ -measurable function  $f : \Omega \rightarrow \overline{\mathbb{R}}$ , we define the modular

$$(1.14) \quad \rho_{p(\cdot), \mu}(f) = \int_{\Omega \setminus \Omega_\infty} |f(x)|^{p(x)} \mu(dx) + \|f\|_{L^\infty(\Omega_\infty, \mu)},$$

and the norm

$$(1.15) \quad \|f\|_{L^{p(\cdot)}(\Omega, \mu)} = \inf \left\{ \lambda > 0 : \rho_{p(\cdot), \mu}(f/\lambda) \leq 1 \right\}.$$

**Definition 1.4.** The variable exponent Lebesgue space on  $\Omega \subset \mathbb{R}^d$ ,  $L^{p(\cdot)}(\Omega, \mu)$  consists on those  $\mu$ -measurable functions  $f$  for which there exists  $\lambda > 0$  such that  $\rho_{p(\cdot), \mu}\left(\frac{f}{\lambda}\right) < \infty$ , i.e.

$$L^{p(\cdot)}(\Omega, \mu) = \left\{ f : \Omega \rightarrow \overline{\mathbb{R}} : f \text{ is measurable and } \rho_{p(\cdot), \mu}\left(\frac{f}{\lambda}\right) < \infty, \text{ for some } \lambda > 0 \right\}.$$

**Observation 1.1.** When  $\mu$  is the Lebesgue measure, we write  $\rho_{p(\cdot)}$  and  $\|f\|_{p(\cdot)}$  instead of  $\rho_{p(\cdot), \mu}$  and  $\|f\|_{p(\cdot), \mu}$ .

**Theorem 1.1.** (Norm conjugate formula) Let  $\nu$  a complete,  $\sigma$ -finite measure on  $\Omega$ .  $p(\cdot) \in \mathcal{P}(\Omega, \nu)$ , then

$$(1.16) \quad \frac{1}{2} \|f\|_{p(\cdot), \nu} \leq \|f\|'_{p(\cdot), \nu} \leq 2 \|f\|_{p(\cdot), \nu},$$

for all  $f$   $\nu$ -measurable on  $\Omega$ ,

$$\text{donde } \|f\|'_{p(\cdot), \nu} = \sup \left\{ \int_{\Omega} |f| g d\nu : g \in L^{p'(\cdot)}(\Omega, \nu), \|g\|_{p'(\cdot), \nu} \leq 1 \right\}.$$

*Proof.* See Corollary 3.2.14 in [3] □

**Theorem 1.2.** (Hölder's inequality) Let  $\nu$  a complete,  $\sigma$ -finite measure on  $\Omega$ .  $r(\cdot), q(\cdot) \in \mathcal{P}(\Omega, \nu)$ , define  $p(\cdot) \in \mathcal{P}(\Omega, \nu)$  by  $\frac{1}{p(x)} = \frac{1}{q(x)} + \frac{1}{r(x)}$   $\nu$  a.e.  $x \in \Omega$ .

Then for all  $f \in L^{q(\cdot)}(\Omega, \nu)$  and  $g \in L^{r(\cdot)}(\Omega, \nu)$ ,  $fg \in L^{p(\cdot)}(\Omega, \nu)$  and

$$(1.17) \quad \|fg\|_{p(\cdot), \nu} \leq 2 \|f\|_{q(\cdot), \nu} \|g\|_{r(\cdot), \nu}$$

*Proof.* See Lemma 3.2.20 in [3] □

**Theorem 1.3.** (Minkowski's integral inequality for variable Lebesgue spaces) Given  $\mu$  and  $\nu$  complete  $\sigma$ -finite measures on  $X$  and  $Y$  respectively,  $p \in \mathcal{P}(X, \mu)$ . Let  $f : X \times Y \rightarrow \overline{\mathbb{R}}$  measurable with respect to the product measure on  $X \times Y$ , such that for almost every  $y \in Y$ ,  $f(\cdot, y) \in L^{p(\cdot)}(X, \mu)$ . Then

$$(1.18) \quad \left\| \int_Y f(\cdot, y) d\nu(y) \right\|_{p(\cdot), \mu} \leq 4 \int_Y \|f(\cdot, y)\|_{p(\cdot), \mu} d\nu(y)$$

*Proof.* It is completely analogous to the proof of Corollary 2.38 in [1] by interchanging the Lebesgue measure for complete  $\sigma$ -finite measures  $\mu$  and  $\nu$  on  $X$  and  $Y$  respectively, and by using (1.17), Fubini's theorem and then (1.16). □

In what follows  $\mu$  represents the measure  $\mu(dt) = \frac{dt}{t}$  on  $\mathbb{R}^+$ .

**Observation 1.2.** For a  $\mu$ -measurable function  $f : \mathbb{R}^+ \rightarrow \overline{\mathbb{R}}$ ,  $q(\cdot) \in \mathcal{P}(\mathbb{R}^+, \mu)$ , and any  $\lambda > 0$

$$\begin{aligned}\rho_{q(\cdot),\mu}\left(\frac{f}{\lambda}\right) &= \int_0^\infty \left| \frac{f(t)}{\lambda} \right|^{q(t)} \mu(dt) = \int_0^\infty \left| \frac{t^{-1/q(t)} f(t)}{\lambda} \right|^{q(t)} dt \\ &= \rho_{q(\cdot)}\left(\frac{t^{-1/q(\cdot)} f}{\lambda}\right)\end{aligned}$$

Thus,

$$(1.19) \quad \|f\|_{q(\cdot),\mu} = \|t^{-1/q(\cdot)} f\|_{q(\cdot)}$$

Next, we present an useful technical results for the measure  $\mu$ .

**Lemma 1.4.** For  $q(\cdot) \in \mathcal{P}(\mathbb{R}^+, \mu)$

- i) For any  $\alpha, \beta > 0$  and  $q_+ < \infty$ ,  $\|t^\alpha e^{-t\beta}\|_{q(\cdot),\mu} < \infty$ .
- ii) For any  $\alpha > 0$ ,  $\|t^\alpha \chi_{(0,1]}\|_{q(\cdot),\mu} < \infty$ .
- iii) For any  $\alpha > 0$ ,  $\|t^{-\alpha} \chi_{(1,\infty)}\|_{q(\cdot),\mu} < \infty$ .
- iv) For any  $t_0 > 0$ ,  $(\ln 2)^{\frac{1}{q_-}} \leq \|\chi_{[t_0/2,t_0]}\|_{q(\cdot),\mu} \leq 1$ .

*Proof.* Let us prove i). Set  $f = t^\alpha e^{-t\beta}$

$$\rho_{q(\cdot),\mu}(f) = \int_0^\infty |f(t)|^{q(t)} \mu(dt) = \int_0^1 |t^\alpha e^{-t\beta}|^{q(t)} \frac{dt}{t} + \int_1^\infty |t^\alpha e^{-t\beta}|^{q(t)} \frac{dt}{t}$$

Now,

$$\int_0^1 |t^\alpha e^{-t\beta}|^{q(t)} \frac{dt}{t} = \int_0^1 t^{\alpha q(t)-1} e^{-t\beta q(t)} dt \leq \int_0^1 t^{\alpha-1} dt < \infty,$$

since  $\alpha, \beta > 0$  and  $0 \leq t \leq 1$ . On the other hand, by making the change of variables  $u = t\beta q_-$

$$\begin{aligned}\int_1^\infty |t^\alpha e^{-t\beta}|^{q(t)} \frac{dt}{t} &= \int_1^\infty t^{\alpha q(t)} e^{-t\beta q(t)} \frac{dt}{t} \\ &\leq \int_1^\infty t^{\alpha q_+} e^{-t\beta q_-} \frac{dt}{t} \leq \int_0^\infty t^{\alpha q_+} e^{-t\beta q_-} \frac{dt}{t} \\ &= \int_0^\infty \left(\frac{u}{\beta q_-}\right)^{\alpha q_+} e^{-u} \frac{du}{u} = \frac{1}{(\beta q_-)^{\alpha q_+}} \int_0^\infty u^{\alpha q_+-1} e^{-u} du \\ &= \frac{1}{(\beta q_-)^{\alpha q_+}} \Gamma(\alpha q_+) < \infty.\end{aligned}$$

since  $\alpha, \beta > 0$  and  $q_+ < \infty$ . Thus,  $\rho_{q(\cdot),\mu}(f) < \infty$ , and therefore

$$\|t^\alpha e^{-t\beta}\|_{q(\cdot),\mu} < \infty.$$

The proof of *ii)* and *iii)* are immediate. Now, in order to prove *iv)*, set  $g = \chi_{[t_0/2, t_0]}$

$$\rho_{q(\cdot),\mu}(g) = \int_0^\infty |g(t)|^{q(t)} \mu(dt) = \int_{t_0/2}^{t_0} \frac{dt}{t} = \ln 2 < 1.$$

Then,  $\lambda \geq 1$  implies  $\rho_{q(\cdot),\mu}(\frac{g}{\lambda}) \leq \rho_{q(\cdot),\mu}(g) \leq 1$ . Thus,  $\|g\|_{q(\cdot),\mu} \leq 1$ .

On the other hand, taking  $0 < \lambda < 1$

$$\rho_{q(\cdot),\mu}(\frac{g}{\lambda}) = \int_{t_0/2}^{t_0} \lambda^{-q(t)} \frac{dt}{t} \geq \int_{t_0/2}^{t_0} \lambda^{-q_-} \frac{dt}{t} = \lambda^{-q_-} (\ln 2)$$

then  $\lambda < (\ln 2)^{1/q_-}$  implies  $\rho_{q(\cdot),\mu}(\frac{g}{\lambda}) > 1$ . Therefore,  $\rho_{q(\cdot),\mu}(\frac{g}{\lambda}) \leq 1$  implies  $\lambda \geq (\ln 2)^{1/q_-}$  and then

$$\|g\|_{q(\cdot),\mu} \geq (\ln 2)^{1/q_-}.$$

□

In the case  $\Omega = \mathbb{R}^+$ , we denote  $\mathcal{M}_{0,\infty}$  the set of all measurable functions  $p(\cdot) : \mathbb{R}^+ \rightarrow \mathbb{R}^+$  which satisfy the following conditions:

- i)  $0 \leq p_- \leq p_+ < \infty$ ,
  - ii<sub>0</sub>) there exists  $p(0) = \lim_{x \rightarrow 0} p(x)$  and  $|p(x) - p(0)| \leq \frac{A}{\ln(1/x)}$ ,  $0 < x \leq 1/2$
  - ii<sub>∞</sub>) there exists  $p(\infty) = \lim_{x \rightarrow \infty} p(x)$  and  $|p(x) - p(\infty)| \leq \frac{A}{\ln(x)}$ ,  $x > 2$ .
- we denote  $\mathcal{P}_{0,\infty}$  the subset of functions  $p(\cdot)$  such that  $p_- \geq 1$ .

Let  $\alpha(\cdot), \beta(\cdot) \in LH(\mathbb{R}^+)$ , bounded with

$$(1.20) \quad \alpha(0) < \frac{1}{p'(0)}, \alpha(\infty) < \frac{1}{p'(\infty)}$$

and

$$(1.21) \quad \beta(0) > -\frac{1}{p(0)}, \beta(\infty) > -\frac{1}{p(\infty)}$$

**Theorem 1.4.** *Let  $p(\cdot) \in \mathcal{P}_{0,\infty}$ ,  $\alpha(\cdot), \beta(\cdot) \in LH(\mathbb{R}^+)$ , bounded. Then the Hardy-type inequalities*

$$(1.22) \quad \left\| x^{\alpha(x)-1} \int_0^x \frac{f(y)}{y^{\alpha(y)}} dy \right\|_{p(\cdot)} \leq C_{\alpha(\cdot), p(\cdot)} \|f\|_{p(\cdot)}$$

$$(1.23) \quad \left\| x^{\beta(x)} \int_x^\infty \frac{f(y)}{y^{\beta(y)+1}} dy \right\|_{p(\cdot)} \leq C_{\beta(\cdot), p(\cdot)} \|f\|_{p(\cdot)}$$

are valid, if and only if,  $\alpha(\cdot), \beta(\cdot)$  satisfy conditions (1.20) and (1.21)

*Proof.* For the proof see Theorem 3.1 and Remark 3.2 in [4]. □

As a consequence, we obtain the Hardy's inequalities associated to the exponent  $q(\cdot) \in \mathcal{P}_{0,\infty}$  and the measure  $\mu$ .

**Corollary 1.2.** *Let  $q(\cdot) \in \mathcal{P}_{0,\infty}$  and  $r > 0$ , then*

$$(1.24) \quad \left\| t^{-r} \int_0^t g(y) dy \right\|_{q(\cdot),\mu} \leq C_{r,q(\cdot)} \|y^{-r+1} g\|_{q(\cdot),\mu}$$

and

$$(1.25) \quad \left\| t^r \int_t^\infty g(y) dy \right\|_{q(\cdot),\mu} \leq C_{r,q(\cdot)} \|y^{r+1} g\|_{q(\cdot),\mu}$$

*Proof.* Let  $\alpha(t) = -r + \frac{1}{q'(t)} = -r + 1 - \frac{1}{q(t)}$ , for any  $t \in \mathbb{R}^+$ ,  $f(y) = y^{\alpha(y)} g(y)$ , for any  $y \in \mathbb{R}^+$  then  $\alpha(\cdot) \in LH(\mathbb{R}^+)$  and bounded,  $\alpha(0) = -r + \frac{1}{q'(0)} < \frac{1}{q'(0)}$  and  $\alpha(\infty) = -r + \frac{1}{q'(\infty)} < \frac{1}{q'(\infty)}$ . Then, using (1.19) and (1.22)

$$\begin{aligned} \left\| t^{-r} \int_0^t g(y) dy \right\|_{q(\cdot),\mu} &= \left\| t^{-r-\frac{1}{q(t)}} \int_0^t g(y) dy \right\|_{q(\cdot)} = \left\| t^{\alpha(t)-1} \int_0^t g(y) dy \right\|_{q(\cdot)} \\ &\leq C_{r,q(\cdot)} \|y^{\alpha(y)} g\|_{q(\cdot)} = C_{r,q(\cdot)} \|y^{-r+1-\frac{1}{q(y)}} g\|_{q(\cdot)} \\ &= C_{r,q(\cdot)} \|y^{-r+1} g\|_{q(\cdot),\mu}. \end{aligned}$$

On the other hand, by taking  $\beta(t) = r - \frac{1}{q(t)}$ ,  $\forall t \in \mathbb{R}^+$ ,  $f(y) = y^{\beta(y)+1} g(y)$ ,  $\forall y \in \mathbb{R}^+$  then  $\beta(\cdot) \in LH(\mathbb{R}^+)$  and the proof of (1.25) is completely analogous.  $\square$

In what follows we will consider only Lebesgue variable spaces with respect to the Gaussian measure  $\gamma_d$ ,  $L^{p(\cdot)}(\mathbb{R}^d, \gamma_d)$ . The next condition was introduced by E. Dalmasso and R. Scotto in [2] and it is crucial to deal with the Gaussian measure.

**Definition 1.5.** *Let  $p(\cdot) \in \mathcal{P}(\mathbb{R}^d, \gamma_d)$ , we say that  $p(\cdot) \in \mathcal{P}_{\gamma_d}^\infty(\mathbb{R}^d)$  if there exist constants  $C_{\gamma_d} > 0$  and  $p_\infty \geq 1$  such that*

$$(1.26) \quad |p(x) - p_\infty| \leq \frac{C_{\gamma_d}}{|x|^2},$$

for  $x \in \mathbb{R}^d \setminus \{(0, 0, \dots, 0)\}$ .

**Observation 1.3.** *It can be proved that if  $p(\cdot) \in \mathcal{P}_{\gamma_d}^\infty(\mathbb{R}^d)$ , then  $p(\cdot) \in LH_\infty(\mathbb{R}^d)$ .*

## 2. THE MAIN RESULTS

In this section we are going to define the variable Gaussian Besov-Lipschitz spaces and the variable Gaussian Triebel-Lizorkin spaces, which are the main goal of the paper.

The following two technical results are needed for defining variable Gaussian Besov-Lipschitz spaces.

**Lemma 2.1.** *Let  $p(\cdot) \in \mathcal{P}_{\gamma_d}^\infty(\mathbb{R}^d) \cap LH_0(\mathbb{R}^d)$  and  $f \in L^{p(\cdot)}(\gamma_d)$ ,  $\alpha \geq 0$  y  $k, l$  integers greater than  $\alpha$ , then*

$$\left\| \frac{\partial^k u(\cdot, t)}{\partial t^k} \right\|_{p(\cdot), \gamma_d} \leq A_k t^{-k+\alpha} \text{ if and only if } \left\| \frac{\partial^l u(\cdot, t)}{\partial t^l} \right\|_{p(\cdot), \gamma_d} \leq A_l t^{-l+\alpha}.$$

Moreover, if  $A_k(f), A_l(f)$  are the smallest constants in the inequalities above then there exist constants  $A_{k,l,\alpha,p(\cdot)}$  and  $D_{k,l,\alpha}$  such that

$$A_{k,l,\alpha,p(\cdot)}A_k(f) \leq A_l(f) \leq D_{k,l,\alpha}A_k(f),$$

for all  $f \in L^{p(\cdot)}(\gamma_d)$ .

*Proof.* Let us suppose without loss of generality that  $k \geq l$ . We start by proving the direct implication. For this we use the representation of the Poisson-Hermite semigroup (1.6), this is,

$$P_t f(x) = \int_0^{+\infty} T_s f(x) \mu_t^{(1/2)}(ds).$$

Then, by differentiating  $k$ -times with respect to  $t$  and by using the dominated convergence theorem, we get

$$\frac{\partial^k P_t f(x)}{\partial t^k} = \int_0^{+\infty} T_s f(x) \frac{\partial^k \mu_t^{(1/2)}}{\partial t^k}(ds).$$

By using Lemma 1.3, it's easy to prove that for all  $m \in \mathbb{N}$

$$\lim_{t \rightarrow +\infty} \frac{\partial^m P_t f(x)}{\partial t^m} = 0.$$

Now, given  $n \in \mathbb{N}$ ,  $n > \alpha$

$$\begin{aligned} - \int_t^{+\infty} \frac{\partial^{n+1} P_s f(x)}{\partial s^{n+1}} ds &= - \lim_{s \rightarrow +\infty} \frac{\partial^n P_s f(x)}{\partial s^n} + \frac{\partial^n P_t f(x)}{\partial t^n} \\ &= \frac{\partial^n P_t f(x)}{\partial t^n}. \end{aligned}$$

Thus, for Minkowski's integral inequality (1.18)

$$\begin{aligned} \left\| \frac{\partial^n u(\cdot, t)}{\partial t^n} \right\|_{p(\cdot), \gamma_d} &\leq 4 \int_t^{+\infty} \left\| \frac{\partial^{n+1} u(\cdot, s)}{\partial s^{n+1}} \right\|_{p(\cdot), \gamma_d} ds \leq 4 \int_t^{+\infty} A_{n+1}(f) s^{-(n+1)+\alpha} ds \\ &= 4 \frac{A_{n+1}(f)}{n-\alpha} t^{-n+\alpha}. \end{aligned}$$

Therefore

$$A_n(f) \leq 4 \frac{A_{n+1}(f)}{n-\alpha},$$

and, since  $n > \alpha$  is arbitrary, then, by using the above result  $k-l$  times, we obtain

$$\begin{aligned} A_l(f) &\leq 4 \frac{A_{l+1}(f)}{l-\alpha} \leq 4^2 \frac{A_{l+2}(f)}{(l-\alpha)(l+1-\alpha)} \\ &\leq \dots \leq 4^{k-l} \frac{A_k(f)}{(l-\alpha)(l+1-\alpha)\dots(k-1-\alpha)} = D_{k,l,\alpha} A_k(f). \end{aligned}$$

To prove the converse, we use again the representation (1.6) and we obtain that

$$u(x, t_1 + t_2) = P_{t_1}(P_{t_2} f)(x) = \int_0^{+\infty} T_s (P_{t_2} f)(x) \mu_{t_1}^{\frac{1}{2}}(ds).$$

Thus, taking  $t = t_1 + t_2$  and differentiating  $l$  times with respect to  $t_2$  and  $k - l$  times with respect to  $t_1$ , we get

$$(2.1) \quad \frac{\partial^k u(x, t)}{\partial t^k} = \int_0^{+\infty} T_s \left( \frac{\partial^l P_{t_2} f(x)}{\partial t_2^l} \right) \frac{\partial^{k-l} \mu_{t_1}^{\frac{1}{2}}}{\partial t_1^{k-l}}(ds).$$

Then, by Corollary 1.1, Minkowski's integral inequality (1.18) and the  $L^{p(\cdot)}$ -boundedness of the Ornstein-Uhlenbeck semigroup (see [5]), we get

$$\begin{aligned} \left\| \frac{\partial^k u(\cdot, t)}{\partial t^k} \right\|_{p(\cdot), \gamma_d} &\leq 4 \int_0^{+\infty} \left\| T_s \left( \frac{\partial^l P_{t_2} f}{\partial t_2^l} \right) \right\|_{p(\cdot), \gamma_d} \left| \frac{\partial^{k-l} \mu_{t_1}^{\frac{1}{2}}}{\partial t_1^{k-l}}(ds) \right| \\ &\leq 4C_{p(\cdot)} \left\| \frac{\partial^l P_{t_2} f}{\partial t_2^l} \right\|_{p(\cdot), \gamma_d} \int_0^{+\infty} \left| \frac{\partial^{k-l} \mu_{t_1}^{\frac{1}{2}}}{\partial t_1^{k-l}}(ds) \right| \\ &\leq 4C_{p(\cdot)} \left\| \frac{\partial^l}{\partial t_2^l} P_{t_2} f \right\|_{p(\cdot), \gamma_d} C_{k-l} t_1^{l-k} \leq 4C_{p(\cdot)} A_l(f) C_{k-l} t_2^{-l+\alpha} t_1^{l-k}. \end{aligned}$$

Therefore, taking  $t_1 = t_2 = \frac{t}{2}$ ,

$$\left\| \frac{\partial^k u(\cdot, t)}{\partial t^k} \right\|_{p(\cdot), \gamma_d} \leq 4C_{p(\cdot)} A_l(f) C_{k-l} \left( \frac{t}{2} \right)^{-k+\alpha}.$$

Thus

$$A_k(f) \leq 4C_{p(\cdot)} \frac{C_{k-l}}{2^{-k+\alpha}} A_l(f).$$

□

**Lemma 2.2.** Let  $p(\cdot) \in \mathcal{P}_{\gamma_d}^\infty(\mathbb{R}^d) \cap LH_0(\mathbb{R}^d)$  and  $q(\cdot) \in \mathcal{P}_{0,\infty}$ . Let  $\alpha \geq 0$  and  $k, l$  integers greater than  $\alpha$ . Then

$$\left\| t^{k-\alpha} \left\| \frac{\partial^k u(\cdot, t)}{\partial t^k} \right\|_{p(\cdot), \gamma_d} \right\|_{q(\cdot), \mu} < \infty$$

if and only if

$$\left\| t^{l-\alpha} \left\| \frac{\partial^l u(\cdot, t)}{\partial t^l} \right\|_{p(\cdot), \gamma_d} \right\|_{q(\cdot), \mu} < \infty.$$

Moreover, there exist constants  $A_{k,l,\alpha,p(\cdot)}$  and  $D_{k,l,\alpha,q(\cdot)}$  such that

$$\begin{aligned} D_{k,l,\alpha,q(\cdot)} \left\| t^{l-\alpha} \left\| \frac{\partial^l u(\cdot, t)}{\partial t^l} \right\|_{p(\cdot), \gamma_d} \right\|_{q(\cdot), \mu} &\leq \left\| t^{k-\alpha} \left\| \frac{\partial^k u(\cdot, t)}{\partial t^k} \right\|_{p(\cdot), \gamma_d} \right\|_{q(\cdot), \mu} \\ &\leq A_{k,l,\alpha,p(\cdot)} \left\| t^{l-\alpha} \left\| \frac{\partial^l u(\cdot, t)}{\partial t^l} \right\|_{p(\cdot), \gamma_d} \right\|_{q(\cdot), \mu}, \end{aligned}$$

for all  $f \in L^{p(\cdot)}(\gamma_d)$ .

*Proof.* Suppose without loss of generality that  $k \geq l$ . We prove first the converse implication; by proceeding as in lemma 2.1, taking  $t_1 = t_2 = \frac{t}{2}$ , we have

$$\begin{aligned} \left\| \frac{\partial^k u(\cdot, t)}{\partial t^k} \right\|_{p(\cdot), \gamma_d} &\leq 4C_{p(\cdot)} \left\| \frac{\partial^l P_{t_2} f}{\partial t_2^l} \right\|_{p(\cdot), \gamma_d} C_{k-l} t_1^{l-k}, \\ &= 4C_{p(\cdot)} \left\| \frac{\partial^l P_{\frac{t}{2}} f}{\partial (\frac{t}{2})^l} \right\|_{p(\cdot), \gamma_d} C_{k-l} \left(\frac{t}{2}\right)^{l-k}. \end{aligned}$$

Thus

$$\begin{aligned} \left\| t^{k-\alpha} \left\| \frac{\partial^k u(\cdot, t)}{\partial t^k} \right\|_{p(\cdot), \gamma_d} \right\|_{q(\cdot), \mu} &\leq 4C_{p(\cdot)} \frac{C_{k-l}}{2^{l-k}} \left\| t^{l-\alpha} \left\| \frac{\partial^l u(\cdot, \frac{t}{2})}{\partial (\frac{t}{2})^l} \right\|_{p(\cdot), \gamma_d} \right\|_{q(\cdot), \mu} \\ &= A_{k,l,\alpha,p(\cdot)} \left\| s^{l-\alpha} \left\| \frac{\partial^l u(\cdot, s)}{\partial s^l} \right\|_{p(\cdot), \gamma_d} \right\|_{q(\cdot), \mu}. \end{aligned}$$

with  $A_{k,l,\alpha,p(\cdot)} = 4C_{p(\cdot)} C_{k-l} 2^{k-\alpha}$ .

For the direct implication, given  $n \in \mathbb{N}$ ,  $n > \alpha$ , again, as in the above lemma

$$\left\| \frac{\partial^n u(\cdot, t)}{\partial t^n} \right\|_{p(\cdot), \gamma_d} \leq 4 \int_t^{+\infty} \left\| \frac{\partial^{n+1} u(\cdot, s)}{\partial s^{n+1}} \right\|_{p(\cdot), \gamma_d} ds.$$

Therefore, by the Hardy's inequality (1.25)

$$\begin{aligned} \left\| t^{n-\alpha} \left\| \frac{\partial^n u(\cdot, t)}{\partial t^n} \right\|_{p(\cdot), \gamma_d} \right\|_{q(\cdot), \mu} &\leq 4 \left\| t^{n-\alpha} \int_t^{+\infty} \left\| \frac{\partial^{n+1} u(\cdot, s)}{\partial s^{n+1}} \right\|_{p(\cdot), \gamma_d} \right\|_{q(\cdot), \mu} \\ &\leq 4C_{n,\alpha,q(\cdot)} \left\| s^{n+1-\alpha} \left\| \frac{\partial^{n+1} u(\cdot, s)}{\partial s^{n+1}} \right\|_{p(\cdot), \gamma_d} \right\|_{q(\cdot), \mu} \end{aligned}$$

Now, since  $n > \alpha$  is arbitrary, by using the previous result  $k - l$  times, we obtain

$$\begin{aligned} \left\| t^{l-\alpha} \left\| \frac{\partial^l u(\cdot, t)}{\partial t^l} \right\|_{p(\cdot), \gamma_d} \right\|_{q(\cdot), \mu} &\leq 4C_{l,\alpha,q(\cdot)} \left\| t^{l+1-\alpha} \left\| \frac{\partial^{l+1} u(\cdot, t)}{\partial t^{l+1}} \right\|_{p(\cdot), \gamma_d} \right\|_{q(\cdot), \mu} \\ &\leq 4^2 C_{l,\alpha,q(\cdot)} C_{l+1,\alpha,q(\cdot)} \left\| t^{l+2-\alpha} \left\| \frac{\partial^{l+2} u(\cdot, t)}{\partial t^{l+2}} \right\|_{p(\cdot), \gamma_d} \right\|_{q(\cdot), \mu} \\ &\quad \vdots \\ &\leq D_{k,l,\alpha,q(\cdot)} \left\| t^{k-\alpha} \left\| \frac{\partial^k u(\cdot, t)}{\partial t^k} \right\|_{p(\cdot), \gamma_d} \right\|_{q(\cdot), \mu} \end{aligned}$$

where  $D_{k,l,\alpha,q(\cdot)} = 4^{k-l} C_{l,\alpha,q(\cdot)} \cdots C_{k-1,\alpha,q(\cdot)}$ .  $\square$

The next technical result will be the key to define the variable Gaussian Triebel-Lizorkin spaces.

**Lemma 2.3.** Let  $p(\cdot) \in \mathcal{P}_{\gamma_d}^\infty(\mathbb{R}^d) \cap LH_0(\mathbb{R}^d)$  and  $q(\cdot) \in \mathcal{P}_{0,\infty}$ . Let  $\alpha \geq 0$  and  $k, l$  integers greater than  $\alpha$ . Then

$$\left\| t^{k-\alpha} \left| \frac{\partial^k}{\partial t^k} P_t f \right| \right\|_{q(\cdot), \mu, p(\cdot), \gamma_d} < \infty$$

if and only if

$$\left\| t^{l-\alpha} \left| \frac{\partial^l}{\partial t^l} P_t f \right| \right\|_{q(\cdot), \mu, p(\cdot), \gamma_d} < \infty.$$

Moreover, there exist constants  $A_{k,l,\alpha,p(\cdot)}, D_{k,l,\alpha,q(\cdot)}$  such that

$$\begin{aligned} D_{k,l,\alpha,q(\cdot)} \left\| t^{l-\alpha} \left| \frac{\partial^l}{\partial t^l} P_t f \right| \right\|_{q(\cdot), \mu, p(\cdot), \gamma_d} &\leq \left\| t^{k-\alpha} \left| \frac{\partial^k}{\partial t^k} P_t f \right| \right\|_{q(\cdot), \mu, p(\cdot), \gamma_d} \\ &\leq A_{k,l,\alpha,p(\cdot)} \left\| t^{l-\alpha} \left| \frac{\partial^l}{\partial t^l} P_t f \right| \right\|_{q(\cdot), \mu, p(\cdot), \gamma_d}, \end{aligned}$$

for all  $f \in L^{p(\cdot)}(\gamma_d)$ .

*Proof.* Suppose without loss of generality that  $k \geq l$ . Let  $n \in \mathbb{N}$  such that  $n > \alpha$ , we can prove that

$$\left| \frac{\partial^n}{\partial t^n} P_t f(x) \right| \leq \int_t^{+\infty} \left| \frac{\partial^{n+1}}{\partial s^{n+1}} P_s f(x) \right| ds .$$

Then, by the Hardy's inequality (1.25),

$$\begin{aligned} \left\| t^{n-\alpha} \left| \frac{\partial^n}{\partial t^n} P_t f(x) \right| \right\|_{q(\cdot), \mu} &\leq \left\| t^{n-\alpha} \int_t^{+\infty} \left| \frac{\partial^{n+1}}{\partial s^{n+1}} P_s f(x) \right| ds \right\|_{q(\cdot), \mu} \\ &\leq C_{n,\alpha,q(\cdot)} \left\| s^{n+1-\alpha} \left| \frac{\partial^{n+1}}{\partial s^{n+1}} P_s f(x) \right| \right\|_{q(\cdot), \mu} \end{aligned}$$

Now, since  $n > \alpha$  is arbitrary, by iterating the previous argument  $k - l$  times, we obtain

$$\begin{aligned} \left\| t^{l-\alpha} \left| \frac{\partial^l}{\partial t^l} P_t f(x) \right| \right\|_{q(\cdot), \mu} &\leq C_{l,\alpha,q(\cdot)} \left\| t^{l+1-\alpha} \left| \frac{\partial^{l+1}}{\partial t^{l+1}} P_t f(x) \right| \right\|_{q(\cdot), \mu} \\ &\leq C_{l,\alpha,q(\cdot)} C_{l+1,\alpha,q(\cdot)} \left\| t^{l+2-\alpha} \left| \frac{\partial^{l+2}}{\partial t^{l+2}} P_t f(x) \right| \right\|_{q(\cdot), \mu} \\ &\quad \vdots \\ &\leq C_{k,l,\alpha,q(\cdot)} \left\| t^{k-\alpha} \left| \frac{\partial^k}{\partial t^k} P_t f(x) \right| \right\|_{q(\cdot), \mu} \end{aligned}$$

where  $C_{k,l,\alpha,q(\cdot)} = C_{l,\alpha,q(\cdot)} C_{l+1,\alpha,q(\cdot)} \cdots C_{k-1,\alpha,q(\cdot)}$ . Thus,

$$D_{k,l,\alpha,q(\cdot)} \left\| t^{l-\alpha} \left| \frac{\partial^l}{\partial t^l} P_t f \right| \right\|_{q(\cdot), \mu, p(\cdot), \gamma_d} \leq \left\| t^{k-\alpha} \left| \frac{\partial^k}{\partial t^k} P_t f \right| \right\|_{q(\cdot), \mu, p(\cdot), \gamma_d},$$

where  $D_{k,l,\alpha,q(\cdot)} = 1/C_{k,l,\alpha,q(\cdot)}$ .

The other inequality is obtain from the case  $k = l + 1$  by an inductive argument. Let  $t_1, t_2 > 0$  and take  $t = t_1 + t_2$ , from (2.1) we get

$$\frac{\partial^k u(x,t)}{\partial t^k} = \int_0^{+\infty} T_s \left( \frac{\partial^l P_{t_2} f(x)}{\partial t_2^l} \right) \frac{\partial^{k-l}}{\partial t_1^{k-l}} \mu_{t_1}^{(1/2)}(ds),$$

and since,  $\frac{\partial}{\partial t_1} \mu_{t_1}^{(1/2)}(ds) = (t_1^{-1} - \frac{t_1}{2s}) \mu_{t_1}^{(1/2)}(ds)$  we obtain

$$\begin{aligned} \left| \frac{\partial^k u(x,t)}{\partial t^k} \right| &\leq \int_0^{+\infty} T_s \left( \left| \frac{\partial^l P_{t_2} f(x)}{\partial t_2^l} \right| \right) \left| (t_1^{-1} - \frac{t_1}{2s}) \right| \mu_{t_1}^{(1/2)}(ds) \\ &\leq t_1^{-1} \int_0^{+\infty} T_s \left( \left| \frac{\partial^l P_{t_2} f(x)}{\partial t_2^l} \right| \right) \mu_{t_1}^{(1/2)}(ds) \\ &\quad + \frac{t_1}{2} \int_0^{+\infty} T_s \left( \left| \frac{\partial^l P_{t_2} f(x)}{\partial t_2^l} \right| \right) \frac{1}{s} \mu_{t_1}^{(1/2)}(ds). \end{aligned}$$

Therefore

$$\begin{aligned} \left\| t_2^{k-\alpha} \left| \frac{\partial^k u(x,t)}{\partial t^k} \right| \right\|_{q(\cdot),\mu} &\leq \left\| t_2^{k-\alpha} t_1^{-1} \int_0^{+\infty} T_s \left( \left| \frac{\partial^l P_{t_2} f(x)}{\partial t_2^l} \right| \right) \mu_{t_1}^{(1/2)}(ds) \right\|_{q(\cdot),\mu} \\ &\quad + \left\| t_2^{k-\alpha} \frac{t_1}{2} \int_0^{+\infty} T_s \left( \left| \frac{\partial^l P_{t_2} f(x)}{\partial t_2^l} \right| \right) \frac{1}{s} \mu_{t_1}^{(1/2)}(ds) \right\|_{q(\cdot),\mu}. \\ &= (I) + (II). \end{aligned}$$

Now, by using Minkowski's integral inequality twice (1.18) (since  $T_s$  is an integral transformation with positive kernel) and the fact that  $\mu_{t_1}^{(1/2)}(ds)$  is a probability measure, we get

$$\begin{aligned} (I) &= \left\| (t_2^{k-\alpha} t_1^{-1} \int_0^{+\infty} T_s \left( \left| \frac{\partial^l P_{t_2} f(x)}{\partial t_2^l} \right| \right) \mu_{t_1}^{(1/2)}(ds)) \right\|_{q(\cdot),\mu} \\ &\leq 4 \int_0^{+\infty} \left\| t_2^{k-\alpha} t_1^{-1} T_s \left( \left| \frac{\partial^l P_{t_2} f(x)}{\partial t_2^l} \right| \right) \right\|_{q(\cdot),\mu} \mu_{t_1}^{(1/2)}(ds) \\ &\leq 16 \int_0^{+\infty} T_s \left( \left\| t_2^{k-\alpha} t_1^{-1} \left| \frac{\partial^l P_{t_2} f(x)}{\partial t_2^l} \right| \right\|_{q(\cdot),\mu} \right) \mu_{t_1}^{(1/2)}(ds) \\ &\leq 16 T^* \left( \left\| t_2^{k-\alpha} t_1^{-1} \left| \frac{\partial^l P_{t_2} f(x)}{\partial t_2^l} \right| \right\|_{q(\cdot),\mu} \right). \end{aligned}$$

For (II) we proceed in analogous way, and by using Lemma 1.2 we get

$$\begin{aligned} (II) &\leq \frac{16}{2} T^* \left( \left\| t_2^{k-\alpha} t_1 \left| \frac{\partial^l P_{t_2} f(x)}{\partial t_2^l} \right| \right\|_{q(\cdot), \mu} \right) \int_0^{+\infty} \frac{1}{s} \mu_{t_1}^{(1/2)}(ds) \\ &= 8T^* \left( \left\| t_2^{k-\alpha} t_1 \left| \frac{\partial^l P_{t_2} f(x)}{\partial t_2^l} \right| \right\|_{q(\cdot), \mu} \right) C_1 \frac{1}{t_1^2}. \end{aligned}$$

Now, since  $T^*$  is defined as a supremum, we get

$$(II) \leq 8C_1 T^* \left( \left\| t_2^{k-\alpha} t_1^{-1} \left| \frac{\partial^l P_{t_2} f(x)}{\partial t_2^l} \right| \right\|_{q(\cdot), \mu} \right).$$

Then, taking  $t_1 = t_2 = \frac{t}{2}$  and the change of variable  $s = \frac{t}{2}$ , we have

$$(I) \leq 16T^* \left( \left\| s^{l-\alpha} \left| \frac{\partial^l P_s f(x)}{\partial s^l} \right| \right\|_{q(\cdot), \mu} \right)$$

and

$$(II) \leq 8C_1 T^* \left( \left\| s^{l-\alpha} \left| \frac{\partial^l P_s f(x)}{\partial s^l} \right| \right\|_{q(\cdot), \mu} \right)$$

Therefore, by the  $L^{p(\cdot)}(\gamma_d)$ -boundedness of  $T^*$  (see [5]),

$$\begin{aligned} \left\| t^{k-\alpha} \left| \frac{\partial^k u(\cdot, t)}{\partial t^k} \right| \right\|_{p(\cdot), \gamma_d} &\leq 2^{k-\alpha} 16 \left\| T^* \left( \left\| s^{l-\alpha} \left| \frac{\partial^l P_s f}{\partial s^l} \right| \right\|_{q(\cdot), \mu} \right) \right\|_{p(\cdot), \gamma_d} \\ &+ 2^{k-\alpha} 8C_1 \left\| T^* \left( \left\| s^{l-\alpha} \left| \frac{\partial^l P_s f}{\partial s^l} \right| \right\|_{q(\cdot), \mu} \right) \right\|_{p(\cdot), \gamma_d} \\ &\leq 2^{k-\alpha} C_{p(\cdot)} (16 + 8C_1) \left\| s^{l-\alpha} \left| \frac{\partial^l P_s f}{\partial s^l} \right| \right\|_{q(\cdot), \mu} \Big|_{p(\cdot), \gamma_d}. \end{aligned}$$

□

Next, we need the following technical result for the  $L^{p(\cdot)}(\gamma_d)$ -norms of the derivatives of the Poisson-Hermite semigroup:

**Lemma 2.4.** *Let  $p(\cdot) \in \mathcal{P}_{\gamma_d}^\infty(\mathbb{R}^d) \cap LH_0(\mathbb{R}^d)$ . Suppose that  $f \in L^{p(\cdot)}(\gamma_d)$ , then for any integer  $k$ ,  $\left\| \frac{\partial^k}{\partial t^k} P_t f \right\|_{p(\cdot), \gamma_d} \leq C_{p(\cdot)} \left\| \frac{\partial^k}{\partial s^k} P_s f \right\|_{p(\cdot), \gamma_d}$ , for whatever  $0 < s < t < +\infty$ .*

Moreover,

$$(2.2) \quad \left\| \frac{\partial^k}{\partial t^k} P_t f \right\|_{p(\cdot), \gamma_d} \leq \frac{C_{k, p(\cdot)}}{t^k} \|f\|_{p(\cdot), \gamma_d}, \quad t > 0.$$

*Proof.* First, let us consider the case  $k = 0$ . Fixed  $t_1, t_2 > 0$ , by using the semigroup property of  $\{P_t\}$ , we get

$$P_{t_1+t_2} f(x) = P_{t_1}(P_{t_2} f(x))$$

Thus, by the  $L^{p(\cdot)}$ -boundedness of  $\{P_t\}$  (see [5]),

$$\|P_{t_1+t_2}f\|_{p(\cdot),\gamma_d} \leq C_{p(\cdot)} \|P_{t_2}f\|_{p(\cdot),\gamma_d}.$$

In order to prove the general case,  $k > 0$ , using the dominated convergence theorem and differentiating the identity  $u(x, t_1 + t_2) = P_{t_1}(u(x, t_2))$   $k$ -times with respect to  $t_2$  we obtain

$$\frac{\partial^k u(x, t_1 + t_2)}{\partial(t_1 + t_2)^k} = P_{t_1} \left( \frac{\partial^k u(x, t_2)}{\partial t_2^k} \right)$$

and then we proceed as in the previous argument. In other to prove (2.2) we use again the representation (1.6) of the Poisson-Hermite semigroup and differentiating  $k$ -times with respect to  $t$  to obtain

$$\frac{\partial^k}{\partial t^k} u(x, t) = \int_0^{+\infty} T_s f(x) \frac{\partial^k}{\partial t^k} \mu_t^{(1/2)}(ds).$$

Thus, by the Minkowski's integral inequality, the  $L^{p(\cdot)}$ -boundedness of the Ornstein-Uhlenbeck semigroup (see [5]) and the Corollary 1.1 , for  $t > 0$

$$\begin{aligned} \left\| \frac{\partial^k u(\cdot, t)}{\partial t^k} \right\|_{p(\cdot),\gamma_d} &\leq 4 \int_0^{+\infty} \left\| T_s f \frac{\partial^k \mu_t^{(1/2)}}{\partial t^k}(ds) \right\|_{p(\cdot),\gamma_d} \\ &= 4 \int_0^{+\infty} \|T_s f\|_{p(\cdot),\gamma_d} \left| \frac{\partial^k \mu_t^{(1/2)}}{\partial t^k}(ds) \right| \\ &\leq 4C_{p(\cdot)} \|f\|_{p(\cdot),\gamma_d} \int_0^{+\infty} \left| \frac{\partial^k \mu_t^{(1/2)}}{\partial t^k}(ds) \right| \leq \frac{C_{k,p(\cdot)}}{t^k} \|f\|_{p(\cdot),\gamma_d}. \end{aligned}$$

□

The Lipschitz spaces can be generalized of the following way (see, for example [6], [7],[8],[9]), using the Poisson-Hermite semigroup.

We are ready to define the variable Gaussian Besov-Lipschitz spaces  $B_{p(\cdot),q(\cdot)}^\alpha(\gamma_d)$ , also called Gaussian Besov-Lipschitz spaces with variable exponents or variable Besov-Lipschitz spaces for expansions in Hermite polynomials.

**Definition 2.1.** Let  $p(\cdot) \in \mathcal{P}_{\gamma_d}^\infty(\mathbb{R}^d) \cap LH_0(\mathbb{R}^d)$  and  $q(\cdot) \in \mathcal{P}_{0,\infty}$ . Let  $\alpha \geq 0$ ,  $k$  the smallest integer greater than  $\alpha$ . The variable Gaussian Besov-Lipschitz space  $B_{p(\cdot),q(\cdot)}^\alpha(\gamma_d)$  is defined as the set of functions  $f \in L^{p(\cdot)}(\gamma_d)$  such that

$$(2.3) \quad \left\| t^{k-\alpha} \left\| \frac{\partial^k P_t f}{\partial t^k} \right\|_{p(\cdot),\gamma_d} \right\|_{q(\cdot),\mu} < \infty.$$

The norm of  $f \in B_{p(\cdot),q(\cdot)}^\alpha(\gamma_d)$  is defined as

$$(2.4) \quad \|f\|_{B_{p(\cdot),q(\cdot)}^\alpha} := \|f\|_{p(\cdot),\gamma_d} + \left\| t^{k-\alpha} \left\| \frac{\partial^k P_t f}{\partial t^k} \right\|_{p(\cdot),\gamma_d} \right\|_{q(\cdot),\mu}.$$

The variable Gaussian Besov-Lipschitz space  $B_{p(\cdot),\infty}^\alpha(\gamma_d)$  is defined as the set of functions  $f \in L^{p(\cdot)}(\gamma_d)$  for which there exists a constant  $A$  such that

$$\left\| \frac{\partial^k P_t f}{\partial t^k} \right\|_{p(\cdot),\gamma_d} \leq A t^{-k+\alpha}$$

and then the norm of  $f \in B_{p(\cdot),\infty}^\alpha(\gamma_d)$  is defined as

$$(2.5) \quad \|f\|_{B_{p(\cdot),\infty}^\alpha} := \|f\|_{p(\cdot),\gamma_d} + A_k(f),$$

where  $A_k(f)$  is the smallest constant  $A$  in the above inequality.

Lemmas 2.1 and 2.2 show that we could have replaced  $k$  with any other integer  $l$  greater than  $\alpha$  and the resulting norms are equivalents.

Now, let us study some inclusion relations between variable Gaussian Besov-Lipschitz spaces. The next result is analogous to Proposition 10, page 153 in [7] (see also [6] or Proposition 7.36 in [10]).

**Proposition 2.1.** Let  $p(\cdot) \in \mathcal{P}_0^\infty(\mathbb{R}^d) \cap LH_0(\mathbb{R}^d)$  and  $q_1(\cdot), q_2(\cdot) \in \mathcal{P}_{0,\infty}$ . The inclusion  $B_{p(\cdot),q_1(\cdot)}^{\alpha_1}(\gamma_d) \subset B_{p(\cdot),q_2(\cdot)}^{\alpha_2}(\gamma_d)$  holds if:

- i)  $\alpha_1 > \alpha_2 > 0$  ( $q_1(\cdot)$  y  $q_2(\cdot)$  not need to be related), or
- ii) If  $\alpha_1 = \alpha_2$  and  $q_1(t) \leq q_2(t)$  a.e.

*Proof.* To prove part ii), let us take  $\alpha$  the common value of  $\alpha_1$  and  $\alpha_2$ .

Let  $f \in B_{p(\cdot),q_1(\cdot)}^\alpha$  and set  $A = \left\| t^{k-\alpha} \left\| \frac{\partial^k P_t f}{\partial t^k} \right\|_{p(\cdot),\gamma_d} \right\|_{q_1(\cdot),\mu}$ .

Fixed  $t_0 > 0$

$$\left\| \chi_{[\frac{t_0}{2},t_0]} t^{k-\alpha} \left\| \frac{\partial^k P_t f}{\partial t^k} \right\|_{p(\cdot),\gamma_d} \right\|_{q_1(\cdot),\mu} \leq A.$$

However, by Lemma 2.4,

$$\left\| \frac{\partial^k P_{t_0} f}{\partial t_0^k} \right\|_{p(\cdot),\gamma_d} \leq C_{p(\cdot)} \left\| \frac{\partial^k P_t f}{\partial t^k} \right\|_{p(\cdot),\gamma_d} \quad t \in [\frac{t_0}{2}, t_0].$$

Thus, we obtain

$$\begin{aligned} \left\| \frac{\partial^k P_{t_0} f}{\partial t_0^k} \right\|_{p(\cdot),\gamma_d} \left\| \chi_{[\frac{t_0}{2},t_0]} t^{k-\alpha} \right\|_{q_1(\cdot),\mu} &\leq C_{p(\cdot)} \left\| \chi_{[\frac{t_0}{2},t_0]} t^{k-\alpha} \left\| \frac{\partial^k P_t f}{\partial t^k} \right\|_{p(\cdot),\gamma_d} \right\|_{q_1(\cdot),\mu} \\ &\leq C_{p(\cdot)} A. \end{aligned}$$

Therefore,

$$\begin{aligned} \left( \frac{t_0}{2} \right)^{k-\alpha} \left\| \frac{\partial^k P_{t_0} f}{\partial t_0^k} \right\|_{p(\cdot),\gamma_d} \left\| \chi_{[\frac{t_0}{2},t_0]} \right\|_{q_1(\cdot),\mu} &\leq \left\| \frac{\partial^k P_{t_0} f}{\partial t_0^k} \right\|_{p(\cdot),\gamma_d} \left\| \chi_{[\frac{t_0}{2},t_0]} t^{k-\alpha} \right\|_{q_1(\cdot),\mu} \\ &\leq C_{p(\cdot)} A \end{aligned}$$

and by Lemma 1.4

$$\begin{aligned} \left( \frac{t_0}{2} \right)^{k-\alpha} \left\| \frac{\partial^k P_{t_0} f}{\partial t_0^k} \right\|_{p(\cdot), \gamma_d} (\ln 2)^{1/q_1^-} &\leq \left( \frac{t_0}{2} \right)^{k-\alpha} \left\| \frac{\partial^k P_{t_0} f}{\partial t_0^k} \right\|_{p(\cdot), \gamma_d} \left\| \chi_{[\frac{t_0}{2}, t_0]} \right\|_{q_1(\cdot), \mu} \\ &\leq C_{p(\cdot)} A \end{aligned}$$

Then,

$$\left\| \frac{\partial^k P_{t_0} f}{\partial t_0^k} \right\|_{p(\cdot), \gamma_d} \leq \frac{C_{p(\cdot)} 2^{k-\alpha}}{(\ln 2)^{1/q_1^-}} A t_0^{-k+\alpha},$$

and since  $t_0$  is arbitrary

$$\left\| \frac{\partial^k P_t f}{\partial t^k} \right\|_{p(\cdot), \gamma_d} \leq C_{k, \alpha, p(\cdot) q_1(\cdot)} A t^{-k+\alpha},$$

for all  $t > 0$ . In other words,  $f \in B_{p(\cdot), q_1(\cdot)}^\alpha$  implies that  $f \in B_{p(\cdot), \infty}^\alpha$ .

Now, let us take  $g(t) = t^{k-\alpha} \left\| \frac{\partial^k P_t f}{\partial t^k} \right\|_{p(\cdot), \gamma_d}$ , then  $\rho_{q_1(\cdot), \mu}(g) < \infty$ , since,  $f \in B_{p(\cdot), q_1(\cdot)}^\alpha$ .

Thus, as  $q_2(t) \geq q_1(t)$  a.e.

$$\begin{aligned} \rho_{q_2(\cdot), \mu}(g) &= \int_0^{+\infty} \left( t^{k-\alpha} \left\| \frac{\partial^k P_t f}{\partial t^k} \right\|_{p(\cdot), \gamma_d} \right)^{q_2(t)} \frac{dt}{t} \\ &= \int_0^{+\infty} \left( t^{k-\alpha} \left\| \frac{\partial^k P_t f}{\partial t^k} \right\|_{p(\cdot), \gamma_d} \right)^{q_2(t)-q_1(t)} \left( t^{k-\alpha} \left\| \frac{\partial^k P_t f}{\partial t^k} \right\|_{p(\cdot), \gamma_d} \right)^{q_1(t)} \frac{dt}{t} \\ &\leq (C_{k, \alpha, p(\cdot) q_1(\cdot)} A)^{q_2^+ - q_1^-} \int_0^{+\infty} \left( t^{k-\alpha} \left\| \frac{\partial^k P_t f}{\partial t^k} \right\|_{p(\cdot), \gamma_d} \right)^{q_1(t)} \frac{dt}{t} \\ &= (C_{k, \alpha, p(\cdot) q_1(\cdot)} A)^{q_2^+ - q_1^-} \rho_{q_1(\cdot), \mu}(g) < +\infty. \end{aligned}$$

Hence,  $f \in B_{p(\cdot), q_2(\cdot)}^\alpha$ . In order to prove part i), by Lemma 2.4, we obtain

$$\left\| \frac{\partial^k P_t f}{\partial t^k} \right\|_{p(\cdot), \gamma_d} \leq C_{k, p(\cdot)} t^{-k}, \quad t > 0.$$

Now, given  $f \in B_{p(\cdot), q_1(\cdot)}^{\alpha_1}$ , again by setting

$$A = \left\| t^{k-\alpha_1} \left\| \frac{\partial^k P_t f}{\partial t^k} \right\|_{p(\cdot), \gamma_d} \right\|_{q_1(\cdot), \mu},$$

we obtain, as in part ii),

$$\left\| \frac{\partial^k P_t f}{\partial t^k} \right\|_{p(\cdot), \gamma_d} \leq C_{k, \alpha_1, p(\cdot) q_1(\cdot)} A t^{-k+\alpha_1},$$

for all  $t > 0$ . Therefore,

$$\begin{aligned} \left\| t^{k-\alpha_2} \left\| \frac{\partial^k P_t f}{\partial t^k} \right\|_{p(\cdot), \gamma_d} \right\|_{q_2(\cdot), \mu} &\leq \left\| \chi_{(0,1]} t^{k-\alpha_2} \left\| \frac{\partial^k P_t f}{\partial t^k} \right\|_{p(\cdot), \gamma_d} \right\|_{q_2(\cdot), \mu} \\ &\quad + \left\| \chi_{(1,\infty)} t^{k-\alpha_2} \left\| \frac{\partial^k P_t f}{\partial t^k} \right\|_{p(\cdot), \gamma_d} \right\|_{q_2(\cdot), \mu} \\ &= (I) + (II). \end{aligned}$$

Now, again by Lemma 1.4 we get,

$$\begin{aligned} (I) &= \left\| \chi_{(0,1]} t^{k-\alpha_2} \left\| \frac{\partial^k P_t f}{\partial t^k} \right\|_{p(\cdot), \gamma_d} \right\|_{q_2(\cdot), \mu} \leq \left\| \chi_{(0,1]} t^{k-\alpha_2} C_{k,\alpha_1,p(\cdot)q_1(\cdot)} A t^{-k+\alpha_1} \right\|_{q_2(\cdot), \mu} \\ &= C_{k,\alpha_1,p(\cdot)q_1(\cdot)} A \left\| \chi_{(0,1]} t^{\alpha_1-\alpha_2} \right\|_{q_2(\cdot), \mu} < \infty, \end{aligned}$$

and also by Lemma 1.4,

$$\begin{aligned} (II) &= \left\| \chi_{(1,\infty)} t^{k-\alpha_2} \left\| \frac{\partial^k P_t f}{\partial t^k} \right\|_{p(\cdot), \gamma_d} \right\|_{q_2(\cdot), \mu} \leq \left\| \chi_{(1,\infty)} t^{k-\alpha_2} C_{k,p(\cdot)} t^{-k} \right\|_{q_2(\cdot), \mu} \\ &= C_{k,p(\cdot)} \left\| \chi_{(1,\infty)} t^{-\alpha_2} \right\|_{q_2(\cdot), \mu} < \infty. \end{aligned}$$

Hence,

$$\left\| t^{k-\alpha_2} \left\| \frac{\partial^k P_t f}{\partial t^k} \right\|_{p(\cdot), \gamma_d} \right\|_{q_2(\cdot), \mu} < +\infty,$$

and then  $f \in B_{p(\cdot), q_2(\cdot)}^{\alpha_2}$ .  $\square$

Let us now define the variable Gaussian Triebel-Lizorkin spaces  $F_{p(\cdot), q(\cdot)}^\alpha(\gamma_d)$ , which represent another way to measure regularity of functions, proceeding as in [6], [8] or [9].

**Definition 2.2.** Let  $p(\cdot) \in \mathcal{P}_{\gamma_d}^\infty(\mathbb{R}^d) \cap LH_0(\mathbb{R}^d)$  and  $q(\cdot) \in \mathcal{P}_{0,\infty}$ . Let  $\alpha \geq 0$  and  $k$  the smallest integer greater than  $\alpha$ . The variable Gaussian Triebel-Lizorkin space  $F_{p(\cdot), q(\cdot)}^\alpha(\gamma_d)$  is the set of functions  $f \in L^{p(\cdot)}(\gamma_d)$  such that

$$(2.6) \quad \left\| \left\| t^{k-\alpha} \frac{\partial^k P_t f}{\partial t^k} \right\|_{q(\cdot), \mu} \right\|_{p(\cdot), \gamma_d} < \infty,$$

The norm of  $f \in F_{p(\cdot), q(\cdot)}^\alpha(\gamma_d)$  is defined as

$$(2.7) \quad \|f\|_{F_{p(\cdot), q(\cdot)}^\alpha} := \|f\|_{p(\cdot), \gamma_d} + \left\| \left\| t^{k-\alpha} \frac{\partial^k P_t f}{\partial t^k} \right\|_{q(\cdot), \mu} \right\|_{p(\cdot), \gamma_d}.$$

By Lemma 2.3, the definition of  $F_{p(\cdot), q(\cdot)}^\alpha$  is independent of the integer  $k > \alpha$  chosen and the resulting norms are equivalents.

**Observation 2.1.** *The variable Gaussian Besov-Lipschitz and variable Gaussian Triebel-Lizorkin spaces are, by construction, subspaces of  $L^{p(\cdot)}(\gamma_d)$ . Moreover, since trivially  $\|f\|_{p(\cdot),\gamma_d} \leq \|f\|_{B_{p(\cdot),q(\cdot)}^\alpha}$  and  $\|f\|_{p(\cdot),\gamma_d} \leq \|f\|_{F_{p(\cdot),q(\cdot)}^\alpha}$ , the inclusions are continuous. On the other hand, from (1.9) it is clear that for all  $t > 0$  and  $k \in \mathbb{N}$ ,*

$$\frac{\partial^k}{\partial t^k} P_t h_\beta(x) = (-1)^k |\beta|^{k/2} e^{-t\sqrt{|\beta|}} h_\beta(x),$$

and again by Lemma 1.4,

$$\begin{aligned} \left\| t^{k-\alpha} \left\| \frac{\partial^k}{\partial t^k} P_t h_\beta \right\|_{p(\cdot),\gamma_d} \right\|_{q(\cdot),\mu} &= \left\| t^{k-\alpha} \left\| (-\beta|^{1/2})^k e^{-t\sqrt{|\beta|}} h_\beta \right\|_{p(\cdot),\gamma_d} \right\|_{q(\cdot),\mu} \\ &= |\beta|^{k/2} \|h_\beta\|_{p(\cdot),\gamma_d} \left\| t^{k-\alpha} e^{-t\sqrt{|\beta|}} \right\|_{q(\cdot),\mu} \\ &= C_{k,\alpha,\beta,q(\cdot)} \|h_\beta\|_{p(\cdot),\gamma_d} < \infty. \end{aligned}$$

Thus,  $h_\beta \in B_{p(\cdot),q(\cdot)}^\alpha(\gamma_d)$  and

$$\|h_\beta\|_{B_{p(\cdot),q(\cdot)}^\alpha} = (1 + C_{k,\alpha,\beta,q(\cdot)}) \|h_\beta\|_{p(\cdot),\gamma_d}.$$

In a similar way,  $h_\beta \in F_{p(\cdot),q(\cdot)}^\alpha(\gamma_d)$  and

$$\begin{aligned} \|h_\beta\|_{F_{p(\cdot),q(\cdot)}^\alpha} &= \|h_\beta\|_{p(\cdot),\gamma_d} + \left\| \left\| t^{k-\alpha} \left| \frac{\partial^k}{\partial t^k} P_t h_\beta \right| \right\|_{q(\cdot),\mu} \right\|_{p(\cdot),\gamma_d} \\ &= \|h_\beta\|_{p(\cdot),\gamma_d} + |\beta|^{k/2} \left\| t^{k-\alpha} e^{-t\sqrt{|\beta|}} \right\|_{q(\cdot),\mu} \|h_\beta\|_{p(\cdot),\gamma_d} \\ &= (1 + C_{k,\alpha,\beta,q(\cdot)}) \|h_\beta\|_{p(\cdot),\gamma_d} = \|h_\beta\|_{B_{p(\cdot),q(\cdot)}^\alpha}. \end{aligned}$$

Hence, the polynomials  $\mathcal{P}$  is contained in  $B_{p(\cdot),q(\cdot)}^\alpha(\gamma_d)$  and in  $F_{p(\cdot),q(\cdot)}^\alpha(\gamma_d)$ .

Also, we have an inclusion result for the variable Gaussian Triebel-Lizorkin spaces, which is analogous to Proposition 2.1, see also [6] or Proposition 7.40 in [10].

**Proposition 2.2.** *Let  $p(\cdot) \in \mathcal{P}_{\gamma_d}^\infty(\mathbb{R}^d) \cap LH_0(\mathbb{R}^d)$  and  $q_1(\cdot), q_2(\cdot) \in \mathcal{P}_{0,\infty}$ . The inclusion  $F_{p(\cdot),q_1(\cdot)}^{\alpha_1}(\gamma_d) \subset F_{p(\cdot),q_2(\cdot)}^{\alpha_2}(\gamma_d)$  holds for  $\alpha_1 > \alpha_2 > 0$  and  $q_1(t) > q_2(t)$  a.e.*

*Proof.* Let us consider  $f \in F_{p(\cdot),q_1(\cdot)}^{\alpha_1}$ , then

$$\begin{aligned} \left\| t^{k-\alpha_2} \left| \frac{\partial^k P_t f(x)}{\partial t^k} \right| \right\|_{q_2(\cdot),\mu} &\leq \left\| t^{k-\alpha_2} \left| \frac{\partial^k P_t f(x)}{\partial t^k} \right| \chi_{(0,1]} \right\|_{q_2(\cdot),\mu} \\ &\quad + \left\| t^{k-\alpha_2} \left| \frac{\partial^k P_t f(x)}{\partial t^k} \right| \chi_{(1,\infty)} \right\|_{q_2(\cdot),\mu} \\ &= (I) + (II). \end{aligned}$$

Now, since  $q_1(t) > q_2(t)$  a.e., by taking  $r(t) = \frac{q_1(t)q_2(t)}{q_1(t) - q_2(t)}$ , we obtain that  $r(\cdot) \geq 1$  and  $\frac{1}{r(\cdot)} + \frac{1}{q_1(\cdot)} = \frac{1}{q_2(\cdot)}$ , thus, by Hölder's inequality (1.17) and Lemma 1.4

$$\begin{aligned} (I) &= \left\| t^{\alpha_1-\alpha_2} \chi_{(0,1]} t^{k-\alpha_1} \left| \frac{\partial^k P_t f(x)}{\partial t^k} \right| \right\|_{q_2(\cdot),\mu} \\ &\leq 2 \|t^{\alpha_1-\alpha_2} \chi_{(0,1]}\|_{r(\cdot),\mu} \left\| t^{k-\alpha_1} \left| \frac{\partial^k P_t f(x)}{\partial t^k} \right| \right\|_{q_1(\cdot),\mu} \\ &= C_{\alpha_1,\alpha_2,q_1(\cdot),q_2(\cdot)} \left\| t^{k-\alpha_1} \left| \frac{\partial^k P_t f(x)}{\partial t^k} \right| \right\|_{q_1(\cdot),\mu}. \end{aligned}$$

Now, for the second term (II), by using Lemmas 1.4 and 1.3, we get

$$\begin{aligned} (II) &= \left\| t^{k-\alpha_2} \left| \frac{\partial^k P_t f(x)}{\partial t^k} \right| \chi_{(1,\infty)} \right\|_{q_2(\cdot),\mu} \leq C_k T^* f(x) \|\chi_{(1,\infty)} t^{k-\alpha_2} t^{-k}\|_{q_2(\cdot),\mu} \\ &= C_k T^* f(x) \|\chi_{(1,\infty)} t^{-\alpha_2}\|_{q_2(\cdot),\mu} = C_{k,\alpha_2,q_2(\cdot)} T^* f(x). \end{aligned}$$

Then, by using the  $L^{p(\cdot)}(\gamma_d)$  boundedness of  $T^*$  (see [5]),

$$\begin{aligned} \left\| t^{k-\alpha_2} \left| \frac{\partial^k P_t f}{\partial t^k} \right| \right\|_{q_2(\cdot),\mu} &\leq C_{\alpha_1,\alpha_2,q_1(\cdot),q_2(\cdot)} \left\| t^{k-\alpha_1} \left| \frac{\partial^k P_t f}{\partial t^k} \right| \right\|_{q_1(\cdot),\mu} \left\| t^{k-\alpha_2} \left| \frac{\partial^k P_t f}{\partial t^k} \right| \right\|_{p(\cdot),\gamma_d} \\ &\quad + C_{k,\alpha_2,q_2(\cdot)} \|T^* f\|_{p(\cdot),\gamma_d} \\ &\leq C_{\alpha_1,\alpha_2,q_1(\cdot),q_2(\cdot)} \left\| t^{k-\alpha_1} \left| \frac{\partial^k P_t f}{\partial t^k} \right| \right\|_{q_1(\cdot),\mu} \left\| t^{k-\alpha_2} \left| \frac{\partial^k P_t f}{\partial t^k} \right| \right\|_{p(\cdot),\gamma_d} \\ &\quad + C_{k,\alpha_2,p(\cdot),q_2(\cdot)} \|f\|_{p(\cdot),\gamma_d} < +\infty. \end{aligned}$$

Therefore,  $f \in F_{p(\cdot),q_2(\cdot)}^{\alpha_2}$ .

□

### 3. INTERPOLATION RESULTS

Finally, we are going to consider some interpolation results for the Gaussian variable Besov-Lipschitz and the variable Triebel-Lizorkin spaces.

We will use the following results for general variable Lebesgue spaces  $L^{p(\cdot)}(X, \nu)$ .

**Lemma 3.1.** *Let  $p(\cdot) \in \mathcal{P}(\Omega, \nu)$  and  $s > 0$  such that  $sp^- \geq 1$ . Then*

$$\|f|^s\|_{p(\cdot),\nu} = \|f\|_{sp(\cdot),\nu}^s.$$

*Proof.* It is the same proof of Lemma 3.2.6 in [3]. □

**Lemma 3.2.** *Let  $\nu$  a complete  $\sigma$ -finite measure on  $X$ .  $r_j(\cdot) \in \mathcal{P}(X, \nu)$ ,  $1 < r_j^-, r_j^+ < \infty$ ,  $j = 0, 1$ . For all  $0 < \lambda < 1$ , if  $f \in L^{r_j(\cdot)}(X, \nu)$ ,  $j = 0, 1$  then  $f \in L^{r(\cdot)}(X, \nu)$  where  $\frac{1}{r(y)} = \frac{1-\lambda}{r_0(y)} + \frac{\lambda}{r_1(y)}$ , a.e.  $y \in X$  and*

$$(3.1) \quad \|f\|_{r(\cdot),\nu} \leq 2 \|f\|_{r_0(\cdot),\nu}^{1-\lambda} \|f\|_{r_1(\cdot),\nu}^\lambda.$$

*Proof.* It is a consequence of Hölder's inequality (1.17) and Lemma 3.1.  $\square$

Now, we present the interpolation result.

**Theorem 3.1.** *Let  $p_j(\cdot) \in \mathcal{P}(\mathbb{R}^d, \gamma_d)$  and  $q_j \in \mathcal{P}(\mathbb{R}^+, \mu)$ ,  $j = 0, 1$*

- i) *For  $1 < p_j^-, q_j^-$ ,  $p_j^+, q_j^+ < +\infty$  and  $\alpha_j \geq 0$ , if  $f \in B_{p_j(\cdot), q_j(\cdot)}^{\alpha_j}(\gamma_d)$ ,  $j = 0, 1$ , then for all  $0 < \theta < 1$ ,  $f \in B_{p(\cdot), q(\cdot)}^\alpha(\gamma_d)$ , where*

$$\alpha = \alpha_0(1 - \theta) + \alpha_1\theta$$

and

$$\begin{aligned} \frac{1}{p(x)} &= \frac{1 - \theta}{p_0(x)} + \frac{\theta}{p_1(x)}, \text{ a.e. } x \in \mathbb{R}^d, \\ \frac{1}{q(t)} &= \frac{1 - \theta}{q_0(t)} + \frac{\theta}{q_1(t)}, \text{ a.e. } t \in \mathbb{R}^+. \end{aligned}$$

- ii) *For  $1 < p_j^-, q_j^-$ ,  $p_j^+, q_j^+ < +\infty$  and  $\alpha_j \geq 0$ , if  $f \in F_{p_j(\cdot), q_j(\cdot)}^{\alpha_j}(\gamma_d)$ ,  $j = 0, 1$ , then for all  $0 < \theta < 1$ ,  $f \in F_{p(\cdot), q(\cdot)}^\alpha(\gamma_d)$ , where*

$$\alpha = \alpha_0(1 - \theta) + \alpha_1\theta,$$

and

$$\begin{aligned} \frac{1}{p(x)} &= \frac{1 - \theta}{p_0(x)} + \frac{\theta}{p_1(x)}, \text{ a.e. } x \in \mathbb{R}^d, \\ \frac{1}{q(t)} &= \frac{1 - \theta}{q_0(t)} + \frac{\theta}{q_1(t)}, \text{ a.e. } t \in \mathbb{R}^+. \end{aligned}$$

*Proof.* i) Let  $k$  be any integer greater than  $\alpha_0$  and  $\alpha_1$ , by using Lemma 3.2, we obtain for  $\alpha = \alpha_0(1 - \theta) + \alpha_1\theta$ ,

$$\begin{aligned} &\left\| t^{k-\alpha} \left\| \frac{\partial^k P_t f}{\partial t^k} \right\|_{p(\cdot), \gamma_d} \right\|_{q(\cdot), \mu} \\ &\leq \left\| t^{k-(\alpha_0(1-\theta)+\alpha_1\theta)} 2 \left\| \frac{\partial^k P_t f}{\partial t^k} \right\|_{p_0(\cdot), \gamma_d}^{1-\theta} \left\| \frac{\partial^k P_t f}{\partial t^k} \right\|_{p_1(\cdot), \gamma_d}^\theta \right\|_{q(\cdot), \mu} \\ &= 2 \left\| t^{(1-\theta)(k-\alpha_0)+\theta(k-\alpha_1)} \left\| \frac{\partial^k P_t f}{\partial t^k} \right\|_{p_0(\cdot), \gamma_d}^{1-\theta} \left\| \frac{\partial^k P_t f}{\partial t^k} \right\|_{p_1(\cdot), \gamma_d}^\theta \right\|_{q(\cdot), \mu} \\ &= 2 \left\| \left( t^{k-\alpha_0} \left\| \frac{\partial^k P_t f}{\partial t^k} \right\|_{p_0(\cdot), \gamma_d} \right)^{1-\theta} \left( t^{k-\alpha_1} \left\| \frac{\partial^k P_t f}{\partial t^k} \right\|_{p_1(\cdot), \gamma_d} \right)^\theta \right\|_{q(\cdot), \mu}. \end{aligned}$$

Thus, by Hölder's inequality (1.17) and Lemma 3.1,

$$\begin{aligned} &\left\| t^{k-\alpha} \left\| \frac{\partial^k P_t f}{\partial t^k} \right\|_{p(\cdot), \gamma_d} \right\|_{q(\cdot), \mu} \\ &\leq 4 \left\| t^{k-\alpha_0} \left\| \frac{\partial^k P_t f}{\partial t^k} \right\|_{p_0(\cdot), \gamma_d} \right\|_{q_0(\cdot), \mu}^{1-\theta} \left\| t^{k-\alpha_1} \left\| \frac{\partial^k P_t f}{\partial t^k} \right\|_{p_1(\cdot), \gamma_d} \right\|_{q_1(\cdot), \mu}^\theta < +\infty, \end{aligned}$$

that is,  $f \in B_{p(\cdot),q(\cdot)}^{\alpha}(\gamma_d)$ .

- ii) Analogously, by Hölder's inequality (1.17) and Lemma 3.1, we obtain for  $\alpha = \alpha_0(1 - \theta) + \alpha_1\theta$ ,

$$\begin{aligned} \left\| t^{k-\alpha} \left| \frac{\partial^k P_t f(x)}{\partial t^k} \right| \right\|_{q(\cdot),\mu} &= \left\| \left( t^{k-\alpha_0} \left| \frac{\partial^k P_t f(x)}{\partial t^k} \right| \right)^{1-\theta} \left( t^{k-\alpha_1} \left| \frac{\partial^k P_t f(x)}{\partial t^k} \right| \right)^\theta \right\|_{q(\cdot),\mu} \\ &\leq 2 \left\| t^{k-\alpha_0} \left| \frac{\partial^k P_t f(x)}{\partial t^k} \right| \right\|_{q_0(\cdot),\mu}^{1-\theta} \left\| t^{k-\alpha_1} \left| \frac{\partial^k P_t f(x)}{\partial t^k} \right| \right\|_{q_1(\cdot),\mu}^\theta, \end{aligned}$$

a.e.  $x \in \mathbb{R}^d$ . Therefore

$$\left\| t^{k-\alpha} \left| \frac{\partial^k P_t f}{\partial t^k} \right| \right\|_{q(\cdot), \mu} \leq 2 \left\| t^{k-\alpha_0} \left| \frac{\partial^k P_t f}{\partial t^k} \right| \right\|_{q_0(\cdot), \mu}^{1-\theta} \left\| t^{k-\alpha_1} \left| \frac{\partial^k P_t f}{\partial t^k} \right| \right\|_{q_1(\cdot), \mu}^\theta, \quad ,$$

and again by Hölder's inequality and Lemma 3.1,

$$\begin{aligned} & \left\| t^{k-\alpha} \left| \frac{\partial^k P_t f}{\partial t^k} \right| \right\|_{q(\cdot), \mu, p(\cdot), \gamma_d} \\ & \leq 4 \left\| t^{k-\alpha_0} \left| \frac{\partial^k P_t f}{\partial t^k} \right| \right\|_{q_0(\cdot), \mu, p_0(\cdot), \gamma_d}^{1-\theta} \left\| t^{k-\alpha_1} \left| \frac{\partial^k P_t f}{\partial t^k} \right| \right\|_{q_1(\cdot), \mu, p_1(\cdot), \gamma_d}^\theta < +\infty. \end{aligned}$$

That is,  $f \in F_{p(\cdot),q(\cdot)}^\alpha(\gamma_d)$ .
