CONJUGATIONS COMMUTING AND INTERTWINING WITH $M_B$ IN $L^2(\mathbb{T})$

ARUP CHATTOPADHYAY AND SOMA DAS

Abstract. A class of conjugations related to model space for a given inner function has been introduced as a generalization of natural conjugations in $L^2(\mathbb{T})$. In this article, we explicitly determine the class of conjugations commuting with $M_B$ or make $M_B$ complex symmetric by identifying the commutant of the multiplication operator $M_B$ in $L^2(\mathbb{T})$, where $B$ is a finite Blaschke product. Moreover, we analyze their properties while keeping the whole Hardy space, model space, and Beurling type subspaces invariant. Furthermore, we also extended our study in the case of finite Blaschke. In particular, our results generalize the related results obtained in [3, 4].

1. Introduction

The study of conjugations and complex symmetric operators has become a widely-interested research area because of its significance in the fields of operator theory, complex analysis, and physics. Recently, several authors have been interested in non-hermitian quantum mechanics and the spectral analysis of certain complex symmetric operators (for more details, see [2, 15]). One of the motivations to study conjugations comes from the study of complex symmetric operators. Complex symmetric operators on Hilbert spaces are natural generalizations of complex symmetric matrices, and the study of complex symmetric (in short C-symmetric) operators was initiated by Garcia, Putinar, and Wogen in [16, 17, 18, 19]. Let $\mathcal{H}$ be a separable complex Hilbert space and let $\mathcal{L}(\mathcal{H})$ denote the space of all bounded linear operators on $\mathcal{H}$. Technically speaking, a conjugation $C$ is an antilinear and isometric involution on $\mathcal{H}$. In other words, a conjugate-linear operator $C : \mathcal{H} \rightarrow \mathcal{H}$ is said to be a conjugation if it satisfies the following two conditions:

(a) $C^2 = I_{\mathcal{H}}$, (the identity operator on $\mathcal{H}$)
(b) $\langle Cf, Cg \rangle = \langle g, f \rangle$, $\forall f, g \in \mathcal{H}$.

It is interesting to observe that the conjugation is a straightforward generalization of the conjugate-linear map $z \rightarrow \bar{z}$ on the one-dimensional Hilbert space $\mathbb{C}$. Moreover, we can also interpret conjugation as a special kind of antilinear operator and note that the antilinear operator is the only type of non-linear operator that is important in the field of quantum mechanics (for more details see [23, 29, 31]). In this connection, it is remarkable to mention that Garcia and Putinar have shown in [16] that for any given conjugation $C$ on $\mathcal{H}$ there exists an orthonormal basis $\{e_n : n \in \mathbb{N}_0\}$ such that $Ce_n = e_n$ for all $n \in \mathbb{N}_0$, where $\mathbb{N}_0$ denotes the set of all non-negative integers.

Definition 1.1. An operator $T \in \mathcal{L}(\mathcal{H})$ is called $C$-symmetric if there exists a conjugation $C$ on $\mathcal{H}$ such that $CTC = T^*$, where $T^*$ is the adjoint of $T$. If $T$ is $C$-symmetric for some conjugation $C$, then $T$ is called complex symmetric.

The class of complex symmetric operators includes all normal operators, Hankel operators, truncated Toeplitz operators, and Volterra integration operators. For more on complex symmetric operators and related topics, including historical comments, we refer the reader to [16, 17, 18, 19, 22, 30].

Key words and phrases. Conjugation, Hardy space, model space, complex symmetric operator, Blaschke product.
and the references cited therein. We denote by $\mathcal{L}A(\mathcal{H})$ the space of all bounded antilinear operators on $\mathcal{H}$. Recall that for $A \in \mathcal{L}A(\mathcal{H})$ there exists a unique antilinear operator $A^\sharp$, known as the antilinear adjoint of $A$, defined by the equality

$$\langle Af, g \rangle = \langle f, A^\sharp g \rangle.$$ 

It is important to observe that $C^\sharp = C$ for any conjugation $C$, $(AB)^\sharp = B^*A^\sharp$, and $(BA)^\sharp = A^\sharp B^*$ for $A \in \mathcal{L}A(\mathcal{H})$, $B \in \mathcal{L}(\mathcal{H})$ (see [3]).

Let $\mathbb{D} = \{z \in \mathbb{C} : |z| < 1\}$ denote the unit disc in the complex plane and $\mathbb{T} = \{z \in \mathbb{C} : |z| = 1\}$ be the unite circle. Let us denote by $L^2(\mathbb{T})$ (or simply $L^2$) the space of all square integrable functions over the unite circle $\mathbb{T}$. The Banach space of all essentially bounded functions on the unit circle $\mathbb{T}$ is denoted by $L^\infty(\mathbb{T})$ (or $L^\infty$ in short). Therefore, if $f \in L^2(\mathbb{T})$, then the function $f$ can be expressed as

$$f(z) = \sum_{n=-\infty}^{\infty} \hat{f}(n)z^n,$$

where $\hat{f}(n)$ denotes the $n$-th Fourier coefficient of $f$ and $\sum_{n=-\infty}^{\infty} |\hat{f}(n)|^2 < \infty$. For $\phi \in L^\infty$, let $M_\phi$ denote the multiplication operator on $L^2$ defined as

$$M_\phi(f) = \phi f, \quad f \in L^2.$$ 

Recall that the classical Hardy space over the unit disc $\mathbb{D}$ is denoted by $H^2(\mathbb{D})$ and defined by

$$H^2(\mathbb{D}) := \left\{ f(z) = \sum_{n=0}^{\infty} a_n z^n : ||f||_{H^2(\mathbb{D})}^2 := \sum_{n=0}^{\infty} |a_n|^2, \ z \in \mathbb{D}, \ a_n \in \mathbb{C} \right\}.$$ 

For $f \in H^2(\mathbb{D})$, the non-tangential boundary limit (radial limit) $\hat{f}(e^{i\theta}) = \lim_{r \to 1^-} f(re^{i\theta})$ exists almost everywhere on $\mathbb{T}$ [12, 13, 24]. Therefore $H^2(\mathbb{D})$ can be embedded isometrically as a closed subspace of $L^2(\mathbb{T})$ by identifying $H^2(\mathbb{D})$ through the nontangential boundary limits of the $H^2(\mathbb{D})$ functions. In other words, we can recognize the Hardy space $H^2(\mathbb{D})$ as a closed subspace of $L^2(\mathbb{T})$, say $H^2$, consisting of $L^2$ functions having negative Fourier coefficients zero. We denote by $H^\infty$ the space of all bounded analytic functions on $\mathbb{D}$ that can be identified with a closed subspace of $L^\infty$, that is $H^\infty := L^\infty \cap H^2$. An inner function $\theta$ is an element in $H^\infty$ such that $|\theta| = 1$ almost everywhere on $\mathbb{T}$. Recall that the unilateral shift $S$ on $H^2$ is defined by $Sf(z) = zf(z)$, $f \in H^2$, a restriction of the bilateral shift $M_z$ on $L^2$. A well-known theorem due to Beurling characterizing all the $S$-invariant subspaces of $H^2$. In other words, any $S$-invariant subspace of $H^2$ is of the form $\theta H^2$, where $\theta$ is an inner function. For any inner function $\theta$, the model space $K_\theta$ is defined by $K_\theta := H^2 \ominus \theta H^2$, which is $S^*$ invariant. For more on model spaces and related stuff, we refer the reader to [12, 13, 14, 24].

It is well known that the commutant of $S$ in $H^2$ is $\{M_\phi : \phi \in H^\infty\}$ and the commutant of $M_z$ in $L^2$ is $\{M_\phi : \phi \in L^\infty\}$ [24]. The commutant of more general shift operators and more general Toeplitz operators in various function spaces has been discussed by many authors (see [11, 18, 19, 10, 11, 20, 21, 25, 27]). In this direction, we calculate the commutant of $M_B$ in $L^2$ to obtain our main results in this article.

Two natural conjugations $\tilde{J}$ and $J^*$ on $L^2(\mathbb{T})$ are defined as follows

$$\tilde{J}f = \bar{f}, \quad J^*f = f^\#, \quad \text{where} \quad \bar{f}(z) = \overline{f(z)} \quad \text{and} \quad f^\#(z) = \overline{f(z)}.$$ 

It is important to observe that the conjugation $\tilde{J}$ intertwining the operators $M_z$ and $M_\zeta$. In other words $M_z$ is $\tilde{J}$-symmetric, that is $\tilde{J}M_z\tilde{J} = M_\zeta$. Moreover, $\tilde{J}H^2 = \overline{H^2}$, that is $\tilde{J}$ maps an analytic
function to a co-analytic function. On the other hand the conjugation $J^*$ has a different nature in compare to $\bar{J}$. For example, $J^*M_2 = M_2J^*$ and it preserves the Hardy space $H^2$. Furthermore, it worth mentioning that the map $J^*$ has connection with model spaces [7] and Hankel operators [24]. In this connection, recently Câmara-Garlicka-Lanucha-Ptak raised a natural question in [4] regarding the characterization of conjugations which posses similar kind of properties as $\bar{J}$ and $J^*$. More precisely, they characterize the class of conjugations that commute with $M_2$ and also classify the class of conjugations intertwining the operators $M_2$ and $M_\sharp$ in scaler-valued $L^2$ space [3, 4] as well as in vector-valued $L^2(H)$ space [5] over the unit circle $\mathbb{T}$. Motivated by the work of Câmara-Garlicka-Lanucha-Ptak [3, 4, 5], we would like to investigate the following questions in this article:

**Question 1.** Which class of conjugations commute with $M_{z2}$ in $L^2(\mathbb{T})$?

**Question 2.** Which class of conjugations intertwining the operators $M_{z2}$ and $M_{\bar{z}2}$ in $L^2(\mathbb{T})$?

It is worth noting that, commutant of $M_2$ is properly contained in the commutant of $M_{z2}$. The major contributions in this article are the following

- We identify the commutant of $M_B$ in $L^2$, where $B$ is a finite Blaschke product.
- Using the above characterization, we classify the set of conjugations that commute with $M_{z2}$ but fail to commute with $M_2$.
- Class of conjugations intertwining the operators $M_{z2}$ and $M_{\bar{z}2}$ but not necessarily intertwining the operators $M_2$ and $M_\sharp$ has been identified.
- As a consequence of our main results, we investigate the properties of the above classes of conjugations keeping the whole Hardy space, model space, and Beurling type subspaces invariant.
- At the end, we extend our discussions in connection to $M_B$, where $B$ is a finite Blaschke product.

In particular, our work generalizes the related results obtained in [3, 4].

The paper is organized as follows: In section 2, we introduce some conjugations in $L^2(\mathbb{T})$ as a generalization of some well-known conjugations. For any finite Blaschke product $B$, the commutant of the multiplication operator $M_B$ has been characterized in section 3. Answer of Question 1 and Question 2 has been provided in section 4. In section 5, we discuss the properties of such conjugations that keep invariant the whole Hardy space, model space, and Beurling type subspaces. Section 6 is devoted to studying the related results in the case of finite Blaschke product $B$ and particularly for $B(z) = z^n$.

## 2. Conjugations in $L^2(\mathbb{T})$

We begin the section by recalling two natural conjugations in $L^2(\mathbb{T})$ which have been mentioned earlier, namely $\bar{J}$ and $J^*$, where $\bar{J}$ is defined by $\bar{J}f = \bar{f}$ and for $J^*$ it is given by $J^*f = f^\sharp$, with $f^\sharp(z) = \overline{f(\bar{z})}$. These two conjugations have some interesting properties. The bilateral shift operator $M_2$ becomes complex symmetric in $L^2$ with respect to the first conjugation $\bar{J}$ and it maps the analytic functions space in other word the Hardy space $H^2(\mathbb{T})$ into the co-analytic functions space $\overline{H^2}(\mathbb{T})$, that is, $\bar{J}(H^2) = \overline{H^2}$. On the other hand, the conjugation $J^*$ commutes with $M_2$ and keeps the analytic function space $H^2(\mathbb{T})$ invariant, that is, $J^*(H^2) \subset H^2$. These are major differences in properties of these two conjugations. As discussed earlier in this section we will introduce some conjugations in $L^2(\mathbb{T})$ as a generalization of these two conjugations $\bar{J}$ and $J^*$ in different point of
view. For any inner function $\theta$, the natural conjugation on $K_{\theta} := H^2 \ominus \theta H^2$ defined by
$$c_{\theta} : K_{\theta} \rightarrow K_{\theta}$$
$$h \mapsto \overline{\theta} h\theta,$$
which has an important connection with truncated Toeplitz operator in model spaces. Indeed the truncated Toeplitz operator is $c_{\theta}$ symmetric (for more details see [14, 16]).

For any inner function $\theta$, by Wold-type Decomposition [28] we can view the $L^2(\mathbb{T})$ space as follows:

$$L^2(\mathbb{T}) = \bigoplus_{k=-\infty}^{\infty} \theta^k K_{\theta}. \tag{2.1}$$

The proof of the above decomposition (2.1) easily obtain from the fact that the corresponding Toeplitz operator $T_{\theta}$ becomes a pure isometry, that is, a shift operator on $H^2$ and using the standard decomposition $L^2(\mathbb{T}) = H^2 \oplus H_0^2$. For more clarification, we briefly provide some justification about the above decomposition. Applying the classical Von Neumann-Wold Decomposition theorem on $H^2$ corresponding to the shift operator $T_{\theta}$ one can obtain the following:

$$H^2 = K_{\theta} \oplus \theta K_{\theta} \oplus \theta^2 K_{\theta} \oplus \cdots.$$ 

So, for any $h \in H^2$ there exists a sequence $\{h_k\}_{k=0}^{\infty}$ in $K_{\theta}$ such that $h = \sum_{k=0}^{\infty} h_k \theta^k$ and $\|h\|^2 = \sum_{k=0}^{\infty} \|h_k\|^2$. Note that, $\theta^k K_{\theta} \perp \theta^m K_{\theta}$ for any $k, m \in \mathbb{Z}$ and considering them as subspaces of $L^2$.

As an immediate consequence of all the above facts we get

$$\bigoplus_{k=-\infty}^{\infty} \theta^k K_{\theta} \subseteq L^2(\mathbb{T}).$$

Consider $f \in L^2 = H^2 \oplus H_0^2$, so there exist $f_1 \in H^2$ and $f_2 \in H_0^2$ such that $f = f_1 \oplus f_2$. Again, $f_1 = \sum_{k=0}^{\infty} \tilde{f}_k \theta^k$, for $\{\tilde{f}_k\}_{k=0}^{\infty} \in K_{\theta}$ and $f_2 = \overline{\theta} f_1$, for some $g \in H^2$. Repeating the same argument, we have $g = \sum_{k=0}^{\infty} g_k \theta^k$ for $\{g_k\}_{k=0}^{\infty} \in K_{\theta}$ and hence

$$f_2 = \sum_{k=0}^{\infty} \overline{g_k} \theta^{-k} = \sum_{k=0}^{\infty} \overline{g_k} \theta^{-(k+1)} = \sum_{k=0}^{\infty} (c_{\theta} g_k) \theta^{-(k+1)}$$

$$= \sum_{k=-1}^{\infty} \tilde{g}_k \theta^k, \text{ where } \tilde{g}_k = c_{\theta} g_k \in K_{\theta}.$$ 

Finally, combining all facts together we conclude

$$f = \sum_{k=-\infty}^{\infty} f_k \theta^k,$$

where, $f_k = \tilde{f}_k$, for $k \geq 0$ and $f_k = \tilde{g}_k$ when $k < 0$. Thus we make the conclusion that (2.1) holds good.

Next we define conjugations extending the natural conjugation $c_{\theta}$ of model space for a fixed inner function $\theta$, to the whole Hardy space in two different ways. First we define $C_{\theta}$ on $L^2(\mathbb{T})$ as follows:

$$C_{\theta} : L^2(\mathbb{T}) \rightarrow L^2(\mathbb{T})$$

$$f \mapsto \sum_{k=-\infty}^{\infty} (c_{\theta} f_k) \theta^{-k}, \text{ where } f = \sum_{k=-\infty}^{\infty} f_k \theta^k, f_k \in K_{\theta} \text{ i.e.},$$
Conjugations in $L^2(\mathbb{T})$

$$\tilde{C}_\theta(\sum_{k=-\infty}^{\infty} f_k \theta^k) = \sum_{k=-\infty}^{\infty} \bar{z} f_k \theta^{-k+1}. \quad (2.2)$$

One can easily check that each $\tilde{C}_\theta$ is a conjugation on $L^2$. For particular $\theta(z) = z$, on $\mathbb{T}$ the standard structure of $L^2$ space is recovered and the action of the corresponding conjugation $\tilde{C}_z$ is,

$$\tilde{C}_z(\sum_{k=-\infty}^{\infty} a_k z^k) = \sum_{k=-\infty}^{\infty} \bar{a}_k z^k. \quad (2.3)$$

The action of $\tilde{C}_\theta$ given in (2.2) and it can also be represented as

$$\tilde{C}_\theta(f) = \theta \bar{f}$$

and hence the action of $\tilde{C}_z$ is basically, $f \to \bar{f}$. In other words $\tilde{C}_z = \tilde{J}$. So, in this point of view one can think $\tilde{C}_\theta$ is a generalization of the conjugation $\tilde{J}$. These kind of conjugations one can find in [4] where they use it to classify all the $M_z$-conjugations preserving model spaces.

Next we define another conjugation for an inner function $\theta$, $C_\theta^* : L^2 \to L^2$ such that if $f = \sum_{k=-\infty}^{\infty} f_k \theta^k$ with $f_k \in K_\theta$, then

$$C_\theta^*(f) = \sum_{k=-\infty}^{\infty} (c_k f_k) \theta^k.$$ 

It implies that,

$$C_\theta^*(\sum_{k=-\infty}^{\infty} f_k \theta^k) = \sum_{k=-\infty}^{\infty} \bar{z} f_k \theta^{k-1}. \quad (2.4)$$

In particular, for $\theta(z) = z$, it actually reduces to $J^*$ which means that $C_z^* = J^*$ using the similar kind of arguments as above. These type of conjugations one can also find in [4].

In the beginning of this section we have already discussed about certain properties of two natural conjugations $\tilde{J}$ and $J^*$ in $L^2$-space. It is now easy to observe that those properties also hold for $\tilde{C}_\theta$ and $C_\theta^*$. To be more specific, $\tilde{C}_\theta M_\theta = M_\theta \tilde{C}_\theta$, $\tilde{C}_\theta(H^2) = \overline{H^2}$, $C_\theta^* M_\theta = M_\theta C_\theta^*$, and $C_\theta^*(H^2) = H^2$. On the contrary, the conjugation $C_{z_2}^*$ has one more extra property, namely $C_{z_2}^* M_z \neq M_z C_{z_2}^*$. In fact $C_{z_2}^* M_z \neq M_z C_{z_2}$ for an arbitrary inner function $\theta$.

3. Commutant of $M_B$ in $L^2(\mathbb{T})$

In this section, we provide the characterization of commutants of the multiplication operator $M_B$ having symbol $B$, a finite Blaschke product, that is, multiplication by a finite Blaschke product $B$ on the space $L^2(\mathbb{T})$. We will denote $\{M_B\}'$ to be the set of all bounded linear operator on $L^2(\mathbb{T})$ that commutes with $M_B$. In other words, if $T \in \{M_B\}'$ then $T : L^2(\mathbb{T}) \to L^2(\mathbb{T})$ is a bounded linear operator such that $TM_B = M_B T$. Our main aim is to characterize the set $\{M_B\}'$. To reach our goal we need the following useful lemma.

**Lemma 3.1.** Let $\phi \in L^2(\mathbb{T})$ be such that $\phi f \in L^2(\mathbb{T})$ for all $f \in L^2(\mathbb{T})$, then $\phi \in L^\infty(\mathbb{T})$.

**Proof.** The given hypothesis allows us to define a linear operator as follows:

$$A_\phi : L^2(\mathbb{T}) \to L^2(\mathbb{T})$$

$$f \to \phi f.$$ 

We show that $A_\phi$ is a bounded linear operator by Closed-Graph Theorem. Let us denote the Graph of $A_\phi$ by $Gr(A_\phi)$. To serve this purpose let us take a sequence $\{(f_n, A_\phi f_n)\} \in Gr(A_\phi)$ such that it
converges to \((f,g)\) in \(L^2\). Then there exist a subsequence \(\{f_{n_j}\}\) of \(\{f_n\}\) such that \(A_\phi f_{n_j} \to g\) a.e. on \(\mathbb{T}\), in other words \(\phi f_{n_j} \to g\) a.e. on \(\mathbb{T}\). Again, \(f_n\) converges to \(f\) implies that \(f_{n_j}\) also converges to \(f\) in \(L^2(\mathbb{T})\). So, using the properties of \(L^2\) convergence there exist a subsequence \(\{f_{n_jk}\}\) of \(\{f_{n_j}\}\) such that \(f_{n_jk}\) converges to \(f\) a.e. on \(\mathbb{T}\). So, \(\phi f_{n_jk} \to \phi f\) a.e. on \(\mathbb{T}\). Also \(\phi f_{n_j} \to g\) a.e. on \(\mathbb{T}\). Hence, \(\phi f = g\) a.e. that means \(A_\phi f = g\). So, \(A_\phi\) is a bounded linear operator. Now, we shall show that \(\phi \in L^\infty(\mathbb{T})\). So, for a \(n \in \mathbb{N}\) we define \(E_n := \{e^{i\theta} \in \mathbb{T} : |\phi(e^{i\theta})| > n\}\). Let \(\chi_{E_n}\) be the characteristic function of \(E_n\). Since, \(A_\phi\) is a bounded linear operator then we can write,

\[ ||A_\phi \chi_{E_n}||^2 \leq ||\chi_{E_n}||^2 ||A_\phi||^2. \]

If \(m\) denote the normalized Lebesgue measure on \(\mathbb{T}\) then we also have,

\[ ||A_\phi \chi_{E_n}||^2 = \int_{E_n} |\phi(e^{i\theta})|^2 > n^2 \ m(E_n). \]

Again, one can find that \(||\chi_{E_n}||^2 = m(E_n)\). Therefore, \(n^2 \ m(E_n) < ||A_\phi \chi_{E_n}||^2 \leq ||A_\phi||^2 m(E_n)\). Hence for \(n > ||A_\phi||\), we have \(m(E_n) = 0\). Consequently, we can conclude that \(\phi \in L^\infty(\mathbb{T})\). \(\square\)

Before going to the main theorem in this section we need to recall some basic facts. We know that for a finite Blaschke product \(B\), the dimension of the model space \(K_B := H^2 \ominus B H^2\) is finite. In fact, if the degree of \(B\) is a finite natural number \(n\), then \(\dim(K_B) = n\). Let \(\{h_1, h_2, \ldots, h_n\}\) be an orthonormal basis of \(K_B\). Due to \textbf{Wold-type} decomposition the space \(L^2(\mathbb{T})\) can be viewed as follows

\[ L^2(\mathbb{T}) = \bigoplus_{k=-\infty}^{\infty} K_B B^k. \]

Using the above decomposition we identify \(L^2(\mathbb{T})\) as orthogonal direct sum of \(n\)-closed subspaces as follows:

\[ L^2(\mathbb{T}) = \mathcal{H}_1 \oplus \mathcal{H}_2 \oplus \cdots \oplus \mathcal{H}_n, \quad (3.1) \]

where

\[ \mathcal{H}_1 = \bigcup_{k=-\infty}^{\infty} \{h_1 B^k\}, \mathcal{H}_2 = \bigcup_{k=-\infty}^{\infty} \{h_2 B^k\}, \ldots, \mathcal{H}_n = \bigcup_{k=-\infty}^{\infty} \{h_n B^k\}. \]

Therefore for any \(f \in L^2(\mathbb{T})\) can be represented as \(f = f_1 + f_2 + \cdots + f_n\), where \(f_i \in \mathcal{H}_i\) for \(i \in \{1, 2, \ldots, n\}\). For a finite sequence \(\{\lambda_k\}_{1 \leq k \leq n}\) (may be repeating) in \(\mathbb{D}\), we consider the following finite Blaschke product

\[ B(z) = \prod_{k=1}^{n} \frac{\lambda_k - z}{1 - \lambda_k z}, z \in \overline{\mathbb{D}}. \quad (3.2) \]

For \(1 \leq j \leq n\), consider the following functions

\[ e_j(z) = \left( \prod_{k=1}^{j-1} \frac{\lambda_k - z}{1 - \lambda_k z} \right) \sqrt{\frac{1 - |\lambda_j|^2}{1 - \lambda_j z}}, \quad (3.3) \]

then it is easy to observe that \(\{e_1, e_2, \ldots, e_n\}\) forms an orthonormal basis of \(K_B\). In fact, this is a standard basis of \(K_B\) and for more details we refer to [12, Theorem:14.7]. It is worth mentioning some nice properties of \(e_j\) as follows:

(i) Each \(e_j\) belongs to \(H^\infty(\mathbb{T})\).
(ii) Each \( e_j \) is invertible in \( L^\infty(\mathbb{T}) \) and

\[
e_j^{-1}(z) = \left( \prod_{k=1}^{j-1} \frac{1 - \lambda_k z}{\lambda_k - z} \right) \frac{1 - \bar{\lambda}_j z}{\sqrt{1 - |\lambda_j|^2}}.
\]

We now proceed to find the commutant of \( M_B \). To this end, we use the decomposition of \( L^2(\mathbb{T}) \) as an orthogonal direct sum of \( n \)-subspaces given in (3.1) along with the fact that \( B \) is of the form \( \{e_1, e_2, \ldots, e_n\} \) and \( \{\varphi_1, \varphi_2, \ldots, \varphi_n\} \) is the required orthonormal basis as mentioned in (3.3). Therefore, for any \( f \in L^2(\mathbb{T}) \) (\( = \mathcal{H}_1 \oplus \mathcal{H}_2 \oplus \cdots \oplus \mathcal{H}_n \)) can be written as \( f = f_1 \oplus f_2 \oplus \cdots \oplus f_n \), where \( f_i \in \mathcal{H}_i \) (\( = \bigvee_{k=-\infty}^{\infty} \{e_i B^k\} \)) for each \( i \in \{1, 2, \ldots, n\} \). Let us consider \( S \in \{M_B\}' \), then \( S \) is a bounded linear operator on \( L^2(\mathbb{T}) \) such that \( M_B S = SM_B \). Since \( f_j \in \mathcal{H}_j \), then there exists \( g_j = \sum_{k=-\infty}^{\infty} a^j_k B^k \in L^2 \) such that \( f_j = e_j g_j \) for each \( j \in \{1, 2, \ldots, n\} \). Since \( e_j^{-1} \in L^\infty(\mathbb{T}) \), then by using the fact that \( S \) commutes with \( M_B \) we have

\[
Sf_j = (Se_j)g_j = (Se_j)e_j^{-1}e_j g_j = (Se_j)e_j^{-1}f_j = \phi_j f_j,
\]

where \( \phi_j = (Se_j)e_j^{-1} \in L^2(\mathbb{T}) \). We claim that each \( \phi_j \in L^\infty(\mathbb{T}) \) for \( j \in \{1, 2, \ldots, n\} \). We already proved that \( \phi_j f_j = S(f_j) \in L^2 \). Now for \( i \neq j \),

\[
\phi_j f_i = \phi_j (e_i g_i) = e_j^{-1} e_j \phi_j (e_i g_i) = e_j^{-1} e_i (\phi_j e_j g_i) = e_j^{-1} e_i S(h_i) \in L^2,
\]

where \( h_j = e_j g_i \in \mathcal{H}_j \). Thus we have \( \phi_j f = \phi_j f_1 + \phi_j f_2 + \cdots + \phi_j f_n \in L^2 \) for any \( f \in L^2 \). Therefore by using previous Lemma (3.1) we conclude \( \phi_j \in L^\infty \) for \( j \in \{1, 2, \ldots, n\} \). Since we prove that each \( \phi_j \in L^\infty \), then for any \( f \in L^2 \) the action of \( S \) can be defined as follows:

\[
Sf = \phi_1 f_1 + \phi_2 f_2 + \cdots + \phi_n f_n
\]

\[
= M_{\phi_1} f_1 + M_{\phi_2} f_2 + \cdots + M_{\phi_n} f_n.
\]

From now on wards we use the notation \( M_{[\phi_1, \phi_2, \ldots, \phi_n]} \) to denote the bounded linear operator on \( L^2 \) such that

\[
M_{[\phi_1, \phi_2, \ldots, \phi_n]}(f) = M_{\phi_1} f_1 + M_{\phi_2} f_2 + \cdots + M_{\phi_n} f_n.
\]  

(3.4)

From now on wards we use the notation \( M_{[\phi_1, \phi_2, \ldots, \phi_n]} \) to denote the bounded linear operator on \( L^2 \) such that

\[
M_{[\phi_1, \phi_2, \ldots, \phi_n]}(f) = M_{\phi_1} f_1 + M_{\phi_2} f_2 + \cdots + M_{\phi_n} f_n.
\]  

Summing up, we have the following main theorem in this section.

**Theorem 3.2.** Let \( B \) be a finite Blaschke of degree \( n \) and \( S \in \{M_B\}' \) in \( L^2(\mathbb{T}) \). Then there exist \( n \)-number of \( L^\infty \) functions \( \phi_1, \phi_2, \cdots, \phi_n \) such that \( S = M_{[\phi_1, \phi_2, \cdots, \phi_n]} \).

One can find the classical theorem for commutant of the shift operator of \( L^2(\mathbb{T}) \)-space in [24] (see Theorem: 2.2.5), which says that the commutant of \( M_z \) in \( L^2(\mathbb{T}) \) is \( \{M_\phi: \phi \in L^\infty(\mathbb{T})\} \). It is worth noticing that, if we consider \( \phi_1 = \phi_2 = \cdots = \phi_n = \phi \) in (3.1), then \( M_{[\phi_1, \phi_2, \cdots, \phi_n]} \) turns out to be the classical multiplication operator \( M_\phi \). So, we have the following remark:

**Remark 3.3.** Suppose \( B(z) = z^2 \) and \( S \in \{M_z\}' \). Since \( \{M_z\}' \subset \{M_z\}' \), then

(i) for \( S \in \{M_z\}' \), there exists \( \phi \in L^\infty \) such that \( S = M_{[\phi, \phi]} = M_\phi \),

(ii) for \( S \notin \{M_z\}' \), there exist \( \phi_1, \phi_2 \in L^\infty \) with \( \phi_1 \neq \phi_2 \) such that \( S = M_{[\phi_1, \phi_2]} \).

In a similar fashion one can distinguish between the commutant of \( M_z \) and the commutant of \( M_B \) corresponding to a finite Blaschke product \( B \).
4. Conjugations Intertwining $M_{x^2}$ and Commuting with $M_{x^2}$ in $L^2$

We recall some existing results of conjugations which intertwining the operators $M_{x}$ and $M_{\bar{x}}$ or commute with $M_{x}$. The conjugations $J$ and $J^*$ in $L^2$-space has already been introduced and their properties are also described earlier. The following theorem obtained in [4] and it provides the characterization of all conjugations $C$ in $L^2$-space intertwining the operators $M_{x}$ and $M_{\bar{x}}$.

**Theorem 4.1.** Let $C$ be a conjugation in $L^2$. Then the following are equivalent:

1. $M_{xC} = CM_{x^2}$,
2. $M_{x^2}C = CM_{\bar{x}}$,
3. there is $\psi \in L^\infty$, with $|\psi| = 1$, such that $C = M_{x^2}J$,
4. there is $\psi' \in L^\infty$, with $|\psi'| = 1$, such that $C = JM_{\bar{x}}$.

Similarly, the following theorem in [4] characterize all $M_{x}$-commuting conjugations.

**Theorem 4.2.** Let $C$ be a conjugation in $L^2$. Then the following are equivalent:

1. $M_{x}C = CM_{x^2}$,
2. $M_{x^2}C = CM_{\bar{x}}$,
3. there is a symmetric unimodular function $\psi \in L^\infty$ such that $C = M_{x^2}J$,
4. there is a symmetric unimodular function $\psi' \in L^\infty$ such that $C = J^*M_{\bar{x}}$.

Motivated from the above characterization results we have raised Question 1 [4] and Question 2 [2] in Section 1. Now we are in a position to give answer of these questions accordingly. At first we characterize all those conjugations $C$ satisfying $CM_{x^2} = M_{x^2}C$. Before going to the main theorems of this section, for any $\phi \in L^2(T)$ we define $\phi^e(z) = \frac{\phi(z) + \phi(-z)}{2}$ and $\phi^o(z) = \frac{\phi(z) - \phi(-z)}{2}$ on $z \in T$. Then it turns out that in particular if $\phi \in L^\infty$, then both $\phi^e, \phi^o \in L^\infty$ but for general case, $\phi^e, \phi^o \in L^2$ such that $\phi = \phi^e \oplus \phi^o$. Indeed, $\phi^e \in \bigcup_{k=-\infty}^{\infty}\{z^{2k}\}$ and $\phi^o \in \bigcup_{k=-\infty}^{\infty}\{z^{2k+1}\}$. Also recall that for $f \in L^2, \tilde{C}_{x^2} (f) = z^J$ is a conjugation satisfying $\tilde{C}_{x^2} M_{x^2} = M_{x^2} \tilde{C}_{x^2}$ which we will use in the following theorem.

**Theorem 4.3.** Let us consider a conjugation $C : L^2(T) \rightarrow L^2(T)$. If $CM_{x^2} = M_{x^2}C$ then there exist $\phi_1, \phi_2 \in L^\infty(T)$ such that $C = M_{[\phi_1, \phi_2]} \tilde{C}_{x^2}$, where $\phi_1, \phi_2$ satisfies $|\phi_1|^2 + |\phi_2|^2 = 2$ along with $\phi_1^e = \phi_2^o$. Conversely, any conjugation $C$ of the form $M_{[\phi_1, \phi_2]} \tilde{C}_{x^2}$, for any $\phi_1, \phi_2 \in L^\infty$ satisfies $CM_{x^2} = M_{x^2}C$.

**Proof.** Let us assume that $C$ be a conjugation on $L^2(T)$ such that $CM_{x^2} = M_{x^2}C$. Therefore, the unitary operator $C \circ \tilde{C}_{x^2}$ commutes with $M_{x^2}$ as $\tilde{C}_{x^2}$ also satisfies the property that $\tilde{C}_{x^2} M_{x^2} = M_{x^2} \tilde{C}_{x^2}$. Using Theorem 3.2 we can find $\phi_1, \phi_2 \in L^\infty(T)$ such that $C \circ \tilde{C}_{x^2} = M_{[\phi_1, \phi_2]}$. Since, $\tilde{C}_{x^2} = I$ then $C = M_{[\phi_1, \phi_2]} \tilde{C}_{x^2}$. Again, $M_{[\phi_1, \phi_2]}$ is an unitary operator by construction. Considering, $L^2(T) = \mathcal{H}_1 \oplus \mathcal{H}_2$ we can view the operator $M_{[\phi_1, \phi_2]} : \mathcal{H}_1 \oplus \mathcal{H}_2 \rightarrow \mathcal{H}_1 \oplus \mathcal{H}_2$ as follows:

\[
M_{[\phi_1, \phi_2]} (f^e \oplus f^o) = \phi_1 f^e + \phi_2 f^o
\]

\[
= (\phi_1^e f^e + \phi_2^o f^o) \oplus (\phi_1^o f^e + \phi_2^e f^o).
\]

where, $\phi_1^e, \phi_1^o, \phi_2^e, \phi_2^o \in L^\infty(T)$, implying that $M_{[\phi_1, \phi_2]}$ as an operator on $\mathcal{H}_1 \oplus \mathcal{H}_2$ is well defined. Now, in matrix notation we can write,

\[
M_{[\phi_1, \phi_2]} = \begin{bmatrix}
\phi_1^e & \phi_1^o \\
\phi_2^o & \phi_2^e 
\end{bmatrix}
\]

and hence, $M_{[\phi_1, \phi_2]}^* = \begin{bmatrix}
\tilde{\phi}_1^e & \tilde{\phi}_2^o \\
\tilde{\phi}_1^o & \tilde{\phi}_2^e 
\end{bmatrix}$. 

8 CHATTOPADHYAY AND DAS
Some easy computation shows that,

\[
M^*_{\phi_1, \phi_2}M_{\phi_1, \phi_2} = \begin{bmatrix}
|\phi_1|^2 + |\phi_2|^2 & \bar{\phi}_1 \phi_2 + \bar{\phi}_2 \phi_1 \\
\bar{\phi}_1 \phi_1 + \bar{\phi}_2 \phi_2 & |\phi_1|^2 + |\phi_2|^2
\end{bmatrix},
\]

\[
M_{\phi_1, \phi_2}M^*_{\phi_1, \phi_2} = \begin{bmatrix}
|\phi_1|^2 + |\phi_2|^2 & \bar{\phi}_1 \phi_1 + \bar{\phi}_2 \phi_2 \\
\bar{\phi}_1 \phi_1 + \bar{\phi}_2 \phi_2 & |\phi_1|^2 + |\phi_2|^2
\end{bmatrix}.
\]

Using the unitary property of \(M_{\phi_1, \phi_2}\) we get the following conditions:

\[
\begin{cases}
|\phi_1|^2 + |\phi_2|^2 = 1, & |\phi_1|^2 + |\phi_2|^2 = 1 \\
|\phi_1|^2 + |\phi_2|^2 = 1, & |\phi_1|^2 + |\phi_2|^2 = 1 \\
\bar{\phi}_1 \phi_1 + \bar{\phi}_2 \phi_2 = 0, & \bar{\phi}_1 \phi_1 + \bar{\phi}_2 \phi_2 = 0
\end{cases}
(4.1)
\]

After simplification we finally obtain the following two conditions:

\[
\begin{cases}
|\phi_1|^2 + |\phi_2|^2 = 2 \\
|\phi_1|^2 + |\phi_2|^2 = 2
\end{cases}
(4.2)
\]

Again, due to the involutive property of conjugation we have \(C^2 = I\) and hence

\[
M_{\phi_1, \phi_2}C_{z^2}M_{\phi_1, \phi_2}C_{z^2} = I \implies C_{z^2}M_{\phi_1, \phi_2}C_{z^2} = M^*_{\phi_1, \phi_2}.
(4.3)
\]

By applying equation (4.3) on the basis elements 1 or \(z\) we conclude \(\phi_2 = \phi_1^e\). Thus the relation between two symbol \(\phi_1\) and \(\phi_2\) is \(\phi_1^e = \phi_2^e\). Therefore, the conditions given in (4.2) reduces to \(|\phi_1|^2 + |\phi_2|^2 = 2\). Finally, we conclude that \(C = M_{\phi_1, \phi_2}C_{z^2}\) with \(\phi_1^e = \phi_2^e\) and \(|\phi_1|^2 + |\phi_2|^2 = 2\).

For the converse, suppose \(C = M_{\phi_1, \phi_2}C_{z^2}\), then \(C\) satisfies \(CM_{z^2} = M_{z^2}C\). Note that for any \(f \in L^2(\mathbb{T})\), there exist \(f^e \in \mathcal{H}_1\) and \(f^o \in \mathcal{H}_2\) such that \(f = f^e + f^o\). Since \(C_{z^2}f = z\bar{f}\), then

\[
CM_{z^2}(f) = C(z^2 f^e + z^2 f^o) = M_{\phi_1, \phi_2}C_{z^2}(z^2 f^e + z^2 f^o) = M_{\phi_1, \phi_2}C_{z^2}(z f^e + z f^o) = \phi_1 z f^o + \phi_2 z f^e.
\]

Similarly, \(M_{z^2}C(f) = M_{z^2}M_{\phi_1, \phi_2}(z f^e + z f^o) = \phi_1 z f^o + \phi_2 z f^e\).

**Corollary 4.4.** Let \(C\) be a conjugation on \(L^2\) satisfying \(CM_{z^2} = M_{z^2}C\), then \(C = M_{\psi_1, \psi_2} \tilde{J}\) for \(\psi_1, \psi_2 \in L^\infty\) with \(\psi_1^o = \psi_2^o\) and \(|\psi_1|^2 + |\psi_2|^2 = 2\). Conversely, any conjugation \(C = M_{\psi_1, \psi_2} \tilde{J}\) for \(\psi_1, \psi_2 \in L^\infty\) satisfies \(CM_{z^2} = M_{z^2}C\).

**Proof.** By definition of \(C_{z^2}\) it follows that \(C_{z^2} = M_z \tilde{J}\). Suppose \(C\) is a conjugation on \(L^2\) satisfying \(CM_{z^2} = M_{z^2}C\). Therefore by using Theorem 4.3 we conclude \(C = M_{\phi_1, \phi_2}C_{z^2}\), where \(\phi_1^e = \phi_2^e\) and \(|\phi_1|^2 + |\phi_2|^2 = 2\). It is easy to observe that \(M_{\phi_1, \phi_2}M_z = M_{\phi_2, z\phi_1}\) and hence \(C = M_{\psi_1, \psi_2} \tilde{J}\), where \(\psi_1 = z \phi_2, \psi_2 = z \phi_1\) are belong to \(L^\infty\). Similarly, the involutive property of the conjugation \(C\) implies \(\psi_1^o = \psi_2^o\). Moreover, the unitary property of \(M_{\psi_1, \psi_2}\) gives \(|\psi_1|^2 + |\psi_2|^2 = 2\). Converse part is easy to conclude. \(\square\)
Conversely, any conjugation applying Theorem 3.2 there exist $M$ matrix notation of

Let

Proof. If Theorem 4.6.

It should be noted that, if we combine the above set of conditions it reduces to the single condition $|\psi_1|^2 + |\psi_2|^2 = 2$ obtained in Corollary 4.4. The usefulness of the conditions in (4.4) can be realized later.

It is important to note that if we assume $\psi_1 = \psi_2$ in Corollary 4.4, then $C = M_{\psi_1, \psi_1}$ intertwining the operators $M_\xi$ and $M_\xi$ and hence intertwining $M_{z_2}$ and $M_{2\xi}$ as well. On the other hand, if $\psi_1 \neq \psi_2$, then $C = M_{[\psi_1, \psi_2]}$ intertwining the operators $M_\xi$ and $M_{2\xi}$ but not intertwining $M_\xi$ and $M_{2\xi}$.

According to our previous discussion our next aim is to characterize all the conjugations commuting with $M_{z_2}$. For instance, the conjugation $C_{s_2}^\ast$ commutes with $M_{z_2}$, where the definition of $C_{s_2}^\ast$ follows from (2.4) by considering $\theta(z) = z^2$. To be more specific, the action of $C_{s_2}^\ast$ is given by

$$C_{s_2}^\ast (\sum_{k=-\infty}^{\infty} a_n z^n) = \sum_{k=-\infty}^{\infty} \bar{a}_{2n} z^{2n+1} + \sum_{k=-\infty}^{\infty} \bar{a}_{2n+1} z^{2n}$$

or equivalently,

$$C_{s_2}^\ast(f) = z f^* + \bar{z} f^\circ \theta \text{ that is,}$$

$$C_{s_2}^\ast(f(z)) = z f(z) + \bar{z} f^\circ(\bar{z})$$

Now we have the following theorem concerning $M_{z_2}$-commuting conjugations:

**Theorem 4.6.** If $C$ is a conjugation on $L^2(\mathbb{T})$ such that $CM_{z_2} = M_{z_2} C$, then there exist $\zeta_1, \zeta_2 \in L^\infty$ satisfying $|\zeta_1|^2 + |\zeta_2|^2 = 2, |\zeta_1|^2 + z \zeta_2 z^\circ |^2 + |\bar{z} \zeta_1 + z \zeta_2|^2 = 2, \zeta_2(z) = \zeta_1^\circ(z), \zeta_2(z) = z \zeta_2^\circ(z), z^2 \zeta_1^\circ(z) = \zeta_1(z)$ such that

$$C = M_{[\zeta_1, \zeta_2]} C_{s_2}^\ast.$$ 

Conversely, any conjugation $C$ of the form $M_{[\zeta_1, \zeta_2]} C_{s_2}^\ast$ for any $\zeta_1, \zeta_2 \in L^\infty$ commutes with $M_{z_2}$.

**Proof.** Let $C$ be a conjugation on $L^2(\mathbb{T})$ that satisfies $CM_{z_2} = M_{z_2} C$. Now using the fact $C_{s_2}^\ast M_{z_2} = M_{z_2} C_{s_2}^\ast$ we conclude that the unitary operator $C \circ C_{s_2}^\ast$ on $L^2$ commutes with $M_{z_2}$. Therefore by applying Theorem 4.3 there exist $\zeta_1, \zeta_2 \in L^\infty(\mathbb{T})$ such that $C \circ C_{s_2}^\ast = M_{[\zeta_1, \zeta_2]}$. Next by using the matrix notation of $M_{[\zeta_1, \zeta_2]}$ and $M_{[\zeta_1, \zeta_2]}^\ast$ and repeating the same procedure as in Theorem 4.3 we conclude

$$M_{[\zeta_1, \zeta_2]} = \begin{bmatrix} \zeta_1 & \zeta_2 \\ \bar{\zeta}_1 & \bar{\zeta}_2 \end{bmatrix} \text{ and hence, } M_{[\zeta_1, \zeta_2]}^\ast = \begin{bmatrix} \bar{\zeta}_1 & \bar{\zeta}_2 \\ \zeta_1 & \zeta_2 \end{bmatrix}.$$ 

Thus the unitary property of $M_{[\zeta_1, \zeta_2]}$ gives the following conditions:

$$|\zeta_1|^2 + |\zeta_2|^2 = 1, |\zeta_1|^2 + |\bar{\zeta}_2|^2 = 1,$$

$$|\zeta_1|^2 + |\bar{\zeta}_2|^2 = 1, |\bar{\zeta}_1|^2 + |\zeta_2|^2 = 1,$$

$$\zeta_1 \bar{\zeta}_2 + \bar{\zeta}_1 \zeta_2 = 0, \bar{\zeta}_1 \zeta_2 + \zeta_1 \bar{\zeta}_2 = 0,$$ 

(4.5)
which after performing some simple computation reduces to
\[
\begin{cases}
|\xi_1|^2 + |\xi_2|^2 = 2, \\
|\bar{z}\xi_1^o + z\xi_1^e|^2 + |\bar{z}\xi_2^o + z\xi_2^e|^2 = 2.
\end{cases}
\] (4.6)

The involutive property of the conjugation, that is, \(C^2 = I\) implies that
\[
C_{z^2}^* M_{[\xi_1, \xi_2]} C_{z^2} = M_{[\xi_1, \xi_2]}^*.
\] (4.7)

Next by applying equation (4.7) on the basis vectors 1 and \(z\) respectively we obtain \(\xi_2^o(z) = \xi_1^i(z)\), \(\xi_2^e(z) = z^2\xi_1^o(z)\) on \(\mathbb{T}\) and \(z^2\xi_1^i(z) = \xi_2^i(z), \xi_2^e(z) = \xi_2^i(z)\) on \(\mathbb{T}\).

Conversely, if \(C = M_{[\xi_1, \xi_2]} C_{z^2}^*\) then it is easy to verify that \(CM_{z^2} = M_{z^2}C\). These completes the proof. \(\square\)

It is remarkable to mention that the conjugation \(C_{z^2}^*\) commutes with \(M_{z^2}\) but does not commute with \(M_z\). Here we characterize \(M_{z^2}\)-commuting conjugations in terms of \(M_{[\xi_1, \xi_2]}\) and \(C_{z^2}^*\), where \(C_{z^2}^*\) does not commute with \(M_z\) but the composition operator \(M_{[\xi_1, \xi_2]} C_{z^2}^*\) may commutes with \(M_z\).

It is quite difficult to distinguish between the class of conjugations commute with \(M_z\), and the class of conjugations does not commute with \(M_z\) among \(M_{z^2}\)-commuting conjugations. We revisit the study of \(M_{z^2}\)-commuting conjugations in the following Corollary for a better understanding of \(M_{z^2}\)-commuting conjugations.

**Corollary 4.7.** For any \(M_{z^2}\)-commuting conjugation \(C\) on \(L^2\), there exist two \(L^\infty\)-functions \(\xi_1, \xi_2\) on \(\mathbb{T}\) such that \(C = M_{[\xi_1, \xi_2]} J^*\), where \(\xi_1\) and \(\xi_2\) satisfy \(|\xi_1|^2 + |\xi_2|^2 = 2, |\xi_2^o + \xi_2^e|^2 + |\xi_2^o + \xi_2^e|^2 = 2, \xi_2^o(z) = \xi_2^i(z), \xi_2^e(z) = \xi_2^o(z)\).

Conversely, any conjugation \(C\) satisfying \(C = M_{[\xi_1, \xi_2]} J^*\) for any \(\xi_1, \xi_2 \in L^\infty\) commutes with \(M_{z^2}\).

**Proof.** We consider a conjugation \(C : L^2(\mathbb{T}) \to L^2(\mathbb{T})\) such that \(CM_{z^2} = M_{z^2}C\). Then using the previous Theorem 4.6 we find two \(L^\infty\)-functions \(\xi_1, \xi_2\) such that \(C = M_{[\xi_1, \xi_2]} C_{z^2}^*\) and
\[
\begin{cases}
|\xi_1|^2 + |\xi_2|^2 = 2, |\bar{z}\xi_1^o + z\xi_1^e|^2 + |\bar{z}\xi_2^o + z\xi_2^e|^2 = 2, \\
\xi_2^o(z) = \xi_1^i(z), \xi_2^e(z) = z^2\xi_1^o(z), z^2\xi_1^i(z) = \xi_2^i(z).
\end{cases}
\] (4.8)

To look at the action of the conjugation \(C_{z^2}^*\) in a different way, we have for any \(f = f^e \oplus f^o\) \(\in L^2\) and \(z \in \mathbb{T}\) that
\[
(C_{z^2}^* f)(z) = z\bar{f}^e(z) + \bar{z}f^o(z) = \bar{z}f^o(z) \oplus zf^e(z) = (M_{[z, z]} J^* f)(z),
\]
and hence \(C_{z^2}^* = M_{[z, z]} J^*\) which implies
\[
C = M_{[\xi_1, \xi_2]} M_{[z, z]} J^*.
\] (4.9)

Next, one can verify that \(M_{[\xi_1, \xi_2]} M_{[z, z]} = M_{[z\xi_2, z\bar{\xi}_1]}\). Then the above identity (4.9) can be rewritten as \(C = M_{[\xi_1, \xi_2]} J^*\), where \(\xi_1 = z\xi_2\) and \(\xi_2 = z\bar{\xi}_1\). Now by identifying the relation between \(\{\xi_1, \xi_2\}\) and \(\{\bar{\xi}_1, \bar{\xi}_2\}\) we obtain
\[
\begin{cases}
\xi_1^i = z\xi_1^o, \xi_2^o = z\xi_2^e, \\
\xi_2^i = z\bar{\xi}_1^o, \xi_2^o = z\bar{\xi}_2^e.
\end{cases}
\] (4.10)

Therefore the conditions in (4.8) becomes
\[
\begin{cases}
|\xi_1|^2 + |\xi_2|^2 = 2, |\xi_2^o + \xi_2^e|^2 + |\xi_2^o + \xi_2^e|^2 = 2, \\
z\xi_1^i(z) = z^2\xi_1^o(z), z\xi_1^e(z) = z^2\xi_1^i(z), z^2\xi_2^e(z) = z\xi_2^o(z),
\end{cases}
\] (4.11)
which by simple modification reduces to

\[
\begin{cases}
|\xi_1|^2 + |\xi_2|^2 = 2, \\
|\xi_2^o + \xi_1^o|^2 + |\xi_2 + \xi_1|^2 = 2,
\end{cases}
\]

(4.12)

For the converse, it is easy to verify that for any conjugation \( C \) on \( L^2 \) having the form \( C = M_{[\xi_1, \xi_2]}J^* \) commutes with \( M_{z_2} \). This completes the proof.

**Remark 4.8.** It is important to note that the conditions \( |\xi_1|^2 + |\xi_2|^2 = 2 \) and \( |\xi_2^o + \xi_1^o|^2 + |\xi_2 + \xi_1|^2 = 2 \) in (4.12) of the above Corollary 4.7 has been reduced from the original conditions (4.5) of Theorem 4.6. Going further, one should always remember that the original explicit conditions behind the above two reduced conditions are

\[
\begin{cases}
|\xi_1|^2 + |\xi_1^o|^2 = 1, \\
|\xi_2|^2 + |\xi_2^o|^2 = 1,
\end{cases}
\]

(4.13)

\[
\epsilon_2^2\xi_1^1 + \epsilon_2^0\xi_2^1 = 0, \\
\epsilon_2^0\xi_2 + \epsilon_2^2\xi_1 = 0.
\]

Now we are in a position to distinguish between the class of conjugations commute with \( M_z \), and the class of conjugations does not commute with \( M_z \) among \( M_{z^2} \)-commuting conjugations with the help of the above Corollary 4.7.

- If the two \( L^\infty \)- functions \( \xi_1 \) and \( \xi_2 \) appearing in the representation of \( M_{z^2} \)-commuting conjugation \( C \) as described in (4.7) becomes identical, that is, if \( \xi_1 = \xi_2 \) then the conclusion can be drawn that \( C \) actually commutes with \( M_z \) and hence commutes with \( M_{z^2} \). Conversely, if any \( M_{z^2} \)-commuting conjugation \( C \) commutes with \( M_z \), then \( C = M_{[\xi_1, \xi_2]}J^* \), where \( \xi \in L^\infty \) satisfying \( |\xi|^2 + |\xi|^2 = 2, \xi^o(\bar{z}) = \xi^o(z), \xi^e(\bar{z}) = \xi^e(z) \), and \( \xi^e(\bar{z}) = \xi^e(z) \) which is equivalent to \( C = M_{[\xi]}J^* \), for \( \xi \in L^\infty \) with \( |\xi| = 1 \) and \( \xi(z) = \xi(\bar{z}) \). In particular, the characterization of \( M_{z^2} \)-commuting conjugations can be found in [4].

- As a matter of fact, if \( \xi_1 \neq \xi_2 \), then \( C = M_{[\xi_1, \xi_2]}J^* \) commutes with \( M_{z^2} \) but not with \( M_z \). Conversely if \( C \) commutes only with \( M_{z^2} \), then there exist \( \xi_1 \neq \xi_2 \) satisfying

\[
|\xi_1|^2 + |\xi_2|^2 = 2, |\xi_2^o + \xi_1^o|^2 + |\xi_2^e + \xi_1^e|^2 = 2, \xi^o(\bar{z}) = \xi^o(z), \xi^e(\bar{z}) = \xi^e(z), \text{ and } \xi^e(\bar{z}) = \xi^e(z)
\]

such that \( C = M_{[\xi_1, \xi_2]}J^* \). We call such type of conjugations as only \( M_{z^2} \)-commuting conjugations.

Therefore, the above facts completely describe the class of conjugations that commute with \( M_{z^2} \) in the \( L^2 \)-space.

5. Conjugations Keeping Invariant Various subspaces of \( L^2(\mathbb{T}) \)

Our main aim in this section is to study the behavior of two special classes of conjugations namely, \( M_{z^2}, M_{z^2} \) intertwining and \( M_{z^2} \)-commuting conjugations that keep invariant various subspaces of \( L^2 \) like the Hardy space \( H^2 \), Model spaces, shift invariant subspaces. We begin our description with Hardy space followed by two special subspaces namely the Model space and Shift invariant space.

5.1. Hardy Space Preserving Conjugations.

We have identified the class of conjugation that intertwine the operators \( M_z \) and \( M_{z^2} \) as well as the conjugations that commute with \( M_{z^2} \) in terms of known conjugations along with the commutant of \( M_{z^2} \). Recall that, the involutive property of a conjugation guarantees that if \( H^2 \) is invariant under any conjugation \( C \) on \( L^2 \), then \( C(H^2) = H^2 \). In the last section, we characterize \( M_{z^2} \)-commuting conjugations and discuss the difference between \( M_{z^2} \)-commuting and \( M_{z^2} \)-commuting conjugations...
separately. Since the study for \( M_z \)-commuting conjugations that preserves \( H^2 \) has been already done by [4] so we only analyze \( M_{z^2} \)-commuting conjugations that keep the Hardy space invariant. The following theorem implies that there is no conjugation that intertwines the operators \( M_{z^2} \) and \( M_z \) and keeps the Hardy Space \( H^2 \) invariant.

**Theorem 5.1.** In \( L^2(\mathbb{T}) \), there is no conjugation that intertwining the operators \( M_{z^2}, M_z \) and keep the Hardy space \( H^2 \) invariant.

**Proof.** Let us consider a conjugation \( C : L^2 \to L^2 \) such that \( CM_{z^2} = M_z C \), then by Corollary 4.4 we can find two functions \( \psi_1, \psi_2 \in L^\infty \) such that \( C = M_{[\psi_1, \psi_2]} \tilde{J} \), along with \( \psi_1^0 = \psi_2^0 \) and \(|\psi_1|^2 + |\psi_2|^2 = 2\). Now if we make the assumption that \( C(H^2) \subseteq H^2 \) then

(i) \( C(1) \in H^2 \implies M_{[\psi_1, \psi_2]} \tilde{J}(1) \in H^2 \implies \psi_1 \in H^2 \), hence \( \psi_1 \in H^\infty \).

(ii) \( C(z) \in H^2 \) implies

\[
M_{[\psi_1, \psi_2]} \tilde{J}(z) \in H^2 \implies z\psi_2 \in H^2, \quad \text{hence } \psi_2 \in zH^2 \subseteq H^2 \implies \psi_2 \in H^\infty.
\]

Now if, \( n = 2k + 1, k \geq 0 \) that is \( n = 1, 3, 5, 7, \ldots \), then we obtain

\[
\langle C(z^{n+1}), \bar{z} \rangle = \langle M_{[\psi_1, \psi_2]} \tilde{J}(z^{n+1}), \bar{z} \rangle = \langle \psi_1 z^{n+1}, \bar{z} \rangle = \langle \psi_1, z^n \rangle.
\]

Due to the Hardy space preserving property of \( C \) we can conclude that \( \langle C(z^{n+1}), \bar{z} \rangle = 0 \), and hence \( \langle \psi_1, z^n \rangle = 0 \). In other words, we deduce that \( \psi_1^0 = 0 \). Similarly for the same \( n = 2k + 1, k \geq 0 \) we can also have

\[
\langle C(z^{n+1}), z^2 \rangle = \langle \psi_1, z^{n-1} \rangle = 0.
\]

which implies \( \psi_1^0 = 0 \) and finally this proves that \( \psi_1 = 0 \). Repeating similar argument we can compute for \( n = 2k, k \geq 0 \)

\[
\langle C(z^{n+1}), \bar{z} \rangle = \langle M_{[\psi_1, \psi_2]} \tilde{J}(z^{n+1}), \bar{z} \rangle = \langle \psi_2 z^{n+1}, \bar{z} \rangle = \langle \psi_2, z^n \rangle = 0.
\]

So, \( \psi_2 = 0 \) and since \( \psi_2^0 = \psi_2^0 \) then we get \( \psi_2 = 0 \). Therefore, \( \psi_1 = \psi_2 = 0 \) contradict the fact that \(|\psi_1|^2 + |\psi_2|^2 = 2\). Consequently, if any conjugation \( C \) that intertwine \( M_{z^2} \) and \( M_z \) cannot make the Hardy space invariant.

Next we discuss about the class of only \( M_{z^2} \)-commuting conjugation that keeps the Hardy space invariant.

**Theorem 5.2.** Let \( C \) be a \( \{z^2\} \)-commuting conjugation in \( L^2(\mathbb{T}) \) such that \( C(H^2) \subseteq H^2 \) then \( C = M_{[\xi_1, \xi_2]} J^* \), where

(i) \( \xi_1 = \lambda_0 + \lambda_1 z \) and \( \xi_2 = \bar{\lambda}_1 \bar{z} + \mu_0 \), for some \( \lambda_0, \lambda_1, \mu_0 \in \mathbb{C} \),

(ii) \( |\lambda_0|^2 + |\lambda_1|^2 = 1, |\lambda_0|^2 + |\mu_0|^2 = 1, \lambda_1 \lambda_0 + \bar{\mu}_0 \lambda_1 = 0, \bar{\mu}_0 \lambda_1 + \lambda_1 \lambda_0 = 0. \)

**Proof.** We consider \( C \) be only \( \{z^2\} \)-commuting conjugation on \( L^2 \) over the unit circle. Then by Corollary 4.7 there exist two \( L^\infty \) functions \( \xi_1, \xi_2 \) such that \( C = M_{[\xi_1, \xi_2]} J^* \) with \(|\xi_1|^2 + |\xi_2|^2 = 2, |\xi_2^0 + \xi_1^0|^2 + |\xi_2^0 + \xi_1^0|^2 = 2, \xi_1^0(z) = \xi_2^0(z), \xi_1^0(z) = \xi_2^0(z), \xi_2^0(z) = \xi_2^0(z) \). As done in the proof of the previous Theorem 5.1 we proceed similarly and the assumption \( C(H^2) \subseteq H^2 \) implies that \( C(1) \in H^2 \) and also \( C(z) \in H^2 \) which gives \( \xi_1 \in H^\infty \) and \( z\xi_2 \in H^\infty \) respectively. Now \( \xi_1 \in H^\infty \) implies that both \( \xi_2^0, \xi_1^0 \in H^\infty \). As an immediate consequence of the fact \( \xi_1^0(z) = \xi_2^0(z) \), we conclude that \( \xi_1^0(z) = \text{a constant} \). Since \( \xi_1, z\xi_2 \in H^2 \), then \( \xi_1 = \sum_{k=0}^{\infty} a_k z^k \) and \( \xi_2 = \sum_{k=-1}^{\infty} a_k z^k \).

The condition \( \xi_2(z) = \xi_2(z) \) implies \( \xi_2 = \text{a constant} \) and \( \xi_1(z) = \xi_2(z) \) implies that \( a_1 = a_{-1}. \)
Hence, $\xi_1 = \lambda_0 + \lambda_1 z$ and $\xi_2 = \tilde{\lambda}_1 \bar{z} + \mu_0$ for some $\lambda_0, \lambda_1, \mu_0 \in \mathbb{C}$. Note that, the two conditions $|\xi_1|^2 + |\xi_2|^2 = 2, |\xi_1^0 + \xi_2^0|^2 + |\xi_1^0 + \xi_2^0|^2 = 2$ has been reduced from the explicit conditions (4.13) mentioned in Remark 4.8, as follows:

$$
\begin{align*}
|\xi_1|^2 + |\xi_2|^2 &= 1, |\xi_1^0|^2 + |\xi_2^0|^2 = 1, \\
|\xi_1^0 + \xi_2^0|^2 + |\xi_1^0 + \xi_2^0|^2 &= 2.
\end{align*}
$$

(5.1)

Here, these explicit conditions implies:

$$
|\lambda_0|^2 + |\lambda_1|^2 = 1, |\mu_0|^2 + |\lambda_1|^2 = 1, \lambda_1 \lambda_0 + \bar{\mu}_0 \lambda_1 = 0, \bar{\mu}_0 \lambda_1 + \bar{\lambda}_1 \lambda_0 = 0.
$$

So, $C = M[\xi_1, \xi_2]J^*$ where $\xi_1 = \lambda_0 + \lambda_1 z, \xi_2 = \tilde{\lambda}_1 \bar{z} + \mu_0$ with $|\lambda_0|^2 + |\lambda_1|^2 = 1, |\mu_0|^2 + |\lambda_1|^2 = 1, \lambda_1 \lambda_0 + \bar{\mu}_0 \lambda_1 = 0, \bar{\mu}_0 \lambda_1 + \bar{\lambda}_1 \lambda_0 = 0$.

We end this subsection by mentioning one fact that there are still many conjugations in $L^2$ outside these two classes which we have discussed just now and one can find such examples easily.

5.2. Model Space Preserving Conjugations. It has been already introduced that for an inner function $\theta$, the natural conjugation $c_\theta$ on the model space $K_\theta := H^2 \ominus \Theta H^2$ defined by $c(h) = \overline{\theta h}$, for any $h \in K_\theta$ gives rise to the following conjugation on $L^2$:

$$
\widetilde{C}_\theta(f) = \overline{\theta} \overline{f}, \ f \in L^2.
$$

(5.2)

One can find these kind of conjugations in [4] where various properties of them has been discussed including the model space preserving one. Since, these conjugations intertwining the operators $M_{z_2}$ and $M_{z_2}$, we investigate when they keep the model space invariant. In other words, we classify those arbitrary conjugations intertwining with $M_{z_2}$ and $M_{z_2}$ and keeping the model space invariant in terms of (5.2). In a different note, one of our main aim for this subsection is to find a relation between $M_{z_2}, M_{z_2}$ intertwining conjugations and the model space. Furthermore, we also investigate similar type of relation for $M_{z_2}$-commuting conjugations. We begin with the following useful observations.

**Proposition 5.3.** If $C$ is a conjugation on $L^2$ such that $CM_{z_2} = M_{z_2}C$, then $M_z CM_z$ is also a conjugation on $L^2$ that intertwining $M_{z_2}, M_{z_2}$ and $M_z CM_z = M[z^2 \psi_2, z^2 \psi_1]J$ with $\psi_1^0 = \psi_2^0$ and $|\psi_1|^2 + |\psi_2|^2 = 2$.

**Proof.** Since $C$ is a conjugation on $L^2$ satisfying $CM_{z_2} = M_{z_2}C$, then by Corollary 4.4, one can find two $L^\infty$ functions $\psi_1, \psi_2$ such that $C = M[\psi_1, \psi_2]J$ with $\psi_1^0 = \psi_2^0$ and $|\psi_1|^2 + |\psi_2|^2 = 2$. It is easy to see that $M_z CM_z$ is a conjugation on $L^2$ and $M_z CM_z M_2 = M_2 M_z CM_z$. So, again by the Corollary 4.4, we can find two $L^\infty$ functions $\theta_1, \theta_2$ satisfying certain properties such that $M_z CM_z = M[\theta_1, \theta_2]J$. The following computation for any $f(= f^e \oplus f^o) \in L^2$ shows that:

$$
M_z CM_z(f) = M_z M[\psi_1, \psi_2]J M_z(f^e \oplus f^o) = M_z M[\psi_1, \psi_2]J(z f^e + \bar{z} f^o) = M_z M[\psi_1, \psi_2](z f^o \oplus z f^e) = M_z(\psi_1 z f^o + \psi_2 z f^e) = z^2 \psi_1 f^o + z^2 \psi_2 f^e = z^2 \psi_2 f^e + z^2 \psi_1 f^o = M[z^2 \psi_2, z^2 \psi_1]J(f).
$$

Therefore, $M_z CM_z = M[z^2 \psi_2, z^2 \psi_1]J$ with $\psi_1^0 = \psi_2^0$ and $|\psi_1|^2 + |\psi_2|^2 = 2$. \(\square\)

**Proposition 5.4.** If a conjugation $C$ on $L^2$ intertwining $M_2$ and $M_{z_2}$, then $CJ = M[\psi_1, \psi_2]$ for some $\psi_1, \psi_2 \in L^\infty$ with $\psi_1^0 = \psi_2^0$ and $|\psi_1|^2 + |\psi_2|^2 = 2$. Furthermore one can show $M_z CM_z = M[\psi_2, \psi_1]J$.  

Proof. As \( CM_{x^2} = M_{x^2}C \), then \( C = M_{(\psi_1, \psi_2)} \tilde{J} \) for some \( \psi_1, \psi_2 \in L^\infty \) with \( \psi_1^0 = \psi_2^0 \) and \( |\psi_1|^2 + |\psi_2|^2 = 2 \). Since \( \tilde{J} \) is also a conjugation then \( C\tilde{J} = M_{(\psi_1, \psi_2)} \) and the first part follows easily. For the second part we proceed similarly as previous Proposition 5.3 and obtain,

\[
M_{x} C \tilde{J} M_{z}(f) = M_{x} M_{(\psi_1, \psi_2)} M_{z}(f^e + f^o) = M_{x}(\psi_1 \tilde{z} f^o + \psi_2 \tilde{z} f^e) = \psi_2 f^e + \psi_1 f^o = M_{(\psi_2, \psi_1)}(f).
\]

Consequently, \( M_{z} C \tilde{J} M_{z} = M_{(\psi_2, \psi_1)} \) with \( \psi_1^0 = \psi_2^0 \) and \( |\psi_1|^2 + |\psi_2|^2 = 2 \). \qed

Now, we are in a position to propose our main theorems in this subsection and the proof is based on similar kind of ideas used in Theorem 4.2 of [1] with appropriate addition in our setting.

**Theorem 5.5.** Let \( \alpha, \theta \) be two non-constant inner functions and consider a \( M_{z^2}, M_{x^2} \)-intertwining conjugation \( C \) on \( L^2 \). If such \( C \) satisfies the following conditions:

(i) \( C(K_\alpha) \subset K_\theta \) and also, \( M_{z} CM_{z}(K_\alpha) \subset K_\theta \),

(ii) \( \text{Re}(M_{z} C \tilde{J} M_{z})^*(C \tilde{J}) = I \),

then there exist an inner function \( \gamma \) such that \( C + M_{z} CM_{z} = \sqrt{2}C\gamma \), where \( \gamma \) is divisible by \( \alpha \) and \( \gamma \) divides \( \theta \) in other words \( \alpha \leq \gamma \leq \theta \).

Proof. Since \( CM_{x^2} = M_{x^2}C \), then \( C = M_{(\psi_1, \psi_2)} \tilde{J} \), for some \( \psi_1, \psi_2 \in L^\infty \) with \( \psi_1^0 = \psi_2^0 \) and \( |\psi_1|^2 + |\psi_2|^2 = 2 \). Considering the reproducing kernel function at 0, \( k_0 = 1 - \overline{\alpha}(0)\alpha \) and its conjugate \( \tilde{k}_0 = C_\alpha k_0 = \tilde{z}(\alpha - \alpha(0)) \) in \( K_\alpha \) we can compute that

\[
C(k_0) = M_{(\psi_1, \psi_2)} \tilde{J}(\tilde{z}(\alpha - \alpha(0))) = M_{(\psi_1, \psi_2)} z(\overline{\alpha - \alpha(0)}) = M_{(\psi_1, \psi_2)} (zf^e + zf^o), \text{ where } f = (\alpha - \alpha(0))
\]

\[
= \psi_1 zf^o + \psi_2 zf^e
\]

Similarly,

\[
M_{z} CM_{z}(k_0) = M_{z} M_{(\psi_1, \psi_2)} \tilde{J}(\alpha - \alpha(0)) = M_{z} M_{(\psi_1, \psi_2)} (\alpha - \alpha(0)) = \psi_1 zf^e + \psi_2 zf^o
\]

Since both \( C(k_0), M_{z} CM_{z}(k_0) \in K_\theta \) then \( C(k_0) + M_{z} CM_{z}(k_0) \in K_\theta \) i.e., \( (\psi_1 + \psi_2)zf \in K_\theta \), which implies that there exist \( g \in K_\theta \) such that \( g = (\psi_1 + \psi_2)z(\alpha - \alpha(0)) \) for \( g = (\psi_1 + \psi_2)z\alpha(1 - \overline{\alpha}(0)\alpha) \). As \( (1 - \overline{\alpha}(0)\alpha)^{-1} \) is a bounded analytic function we can conclude that

\[
z\alpha(\psi_1 + \psi_2) = g(1 - \overline{\alpha}(0)\alpha)^{-1} \in H^2.
\]

So, \( z(\psi_1 + \psi_2) \) is an \( H^\infty \) function. Our claim is that \( z(\psi_1 + \psi_2) = \gamma(say) \) is an inner function in other words \( |\gamma| = 1 \) a.e. on the unit circle \( \mathbb{T} \).

From [2,3] it follows that, \( C\tilde{J} = M_{(\psi_1, \psi_2)} \) and \( M_z C\tilde{J} M_z = M_{(\psi_2, \psi_1)} \), which shows that

\[
(M_z C\tilde{J} M_z)^*(C\tilde{J}) = M_{(\psi_2, \psi_1)}^* M_{(\psi_1, \psi_2)}.
\]

Considering both of the operator \( M_{(\psi_1, \psi_2)}, M_{(\psi_2, \psi_1)} \) acting on \( L^2(\mathbb{T}) \equiv \mathcal{H}_1 \oplus \mathcal{H}_2 \), where

\[
\mathcal{H}_1 = \bigoplus_{k=-\infty}^{\infty} \{z^{2k}\} \text{ and } \mathcal{H}_2 = \bigoplus_{k=-\infty}^{\infty} \{z^{2k+1}\},
\]
notationally we can write this operator as a $2 \times 2$ matrix as follows:

$$M^*_{[\psi_2, \psi_1]}M_{[\psi_1, \psi_2]} = \begin{bmatrix}
\bar{\psi}_2^o \psi_1^o + \bar{\psi}_2^e \psi_1^e & \bar{\psi}_2^e \psi_2^o + \bar{\psi}_2^o \psi_2^e \\
\bar{\psi}_1^o \psi_1^o + \bar{\psi}_1^e \psi_1^e & \bar{\psi}_1^e \psi_2^o + \bar{\psi}_1^o \psi_2^e
\end{bmatrix}. $$

So, the condition $\text{Re}[(M_z C \bar{J} M_z)^*(C \bar{J})] = I$ in hypothesis basically gives $\text{Re}[M^*_{[\psi_2, \psi_1]}M_{[\psi_1, \psi_2]}] = I$ which is nothing but the following two conditions:

$$\text{Re}[\bar{\psi}_2^e \psi_1^o + \bar{\psi}_2^o \psi_1^o] = 1 \quad (5.3)$$

$$\bar{\psi}_2^e \psi_2^o + \bar{\psi}_2^o \psi_2^e = \psi_1^o \psi_1^o + \psi_1^e \psi_1^e = 0 \quad (5.4)$$

Recall that in characterizing the class of conjugations $C$ that intertwines $M_{z_2}$ and $M_{z_2}$ we initially obtain the conditions mentioned in Remark 4.3. Therefore, the condition $(5.3)$ along with $\bar{\psi}_2^e \psi_1^o + \bar{\psi}_2^o \psi_1^o = 0$ we can derive,

$$2\text{Re}[\psi_2 \bar{\psi}_1] = \psi_2 \bar{\psi}_1 + \psi_1 \bar{\psi}_2$$

$$= (\psi_2^o \psi_1^o + \psi_2^e \psi_1^e) + (\psi_2^e \psi_1^o + \psi_2^o \psi_1^e)$$

$$= \psi_2^o \psi_1^o + \psi_2^o \psi_1^e + \psi_2^e \psi_1^o + \psi_2^e \psi_1^e + \psi_1^o \psi_2^e + \psi_1^o \psi_2^e + \psi_1^e \psi_2^o + \psi_1^e \psi_2^o$$

$$= 2\text{Re}[\psi_2 \bar{\psi}_1] + 2\text{Re}[\psi_2^e \psi_1^e] = 2.$$ 

Therefore, $|\psi_1 + \psi_2|^2 = |\psi_1|^2 + \psi_1 \psi_2 + \psi_2 \psi_1 + |\psi_2|^2 = |\psi_1|^2 + |\psi_2|^2 + 2\text{Re}[\psi_2 \bar{\psi}_1] = 2 + 2 = 4$, implying $|\gamma| = 2(\psi_1 + \psi_2) = 1$ a.e., on $T$ that means that $\gamma$ is an inner function. Hence, $\tilde{\alpha} \gamma \in H^2$ which shows that $\tilde{\gamma}$ is divisible by $\alpha$. Similarly, one can find that

$$C_\theta(C + M_z CM_z)(k_0^o) = C_\theta[M_{[\psi_1, \psi_2]}(1 - \alpha(0)\bar{\alpha})] = \theta z(\psi_1 + \psi_2)(1 - \alpha(0)\bar{\alpha})$$

Therefore, $\theta \bar{\gamma} \in K_\theta$, implies that $\theta$ is divisible by $\gamma$. Observing the above calculations we can say that the action of the operator $C + M_z CM_z$ is same as $2C_\gamma$ on the $L^2$ space, in other words $(C + M_z CM_z)(f) = 2\gamma \bar{\alpha} f$. These completes the proof. 

We now pay our attention to the relation between only $M_{z_2} - \text{commuting}$ conjugations and model spaces. But, first we recall some needful facts:

(i) $J^*(K_\alpha) = K_{\alpha^*}$,

(ii) $J^*C_\alpha = C_{\alpha^*}J^*$,

(iii) $J^*(\alpha H^2) = \alpha^# H^2$.

For the proof of the above results we refer to [7] and for the relation between $M_z - \text{commuting}$ conjugations and model spaces one can see [4]. Now we move to the discussion regarding only $M_{z_2} - \text{commuting}$ conjugations and model space. Note that, for an antilinear operator $T$, $T^*$ denote the antilinear adjoint of $T$.

**Theorem 5.6.** Let $\alpha, \theta$ be two non-constant inner functions and consider a only $M_{z_2} - \text{commuting}$ conjugation $C$ on $L^2$. If such $C$ satisfies the following conditions:

(i) $J^*C$ is $C_\alpha$ symmetric,

(ii) $C(K_\alpha) \subset K_\theta$ and $M_z CM_z(K_\alpha) \subset K_\theta$,

(iii) $\text{Re}[(M_z C_{\alpha^*} J M_z)(C C_{\alpha^*} J)] = I$, 

then there exist an inner function $\psi$ satisfying $\alpha \leq \psi \leq \theta^H$ such that $C + M_2CM_2 = J^*M_2$.

Proof. It is given that $C$ is a only $M_2$ – commuting conjugation so by Corollary 5.7 we can find two $L^\infty$-functions $\xi_1, \xi_2$ on $T$ such that $C = M_{[\xi_1,\xi_2]}$ where $\xi_1, \xi_2$ satisfies $|\xi_1|^2 + |\xi_2|^2 = 2$. Now it is easy to see that $J^*C$ is basically the unitary operator $M_{[\xi_1,\xi_2]}^*$, which by given hypothesis is $C_\alpha$ symmetric. We consider the antilinear operator $J^*CC_\alpha$ on $L^2$ and we can compute that

(i) $(J^*CC_\alpha)^2 = J^*CC_\alpha J^*CC_\alpha = M_{[\xi_1,\xi_2]}^* C_\alpha M_{[\xi_1,\xi_2]} C_\alpha = M_{[\xi_1,\xi_2]}^* M_{[\xi_1,\xi_2]} = I$

(ii) $\langle J^*CC_\alpha(f), J^*CC_\alpha(g) \rangle = \langle g, f \rangle$, for any $f, g \in L^2$.

So, $J^*CC_\alpha$ is a conjugation and also it satisfy the equality $J^*CC_\alpha M_2 = M_2 J^*CC_\alpha$, but note that $J^*CC_\alpha M_2 \neq M_2 J^*CC_\alpha$. Again, using the hypothesis we can check that

$J^*CC_\alpha(K_\alpha) = J^*C(K_\alpha) \subset J^*(K_\theta) = K_\theta$

and $M_2 J^*CC_\alpha M_2(K_\alpha) = J^*M_2CM_2C_\alpha(K_\alpha) = J^*M_2CM_2(K_\alpha) \subset J^*(K_\theta) = K_\theta$.

Also, $\Re \langle M_2 J^*CC_\alpha \bar{M}_2, (J^*CC_\alpha \bar{J}) \rangle = \Re \langle M_2 \bar{J}C_\alpha C J^*M_2 \bar{J} \rangle$

$= \Re \langle M_2 \bar{J}C_\alpha C J^*M_2C_\alpha \bar{J} \rangle = \Re \langle M_2 \bar{J}C_\alpha CM_2C_\alpha \bar{J} \rangle$

$= \Re \langle (M_2CM_2 \bar{J})^2(C_\alpha \bar{J}) \rangle = I$

So, by previous Theorem 5.5 there exist an inner function $\psi$ satisfying $\alpha \leq \psi \leq \theta^H$ such that

$J^*CC_\alpha + M_2 J^*CC_\alpha M_2 = 2C_\psi \implies J^*CC_\alpha + J^*M_2CM_2C_\alpha = 2C_\psi$

$\implies C + M_2CM_2 = J^*2C_\psi C_\alpha \implies C + M_2CM_2 = J^*M_2$.

This completes the proof. 

5.3. $S$-Invariant Subspaces Preserving Conjugations. This subsection is mainly devoted to the investigation regarding some important class of subspaces which are unilateral shift invariant. Due to the well-known classical Beurling’s theorem we know that the unilateral shift invariant subspaces in Hardy space are of the form $\theta H^2$, where $\theta$ is an inner function. We study those $M_2$ – commuting conjugations that preserve Beurling type subspaces followed by the similar type of investigation regarding $M_2$, $M_2$-intertwining conjugations.

Theorem 5.7. There exist no $M_2$ and $M_2$ intertwining conjugation in $L^2$ that maps any Beurling type subspace $\alpha H^2$ into another $\theta H^2$ for any two inner functions $\alpha$ and $\theta$.

Proof. We consider a $M_2$, $M_2$ – intertwining conjugation $C$ on $L^2$, such that $C(\alpha H^2) \subset \theta H^2$. Since $C$ satisfies $CM_2 = M_2C$ then we can find two functions $\psi_1, \psi_2 \in L^\infty$ such that $C = M_{[\psi_1,\psi_2]}$ such that $\psi_1^* = \psi_2^\theta$ and $|\psi_1|^2 + |\psi_2|^2 = 2$. Now $C(\alpha H^2) \subset \theta H^2$ gives, in particular that $C(\alpha) \in \theta H^2$ but one can find that

$C(\alpha) = M_{[\psi_1,\psi_2]} \bar{J}(\alpha) = M_{[\psi_1,\psi_2]} \bar{J}(\alpha^e \oplus \alpha^o) = \psi_1 \bar{\alpha}^e + \psi_2 \bar{\alpha}^o$. 

So, there exist an element \( f \in H^2 \), such that \( C(\alpha) = \theta f \) that means \( \psi_1 \alpha^e + \psi_2 \alpha^o = \theta f \). For any even non negative integer \( n = 2k, k \geq 0 \) we can compute,

\[
C(\alpha z^n) = M_{[\psi_1, \psi_2]} J(\alpha z^n) = M_{[\psi_1, \psi_2]} J(\alpha^e z^n \ominus \alpha^o z^n) = \bar{z}^n (\psi_1 \alpha^e + \psi_2 \alpha^o).
\]

Again, \( C(\alpha z^n) \in \theta H^2 \) so there exist some \( h \in H^2 \) such that \( \bar{z}^n (\psi_1 \alpha^e + \psi_2 \alpha^o) = \theta h \) which implies that \( \bar{z}^n \theta f = \theta h \) and hence \( \bar{z}^n f = h \in H^2 \), for every non negative even integer \( n \). So, for any non-negative even integer \( n \),

\[
\langle \bar{z}^n f, \bar{z} \rangle = 0 \implies \langle f, z^{n-1} \rangle = 0 \implies f^o = 0.
\]

Similarly, \( \langle \bar{z}^n f, \bar{z}^2 \rangle = 0 \) gives that \( f^e = 0 \) and finally we get that \( f = 0 \) that mean \( C(\alpha) = 0 \). So we arrive at a contradiction which proves the result. \( \Box \)

Now we move to the characterization of \( M_{z^2} - \text{commuting} \) conjugations that map a shift invariant subspace \( \alpha H^2 \) into another one, say \( \theta H^2 \).

**Theorem 5.8.** Let \( \alpha \) and \( \beta \) be two inner functions, and let \( C \) be any \( M_{z^2} \)-commuting conjugation on \( L^2 \) satisfying \( \text{Re}[[M_{z^2} C \cdot J^*] M_{z^2}^o (C \cdot J^*)] = I \). If \( C(\alpha H^2) \subset \beta H^2 \), then \( \beta^\# \leq \alpha \alpha^\# \) and \( C + M_{z^2} \alpha H^2 \subset 2C \beta J^* C_{\alpha} \), where \( \theta \) is an inner function with \( \beta \leq \theta, \theta \theta^\# = \alpha \alpha^\# \).

**Proof.** We first consider that, \( C \) be a \( M_{z^2} \)-commuting conjugation on \( L^2 \) space that satisfies \( C(\alpha H^2) \subset \beta H^2 \). Since \( C M_{z^2} \subset M_{z^2} C \), then we can find two functions \( \xi_1, \xi_2 \in L^\infty(\mathbb{T}) \) such that \( C = M_{[\xi_1, \xi_2]} J^* \) where \( \xi_1, \xi_2 \) satisfies \( |\xi_1|^2 + |\xi_2|^2 = 2, |\xi_1 + \xi_2^o|^2 + |\xi_2 + \xi_1^o|^2 = 2, \xi_1^o(\bar{z}) = \xi_2^o(z), \xi_1^o(\bar{z}) = \xi_2^o(z) \). Now, using the condition \( C(\alpha H^2) \subset \beta H^2 \) we can say that

\[
C(\alpha) = M_{[\xi_1, \xi_2]} J^* (\alpha) = \xi_1 \alpha^e + \xi_2 \alpha^o \in \beta H^2
\]

Again, the same condition \( C(\alpha H^2) \subset \beta H^2 \) together with Beurling’s theorem one can easily find that \( M_{z^2} C(\alpha H^2) \subset M_{z^2} C(\alpha H^2) \subset \beta H^2 \). So, in a similar manner we can conclude that

\[
M_{z^2} C(\alpha H^2) = \xi_1 \alpha^o + \xi_2 \alpha^o \in \beta H^2
\]

Therefore, \( \xi_1 \alpha^o + \xi_2 \alpha^o + \xi_2 \alpha^e + \xi_2 \alpha^e \in \beta H^2 \) implying that there exist \( h \in H^2 \) such that

\[
(\xi_1 + \xi_2) = \beta h
\]  

(5.5)

Note that, \( CJ^* = M_{[\xi_1, \xi_2]} \) and \( M_{z^2} CJ^* M_{z^2} = M_{[\xi_2, \xi_1]} \). So, \( \text{Re}[[M_{z^2} C \cdot J^*] M_{z^2}^o (C \cdot J^*)] = I \) is basically \( \text{Re}[[M_{[\xi_2, \xi_1]} M_{[\xi_1, \xi_2]}] = I \) which gives

\[
\text{Re}[\xi_2 \xi_1^e + \xi_2 \xi_1^o] = 1
\]

(5.6)

\[
\xi_2 \xi_2^o + \xi_2 \xi_2^o + \xi_1 \xi_1^o + \xi_1 \xi_1^o = 0.
\]

(5.7)

Recall the condition \( \xi_2 \xi_1 + \xi_2 \xi_1^o = 0, \xi_2 \xi_2^o + \xi_2 \xi_2^o = 0 \) mentioned in (4.13) and the condition \( \text{Re}[\xi_2 \xi_1 + \xi_2 \xi_1^o] = 1 \). Combining these two conditions we can conclude that,

\[
2 \text{Re}[\xi_2 \xi_1] = \xi_2 \xi_1 + \xi_1 \xi_2 = (\xi_2 \xi_2^o + \xi_2 \xi_2^o) + (\xi_2 \xi_2^o + \xi_2 \xi_2^o) = 2 \text{Re}[\xi_2 \xi_1 + \xi_2 \xi_1^o] = 2.
\]

Hence \( |\xi_1 + \xi_2|^2 = |\xi_1|^2 + |\xi_2|^2 + 2 \text{Re}[\xi_2 \xi_1] = 4 \). Let \( \psi = \frac{\xi_1 + \xi_2}{2} \), then \( |\psi| = 1 \). So, from (5.5) we can write, \( \psi \alpha^o = \beta f \) for some \( f \in H^2 \), infact \( f \) is an inner function. Also \( \psi \) is a symmetric function as \( \psi(\bar{z}) = \frac{1}{2} [\xi_1(\bar{z}) + \xi_2(\bar{z})] = \frac{1}{2} [\xi_1^o(\bar{z}) + \xi_1^o(\bar{z}) + (\xi_2^o(\bar{z}) + \xi_2^o(\bar{z})) = \frac{1}{2} [(\xi_1^o(\bar{z}) + \xi_2^o(\bar{z})) + (\xi_2^o(\bar{z}) + \xi_2^o(\bar{z})] = \)

\[
\frac{1}{2} [(\xi_1^o(\bar{z}) + \xi_2^o(\bar{z})) + (\xi_2^o(\bar{z}) + \xi_2^o(\bar{z})] = \frac{1}{2} [(\xi_1^o(\bar{z}) + \xi_2^o(\bar{z})) + (\xi_2^o(\bar{z}) + \xi_2^o(\bar{z})].
\]
\( \frac{1}{2}[(\xi_1 + \xi_2)(z)] = \psi(z) \). Let \( \theta = \beta f \) then \( \psi = \theta \overline{\alpha} \) and hence \( \theta \overline{\alpha} \) is symmetric. In other words, \( \theta \) is an inner function such that \( \beta \leq \theta \) and \( \theta \overline{\alpha} = \alpha \overline{\alpha} \) which implies \( \beta \overline{\alpha} \leq \alpha \overline{\alpha} \). Also one can check that the conjugation \( C \) satisfies the following identity,

\[
C + M_z C M_z = 2C \beta J^* \alpha.
\]

This completes the proof. \( \square \)

Note that the converse of Theorem 5.8 may not be true. In other words, for the converse part, if we assume \( \beta \overline{\alpha} \leq \alpha \overline{\alpha} \), then by proceeding similarly as done in the proof of Theorem 5.2 in [4] one can show that \( C + M_z C M_z = 2C \beta J^* \alpha \) maps \( \alpha H^2 \) onto \( \beta H^2 \subset \beta H^2 \). On the other hand \( C + M_z C M_z(\alpha H^2) \subset \beta H^2 \) not necessarily implies \( C(\alpha H^2) \subset \beta H^2 \).

6. Conjugations related to \( M_B \)

For any finite Blaschke product \( B \), the multiplication operator \( M_B \) is a generalization of the bilateral shift operator \( M_z \) in the space \( L^2(\mathbb{T}) \). So, it is natural to discuss similar set of properties in the context of \( M_B \). We consider a finite Blaschke product \( B \in H(\mathbb{D}) \), where \( \mathbb{D} \) is the open unit disk in \( \mathbb{C} \).

Due to this decomposition of \( L^2(\mathbb{T}) \), any \( f \in L^2(\mathbb{T}) \) can be represented as \( f = f_1 + f_2 + \cdots + f_n \), where each \( f_i \in \mathcal{H}_i \) for all \( i \in \{1, 2, \ldots, n\} \). A simplest example of Blaschke is \( B(z) = z \) which basically returns the classical representation of any element \( f \in L^2(\mathbb{T}) \) that is \( f(z) = \sum_{k=0}^{\infty} \hat{f}(k)z^k \) on \( \mathbb{T} \).

For \( B(z) = z^2 \), we observed that any \( f \in L^2(\mathbb{T}) = \bigvee_{k=0}^{\infty} \{z^k\} \oplus \bigvee_{k=0}^{\infty} \{z^{2k+1}\} \) can be written as \( f = f^e \oplus f^o \), where \( f^e \in \bigvee_{k=0}^{\infty} \{z^k\} \) and \( f^o \in \bigvee_{k=0}^{\infty} \{z^{2k+1}\} \). We have already introduced this kind of factorization and deal with these facts various times in previous sections. Now if \( B(z) = z^n \) then any \( f \in L^2(\mathbb{T}) \), \( f \) can be written as \( f = f_1 + f_2 + \cdots + f_n \) for each \( f_i \in \mathcal{H}_i \) where,

\[
\mathcal{H}_1 = \bigvee_{k=-\infty}^{\infty} \{z^{nk}\}, \mathcal{H}_2 = \bigvee_{k=-\infty}^{\infty} \{z^{nk+1}\}, \ldots, \mathcal{H}_n = \bigvee_{k=-\infty}^{\infty} \{z^{nk+n-1}\}.
\]

It should be observed that, here we have consider the standard orthonormal basis \( \{1, z, z^2, \ldots, z^n\} \) for \( K_B \). If \( f \in L^2 \) such that \( f(z) = \sum_{k=-\infty}^{\infty} a_k z^k \) then one can also write it as

\[
f(z) = \sum_{k=-\infty}^{\infty} a_n z^{nk} + \sum_{k=-\infty}^{\infty} a_{n+1} z^{nk+1} + \cdots + \sum_{k=-\infty}^{\infty} a_{n+k} z^{nk+n-1}
\]  \quad (6.1)
in other words actually here $f_i(z) = \sum_{k=-\infty}^{\infty} a_{n,k+i-1} z^{n+k+i-1}$, for each $i \in \{1, 2, \ldots, n\}$. Now we back to the study regarding conjugations related to finite Blaschke and its invariant property towards the various subspaces of $L^2$. Recall the conjugations $\bar{C}_B$ and $C_B^*$ for $\theta = B$, a finite Blaschke from Section 2. If $f \in L^2$ such that $f = \sum_{k=-\infty}^{\infty} h_k B^k$ then

$$\bar{C}_B(f) = \sum_{k=-\infty}^{\infty} \bar{z} h_k B^{-k+1}, C_B^*(f) = \sum_{k=-\infty}^{\infty} \bar{z} h_k B^{k+1}. $$

First observe the following two facts:

(i) $\bar{C}_B M_B = M_B \bar{C}_B$,

(ii) $C_B^* M_B = M_B C_B^*$.

These inspire us to find some characterization of conjugations with respect to the above two properties.

**Theorem 6.1.** Let $C : L^2(\mathbb{T}) \to L^2(\mathbb{T})$ be a conjugation.

(i) If $CM_B = M_B C$, then we can find $\phi_1, \phi_2, \ldots, \phi_n \in L^\infty$ such that $C = M_{[\phi_1, \phi_2, \ldots, \phi_n]} \bar{C}_B$, where $M_{[\phi_1, \phi_2, \ldots, \phi_n]}$ is unitary and $\bar{C}_B$ symmetric.

(ii) If $CM_B = M_B C$, then there exist $\psi_1, \psi_2, \ldots, \psi_n \in L^\infty$ for which $C = M_{[\psi_1, \psi_2, \ldots, \psi_n]} C_B^*$, with $M_{[\psi_1, \psi_2, \ldots, \psi_n]}$ is unitary and $C_B^*$ symmetric.

**Proof.** (i) Let $C : L^2(\mathbb{T}) \to L^2(\mathbb{T})$ be a conjugation such that $CM_B = M_B C$ then $C \bar{C}_B$ is an unitary operator on $L^2$ satisfying $C \bar{C}_B M_B = M_B C \bar{C}_B$. So, from Theorem 3.2 we can say that there exist $n$-functions $\phi_1, \phi_2, \ldots, \phi_n$ in $L^\infty$ such that $C \bar{C}_B = M_{[\phi_1, \phi_2, \ldots, \phi_n]}$ and hence $C = M_{[\phi_1, \phi_2, \ldots, \phi_n]} \bar{C}_B$. Since, $C \bar{C}_B$ is an unitary operator then $M_{[\phi_1, \phi_2, \ldots, \phi_n]}$ is also an unitary operator. Again, $C$ being a conjugation we have $C^2 = I$, which gives

$$M_{[\phi_1, \phi_2, \ldots, \phi_n]} \bar{C}_B M_{[\phi_1, \phi_2, \ldots, \phi_n]} \bar{C}_B = I.$$  

From above relation it easily follows that

$$\bar{C}_B M_{[\phi_1, \phi_2, \ldots, \phi_n]} \bar{C}_B = M_{[\phi_1, \phi_2, \ldots, \phi_n]}^*,$$

in other words $M_{[\phi_1, \phi_2, \ldots, \phi_n]}$ is $\bar{C}_B$-symmetric.

(ii) In this case we assume that $C$ is a conjugation on $L^2$ such that it commutes with $M_B$. Then one can easily verify that the unitary operator $C \bar{C}_B$ also commutes with $M_B$. So once again from Theorem 3.2 we can find $n$-functions $\psi_1, \psi_2, \ldots, \psi_n \in L^\infty$ such that

$$C \bar{C}_B^* = M_{[\psi_1, \psi_2, \ldots, \psi_n]}$$

which implies $C = M_{[\psi_1, \psi_2, \ldots, \psi_n]} C_B^*$. Again using the unitary property of $C \bar{C}_B^*$ we can conclude that $M_{[\psi_1, \psi_2, \ldots, \psi_n]} C_B^*$ is also an unitary operator. Being a conjugation the involutive property of $C$ that is $C^2 = I$ gives

$$C_B^* M_{[\psi_1, \psi_2, \ldots, \psi_n]} C_B^* = M_{[\psi_1, \psi_2, \ldots, \psi_n]} $$

which implies $M_{[\psi_1, \psi_2, \ldots, \psi_n]}$ is $C_B^*$ symmetric.

□

Now we move our discussion to the invariant property of such conjugations towards Hardy space considering as a subspace of $L^2$-space but for the special finite Blaschke, namely $B(z) = z^n$. It is easy to identify that if $B(z) = z^n$, then $dim(K_B) = n$ and $\{1, z, z^2, \ldots, z^{n-1}\}$ forms an orthonormal
basis for $K_B$ and in this context we will basically deal with this standard orthonormal basis of $K_B$.

First observe that the actions $\bar{C}_B$ and $C_B^*$ is same on $K_B$, basically both of them become identical with the natural conjugation on $K_B$ when they are restricted to $K_B$, that is $\bar{C}_B = C_B^* = C_B$ on $K_B$ where $C_B(h) = \bar{z}hB$, for any $h \in K_B$. First we observe the action of $C_{2^n}$ on the set of this standard orthonormal basis which is given by $C_{2^n}(z^k) = z^{(n-1) - k}$, for $1 \leq k \leq n - 1$. Now two cases may arise either $n$ is odd or $n$ is even.

(1) If $n$ is an odd natural number, then the action of $C_{2^n}$ is given as follows:

\[
\begin{array}{cccccccc}
1 & z & z^2 & \cdots & z^{\frac{n-1}{2}} & z^{\frac{n+1}{2}} & \cdots & z^{2n-3} & z^{2n-2} & z^{2n-1} \\
\bar{z} & \bar{z} & \bar{z} & \bar{z} & \cdots & \bar{z} & \cdots & \bar{z} & \bar{z} & \bar{z} & 1
\end{array}
\]  

(6.2)

The first row contains the basis elements and in the second row consists of their images in the corresponding columns.

(2) Similarly, if $n$ is even then as in the above case (1) the action of $C_{2^n}$ is as follows:

\[
\begin{array}{cccccccc}
1 & z & z^2 & \cdots & z^{\frac{n+1}{2}} & z^{\frac{n-1}{2}} & \cdots & z^{2n-3} & z^{2n-2} & z^{2n-1} \\
\bar{z} & \bar{z} & \bar{z} & \bar{z} & \cdots & \bar{z} & \cdots & \bar{z} & \bar{z} & \bar{z} & 1
\end{array}
\]  

(6.3)

Also note that $\bar{C}_{2^n} = M_{\bar{z}^{-1}} \bar{J}$ and

\[
C_{2^n}^* = \begin{cases} 
M_{[\bar{z}_{2n-1},\bar{z}_{2n-3},\ldots,\bar{z}_{2},\bar{z}_2,\bar{z}_3,\ldots,\bar{z}_{2n-1},\bar{z}_{n}]}J^*, & \text{if } n \text{ is odd} \\
M_{[\bar{z}_{2n-1},\bar{z}_{2n-3},\ldots,\bar{z}_{2},\bar{z}_2,\bar{z}_3,\ldots,\bar{z}_{2n-1},\bar{z}_{n}]}J^*, & \text{if } n \text{ is even}.
\end{cases}
\]  

(6.4)

The above two relations follow from the decomposition of any function $f \in L^2$ mentioned in (6.1) and the action of $\bar{C}_{2^n}$ and $C_{2^n}^*$ respectively. Now we are in a position to state and prove our main theorem in this section.

**Theorem 6.2.** If $C$ is a conjugation on $L^2$ space satisfying $CM_{2^n} = M_{2^n}C$ such that $C(H^2) \subset H^2$, then $C = M_{[\xi_1,\xi_2,\ldots,\xi_n]}J^*$, where $\xi_1, z\xi_2, z^2\xi_3, \ldots, z^{n-1}\xi_n \in H^\infty$ and $M_{[\xi_1,\xi_2,\ldots,\xi_n]}$ is a $J^*$ symmetric unitary operator.

**Proof.** We consider $C$ to be a $M_{2^n}$ commuting conjugation on $L^2$ that preserves the Hardy space $H^2$. So, using Theorem 6.1 we can find $n$-functions $\psi_1, \psi_2, \ldots, \psi_n \in L^\infty$ such that $C = M_{[\psi_1,\psi_2,\ldots,\psi_n]}C_{2^n}$.

Now from (6.4) one can write

\[
C = \begin{cases} 
M_{[\psi_1,\psi_2,\ldots,\psi_n]}M_{[\bar{z}_{2n-1},\bar{z}_{2n-3},\ldots,\bar{z}_{2},\bar{z}_2,\bar{z}_3,\ldots,\bar{z}_{2n-1},\bar{z}_{n}]}J^*, & \text{if } n \text{ is odd} \\
M_{[\psi_1,\psi_2,\ldots,\psi_n]}M_{[\bar{z}_{2n-1},\bar{z}_{2n-3},\ldots,\bar{z}_{2},\bar{z}_2,\bar{z}_3,\ldots,\bar{z}_{2n-1},\bar{z}_{n}]}J^*, & \text{if } n \text{ is even}.
\end{cases}
\]

So, we divide our analysis into two cases as follows:

(i) **Let $n$ be an odd natural number.**

In this case we can rewrite $C$ as,

\[
C = M_{[\xi_1,\xi_2,\ldots,\xi_n]}J^*
\]

where $\xi_1 = z^{n-1}\psi_n, \xi_2 = z^{n-3}\psi_{n-1}, \ldots, \xi_{n-1} = z^2\psi_{n+1}, \xi_{n-1} = \psi_{n+1}, \xi_{n+3} = z^2\psi_{n-1}, \ldots$ and $\xi_n = z^{n-1}\psi_1$. Now, proceeding similarly as in Theorem 6.1 we can conclude that $M_{[\xi_1,\xi_2,\ldots,\xi_n]}$. 

is an unitary operator and $J^*$ symmetric. Again due to the fact $C(H^2) \subset H^2$, we can easily compute the following:

\[ C(1) \in H^2 \implies \xi_1 \in H^\infty \]
\[ C(z) \in H^2 \implies z\xi_2 \in H^\infty \]
\[ C(z^2) \in H^2 \implies z^2\xi_3 \in H^\infty \]
\[ \vdots \]
\[ C(z^{n-1}) \in H^2 \implies z^{n-1}\xi_n \in H^\infty. \]

\[ \text{(ii) We consider } n \text{ to be an even natural number.} \]

Like the case (i), here we can again rewrite $C$ as,

\[ C = M_{\{ζ_1,ζ_2,\ldots,ζ_n\}}J^* \]

where $ζ_1 = z^{n-1}\psi_n, ζ_2 = z^{n-2}\psi_{n-1}, \ldots, ζ_i = z^{n-i+1}\psi_i, ζ_{n-1} = z^{n-1}\bar{ψ}_n$ and $ζ_n = z^{n-1}\bar{ψ}_1$.

Similarly, the invariance property $C(H^2) \subset H^2$ implies $ζ_1, zζ_2, z^2ζ_3, \ldots, z^nζ_n \in H^\infty$. So, in both the cases $C = M_{\{ζ_1,ζ_2,\ldots,ζ_n\}}J^*$ where $ζ_1, zζ_2, z^2ζ_3, \ldots, z^nζ_n \in H^\infty$. Since, $C$ and $J^*$ both are conjugations and also $M_{\{ζ_1,ζ_2,\ldots,ζ_n\}} = CJ^*$, it is trivial to check that $M_{\{ζ_1,ζ_2,\ldots,ζ_n\}}$ is an unitary operator and also it is $J^*$ symmetric.

**Theorem 6.3.** There is no conjugation $C$ for which $M_{z^n}$ is $C$–symmetric and $C(H^2) \subset H^2$.

**Proof.** Let us consider $C$ be a conjugation on $L^2$ such that $CM_{z^n}C = M_{z^n}$ and we also assume $C$ preserves the Hardy space, that is $C(H^2) \subset H^2$. Due to the first condition $CM_{z^n}C = M_{z^n}$, we can write

\[ C = M_{\{ϕ_1,ϕ_2,\ldots,ϕ_n\}}C_{z^n} = M_{\{ϕ_1,ϕ_2,\ldots,ϕ_n\}}M_{z^{n-1}}J = M_{\{ζ_1,ζ_2,\ldots,ζ_n\}}J^\dagger, \]

where $ζ_1 = z^nϕ_n, ζ_2 = z^{n-1}ϕ_1, ζ_3 = z^{n-1}ϕ_2, \ldots, ζ_n = z^nϕ_{n-2}$. Since $C(H^2) \subset H^2$ then, $C(1) \in H^2$ implies $ζ_1 \in H^\infty$ and $C(z) = zζ_2 \in H^2$ implies $ζ_2 \in H^\infty$. In a similar manner we can conclude that $ζ_3, ζ_4, \ldots, ζ_n \in H^\infty$. For any $k \geq 0$,

\[ \langle C(z^{nk}), z \rangle = 0 \implies \langle ζ_1, z^{nk-1} \rangle = 0. \]

Similarly $\langle C(z^{nk}), z^2 \rangle = 0$ implies $\langle ζ_1, z^{nk-2} \rangle = 0$, $\langle C(z^{nk}), z^3 \rangle = 0$ implies $\langle ζ_1, z^{nk-3} \rangle = 0$ and so on up-to $\langle C(z^{nk}), z^n \rangle = 0$ implies $\langle ζ_1, z^{nk-(n-1)} \rangle = 0$. So, finally we can conclude that $ζ_1 = 0$.

Again for $k \geq 0$,

\[ \langle C(z^{nk+1}), z \rangle = 0 \implies \langle ζ_1, z^{nk} \rangle = 0. \]

Similarly $\langle C(z^{nk+1}), z^2 \rangle = 0$ implies $\langle ζ_2, z^{nk-1} \rangle = 0$, $\langle C(z^{nk+1}), z^3 \rangle = 0$ implies $\langle ζ_2, z^{nk-2} \rangle = 0$ and same calculation continuing up-to $\langle C(z^{nk+1}), z^n \rangle = 0$ implies $\langle ζ_2, z^{nk-(n-1)} \rangle = 0$. Hence, $ζ_2 = 0$.

In fact for any $1 \leq i \leq n-1$, we can compute if $k \geq 0$ then

\[ \langle C(z^{nk+i}), z \rangle = 0 \implies \langle ζ_{i+1}, z^{nk+(i-1)} \rangle = 0. \]

Similarly $\langle C(z^{nk+i}), z^2 \rangle = 0$ implies $\langle ζ_{i+1}, z^{nk+(i-2)} \rangle = 0$, $\langle C(z^{nk+i}), z^3 \rangle = 0$ implies $\langle ζ_{i+1}, z^{nk+(i-3)} \rangle = 0$, $\ldots$, $\langle C(z^{nk+i}), z^{(i-1)} \rangle = 0$ implies $\langle ζ_{i+1}, z^{nk+i} \rangle = 0$, $\langle C(z^{nk+i}), z^i \rangle = 0$ implies $\langle ζ_{i+1}, z^{nk} \rangle = 0$, $\langle C(z^{nk+i}), z^{(i+1)} \rangle = 0$ implies $\langle ζ_{i+1}, z^{nk-1} \rangle = 0$, $\ldots$, $\langle C(z^{nk+i}), z^{(n-1)} \rangle = 0$ implies $\langle ζ_{i+1}, z^{nk-(n-i)} \rangle = 0$. Consequently, $ζ_i = 0$. Therefore, we can conclude that $ζ_i = 0$, for each $0 \leq i \leq n-1$.
But, $M_{[\zeta_1, \zeta_2, \cdots, \zeta_n]} = C\tilde{J}$ is an unitary operator, which gives a contradiction. So, there is no $M_{z_n}$-conjugation that preserves the Hardy space $H^2$.

We end the article with the following interesting question:

**Question 3.** What is the complete characterization for the class of conjugations that either commute with $M_B$ or that intertwining the operators $M_B$ and $M_{\tilde{B}}$ together with the invariant property of various subspaces of $L^2$ corresponding to any arbitrary finite Blaschke product $B$?
