#### Abstract

This paper studies the $N$-tuple noncommutative Orlicz spaces $\bigoplus_{j=1}^{n} L_{p, \lambda}^{\left(\Phi_{j}\right)}(\widetilde{\mathcal{M}}, \tau)$, where $L^{\left(\Phi_{j}\right)}(\widetilde{\mathcal{M}}, \tau)$ is noncommutative Orlicz spaces and $\widetilde{\mathcal{M}}$ is the $\tau$-measurable operators. Based on the maximum principle, we give the Riesz-Thorin interpolation theorem on $\bigoplus_{j=1}^{n} L_{p, \lambda}^{\left(\Phi_{j}\right)}(\widetilde{\mathcal{M}}, \tau)$. As applications, the Clarkson inequality and some geometrical properties such as uniform convexity and unform smooth of noncommutative Orlicz space $L^{\left(\Phi_{s}\right)}(\widetilde{\mathcal{M}}, \tau), 0<s \leq 1$ are given.

Keywords: Noncommutative Orlicz spaces, $\tau$-measurable operator, von Neumann algebra, Orlicz function, Riesz-Thorin interpolation
2010 MSC: 46L52, 47L10, 46A80

## 1. Preliminaries

In 1936, for study uniform convexity of $L^{p}$ space, Clarkson gave some famous inequalities named Clarkson inequality [3]. In [10], the author used the noncommutative Riesz-Thorin interpolation theorem get the Clarkson inequality on noncommu5 tative $L^{p}$ space. The principal objective of this paper is to investigate Riesz-Thorin interpolation theorem on noncommutative Orlicz spaces which yields the Clarkson inequality of noncommutative $L^{p}$ space. As applications, some geometrical properties such as uniform convexity and unform smooth of noncommutative Orlicz space $L^{\left(\Phi_{s}\right)}(\widetilde{\mathcal{M}}, \tau), 0<s \leq 1$ are given.

[^0] and Kunze [12]. Let $\mathcal{M}$ be a semi-finite von Neumann algebra acting on a Hilbert space $\mathcal{H}$ with a normal semi-finite faithful trace $\tau$. A densely-defined closed linear operator $A: \mathcal{D}(A) \rightarrow \mathcal{H}$ with domain $\mathcal{D}(A) \subseteq \mathcal{H}$ is called affiliated with $\mathcal{M}$ if and only if $U^{*} A U=A$ for all unitary operators $U$ belonging to the commutant $\mathcal{M}^{\prime}$ of $\mathcal{M}$. Clearly, if $A \in \mathcal{M}$ then $A$ is affiliated with $\mathcal{M}$. If $A$ is a (densely-defined closed) operator affiliated with $\mathcal{M}$ and $A=U|A|$ the polar decomposition, where $|A|=\left(A^{*} A\right)^{\frac{1}{2}}$ and $U$ is a partial isometry, then $A$ said to be $\tau$-measurable if and only if there exists a number $\lambda \geq 0$ such that $\tau\left(e_{(\lambda, \infty)}(|A|)\right)<\infty$, where $e_{[0, \lambda]}$ is the spectral projection of $|A|$ and $\tau$ is the trace of normal faithful and semifinite. The collection of all $\tau$-measurable operators is denoted by $\widetilde{\mathcal{M}}$. The spectral decomposition implies that a von Neumann algebra $\mathcal{M}$ is generated by its projections. Recall that an element $A \in \mathcal{M}_{+}$is a linear combination of mutually orthogonal projections if $A=\sum_{k=1}^{n} \alpha_{k} e_{k}$ with $\alpha_{k} \in \mathbb{R}_{+}$and projection $e_{k} \in \mathcal{M}$ such that $e_{k} e_{j}=0$ whenever $k \neq j$ [10].

Next we recall the definition and some basic properties of noncommutative Orlicz spaces.

A function $\Phi:[0, \infty) \rightarrow[0, \infty]$ is called an Orlicz function if and only if $\Phi(u)=$ $\int_{0}^{|u|} p(t) d t$, where the right derivative $p$ of $\Phi$ satisfies $p$ is right-continuous and nondecreasing, $p(t)>0$ whenever $t>0$ and $p(0)=0$ with $\lim _{t \rightarrow \infty} p(t)=\infty$ [11]. Further we say an Orlicz function $\Phi$ satisfies the $\Delta_{2}$-condition for large $t$ (for small $t$, or for all $t$ ), written often as $\Phi \in \Delta_{2}$, if there exist constants $t_{0}>0, K>2$ such that $\Phi(2 t) \leq K \Phi(t)$ for $|t| \geq t_{0}[7]$.

If $A \in \widetilde{\mathcal{M}}$ and $\Phi$ is an Orlicz function, we denote $\widetilde{\rho}_{\Phi}(A)=\tau(\Phi(|A|))$, hence we can define a corresponding space, which is named the noncommutative Orlicz space, as follows:

$$
L^{\Phi}(\widetilde{\mathcal{M}}, \tau)=\{A \in \widetilde{\mathcal{M}}: \tau(\Phi(\lambda|A|))<\infty \text { for some } \lambda>0\}
$$

Also we could define the subspace

$$
E^{\Phi}(\widetilde{\mathcal{M}}, \tau)=\{A \in \widetilde{\mathcal{M}}: \tau(\Phi(\lambda|A|))<\infty \text { for any } \lambda>0\}
$$

We equip these spaces with the Luxemburg norm

$$
\|A\|_{(\Phi)}=\inf \left\{\lambda>0: \tau\left(\Phi\left(\frac{|A|}{\lambda}\right)\right) \leq 1\right\} .
$$

In the case of $\Phi(A)=|A|^{p}, 1 \leq p<\infty, L^{(\Phi)}(\widetilde{\mathcal{M}}, \tau)$ is nothing but the noncommutative space $L^{p}(\widetilde{\mathcal{M}}, \tau)=\left\{A \in \widetilde{\mathcal{M}}: \tau\left(|A|^{p}\right)<\infty\right\}$ [5] and the Luxemburg norm
generated by this function is expressed by the formula

$$
\|A\|_{p}=\left(\tau\left(|A|^{p}\right)\right)^{\frac{1}{p}}
$$

One can define another norm on $L^{\Phi}(\widetilde{\mathcal{M}}, \tau)$ as follows

$$
\|A\|_{\Phi}=\sup \left\{\tau(|A B|): B \in L^{\Psi}(\widetilde{\mathcal{M}}, \tau) \text { and } \tau(\Psi(B)) \leq 1\right\}
$$

where $\Psi:[0, \infty) \rightarrow[0, \infty]$ is defined by $\Psi(u)=\sup \{u v-\Phi(v): v \geq 0\}$. Here we call $\Psi$ the complementary function of $\Phi$. In the following, we use $L^{(\Phi)}(\widetilde{\mathcal{M}}, \tau)$ and $L^{\Phi}(\widetilde{\mathcal{M}}, \tau)$ denote the Orlicz which equipped Luxemberg and Orlicz norm respectively. The same as $E^{(\Phi)}(\widetilde{\mathcal{M}}, \tau)$ and $E^{\Phi}(\widetilde{\mathcal{M}}, \tau)$.

For more information on the theory of noncommutative Orlicz spaces we refer the reader to $[8,9,2,12,5,6]$.

## 2. Riesz-Thorin interpolation theorem of Noncommutative Orlicz spaces

In this section, we will give the definition of $N$-tuple noncommutative Orlicz spaces, also give some norm inequalities. For research the Riesz-Thorin interpolation theorem, a equivalent definition of Luxmburg norm must be given. As a corollary, the Clarkson inequality of noncommutive $L^{p}$ space could be get. The main ideas and proof ideas in this article are derived from literatures [10] and [7].

Now let $\mathcal{N}=\mathcal{M} \oplus \mathcal{M} \oplus \cdots \oplus \mathcal{M}$ be the $n$-th von Neumann algebra direct sum of $\mathcal{M}$ with it self. We know that $\mathcal{N}$ acts on the direct sum Hilbert space $\mathcal{H} \oplus \mathcal{H} \oplus \cdots \oplus \mathcal{H}$ coordinatewise:

$$
\left(A_{1}, A_{2}, \ldots, A_{n}\right)\left(x_{1}, x_{2}, \ldots, x_{n}\right)=\sum_{j=1}^{n} A_{j} x_{n}
$$

where $A_{j} \in \mathcal{M}, i=1,2, \ldots n$. Then $\mathcal{N}_{+}=\mathcal{M}_{+} \oplus \mathcal{M}_{+} \oplus \cdots \oplus \mathcal{M}_{+}$.
Define: $v: \mathcal{N}_{+} \rightarrow \mathbb{C}$ by $v\left(A_{1}, A_{2}, \ldots, A_{n}\right)=\sum_{j=1}^{n} \lambda_{j} \tau\left(A_{j}\right)$, where $\lambda_{j} \geq 0$ and $\tau$ is a normal faithful normal faithful normalized trace on $\mathcal{M}$, then $v$ is a normal faithful normal faithful normalized trace on $\mathcal{N}$. Now we give the following definition:

Definition 2.1. Let $\Phi=\left(\Phi_{1}, \Phi_{2}, \ldots \Phi_{n}\right)$ be an n-tuple of $N$ functions $\Phi_{j}$. For each $p \geq 1, \lambda_{j} \geq 0$, and $n$-tuple of wights $\lambda=\left(\lambda_{1}, \ldots, \lambda_{n}\right)$ consider the direct sum space, named n-tuple of wights noncommutative Orlicz spaces as follows:

$$
\bigoplus_{j=1}^{n} E_{p, \lambda}^{\left(\Phi_{j}\right)}=\left\{A=\left(A_{1}, A_{2}, \ldots, A_{n}\right): A_{j} \in E^{\left(\Phi_{j}\right)}(\widetilde{\mathcal{M}}, \tau), 1 \leq j \leq n\right\}
$$

with norm $\|\cdot\|_{(\Phi), p, \lambda}$ defined for $A_{j} \in E^{\left(\Phi_{j}\right)}(\widetilde{\mathcal{M}}, \tau)$ :

$$
\|A\|_{(\Phi), p, \lambda}= \begin{cases}{\left[\sum_{j=1}^{n} \lambda_{j}\left\|A_{j}\right\|_{\left(\Phi_{j}\right)}^{p}\right]^{\frac{1}{p}},} & 1 \leq p<\infty \\ \max _{j}\left\|A_{j}\right\|_{\left(\Phi_{j}\right)}, & p=\infty\end{cases}
$$

or the norm $\|\cdot\|_{\Phi, p, \lambda}$ defined in the same way as before in which $\|\cdot\|_{\left(\Phi_{j}\right)}$ is replaced by the Orlicz norm $\|\cdot\|_{\Phi_{j}}$, denotes by $\bigoplus_{j=1}^{n} E_{p, \lambda}^{\Phi_{j}}$. The same way, if $\Psi_{j}$ is the complementary N-function of $\Phi_{j}$, denotes by $\bigoplus_{j=1}^{n} E_{q, \lambda}^{\left(\Psi_{j}\right)}$ which equip with $\|\cdot\|_{(\Psi), q, \lambda}$ and $\bigoplus_{j=1}^{n} E_{q, \lambda}^{\Psi_{j}}$ which equip with $\|\cdot\|_{\Psi, q, \lambda}$ for the same weights $\lambda=\left(\lambda_{1}, \ldots, \lambda_{n}\right)$ and $q=\frac{p}{p-1}$. The same way, we also could define $\bigoplus_{j=1}^{n} L_{p, \lambda}^{\left(\Phi_{j}\right)}, \bigoplus_{j=1}^{n} L_{p, \lambda}^{\Phi_{j}}, \bigoplus_{j=1}^{n} L_{q, \lambda}^{\left(\Psi_{j}\right)}, \bigoplus_{j=1}^{n} L_{q, \lambda}^{\Psi_{j}}$, and the norm as before.
Remark 1. By the Theorem 3.4 of [5], if for any $1 \leq j \leq n$ with $\Phi_{j} \in \Delta_{2}$, we have ${ }_{55} \bigoplus_{j=1}^{n} L_{p, \lambda}^{\left(\Phi_{j}\right)}=\bigoplus_{j=1}^{n} E_{p, \lambda}^{\left(\Phi_{j}\right)}$.

Lemma 2.1. If $A \in \bigoplus_{j=1}^{n} L_{p, \lambda}^{\left(\Phi_{j}\right)}$ and $B \in \bigoplus_{j=1}^{n} L_{q, \lambda}^{\Psi_{j}}$, where $1 \leq p<\infty$, we have
(1) If $\|A\|_{(\Phi), p, \lambda} \leq 1$, then we have $v(\Phi(A)) \leq\|A\|_{(\Phi), p, \lambda} \cdot \delta_{1}$, where $\delta_{1}=\left(\sum_{j=1}^{n} \lambda_{j}\right)^{\frac{1}{q}}$.
(2) If $\|A\|_{(\Phi), p, \lambda}>1$, then we have $v(\Phi(A))>\delta_{2}$, where $\delta_{2}=\left[\sum_{j=1}^{n} \lambda_{j}^{p}\left\|A_{j}\right\|_{\left(\Phi_{j}\right)}^{p}\right]^{\frac{1}{p}}$.
(3) $v(A B) \leq\|A\|_{(\Phi), p, \lambda} \cdot\|B\|_{\Psi, q, \lambda}$.
${ }_{60}$ Proof. (1) If $\|A\|_{(\Phi), p, \lambda} \leq 1$, then from Proposition 3.4 of [2] and classical Hölder inequality, we have

$$
\begin{aligned}
v(\Phi(A)) & =\sum_{j=1}^{n} \lambda_{j} \tau\left(\Phi_{j}\left(A_{j}\right)\right) \\
& =\sum_{j=1}^{n} \lambda_{j}^{\frac{1}{q}} \cdot \lambda_{j}^{\frac{1}{p}} \tau\left(\Phi_{j}\left(A_{j}\right)\right) \\
& \leq\left[\sum_{j=1}^{n} \lambda_{j}\left[\tau\left(\Phi_{j}\left(A_{j}\right)\right)\right)^{p}\right]^{\frac{1}{p}} \cdot\left(\sum_{j=1}^{n} \lambda_{j}\right)^{\frac{1}{q}} \\
& \leq\left[\sum_{j=1}^{n} \lambda_{j}\left\|A_{j}\right\|_{\left(\Phi_{j}\right)}^{p}\right]^{\frac{1}{p}} \cdot \delta_{1} \\
& =\|A\|_{(\Phi), p, \lambda} \cdot \delta_{1}
\end{aligned}
$$

(2) If $\|A\|_{(\Phi), p, \lambda}>1$, then from Proposition 3.4 of [2], we have

$$
\begin{aligned}
{[v(\Phi(A))]^{p} } & =\left[\sum_{j=1}^{n} \lambda_{j} \tau\left(\Phi_{j}\left(A_{j}\right)\right)\right]^{p} \\
& >\left[\sum_{j=1}^{n} \lambda_{j}\left\|A_{j}\right\|_{\left(\Phi_{j}\right)}\right]^{p} \\
& \geq \sum_{j=1}^{n} \lambda_{j}^{p}\left\|A_{j}\right\|_{\left(\Phi_{j}\right)}^{p},
\end{aligned}
$$

which means that

$$
v(\Phi(A))>\left[\sum_{j=1}^{n} \lambda_{j}^{p}\left\|A_{j}\right\|_{\left(\Phi_{j}\right)}^{p}\right]^{\frac{1}{p}}=\delta_{2} .
$$

(3) From Theorem 3.3 of [2] and classical Hölder inequality, we get that

$$
\begin{aligned}
v(A B) & =\sum_{j=1}^{n} \lambda_{j}\left|\tau\left(A_{j} B_{j}\right)\right| \\
& \leq \sum_{j=1}^{n} \lambda_{j}^{\frac{1}{p}+\frac{1}{q}}\left\|A_{j}\right\|_{(\Phi)}\left\|B_{j}\right\|_{\Psi} \\
& \leq\left(\sum_{j=1}^{n} \lambda_{j}\left\|A_{j}\right\|_{(\Phi)}^{p}\right)^{\frac{1}{p}} \cdot\left(\sum_{j=1}^{n} \lambda_{j}\left\|B_{j}\right\|_{\Psi}^{q}\right)^{\frac{1}{q}} \\
& =\|A\|_{(\Phi), p, \lambda} \cdot\|B\|_{\Psi, q, \lambda},
\end{aligned}
$$

Remark 2. If $\Phi$ is 1-tuple $N$-function and $\lambda=1$, the Lemma 2.1 just be the Theorem 3.3 and Proposition 3.4 of [2].

Theorem 2.1. If $A \in \bigoplus_{j=1}^{n} E_{p, \lambda}^{\left(\Phi_{j}\right)}$, then for $1 \leq p<\infty$, the weighted norms $\|\cdot\|_{(\Phi), p, \lambda}$ is given by

$$
\|A\|_{(\Phi), p, \lambda}=\sup \left\{v(A B):\|B\|_{\Psi, q, \lambda} \leq 1\right\}
$$

Proof. If $\|B\|_{\Psi, q, \lambda} \leq 1$. One side, by (3) of the Lemma 2.1, we have

$$
v(A B) \leq\|A\|_{(\Phi), p, \lambda} \cdot\|B\|_{\Psi, q, \lambda} \leq\|A\|_{(\Phi), p, \lambda} .
$$

The other side, for simplicity, we may take that $\|A\|_{(\Phi), p, \lambda}=1$ and assume that $A_{j} \geq 0$. Let $\left\{e_{j n}\right\}$ be the projection of $A_{j}$ and $0<\tau\left(e_{j n}\right)<\infty$. By Proposition 3.4 of [2], for any $\varepsilon>0$, we have $\tau\left[\Phi_{j}\left((1+\varepsilon) A_{j}\right)\right] \geq\left\|(1+\varepsilon) A_{j}\right\|_{\left(\Phi_{j}\right)}=1+\varepsilon$.

If we define the operator $A_{j m}=A_{j}\left(e_{j 1}+e_{j 2}+\cdots+e_{j m}\right)(m \leq n)$, where $A_{j}=$ $\sum_{k=1}^{n} \alpha_{k} e_{j k}$ and $e_{j k}=0, k>n$, then $A_{j m} \uparrow A_{j}$ as $m \rightarrow \infty$, there exists an $m_{0}$ such that for $m \geq m_{0}$ one have

$$
v\left[\frac{1}{\delta_{2}} \Phi\left((1+\varepsilon) A_{m}\right)\right]=\sum_{k=1}^{n} \frac{1}{\delta_{2}} \lambda_{j} \Phi_{j}\left((1+\varepsilon) A_{j m}\right) \geq\left(1+\frac{\varepsilon}{2}\right) .
$$

If we set

$$
B_{j m}=\frac{\delta_{2}^{-1} p\left((1+\varepsilon) \lambda_{j} A_{j m}\right)}{\delta_{1}\left(1+\tau\left(\Psi_{j}\left(\delta_{2}^{-1} p\left((1+\varepsilon) \lambda_{j} A_{j m}\right)\right)\right)\right)},
$$

then $B_{j m}$ is bounded operators and $B_{m} \in \bigoplus_{j=1}^{n} E_{q, \lambda}^{\Psi_{j}}$ for each $m$. Moreover by definition 1.7 of [5] and 1.9 of [11] we have, $\left\|B_{j m}\right\|_{\Psi_{j}, q, \lambda} \leq 1$ since $\|A\|_{(\Phi), p, \lambda}=1$.

Hence,

$$
\left\|B_{m}\right\|_{\Psi, q, \lambda}=\left(\sum_{j=1}^{n} \lambda_{j}\left\|B_{j m}\right\|_{\Psi_{j}}^{q}\right)^{\frac{1}{q}} \leq 1 .
$$

However, one has

$$
\begin{aligned}
\sup \{v(A B)\} & =\sup \left\{\sum_{j=1}^{n} \lambda_{j} \tau\left(A_{j} B_{j}\right): B_{j} \in E^{\Psi_{j}},\|B\|_{\Psi, q, \lambda} \leq 1\right\} \\
& \geq \sup _{m \geq m_{0}}\left\{\sum_{j=1}^{n} \lambda_{j} \tau\left(A_{j} B_{j m}\right): B_{j m} \in E^{\Psi_{j}},\left\|B_{m}\right\|_{\Psi, q, \lambda} \leq 1\right\} \\
& \geq \frac{1}{1+\varepsilon} \sup _{m \geq m_{0}}\left\{\sum_{j=1}^{n} \tau\left((1+\varepsilon) \lambda_{j} A_{j m} B_{j m}\right)\right\} \\
& =\frac{1}{1+\varepsilon} \sup _{m \geq m_{0}}\left\{\sum_{j=1}^{n} \frac{\tau\left(\Phi_{j}(1+\varepsilon) \lambda_{j} A_{j m}\right)+\tau\left(\Psi_{j}\left(\delta_{2}^{-1} p(1+\varepsilon) \lambda_{j} A_{j m}\right)\right)}{\delta_{1} \delta_{2}\left(1+\tau\left(\Psi_{j}\left(\delta_{2}^{-1} p(1+\varepsilon) \lambda_{j} A_{j m}\right)\right)\right)}\right\} \\
& >\frac{1}{1+\varepsilon},
\end{aligned}
$$

since $\varepsilon>0$ is arbitrary we get the desired inequality.
Definition 2.2. [1] Let $\Phi_{1}$ and $\Phi_{2}$ be $N$-functions and define $\Phi_{s}$ to be the inverse of $\Phi_{s}^{-1}(u)=\left[\Phi_{1}^{-1}(u)\right]^{1-s}\left[\Phi_{2}^{-1}(u)\right]^{s}$ for $0 \leq s \leq 1, u \geq 0$, where $\Phi^{-1}$ is the unique inverse of the $N$-function $\Phi$.

Theorem 2.2. Let $\Phi_{i}=\left(\Phi_{i 1}, \Phi_{i 2}, \ldots \Phi_{i n}\right), Q_{i}=\left(Q_{i 1}, Q_{i 2}, \ldots Q_{i n}\right), i=1,2$ be $n$ tuples of $N$-functions and $0 \leq r_{1}, r_{2}, t_{1}, t_{2} \leq \infty, \lambda=\left(\lambda_{1}, \ldots, \lambda_{n}\right)$ be given positive numbers. Next let $\Phi_{s}=\left(\Phi_{s 1}, \Phi_{s 2}, \ldots \Phi_{s n}\right), Q_{s}=\left(Q_{s 1}, Q_{s 2}, \ldots Q_{s n}\right)$ be the associated
intermediate $N$-functions,

$$
\frac{1}{r_{s}}=\frac{1-s}{r_{1}}+\frac{s}{r_{2}}, \frac{1}{t_{s}}=\frac{1-s}{t_{1}}+\frac{s}{t_{2}}, 0 \leq s \leq 1 .
$$

If $T: \bigoplus_{j=1}^{n} E_{r_{i}, \lambda}^{\left(\Phi_{i j}\right)} \rightarrow \bigoplus_{j=1}^{n} L_{t_{i}, \lambda}^{\left(Q_{i j}\right)}$ is a bounded linear operator with bounds $K_{1}, K_{2}$, such that $\|T A\|_{\left(Q_{i}\right), t_{i}, \lambda} \leq K_{i}\|A\|_{\left(\Phi_{i}\right), r_{i}, \lambda}, A \in \bigoplus_{j=1}^{n} E_{r_{i}, \lambda}^{\left(\Phi_{i j}\right)}, i=1,2$.

Then $T$ is also defined on $\bigoplus_{j=1}^{n} E_{r_{s}, \lambda}^{\left(\Phi_{s j}\right)}$ into $\bigoplus_{j=1}^{n} L_{r_{s}, \lambda}^{\left(\Phi_{s j}\right)}$ for all $0 \leq s \leq 1$ and one have the bound

$$
\|T A\|_{\left(Q_{s}\right), t_{s}, \lambda} \leq K_{1}^{1-s} K_{2}^{s}\|A\|_{\left(\Phi_{s}\right), r_{s}, \lambda},
$$

where $A \in \bigoplus_{j=1}^{n} E_{r_{s}, \lambda}^{\left(\Phi_{s j}\right)}$.

80
Proof. Let $A=\left(A_{1}, A_{2}, \ldots, A_{n}\right) \in \bigoplus_{j=1}^{n} E_{r_{s}, \lambda}^{\left(\Phi_{s, j}\right)}, B=\left(B_{1}, B_{2}, \ldots, B_{n}\right) \in \bigoplus_{j=1}^{n} E_{t_{s}, \lambda}^{\Psi_{t j}}$ with polar decompositions $A_{k}=U_{k}\left|A_{k}\right|, B_{k}=V_{k}\left|B_{k}\right|$. Assume that $\|A\|_{\left(\Phi_{i}\right), r_{s}, \lambda} \leq 1,\|B\|_{\Psi_{i, t_{s}, \lambda}} \leq$ 1 where $\left|A_{k}\right|=\sum_{j=1}^{n} \alpha_{j} e_{k j},\left|B_{k}\right|=\sum_{j=1}^{n} \beta_{j} e_{k j}^{\prime}$.

Define for $z=\mathbb{C}$ and $k=1,2, \ldots, n$

$$
A(z)=\left(A_{1}(z), A_{2}(z), \ldots, A_{n}(z)\right)
$$

and

$$
B(z)=\left(B_{1}(z), B_{2}(z), \ldots, B_{n}(z)\right),
$$

where

$$
\begin{aligned}
& A_{k}(z)=U_{k} \Phi_{s k}\left[\left(\Phi_{1 k}^{-1}\right)^{1-z}\left(\Phi_{2 k}^{-1}\right)^{z}\right]\left(\left|A_{k}\right|\right), \\
& B_{k}(z)=V_{k} \Psi_{s k}\left[\left(\Psi_{1 k}^{-1}\right)^{1-z}\left(\Psi_{2 k}^{-1}\right)^{z}\right]\left(\left|B_{k}\right|\right) .
\end{aligned}
$$

Then,

$$
\begin{aligned}
A_{k}(z) & =U_{k} \Phi_{s k}\left[\left(\Phi_{1 k}^{-1}\left(\sum_{j=1}^{n} \alpha_{j} e_{k j}\right)\right)^{1-z}\left(\Phi_{2 k}^{-1}\left(\sum_{j=1}^{n} \alpha_{j} e_{k j}\right)\right)^{z}\right] \\
& =\sum_{j=1}^{n} \Phi_{s k}\left[\left(\Phi_{1 k}^{-1}\left(\alpha_{j}\right)\right)^{1-z}\left(\Phi_{2 k}^{-1}\left(\alpha_{j}\right)\right)^{z}\right] U_{k} e_{k j}
\end{aligned}
$$

Hence, $z \rightarrow A(z)$ is an analytic function on $\mathbb{C}$ with value in $\widetilde{\mathcal{M}}$. The same reduction applies to $B$.

Now we could define a bounded entire function

$$
H(z)=K_{1}^{z-1} K_{2}^{-z} \tau(B(z) T A(z))
$$

If $z=i t$ for $t \in \mathbb{R}$, we have

$$
\begin{aligned}
A_{k}(i t) & =\sum_{j=1}^{n} \Phi_{s k}\left[\Phi_{s k}^{-1}\left(\alpha_{j}\right)\right] U_{k} e_{k j} \\
& =\sum_{j=1}^{n} \Phi_{s k}\left[\left(\Phi_{1 k}^{-1}\left(\alpha_{j}\right)\right)^{1-i t}\left(\Phi_{2 k}^{-1}\left(\alpha_{j}\right)\right)^{i t}\right] U_{k} e_{k j} \\
& =\sum_{j=1}^{n} \Phi_{s k}\left[\left(\frac{\Phi_{2 k}^{-1}\left(\alpha_{j}\right)}{\Phi_{1 k}^{-1}\left(\alpha_{j}\right)}\right)^{i t}\right] U_{k} e_{k j} \cdot \sum_{j=1}^{n} \Phi_{s k}\left[\Phi_{1 k}^{-1}\left(\alpha_{j}\right)\right] U_{k} e_{k j} \\
& =\left[\Phi_{s k}\left(\frac{\Phi_{2 k}^{-1}}{\Phi_{1 k}^{-1}}\left(\left|A_{k}\right|\right)\right)\right]^{i t} \cdot \Phi_{s k}\left(\Phi_{1 k}^{-1}\left(\left|A_{k}\right|\right)\right) .
\end{aligned}
$$

Hence,

$$
\left|A_{k}(i t)\right|^{2}=A_{k}(i t)^{*} A_{k}(i t)=\left[\Phi_{s k}\left(\Phi_{1 k}^{-1}\left(\left|A_{k}\right|\right)\right)\right]^{2}
$$

which means

$$
\left|A_{k}(i t)\right|=\Phi_{s k}\left(\Phi_{1 k}^{-1}\left(\left|A_{k}\right|\right)\right) .
$$

Hence for any $1 \leq k \leq n$ we have $\tau\left(\Phi_{1 k}\left(A_{k}(i t)\right)\right)=\tau\left(\Phi_{s k}\left(A_{k}\right)\right)$ which implies that

$$
\left\|A_{j}(i t)\right\|_{\left(\Phi_{1 j}\right)}=\left\|A_{j}\right\|_{\left(\Phi_{s j}\right)}
$$

and

$$
\begin{aligned}
v\left(\Phi_{1}(A(i t))\right) & =\sum_{j=1}^{n} \lambda_{j} \tau\left[\Phi_{1 j}\left[\Phi_{s k}\left(\Phi_{1 j}^{-1}\left(\left|A_{j}\right|\right)\right)\right]\right] \\
& =\lambda_{1} \tau\left(\Phi_{s 1}\left(\left|A_{1}\right|\right)\right)+\lambda_{2} \tau\left(\Phi_{s 2}\left(\left|A_{2}\right|\right)\right)+\ldots+\lambda_{n} \tau\left(\Phi_{s n}\left(\left|A_{n}\right|\right)\right) \\
& =v\left(\Phi_{s}(|A|)\right)
\end{aligned}
$$

we get that

$$
\|A(i t)\|_{\left(\Phi_{1}\right), r_{s}, \lambda}=\|A\|_{\left(\Phi_{s}\right), r_{s}, \lambda} \leq 1
$$

Similar $\|B(i t)\|_{\Psi_{1}, t_{s}, \lambda}=\|B\|_{\Psi_{s}, t_{s}, \lambda} \leq 1$. Thus by (3) of the Lemma 2.1 and the assumption on $T$, we have

$$
|\tau(B(i t) T A(i t))| \leq K_{1}\|B(i t)\|_{\Psi_{1}, t_{s}, \lambda}\|A(i t)\|_{\left(\Phi_{1}\right), r_{s}, \lambda} \leq K_{1} .
$$

It then follows that $|H(i t)| \leq 1$ for any $t \in \mathbb{R}$. In the same way, we show $|H(1+i t)| \leq$

1. Therefore, by the maximum principle, for any $\theta \in \mathbb{C}$, we get

$$
|H(\theta)|=\mid K_{1}^{\theta-1} K_{2}^{-\theta} \tau(B(\theta) T A(\theta) \mid \leq 1
$$

Hence,

$$
|\tau(B T A)| \leq K_{1}^{1-\theta} K_{2}^{\theta}
$$

By the Theorem 2.1 we could get that

$$
\|T A\|_{\left(Q_{s}\right), r_{s}, \lambda} \leq K_{1}^{1-\theta} K_{2}^{\theta}\|A\|_{\left(\Phi_{s}\right), r_{s}, \lambda} .
$$

Theorem 2.3. Let $\Phi$ be an $N$-function and $\Phi_{s}$ be the inverse which satisfies that $\Phi_{s}^{-1}(u)=\left[\Phi^{-1}(u)\right]^{1-s}\left[\Phi_{0}^{-1}(u)\right]^{s}=\left[\Phi^{-1}(u)\right]^{1-s} u^{\frac{s}{2}}$ where $0<s \leq 1$ and $\Phi_{0}(u)=u^{2}$. If $L^{(\Phi)}(\widetilde{\mathcal{M}}, \tau)$ is the noncommutative Orlicz space, then we have for $A, B \in L^{\left(\Phi_{s}\right)}(\widetilde{\mathcal{M}}, \tau)$ :

$$
\left(\|A+B\|_{\left(\Phi_{s}\right)}^{\frac{2}{s}}+\|A-B\|_{\left(\Phi_{s}\right)}^{\frac{2}{s}}\right)^{\frac{s}{2}} \leq 2^{\frac{s}{2}}\left(\|A\|_{\left(\Phi_{s}\right)}^{\frac{2}{2-s}}+\|B\|_{\left(\Phi_{s}\right)}^{\frac{2}{2-s}}\right)^{\frac{2-s}{2}}
$$

Proof. Let $\Phi_{1}=(\Phi, \Phi)$ be the 2 -vector of N-functions, $\lambda=(1,1), 1 \leq r_{1} \leq \infty$ and set

$$
\bigoplus_{j=1}^{2} E_{r_{1}}^{(\Phi)}(\widetilde{\mathcal{M}}, \tau)=\left\{(A, B): A, B \in E^{(\Phi)}(\widetilde{\mathcal{M}}, \tau),\|(A, B)\|_{\left(\Phi_{1}\right), r_{1}}<\infty\right\}
$$

where

$$
\|(A, B)\|_{\left(\Phi_{1}\right), r_{1}}= \begin{cases}{\left[\|A\|_{(\Phi)}^{r_{1}}+\|B\|_{(\Phi)}^{r_{1}}\right]^{\frac{1}{r_{1}}},} & 1 \leq r_{1}<\infty \\ \max \left\{\|A\|_{(\Phi)},\|B\|_{(\Phi)}\right\}, & r_{1}=\infty .\end{cases}
$$

Take $Q_{1}=\Phi_{1}=(\Phi, \Phi)$ and $Q_{2}=\Phi_{2}=\left(\Phi_{0}, \Phi_{0}\right)$ where $\Phi_{0}(u)=u^{2}$.
Set $r_{1}=1, r_{2}=t_{2}=2$ and $t_{1}=+\infty$. Define the linear operator $T: \bigoplus_{j=1}^{2} E_{r_{i}}^{\left(\Phi_{i}\right)} \rightarrow$ $\bigoplus_{j=1}^{2} L_{t_{i}}^{\left(Q_{i}\right)}$ by the equation $T(A, B)=(A+B, A-B)$, we then have

$$
\begin{aligned}
\|T(A, B)\|_{\left(Q_{1}\right), t_{1}} & =\max \left\{\|A+B\|_{(\Phi)},\|A-B\|_{(\Phi)}\right\} \\
& \leq\|A\|_{(\Phi)}+\|B\|_{(\Phi)} \\
& =K_{1}\|(A, B)\|_{\left(\Phi_{1}\right), r_{1}} .
\end{aligned}
$$

Hence, $K_{1}=1$ and since $\|\cdot\|_{\left(\Phi_{0}\right)}=\|\cdot\|_{2}$, we find

$$
\begin{aligned}
\|T(A, B)\|_{\left(Q_{2}\right), t_{2}} & =\left[\|A+B\|_{2}^{2}+\|A-B\|_{2}^{2}\right]^{\frac{1}{2}} \\
& =\sqrt{2}\left[\|A\|_{2}^{2}+\|B\|_{2}^{2}\right]^{\frac{1}{2}} \\
& =K_{2}\|(A, B)\|_{\left(\Phi_{2}\right), r_{2}} .
\end{aligned}
$$

Thus $K_{2}=\sqrt{2}$. Let $r_{s}$ and $t_{s}$ be given by

$$
\frac{1}{r_{s}}=\frac{1-s}{r_{1}}+\frac{s}{r_{2}}, \frac{1}{t_{s}}=\frac{1-s}{t_{1}}+\frac{s}{t_{2}}
$$

then we have, $r_{s}=\frac{2}{2-s}, t_{s}=\frac{2}{s}$.
By the results of Theorem 2.2,

$$
\|T(A, B)\|_{\left(Q_{s}\right), t_{s}} \leq 2^{\frac{s}{s}}\|(A, B)\|_{\left(\Phi_{s}\right), r_{s}}
$$

since $K_{1}^{1-s} K_{2}^{s}=2^{\frac{s}{2}}$. Hence, we have

$$
\|(A, B)\|_{\left(Q_{s}\right), r_{s}}=\left[\|A\|_{\left(\Phi_{s}\right)}^{\frac{2}{2-s}}+\|B\|_{\left(\Phi_{s}\right)}^{\frac{2}{2-s}}\right]^{\frac{2-s}{2}}
$$

and

$$
\|T(A, B)\|_{\left(Q_{s}\right), t_{s}}=\left(\|A+B\|_{\left(\Phi_{s}\right)}^{\frac{2}{s}}+\|A-B\|_{\left(\Phi_{s}\right)}^{\frac{2}{s}}\right)^{\frac{s}{2}}
$$

which we could get the result.
The following corollary is Clarkson inequality of noncommutative $L^{p}$ space and proof the process is completely similar to the P42 of [7].

Corollary 2.1. Suppose that $1<p<\infty$ and $q=\frac{p}{p-1}$. Then for $A, B \in L^{p}(\widetilde{\mathcal{M}}, \tau)$, we have

$$
\left(\|A+B\|_{p}^{q}+\|A-B\|_{p}^{q}\right)^{\frac{1}{q}} \leq 2^{\frac{1}{q}}\left(\|A\|_{p}^{p}+\|B\|_{p}^{p}\right)^{\frac{1}{p}}, 1<p \leq 2
$$

and

$$
\left(\|A+B\|_{p}^{p}+\|A-B\|_{p}^{p}\right)^{\frac{1}{p}} \leq 2^{\frac{1}{p}}\left(\|A\|_{p}^{q}+\|B\|_{p}^{q}\right)^{\frac{1}{q}}, 2 \leq p \leq \infty
$$

Proof. If $1<p \leq 2$, let $1<\alpha<p \leq 2$ and $\Phi(u)=|u|^{\alpha}, \Phi_{0}(u)=|u|^{2}, s=\frac{2(p-\alpha)}{p(2-\alpha)}$. Then $0<s \leq 1$ and $\Phi_{s}^{-1}(u)=|u|^{\frac{1}{p}}$ or $\Phi_{s}(u)=|u|^{p}$. Hence $\|\cdot\|_{\left(\Phi_{s}\right)}=\|\cdot\|_{(p)}$ and since $\lim _{\alpha \downarrow 1} \frac{2}{s}=\frac{p}{p-1}=q ; \lim _{\alpha \downarrow 1} \frac{2-s}{2}=\frac{1}{p}$ by the Theorem 2.3 we get the first inequality.

Similar let $2 \leq p<\beta<\infty$ and $\Phi(u)=|u|^{\beta}, \Phi_{0}(u)=|u|^{2}, s=\frac{2(\beta-p)}{p(\beta-2)}$. Then $0 \leq s \leq 1$ and $\Phi_{s}(u)=|u|^{p}, \lim _{\beta \uparrow \infty} \frac{2}{s}=p ; \lim _{\beta \uparrow \infty} \frac{2-s}{2}=\frac{1}{q}$, by the Theorem 2.3 we get the second inequality.

## 3. Some geometrical properties

This section we contains some geometrical properties of noncommutative Orlicz spaces. These include uniform convexity, uniform smoothness which generalize the results of noncommutative $L^{p}$ spaces. All these properties are based on Clarkson inequalities.

Definition 3.1. [4] Let $X$ be a Banach space. We define its modulus of convexity by

$$
\delta_{X}(\varepsilon)=\inf \left\{1-\left\|\frac{x+y}{2}\right\|: x, y \in X,\|x\|=\|y\|=1,\|x-y\|=\varepsilon\right\}, 0<\varepsilon<2
$$

and its modulus of smoothness by

$$
\rho_{X}(t)=\sup \left\{\frac{\|x+t y\|+\|x-t y\|}{2}-1: x, y \in X,\|x\|=\|y\|=1\right\}, t>0 .
$$

$X$ is said to be uniformly convex if $\delta_{X}(\varepsilon)>0$ for every $2 \geq \varepsilon>0$, and uniformly smooth if $\lim _{t \rightarrow 0} \frac{\rho_{X}(t)}{t}=0$.

Theorem 3.1. Let $\Phi$ be an $N$-function and $\Phi_{s}$ be the inverse which satisfies that $\Phi_{s}^{-1}(u)=\left[\Phi^{-1}(u)\right]^{1-s}\left[\Phi_{0}^{-1}(u)\right]^{s}=\left[\Phi^{-1}(u)\right]^{1-s} u^{\frac{s}{2}}$ where $0<s \leq 1$ and $\Phi_{0}(u)=u^{2}$, then we have for $0<\varepsilon \leq 2$,

$$
\delta_{L^{\left(\Phi_{s}\right)}}(\varepsilon) \geq 1-\frac{1}{2}\left[2^{\frac{2}{s}}-\varepsilon^{\frac{2}{s}}\right]^{\frac{s}{2}}
$$

and

$$
\rho_{L^{\left(\Phi_{s}\right)}(t)} \leq\left(1+t^{\frac{2}{2-s}}\right)^{\frac{2-s}{2}}-1 .
$$

Proof. First, if $\|A-B\|_{\left(\Phi_{s}\right)}=\varepsilon$, then theorem 2.3 implies for $A, B \in L^{\left(\Phi_{s}\right)}(\widetilde{\mathcal{M}}, \tau)$,

$$
\left(\|A+B\|_{\left(\Phi_{s}\right)}^{\frac{2}{s}}+\varepsilon^{\frac{2}{s}}\right)^{\frac{s}{2}} \leq 2^{\frac{s}{2}} \cdot 2^{\frac{2-s}{2}}=2
$$

Hence,

$$
1-\frac{1}{2}\|A+B\|_{\left(\Phi_{s}\right)} \geq 1-\frac{1}{2}\left[2^{\frac{2}{s}}-\varepsilon^{\frac{2}{s}}\right]^{\frac{s}{2}} .
$$

110 Taking infimum of $\|A\|_{\left(\Phi_{s}\right)}=\|B\|_{\left(\Phi_{s}\right)}=1$ we can get the desired result and $L^{\left(\Phi_{s}\right)}(\widetilde{\mathcal{M}}, \tau)$ is uniform convexity if $0<\varepsilon \leq 2$, and reflexive.

Second, if $\|A\|_{\left(\Phi_{s}\right)}=\|B\|_{\left(\Phi_{s}\right)}=1$, then since $\frac{2}{s} \geq 2$,

$$
\begin{aligned}
{\left[\frac{1}{2}\left(\|A+t B\|_{\left(\Phi_{s}\right)}+\|A-t B\|_{\left(\Phi_{s}\right)}\right)\right]^{\frac{2}{s}} } & \leq \frac{1}{2}\left[\|A+t B\|_{\left(\Phi_{s}\right)}^{\frac{2}{s}}+\|A-t B\|_{\left(\Phi_{s}\right)}^{\frac{2}{s}}\right] \\
& \leq \frac{1}{2}\left[2^{\frac{s}{2}}\left(\|A\|_{\left(\Phi_{s}\right)}^{\frac{2}{2-s}}+\|t B\|_{\left(\Phi_{s}\right)}^{\frac{2}{2-s}}\right)^{\frac{2-s}{2}}\right]^{\frac{2}{s}} \\
& =\frac{1}{2}\left[2^{\frac{s}{2}}\left(1+t^{\frac{2}{2-s}}\right)^{\frac{2-s}{2}}\right]^{\frac{2}{s}} \\
& =\left(1+t^{\left.\frac{2}{2-s}\right)^{\frac{2-s}{s}}} .\right.
\end{aligned}
$$

Hence,

$$
\frac{1}{2}\left(\|A+t B\|_{\left(\Phi_{s}\right)}+\|A-t B\|_{\left(\Phi_{s}\right)}\right)-1 \leq\left(1+t^{\frac{2}{2-s}}\right)^{\frac{2-s}{2}}-1
$$

Taking the supremum on the left we can get the conclusion. Since $t>0$, we have that $L^{\left(\Phi_{s}\right)}(\widetilde{\mathcal{M}}, \tau)$ is uniformly smooth.

Corollary 3.1. Suppose that $1<p<\infty, q=\frac{p}{p-1}, 0<\varepsilon<\varepsilon$ and $t>0$. Then for $A, B \in L^{p}(\widetilde{\mathcal{M}}, \tau)$, we have
(1) If $1<p<2$, then

$$
\delta_{L^{p}}(\varepsilon) \geq \frac{\varepsilon^{q}}{q \cdot 2^{q}} \quad \text { and } \quad \rho_{L^{p}(t)} \leq \frac{t^{p}}{p}
$$

(2) If $2<p<\infty$, then

$$
\delta_{L^{p}}(\varepsilon) \geq \frac{\varepsilon^{p}}{p \cdot 2^{p}} \quad \text { and } \quad \rho_{L^{p}(t)} \leq \frac{t^{q}}{q} .
$$

(3) $L^{p}(\widetilde{\mathcal{M}}, \tau)$ is uniformly convex and uniformly smooth. Consequently its reflexive.

## Acknowledgement

We want to express our gratitude to the referee for all his/her careful revision and suggestions which has improved the final version of this work.
