SPURIOUS SOLUTIONS FOR HIGH ORDER CURL PROBLEMS

KAIBO HU, QIAN ZHANG, JIAYU HAN, LIXIU WANG, AND ZHIMIN ZHANG

ABSTRACT. We investigate numerical solutions of high order curl problems with various formulations and finite elements. We show that several classical conforming finite elements lead to spurious solutions, while mixed formulations with finite elements in complexes solve the problems correctly. To explain the numerical results, we clarify the cohomological structures in high order curl problems by relating the partial differential equations to the Hodge-Laplacian boundary problems of the grad curl-complexes.

1. Introduction

Spurious solutions usually refer to numerical solutions that converge to a “wrong solution” of partial differential equations (PDEs) or variational problems. Such solutions are dangerous for applications because of the lack of a visible condition (e.g., non-convergence or instability) to tell them from the correct solutions. This notorious issue appears in computational electromagnetism when one solves the Maxwell equations with nodal (Lagrangian) finite elements, and certain discretizations of the biharmonic equations [8, 20].

Several electromagnetic and continuum models involve the fourth order operator (curl)⁴, or its variant, −curlΔcurl, c.f., [5, 15, 6, 13, 17]. In this paper, we compare the numerical solutions of these high order curl problems with various finite elements and investigate the spurious solutions. Specifically, we compare the primal and/or mixed formulations with the $H(\text{grad curl})$-conforming element [12], the $H^1(\text{curl})$-conforming element [7], and the $H^2$-conforming (Argyris) element. As we shall see, mixed formulations with finite elements that fit into complexes (c.f., [12, 11, 19, 16]) lead to the correctly convergent solutions, while other combinations may produce spurious solutions.

To explain the spurious solutions, we relate the grad curl model problem to the Hodge-Laplacian boundary value problems of the grad curl-complex, which is derived by connecting de Rham complexes in an algebraic framework inspired by the Bernstein-Gelfand-Gelfand construction [3, (46)]. As a consequence, the analytic results in [3] and tools from the finite element exterior calculus (FEEC) can be applied to the high order curl problems.

The high order nature and the differential structures in the high order curl problems bring in more subtlety in the issue of spurious solutions. To elaborate on this, recall that the spurious solutions of the Maxwell equations have the following origins (c.f., [2]):

2000 Mathematics Subject Classification. 65N30 and 35Q60 and 65N15 and 35B45.

Key words and phrases. $H(\text{curl}^2)$-conforming, finite elements, spurious solution, de Rham complexes, exterior calculus, high order curl problems.

This work is supported in part by the National Natural Science Foundation of China grants NSFC 11871092 (Zhimin Zhang), NSAF U1930402 (Zhimin Zhang), NSFC 12001130 (Jiayu Han), and NSFC 12101036 (Lixiu Wang).
(1) Approximation issue. The finite element space is not dense in the space of the continuous solutions. In particular, this happens for, e.g., non-convex domains with corners.

(2) Stability issue. The solution of the eigenvalue problems may suffer from instability. For example, the Maxwell eigenvalue problems with the nodal elements have spurious solutions on domains with even trivial topology.

For high order curl problems, zero eigenvalues exist even on contractible domains (on the other hand, for the Maxwell equations the zero eigenvalues only exist if the domain has nontrivial topology). From the cohomological perspective, this is because the grad curl-complex has nontrivial cohomology even on contractible domains [3] due to the high order nature of the operators. These harmonic forms correspond to zero eigenvalues. As we shall see, finite elements which do not respect the complex structure (e.g., the Argyris element) fail to capture these zero eigenmodes and produce other spurious solutions. Through a convergence analysis, we show that mixed formulations with the finite element complexes from [12] provide correct solutions.

The rest of the paper will be organized as follows. In Section 2, we show numerical examples of the spurious solutions by comparing various schemes and finite elements. In Section 3, we relate the high order curl problem to the grad rot-complex and the Hodge-Laplacian boundary value problem. In Section 4, we show the convergence of the mixed formulations with finite element complexes [12] and analyze the spurious solutions. We provide concluding remarks in Section 5.

2. Finite element discretization for high order curl problems

Unless otherwise specified, in this paper Ω is a bounded Lipschitz domain in two space dimensions (2D) with unit outward normal vector $n$ and unit tangential vector $\tau$ on its boundary $\partial\Omega$. We adopt standard notation for Sobolev spaces such as $H^s(\Omega)$ with norm $\| \cdot \|_s$ and inner product $(\cdot, \cdot)_s$. When $s = 0$, $H^0(\Omega)$ coincides with $L^2(\Omega)$, in which case we omit the subscript 0 in the notation of the norm and the inner product. We use $H^1_0(\Omega)$ to denote the spaces with vanishing trace.

Define

$$H_{\text{rot}}(\text{grad rot}; \Omega) := \{ u \in H(\text{grad rot}; \Omega) : \text{rot } u = 0 \text{ on } \partial\Omega \},$$

$$X_{\text{rot}} := H_{\text{rot}}(\text{grad rot}; \Omega) \cap H^1_0(\text{div}; \Omega).$$

We consider the following source problem on a simply-connected domain. Denote by $\mathbb{V}$ the space of vectors. For $f \in L^2(\Omega) \otimes \mathbb{V}$ (tensor product of $L^2(\Omega)$ and $\mathbb{V}$), we seek $u \in X_{\text{rot}}$ such that

\begin{equation}
- \text{curl } \Delta \text{ rot } u - \text{grad div } u = f \quad \text{in } \Omega,
\end{equation}

with the boundary conditions

\begin{equation}
\Delta \text{ rot } u = 0, \quad \text{rot } u = 0, \quad \text{and } u \cdot n = 0 \quad \text{on } \partial\Omega.
\end{equation}

The primal variational formulation is to seek $u \in X_{\text{rot}}$ such that

\begin{equation}
(\text{grad rot } u, \text{grad rot } v) + (\text{div } u, \text{div } v) = (f, v), \quad \forall v \in X_{\text{rot}}.
\end{equation}
Let \( \sigma = - \text{div} \, \mathbf{u} \). Then the mixed variational formulation seeks \((\mathbf{u}, \sigma) \in H_{\text{rot}}(\text{grad rot}; \Omega) \times H^1(\Omega)\) such that
\[
(\text{grad rot} \, \mathbf{u}, \text{grad rot} \, \mathbf{v}) + (\text{grad} \, \sigma, \mathbf{v}) = (f, \mathbf{v}), \quad \forall \mathbf{v} \in H_{\text{rot}}(\text{grad rot}; \Omega),
\]
\[
(\mathbf{u}, \text{grad} \, \tau) - (\sigma, \tau) = 0, \quad \forall \tau \in H^1(\Omega).
\]

We also consider the corresponding eigenvalue problem on a general domain. The strong formulation is to seek \((\lambda, \mathbf{u}) \in \mathbb{R} \times X_{\text{rot}}\) such that
\[
\text{curl} \Delta \text{rot} \, \mathbf{u} - \text{grad} \, \text{div} \, \mathbf{u} = \lambda \mathbf{u} \quad \text{in} \, \Omega,
\]
with the boundary conditions (2.2). The primal variational formulation is to seek \((\lambda; \mathbf{u}) \in \mathbb{R} \times X_{\text{rot}}\) such that
\[
(\text{grad rot} \, \mathbf{u}, \text{grad rot} \, \mathbf{v}) + (\text{div} \, \mathbf{u}, \text{div} \, \mathbf{v}) = \lambda (\mathbf{u}, \mathbf{v}), \quad \forall \mathbf{v} \in X_{\text{rot}}.
\]
The mixed variational formulation seeks \((\lambda, \mathbf{u}, \sigma) \in \mathbb{R} \times H_{\text{rot}}(\text{grad rot}; \Omega) \times H^1(\Omega)\) s.t.
\[
(\text{grad rot} \, \mathbf{u}, \text{grad rot} \, \mathbf{v}) + (\text{grad} \, \sigma, \mathbf{v}) = \lambda (\mathbf{u}, \mathbf{v}), \quad \forall \mathbf{v} \in H_{\text{rot}}(\text{grad rot}; \Omega),
\]
\[
(\mathbf{u}, \text{grad} \, \tau) - (\sigma, \tau) = 0, \quad \forall \tau \in H^1(\Omega).
\]

We consider four finite element methods (FEMs) to solve the problems (2.1) and (2.5): a primal formulation with the \(H^2\)-conforming Argyris element, a mixed formulation with the \(\text{grad rot}\)-conforming element \([7]\), and the mixed and primal formulations with the \(H^1(\text{rot})\)-conforming element \([7]\). Let \(\mathcal{T}_h\) be a partition of the domain \(\Omega\) consisting of shape regular triangles, and let \(\mathcal{V}\) be the set of vertices. We denote by \(P_k\) the space of polynomials with degree no larger than \(k\). For \(K \in \mathcal{T}_h\), define
\[
\mathcal{R}_k(K) := \text{grad} \, P_k(K) \oplus P_{k-1}(K) x^+, \quad k \geq 4,
\]
\[
\mathcal{W}_k(K) := \left\{ \mathbf{v} \in P_k(K) \otimes \mathbb{R}^2 : \text{rot} \, \mathbf{v} \in P_{k-3}(K) \cup [P_{k-1}(K) \cap H^1_0(K)] \right\}, \quad k \geq 4.
\]

**Remark 2.1.** We can use the Poincaré operator \(\text{pu} = \int_0^1 u(tx) x^+ \, dt\) to construct \(\mathcal{W}_k(K)\). For example, when \(k = 4\), \(\mathcal{W}_k(K) = \text{grad} \, P_5(K) \oplus P_1(K) x^+ \oplus \{p(\lambda_1 \lambda_2 \lambda_3)\}\).

The \(H(\text{grad rot})\)- and \(H^1(\text{rot})\)- conforming finite element spaces on the partition \(\mathcal{T}_h\) are listed as follows:
\[
V_h = \left\{ \mathbf{v}_h \in H_{\text{rot}}(\text{grad rot}; \Omega) : \mathbf{v}_h|_K \in \mathcal{R}_k(K), \ \forall K \in \mathcal{T}_h \right\},
\]
\[
V_h^1 = \left\{ \mathbf{v}_h \in H^1(\text{rot}; \Omega) \cap H_{\text{rot}}(\text{grad rot}; \Omega) : \mathbf{v}_h|_K \in \mathcal{W}_k(K), \ \forall K \in \mathcal{T}_h \right\}.
\]

**Remark 2.2.** We can also choose \(V_h\) as the other grad rot-conforming finite element spaces in \([12]\).

We also define the following two finite element spaces for the mixed schemes.
\[
S_h = \left\{ w_h \in H^1(\Omega) : w_h|_K \in P_k(K), \ \forall K \in \mathcal{T}_h \right\},
\]
\[
S_h^1 = \left\{ w_h \in H^2(\Omega) : w_h|_K \in P_k(K), \ \forall K \in \mathcal{T}_h, \ w_h \in C^2(\mathcal{V}) \right\} \text{ for } k \geq 5.
\]

The vector-valued \(H^2\)-conforming finite element space is defined as
\[
V_h^{\text{Avg}} = S_h^1 \otimes \mathbb{R}^2.
\]

Define
\[
\tilde{V}_h^1 = \left\{ \mathbf{v}_h \in V_h^1 : \mathbf{v}_h \cdot \mathbf{n} = 0 \text{ on } \partial \Omega \right\}.
\]
\[ \hat{V}_h^{\text{Arg}} = \{ \mathbf{v}_h \in \hat{V}_h^{\text{Arg}} : \mathbf{v}_h \cdot \mathbf{n} = 0 \text{ and } \text{rot } \mathbf{v}_h = 0 \text{ on } \partial \Omega \}. \]

2.1. Source problem. We are in a position to present the four finite element schemes for the problem (2.1).

**Scheme 1** (Mixed formulation with the \(H(\text{grad rot})\)-conforming element). Find \((\mathbf{u}_h, \mathbf{\sigma}_h) \in V_h \times S_h\) such that
\[
(\text{grad rot } \mathbf{u}_h, \text{grad rot } \mathbf{v}_h) + (\text{grad } \mathbf{\sigma}_h, \mathbf{v}_h) = (\mathbf{f}, \mathbf{v}_h), \quad \forall \mathbf{v}_h \in V_h,
\]
\[
(\mathbf{u}_h, \text{grad } \mathbf{\tau}_h) - (\mathbf{\sigma}_h, \mathbf{\tau}_h) = 0, \quad \forall \mathbf{\tau}_h \in S_h.
\]

**Scheme 2** (Mixed formulation with the \(H^1(\text{rot})\)-conforming element). Find \((\mathbf{u}_h, \mathbf{\sigma}_h) \in V_h^1 \times S_h^1\) such that
\[
(\text{grad rot } \mathbf{u}_h, \text{grad rot } \mathbf{v}_h) + (\text{grad } \mathbf{\sigma}_h, \mathbf{v}_h) = (\mathbf{f}, \mathbf{v}_h), \quad \forall \mathbf{v}_h \in V_h^1,
\]
\[
(\mathbf{u}_h, \text{grad } \mathbf{\tau}_h) - (\mathbf{\sigma}_h, \mathbf{\tau}_h) = 0, \quad \forall \mathbf{\tau}_h \in S_h^1.
\]

**Scheme 3** (Primal formulation with the \(H^1(\text{rot})\)-conforming element). Find \(\mathbf{u}_h \in \hat{V}_h^1\) such that
\[
(\text{grad rot } \mathbf{u}_h, \text{grad rot } \mathbf{v}_h) + (\text{div } \mathbf{u}_h, \text{div } \mathbf{v}_h) = (\mathbf{f}, \mathbf{v}_h), \quad \forall \mathbf{v}_h \in \hat{V}_h^1.
\]

**Scheme 4** (Primal formulation with the \(H^2\)-conforming (Argyris) element). Find \(\mathbf{u}_h \in \hat{V}_h^{\text{Arg}}\) such that
\[
(\text{grad rot } \mathbf{u}_h, \text{grad rot } \mathbf{v}_h) + (\text{div } \mathbf{u}_h, \text{div } \mathbf{v}_h) = (\mathbf{f}, \mathbf{v}_h), \quad \forall \mathbf{v}_h \in \hat{V}_h^{\text{Arg}}.
\]

The numerical results for the Hodge-Laplacian source problem (2.1) with \(\mathbf{f} = (1, 0)^T\) on an L-shape domain are shown in Figure 2.1. As we see in Figure 2.1, the primal formulation with the Argyris and the \(H^1(\text{rot})\)-conforming finite elements show different solutions compared with the mixed formulations with the \(H(\text{grad rot})\) and \(H^1(\text{rot})\)-conforming elements. In fact, the primal formulation produces spurious solutions, which we will elaborate on in Section 4 by proving the convergence of the mixed formulations and explaining the reason of the spurious solutions.

2.2. Eigenvalue problem. Similar to the source problem, we consider the following four numerical schemes for the problem (2.5).

**Scheme 5** (Mixed formulation with the \(H(\text{grad rot})\)-conforming element). Find \((\lambda_h, \mathbf{u}_h, \mathbf{\sigma}_h) \in \mathbb{R} \times V_h \times S_h\) such that
\[
(\text{grad rot } \mathbf{u}_h, \text{grad rot } \mathbf{v}_h) + (\text{grad } \mathbf{\sigma}_h, \mathbf{v}_h) = \lambda_h(\mathbf{u}_h, \mathbf{v}_h), \quad \forall \mathbf{v}_h \in V_h,
\]
\[
(\mathbf{u}_h, \text{grad } \mathbf{\tau}_h) - (\mathbf{\sigma}_h, \mathbf{\tau}_h) = 0, \quad \forall \mathbf{\tau}_h \in S_h.
\]

**Scheme 6** (Mixed formulation with the \(H^1(\text{rot})\)-conforming element). Find \((\lambda_h, \mathbf{u}_h, \mathbf{\sigma}_h) \in \mathbb{R} \times V_h^1 \times S_h^1\) such that
\[
(\text{grad rot } \mathbf{u}_h, \text{grad rot } \mathbf{v}_h) + (\text{grad } \mathbf{\sigma}_h, \mathbf{v}_h) = \lambda_h(\mathbf{u}_h, \mathbf{v}_h), \quad \forall \mathbf{v}_h \in V_h^1,
\]
\[
(\mathbf{u}_h, \text{grad } \mathbf{\tau}_h) - (\mathbf{\sigma}_h, \mathbf{\tau}_h) = 0, \quad \forall \mathbf{\tau}_h \in S_h^1.
\]

**Scheme 7** (Primal formulation with the \(H^1(\text{rot})\)-conforming element). Find \((\lambda_h, \mathbf{u}_h) \in \mathbb{R} \times \hat{V}_h^1\) such that
\[
(\text{grad rot } \mathbf{u}_h, \text{grad rot } \mathbf{v}_h) + (\text{div } \mathbf{u}_h, \text{div } \mathbf{v}_h) = \lambda_h(\mathbf{u}_h, \mathbf{v}_h), \quad \forall \mathbf{v}_h \in \hat{V}_h^1.
SPURIOUS SOLUTIONS FOR HIGH ORDER CURL PROBLEMS

Figure 2.1. Numerical solutions to the problem (2.1) on an L-shape domain with \( f = (1, 0)^T \).

Scheme 8 (Primal formulation with the \( H^2 \)-conforming (Argyris) element). Find \( (\lambda_h, u_h) \in \mathbb{R} \times V_h^{Arg} \), such that

\[
(\text{grad rot } u_h, \text{grad rot } v_h) + (\text{div } u_h, \text{div } v_h) = \lambda_h (u_h, v_h), \quad \forall v_h \in \hat{V}_h^{Arg}.
\]

We apply Schemes 5 – 8 to solve the eigenvalue problem (2.5) on three different domains (see Figure 2.2):

- \( \Omega_1 = (0, 1) \times (0, 1) \).
- \( \Omega_2 = (0, 1) \times (0, 1)/(1/3, 3/4) \times (1/4, 2/3) \).
- \( \Omega_3 = (-1, 1) \times (-1, 1)/(0, 1) \times (-1, 0) \).

We observe from Table 2.1–2.12 that the four schemes lead to the same numerical eigenvalues on \( \Omega_1 \) and different numerical eigenvalues on \( \Omega_2 \) and \( \Omega_3 \). We will prove in Section 4 that Scheme 5 produces correctly convergent numerical eigenvalues on simply-connected domains, which implies that Scheme 7 and Scheme 8 lead to spurious eigenvalues on \( \Omega_3 \).

2.3. Eigenvalue problem with different boundary conditions. Denote

\[
X = H(\text{grad rot}; \Omega) \cap H_0(\text{div}; \Omega).
\]
In this section, we consider another eigenvalue problem: find $(\lambda, u) \in \mathbb{R} \times X$, such that

$$-\text{curl}\Delta \text{rot } u - \text{grad\ div } u = \lambda u \text{ in } \Omega,$$

(2.8)
with the boundary conditions
\[ \Delta \text{rot} \, u = 0, \, \text{grad rot} \, u \cdot n = 0, \, \text{and} \, u \cdot n = 0 \text{ on } \partial \Omega. \]

The primal variational formulation is to find \((\lambda, u) \in \mathbb{R} \times X\) s.t.
\[ (\text{grad rot} \, u, \text{grad rot} \, v) + (\text{div} \, u, \text{div} \, v) = \lambda (u, v), \; \forall v \in X. \] (2.9)

The mixed variational formulation is to find \((\lambda, u, \sigma) \in \mathbb{R} \times H(\text{grad rot}; \Omega) \times H^1(\Omega)\) s.t.
\[ (\text{grad rot} \, u, \text{grad rot} \, v) + (\text{grad} \, \sigma, v) = \lambda (u, v), \; \forall v \in H(\text{grad rot}; \Omega), \]
\[ (u, \text{grad} \, \tau) - (\sigma, \tau) = 0, \; \forall \tau \in H^1(\Omega). \] (2.10)

We consider four numerical schemes similar to Scheme 5–8 but without the boundary condition \(\text{rot} \, u^h = 0\) on the three different domains. Again, we observe that the four schemes lead to different numerical solutions. In particular, from the mixed formulations we obtain one zero eigenvalue on \(\Omega_1, \Omega_3\), and two zero eigenvalues on \(\Omega_2\). On the other hand, other schemes do not produce zero numerical eigenvalues. This difference will also be explained in Section 4.

</tbody>
</table>
A major conclusion of the construction in [3] is that the cohomology of (3.1) is isomorphic to the cohomology of the rows of (3.2). Note that the dimension of cohomology at $H^{q-1}(\Omega) \otimes V$ in the first row of (3.2) is the first Betti number $\beta_1$ of the domain, and the dimension of cohomology at $H^{q-2}(\Omega)$ in the second row of (3.2) is 1 (the kernel of grad consists of constants). Consequently,

$$\mathcal{N}(\text{grad rot}, H^{q-1}(\Omega) \otimes V) = \mathcal{R}(\text{grad}, H^q(\Omega)) \oplus \mathcal{H}_\infty,$$

where $\mathcal{H}_\infty$ is a finite dimensional space of smooth functions with dimension $\dim \mathcal{H}_\infty = 1 + \beta_1$.

Remark 3.1. A general algebraic construction from (3.2) implies $\dim \mathcal{H}_\infty \leq 1 + \beta_1$ [3, Theorem 6]. From the identity $\text{rot}(u \times \nabla) = \nabla \cdot \text{grad} u + 2u$, we see that $I = \text{rot} \tilde{K}_1 - \tilde{K}_2 \text{grad}$, where $\tilde{K}_1 u := 1/2u \times \nabla$ and $\tilde{K}_2 v := 1/2v \cdot \nabla$. Therefore one can verify the condition [3 (28)] by defining $K_1, K_2$ in the way of [3 (43)]. Then $\dim \mathcal{H}_\infty = 1 + \beta_1$ follows.

The $L^2$ version of (3.1) with unbounded linear operators, i.e.,

$$(3.3) \quad 0 \longrightarrow L^2(\Omega) \xrightarrow{\text{grad}} L^2(\Omega) \otimes V \xrightarrow{\text{grad rot}} L^2(\Omega) \otimes V \xrightarrow{\text{rot}} L^2(\Omega) \longrightarrow 0,$$

is closely related to the PDEs and the numerics. Consider the following domain complex of (3.3) (c.f., [3])

$$(3.4) \quad 0 \longrightarrow H^1(\Omega) \xrightarrow{\text{grad}} H(\text{grad rot}; \Omega) \xrightarrow{\text{grad rot}} H(\text{rot}; \Omega) \xrightarrow{\text{rot}} L^2(\Omega) \longrightarrow 0.$$

Hereafter, for a differential operator $D$,

$$H(D; \Omega) := \{ u \in L^2(\Omega) : Du \in L^2(\Omega) \}$$

with the inner product

$$(u, v)_{H(D; \Omega)} = (u, v) + (Du, Dv)$$

and the norm

$$\|u\|^2_{H(D; \Omega)} = \|u\|^2 + \|Du\|^2.$$

The domain complex of the adjoint of (3.3) is

$$(3.5) \quad 0 \leftarrow L^2(\Omega) \xleftarrow{\text{div}} H_0(\text{div}; \Omega) \xleftarrow{\text{curl div}} H_0(\text{curl div}; \Omega) \xleftarrow{\text{curl}} H_0^1(\Omega) \leftarrow 0.$$

Here $H_0(\text{div}; \Omega)$ is the space of functions in $H(\text{div}; \Omega)$ with vanishing trace and at this stage $H_0(\text{curl div}; \Omega)$ is a formal notation for the domain of the adjoint of the operator $(\text{grad rot}, H(\text{grad rot}; \Omega))$. We will characterize this space in Section 3.3 to show that it is a subspace of $H(\text{curl div}; \Omega)$ with boundary conditions $u \cdot n = 0$ and $\text{div} u = 0$.

A corollary of [3 Theorem 1] is the following.

Theorem 3.2. The following decomposition holds

$N(\text{grad rot}, H(\text{grad rot}; \Omega)) = \mathcal{R}(\text{grad}, H^1(\Omega)) \oplus \mathcal{H}_\infty$, \hspace{1cm} (3.6)

with $\dim \mathcal{H}_\infty = 1 + \beta_1$, where $\beta_1$ is the first Betti number of the domain.

From general results on Hilbert complexes, we have the Hodge decomposition

$L^2(\Omega) \otimes \mathbb{V} = \text{grad} H^1(\Omega) \oplus \text{curl div} H_0(\text{curl div}; \Omega) \oplus \mathcal{H}$,

where $\mathcal{H}$ is the space of harmonic forms with the same dimension as $\mathcal{H}_\infty$. In addition to the harmonic forms of the de Rham complex, i.e. the functions satisfying $\text{rot} u = 0$ and $\text{div} u = 0$, the function $u = \text{grad} p$ with $p$ solving

$\Delta p = 1 \text{ in } \Omega, \quad p = 0 \text{ on } \partial \Omega$

is also a harmonic form in $\mathcal{H}$.

The Hodge-Laplacian operator follows from the abstract definition:

$\mathcal{L} := - (\text{curl div}) \text{grad rot} - \text{grad div} = - \text{curl } \Delta \text{ rot} - \text{grad div}$,

with the domain $D_{\mathcal{L}} = \{ u \in X : \text{grad rot } u \in H_0(\text{curl div}; \Omega), \text{div } u \in H^1(\Omega) \}$. For $f \in L^2(\Omega) \otimes \mathbb{V}$, the strong formulation of the Hodge-Laplacian boundary value problem seeks $u \in D_{\mathcal{L}}$ and $u \perp \mathcal{H}$ such that

$- \text{curl } \Delta \text{ rot } u - \text{grad div } u = f - P_{\mathcal{H}} f \quad \text{in } \Omega.$

Here and after, $P_{\mathcal{H}}$ is the $L^2$ projection onto $\mathcal{H}$. The corresponding eigenvalue problem is to seek $(\lambda, u) \in \mathbb{R} \times D_{\mathcal{L}}$ such that

$- \text{curl } \Delta \text{ rot } u - \text{grad div } u = \lambda u \quad \text{in } \Omega,$

which is exactly the eigenvalue problem (2.8).

3.2. Hodge-Laplacian boundary value problems. Consider another domain complex of (3.3) with boundary conditions:

$0 \rightarrow H^1(\Omega) \xrightarrow{\text{grad}} H_{\text{rot}}(\text{grad rot}; \Omega) \xrightarrow{\text{grad rot}} H_0(\text{rot}; \Omega) \xrightarrow{\text{rot}} L^2_0(\Omega) \rightarrow 0,$

which is derived from the following diagram:

\[ \begin{array}{ccccccc}
0 & \rightarrow & H^1(\Omega) & \xrightarrow{\text{grad}} & H_{\text{rot}}(\text{grad rot}; \Omega) & \xrightarrow{\text{rot}} & H^1_0(\Omega) & \rightarrow & 0 \\
& & \downarrow & & \downarrow & & \downarrow & & \\
0 & \rightarrow & 0 & \xrightarrow{\text{id}} & H^1_0(\Omega) & \xrightarrow{\text{grad}} & H_0(\text{rot}; \Omega) & \xrightarrow{\text{rot}} & L^2_0(\Omega) & \rightarrow & 0.
\end{array} \]
By the algebraic construction in [3], we can show the cohomology of (3.9) in a similar way as (3.4). In particular, we have

\[ N(\text{grad rot}, H_{\text{rot}}(\text{grad rot}; \Omega)) = R(\text{grad}, H^1(\Omega)) \oplus \mathcal{H}_{\infty}^{\text{rot}}, \]

where \( \mathcal{H}_{\infty}^{\text{rot}} \) is a set of smooth functions with dimension equal to the dimension of the cohomology of the first row of (3.10) at \( H_{\text{rot}}(\text{grad rot}; \Omega) \) plus the dimension of the cohomology of the second row at \( H^1_0(\Omega) \), and hence \( \dim \mathcal{H}_{\infty}^{\text{rot}} = \beta_1 \), which means that there is no nontrivial cohomology on contractible domains.

The domain complex of the adjoint of (3.9) is:

\[ L^2(\Omega) \otimes V = H^1(\Omega) \oplus \text{curl div} H_{\text{div}}(\text{curl div}; \Omega) \oplus H^1(\Omega). \]

Here \( H_{\text{div}}(\text{curl div}; \Omega) \) is again a formal notation for the domain of the adjoint of the unbounded operator \((\text{grad rot}, H_{\text{rot}}(\text{grad rot}; \Omega))\). We will characterize this space in Section 3.3 to show that it is a subspace \( H(\text{curl div}; \Omega) \) with boundary condition \( \text{div} u = 0 \).

The Hodge decomposition at \( H_{\text{rot}}(\text{grad rot}) \) now reads:

\[ L^2(\Omega) \ominus \mathcal{H} = \text{grad} H^1(\Omega) \oplus \text{curl div} H_{\text{div}}(\text{curl div}; \Omega) \oplus \mathcal{H}_{\text{rot}}, \]

where the space of harmonic forms \( \mathcal{H}_{\text{rot}} \) has the same dimension as \( \mathcal{H}_{\infty}^{\text{rot}} \), which is trivial if \( \Omega \) is contractible.

The Hodge-Laplacian operator follows from the abstract definition:

\[ \mathcal{L} := -(\text{curl div}) \text{grad rot} - \text{grad div} = -\text{curl} \Delta \text{rot} - \text{grad div}, \]

with the domain \( D_{\mathcal{L}; \text{rot}} = \{ u \in X_{\text{rot}} : \text{grad rot } u \in H_{\text{div}}(\text{curl div}; \Omega), \text{div } u \in H^1(\Omega) \} \). For \( f \in L^2(\Omega) \otimes V \), the strong formulation of the Hodge-Laplacian boundary value problem seeks \( u \in D_{\mathcal{L}; \text{rot}} \) and \( u \perp \mathcal{H}_{\text{rot}} \) such that

\[ -\text{curl} \Delta \text{rot } u - \text{grad div } u = f - P_{\mathcal{H}_{\text{rot}}} f \quad \text{in } \Omega, \]

The primal variational formulation is to seek \( u \in X_{\text{rot}} \) and \( u \perp \mathcal{H}_{\text{rot}} \) such that

\[ (\text{grad rot } u, \text{grad rot } v) + (\text{div } u, \text{div } v) = (f - P_{\mathcal{H}_{\text{rot}}} f, v), \quad \forall v \in X_{\text{rot}}. \]

The mixed variational formulation seeks \( (u, \sigma) \in H_{\text{rot}}(\text{grad rot}; \Omega) \times H^1(\Omega) \), such that \( u \perp \mathcal{H}_{\text{rot}} \) and

\[ (\text{grad rot } u, \text{grad rot } v) + (\sigma, v) = (f - P_{\mathcal{H}_{\text{rot}}} f, v), \quad \forall v \in H_{\text{rot}}(\text{grad rot}; \Omega), \]

\[ (u, \text{grad } \tau) - (\sigma, \tau) = 0, \quad \forall \tau \in H^1(\Omega). \]

Remark 3.3. When \( \Omega \) is simply-connected, \( \mathcal{H}_{\text{rot}} \) vanishes and hence the Hodge-Laplacian problem is exactly the problem (2.1).

According to Theorem 4.7 in [2], the strong formulation (3.13), the primal formulation (3.14), and the mixed formulation (3.15) are equivalent. The well-posedness of (3.13) follows from standard results on the Hodge-Laplacian problems of Hilbert complexes (c.f., [2, Theorem 4.8]), and the following estimate holds

\[ \|u\| + \|\text{grad rot } u\| + \|\text{div } u\|_1 + \|\text{curl } \Delta \text{rot } u\| \leq C\|f\|. \]

Since \( u \in D_{\mathcal{L}; \text{rot}} \), \( \Delta \text{rot } u = 0 \) on \( \partial \Omega \). By the Poincaré inequality we have

\[ \|\Delta \text{rot } u\| \leq C\|\text{curl } \Delta \text{rot } u\| \leq C\|f\|. \]

Next we investigate the regularity of the solutions.
Theorem 3.4. In addition to the assumptions on $\Omega$, we further assume that $\Omega$ is a polygon. There exists a constant $\alpha > 1/2$ such that the solution $u$ of (3.13) satisfies

$$u \in H^{\alpha}(\Omega) \otimes V \text{ and } \text{rot} \ u \in H^{1+\alpha}(\Omega),$$

and it holds

$$\|u\|_\alpha + \|\text{rot} \ u\|_{1+\alpha} \leq C\|f\|.$$

Moreover, if $f \in H(\text{div}; \Omega)$ and $f \cdot n \in H^{\alpha-1/2}(\partial \Omega)$, then $\text{div} \ u \in H^{1+\alpha}(\Omega)$ and it holds

$$\|\text{div} \ u\|_{1+\alpha} \leq C (\|\text{div} f\| + \|f \cdot n\|_{\alpha-1/2, \partial \Omega}).$$

Proof. It follows from the embedding $H(\text{rot}; \Omega) \cap H_0(\text{div}; \Omega) \hookrightarrow H^{\alpha}(\Omega) \otimes V$ with $\alpha > 1/2$ [1] that $u \in H^{\alpha}(\Omega) \otimes V$, and

$$\|u\|_\alpha \leq C (\|u\| + \|\text{div} \ u\| + \|\text{rot} \ u\|).$$

Furthermore, by the Poincaré inequality we have

$$\|u\|_\alpha \leq C (\|u\| + \|\text{div} \ u\| + \|\text{grad rot} \ u\|) \leq C\|f\|,$$

Therefore it suffices to show that $\text{rot} \ u \in H^{1+\alpha}(\Omega)$. Since $\text{curl} \Delta \text{rot} \ u \in L^2(\Omega)$, we have

$$-\Delta \text{rot} \ u \in L^2(\Omega).$$

Moreover, $\text{rot} \ u$ satisfies the boundary condition $\text{rot} \ u = 0$. By the regularity of the Laplace problem [14, Theorem 3.18], there exists an $\alpha > 1/2$ such that $\text{rot} \ u \in H^{1+\alpha}(\Omega)$, and

$$\|\text{rot} \ u\|_{1+\alpha} \leq C\|\Delta \text{rot} \ u\| \leq C\|f\|,$$

where we have used (3.17).

Multiplying both sides of (3.13) by $-\text{grad} \ q \in \text{grad} H^1(\Omega)$ and integrating over $\Omega$, we obtain

$$(\text{grad div} \ u, \text{grad} \ q) = (\text{div} \ f, q) - \langle f \cdot n, q \rangle,$$

From the regularity of the Laplace problem [14, Theorem 3.18] again, there exists a constant $\alpha > 1/2$ such that

$$\|\text{div} \ u\|_{1+\alpha} \leq C (\|\text{div} f\| + \|f \cdot n\|_{\alpha-1/2, \partial \Omega}).$$

3.3. Characterization of $H_0(\text{curl div})$ and $H_{\text{div}}(\text{curl div})$. In the following, we characterize the spaces $H_{\text{div}}(\text{curl div}; \Omega)$ and $H_0(\text{curl div}; \Omega)$. We denote by $C^\infty(\Omega)$ the space of infinitely differentiable functions on $\Omega$ and $C_0^\infty(\Omega)$ the space of infinitely differentiable functions with compact support on $\Omega$.

We start by defining a different norm.

Lemma 3.1. The following is an equivalent norm for $H(\text{grad rot}; \Omega)$:

$$\|u\|_{H(\text{grad rot}; \Omega)} = \|u\| + \|\text{rot} \ u\| + \|\text{grad rot} \ u\|.$$

Proof. It is easy to check that $H(\text{grad rot}; \Omega)$ is a Banach space under the two norms $\|\cdot\|_{H(\text{grad rot}; \Omega)}$ and $\|\cdot\|_{H(\text{grad rot}; \Omega)}$. Applying the bounded inverse theorem, we obtain that the two norms are equivalent. \[\blacksquare\]
Theorem 3.5. Define \( \gamma_{\tau, \text{rot}} u = \{ u \cdot \tau, \text{rot } u \} \). Then \( \gamma_{\tau, \text{rot}} \) is a linear bounded operator from \( H(\text{grad rot}; \Omega) \) to \( H^{-1/2}(\partial\Omega) \times H^{1/2}(\Omega) \) with the bound:

\[
\| \gamma_{\tau, \text{rot}} u \|_{H^{-1/2}(\partial\Omega) \times H^{1/2}(\Omega)} \leq C \| u \|_{H(\text{grad rot}; \Omega)}.
\]

Proof. Since \( \gamma_{\tau} u = u \cdot \tau \) is a linear bounded operator from \( H(\text{rot}; \Omega) \) to \( H^{-1/2}(\partial\Omega) \) and \( \text{tr} v = v|_{\partial\Omega} \) is a linear bounded operator from \( H^1(\Omega) \) to \( H^{1/2}(\partial\Omega) \), we have

\[
\| \gamma_{\tau, \text{rot}} u \|_{H^{-1/2}(\partial\Omega) \times H^{1/2}(\Omega)}^2 = \| u \cdot \tau \|_{H^{-1/2}(\partial\Omega)}^2 + \| \text{rot } u \|_{H^{1/2}(\partial\Omega)}^2
\]

\[
\leq C \| u \|_{H(\text{rot}; \Omega)}^2 + C \| \text{rot } u \|_{H^1(\Omega)}^2
\]

\[
\leq C \| u \|_{H(\text{grad rot}; \Omega)}^2
\]

where we have used the equivalence between the norms \( \| \cdot \|_{H(\text{grad rot}; \Omega)} \) and \( \| \cdot \|_{H(\text{grad rot}; \Omega)} \).

\[\blacksquare\]

Similarly, we have

Theorem 3.6. Define \( \gamma_{n, \text{div}} u = \{ u \cdot n, \text{div } u \} \). Then \( \gamma_{n, \text{div}} \) is a linear bounded operator from \( H(\text{curl div}; \Omega) \) to \( H^{-1/2}(\partial\Omega) \times H^{1/2}(\Omega) \) with the bound:

\[
\| \gamma_{n, \text{div}} u \|_{H^{-1/2}(\partial\Omega) \times H^{1/2}(\Omega)} \leq C \| u \|_{H(\text{curl div}; \Omega)}.
\]

Theorem 3.7. The trace operator \( \gamma_{\tau, \text{rot}} \) is surjective from \( H(\text{grad rot}; \Omega) \) to \( H^{-1/2}(\partial\Omega) \times H^{1/2}(\Omega) \). That is, for any \( g_1 \in H^{-1/2}(\partial\Omega) \) and \( g_2 \in H^{1/2}(\partial\Omega) \), there exists \( u \in H(\text{grad rot}; \Omega) \) such that \( u \cdot \tau|_{\partial\Omega} = g_1 \), \( \text{rot } u|_{\partial\Omega} = g_2 \), and

\[
\| u \|_{H(\text{grad rot}; \Omega)} \leq C \left( \| g_1 \|_{H^{-1/2}(\partial\Omega)} + \| g_2 \|_{H^{1/2}(\partial\Omega)} \right).
\]

Proof. For \( g_2 \in H^{1/2}(\partial\Omega) \), there exists \( v \in H^1(\Omega) \) such that \( v|_{\partial\Omega} = g_2 \) and

\[
\| v \|_{H^1(\Omega)} \leq C \| g_2 \|_{H^{1/2}(\partial\Omega)}.
\]

Take \( x_0 \) and \( r \) such that \( B(x_0, r) \subset \Omega \) and define

\[
\eta_{r, x_0}(x) = \frac{1}{r^2} \eta \left( \frac{x - x_0}{r} \right),
\]

where

\[
\eta(x) = \begin{cases} 
C_1 \exp \left( \frac{1}{|x|^2 - 1} \right), & |x| < 1, \\
0, & |x| \geq 1
\end{cases}
\]

with \( C_1 = \left( \int_{\mathbb{R}^2} \exp \left( \frac{1}{|x|^2 - 1} \right) \, dx \right)^{-1} \). Then we have \( \eta_{r, x_0}(x) \in C_0^\infty(\Omega) \) and \( \int_\Omega \eta_{r, x_0}(x) \, dx = 1 \).

Let \( C_0 = \langle g_1, 1 \rangle_{\partial\Omega} - (v, 1) \) and \( \bar{v} = v + C_0 \eta_{r, x_0} \). Then

\[
(\bar{v}, 1) = (v, 1) + C_0 (\eta_{r, x_0}, 1) = \langle g_1, 1 \rangle_{\partial\Omega}
\]

and

\[
\| \bar{v} \|_{H^1(\Omega)} \leq \| v \|_{H^1(\Omega)} + C (\langle g_1, 1 \rangle_{\partial\Omega} - (v, 1))
\]

\[
\leq C \left( \| v \|_{H^1(\Omega)} + \| g_1 \|_{H^{-1/2}(\partial\Omega)} \right)
\]

\[
(3.18)
\]

\[
\leq C \left( \| g_2 \|_{H^{1/2}(\partial\Omega)} + \| g_1 \|_{H^{-1/2}(\partial\Omega)} \right).
\]
Now we seek \( w \in H^1(\Omega) \) such that
\[
-\Delta w = -\tilde{v} \quad \text{in} \; \Omega,
\]
\[
\text{grad} \; w \cdot \mathbf{n} = g_1 \quad \text{on} \; \partial \Omega,
\]
where \( \tilde{v} \) and \( g_1 \) satisfy
\[
-(\tilde{v}, 1) + (g_1, 1)_{\partial \Omega} = 0.
\]
By virtue of the regularity result of the elliptic problem [14, Theorem 3.18], we have
\[
\|w\|_{H^1(\Omega)} \leq C \left( \|\tilde{v}\| + \|g_1\|_{H^{-1/2}(\partial \Omega)} \right).
\]
(3.19)

Take \( u = \text{curl} \; w \). Then \( u \in L^2(\Omega) \) and \( \text{rot} \; u = \Delta w = \tilde{v} \in H^1(\Omega) \), and hence \( u \in H(\text{grad rot}; \Omega) \). Restricted on \( \partial \Omega \),
\[
\begin{align*}
\mathbf{u} \cdot \mathbf{n} &= \text{curl} \; w \cdot \mathbf{n} = \text{grad} \; w \cdot \mathbf{n} = g_1, \\
\text{rot} \; \mathbf{u} &= \Delta w = \tilde{v} = v = g_2.
\end{align*}
\]
Combining (3.18) and (3.19), we obtain
\[
\|u\|_{H(\text{grad rot}; \Omega)} \leq \|u\| + \|\text{grad rot} \; u\|
\leq \|\text{curl} \; w\| + \|\text{grad} \; \tilde{v}\|
\leq \|w\|_{H^1(\Omega)} + \|\tilde{v}\|_{H^1(\Omega)}
\leq C \left( \|\tilde{v}\| + \|g_1\|_{H^{-1/2}(\partial \Omega)} + \|\tilde{v}\|_{H^1(\Omega)} \right)
\leq C \left( \|g_1\|_{H^{-1/2}(\partial \Omega)} + \|g_2\|_{H^{1/2}(\partial \Omega)} \right).
\]

Lemma 3.2. \( C^\infty(\overline{\Omega}) \otimes \mathbb{V} \) is dense in \( H(\text{grad rot}; \Omega) \).

Proof. We follow the proof of [14, Theorem 2.4], which is based upon the following property of Banach spaces:

A subspace \( M \) of a Banach space \( M' \) is dense in \( M' \) if and only if every element of \( M' \) that vanishes on \( M \) also vanishes on \( M \).

Let \( l \in [H(\text{grad rot}; \Omega)]' \) and let \( l \) be the element of \( H(\text{grad rot}; \Omega) \) associated with \( l \) by
\[
\langle l, \mathbf{u} \rangle = (l, \mathbf{u}) + (\text{grad rot} \; l, \text{grad rot} \; \mathbf{u})
\]
Now, we assume that \( l \) vanishes on \( C^\infty(\overline{\Omega}) \otimes \mathbb{V} \). Denote \( Dl = \text{grad rot} \; l \). Let \( \tilde{l} \) and \( \tilde{Dl} \) denote the extensions of \( l \) and \( Dl \) by zero outside \( \Omega \). The above formula can be rewritten as
\[
\int_{\mathbb{R}^2} \tilde{l} \cdot \phi + \tilde{Dl} \cdot \text{grad rot} \; \phi dx = 0, \; \forall \phi \in C^\infty(\mathbb{R}^2) \otimes \mathbb{V},
\]
which implies that, in the sense of distributions,
\[
\tilde{l} = \text{curl} \; \text{div} \; \tilde{Dl} \in L^2(\mathbb{R}^2) \otimes \mathbb{V}.
\]
(3.20)

Thus \( \tilde{Dl} \in H(\text{curl div}; \mathbb{R}^2) \), and then \( \tilde{Dl} \in H(\text{curl div}; \Omega) \). Now let \( \mathcal{O} \) be a ball such that \( \Omega \subset \mathcal{O} \). Then \( \mathcal{O} \setminus \overline{\Omega} \) is a bounded Lipschitz domain and \( \tilde{Dl}|_{\mathcal{O} \setminus \overline{\Omega}} = 0 \). Since \( \gamma_n \mathbf{u} = \mathbf{u} \cdot \mathbf{n} \) is a bounded operator from \( H(\text{div}; \mathcal{O} \setminus \overline{\Omega}) \rightarrow H^{-1/2}(\partial \mathcal{O} \cup \partial \Omega) \), we have \( \tilde{Dl} \cdot \mathbf{n}|_{\partial \Omega} = 0 \).
Then \( \tilde{D}l \in H_0(\text{div}; \Omega) \), and hence \( Dl \in H_0(\text{div}; \Omega) \). Similarly, we can get \( \text{div} Dl \in H^1_0(\Omega) \).

Using \( l = \text{curl div} Dl \) and \( Dl \in H_0(\text{div}; \Omega) \), we have
\[
\langle l, u \rangle = \langle l, u \rangle + (\text{grad rot} \ l, \text{grad rot} \ u) = (\text{curl div} Dl, u) - (\text{div} Dl, \text{rot} u), \forall u \in H(\text{grad rot}; \Omega)
\]

Since \( C_0^\infty(\Omega) \) is dense in \( H^1_0(\Omega) \), there is a sequence \( \{\phi_n\}_{n=1}^\infty \subset C_0^\infty(\Omega) \) such that \( \phi_n \to \text{div} Dl \) in \( H^1_0(\Omega) \) as \( n \to \infty \). Then
\[
\langle l, u \rangle = (\text{curl div} Dl, u) - (\text{div} Dl, \text{rot} u) = \lim_{n \to \infty} \{\langle \text{curl} \phi_n, u \rangle - \langle \phi_n, \text{rot} u \rangle\} = 0, \forall u \in H(\text{grad rot}; \Omega).
\]

Therefore \( l \) also vanishes on \( H(\text{grad rot}; \Omega) \).

Similarly, we can prove the following lemma.

**Lemma 3.3.** \( C^\infty(\overline{\Omega}) \otimes V \) is dense in \( H(\text{curl div}; \Omega) \).

**Lemma 3.4.** For \( u \in H(\text{grad rot}; \Omega) \) and \( w \in H(\text{curl div}; \Omega) \), the following identity holds
\[
(\text{grad rot} \ u, w) + (\text{grad rot} \ u, w) = \langle u \cdot \tau, \text{div} w \rangle_{\partial \Omega} + \langle w \cdot n, \text{rot} u \rangle_{\partial \Omega}.
\]

**Proof.** It is easy to check that \( (3.21) \) holds for smooth functions \( u, w \). By Lemma 3.2, Lemma 3.3, Theorem 3.5, and Theorem 3.6, we can prove \( (3.21) \) for \( u \in H(\text{grad rot}; \Omega) \) and \( w \in H(\text{curl div}; \Omega) \).

**Lemma 3.5.** The space \( H_0(\text{curl div}; \Omega) \) can be characterized as
\[
H_0(\text{curl div}; \Omega) = \{w \in H(\text{curl div}; \Omega) : \text{div} w = 0, \ u \cdot n = 0 \text{ on } \partial \Omega\}.
\]

**Proof.** If \( w \in H_0(\text{curl div}; \Omega) \), i.e., the domain of the adjoint of \( \text{grad rot}, H(\text{grad rot}; \Omega) \), then there exists \( v \in L^2(\Omega) \otimes V \) such that
\[
(\text{grad rot} \ u, w) = -\langle u, v \rangle, \quad u \in H(\text{grad rot}; \Omega).
\]

Such a function \( w \) must be in \( H(\text{curl div}; \Omega) \) and satisfies \( \text{curl div} w = v \). Therefore, \( w \) belongs to \( H_0(\text{curl div}; \Omega) \) if and only if
\[
(\text{grad rot} \ u, w) = -\langle u, \text{curl div} w \rangle, \quad u \in H(\text{grad rot}; \Omega).
\]

From Lemma 3.4, the above identity holds if and only if
\[
\langle u \cdot \tau, \text{div} w \rangle_{\partial \Omega} + \langle w \cdot n, \text{rot} u \rangle_{\partial \Omega} = 0.
\]

which holds when \( \gamma_{n, \text{div}} w = \{w \cdot n, \text{div} w \} = 0 \) since \( \gamma_{\tau, \text{rot}} \) is surjective from \( H(\text{grad rot}; \Omega) \) to \( H^{-1/2}(\partial \Omega) \times H^{1/2}(\partial \Omega) \) (see Theorem 3.7).

**Lemma 3.6.** The space \( H_{\text{div}}(\text{curl div}; \Omega) \) can be characterized as
\[
H_{\text{div}}(\text{curl div}; \Omega) = \{w \in H(\text{curl div}; \Omega) : \text{div} w = 0 \text{ on } \partial \Omega\}.
\]

**Proof.** The proof is similar to that of Lemma 3.5.
4. Convergence analysis and explanations of spurious solutions

In this section, we prove that the mixed formulations provide correctly convergent solutions for both the source and the eigenvalue problems. Therefore the different solutions by other schemes in Section 2 are spurious. We also provide an explanation of the spurious solutions. Here we assume that $\Omega$ is simply-connected, and hence $\mathcal{S}_{\text{rot}}$ vanishes. Define

$$\mathcal{Z}_h = \{v_h \in V_h : \text{grad rot } v_h = 0\}.$$ 

From the finite element complexes in [12] and the vanishing $\mathcal{S}_{\text{rot}}$, we have $\mathcal{Z}_h = \text{grad } S_h$.

4.1. Source problem. We first show the convergence for the source problems.

According to [2, Theorem 5.4], Scheme 1 is stable if the following discrete Poincaré inequality holds. The discrete Poincaré inequality for $V_h$ is due to special structures of the $H(\text{grad curl})$-conforming elements and the complexes in [12][18], i.e., 1) these elements are subspaces of the Nédélec elements, 2) the 0-forms in the complexes [12] are the Lagrange elements (standard finite element differential forms).

**Lemma 4.1** (discrete Poincaré inequality for $V_h$). For $v_h \in V_h \cap \mathcal{Z}_h^1$, we have

$$\|v_h\|_{H(\text{grad rot}; \Omega)} \leq C\|\text{grad rot } v_h\|,$$

where $C$ is a constant independent of $h$.

**Proof.** Let $P_k^{-}\Lambda_l$ be the standard finite element differential $k$-forms on triangles [2], i.e., $l = 0$ corresponds to the Lagrange element and $l = 1$ corresponds to the Nédélec elements. Due to the interelement continuity, $V_h \subset P_k^{-}\Lambda_1$. Moreover, $\mathcal{Z}_h = \text{grad } S_h = \text{grad } P_k^{-}\Lambda^0$. Then (4.1) follows from the discrete Poincaré inequality of $P_k\Lambda^1$ and $P_k\Lambda^0$.

**Theorem 4.1.** Suppose that $\Omega$ is a simply-connected Lipschitz polygon. Let $(u_h, \sigma_h)$ be the numerical solution of Scheme 1 and $(u, \sigma)$ be the exact solution of the problem (3.13). Then

$$\|u - u_h\|_{H(\text{grad rot}; \Omega)} + \|\sigma - \sigma_h\|_1 \leq C h^\alpha (\|u\|_\alpha + \|\text{rot } u\|_{1+\alpha} + \|\sigma\|_{1+\alpha}).$$

**Proof.** When the harmonic function space vanishes, it follows from the proof of [2, Theorem 5.5] and the discrete Poincaré inequality that

$$\|u - u_h\|_{H(\text{grad rot}; \Omega)} + \|\sigma - \sigma_h\|_1 \leq C (\inf_{\tau_h \in S_h} \|\sigma - \tau_h\| + C \inf_{v_h \in V_h} \|u - v_h\|).$$

Let $\pi_h$ and $\Pi_h$ be the canonical interpolations to $S_h$ and $V_h$. From their approximation properties [18][12], we have

$$\|u - u_h\|_{H(\text{grad rot}; \Omega)} + \|\sigma - \sigma_h\|_1 \leq C h^\alpha (\|u\|_\alpha + \|\text{rot } u\|_{1+\alpha} + \|\sigma\|_{1+\alpha}).$$

Now we are in a position to explain the spurious solutions.

Let $H_{n,\text{rot}}^1(\Omega) = H^1(\text{rot}; \Omega) \cap X_{\text{rot}}$ denote the space of $H^1(\text{rot}; \Omega)$ vector fields with vanishing normal components and rot on the boundary, which is a closed subspaces of $H^1(\text{rot}; \Omega)$. Clearly, $H_{n,\text{rot}}^1(\Omega) \subset X_{\text{rot}}$. Moreover, by the Poincaré inequality and the fact that $\|\text{grad } u\|^2 = \|\text{rot } u\|^2 + \|\text{div } u\|^2$ for $u \in H_{n,\text{rot}}^1(\Omega)$ [2], we have, for $u \in H_{n,\text{rot}}^1(\Omega)$,

$$\|\text{grad rot } u\|^2 + \|\text{grad rot } u\|^2 \leq C(\|\text{grad rot } u\|^2 + \|\text{div } u\|^2) \leq C(\|\text{grad rot } u\|^2 + \|\text{grad } u\|^2).$$
Therefore, the restriction of the $X$-norm to $H^1_{n,\text{rot}}(\text{rot}; \Omega)$ is equivalent to the full norm of $H^1(\text{rot}; \Omega)$. It follows from the fact $H^1_{n,\text{rot}}(\text{rot}; \Omega)$ is closed in $H^1(\text{rot}; \Omega)$ that $H^1_{n,\text{rot}}(\text{rot}; \Omega)$ is a closed subspace of $X_{\text{rot}}$. To prove $X_{\text{rot}} \neq H^1_{n,\text{rot}}(\text{rot}; \Omega)$, it suffices to find a function in $X_{\text{rot}}$ which is not in $H^1_{n,\text{rot}}(\text{rot}; \Omega)$. Consider the function $\phi \in H^1(\Omega)$ such that $\Delta \phi \in L^2(\Omega)$ and $\frac{\partial \phi}{\partial n} = 0$ on $\partial \Omega$. When $\Omega$ is a nonconvex polygonal domain, we have $\phi \notin H^2(\Omega)$. Setting $u = \text{grad } \phi$, we see that $u \in X_{\text{rot}}$ but $u \notin H^1_{n,\text{rot}}(\text{rot}; \Omega)$. For any such function $u$, we have

$$\inf_{v \in H^1_{n,\text{rot}}(\text{rot}; \Omega)} \| u - v \|_X = \delta_u > 0,$$

where $\delta_u$ is the distance of $u$ from $H^1_{n,\text{rot}}(\text{rot}; \Omega)$.

Therefore, if the finite element space $V_h$ is contained in $H^1_{n,\text{rot}}(\text{rot}; \Omega)$, then the numerical solution $u_h \in V_h$ can not converge to $u$ in general. The mixed variational formulation, however, does not suffer from this restriction, and hence does not lead to spurious solutions. On the other hand, the choice of finite elements are crucial for the success of the mixed formulations. The finite elements shown above are stable as they fit into complexes.

Since $\dim \mathcal{N}_{\text{rot}} = \beta_1 = 1$ on $\Omega_2$, there is a zero eigenvalue on $\Omega_2$ corresponding to the harmonic forms in $\mathcal{N}_{\text{rot}}$. However, Scheme 7 and Scheme 8 fail to capture this zero eigenmode. The same issue occurs for the numerical solutions of the problem (2.8). Generally speaking, this is because the formulations and finite elements do not respect the underlying cohomological structures of the grad rot complex.

### 4.2. Eigenvalue problem

To obtain the convergence estimate for Scheme 5 we rewrite (2.7) and Scheme 6 as follows.

Seek $(\tilde{\lambda}, u, \sigma) \in \mathbb{R} \times H^1(\text{rot}; \Omega) \times H^1(\Omega)$ such that

$$\begin{align*}
(\text{grad rot } u, \text{grad rot } v) + (u, v) + (\text{grad } \sigma, v) &= \tilde{\lambda} (u, v), \quad \forall v \in H^1(\text{rot}; \Omega), \\
(u, \text{grad } \tau) - (\sigma, \tau) &= 0, \quad \forall \tau \in H^1(\Omega).
\end{align*}
$$

Find $(\tilde{\lambda}_h, u_h, \sigma_h) \in \mathbb{R} \times V_h \times S_h$, such that

$$\begin{align*}
(\text{grad rot } u_h, \text{grad rot } v_h) + (u_h, v_h) + (\text{grad } \sigma_h, v_h) &= \tilde{\lambda}_h (u_h, v_h), \quad \forall v_h \in V_h, \\
(u_h, \text{grad } \tau_h) - (\sigma_h, \tau_h) &= 0, \quad \forall \tau_h \in S_h.
\end{align*}
$$

Note that $\tilde{\lambda} = \lambda + 1$ and $\tilde{\lambda}_h = \lambda_h + 1$. We also consider the corresponding source problem and its finite element discretization.

Seek $(u, \sigma) \in H^1(\text{rot}; \Omega) \times H^1(\Omega)$ such that

$$\begin{align*}
(\text{grad rot } u, \text{grad rot } v) + (u, v) + (\text{grad } \sigma, v) &= (f, v), \quad \forall v \in H^1(\text{rot}; \Omega), \\
(u, \text{grad } \tau) - (\sigma, \tau) &= 0, \quad \forall \tau \in H^1(\Omega).
\end{align*}
$$

Find $(u_h, \sigma_h) \in V_h \times S_h$, such that

$$\begin{align*}
(\text{grad rot } u_h, \text{grad rot } v_h) + (u_h, v_h) + (\text{grad } \sigma_h, v_h) &= (f, v_h), \quad \forall v_h \in V_h, \\
(u_h, \text{grad } \tau_h) - (\sigma_h, \tau_h) &= 0, \quad \forall \tau_h \in S_h.
\end{align*}
$$

By suitable modification to the proof of [2, Theorem 4.8]) and [2, Theorem 4.9]), we can show the problem (4.4) is well-posed, and (3.16) holds. Similar to the problem (3.13), we can get the same regularity estimate as Theorem 3.4.

Define the solution operators $T : L^2(\Omega) \otimes V \to L^2(\Omega) \otimes V$ and $S : L^2(\Omega) \otimes V \to H^1(\Omega)$ by

$$Tf := u \quad \text{and} \quad Sf := \sigma.$$
We introduce the following auxiliary problem: find \( \hat{\sigma} \). The discrete problem is to find \( \hat{\sigma} \) by

\[
T_h f := u_h \text{ and } S_h f := \sigma_h.
\]

From (4.14) and (4.15), these operators are bounded and satisfy

\[
\| T f \|_{H(\text{grad rot};\Omega)} \leq \| f \|, \quad \| T_h f \|_{H(\text{grad rot};\Omega)} \leq \| f \|,
\]

\[
\| S f \|_1 \leq \| f \|, \quad \text{and } \| S_h f \|_1 \leq \| f \|.
\]

We have the following orthogonality:

\[
(T f - T_h f, v_h)_{H(\text{grad rot};\Omega)} + (\text{grad}(S f - S_h f), v_h) = 0, \quad \forall \ v_h \in V_h,
\]

\[
(T f - T_h f, \text{grad } \tau_h) - (S f - S_h f, \tau_h) = 0, \quad \forall \ \tau_h \in S_h.
\]

Taking \( v_h = \text{grad } \tau_h \) in the first equation of (4.7) and subtracting the second equation from the first equation, we obtain

\[
(\text{grad}(S f - S_h f), \text{grad } \tau_h) + (S f - S_h f, \tau_h) = 0.
\]

If we can prove \( \| T - T_h \|_{L^2(\Omega) \to L^2(\Omega)} \to 0 \), then from the spectral approximation theory in [4], the eigenvalues of (4.3) converge to the eigenvalues of (4.2), and hence, the eigenvalues of Scheme 4 converge to the eigenvalues of (2.7).

To obtain the uniform convergence, we present some preliminary results. First, we will need the Hodge mapping \( \hat{q} \) of \( q_h \), which is a continuous approximation of a finite element function [9, 10]. In fact, for any \( q_h \in \mathcal{P}_1(\Omega) \cap V_h \), there exists \( \hat{q} \in H(\text{rot};\Omega) \cap H_0(\text{div};\Omega) \) satisfying \( \text{rot } q_h = \text{rot } \hat{q} \). Here \( H_0(\text{div};\Omega) := \{ u \in H(\text{div};\Omega) : \text{div } u = 0 \} \).

**Lemma 4.2.** There exists a constant \( C \) independent of \( q_h \) and \( h \) such that

\[
\| \hat{q} - q_h \| \leq C h^\alpha \| \hat{q} \|, \quad \forall q_h \in \mathcal{P}_1(\Omega) \cap V_h.
\]

**Proof.** Proceeding as the proof of [14, Lemma 7.6] or [10, Lemma 4.5], we can complete the proof. \( \blacksquare \)

**Lemma 4.3.** Under the assumptions of Theorem 3.4, the solutions of (4.4) and (4.5) satisfy

\[
\| \sigma - \sigma_h \| \leq C h^\alpha \| f \|.
\]

**Proof.** We introduce the following auxiliary problem: find \( \hat{\sigma} \in H^1(\Omega) \) such that

\[
(\text{grad } \hat{\sigma}, \text{grad } \tau) + (\hat{\sigma}, \tau) = (\sigma - \sigma_h, \tau), \quad \forall \tau \in H^1(\Omega).
\]

The discrete problem is to find \( \hat{\sigma}_h \in S_h \) such that

\[
(\text{grad } \hat{\sigma}_h, \text{grad } \tau_h) + (\hat{\sigma}_h, \tau_h) = (\sigma - \sigma_h, \tau_h), \quad \forall \tau_h \in S_h.
\]

According to Theorem 3.18 in [14] again, there exists the same constant \( \alpha > 1/2 \) such that

\[
\| \hat{\sigma} \|_{1+\alpha} \leq C \| \sigma - \sigma_h \|.
\]

From the Ceá lemma, we have

\[
\| \hat{\sigma} - \hat{\sigma}_h \|_1 \leq C h^\alpha \| \hat{\sigma} \|_{1+\alpha} \leq C h^\alpha \| \sigma - \sigma_h \|.
\]

Taking \( \tau = \sigma - \sigma_h \) in (4.9) and applying (4.8), we obtain

\[
(\sigma - \sigma_h, \sigma - \sigma_h) = (\hat{\sigma}, \sigma - \sigma_h) + (\text{grad } \hat{\sigma}, \text{grad } (\sigma - \sigma_h)) = (\hat{\sigma} - \hat{\sigma}_h, \sigma - \sigma_h) + (\text{grad } (\hat{\sigma} - \hat{\sigma}_h), \text{grad } (\sigma - \sigma_h))
\]

\[
\leq C h^\alpha \| \hat{\sigma} - \hat{\sigma}_h \| + C h^\alpha \| \sigma - \sigma_h \|.
\]
Collecting all the estimates, we complete the proof.

Now it remains to estimate \(IV\). We decompose \(\tilde{\sigma}_h\) which together with (4.6) leads to

\[\|\sigma - \sigma_h\| \leq Ch^\alpha \|\sigma - \sigma_h\| \leq Ch^\alpha \|f\|.

\[\]

We are now in a position to estimate \(\|T - T_h\|\).

**Theorem 4.2.** Under the assumptions of Theorem 3.4, we have

\[\|T - T_h\|_{L^2 (\Omega) \rightarrow L^2 (\Omega)} \leq Ch^\alpha.

**Proof.** We shall prove \(\|u - u_h\| \leq Ch^\alpha \|f\|\). Denote \(\tilde{u} = T(u - u_h)\), \(\tilde{u}_h = T_h(u - u_h)\), \(\tilde{\sigma} = S(u - u_h)\), and \(\tilde{\sigma}_h = S_h(u - u_h)\). Proceeding as the dual argument, we have

\[
(u - u_h, u - u_h) = (\tilde{u}, u - u_h)_{H(\text{grad}, \Omega)} + (\text{grad} \tilde{\sigma}, u - u_h)
\]

\[
= (\tilde{u} - \tilde{u}_h, u - u_h)_{H(\text{grad}, \Omega)} + (\text{grad} \tilde{\sigma}, u - u_h) - (\text{grad} \sigma - \sigma_h, \tilde{u}_h) \quad \text{by (4.7)}
\]

\[
= (\tilde{u} - \tilde{u}_h, u - \Pi_h u)_{H(\text{grad}, \Omega)} + (\text{grad} (\tilde{\sigma} - \tilde{\sigma}_h), u - \Pi_h u) + (\sigma - \sigma_h, \tilde{\sigma}_h) \quad \text{by (4.7), (4.8)}
\]

\[
- (\text{grad}(\sigma - \sigma_h), \tilde{u}_h) =: I + II + III + IV,
\]

where \(\Pi_h\) is the canonical interpolation to \(V_h\). Applying (4.6) and the approximation property of \(\Pi_h\), we have

\[
I + II \leq \|u - \Pi_h u\|_{H(\text{grad}, \Omega)} \left(\|\tilde{u} - \tilde{u}_h\|_{H(\text{grad}, \Omega)} + \|\text{grad} (\tilde{\sigma} - \tilde{\sigma}_h)\|\right)
\]

\[
\leq C\|u - \Pi_h u\|_{H(\text{grad}, \Omega)} \|u - u_h\|
\]

\[
\leq Ch^\alpha \|u - u_h\| \left(\|u\|_\alpha + \|\text{rot} u\|_{1+\alpha}\right)
\]

\[
\leq Ch^\alpha \|f\| \|u - u_h\|.
\]

Using Lemma 4.3, we get

\[
III \leq Ch^\alpha \|f\| \|\tilde{\sigma}_h\| \leq Ch^\alpha \|f\| \|u - u_h\|.
\]

Now it remains to estimate IV. We decompose \(\tilde{u}_h = p_h + q_h\) with \(p_h \in Z_h\) and \(q_h \in Z_h^\perp \cap V_h\). Then

\[
IV = (\text{grad}(\sigma - \sigma_h), \tilde{u}_h) = (\text{grad}(\sigma - \sigma_h), q_h) + (\text{grad}(\sigma - \sigma_h), p_h) =: IV_1 + IV_2.
\]

Applying Lemma 4.2, we obtain

\[
IV_1 = (\text{grad}(\sigma - \sigma_h), q_h - q) \leq Ch^\alpha \|\text{rot} q_h\| \|f\| \leq Ch^\alpha \|\text{rot} \tilde{u}_h\| \|f\| \leq Ch^\alpha \|u - u_h\| \|f\|.
\]

Since \(Z_h = S_h\), there exists a function \(\phi_h \in S_h\) satisfying \((\phi_h, 1) = 0\) and \(p_h = \text{grad} \phi_h\). By (4.8), we get

\[
IV_2 = (\text{grad}(\sigma - \sigma_h), \text{grad} \phi_h) = - (\sigma - \sigma_h, \phi_h) \leq C\|\sigma - \sigma_h\| \|\text{grad} \phi_h\|
\]

\[= C\|\sigma - \sigma_h\| \|p_h\| \leq C\|\sigma - \sigma_h\| \|\tilde{u}_h\| \leq Ch^\alpha \|f\| \|u - u_h\|.
\]

Collecting all the estimates, we complete the proof. \(\blacksquare\)
5. Conclusion

In this paper, we showed that inappropriate discretizations for high order curl problems lead to spurious solutions. Comparing to the spurious solutions of the Maxwell and biharmonic equations, the differential structure and the high order nature of these operators bring in new ingredients, e.g., the failure of capturing zero eigenmodes by some finite element methods. This issue is rooted in the cohomological structures of the grad rot complex, which further shows that the algebraic structures in the (generalized) BGG complexes have a practical impact for computation (even though the grad rot complex is the simplest example in the framework). Reliable numerical methods, e.g., mixed formulations with elements in a complex, should respect these cohomological structures. The algebraic and analytic results for the grad rot complex also have various consequences for the high order curl problems, e.g., equivalent variational forms and the well-posedness etc.

Future directions include, e.g., bounded cochain projections for the finite elements and kernel-capturing algebraic solvers.
