ON THE PAPER “CHARACTERIZATIONS OF WEA VING FOR $g$-FRAMES BY INDUCED SEQUENCES”

DEEPSHIKHA, LALIT KUMAR VASHISHT, AND GEETIKA VERMA

1. Generalized Weaving Frames in Hilbert Spaces

In [1], Deepshikha, Vashisht and Verma studied $\Theta$-$g$-woven frames in separable Hilbert spaces. They consider the following definition.

Definition 1.1. [1] Two $\Theta$-frames $\{\Lambda_j^*f_{jk}\}_{j\in\mathbb{N},k\in I_j}$ and $\{\Omega_j^*g_{jk}\}_{j\in\mathbb{N},k\in Q_j}$ of a separable Hilbert space $\mathcal{H}$ are said to be woven if there exist universal positive constants $A$ and $B$ such that for any $\sigma \subseteq \mathbb{N}$, the family $\{\Lambda_j^*f_{jk}\}_{j\in\sigma,k\in I_j} \cup \{\Omega_j^*g_{jk}\}_{j\in\mathbb{N}\setminus\sigma,k\in Q_j}$ is a $\Theta$-frame for $\mathcal{H}$ with lower frame bound $A$ and upper frame bound $B$.

Deepshikha et al. proved the following characterization for $\Theta$-$g$-woven frames in terms of woven $\Theta$-frames in [1].

Theorem 1.2. [1] Suppose that $\Lambda \equiv \{\Lambda_j\}_{j=1}^\infty$ and $\Omega \equiv \{\Omega_j\}_{j=1}^\infty$ are $\Theta$-$g$-frames for $\mathcal{H}$ with respect to $\{\mathcal{H}_j\}_{j=1}^\infty$ and $\{\mathcal{W}_j\}_{j=1}^\infty$, respectively. Let $\{f_{jk}\}_{k\in I_j\cap\mathbb{N}}$ and $\{g_{jk}\}_{k\in Q_j\cap\mathbb{N}}$ be frames for $\mathcal{H}_j$ and $\mathcal{W}_j$, respectively ($j \in \mathbb{N}$) with frame bounds $\alpha$, $\beta$ and $\alpha'$, $\beta'$, respectively. Then the following conditions are equivalent.

(i) $\Lambda$ and $\Omega$ are $\Theta$-$g$-woven.

(ii) $\{\Lambda_j^*f_{jk}\}_{j\in\mathbb{N},k\in I_j}$ and $\{\Omega_j^*g_{jk}\}_{j\in\mathbb{N},k\in Q_j}$ are woven $\Theta$-frames for $\mathcal{H}$.

Remark 1.3. In the above theorem, we can see that the family $\{\Lambda_j^*f_{jk}\}_{j\in\mathbb{N},k\in I_j}$ has two indexing sets $\mathbb{N}$ and $I_j$, and the family $\{\Omega_j^*g_{jk}\}_{j\in\mathbb{N},k\in Q_j}$ has two indexing sets $\mathbb{N}$ and $Q_j$. In general, the indexing sets $I_j$ and $Q_j$ are not same. So we can only take the partition of $\mathbb{N}$, the common indexing set. Thus, we consider Definition 1.1 (see, [1] also) for the weaving of $\Theta$-frames $\{\Lambda_j^*f_{jk}\}_{j\in\mathbb{N},k\in I_j}$ and $\{\Omega_j^*g_{jk}\}_{j\in\mathbb{N},k\in Q_j}$ in Theorem 1.2.

Xiangchun Xiao, Guoping Zhao and Guorong Zhou in [2] consider the following definition for the weaving of $\Theta$-frames (or frames) $\{\Lambda_j^*f_{jk}\}_{j\in\mathbb{N},k\in K_j}$ and $\{\Omega_j^*g_{jk}\}_{j\in\mathbb{N},k\in K_j}$.

Definition 1.4. [2] Two $\Theta$-frames $\{\Lambda_j^*f_{jk}\}_{j\in\mathbb{N},k\in K_j}$ and $\{\Omega_j^*g_{jk}\}_{j\in\mathbb{N},k\in K_j}$ are said to be woven $\Theta$-frames for $\mathcal{H}$ if there exist universal positive constants $A$ and $B$ such that for any $\tau_0 \subseteq \mathbb{N}$, and $\sigma_j \subseteq K_j, j \in \tau_0$, $\tau_0$.

2020 Mathematics Subject Classification: 42C15; 42C30; 42C40.

Key words and phrases: Frames; $g$-frames, weaving frames.
the family \( \{ A_j f_{jk} \}_{j \in \tau_0, k \in \sigma_j} \cup \{ \Omega_j^* g_{jk} \}_{j \in \tau_0, k \in K_j \cap \sigma_j} \cup \{ \Omega_j^* g_{jk} \}_{j \in \tau_0 \setminus \tau_0, k \in K_j} \) is a \( \Theta \)-frame for \( \mathcal{H} \) with lower frame bound \( A \) and upper frame bound \( B \).

A counter-example (Example 3.3 in [2]) by Xiao et al. in the context of characterization of weaving of \( \Theta \)-frames (see Theorem 1.2) is incorrect. Further, there is no new characterization of weaving of \( g \)-frames in [2]. This is given in the following remarks.

**Remark 1.5.** Note that in Definition 1.4, \( I_j = Q_j = K_j \). Thus, weaving of \( \Theta \)-frames \( \{ A_j^* f_{jk} \}_{j \in N, k \in I_j} \) and \( \{ \Omega_j^* g_{jk} \}_{j \in N, k \in Q_j} \) for \( \mathcal{H} \) given in Definition 1.4 of [2] is meaningless as the indexing sets \( I_j \) and \( Q_j \) need not be same.

**Remark 1.6.** Due to different indexing sets, we cannot use Definition 1.4 in Theorem 1.2 for the weaving of \( \Theta \)-frames \( \{ A_j^* f_{jk} \}_{j \in N, k \in I_j} \) and \( \{ \Omega_j^* g_{jk} \}_{j \in N, k \in Q_j} \).

**Remark 1.7.** In Example 3.3 of [2], Xiao et al. showed the existence of woven \( g \)-frames \( \{ A_j^* f_{jk} \}_{j = 1}^{\infty} \) and \( \{ \Omega_j^* g_{jk} \}_{j = 1}^{\infty} \) such that the frames \( \{ A_j^* f_{jk} \}_{j \in N, k \in K_j} \) and \( \{ \Omega_j^* g_{jk} \}_{j \in N, k \in K_j} \) are not woven. However, they used Definition 1.4 for the weaving of frames \( \{ A_j^* f_{jk} \}_{j \in N, k \in K_j} \) and \( \{ \Omega_j^* g_{jk} \}_{j \in N, k \in K_j} \), where \( \Theta \) is the identity operator. Using Example 3.3 of [2], Xiao et al., claimed that the part (ii) \( \iff \) (i) of Theorem 1.2 is incorrect. But, their claim is wrong as Definition 1.1 was used in Theorem 1.2 while Definition 1.4 was used in Example 3.3 of [2]. Hence, Example 3.3 [2] does not contradict Theorem 1.2. Furthermore, Theorem 3.9 of [1] is mathematically correct.

**Remark 1.8.** Definition 1.1 and Definition 1.4 are equivalent if \(| I_j | = | Q_j | = | K_j | = 1 \) for all \( j \in N \).

**Proof.** Let \( I_j = Q_j = K_j \) for \( j \in N \).

First suppose that the \( \Theta \)-frames \( \{ A_j^* f_{jk} \}_{j \in N, k \in I_j} \) and \( \{ \Omega_j^* g_{jk} \}_{j \in N, k \in Q_j} \) are woven with universal bounds \( A \) and \( B \) (in the sense of Definition 1.1).

Let \( \tau_0 \) be any subset of \( N \), and \( \sigma_j \subseteq K_j \) for \( j \in \tau_0 \).

**Case(i):** Let \( \sigma_j \) is non-empty, that is, \( \sigma_j = K_j \). Then, \( K_j \setminus \sigma_j \) is an empty set and hence we have

\[
\{ A_j^* f_{jk} \}_{j \in \tau_0, k \in \sigma_j} \cup \{ \Omega_j^* g_{jk} \}_{j \in \tau_0, k \in K_j \setminus \sigma_j} \cup \{ \Omega_j^* g_{jk} \}_{j \in \tau_0 \setminus \tau_0, k \in K_j} = \{ A_j^* f_{jk} \}_{j \in \tau_0, k \in K_j} \cup \{ \Omega_j^* g_{jk} \}_{j \in \tau_0, k \in K_j} \cup \{ \Omega_j^* g_{jk} \}_{j \in \tau_0 \setminus \tau_0, k \in K_j} = \{ A_j^* f_{jk} \}_{j \in \tau_0, k \in I_j} \cup \{ \Omega_j^* g_{jk} \}_{j \in \tau_0, k \in I_j}.
\]

Thus, \( \{ A_j^* f_{jk} \}_{j \in \tau_0, k \in \sigma_j} \cup \{ \Omega_j^* g_{jk} \}_{j \in \tau_0, k \in K_j \setminus \sigma_j} \cup \{ \Omega_j^* g_{jk} \}_{j \in \tau_0 \setminus \tau_0, k \in K_j} \) is a \( \Theta \)-frame for \( \mathcal{H} \) with lower frame bound \( A \) and upper frame bound \( B \).

**Case(ii):** Let \( \sigma_j \) is empty, that is, \( K_j \setminus \sigma_j = K_j \). Then, we have

\[
\{ A_j^* f_{jk} \}_{j \in \tau_0, k \in \sigma_j} \cup \{ \Omega_j^* g_{jk} \}_{j \in \tau_0, k \in K_j \setminus \sigma_j} \cup \{ \Omega_j^* g_{jk} \}_{j \in \tau_0 \setminus \tau_0, k \in K_j} = \{ \Omega_j^* g_{jk} \}_{j \in \tau_0, k \in K_j} \cup \{ \Omega_j^* g_{jk} \}_{j \in \tau_0, k \in K_j} \cup \{ \Omega_j^* g_{jk} \}_{j \in \tau_0 \setminus \tau_0, k \in K_j} = \{ \Omega_j^* g_{jk} \}_{j \in \tau_0, k \in K_j}.
\]

Thus, \( \{ A_j^* f_{jk} \}_{j \in \tau_0, k \in \sigma_j} \cup \{ \Omega_j^* g_{jk} \}_{j \in \tau_0, k \in K_j \setminus \sigma_j} \cup \{ \Omega_j^* g_{jk} \}_{j \in \tau_0 \setminus \tau_0, k \in K_j} \) is a \( \Theta \)-frame for \( \mathcal{H} \) with lower frame bound \( A \) and upper frame bound \( B \). Hence, \( \Theta \)-frames \( \{ A_j^* f_{jk} \}_{j \in N, k \in I_j} \) and \( \{ \Omega_j^* g_{jk} \}_{j \in N, k \in Q_j} \) (according to Definition 1.4) are woven with universal bounds \( A \) and \( B \).

In the other direction, suppose that \( \Theta \)-frames \( \{ A_j^* f_{jk} \}_{j \in N, k \in I_j} \) and \( \{ \Omega_j^* g_{jk} \}_{j \in N, k \in Q_j} \) are woven with universal bounds \( A \) and \( B \) (in the sense of Definition 1.4).
Let $\sigma$ be any subset of $\mathbb{N}$. Take $\sigma_j = K_j$ for $j \in \sigma$. Then, $K_j \setminus \sigma_j$ is an empty set and hence
\[
\{\Lambda_j^* f_{jk}\}_{j \in \sigma, k \in I_j} \cup \{\Omega_j^* g_{jk}\}_{j \in \sigma, k \in Q_j} = \{\Lambda_j^* f_{jk}\}_{j \in \sigma, k \in K_j} \cup \{\Omega_j^* g_{jk}\}_{j \in \sigma, k \in K_j} = \{\Lambda_j^* f_{jk}\}_{j \in \sigma, k \in \sigma_j} \cup \{\Omega_j^* g_{jk}\}_{j \in \sigma, k \in \sigma_j} \cup \{\Omega_j^* g_{jk}\}_{j \in \sigma, k \in K_j}.
\]
Thus, $\{\Lambda_j^* f_{jk}\}_{j \in \sigma, k \in I_j} \cup \{\Omega_j^* g_{jk}\}_{j \in \sigma, k \in Q_j}$ is a $\Theta$-frame for $\mathcal{H}$ with upper and lower frame bounds $A$ and $B$, respectively. Hence, $\{\Lambda_j^* f_{jk}\}_{j \in \mathbb{N}, k \in I_j}$ and $\{\Omega_j^* g_{jk}\}_{j \in \mathbb{N}, k \in Q_j}$ are woven with universal bounds $A$ and $B$ (in the sense of Definition 1.1).

By invoking Remark 1.8, we have the following corollary to the Theorem 1.2.

**Corollary 1.9.** Suppose that $\Lambda \equiv \{\Lambda_j\}_{j=1}^\infty$ and $\Omega \equiv \{\Omega_j\}_{j=1}^\infty$ are $\Theta$-$g$-frames for $\mathcal{H}$ with respect to $\{\mathcal{H}_j\}_{j=1}^\infty$ and $\{\mathcal{W}_j\}_{j=1}^\infty$, respectively. Let $\{f_{jk}\}_{k \in K_j \subset \mathbb{N}}$ and $\{g_{jk}\}_{k \in K_j \subset \mathbb{N}}$ be orthonormal bases for $\mathcal{H}_j$ and $\mathcal{W}_j$, respectively ($j \in \mathbb{N}$). If $|K_j| = 1$ for all $j \in \mathbb{N}$, then the following conditions are equivalent.

(i) $\Lambda$ and $\Omega$ are $\Theta$-$g$-woven.

(ii) $\{\Lambda_j^* f_{jk}\}_{j \in \mathbb{N}, k \in K_j}$ and $\{\Omega_j^* g_{jk}\}_{j \in \mathbb{N}, k \in K_j}$ are woven $\Theta$-frames for $\mathcal{H}$ (weaving in the sense of Definition 1.4).

**Remark 1.10.** One can obtain Theorem 3.4 of [2] (in which Xiao et al. claim new characterization of weaving $g$-frames) by taking $\Theta$ to be the identity operator in Corollary 1.9.
