# Navier-Stokes equations, the algebraic aspect 

Zharinov V.V. *

#### Abstract

Analysis of the Navier-Stokes equations in the frames of the algebraic approach to systems of partial differential equations (formal theory of differential equations) is presented.

Keywords: Navier-Stokes equations, integrability conditions, evolution, constraints, differential algebra, symmetries, cohomologies.

## 1 Preliminaries.

### 1.1 Navier-Stokes equations

The Navier-Stokes equations in physical notation are (see [1] - 6], for example)

$$
\begin{align*}
\mathbf{u}_{t}+(\mathbf{u} \cdot \nabla) \mathbf{u} & =\nu \Delta \mathbf{u}-\nabla p  \tag{1}\\
\nabla \cdot \mathbf{u} & =0 \tag{2}
\end{align*}
$$

where $\mathbf{u}=\left(u^{1}, u^{2}, u^{3}\right)$ is the velocity field, $t$ is the time variable, the dot "." denotes the scalar product, $\nabla=\left(\nabla_{1}, \nabla_{2}, \nabla_{3}\right)$ is the gradient with respect to the spacial variables $\mathbf{x}=\left(x^{1}, x^{2}, x^{3}\right)$, the parameter $\nu>0$ is the viscosity of the flow (do not confuse it with the index $\nu$ ), $\Delta=\nabla_{1}^{2}+\nabla_{2}^{2}+\nabla_{3}^{2}$ is the Laplacian, $p$ is the pressure.

Here we study the Navier-Stokes equations from the algebra-geometrical point of view. The system (1)-(2) is not formally integrable, as we need, to

[^0]get the equivalent formally integrable system we add (see [7], for example) the trivial differential prolongations
\[

$$
\begin{equation*}
\nabla \cdot \mathbf{u}_{t}=0, \quad \nabla(\nabla \cdot \mathbf{u})=0 \tag{3}
\end{equation*}
$$

\]

and the non-trivial differential prolongation (hidden integrability condition)

$$
\begin{equation*}
\Delta p+\nabla((\mathbf{u} \cdot \nabla) \mathbf{u})=\Delta p+\nabla \mathbf{u} \cdot \nabla \mathbf{u}=0 \tag{4}
\end{equation*}
$$

(we have used the equation (2)).
Remark 1. The equation (4) is a Poisson equation for the pressure $p$ with the density $\rho=-\nabla \mathbf{u} \cdot \nabla \mathbf{u}$, it can be considered as the inner constraint for the Navier-Stokes equations.

### 1.2 Notation

We use rather sophisticated notation:

- $\mathbb{Z}=\{0, \pm 1, \pm 2, \ldots\} \supset \mathbb{Z}_{+}=\{0,1,2, \ldots\} \supset \mathbb{N}=\{1,2,3, \ldots\} ;$
- $\mathrm{M}=\overline{1, m}=\{1,2, \ldots, m\}, \quad \mathrm{N}=\overline{2, m}=\{2, \ldots, m\}, \quad \mathrm{M}=\{1\} \cup \mathrm{N} ;$
- $\mathbb{I}=\mathbb{Z}_{+}^{\mathrm{M}}=\left\{\mathrm{i}=\left(i^{1}, \ldots, i^{m}\right) \mid i^{\mu} \in \mathbb{Z}_{+}, \mu \in \mathrm{M}\right\}, \quad|\mathrm{i}|=i^{1}+\cdots+i^{m} ;$
- $\mathrm{i}+\mathrm{j}=\left(i^{1}+j^{1}, \ldots, i^{m}+j^{m}\right), \quad \mathrm{i}+(\mu)=\left(i^{1}, \ldots, i^{\mu}+1, \ldots, i^{m}\right)$, $(\mu)=0+(\mu)$, for all $\mathrm{i}, \mathrm{j} \in \mathbb{I}, \mu \in \mathrm{M}$;
- $\mathbb{J}=\mathbb{Z}_{+}^{\mathrm{N}}=\left\{\mathrm{j}=\left(j^{2}, \ldots, j^{m}\right) \mid j^{\alpha} \in \mathbb{Z}_{+}, \alpha \in \mathrm{N}\right\} ;$
- $\mathbb{I}=\mathbb{Z}_{+} \times \mathbb{J}=\left\{\mathrm{i}=\left(i^{1}, \mathrm{j}\right) \mid i^{1} \in \mathbb{Z}_{+}, \mathrm{j} \in \mathbb{J}\right\} ;$
- $\mathbb{I}_{0}=\left\{\mathrm{i} \in \mathbb{I} \mid i^{1}=0\right\}=\{0\} \times \mathbb{J}, \quad \mathbb{I}_{1}=\left\{\mathrm{i} \in \mathbb{I} \mid i^{1}=0,1\right\}=\{0,1\} \times \mathbb{J} ;$
- $\mathbb{I}_{0}^{\prime}=\mathbb{I} \backslash \mathbb{I}_{0}=\left\{\mathrm{i} \in \mathbb{I} \mid i^{1}>0\right\}, \mathbb{I}_{1}^{\prime}=\mathbb{I} \backslash \mathbb{I}_{1}=\left\{\mathrm{i} \in \mathbb{I} \mid i^{1}>1\right\}$, $\mathbb{I}=\mathbb{I}_{0} \cup \mathbb{I}_{0}^{\prime}=\mathbb{I}_{1} \cup \mathbb{I}_{1}^{\prime}$.

We shall also use the notation:

- $\mathrm{X}=\mathbb{R}^{\mathrm{M}}=\left\{\mathrm{x}=\left(x^{1}, \ldots, x^{m}\right) \mid x^{\mu} \in \mathbb{R}, \mu \in \mathrm{M}\right\} ;$
- $\mathbb{R}_{\mathbb{I}}^{\mathrm{M}}=\left\{\mathbf{u}=\left(u_{\mathrm{i}}^{\mu}\right) \mid u_{\mathrm{i}}^{\mu} \in \mathbb{R}, \mu \in \mathrm{M}, \mathrm{i} \in \mathbb{I}\right\}$, $\mathbb{R}_{\mathbb{I}}^{\mathrm{N}}=\left\{\mathbf{u}=\left(u_{\mathrm{i}}^{\alpha}\right) \mid u_{\mathrm{i}}^{\alpha} \in \mathbb{R}, \alpha \in \mathrm{N}, \mathrm{i} \in \mathbb{I}\right\}$, $\mathbb{R}_{\mathbb{I}}^{\mathrm{M}}=\mathbb{R}_{\mathbb{I}}^{1} \times \mathbb{R}_{\mathbb{I}}^{N}=\mathbb{R}_{\mathbb{I}_{0}}^{1} \times \mathbb{R}_{\mathbb{I}_{0}^{\prime}}^{1} \times \mathbb{R}_{\mathbb{I}}^{\mathrm{N}} ;$
- $\mathbb{R}_{\mathbb{I}}=\left\{\mathbf{p}=\left(p_{\mathrm{i}}\right) \mid p_{\mathrm{i}} \in \mathbb{R}, \mathrm{i} \in \mathbb{I}\right\}=\mathbb{R}_{\mathbb{I}_{1}} \times \mathbb{R}_{\mathbb{I}_{1}^{\prime}} ;$
- $\mathbf{B}=\mathrm{X} \times \mathbb{R}_{\mathbb{I}}^{\mathrm{M}} \times \mathbb{R}_{\mathbb{I}}$,
$\mathrm{CE}=\mathrm{X} \times \mathbb{R}_{\mathbb{I}_{0}}^{1} \times \mathbb{R}_{\mathbb{I}}^{N} \times \mathbb{R}_{\mathbb{I}}$,
$\mathrm{CPE}=\mathrm{X} \times \mathbb{R}_{\mathbb{I}_{0}}^{1} \times \mathbb{R}_{\mathbb{I}}^{N} \times \mathbb{R}_{\mathbb{I}_{1}}$.
We assume the summation over repeated upper and lower indices in the prescribed limits.

The paper is rather calculative, the calculations are straightforward but tiresome, and we omit them as a rule.

### 1.3 The base components

The base space for the Navier-Stokes equations in the algebraic approach is the infinite dimensional space $\mathbf{B}=\mathrm{X} \times \mathbb{R}_{\mathbb{I}}^{M} \times \mathbb{R}_{\mathbb{I}}$, where X is the set of independent variables (space coordinates), $\mathbb{R}_{\mathbb{I}}^{M}$ is the set of differential variables (velocity coordinates and their partial derivatives), $\mathbb{R}_{\mathbb{I}}$ is the set of differential variables (pressure and its partial derivatives).

The base algebra in the algebraic approach is the unital commutative associative algebra $\mathcal{A}(\mathbf{B})=\mathcal{C}_{\text {fin }}^{\infty}(\mathbf{B})$ of all smooth real functions on the base space $\mathbf{B}$ of a finite order, i.e., depending on a finite number of the variables $x^{\mu}, u_{\mathrm{i}}^{\mu}, p_{\mathrm{i}}$, where $\mu \in \mathrm{M}, \mathrm{i} \in \mathbb{I}$. In more detail, the integer $r \in \mathbb{Z}_{+}$is called the $\mathbf{u}$-order of a function $f(x, \mathbf{u}, \mathbf{p}) \in \mathcal{A}(\mathbf{B})$, we write $\operatorname{ord}_{\mathbf{u}} f=r$, if the partial derivative $\partial_{u_{\mathrm{i}}^{\mu}} f \neq 0$ for some variable $u_{\mathrm{i}}^{\mu}$, $|\mathrm{i}|=r$, while partial derivatives $\partial_{u_{\mathrm{i}}^{\mu}} f=0$ for all $|\mathrm{i}|>r$. In the same way, the $\mathbf{p}$-order is defined.

The base algebra of derivations of the algebra $\mathcal{A}(\mathbf{B})$ is the Lie algebra

$$
\mathfrak{D}(\mathbf{B})=\mathfrak{D}(\mathcal{A}(\mathbf{B}))=\left\{\zeta=\zeta^{\mu} \partial_{x^{\mu}}+\zeta_{\mathrm{i}}^{\mu} \partial_{u_{\mathrm{i}}^{\mu}}+\zeta_{\mathrm{i}} \partial_{p_{\mathrm{i}}} \mid \zeta^{\mu}, \zeta_{\mathrm{i}}^{\mu}, \zeta_{\mathrm{i}} \in \mathcal{A}(\mathbf{B})\right\}
$$

The Lie algebra $\mathfrak{D}(\mathbf{B})$ splits into the vertical and horizontal subalgebras,

$$
\mathfrak{D}(\mathbf{B})=\mathfrak{D}_{\mathrm{V}}(\mathbf{B}) \oplus_{\mathcal{A}(\mathbf{B})} \mathfrak{D}_{\mathrm{H}}(\mathbf{B}),
$$

where

$$
\begin{array}{rlc}
\bullet \mathfrak{D}_{\mathrm{V}}(\mathbf{B})= & \left\{\zeta \in \mathfrak{D}(\mathbf{B})|\zeta|_{\mathcal{C}^{\infty}(\mathrm{X})}=0\right\} & \left(\text { note }, \mathcal{C}^{\infty}(\mathrm{X}) \subset \mathcal{A}(\mathbf{B})\right) \\
= & \left\{\zeta=\zeta_{\mathrm{i}}^{\mu} \partial_{u_{\mathrm{i}}^{\mu}}+\zeta_{\mathrm{i}} \partial_{p_{\mathrm{i}}} \mid \zeta_{\mathrm{i}}^{\mu}, \zeta_{\mathrm{i}} \in \mathcal{A}(\mathbf{B})\right\} ; & \\
\text { - } \mathfrak{D}_{\mathrm{H}}(\mathbf{B})= & \left\{\zeta=\zeta^{\mu} D_{\mu} \mid \zeta^{\mu} \in \mathcal{A}(\mathbf{B})\right\}, & \left(D_{\mu} \mid \mathcal{C}^{\infty}(\mathrm{X})=\partial_{x^{\mu}}\right) \\
& D_{\mu}=\partial_{x^{\mu}}+u_{\mathrm{i}+(\mu)}^{\lambda} \partial_{u_{\mathrm{i}}^{\lambda}}+p_{\mathrm{i}+(\mu)} \partial_{p_{\mathrm{i}},} & \lambda, \mu \in \mathrm{M} ;
\end{array}
$$

- $\left[D_{\mu}, D_{\nu}\right]=0, \quad\left[D_{\mu}, \zeta\right]=\left(D_{\mu} \zeta_{\mathrm{i}}^{\lambda}-\zeta_{\mathrm{i}+(\mu)}^{\lambda}\right) \partial_{u_{\mathrm{i}}^{\lambda}}+\left(D_{\mu} \zeta_{\mathrm{i}}-\zeta_{\mathrm{i}+(\mu)}\right) \partial_{p_{\mathrm{i}}}$, for all $\lambda, \mu, \nu \in \mathrm{M}, \zeta=\zeta_{\mathrm{i}}^{\lambda} \partial_{u_{\mathrm{i}}^{\lambda}}+\zeta_{\mathrm{i}} \partial_{p_{\mathrm{i}}} \in \mathfrak{D}_{\mathrm{V}}(\mathbf{B})$.

We denote

- $D_{\mathrm{i}}=\left(D_{1}\right)^{i^{1}} \circ \ldots \circ\left(D_{m}\right)^{i^{m}} \quad$ for all $\quad \mathrm{i}=\left(i^{1}, \ldots, i^{m}\right) \in \mathbb{I}$.

The pair $\left(\mathcal{A}(\mathbf{B}), \mathfrak{D}_{\mathrm{H}}(\mathbf{B})\right)$ is called the differential algebra associated with the base space $\mathbf{B}$.

The Lie algebra

$$
\operatorname{Sym}\left(\mathcal{A}(\mathbf{B}), \mathfrak{D}_{\mathrm{H}}(\mathbf{B})\right)=\left\{\zeta=\operatorname{ev}_{\mathrm{f}} \in \mathfrak{D}_{\mathrm{V}}(\mathbf{B}) \mid\left[D_{\mu}, \mathrm{ev}_{\mathrm{f}}\right]=0, \mu \in \mathrm{M}\right\}
$$

is the Lie algebra of symmetries of the differential algebra $\left(\mathcal{A}(\mathbf{B}), \mathfrak{D}_{\mathrm{H}}(\mathbf{B})\right)$, where

- $\mathrm{f}=\left(f^{\mu}, f\right) \in \mathcal{A}^{\mathrm{M}}(\mathbf{B}) \times \mathcal{A}(\mathbf{B}), \quad f^{\mu}=\zeta_{0}^{\mu}, f=\zeta_{0}$,
- $\mathrm{ev}_{\mathrm{f}}=D_{\mathrm{i}} f^{\mu} \cdot \partial_{u_{\mathrm{i}}^{\mu}}+D_{\mathrm{i}} f \cdot \partial_{p_{\mathrm{i}}}, \quad D_{\mathrm{i}} f^{\mu}=\zeta_{\mathrm{i}}^{\mu}, D_{\mathrm{i}} f=\zeta_{\mathrm{i}}$.

The $\mathbb{Z}$-graded $\mathcal{A}(\mathbf{B})$-module $\Omega_{\mathrm{H}}(\mathbf{B})=\oplus_{q \in \mathbb{Z}} \Omega_{\mathrm{H}}^{q}(\mathbf{B})$ of horizontal differential forms is defined as follows,

$$
\Omega_{\mathrm{H}}^{q}(\mathbf{B})= \begin{cases}0, & q<0, q>m ; \\ \mathcal{A}(\mathbf{B}), & q=0 ; \\ \operatorname{Hom}_{\mathcal{A}(\mathbf{B})}\left(\wedge^{q} \mathfrak{D}_{\mathrm{H}}(\mathbf{B}) ; \mathcal{A}(\mathbf{B})\right), & 1 \leq q \leq m .\end{cases}
$$

Here,

$$
\begin{aligned}
\operatorname{Hom}_{\mathcal{A}(\mathbf{B})} & \left(\wedge^{q} \mathfrak{D}_{\mathrm{H}}(\mathbf{B}) ; \mathcal{A}(\mathbf{B})\right) \\
& =\left\{\omega^{q}=\omega_{\mu_{1} \ldots \mu_{q}} \cdot d x^{\mu_{1}} \wedge \ldots \wedge d x^{\mu_{q}} \mid \omega_{\mu_{1} \ldots \mu_{q}} \in \mathcal{A}(\mathbf{B}),+\mathrm{s}-\mathrm{s}\right\}
\end{aligned}
$$

where the abbreviation " +s -s" states that components $\omega_{\mu_{1} \ldots \mu_{q}}$ are skewsymmetric in indices $\mu_{1}, \ldots, \mu_{q} \in \mathrm{M}$.

The horizontal differential $d_{\mathrm{H}} \in \operatorname{End}_{\mathbb{R}}\left(\Omega_{\mathrm{H}}(\mathbf{B})\right), d_{\mathrm{H}} \circ d_{\mathrm{H}}=0$, is defined by the rule,

$$
\begin{aligned}
d_{\mathrm{H}}^{q}=\left.d_{\mathrm{H}}\right|_{\Omega_{\mathrm{H}}^{q}(\mathbf{B})}: \Omega_{\mathrm{H}}^{q}(\mathbf{B}) \rightarrow \Omega_{\mathrm{H}}^{q+1}(\mathbf{B}), \\
\omega_{\mu_{1} \ldots \mu_{q}} \cdot d x^{\mu_{1}} \wedge \ldots \wedge d x^{\mu_{q}} \mapsto D_{\left[\mu_{0}\right.} \omega_{\left.\mu_{1} \ldots \mu_{q}\right]} \cdot d x^{\mu_{0}} \wedge \ldots \wedge d x^{\mu_{q}},
\end{aligned}
$$

the brackets [...] denote the skew-symmetrization in indices $\mu_{0}, \ldots, \mu_{q} \in \mathrm{M}$, so $d_{\mathrm{H}}^{q+1} \circ d_{\mathrm{H}}^{q}=0, q \in \mathbb{Z}$.

The $\mathbb{Z}$-graded linear space $H\left(\Omega_{\mathrm{H}}(\mathbf{B}) ; d_{\mathrm{H}}\right)=\oplus_{q \in \mathbb{Z}} H_{\mathrm{H}}^{q}(\mathbf{B})$ of cohomologies of the differential algebra $\left(\mathcal{A}(\mathbf{B}) ; \mathfrak{D}_{\mathrm{H}}(\mathbf{B})\right)$ is defined in the usual way, $H\left(\Omega_{\mathrm{H}}(\mathbf{B}) ; d_{\mathrm{H}}\right)=\operatorname{Ker} d_{\mathrm{H}} / \operatorname{Im} d_{\mathrm{H}}, H_{\mathrm{H}}^{q}(\mathbf{B})=\operatorname{Ker} d_{\mathrm{H}}^{q} / \operatorname{Im} d_{\mathrm{H}}^{q-1}, q \in \mathbb{Z}$.
Theorem 1 (The main theorem of the formal calculus of variations, see, for example, [8], and the references therein). The linear spaces

$$
H_{\mathrm{H}}^{q}(\mathbf{B})= \begin{cases}0, & q<0, q>m \\ \mathbb{R}, & q=0 \\ 0, & 1 \leq q \leq m-1 \\ \mathcal{H}(\mathbf{B}), & q=m\end{cases}
$$

where (in our setting) the Helmholtz linear space

$$
\mathcal{H}(\mathbf{B})=\left\{\chi=\left(\chi_{\mu}, \chi\right) \in \mathcal{A}_{\mathrm{M}}(\mathbf{B}) \times \mathcal{A}(\mathbf{B}) \mid \chi_{*}=\chi^{*}\right\}
$$

the linear mappings $\chi_{*}, \chi^{*}: \mathcal{A}^{\mathrm{M}}(\mathbf{B}) \times \mathcal{A}(\mathbf{B}) \rightarrow \mathcal{A}_{\mathrm{M}}(\mathbf{B}) \times \mathcal{A}(\mathbf{B})$ act by the rules:

$$
\begin{aligned}
& \mathcal{A}^{\mathrm{M}}(\mathbf{B}) \times \mathcal{A}(\mathbf{B}) \ni \mathrm{f}=\left(f^{\mu}, f\right) \mapsto \chi_{*} \mathrm{f}=\mathrm{g}=\left(g_{\mu}, g\right) \in \mathcal{A}_{\mathrm{M}}(\mathbf{B}) \times \mathcal{A}(\mathbf{B}), \\
& g_{\mu}=\partial_{u_{\mathrm{i}}^{\nu}} \chi_{\mu} \cdot D_{\mathrm{i}} f^{\nu}+\partial_{p_{\mathrm{i}}} \chi_{\mu} \cdot D_{\mathrm{i}} f, \quad g=\partial_{u_{\mathrm{i}}^{\nu}} \chi \cdot D_{\mathrm{i}} f^{\nu}+\partial_{p_{\mathrm{i}}} \chi \cdot D_{\mathrm{i}} f ; \\
& \mathcal{A}^{\mathrm{M}}(\mathbf{B}) \times \mathcal{A}(\mathbf{B}) \ni \mathrm{f}=\left(f^{\mu}, f\right) \mapsto \chi^{*} \mathrm{f}=\mathrm{g}=\left(g_{\mu}, g\right) \in \mathcal{A}_{\mathrm{M}}(\mathbf{B}) \times \mathcal{A}(\mathbf{B}), \\
& g_{\mu}=(-D)_{\mathrm{i}}\left(f^{\nu} \cdot \partial_{u_{\mathrm{i}}^{\mu}} \chi_{\nu}+f \cdot \partial_{u_{\mathrm{i}}^{\mu}} \chi\right), \quad g=(-D)_{\mathrm{i}}\left(f^{\nu} \cdot \partial_{p_{\mathrm{i}}} \chi_{\nu}+f \cdot \partial_{p_{\mathrm{i}}} \chi\right) .
\end{aligned}
$$

The isomorphism $\delta=\left(\delta_{u^{\mu}}, \delta_{p}\right): H_{\mathrm{H}}^{m}(\mathbf{B}) \simeq \mathcal{H}(\mathbf{B})$ of linear spaces is defined as the variational derivatives:

$$
\begin{aligned}
& \Omega_{\mathrm{H}}^{m}(\mathbf{B}) \ni \omega=L \cdot d^{m} x \mapsto \chi=\delta L=\left(\delta_{u^{\mu}} L, \delta_{p} L\right), \\
& \delta_{u^{\mu}} L=(-D)_{\mathrm{i}} \partial_{u_{\mathrm{i}}^{\mu}} L, \quad \delta_{p} L=(-D)_{\mathrm{i}} \partial_{p_{\mathrm{i}}} L .
\end{aligned}
$$

Remark 2. Note, cohomologies are defined up to isomorphisms.

## 2 Constraints

### 2.1 The divergence-free space

The continuity equation $\mathrm{CE}=\left\{\partial_{x^{\mu}} u^{\mu}=0\right\}$ (see (2)) has the algebraic counterpart

$$
\mathbf{C E}=\left\{(x, \mathbf{u}, \mathbf{p}) \in \mathbf{B} \mid \mathrm{CE}_{\mathrm{i}}=u_{\mathrm{i}+(\mu)}^{\mu}=0, \mathrm{i} \in \mathbb{I}\right\} .
$$

The subset $\mathbf{C E} \subset \mathbf{B}$ is called the solution manifold of the equation CE , because a smooth function $\phi(\mathrm{x})=\left(\phi^{\mu}(\mathrm{x})\right) \in \mathcal{C}^{\infty}\left(\mathrm{X} ; \mathbb{R}^{\mathrm{M}}\right)$ is a solution of the equation CE iff the graph

$$
\operatorname{graph} \mathbf{j} \phi(\mathrm{x})=\left\{(\mathrm{x}, \mathbf{u}, \mathbf{p}) \mid u_{\mathrm{i}}^{\mu}=\partial_{x^{\mathrm{i}}} \phi^{\mu}(\mathrm{x}), \mu \in \mathrm{M}, \mathrm{i} \in \mathbb{I}\right\} \subset \mathbf{C E},
$$

where $\mathbf{j} \phi(\mathrm{x})=\left\{\partial_{x^{\mathrm{i}}} \phi^{\mu}(\mathrm{x}) \mid \mathrm{i} \in \mathbb{I}, \mu \in \mathrm{M}\right\}$ is the $j e t$ of the function $\phi(\mathrm{x})$, the variables $\mathbf{p}=\left(p_{\mathrm{i}}\right) \in \mathbb{R}_{\mathbb{I}}$ are parameters, $\partial_{x^{i}}=\left(\partial_{x^{1}}\right)^{i^{1}} \circ \ldots \circ\left(\partial_{x^{m}}\right)^{i^{m}}, \mathrm{i} \in \mathbb{I}$.

With the solution manifold CE there is associated the ideal

$$
\begin{aligned}
\mathcal{I}=\left\{f \in \mathcal{A}(\mathbf{B})|f|_{\mathbf{C E}}=0\right\} & =\left\{f=P(D) u_{(\mu)}^{\mu} \mid P(D) \in \mathcal{A}(\mathbf{B})[D]\right\} \\
& =\left\{f=\phi^{\mathrm{i}} \cdot u_{\mathrm{i}+(\mu)}^{\mu} \mid \phi^{\mathrm{i}} \in \mathcal{A}(\mathbf{B}), \mathrm{i} \in \mathbb{I},+\mathrm{fin}\right\}
\end{aligned}
$$

of the algebra $\mathcal{A}(\mathbf{B})$, where $\mathcal{A}(\mathbf{B})[D]$ is the unital associative algebra of all polynomials in the indeterminates $D_{1}, \ldots, D_{m}$ with coefficients in $\mathcal{A}(\mathbf{B})$, i.e.,

$$
\mathcal{A}(\mathbf{B})[D]=\left\{P(D)=\phi^{\mathrm{i}} \cdot D_{\mathrm{i}} \mid \phi^{\mathrm{i}} \in \mathcal{A}(\mathbf{B}), \mathrm{i} \in \mathbb{I},+\mathrm{fin}\right\},
$$

where the abbreviation "+fin" states that only a finite number of the coefficients $\phi^{\mathrm{i}} \neq 0$. The ideal $\mathcal{I}$ is differential, i.e., $\left.D_{\mu}\right|_{\mathcal{I}}: \mathcal{I} \rightarrow \mathcal{I}, \mu \in \mathrm{M}$.

By definition, we assume $\mathcal{A}(\mathbf{C E})=\mathcal{A}(\mathbf{B}) / \mathcal{I}$, i.e., we define the algebra $\mathcal{A}(\mathbf{C E})$ of smooth functions on the space $\mathbf{C E}$ as the factor-algebra. We denote $\bar{f}=\left.f\right|_{\mathbf{C E}}=f+\mathcal{I}$ the restriction of the function $f \in \mathcal{A}(\mathbf{B})$ to the solution manifold $\mathbf{C E}$ and its equivalence class in $\mathcal{A}(\mathbf{C E})$.

We shall need:

- the subalgebra of the Lie algebra $\mathfrak{D}(\mathbf{B})$

$$
\begin{aligned}
\mathfrak{D}_{\mathcal{I}}(\mathbf{B}) & =\left\{\zeta \in \mathfrak{D}(\mathbf{B})|\zeta|_{\mathcal{I}}: \mathcal{I} \rightarrow \mathcal{I}\right\}=\left\{\zeta \in \mathfrak{D}(\mathbf{B})|\zeta|_{\mathcal{I}} \in \mathfrak{D}(\mathcal{I})\right\} \\
& =\left\{\zeta=\zeta^{\mu} \partial_{x^{\mu}}+\zeta_{\mathrm{i}}^{\mu} \partial_{u_{\mathrm{i}}^{\mu}}+\zeta_{\mathrm{i}} \partial_{p_{\mathrm{i}}} \mid \zeta_{\mathrm{i}+(\mu)}^{\mu} \in \mathcal{I}, \mathrm{i} \in \mathbb{I}\right\}
\end{aligned}
$$

of all derivations of the algebra $\mathcal{A}(\mathbf{B})$ leaving the ideal $\mathcal{I}$ invariant;

- the subalgebra of the Lie algebra $\mathfrak{D}(\mathbf{B})$ and the ideal of the Lie algebra $\mathfrak{D}_{\mathcal{I}}(\mathbf{B}) \subset \mathfrak{D}(\mathbf{B})$

$$
\begin{aligned}
\mathfrak{D}(\mathbf{B} ; \mathcal{I}) & =\{\zeta \in \mathfrak{D}(\mathbf{B}) \mid \zeta: \mathcal{A}(\mathbf{B}) \rightarrow \mathcal{I}\} \\
& =\left\{\zeta=\zeta^{\mu} \partial_{x^{\mu}}+\zeta_{\mathrm{i}}^{\mu} \partial_{u_{\mathrm{i}}^{\mu}}+\zeta_{\mathrm{i}} \partial_{p_{\mathrm{i}}} \mid \zeta^{\mu}, \zeta_{\mathrm{i}}^{\mu}, \zeta_{\mathrm{i}} \in \mathcal{I}\right\}
\end{aligned}
$$

of all derivations with the image in the ideal $\mathcal{I}$,

- the Lie factor-algebra $\mathfrak{D}(\mathbf{C E})=\mathfrak{D}_{\mathcal{I}}(\mathbf{B}) / \mathfrak{D}(\mathbf{B} ; \mathcal{I})$ of derivations of the factor-algebra $\mathcal{A}(\mathbf{C E})$.

Here, the mapping $\mathfrak{D}_{\mathcal{I}}(\mathbf{B}) \rightarrow \mathfrak{D}(\mathbf{C E})$ is defined as follows:

$$
\begin{aligned}
\mathfrak{D}_{\mathcal{I}}(\mathbf{B}) \ni \zeta \mapsto \bar{\zeta}=\zeta+\mathfrak{D}(\mathbf{B} ; \mathcal{I}): \mathcal{A}(\mathbf{C E}) & \rightarrow \mathcal{A}(\mathbf{C E}), \\
\bar{f}=f+\mathcal{I} & \mapsto \bar{\zeta} \bar{f}=\overline{\zeta f}=\zeta f+\mathcal{I}
\end{aligned}
$$

(we denote $\bar{\zeta}=\zeta+\mathfrak{D}(\mathbf{B} ; \mathcal{I})$ the equivalence class of a derivation $\zeta \in \mathfrak{D}_{\mathcal{I}}(\mathbf{B})$ ).
The Lie algebra $\mathfrak{D}(\mathbf{C E})$ splits into the vertical and horizontal subalgebras:

- $\mathfrak{D}(\mathbf{C E})=\mathfrak{D}_{\mathrm{V}}(\mathbf{C E}) \oplus_{\mathcal{A}(\mathbf{C E})} \mathfrak{D}_{\mathrm{H}}(\mathbf{C E})$,
- $\mathfrak{D}_{\mathrm{V}}(\mathbf{C E})=\left\{\bar{\zeta} \in \mathfrak{D}(\mathbf{C E}) \mid \zeta \in \mathfrak{D}_{\mathrm{V}}(\mathbf{B}) \cap \mathfrak{D}_{\mathcal{I}}(\mathbf{B})\right\}$,
- $\mathfrak{D}_{\mathrm{H}}(\mathbf{C E})=\left\{\bar{\zeta} \in \mathfrak{D}(\mathbf{C E}) \mid \zeta \in \mathfrak{D}_{\mathrm{H}}(\mathbf{B})\right\} \quad\left(\right.$ note, $\left.\mathfrak{D}_{\mathrm{H}}(\mathbf{B}) \subset \mathfrak{D}_{\mathcal{I}}(\mathbf{B})\right)$.

The Lie algebra

$$
\begin{aligned}
& \operatorname{Sym}\left(\mathcal{A}(\mathbf{C E}), \mathfrak{D}_{\mathrm{H}}(\mathbf{C E})\right)=\left\{\bar{\zeta} \in \mathfrak{D}_{\mathrm{V}}(\mathbf{C E}) \mid\left[\bar{D}_{\mu} \bar{\zeta}\right]=\overline{0}=\mathcal{I}, \mu \in \mathrm{M}\right\} \\
& \quad=\left\{\bar{\zeta} \mid \zeta=D_{\mathrm{i}} f^{\mu} \cdot \partial_{u_{\mathrm{i}}^{\mu}}+D_{\mathrm{i}} f \cdot \partial_{p_{\mathrm{i}}}, \quad D_{\mu} f^{\mu} \in \mathcal{I}\right\} \\
& \quad=\left\{\bar{\zeta}\left|\zeta=\mathrm{ev}_{\mathrm{f}}, \quad \mathrm{f}=\left(f^{\mu}, f\right) \in \mathcal{A}^{\mathrm{M}}(\mathbf{B}) \times \mathcal{A}(\mathbf{B}),\left(D_{\mu} f^{\mu}\right)\right|_{\mathbf{C E}}=0\right\}
\end{aligned}
$$

is the Lie algebra of symmetries of the differential algebra $\left(\mathcal{A}(\mathbf{C E}), \mathfrak{D}_{\mathrm{H}}(\mathbf{C E})\right)$.
The $\mathbb{Z}$-graded $\mathcal{A}(\mathbf{C E})$-module $\Omega_{\mathrm{H}}(\mathbf{C E})=\oplus_{q \in \mathbb{Z}} \Omega_{\mathrm{H}}^{q}(\mathbf{C E})$ of horizontal differential forms is defined as follows,

$$
\Omega_{\mathrm{H}}^{q}(\mathbf{C E})= \begin{cases}0, & q<0, q>m ; \\ \mathcal{A}(\mathbf{C E}), & q=0 ; \\ \operatorname{Hom}_{\mathcal{A}(\mathbf{C E})}\left(\wedge^{q} \mathfrak{D}_{\mathrm{H}}(\mathbf{C E}) ; \mathcal{A}(\mathbf{C E})\right), & 1 \leq q \leq m\end{cases}
$$

Here,

$$
\begin{aligned}
\operatorname{Hom}_{\mathcal{A}(\mathbf{C E})} & \left(\wedge^{q} \mathfrak{D}_{\mathrm{H}}(\mathbf{C E}) ; \mathcal{A}(\mathbf{C E})\right) \\
& =\left\{\bar{\omega}^{q}=\bar{\omega}_{\mu_{1} \ldots \mu_{q}} \cdot d \bar{x}^{\mu_{1}} \wedge \ldots \wedge d \bar{x}^{\mu_{q}} \mid \bar{\omega}_{\mu_{1} \ldots \mu_{q}} \in \mathcal{A}(\mathbf{C E}),+\mathrm{s}-\mathrm{s}\right\},
\end{aligned}
$$

where $d \bar{x}^{\mu}\left(\bar{D}_{\nu}\right)=\bar{\delta}_{\nu}^{\mu}=\delta_{\nu}^{\mu}+\mathcal{I}, \mu, \nu \in \mathrm{M}$.
The horizontal differential $d_{\mathrm{H}} \in \operatorname{End}_{\mathbb{R}}\left(\Omega_{\mathrm{H}}(\mathbf{C E})\right)$, $d_{\mathrm{H}} \circ d_{\mathrm{H}}=0$, is defined by the rule,

$$
\begin{aligned}
& d_{\mathrm{H}}^{q}=\left.d_{\mathrm{H}}\right|_{\Omega_{\mathrm{H}}^{q}(\mathbf{C E})}: \Omega_{\mathrm{H}}^{q}(\mathbf{C E}) \rightarrow \Omega_{\mathrm{H}}^{q+1}(\mathbf{C E}), \\
& \bar{\omega}_{\mu_{1} \ldots \mu_{q}} \cdot d \bar{x}^{\mu_{1}} \wedge \ldots \wedge d \bar{x}^{\mu_{q}} \mapsto \bar{D}_{\left[\mu_{0}\right.} \bar{\omega}_{\left.\mu_{1} \ldots \mu_{q}\right]} \cdot d \bar{x}^{\mu_{0}} \wedge \ldots \wedge d \bar{x}^{\mu_{q}},
\end{aligned}
$$

where $d_{\mathrm{H}}^{q+1} \circ d_{\mathrm{H}}^{q}=0, q \in \mathbb{Z}$.
The $\mathbb{Z}$-graded linear space $H\left(\Omega_{\mathrm{H}}(\mathbf{C E}) ; d_{\mathrm{H}}\right)=\oplus_{q \in \mathbb{Z}} H_{\mathrm{H}}^{q}(\mathbf{C E})$ of cohomologies of the differential algebra $\left(\mathcal{A}(\mathbf{C E}) ; \mathfrak{D}_{\mathrm{H}}(\mathbf{C E})\right)$ is defined in the usual way, $H\left(\Omega_{\mathrm{H}}(\mathbf{C E}) ; d_{\mathrm{H}}\right)=\operatorname{Ker} d_{\mathrm{H}} / \operatorname{Im} d_{\mathrm{H}}, H_{\mathrm{H}}^{q}(\mathbf{C E})=\operatorname{Ker} d_{\mathrm{H}}^{q} / \operatorname{Im} d_{\mathrm{H}}^{q-1}, q \in \mathbb{Z}$.

To move further, in particular to calculate the cohomology spaces, we introduce global coordinates on the solution manifold CE. Namely, the linear space $\mathbb{R}_{\mathbb{I}}^{M}$ we split as

$$
\mathbb{R}_{\mathbb{I}}^{\mathrm{M}}=\mathbb{R}_{\mathbb{I}}^{1} \times \mathbb{R}_{\mathbb{I}}^{\mathrm{N}}=\mathbb{R}_{\mathbb{I}_{0}}^{1} \times \mathbb{R}_{\mathbb{I}_{0}^{\prime}}^{1} \times \mathbb{R}_{\mathbb{I}}^{\mathrm{N}}
$$

(see Subsection (1.2). Then, the global coordinates on CE are defined by the isomorphism of the linear spaces

$$
\begin{aligned}
\mathbf{C E}=\left\{\left(x^{\mu}, u_{\mathrm{i}}^{\mu}, p_{\mathrm{i}}\right) \in \mathbf{B} \mid u_{\mathrm{i}+(\mu)}^{\mu}=0\right\} & \rightarrow \mathrm{X} \times \mathbb{R}_{\mathbb{I}_{0}}^{1} \times \mathbb{R}_{\mathbb{I}}^{\mathrm{N}} \times \mathbb{R}_{\mathbb{I}}, \\
\left(x^{\mu}, u_{\mathrm{i}}^{1}, u_{\mathrm{i}}^{\alpha}, p_{\mathrm{i}}\right) & \mapsto\left(x^{\mu}, u_{\mathrm{i}_{0}}^{1}, u_{\mathrm{i}}^{\alpha}, p_{\mathrm{i}}\right),
\end{aligned}
$$

with the inverse mapping

$$
\begin{aligned}
\mathrm{X} \times \mathbb{R}_{\mathbb{I}_{0}}^{1} \times \mathbb{R}_{\mathbb{I}}^{\mathrm{N}} \times \mathbb{R}_{\mathbb{I}} & \rightarrow\left\{\left(x^{\mu}, u_{\mathrm{i}}^{\mu}, p_{\mathrm{i}}\right) \in \mathbf{B} \mid u_{\mathrm{i}+(\mu)}^{\mu}=0\right\}=\mathbf{C E}, \\
\left(x^{\mu}, u_{\mathrm{i}_{0}}^{1}, u_{\mathrm{i}}^{\alpha}, p_{\mathrm{i}}\right) & \mapsto\left(x^{\mu}, u_{\mathrm{i}}^{1}, u_{\mathrm{i}}^{\alpha}, p_{\mathrm{i}}\right)
\end{aligned}
$$

where $u_{\mathrm{i}_{0}^{\prime}}^{1}=-u_{\mathrm{i}_{0}^{\prime}-(1)+(\beta)}^{\beta}, \mu=(1, \alpha) \in \mathrm{M}, \mathrm{i}_{0} \in \mathbb{I}_{0}, \alpha, \beta \in \mathrm{~N}, \mathrm{i}_{0}^{\prime} \in \mathbb{I}_{0}^{\prime}$. In these global coordinates we have:

- $\mathrm{CE}=\mathrm{X} \times \mathbb{R}_{\mathbb{I}_{0}}^{1} \times \mathbb{R}_{\mathbb{I}}^{\mathrm{N}} \times \mathbb{R}_{\mathbb{I}}, \quad \mathcal{A}(\mathbf{C E})=\mathcal{C}_{\text {fin }}^{\infty}(\mathbf{C E}) ;$
- $\mathfrak{D}_{\mathrm{V}}(\mathbf{C E})=\left\{\zeta=\zeta_{\mathrm{i}_{0}}^{1} \partial_{u_{i_{0}}^{1}}+\zeta_{\mathrm{i}}^{\alpha} \partial_{u_{\mathrm{i}}^{\alpha}}+\zeta_{\mathrm{i}} \partial_{p_{\mathrm{i}}} \mid \zeta_{\mathrm{i}_{0}}^{1}, \zeta_{\mathrm{i}}^{\alpha}, \zeta_{\mathrm{i}} \in \mathcal{A}(\mathbf{C E})\right\} ;$
- $D_{\mu}=\partial_{x^{\mu}}+u_{\mathrm{i}_{0}+(\mu)}^{1} \partial_{u_{\mathrm{i}_{0}}^{1}}+u_{\mathrm{i}+(\mu)}^{\alpha} \partial_{u_{\mathrm{i}}^{\alpha}}+p_{\mathrm{i}+(\mu)} \partial_{p_{\mathrm{i}}}, \quad \mu \in \mathrm{M}$, where $u_{\mathrm{i}_{0}+(1)}^{1}=-u_{\mathrm{i}_{0}+(\alpha)}^{\alpha}$;
- $\operatorname{Sym}\left(\mathcal{A}(\mathbf{C E}), \mathfrak{D}_{\mathrm{H}}(\mathbf{C E})\right)=\left\{\zeta=\mathrm{ev}_{\mathrm{f}} \in \mathfrak{D}_{\mathrm{V}}(\mathbf{C E}) \mid\left[D_{\mu}, \mathrm{ev}_{\mathrm{f}}\right]=0, \mu \in \mathrm{M}\right\}$, where

$$
\begin{aligned}
& -\mathrm{f}=\left(f^{\mu}, f\right) \in \mathcal{A}^{\mathrm{M}}(\mathbf{C E}) \times \mathcal{A}(\mathbf{C E}), \quad D_{\mu} f^{\mu}=0, \\
& -\mathrm{ev}_{\mathrm{f}}=D_{\mathrm{i}_{0}} f^{1} \cdot \partial_{u_{\mathrm{i}_{0}}}+D_{\mathrm{i}} f^{\alpha} \cdot \partial_{u_{\mathrm{i}}^{\alpha}}+D_{\mathrm{i}} f \cdot \partial_{p_{\mathrm{i}}}
\end{aligned}
$$

- $\Omega_{\mathrm{H}}^{q}(\mathbf{C E})=\left\{\omega=\omega_{\mu_{1} \ldots \mu_{q}} \cdot d x^{\mu_{1}} \wedge \ldots \wedge d x^{\mu_{q}} \mid \omega_{\mu_{1} \ldots \mu_{q}} \in \mathcal{A}(\mathbf{C E}),+{ }_{\mathrm{s}-\mathrm{s}}\right\}$, $1 \leq q \leq m$.

In more detail, here the equation $D_{\mu} f^{\mu}=0$ takes the form

$$
\begin{equation*}
D_{\mu} f^{\mu}=\partial_{x^{\mu}} f^{\mu}+u_{\mathrm{i}_{0}+(\mu)}^{1} \partial_{u_{\mathrm{i}_{0}}^{1}} f^{\mu}+u_{\mathrm{i}+(\mu)}^{\alpha} \partial_{u_{\mathrm{i}}^{\alpha}} f^{\mu}+p_{\mathrm{i}+(\mu)} \partial_{p_{\mathrm{i}}} f^{\mu}=0 \tag{5}
\end{equation*}
$$

Let us suppose the function $f=\left(f^{\mu}\right)$ has the $\mathbf{p}$-order $r=\max _{\mu \in \mathrm{M}} \operatorname{ord}_{\mathbf{p}} f^{\mu}$, then the term $\partial_{p_{\kappa, \mathrm{i}}} f^{\mu} \cdot p_{\kappa, \mathrm{i}+(\mu)}$ will be of the $\mathbf{p}$-order $r+1$, while all other terms of the equation (5) will have $\mathbf{p}$-orders $\leq r$. This leads to the conclusion $\partial_{p_{\kappa, i}} f^{\mu}=0,|\mathrm{i}|=r$, hence the $\mathbf{p}$-order of the function $f$ is $\leq r-1$. By induction we get $f^{\mu}=f^{\mu}(x, \mathbf{u}), \mu \in \mathrm{M}$, i.e., $f$ does not depend on the variable $\mathbf{p} \in \mathbb{R}_{\mathbb{I}}$, and we get the following statement.
Proposition 1. In the above setting the equation (5) is reduced to

$$
\begin{equation*}
\partial_{x^{\mu}} f^{\mu}+u_{\mathrm{i}_{0}+(\mu)}^{1} \partial_{u_{i_{0}}^{1}} f^{\mu}+u_{\mathrm{i}+(\mu)}^{\alpha} \partial_{u_{\mathrm{i}}^{\alpha}} f^{\mu}=0, \quad f^{\mu}(x, \mathbf{u}) \in \mathcal{C}_{\text {fin }}^{\infty}\left(\mathrm{X} \times \mathbb{R}_{\mathbb{I}_{0}}^{1} \times \mathbb{R}_{\mathbb{I}}^{\mathrm{N}}\right) \tag{6}
\end{equation*}
$$

Remark 3. If we want to have symmetries that really depend on the variable $\mathbf{p} \in \mathbb{R}_{\mathbb{I}}$, we must narrow down to a subvariety of the space $\mathbf{C E}$. Exactly such situation arises when studying the Navier-Stokes equations.

To calculate the cohomology spaces $H_{\mathrm{H}}^{q}(\mathbf{C E})$ we introduce the auxiliary complex $\left\{\Theta^{q}, d_{\Theta}^{q} \mid q \in \mathbb{Z}\right\}$, where

- $\Theta^{q}=\left\{\theta^{q}=\theta_{\alpha_{1} \ldots \alpha_{q}} d x^{\alpha_{1}} \wedge \ldots \wedge d x^{\alpha_{q}} \mid \alpha_{1}, \ldots, \alpha_{q} \in \mathrm{~N}, \theta_{\alpha_{1} \ldots \alpha_{q}} \in \mathcal{A}(\mathbf{C E})\right\} ;$
- $d_{\Theta}^{q}: \Theta^{q} \rightarrow \Theta^{q+1}, \theta_{\alpha_{1} \ldots \alpha_{q}} d x^{\alpha_{1}} \wedge \ldots \wedge d x^{\alpha_{q}} \mapsto D_{\left[\alpha_{0}\right.} \theta_{\left.\alpha_{1} \ldots \alpha_{q}\right]} \cdot d x^{\alpha_{0}} \wedge \ldots \wedge d x^{\alpha_{q}} ;$
- $H^{q}(\Theta)=\operatorname{Ker} d_{\Theta}^{q} / \operatorname{Im} d_{\Theta}^{q-1}$.

There is defined the commutative diagram

where

- $\Omega^{q}=\Omega_{\mathrm{H}}^{q}(\mathbf{C E}), \quad \Omega^{0}=\Theta^{0}=\mathcal{A}(\mathbf{C E}) ;$
- $\Omega^{q}=d x^{1} \wedge \Theta^{q-1} \oplus_{\mathcal{A}(\mathbf{C E})} \Theta^{q}$;
- $d_{\mathrm{H}}\left(d x^{1} \wedge \theta^{q-1}+\theta^{q}\right)=d x^{1} \wedge\left(D_{1} \theta^{q}-d_{\Theta} \theta^{q-1}\right)+d_{\Theta} \theta^{q} ;$
- $D_{1} \theta^{q}=D_{1}\left(\theta_{\alpha_{1} \ldots \alpha_{q}} \cdot d x^{\alpha_{1}} \wedge \ldots \wedge d x^{\alpha_{q}}\right)=\left(D_{1} \theta_{\alpha_{1} \ldots \alpha_{q}}\right) \cdot d x^{\alpha_{1}} \wedge \ldots \wedge d x^{\alpha_{q}} ;$
- $\iota^{q}: \Theta^{q} \rightarrow \Omega^{q+1}, \quad \theta^{q} \mapsto \omega^{q+1}=(-1)^{q} d x^{1} \wedge \theta^{q}+0 ;$
- $\pi^{q}: \Omega^{q} \rightarrow \Theta^{q}, \quad \omega^{q}=d x^{1} \wedge \theta^{q-1}+\theta^{q} \mapsto \theta^{q} ;$

According to the general results of homology theory (see, for example, [9]) this diagram defines the long exact sequence of the cohomology spaces

$$
\begin{aligned}
& 0 \rightarrow H_{\mathrm{H}}^{0}(\mathbf{C E}) \rightarrow H^{0}(\Theta) \xrightarrow{D_{1}^{0}} H^{0}(\Theta) \rightarrow H_{\mathrm{H}}^{1}(\mathbf{C E}) \rightarrow H^{1}(\Theta) \xrightarrow{D_{1}^{1}} \ldots \\
& \ldots \xrightarrow{D_{1}^{m-2}} H^{m-2}(\Theta) \rightarrow H_{\mathrm{H}}^{m-1}(\mathbf{C E}) \rightarrow H^{m-1}(\Theta) \xrightarrow{D_{1}^{m-1}} H^{m-1}(\Theta) \rightarrow \\
& \rightarrow H_{\mathrm{H}}^{m}(\mathbf{C E}) \rightarrow 0,
\end{aligned}
$$

where $D_{1}^{q}: H^{q}(\Theta) \rightarrow H^{q}(\Theta)$,

$$
\left[\theta^{q}\right]=\theta^{q}+\operatorname{Im} d_{\Theta}^{q-1} \mapsto D_{1}^{q}\left[\theta^{q}\right]=\left[D_{1} \theta^{q}\right]=D_{1} \theta^{q}+\operatorname{Im} d_{\Theta}^{q-1}
$$

By Theorem 1, we have $H^{q}(\Theta)=0$ for $q \neq 0$ and $q \neq m-1$, while

- $H^{0}(\Theta)=\left\{\phi\left(x^{1}\right) \in \mathcal{C}^{\infty}(\mathbb{R})\right\} ;$
- $H^{m-1}(\Theta)=\mathcal{H}(\Theta)=\left\{\chi \in \mathcal{F}(\Theta) \mid \chi_{*}=\chi^{*}\right\}$,

$$
\mathcal{F}(\Theta)=\mathcal{A}_{1}(\mathbf{C E}) \times \mathcal{A}_{\mathrm{N}}^{\mathbb{Z}_{+}^{1}}(\mathbf{C E}) \times \mathcal{A}^{\mathbb{Z}_{+}^{1}}(\mathbf{C E})
$$

where the isomorphism $\delta: H^{m-1}(\Theta) \simeq \mathcal{H}(\Theta)$ is defined as follows:

$$
\begin{aligned}
& \Theta^{m-1} \ni \theta=L \cdot d x^{2} \wedge \ldots \wedge d x^{m} \mapsto \delta L=\left(\delta_{u_{0}^{1}} L, \delta_{u_{i 1}^{\alpha}} L, \delta_{p_{i_{1}}} L\right), \\
& \delta_{u_{0}^{1}} L=(-D)_{\mathrm{j}} \partial_{u_{0, \mathrm{j}}^{1}} L, \quad \delta_{u_{i 1}^{\alpha}} L=(-D)_{\mathrm{j}} \partial_{u_{i, \mathrm{j}}^{\alpha}} L, \quad \delta_{p_{i 1}} L=(-D)_{\mathrm{j}} \partial_{p_{i^{1}, \mathrm{j}}} L,
\end{aligned}
$$

here $\mathrm{j} \in \mathbb{J}, \alpha \in \mathrm{N}, i^{1} \in \mathbb{Z}_{+}$, remind, $\mathrm{i}_{0}=(0, \mathrm{j}), \mathrm{i}=\left(i^{1}, \mathrm{j}\right)$ (see Subsection (1.2), so $u_{\mathrm{i}_{0}}^{1}=u_{0, \mathrm{j}}^{1}, u_{\mathrm{i}}^{\alpha}=u_{i^{1}, \mathrm{j}}^{\alpha}, p_{\mathrm{i}}=p_{i^{1}, \mathrm{j}}$.

The above long exact sequence defines the short exact sequence

$$
0 \rightarrow H_{\mathrm{H}}^{0}(\mathbf{C E}) \rightarrow \operatorname{Ker} D_{1}^{0} \rightarrow 0, \quad \text { hence }, \quad H_{\mathrm{H}}^{0}(\mathbf{C E})=\mathbb{R}
$$

In the same way, we have the exact sequence

$$
0 \rightarrow \operatorname{Im} D_{1}^{0} \rightarrow H^{0}(\Theta) \rightarrow H_{\mathrm{H}}^{1}(\mathbf{C E}) \rightarrow 0 \quad\left(H^{1}(\Theta)=0\right)
$$

hence, $H_{\mathrm{H}}^{1}(\mathbf{C E})=H^{0}(\Theta) / \operatorname{Im} D_{1}^{0}=0$. Further, for $1 \leq q \leq m-2$ we have $H^{q}(\Theta)=0$ and $H^{q-1}(\Theta) \rightarrow H_{\mathrm{H}}^{q}(\mathbf{C E}) \rightarrow H^{q}(\Theta)$, so $H_{\mathrm{H}}^{q}(\mathbf{C E})=0$ for $2 \leq q \leq m-2$. Now, for $q=m-1$ we have

$$
\ldots H^{m-2}(\Theta) \rightarrow H_{\mathrm{H}}^{m-1}(\mathbf{C E}) \rightarrow H^{m-1}(\Theta) \xrightarrow{D_{1}^{m-1}} \ldots
$$

Here, $H^{m-2}(\Theta)=0$, hence, $0 \rightarrow H_{\mathrm{H}}^{m-1}(\mathbf{C E}) \rightarrow \operatorname{Ker} D_{1}^{m-1} \rightarrow 0$ is the exact sequence, i.e., $H_{\mathrm{H}}^{m-1}(\mathbf{C E})=\operatorname{Ker} D_{1}^{m-1}$ (note, cohomologies are defined up to isomorphisms).

Lemma 1. (See, for example, [10], [11]) There is defined the commutative diagram

$$
\begin{aligned}
& 0 \longrightarrow H^{m-1}(\Theta) \xrightarrow{\delta} \mathcal{H}(\Theta) \longrightarrow 0 \\
& 0 \longrightarrow H^{m-1}(\Theta) \xrightarrow{\left.D_{1}^{m-1}\right|^{\delta}} \stackrel{\tilde{D}_{1}}{\downarrow} \mathcal{H}(\Theta) \longrightarrow 0,
\end{aligned}
$$

in particular, $\delta \circ D_{1}^{m-1}=\tilde{D}_{1} \circ \delta$, where $D_{1}=\partial_{x^{1}}+\mathrm{ev}_{\mathrm{f}}^{\prime}, \tilde{D}_{1}=D_{1}+\mathrm{f}^{*}$,

$$
\mathrm{ev}_{\mathrm{f}}^{\prime}=D_{\mathrm{j}} f_{0}^{1} \cdot \partial_{u_{0, \mathrm{j}}^{1}}+D_{\mathrm{j}} f_{i^{1}}^{\alpha} \cdot \partial_{u_{i^{1}, \mathrm{j}}^{\alpha}}+D_{\mathrm{j}} f_{i^{1}} \cdot \partial_{p_{i^{1}, \mathrm{j}}},
$$

$\mathrm{j} \in \mathbb{J}, \quad \alpha \in \mathrm{N}, \quad i^{1} \in \mathbb{Z}_{+}$.
In our setting, $\mathrm{f}=\left(f_{0}^{1}=-u_{(\alpha)}^{\alpha}, f_{i^{1}}^{\alpha}=u_{i^{1}+1,0}^{\alpha}, f_{i^{1}}=p_{i^{1}+1,0}\right)$. Hence, here $\tilde{D}_{1}, \mathrm{f}^{*} \in \operatorname{End}_{\mathbb{R}}\left(\mathcal{A}_{1}(\mathbf{C E}) \times \mathcal{A}_{\mathrm{N}}^{\mathbb{Z}_{+}^{1}}(\mathbf{C E}) \times \mathcal{A}^{\mathbb{Z}_{+}^{1}}(\mathbf{C E})\right)$,

$$
\chi=\left(\chi_{1}^{0}, \chi_{\alpha}^{i^{1}}, \chi^{i^{1}}\right) \mapsto \mathrm{f}^{*} \chi=\left(\left(\mathrm{f}^{*} \chi\right)_{1}^{0},\left(\mathrm{f}^{*} \chi\right)_{\alpha}^{i^{1}},\left(\mathrm{f}^{*} \chi\right)^{i^{1}}\right.
$$

where

$$
\left(\mathrm{f}^{*} \chi\right)_{1}^{0}=0, \quad\left(\mathrm{f}^{*} \chi\right)_{\alpha}^{i^{1}}=\delta_{0}^{i^{1}} D_{\alpha} \chi_{1}^{0}+\chi_{\alpha}^{i^{1}-1}, \quad\left(\mathrm{f}^{*} \chi\right)^{i^{1}}=\chi^{i^{1}-1} .
$$

The system $\left(D_{1}+\mathrm{f}^{*}\right) \chi=0$ of the equations for defining an unknown function $\chi \in \mathcal{A}_{1}(\mathbf{C E}) \times \mathcal{A}_{\mathrm{N}}^{\mathbb{Z}_{+}^{1}}(\mathbf{C E}) \times \mathcal{A}^{\mathbb{Z}_{+}^{1}}(\mathbf{C E})$ with a finite number of the components $\chi_{1}^{0}, \chi_{\alpha}^{i^{1}}, \chi^{i^{1}} \neq 0$, reduces to

$$
D_{1} \chi_{1}^{0}=0, \quad D_{1} \chi_{\alpha}^{i^{1}}+\delta_{0}^{i^{1}} D_{\alpha} \chi_{1}^{0}+\chi_{\alpha}^{i^{1}-1}=0, \quad D_{1} \chi^{i^{1}}+\chi^{i^{1}-1}=0
$$

and has the general solution: $\chi=\left(\chi_{1}^{0}, 0,0\right), \chi_{1}^{0} \in \mathbb{R}$. Now, we may take $\delta u^{1}=(1,0,0)$, hence the linear space $\operatorname{Ker} D_{1}^{m-1}$ is one-dimensional with the basis $\left[u^{1} d_{1} x\right]$ (remind, $d_{\mu} x=(-1)^{\mu-1} d x^{1} \wedge \ldots d \check{x}^{\mu} \ldots \wedge d x^{m}$, the term $d \check{x}^{\mu}$ is omitted, so $d x^{\nu} \wedge d_{\mu} x=\delta_{\mu}^{\nu} \cdot d^{m} x, \mu, \nu \in \mathrm{M}$ ), i.e., $\operatorname{Ker} D_{1}^{m-1}=\mathbb{R} \cdot\left[u^{1} d_{1} x\right]$ (cf., [10], [11]). The condition $\chi_{*}=\chi^{*}$ is trivially fulfilled, hence the following statement is valid.

Proposition 2. The cohomology space $H_{\mathrm{H}}^{m-1}(\mathbf{C E})=\mathbb{R} \cdot\left[u^{\mu} d_{\mu} x\right]$.
Note, here $H_{\mathrm{H}}^{m-1}(\mathbf{C E}) \ni\left[u^{\mu} d_{\mu} x\right] \mapsto\left[u^{1} d_{1} x\right] \in \operatorname{Ker} D_{1}^{m-1}$.
Remark 4. The cohomology $\left[u^{\mu} d_{\mu} x\right]$ is generated by the constraint $\mathrm{CE}=$ $D_{\mu} u^{\mu}=0$.

At last, we have $H^{m-1}(\Theta) \xrightarrow{D_{1}^{m-1}} H^{m-1}(\Theta) \rightarrow H_{\mathrm{H}}^{m}(\mathbf{C E}) \rightarrow 0$, i.e.,

$$
0 \rightarrow \operatorname{Im} D_{1}^{m-1} \rightarrow H^{m-1}(\Theta) \rightarrow H^{m}(\mathbf{C E}) \rightarrow 0
$$

so $H_{\mathrm{H}}^{m}(\mathbf{C E})=H^{m-1}(\Theta) / \operatorname{Im} D_{1}^{m-1}$ Thus, the following theorem holds.
Theorem 2. The linear spaces of the cohomologies of the differential algebra $\left(\mathcal{A}(\mathbf{C E}) ; \mathfrak{D}_{\mathrm{H}}(\mathbf{C E})\right)$ are

$$
H_{\mathrm{H}}^{q}(\mathbf{C E})= \begin{cases}0, & q<0,1 \leq q \leq m-2, q>m ; \\ \mathbb{R}, & q=0 ; \\ \operatorname{Ker} D_{1}^{m-1}=\mathbb{R} \cdot\left[u^{\mu} d_{\mu} x\right], & q=m-1 ; \\ H^{m-1}(\Theta) / \operatorname{Im} D_{1}^{m-1}, & q=m ;\end{cases}
$$

where $H^{m-1}(\Theta) / \operatorname{Im} D_{1}^{m-1}=\mathcal{H}(\Theta) / \operatorname{Im} \tilde{D}_{1}$.

### 2.2 An additional constraint.

According to Remark 3, to apply the algebraic analysis to the Navier-Stokes equations, explicitly containing dependence on the pressure $p$, we need to add an additional constraint in the space CE. Having in mind the specific form of these equations, we choose the constraint defined by the equation

$$
\mathrm{PE}=\Delta p+\nabla \mathbf{u} \cdot \nabla \mathbf{u}=\delta^{\lambda \mu} \partial_{x^{\lambda}} \partial_{x^{\mu}} p+\partial_{x^{\lambda}} u^{\mu} \cdot \partial_{x^{\mu}} u^{\lambda}=0
$$

(see the integrability condition (4), we took into account the equation (2)). Namely, we set

$$
\begin{equation*}
\mathbf{P E}=\left\{(x, \mathbf{u}, \mathbf{p}) \in \mathbf{B} \mid \mathrm{PE}_{\mathrm{i}}=\Delta p_{\mathrm{i}}+D_{\mathrm{i}}\left(u_{(\mu)}^{\lambda} u_{(\lambda)}^{\mu}\right)=0, \mathrm{i} \in \mathbb{I}\right\} . \tag{7}
\end{equation*}
$$

where

- $\Delta=\delta^{\lambda \mu} D_{\lambda} \circ D_{\mu}=\delta^{\lambda \mu} D_{(\lambda)+(\mu)}=\sum_{\mu} D_{2(\mu)}$,
- $D_{\mathrm{i}}\left(u_{(\mu)}^{\lambda} u_{(\lambda)}^{\mu}\right)=\sum_{\mathrm{k}+\mathrm{l}=\mathrm{i}}\binom{\mathrm{i}}{\mathrm{k}} u_{\mathrm{k}+(\mu)}^{\lambda} u_{1+(\lambda)}^{\mu}$.

The subspace $\mathbf{C P E}=\mathbf{C E} \cap \mathbf{P E} \subset \mathbf{B}$ generates the differential ideal

$$
\mathcal{J}=\left\{f \in \mathcal{A}(\mathbf{B})|f|_{\mathbf{C P E}}=0\right\}=\left\{f=g^{\mathrm{i}} \cdot \mathrm{CE}_{\mathrm{i}}+h^{\mathrm{i}} \cdot \mathrm{PE}_{\mathrm{i}} \mid g^{\mathrm{i}}, h^{\mathrm{i}} \in \mathcal{A}(\mathbf{B})\right\} .
$$

The factor-algebra $\mathcal{A}(\mathbf{C P E})=\mathcal{A}(\mathbf{B}) / \mathcal{J}$ is the algebra of smooth functions on the space CPE.

The Lie algebra $\mathfrak{D}(\mathbf{C P E})$ of derivations of the algebra $\mathcal{A}(\mathbf{C P E})$, the Lie algebra $\operatorname{Sym}\left(\mathcal{A}(\mathbf{C P E}), \mathfrak{D}_{\mathrm{H}}(\mathbf{C P E})\right)$ of the symmetries of the differential algebra $\left(\mathcal{A}(\mathbf{C P E}), \mathfrak{D}_{\mathrm{H}}(\mathbf{C P E})\right)$, the $\mathbb{Z}$-graded $\mathcal{A}(\mathbf{C P E})$-module $\Omega_{\mathrm{H}}(\mathbf{C P E})=$ $\oplus_{q \in \mathbb{Z}} \Omega_{\mathrm{H}}^{q}(\mathbf{C P E})$ of horizontal differential forms and the horizontal differential $d_{\mathrm{H}} \in \operatorname{End}_{\mathbb{R}}\left(\Omega_{\mathrm{H}}(\mathbf{C P E})\right)$ on the space $\mathbf{C P E}$ are defined as above (see Subsection (2.1). Namely, here:

- $\mathfrak{D}_{\mathcal{J}}(\mathbf{B})=\left\{\zeta \in \mathfrak{D}(\mathbf{B})|\zeta|_{\mathcal{J}}: \mathcal{J} \rightarrow \mathcal{J}\right\} ;$
- $\mathfrak{D}(\mathbf{B} ; \mathcal{J})=\{\zeta \in \mathfrak{D}(\mathbf{B}) \mid \zeta: \mathcal{A}(\mathbf{B}) \rightarrow \mathcal{J}\} ;$
- $\mathfrak{D}(\mathbf{C P E})=\mathfrak{D}_{\mathcal{J}}(\mathbf{B}) / \mathfrak{D}(\mathbf{B} ; \mathcal{J})$ is the Lie factor-algebra of derivations of the factor-algebra $\mathcal{A}(\mathbf{C P E})$;
- $\mathfrak{D}(\mathbf{C P E})=\mathfrak{D}_{\mathrm{V}}(\mathbf{C P E}) \oplus_{\mathcal{A}(\mathrm{CPE})} \mathfrak{D}_{\mathrm{H}}(\mathrm{CPE}) ;$
- $\mathfrak{D}_{\mathrm{V}}(\mathbf{C P E})=\left\{\bar{\zeta} \in \mathfrak{D}(\mathbf{C P E}) \mid \zeta \in \mathfrak{D}_{\mathrm{V}}(\mathbf{B}) \cap \mathfrak{D}_{\mathcal{J}}(\mathbf{B})\right\} ;$
- $\mathfrak{D}_{\mathrm{H}}(\mathbf{C P E})=\left\{\bar{\zeta} \in \mathfrak{D}(\mathbf{C P E}) \mid \zeta \in \mathfrak{D}_{\mathrm{H}}(\mathbf{B}) \subset \mathfrak{D}_{\mathcal{J}}(\mathbf{B})\right\}$;
- $\operatorname{Sym}\left(\mathcal{A}(\mathbf{C P E}), \mathfrak{D}_{\mathrm{H}}(\mathbf{C P E})\right)=\left\{\bar{\zeta} \in \mathfrak{D}_{\mathrm{V}}(\mathbf{C P E}) \mid\left[\bar{D}_{\mu}, \bar{\zeta}\right]=\overline{0}=\mathcal{J}, \mu \in \mathrm{M}\right\}$.

To write the $\mathbb{Z}$-graded $\mathcal{A}(\mathbf{C P E})$-module $\Omega_{\mathrm{H}}(\mathbf{C P E})=\oplus_{q \in \mathbb{Z}} \Omega_{\mathrm{H}}^{q}(\mathbf{C P E})$ and its cohomology spaces it is sufficient to replace $\mathbf{C E}$ with CPE in all relevant formulas. In particular,

$$
\Omega_{\mathrm{H}}^{q}(\mathbf{C P E})= \begin{cases}0, & q<0, q>m \\ \mathcal{A}(\mathbf{C P E}), & q=0 \\ \operatorname{Hom}_{\mathcal{A}(\mathbf{C P E})}\left(\wedge^{q} \mathfrak{D}_{\mathrm{H}}(\mathbf{C P E}) ; \mathcal{A}(\mathbf{C P E})\right), & 1 \leq q \leq m\end{cases}
$$

The horizontal differential $d_{\mathrm{H}} \in \operatorname{End}_{\mathbb{R}}\left(\Omega_{\mathrm{H}}(\mathbf{C P E})\right)$, $d_{\mathrm{H}} \circ d_{\mathrm{H}}=0$, is defined by the rule,

$$
\begin{aligned}
d_{\mathrm{H}}^{q}=\left.d_{\mathrm{H}}\right|_{\Omega_{\mathrm{H}}^{q}(\mathbf{C P E})}: \Omega_{\mathrm{H}}^{q}(\mathbf{C P E}) \rightarrow \Omega_{\mathrm{H}}^{q+1}(\mathbf{C P E}), \\
\bar{\omega}_{\mu_{1} \ldots \mu_{q}} \cdot d \bar{x}^{\mu_{1}} \wedge \ldots \wedge d \bar{x}^{\mu_{q}} \mapsto \bar{D}_{\left[\mu_{0}\right.} \bar{\omega}_{\left.\mu_{1} \ldots \mu_{q}\right]} \cdot d \bar{x}^{\mu_{0}} \wedge \ldots \wedge d \bar{x}^{\mu_{q}}
\end{aligned}
$$

where $d_{\mathrm{H}}^{q+1} \circ d_{\mathrm{H}}^{q}=0, q \in \mathbb{Z}$.
Now, let us define the global coordinates on the subspace $\mathbf{C P E} \subset \mathbf{B}$. Namely, we split $\mathbb{I}=\mathbb{I}_{1} \cup \mathbb{I}_{1}^{\prime}$ (see Subsection (1.2) and get

- $\mathbb{R}_{\mathbb{I}}=\mathbb{R}_{\mathbb{I}_{1}} \times \mathbb{R}_{\mathbb{I}_{1}^{\prime}} ;$
- $\mathbf{B}=\mathrm{X} \times \mathbb{R}_{\mathbb{I}_{0}}^{1} \times \mathbb{R}_{\mathbb{I}_{0}^{\prime}}^{1} \times \mathbb{R}_{\mathbb{I}}^{N} \times \mathbb{R}_{\mathbb{I}_{1}} \times \mathbb{R}_{\mathbb{I}_{1}^{\prime}} ;$
- $\mathbf{C P E}=\mathbf{C E} \cap \mathbf{P E}=\mathrm{X} \times \mathbb{R}_{\mathbb{I}_{0}}^{1} \times \mathbb{R}_{\mathbb{I}}^{\mathbb{N}} \times \mathbb{R}_{\mathbb{I}_{1}}$, i.e., the subspace $\mathbf{C P E}$ has the global coordinates $(x, \mathbf{u}, \mathbf{p})=\left\{x^{\mu}, u_{i_{0}}^{1}, u_{\mathrm{i}}^{\alpha}, p_{\mathrm{i}_{1}}\right\}$, where the indices $\mu \in \mathrm{M}, \alpha \in \mathrm{N}, \mathrm{i}_{0} \in \mathbb{I}_{0}, \mathrm{i}_{1} \in \mathbb{I}_{1}, \mathrm{i} \in \mathbb{I} ;$
- $\mathrm{CE}=u_{(\mu)}^{\mu}=0, \quad \mathrm{PE}=\Delta p+\left.u_{(\mu)}^{\lambda} u_{(\lambda)}^{\mu}\right|_{\mathbf{C E}}=p_{2(1)}+\Phi(\mathbf{u}, \mathbf{p})=0 ;$
- $\Phi(\mathbf{u}, \mathbf{p})=\Delta^{\prime} p+\left.u_{(\mu)}^{\lambda} u_{(\lambda)}^{\mu}\right|_{\mathbf{C E}}, \quad \Delta^{\prime}=\delta^{\alpha \beta} D_{\alpha} \circ D_{\beta} ;$
- $u_{\mathrm{i}_{0}^{\prime}}^{1}=-u_{\mathrm{i}_{0}^{\prime}-(1)+(\alpha)}^{\alpha}, \mathrm{i}_{0}^{\prime} \in \mathbb{I}_{0}^{\prime}, \quad p_{\mathrm{i}_{1}^{\prime}}=-D_{\mathrm{i}_{1}^{\prime}-2(1)} \Phi(\mathbf{u}, \mathbf{p}), \mathrm{i}_{1}^{\prime} \in \mathbb{I}_{1}^{\prime} ;$
- $D_{\mathrm{i}}\left(u_{(\mu)}^{\lambda} u_{(\lambda)}^{\mu}\right)=\sum_{\mathrm{k}+\mathrm{l}=\mathrm{i}}\binom{\mathrm{i}}{\mathrm{k}} u_{\mathrm{k}+(\mu)}^{\lambda} u_{1+(\lambda)}^{\mu}, \mathrm{i}=\mathrm{i}_{1}^{\prime}-2(1) \in \mathbb{I}$.

In these coordinates, we have:

- $\mathcal{A}(\mathrm{CPE})=\mathcal{C}_{\text {fin }}^{\infty}(\mathrm{CPE})$

$$
=\left\{f \in \mathcal{A}(\mathbf{B}) \mid \partial_{u_{i_{0}^{\prime}}^{1}} f=0, \partial_{p_{i_{1}^{\prime}}^{\prime}} f=0, \mathrm{i}_{0}^{\prime} \in \mathbb{I}_{0}^{\prime}, \mathrm{i}_{1}^{\prime} \in \mathbb{I}_{1}^{\prime}\right\} \subset \mathcal{A}(\mathbf{B}) ;
$$

 $\zeta_{\mathrm{i}_{0}}^{1}, \zeta_{\mathrm{i}}^{\alpha}, \zeta_{\mathrm{i}_{1}} \in \mathcal{A}(\mathbf{C P E}), \mathrm{i}_{0} \in \mathbb{I}_{0}, \mathrm{i}_{1} \in \mathbb{I}_{1}, \mathrm{i} \in \mathbb{I}, \alpha \in \mathrm{N} ;$

- $D_{\mu}=\partial_{x^{\mu}}+u_{\mathrm{i}_{0}+(\mu)}^{1} \partial_{u_{\mathrm{i}_{0}}^{1}}+u_{\mathrm{i}+(\mu)}^{\alpha} \partial_{u_{\mathrm{i}}^{\alpha}}+p_{\mathrm{i}_{1}+(\mu)} \partial_{p_{\mathrm{i}_{1}}}, \quad \mu \in \mathrm{M}, \quad$ where $u_{\mathrm{i}_{0}+(1)}^{1}=-u_{\mathrm{i}_{0}+(\alpha)}^{\alpha}, \quad p_{\mathrm{i}_{0}+2(1)}=-D_{\mathrm{i}_{0}} \Phi(\mathbf{u}, \mathbf{p}), \quad \mathrm{i}_{0} \in \mathbb{I}_{0}, \quad \mathrm{i}_{1}=\mathrm{i}_{0}, \mathrm{i}_{0}+(1) ;$
- $\operatorname{Sym}\left(\mathcal{A}(\mathbf{C P E}), \mathfrak{D}_{\mathrm{H}}(\mathbf{C P E})\right)$

$$
=\left\{\zeta=\operatorname{ev}_{\mathrm{f}} \in \mathfrak{D}_{\mathrm{V}}(\mathbf{C P E}) \mid\left[D_{\mu}, \mathrm{ev}_{\mathrm{f}}\right]=0, \mu \in \mathrm{M}\right\}, \text { where }
$$

$$
-\mathrm{ev}_{\mathrm{f}}=D_{\mathrm{i}_{0}} f^{1} \cdot \partial_{u_{\mathrm{i}_{0}}^{1}}+D_{\mathrm{i}} f^{\alpha} \cdot \partial_{u_{\mathrm{i}}^{\alpha}}+D_{\mathrm{i}_{1}} f \cdot \partial_{p_{\mathrm{i}_{1}}}
$$

$$
-\mathrm{f}=\left(f^{\mu}, f\right) \in \mathcal{A}(\mathbf{C P E})^{\mathrm{M}} \times \mathcal{A}(\mathbf{C P E})
$$

$$
-D_{\mu} f^{\mu}=0, \quad \Delta f+\operatorname{ev}_{\mathrm{f}}\left(u_{(\mu)}^{\lambda} u_{(\lambda)}^{\mu}\right)=0
$$

$$
-\Delta=\delta^{\lambda \mu} D_{(\lambda)+(\mu)}, \quad \operatorname{ev}_{\mathrm{f}}\left(u_{(\mu)}^{\lambda} u_{(\lambda)}^{\mu}\right)=\left.2 u_{(\mu)}^{\lambda} D_{\lambda} f^{\mu}\right|_{u_{(1)}^{1}=-u_{(\alpha)}^{\alpha}} ;
$$

- $\Omega_{\mathrm{H}}^{q}(\mathbf{C P E})=\left\{\omega=\omega_{\mu_{1} \ldots \mu_{q}} \cdot d x^{\mu_{1}} \wedge \ldots \wedge d x^{\mu_{q}} \mid \omega_{\mu_{1} \ldots \mu_{q}} \in \mathcal{A}(\mathbf{C P E}),+\mathrm{s}-\mathrm{s}\right\}$, $1 \leq q \leq m ;$
- $d_{\mathrm{H}}^{q}=\left.d_{\mathrm{H}}\right|_{\Omega_{\mathrm{H}}^{q}(\mathbf{C P E})}: \Omega_{\mathrm{H}}^{q}(\mathbf{C P E}) \rightarrow \Omega_{\mathrm{H}}^{q+1}(\mathbf{C P E})$, where $\omega=\omega_{\mu_{1} \ldots \mu_{q}} \cdot d x^{\mu_{1}} \wedge \ldots \wedge d x^{\mu_{q}} \mapsto D_{\left[\mu_{0}\right.} \omega_{\left.\mu_{1} \ldots \mu_{q}\right]} \cdot d x^{\mu_{0}} \wedge \ldots \wedge d x^{\mu_{q}}$.

Like it was done in the Subsection 2.1, to calculate the cohomology spaces $H_{\mathrm{H}}^{q}(\mathbf{C P E})$ we introduce the auxiliary complex $\left\{\Theta^{q}, d_{\Theta}^{q} \mid q \in \mathbb{Z}\right\}$ (see page (9)). The only changes are

- the set CE is replaced with the set CPE;
- the basic derivations $D_{1}, D_{\alpha}$ are as in the present section;
- the operator $\tilde{D}_{1}=D_{1}+\mathrm{f}^{*}$,
- $D_{1}=\partial_{x^{1}}+\mathrm{ev}_{\mathrm{f}}^{\prime}$, where $\mathrm{f}=\left(f_{0}^{1}, f_{i^{1}}^{\alpha}, f_{0}, f_{1}\right)$,
$\mathrm{i}_{0}=(0, \mathrm{j}), \quad \mathrm{i}_{1}=(0, \mathrm{j}),(1, \mathrm{j}), \quad \mathrm{i}=\left(i^{1}, \mathrm{j}\right), i^{1} \in \mathbb{Z}_{+}, \quad \mathrm{j} \in \mathbb{J}$;
- $\mathrm{ev}_{\mathrm{f}}^{\prime}=D_{\mathrm{j}} f_{0}^{1} \cdot \partial_{u_{0, \mathrm{j}}^{1}}+D_{\mathrm{j}} f_{i^{1}}^{\alpha} \cdot \partial_{u_{i^{1}, \mathrm{j}}^{\alpha}}+D_{\mathrm{j}} f_{0} \cdot \partial_{p_{0, \mathrm{j}}}+D_{\mathrm{j}} f_{1} \cdot \partial_{p_{1, \mathrm{j}}} ;$
- $f_{0}^{1}=-u_{(\alpha)}^{\alpha}, f_{i^{1}}^{\alpha}=u_{i^{1}+1,0}^{\alpha}, f_{0}=p_{1,0}, f_{1}=-\Phi(\mathbf{u}, \mathbf{p})$;
- $\Delta^{\prime}=\delta^{\alpha \beta} D_{(\alpha)+(\beta)}, \quad u_{(\mu)}^{\lambda} u_{(\lambda)}^{\mu}=u_{(\alpha)}^{\alpha} u_{(\beta)}^{\beta}+2 u_{(\alpha)}^{1} u_{(1)}^{\alpha}+u_{(\beta)}^{\alpha} u_{(\alpha)}^{\beta}$;
- $\chi \mapsto \mathrm{f}^{*} \chi, \quad \chi=\left(\chi_{1}^{0}, \chi_{\alpha}^{i^{1}}, \chi^{0}, \chi^{1}\right)$, where the set $\chi$ is finite, i.e., only finitely many of its elements are nonzero,
- $\left(\mathrm{f}^{*} \chi\right)=\left(\left(\mathrm{f}^{*} \chi\right)_{1}^{0},\left(\mathrm{f}^{*} \chi\right)_{\alpha}^{i^{1}},\left(\mathrm{f}^{*} \chi\right)^{0},\left(\mathrm{f}^{*} \chi\right)^{1}\right) ;$
- $\left(\mathrm{f}^{*} \chi\right)_{1}^{0}=2 D_{\alpha}\left(u_{(1)}^{\alpha} \chi^{1}\right)$,
$\left(\mathrm{f}^{*} \chi\right)_{\alpha}^{i^{1}}=\delta_{0}^{i^{1}} D_{\alpha} \chi_{1}^{0}+\chi_{\alpha}^{i^{1}-1}$
$+2\left(\delta_{0}^{i^{1}} D_{\alpha}\left(u_{(\beta)}^{\beta} \chi^{1}\right)-\delta_{1}^{i^{1}} u_{(\alpha)}^{1} \chi^{1}+\delta_{0}^{i^{1}} D_{\beta}\left(u_{(\alpha)}^{\beta} \chi^{1}\right)\right)$, $\left(\mathrm{f}^{*} \chi\right)^{0}=-\Delta^{\prime} \chi^{1}, \quad\left(\mathrm{f}^{*} \chi\right)^{1}=\chi^{0}$,
where $\alpha, \beta \in \mathrm{N}, \quad \lambda, \mu \in \mathrm{M}, i^{1} \in \mathbb{Z}_{+}, \quad \mathrm{j} \in \mathbb{J}$.
The resulting system $\left(D_{1}+\mathrm{f}^{*}\right) \chi=0$ for unknown function $\chi$ with a finite number of nonzero components reduces to

$$
\begin{array}{ll}
D_{1} \chi_{1}^{0}+\left(\mathrm{f}^{*} \chi\right)_{1}^{0}=0, & D_{1} \chi_{\alpha}^{i^{1}}+\left(\mathrm{f}^{*} \chi\right)_{\alpha}^{i^{1}}=0 \\
D_{1} \chi^{0}+\left(\mathrm{f}^{*} \chi\right)^{0}=0, & D_{1} \chi^{1}+\left(\mathrm{f}^{*} \chi\right)^{1}=0
\end{array}
$$

The equation

$$
\begin{aligned}
D_{1} \chi_{\alpha}^{i^{1}}+\left(\mathrm{f}^{*} \chi\right)_{\alpha}^{i^{1}} & =D_{1} \chi_{\alpha}^{i^{1}}+\delta_{0}^{i^{1}} D_{\alpha} \chi_{1}^{0}+\chi_{\alpha}^{i^{1}-1} \\
& +2\left(\delta_{0}^{i^{1}} D_{\alpha}\left(u_{(\beta)}^{\beta} \chi^{1}\right)-\delta_{1}^{i^{1}} u_{(\alpha)}^{1} \chi^{1}+\delta_{0}^{i^{1}} D_{\beta}\left(u_{(\alpha)}^{\beta} \chi^{1}\right)\right)=0
\end{aligned}
$$

for $i^{1} \geq 2$, gives $\chi_{\alpha}^{i^{1}}=0$ for $i^{1} \geq 1$, for $i^{1}=1$ it gives $\chi_{\alpha}^{0}=2 u_{(\alpha)}^{1} \chi^{1}$, and for $i^{1}=0$ it takes the form $D_{1} \chi_{\alpha}^{0}+D_{\alpha} \chi_{1}^{0}+2\left(D_{\alpha}\left(u_{(\beta)}^{\beta} \chi^{1}\right)+D_{\beta}\left(u_{(\alpha)}^{\beta} \chi^{1}\right)\right)=0$. Further, the equation $D_{1} \chi^{1}+\left(\mathrm{f}^{*} \chi\right)^{1}=D_{1} \chi^{1}+\chi^{0}=0$ gives $\chi^{0}=-D_{1} \chi^{1}$, the equation $D_{1} \chi^{0}+\left(f^{*} \chi\right)^{0}=-D_{2(1)} \chi^{1}-\Delta^{\prime} \chi^{1}=-\Delta \chi^{1}=0$ gives $\Delta \chi^{1}=0$, and the last one equation $D_{1} \chi_{1}^{0}+\left(\mathrm{f}^{*} \chi\right)_{1}^{0}=D_{1} \chi_{1}^{0}+2 D_{\alpha}\left(u_{(1)}^{\alpha} \chi^{1}\right)=0$ gives $D_{1} \chi_{1}^{0}+2 D_{\alpha}\left(u_{(1)}^{\alpha} \chi^{1}\right)=0$.

After some algebra we get
Lemma 2. The system $\left(D_{1}+\mathrm{f}^{*}\right) \chi=0$, $\chi=\left(\chi_{1}^{0}, \chi_{\alpha}^{i^{1}}, \chi^{0}, \chi^{1}\right)$, reduces to

$$
\begin{equation*}
\chi_{\alpha}^{0}=2 u_{(\alpha)}^{1} \chi^{1}, \quad \chi_{\alpha}^{i^{1}}=0, \quad \chi^{0}=-D_{1} \chi^{1}, \quad i^{1} \geq 1, \quad \alpha \in \mathrm{~N}, \tag{8}
\end{equation*}
$$

where $\chi^{1}, \chi_{1}^{0}$ are solutions of the system

$$
\begin{align*}
& \Delta \chi^{1}=0, \quad\left(u_{(1)}^{\mu} D_{\mu} D_{\alpha}-u_{(\alpha)}^{\mu} D_{\mu} D_{1}\right) \chi^{1}=0, \quad \alpha \in \mathrm{~N}  \tag{9}\\
& D_{1} \chi_{1}^{0}=-2 D_{\alpha}\left(u_{(1)}^{\alpha} \chi^{1}\right), D_{\alpha} \chi_{1}^{0}=-2\left(u_{(\alpha)}^{\mu} D_{\mu} \chi^{1}+D_{\alpha}\left(u_{(\beta)}^{\beta} \chi^{1}\right)\right), \alpha \in \mathrm{N} \tag{10}
\end{align*}
$$

Remark 5. The right subsystem of the system (9) is the non-trivial compatibility condition of the system (10).

Remark 6. The system (9) has the trivial solution $\chi^{1}=0$, then the system (10) gives $\chi_{1}^{0}=$ const, and we get the solution $\chi=(1,0,0,0)$ of the full system $\left(D_{1}+\mathrm{f}^{*}\right) \chi=0$ (see the similar result in Subsection 2.1).

Theorem 3. The linear spaces of the cohomologies of the differential algebra $\left(\mathcal{A}(\mathbf{C P E}), \mathfrak{D}_{\mathrm{H}}(\mathbf{C P E})\right)$ are (cf., Theorem 1 and Theorem 2)

$$
H_{\mathrm{H}}^{q}(\mathbf{C P E})= \begin{cases}0, & q<0,1 \leq q \leq m-2, q>m \\ \mathbb{R}, & q=0 \\ \operatorname{Ker} D_{1}^{m-1} \simeq \mathcal{S} \cap \mathcal{H}, & q=m-1 \\ H^{m-1}(\Theta) / \operatorname{Im} D_{1}^{m-1}, & q=m\end{cases}
$$

where

- $\mathcal{S}=\operatorname{Sol}\left(D_{1}+\mathrm{f}^{*}\right)$ is the linear space of solutions $\chi=\left(\chi_{1}^{0}, \chi_{\alpha}^{i^{1}}, \chi^{0}, \chi^{1}\right)$ of the linear system $D_{1} \chi+\mathrm{f}^{*} \chi=0$ (the mapping $\mathrm{f}^{*}$ is defined above);
- $\mathcal{H}=\left\{\chi=\left(\chi_{1}^{0}, \chi_{\alpha}^{i^{1}}, \chi^{0}, \chi^{1}\right) \mid \chi_{*}=\chi^{*}\right\}$ is the Helmholtz space of the differential algebra ( $\mathcal{A}(\mathbf{C P E}), \mathfrak{D}_{\mathrm{H}}(\mathbf{C P E})$ );
- $H_{\mathrm{H}}^{m-1}(\mathbf{C P E})=\mathcal{S} \cap \mathcal{H}, \quad\left[J^{\mu} \cdot d_{\mu} x\right] \mapsto\left(\delta_{u_{0}^{1}} J^{1}, \delta_{u_{i 1}^{\alpha}} J^{1}, \delta_{p_{0}} J^{1}, \delta_{p_{1}} J^{1}\right)$ (remind, cohomologies are defined up to isomorphisms).

Remark 7. In particular, $H_{\mathrm{H}}^{m-1}(\mathbf{C P E}) \ni\left[u^{\mu} d_{\mu} x\right]$, see Remark 6. Moreover, the additional constraint $\mathrm{PE}=\Delta p+u_{(\mu)}^{\lambda} u_{(\lambda)}^{\mu}=0$ generates the additional cohomology $\left[F^{\mu} d_{\mu} x\right] \in H_{\mathrm{H}}^{m-1}(\mathbf{C P E})$, where $F^{\mu}=-u^{\lambda} u_{(\lambda)}^{\mu}+\nu \Delta u^{\mu}+p^{(\mu)}$, since here

$$
\begin{aligned}
D_{\mu} F^{\mu} & =-\left(\Delta p+u_{(\mu)}^{\lambda} u_{(\lambda)}^{\mu}\right)+\left(-u^{\lambda} D_{\lambda} u_{(\mu)}^{\mu}+\nu \Delta u_{(\mu)}^{\mu}\right) \\
& =-\operatorname{PE}+\left(\nu \Delta-u^{\lambda} D_{\lambda}\right) \mathrm{CE}=0
\end{aligned}
$$

due to the constraints $\mathrm{PE}=0$ and $\mathrm{CE}=0$. Here, $p^{(\mu)}=D^{\mu} p=\delta^{\mu \lambda} D_{\lambda} p=$ $D_{\mu} p=p_{(\mu)}$ (the euclidean metrics).

Remark 8. Every symmetry $\mathrm{ev}_{\mathrm{f}} \in \operatorname{Sym}\left(\mathcal{A}(\mathbf{C P E}), \mathfrak{D}_{\mathrm{H}}(\mathbf{C P E})\right), \mathrm{f}=\left(f^{\mu}, f\right)$, generates (possibly trivial) cohomology $\left[f^{\mu} d_{\mu} x\right] \in H_{\mathrm{H}}^{m-1}(\mathbf{C P E})$, because in this case $D_{\mu} f^{\mu}=0$ by definition.

## 3 Navier-Stokes equations as evolution in the space CPE.

### 3.1 Evolution in the space CPE.

The evolution in the space

$$
\mathbf{C P E}=\mathrm{T} \times \mathrm{X} \times\left(\mathbb{R}_{\mathbb{I}_{0}}^{1} \times \mathbb{R}_{\mathbb{I}}^{\mathrm{N}}\right) \times \mathbb{R}_{\mathbb{I}_{1}}=\left\{t, \mathrm{x}=\left(x^{\mu}\right), \mathbf{u}=\left(u_{\mathrm{i}_{0}}^{1}, u_{\mathrm{i}}^{\alpha}\right), \mathbf{p}=\left(p_{\mathrm{i}_{1}}\right)\right\}
$$

$(\mathrm{M}=2,3)$ is governed by an evolution derivation $D_{t}=\partial_{t}+\mathrm{ev}_{\mathrm{E}}$, where

- we added the time variable $t \in \mathrm{~T}=\mathbb{R}$, one may assume that it was present from the start as a parameter;
- $\mathrm{E}=\left(E^{\mu}, E\right) \in \mathcal{A}^{\mathrm{M}}(\mathbf{C P E}) \times \mathcal{A}(\mathbf{C P E})$;
- $D_{\mu} E^{\mu}=0, \quad \Delta E+\left.2\left(u_{(\mu)}^{\lambda} D_{\lambda} E^{\mu}\right)\right|_{u_{(1)}^{1}=-u_{(\alpha)}^{\alpha}}=0, \quad \Delta=\delta^{\lambda \mu} D_{(\lambda)+(\mu)}$;
- $\mathrm{ev}_{\mathrm{E}}=D_{\mathrm{i}_{0}} E^{1} \cdot \partial_{u_{\mathrm{i}_{0}}^{1}}+D_{\mathrm{i}} E^{\alpha} \cdot \partial_{u_{\mathrm{i}}^{\alpha}}+D_{\mathrm{i}_{1}} E \cdot \partial_{p_{\mathrm{i}_{1}}} \in \operatorname{Sym}\left(\mathcal{A}(\mathbf{C P E}), \mathfrak{D}_{\mathrm{H}}(\mathbf{C P E})\right)$
(see Subsection 2.2, remind also Proposition 1 and Remark (3).
Remark 9. In particular, $D_{t} u^{\mu}=F^{\mu}, \mu \in \mathrm{M}$, and $D_{t} p=F$, while

$$
D_{t} \mathrm{CE}=D_{t}\left(D_{\mu} u^{\mu}\right)=D_{\mu} E^{\mu}, \quad D_{t} \mathrm{PE}=D_{t}\left(\Delta p+u_{(\mu)}^{\lambda} u_{(\lambda)}^{\mu}\right)=\Delta E+2 u_{(\mu)}^{\lambda} D_{\lambda} E^{\mu} .
$$

There is defined the differential algebra $\left(\mathcal{A}(\mathbf{C P E}), \mathfrak{D}_{\mathrm{E}}(\mathbf{C P E})\right)$, where

- $\mathfrak{D}(\mathbf{C P E})=\mathfrak{D}_{\mathrm{V}}(\mathbf{C P E}) \oplus_{\mathcal{A}(\mathbf{C P E})} \mathfrak{D}_{\mathrm{E}}(\mathbf{C P E})$;
- $\mathfrak{D}_{\mathrm{V}}(\mathbf{C P E})=\left\{\zeta=\zeta_{\mathrm{i}_{0}}^{1} \partial_{u_{\mathrm{i}_{0}}^{1}}+\zeta_{\mathrm{i}}^{\alpha} \partial_{u_{\mathrm{i}}^{\alpha}}+\zeta_{\mathrm{i}_{1}} \partial_{{p_{i_{1}}}} \mid \zeta_{\mathrm{i}_{0}}^{1}, \zeta_{\mathrm{i}}^{\alpha}, \zeta_{\mathrm{i}_{1}} \in \mathcal{A}(\mathbf{C P E})\right\} ;$
- $\mathfrak{D}_{\mathrm{E}}(\mathbf{C P E})$ has the $\mathcal{A}(\mathbf{C P E})$-basis $\left\{D_{t}, D_{\mu} \mid \mu \in \mathrm{M}\right\}$, the basic time derivation $D_{t}=\partial_{t}+\mathrm{ev}_{\mathrm{E}},\left[D_{t}, D_{\mu}\right]=0, \mu \in \mathrm{M}$, so

$$
\mathfrak{D}_{\mathrm{E}}(\mathbf{C P E})=\left\{\zeta=\zeta^{t} D_{t}+\zeta^{\mu} D_{\mu} \mid \zeta^{t}, \zeta^{\mu} \in \mathcal{A}(\mathbf{C P E})\right\} .
$$

The Lie algebra of symmetries here is

$$
\begin{aligned}
\operatorname{Sym}(\mathcal{A}(\mathbf{C P E}), & \left.\mathfrak{D}_{\mathrm{E}}(\mathbf{C P E})\right) \\
& =\left\{\zeta=\mathrm{ev}_{\mathrm{f}} \in \operatorname{Sym}\left(\mathcal{A}\left(\mathbf{C P E}, \mathfrak{D}_{\mathrm{H}}(\mathbf{C P E})\right) \mid\left[D_{t}, \mathrm{ev}_{\mathrm{f}}\right]=0\right\}\right.
\end{aligned}
$$

where the condition $\left[D_{t}, \mathrm{ev}_{\mathrm{f}}\right]=0$ reduces to the equation $\left(D_{t}-\mathrm{E}_{*}\right) \mathrm{f}=0$.
In more detail, here

- $\mathrm{E}_{*}: \mathcal{A}(\mathbf{C P E})^{\mathrm{M}} \times \mathcal{A}(\mathbf{C P E}) \rightarrow \mathcal{A}(\mathbf{C P E})^{\mathrm{M}} \times \mathcal{A}(\mathbf{C P E})$,
- $\mathrm{f}=\left(f^{\mu}, f\right) \mapsto \mathrm{F}_{*} \mathrm{f}=\left(\left(\mathrm{F}_{*} \mathrm{f}\right)^{\mu},\left(\mathrm{F}_{*} \mathrm{f}\right)\right)$,
- $\left(\mathrm{E}_{*} \mathrm{f}\right)^{\mu}=\partial_{u_{\mathrm{i}_{0}}^{1}} E^{\mu} \cdot D_{\mathrm{i}_{0}} f^{1}+\partial_{u_{\mathrm{i}}^{\alpha}} E^{\mu} \cdot D_{\mathrm{i}} f^{\alpha}+\partial_{p_{\mathrm{i}_{1}}} E^{\mu} \cdot D_{\mathrm{i}_{1}} f$,
- $\left(\mathrm{E}_{*} \mathrm{f}\right)=\partial_{u_{\mathrm{i}_{0}}^{1}} E \cdot D_{\mathrm{i}_{0}} f^{1}+\partial_{u_{\mathrm{i}}^{\alpha}} E \cdot D_{\mathrm{i}} f^{\alpha}+\partial_{p_{\mathrm{i}_{1}}} E \cdot D_{\mathrm{i}_{1}} f$.

As above, to study the cohomology spaces $H_{\mathrm{E}}^{q}(\mathbf{C P E})=\operatorname{Ker} d_{\mathrm{E}}^{q} / \operatorname{Im} d_{\mathrm{E}}^{q-1}$, $q \in \mathbb{Z}$, of the differential algebra $\left(\mathcal{A}(\mathbf{C P E}), \mathfrak{D}_{\mathrm{E}}(\mathbf{C P E})\right)$ we shall use the decomposition (see pages 9 and 15):

- $\Omega_{\mathrm{H}}^{q}=\Omega_{\mathrm{H}}^{q}(\mathbf{C P E})$

$$
=\left\{\omega_{\mathrm{H}}^{q}=\omega_{\mu_{1} \ldots \mu_{q}} \cdot d x^{\mu_{1}} \wedge \ldots \wedge d x^{\mu_{q}} \mid \omega_{\mu_{1} \ldots \mu_{q}} \in \mathcal{A}(\mathbf{C P E}),+\mathrm{s}-\mathrm{s}\right\} ;
$$

- $\Omega_{\mathrm{E}}^{q}=\Omega_{\mathrm{E}}^{q}(\mathbf{C P E})=d t \wedge \Omega_{\mathrm{H}}^{q-1} \oplus_{\mathcal{A}(\mathbf{C P E})} \Omega_{\mathrm{H}}^{q}, \quad q \in \mathbb{Z} ;$
- $0 \rightarrow \Omega_{\mathrm{H}}^{q-1} \xrightarrow{\ell^{q-1}} \Omega_{\mathrm{E}}^{q} \xrightarrow{\pi^{q}} \Omega_{\mathrm{H}}^{q} \rightarrow 0$,

$$
\omega_{\mathrm{E}}^{q}=d t \wedge \omega_{\mathrm{H}}^{q-1}+\omega_{\mathrm{H}}^{q} \mapsto \pi^{q} \omega_{\mathrm{E}}^{q}=\omega_{\mathrm{H}}^{q} ;
$$

- $d_{\mathrm{E}}^{q}=d_{t}^{q}+d_{\mathrm{H}}^{q}: \Omega_{\mathrm{E}}^{q} \rightarrow \Omega_{\mathrm{E}}^{q+1}, \quad d_{t}=d t \wedge D_{t}, \quad d_{\mathrm{H}}=d x^{\mu} \wedge D_{\mu}$, $\omega_{\mathrm{E}}^{q}=d t \wedge \omega_{\mathrm{H}}^{q-1}+\omega_{\mathrm{H}}^{q} \mapsto d_{\mathrm{E}} \omega_{\mathrm{E}}^{q}=d t \wedge\left(D_{t} \omega_{\mathrm{H}}^{q}-d_{\mathrm{H}} \omega_{\mathrm{H}}^{q-1}\right)+d_{\mathrm{H}} \omega_{\mathrm{H}}^{q}$.

These constructions lead to the commutative diagram with the long exact sequence of the cohomology spaces

$$
\begin{aligned}
0 & \rightarrow H_{\mathrm{E}}^{0}(\mathbf{C P E}) \rightarrow H_{\mathrm{H}}^{0}(\mathbf{C P E}) \xrightarrow{D_{t}^{0}} \\
\stackrel{D_{t}^{0}}{\longrightarrow} H_{\mathrm{H}}^{0}(\mathbf{C P E}) & \rightarrow H_{\mathrm{E}}^{1}(\mathbf{C P E}) \rightarrow H_{\mathrm{H}}^{1}(\mathbf{C P E}) \xrightarrow{D_{t}^{1}} \ldots \\
\xrightarrow{D_{t}^{m-2}} H_{\mathrm{H}}^{m-2}(\mathbf{C P E}) & \rightarrow H_{\mathrm{E}}^{m-1}(\mathbf{C P E}) \rightarrow H_{\mathrm{H}}^{m-1}(\mathbf{C P E}) \xrightarrow{D_{t}^{m-1}} \\
\xrightarrow{D_{t}^{m-1}} H_{\mathrm{H}}^{m-1}(\mathbf{C P E}) & \rightarrow H_{\mathrm{E}}^{m}(\mathbf{C P E}) \rightarrow H_{\mathrm{H}}^{m}(\mathbf{C P E}) \xrightarrow{D_{t}^{m}} \\
\xrightarrow{D_{t}^{m}} H_{\mathrm{H}}^{m}(\mathbf{C P E}) & \rightarrow H_{\mathrm{E}}^{m+1}(\mathbf{C P E}) \rightarrow 0,
\end{aligned}
$$

where $D_{t}^{q}: H_{\mathrm{H}}^{q}(\mathbf{C P E}) \rightarrow H_{\mathrm{H}}^{q}(\mathbf{C P E})$ by the component-wise rule

$$
D_{t}^{q}\left[\omega_{\mu_{1} \ldots \mu_{q}} \cdot d x^{\mu_{1}} \wedge \ldots \wedge d x^{\mu_{q}}\right]=\left[\left(D_{t} \omega_{\mu_{1} \ldots \mu_{q}}\right) \cdot d x^{\mu_{1}} \wedge \ldots \wedge d x^{\mu_{q}}\right] .
$$

Theorem 4. The linear spaces of cohomologies of the differential algebra $\left(\mathcal{A}(\mathbf{C P E}) ; \mathfrak{D}_{\mathrm{E}}(\mathbf{C P E})\right)$ are

$$
H_{\mathrm{E}}^{q}(\mathbf{C P E})= \begin{cases}0, & q<0,1 \leq q \leq m-2, q>m+1 ; \\ \mathbb{R}, & q=0 ; \\ \operatorname{Ker} D_{t}^{m-1}, & q=m-1 ; \\ H_{\mathrm{H}}^{m}(\mathbf{C P E}) / \operatorname{Im} D_{t}^{m}, & q=m+1 ;\end{cases}
$$

while in the case $q=m$ one has $H_{\mathrm{E}}^{m}(\mathbf{C P E}) / \operatorname{Im} H_{\mathrm{H}}^{m-1}(\mathbf{C P E})=\operatorname{Ker} D_{t}^{m}$.
Proof. Indeed, the exact subsequence $0 \rightarrow H_{\mathrm{E}}^{0}(\mathbf{C P E}) \rightarrow$ Ker $D_{t}^{0} \rightarrow 0$ gives $H_{\mathrm{E}}^{0}(\mathbf{C P E})=\mathbb{R}$ (remind, we added the time variable $t \in \mathrm{~T}=\mathbb{R}$, so now $\left.H_{\mathrm{H}}^{0}(\mathbf{C P E})=\mathcal{T}=\left\{\phi(t) \in \mathcal{C}^{\infty}(\mathbb{R})\right\}\right)$. Further, the exact subsequence

$$
H_{\mathrm{H}}^{0}(\mathbf{C P E}) \xrightarrow{D_{t}^{0}} H_{\mathrm{H}}^{0}(\mathbf{C P E}) \rightarrow H_{\mathrm{E}}^{1}(\mathbf{C P E}) \rightarrow H_{\mathrm{H}}^{1}(\mathbf{C P E})=0
$$

gives $H_{\mathrm{E}}^{1}(\mathbf{C P E})=\mathcal{T} / \operatorname{Im} D_{t}^{0}=0$. Now, the exact subsequence

$$
H_{\mathrm{H}}^{q-1}(\mathbf{C P E}) \rightarrow H_{\mathrm{E}}^{q}(\mathbf{C P E}) \rightarrow H_{\mathrm{H}}^{q}(\mathbf{C P E})
$$

gives $H_{\mathrm{E}}^{q}(\mathbf{C P E})=0$ for $2 \leq q \leq m-2$ because in this case $H_{\mathrm{H}}^{q-1}(\mathbf{C P E})=$ $H_{\mathrm{H}}^{q}(\mathbf{C P E})=0$. Then, the exact subsequence

$$
0=H_{\mathrm{H}}^{m-2}(\mathbf{C P E}) \rightarrow H_{\mathrm{E}}^{m-1}(\mathbf{C P E}) \rightarrow H_{\mathrm{H}}^{m-1}(\mathbf{C P E}) \xrightarrow{D_{t}^{m-1}} \ldots
$$

gives $H_{\mathrm{E}}^{m-1}(\mathbf{C P E})=\operatorname{Ker} D_{t}^{m-1}$. At last, for $q=m, m+1$ the statements follow from the exact subsequence $H_{\mathrm{H}}^{m-1}(\mathbf{C P E}) \rightarrow H_{\mathrm{E}}^{m}(\mathbf{C P E}) \rightarrow$ Ker $D_{t}^{m} \rightarrow 0$ and from the exact subsequence $0 \rightarrow \operatorname{Im} D_{t}^{m} \rightarrow H_{\mathrm{H}}^{m}(\mathbf{C P E}) \rightarrow$ $H_{\mathrm{E}}^{m+1}(\mathbf{C P E}) \rightarrow 0$.
Remark 10. To calculate $\operatorname{Ker} D_{t}^{m-1}$ one may use the technics from lemmas 1 and 2. The cases $q=m, m+1$ in this approach are uninformative. They demand a special study.

### 3.2 Navier-Stokes equations as the evolution with constraints.

We consider the Navier-Stokes system (1)-(4) as the evolution process governed by the equation (1) in the divergence-free space with the inner constraint (4).

The algebraic counterpart of the equation (1) is the symmetry

$$
\mathrm{ev}_{\mathrm{E}}=D_{\mathrm{i}_{0}} E^{1} \cdot \partial_{u_{\mathrm{i}_{0}}^{1}}+D_{\mathrm{i}} E^{\alpha} \cdot \partial_{u_{\mathrm{i}}^{\alpha}}+D_{\mathrm{i}_{1}} E \cdot \partial_{p_{\mathrm{i}_{1}}} \in \operatorname{Sym}\left(\mathcal{A}(\mathbf{C P E}), \mathfrak{D}_{\mathrm{H}}(\mathbf{C P E})\right),
$$

where

- $\mathrm{E}=\left(E^{\mu}, E\right) \in \mathcal{A}(\mathbf{C P E})^{\mathrm{M}} \times \mathcal{A}(\mathbf{C P E}) ;$
- $E^{\mu}=-u^{\lambda} \nabla_{\lambda} u^{\mu}+\nu \Delta u^{\mu}-\nabla^{\mu} p=-u^{\lambda} u_{(\lambda)}^{\mu}+\nu \Delta u^{\mu}-p_{(\mu)}$;
- $u_{(1)}^{1}=-u_{(\alpha)}^{\alpha}, \quad \Delta u^{\mu}=\sum_{\lambda} u_{2(\lambda)}^{\mu}, \quad \Delta u^{1}=-u_{(1)+(\alpha)}^{\alpha}+\sum_{\alpha} u_{2(\alpha)}^{1}$;
- $\nabla^{\mu}=\delta^{\mu \nu} \nabla_{\nu}=\nabla_{\mu}$ (the euclidean metrics), so $p^{(\mu)}=p_{(\mu)}$;
- $E$ to be defined from the condition $\mathrm{ev}_{\mathrm{E}} \in \operatorname{Sym}\left(\mathcal{A}(\mathbf{C P E}), \mathfrak{D}_{\mathrm{H}}(\mathbf{C P E})\right)$.

One can easily check that here $D_{\mu} E^{\mu}=0$. On the other hand the condition

$$
\begin{equation*}
\Delta E+\operatorname{ev}_{\mathrm{E}}\left(u_{(\mu)}^{\lambda} u_{(\lambda)}^{\mu}\right)=\Delta E+2 u_{(\mu)}^{\lambda} D_{\lambda} E^{\mu}=0 \tag{11}
\end{equation*}
$$

is the Poisson equation for the component E (cf., Remark (1).
Thus, for the algebraic analysis of the Navier-Stokes equations, one can use the technique outlined in the previous subsection.

### 3.3 Conclusion.

It can be seen from the above constructions that the Navier-Stokes equations are subject to meaningful analysis within the framework of the algebraic approach to differential equations. The resulting equations for finding algebraic characteristics of Navier-Stokes equations, such as symmetries and cohomologies, are essentially complicated. One may hope to find their partial solutions at least, especially using analytical computational packets (Mathematica, for example).
