ON POWER INTEGRAL BASES OF CERTAIN PURE NUMBER FIELDS DEFINED BY $X^{60} - m$

LHOUSSAIN EL FADIL, OMAR KCHIT, AND HANAN CHOULLI

1. Introduction

Let $K = \mathbb{Q}(\alpha)$ be a number field generated by a complex root $\alpha$ of a monic irreducible polynomial $F(x) = X^{60} - m \in \mathbb{Z}[x]$, with $m \neq \pm 1$ a square free integer. In this paper, we study the monogeneity of $K$. We prove that if $m \not\equiv 1 \pmod{4}$, $m \not\equiv \pm 1 \pmod{9}$ and $m \not\equiv \pm 1 \pmod{25}$, then $K$ is monogenic. But if $m \equiv 1 \pmod{4}$, $m \equiv \pm 1 \pmod{9}$, or $m \equiv \pm 1 \pmod{25}$, then $K$ is not monogenic. Our results are illustrated by examples.
quartic fields generated by $m^{\frac{1}{2}}$ for $1 < m < 10^7$ and $m \equiv 2, 3 \pmod{4}$. In [1], Ahmad, Nakahara, and Husnine proved that if $m \equiv 2, 3 \pmod{4}$ and $m \not\equiv \pm 1 \pmod{9}$, then the sextic number field generated by $m^{\frac{1}{6}}$ is monogenic. They also showed in [2], that if $m \equiv 1 \pmod{4}$ and $m \not\equiv \pm 1 \pmod{9}$, then the sextic number field generated by $m^{\frac{1}{6}}$ is not monogenic. In [7], based on prime ideal factorization, El Fadil showed that if $m \equiv 1 \pmod{4}$ or $m \not\equiv 1 \pmod{9}$, then the sextic number field generated by $m^{\frac{1}{6}}$ is not monogenic. Hameed and Nakahara [22], proved that if $m \equiv 1 \pmod{16}$, then the octic number field generated by $m^{18}$ is not monogenic, but if $m \equiv 2, 3 \pmod{4}$, then it is monogenic. In [19], by applying the explicit form of the index equation, Gaál and Remete obtained deep new results and they gave a complete answer to the problem of monogeneity of number fields generated by $m^{\frac{1}{n}}$, where $3 \leq n \leq 9$. While Gaál’s and Remete’s techniques are based on the index calculation, Nakahara’s methods are based on the existence of power relative integral bases of some special sub-fields. In [7, 8, 21, 15, 19, 9], El Fadil et al. used Newton polygon techniques to study the monogeneity of the pure number fields of degrees 6, 12, 18, 24, and 36. In this paper, Our purpose is for a square free integer $m \not\equiv \pm 1 \pmod{4}$ and $F(x) = x^{60} - m$ is an irreducible polynomial over $\mathbb{Q}$, to study the monogeneity of the number field $K = \mathbb{Q}(\alpha)$ generated by a complex root $\alpha$ of $F(x)$. Our method applying the Newton polygon techniques and the explicit prime ideal factorization. Recall that some authors like Khanduja and Gassert introduced a new topic of monogeneity of polynomials as follows (see [25, 16]): For a monic irreducible polynomial $F(x)$ and $K$ the number field generated by a root of $F(x)$, is said to be monogenic if the ring $\mathbb{Z}_K = \mathbb{Z}[\alpha]$, and not monogenic otherwise. Unfortunately, this notion of monogeneity is not noting other the integral closedness of $\mathbb{Z}[\alpha]$. Even if the problem of the integral closedness of $\mathbb{Z}[\alpha]$ gives a partial answer to the problem of monogeneity of $K$, the problem of monogeneity is more hard to solve. Unfortunately this notion of monogeneity does not coincide with the well known notion of monogeneity of number fields, treated by Gaal, Nakahara, Pohst and their collaborators. In fact let us consider $F(x) = x^2 - 9$ and $K$ the number field generated by a complex root $\alpha$ of $F(x)$, since 3 divides the index $(\mathbb{Z}_K : \mathbb{Z}[\alpha])$, we conclude that $\mathbb{Z}[\alpha]$ is not integrally closed even if $K$ is monogenic and $\theta = \frac{\alpha^2}{3}$ generates a power integral closure of $K$. (For more details on the confusion between the two different notions of monogeneity, we refer to El Fadil’s preprint “A note on monogeneity of pure number fields” on the link https://arxiv.org/abs/2106.00004).

2. Main Results

Let $K$ be a pure number field defined by a complex root $\alpha$ of a monic irreducible polynomial $F(x) = x^{60} - m$, with $m \not\equiv \pm 1$ a square free integer. The main goal of this section is to study the monogeneity of pure number fields of degree 60. Theorem 2.1 gives a necessary and sufficient condition on the integral closure of $\mathbb{Z}[\alpha]$. This theorem covers [16 Theorem 1.1] in the context of pure number fields of degree 60. But on the contrary, [16 Theorem 1.1] does not cover our Theorem 2.1. In fact, our
Theorem 2.1. The ring $\mathbb{Z}[\alpha]$ is the ring of integers of $K$ if and only if $m \not\equiv 1 \pmod{4}$, $m \not\equiv \mp 1 \pmod{9}$ and $m \not\equiv \mp 1, \mp 7 \pmod{25}$.

In particular, if $m \not\equiv 1 \pmod{4}$, $m \not\equiv \mp 1 \pmod{9}$ and $m \not\equiv \mp 1, \mp 7 \pmod{25}$, then $K$ is monogenic.

Remark that based on Theorem 2.1 if $m \equiv 1 \pmod{4}$ or $m \equiv \mp 1 \pmod{9}$ or $m \equiv \mp 1, \mp 7 \pmod{25}$ then $\mathbb{Z}[\alpha]$ is not the ring of integers of $K$. But in this case, Theorem 2.1 can not decide on monogeneity of $K$. The following theorem gives a partial answer, the exception is when $m \equiv \mp 7 \pmod{25}$.

Theorem 2.2. If one of the following statements holds,

1. $m \equiv 1 \pmod{4}$,
2. $m \equiv \mp 1 \pmod{9}$,
3. $m \equiv \mp 1 \pmod{25}$,

then $K$ is not monogenic.

Theorem 2.3. Let $K$ be a pure number field defined by a complex root $\alpha$ of a monic irreducible polynomial $F(x) = x^{60} - a^u$, with $a \not\equiv \pm 1$ a square free integer and $u$ a positive integer which is coprime to $30$. Then

1. If $a \not\equiv 1 \pmod{4}, a \not\equiv \mp 1 \pmod{9},$ and $a \not\equiv \mp 1, \mp 7 \pmod{25}$, then $K$ is monogenic.
2. If $a \equiv 1 \pmod{4}$ or $a \equiv \mp 1 \pmod{9}$ or $a \equiv \mp 1 \pmod{25}$, then $K$ is not monogenic.

3. Preliminaries

In order to prove our main Theorems, we recall some fundamental facts about Newton polygon techniques applied on prime ideal factorization and calculation of index. Let $F(x) = \prod_{i=1}^{r} \phi_i(x)^{i_j}$ in $\mathbb{F}_p[x]$ be the factorization of $F(x)$ into powers of monic irreducible coprime polynomials of $\mathbb{F}_p[x]$. Recall that a well-known theorem of Dedekind says that:

Theorem 3.1. ([29, Chapter I, Proposition 8.3])

If $p$ does not divide the index $(\mathbb{Z}_K : \mathbb{Z}[\alpha])$, then

$$p\mathbb{Z}_K = \prod_{i=1}^{r} \mathfrak{p}_i^{j_i},$$

where every $\mathfrak{p}_i = p\mathbb{Z}_K + \phi_i(a)\mathbb{Z}_K$, and the residue degree of $\mathfrak{p}_i$ is $f(\mathfrak{p}_i) = \deg(\phi_i)$. 

In order to apply this theorem in an effective way one needs a criterion to test whether $p$ divides or not the index ($\mathbb{Z}_K : \mathbb{Z}[\alpha]$). In 1878, Dedekind gave a criterion to test whether $p$ divides or not ($\mathbb{Z}_K : \mathbb{Z}[\alpha]$).

**Theorem 3.2. (Dedekind’s Criterion [4] Theorem 6.1.4 and [5])**

For a number field $K$ generated by $\alpha$ a complex root of a monic irreducible polynomial $F(x) \in \mathbb{Z}[x]$ and a rational prime integer $p$, let $\overline{F(x)} = \prod_{i=1}^{r} \phi_i(x) \overline{\phi_i(x)}^i \pmod{p}$ be the factorization of $\overline{F(x)}$ in $\mathbb{F}_p[x]$, where the polynomials $\phi_1(x), \ldots, \phi_r(x)$ are monic polynomials in $\mathbb{Z}[x]$, their reductions are coprime polynomials irreducible over $\mathbb{F}_p$. If we set $M(x) = \overline{F(x)} \prod_{i=1}^{r} \phi_i(x)^i$, then $M(x) \in \mathbb{Z}[x]$ and the following statements are equivalent:

1. $p$ does not divide the index ($\mathbb{Z}_K : \mathbb{Z}[\alpha]$).
2. For every $i = 1, \ldots, r$, either $l_i = 1$ or $l_i \geq 2$ and $\overline{\phi_i(x)}$ does not divide $\overline{M(x)}$ in $\mathbb{F}_p[x]$.

When Dedekind’s criterion fails, that is, $p$ divides the index ($\mathbb{Z}_K : \mathbb{Z}[\theta]$) for every primitive element $\theta \in \mathbb{Z}_K$, then for such primes and number fields, it is not possible to obtain the prime ideal factorization of $p\mathbb{Z}_K$ by Dedekind’s theorem. In 1928, Ore developed an alternative approach for obtaining the index ($\mathbb{Z}_K : \mathbb{Z}[\alpha]$), the absolute discriminant $d_K$, and the prime ideal factorization of the rational primes in a number field $K$ by using Newton polygons (see for instance [14] [26] [30]). Now we recall some fundamental facts on Newton polygons, for more details, we refer to [13] [20].

For any prime integer $p$ and for any monic polynomial $\phi \in \mathbb{Z}[x]$ whose reduction is irreducible in $\mathbb{F}_p[x]$, let $\mathbb{F}_\phi$ be the finite field $\mathbb{F}_p[x]/(\phi)$. For any monic polynomial $F(x) \in \mathbb{Z}[x]$, upon to the Euclidean division by successive powers of $\phi$, we expand $F(x)$ as $F(x) = a_0(x) + a_1(x)\phi(x) + \cdots + a_l(x)\phi(x)^l$, called the $\phi$-expansion of $F(x)$, (for every $i$, $\deg(a_i(x)) < \deg(\phi)$). To any coefficient $a_i(x)$ we attach $u_i = v_p(a_i(x)) \in \mathbb{Z} \cup \{\infty\}$. The $\phi$-Newton polygon of $F(x)$ with respect to $p$, is the lower boundary convex envelope of the set of points $(i, u_i, a_i(x) \not\equiv 0)$ in the Euclidean plane, which we denote by $N_\phi(F)$. Geometrically, the $\phi$-Newton polygon of $F$, is the process of joining the obtained edges $S_1, \ldots, S_l$ ordered by increasing slopes, which can be expressed as $N_\phi(F) = S_1 + \cdots + S_l$. The principal $\phi$-Newton polygon of $F$, denoted $N_\phi^-(F)$, is the part of the polygon $N_\phi(F)$, which is determined by joining all sides of $N_\phi(F)$ of negative slopes. For every side $S$ of $N_\phi^-(F)$, the length of $S$, denoted $l(S)$, is the length of its projection to the $x$-axis and its height, denoted $h(S)$, is the length of its projection to the $y$-axis. Let $d = \gcd(l(S), h(S))$ be the degree of $S$. For every side $S$ of $N_\phi^-(F)$, with initial point $(s, u_s)$, length $l$, and for every abscissa $i = 0, \ldots, l$, we attach the following residue coefficient $c_i \in F_\phi$ as follows:

$$c_i = \begin{cases} 0, & \text{if } (s + i, u_{s+i}) \text{ lies strictly above } S, \\ \left(\frac{a_{s+i}(x)}{p^{u_{s+i}}}\right) \mod (p, \phi(x)), & \text{if } (s + i, u_{s+i}) \text{ lies on } S. \end{cases}$$

where $(p, \phi(x))$ is the maximal ideal of $\mathbb{Z}[x]$ generated by $p$ and $\phi$. Let $\lambda = -h/e$ be the slope of $S$, where $h$ and $e$ are two positive coprime integers. Then $d = l/e$ is the
degree of $S$. Since the points with integer coordinates lying on $S$ are exactly
\[(s, u_s), (s + e, u_s - h), \ldots, (s + de, u_s - dh),\]
if $i$ is not a multiple of $e$, then $(s + i, u_{s+i})$ does not lie on $S$, and so $c_i = 0$. Let
\[R_\alpha(F)(y) = t_d y^d + t_{d-1} y^{d-1} + \cdots + t_1 y + t_0 \in \mathbb{F}_\phi[y],\]
called the residual polynomial of $F(x)$ associated to the side $S$, where for every $i = 0, \ldots, d$, $t_i = c_i$.

Remark that as $(s, u_s)$ and $(s + l, u_{s+l})$ lie on $S$, then $\deg(R_\alpha(F)(y)) = d$ and $t_0 \neq 0$.

Let $N_\phi^{-}(F) = S_1 + \cdots + S_t$ be the principal $\phi$-Newton polygon of $F$ with respect to $p$. We say that $F$ is a $\phi$-regular polynomial with respect to $p$, if $R_\alpha(F)(y)$ is square free in $\mathbb{F}_\phi[y]$ for every $i = 1, \ldots, t$. The polynomial $F$ is said to be $p$-regular if $\overline{F(x)} = \prod_{i=1}^{r} \overline{\phi_i(x)}^{l_i}$ for some monic polynomials $\phi_1(x), \ldots, \phi_r(x)$ of $\mathbb{Z}[x]$ such that $\overline{\phi_1(x)}, \ldots, \overline{\phi_r(x)}$ are irreducible coprime polynomials over $\mathbb{F}_p$ and $F$ is a $\phi_i$-regular polynomial with respect to $p$ for every $i = 1, \ldots, r$.

The theorem of Ore plays a key role for proving our main Theorems. Let $\phi(x) \in \mathbb{Z}[x]$ be a monic polynomial, with $\overline{\phi(x)}$ is irreducible in $\mathbb{F}_p[x]$. As defined in [14 Def. 1.3], the $\phi$-index of $F(x)$, denoted by $\text{ind}_\phi(F)$, is $\deg(\phi)$ times the number of points with natural integer coordinates that lie below or on the polygon $N_\phi^{-}(F)$, strictly above the horizontal axis, and strictly beyond the vertical axis (see Figure 1). In the example of Figure 1, $\text{ind}_\phi(F) = 9 \times \deg(\phi)$.

![Figure 1. The principal $\phi$-Newton polygon of $F(x)$.](image)

Now assume that $\overline{F(x)} = \prod_{i=1}^{r} \overline{\phi_i}^{l_i}$ is the factorization of $\overline{F(x)}$ in $\mathbb{F}_p[x]$, where every $\phi_i \in \mathbb{Z}[x]$ is monic polynomial, with $\overline{\phi_i(x)}$ is irreducible in $\mathbb{F}_p[x]$, $\overline{\phi_i(x)}$ and $\overline{\phi_j(x)}$ are coprime when $i \neq j$ and $i, j = 1, \ldots, r$. For every $i = 1, \ldots, r$, let $N_{\phi_i}^{-}(F) = S_{i1} + \cdots + S_{it_i}$ be the principal $\phi_i$-Newton polygon of $F(x)$ with respect to $p$. For every $j = 1, \ldots, t_i$,
let \( R_{i,j}(F)(y) = \prod_{s=1}^{s_{ij}} \psi_{i,j,s}^{\nu_{i,j,s}}(y) \) be the factorization of \( R_{i,j}(F)(y) \) in \( \mathbb{F}_{\phi_i}[y] \). Then we have the following index theorem of Ore (see [14] Theorem 1.7 and Theorem 1.9), [13] Theorem 3.9], and [26, pp: 323–325]).

**Theorem 3.3. (Theorem of Ore)** Under the above hypothesis,

1. \[
    v_p((\mathbb{Z}_K : \mathbb{Z}[x])) \geq \sum_{i=1}^{r} \text{ind}_{\phi_i}(F).
\]

The equality holds if \( F(x) \) is \( p \)-regular.

2. If \( F(x) \) is \( p \)-regular, then

\[
    p\mathbb{Z}_K = \prod_{i=1}^{r} \prod_{j=1}^{l_i} \prod_{s=1}^{s_{ij}} \mathfrak{p}_{i,j,s}^{e_{i,j,s}}
\]

where \( e_{i,j} \) is the smallest positive integer satisfying \( e_{i,j} \lambda_{i,j} \in \mathbb{Z} \) and \( f_{i,j,s} = \deg(\phi_i) \times \deg(\psi_{i,j,s}) \) is the residue degree of \( \psi_{i,j,s} \) over \( p \) for every \( (i, j, s) \).

**Corollary 3.4.** Under the hypothesis above Theorem 3.3, if for every \( i = 1, \ldots, r, l_i = 1 \) or \( N_{\phi_i}(F) = S_i \) has a single side of height 1, then \( v_p((\mathbb{Z}_K : \mathbb{Z}[x])) = 0 \).

An alternative proof of the theorem of index of Ore is given in [14] Theorem 1.7 and Theorem 1.9]. In [20], Guardia, Montes, and Nart introduced the notion of \( \phi \)-admissible expansion used in order to treat some special cases when the \( \phi \)-adic expansion is not obvious. Let

\[
    F(x) = \sum_{i=0}^{n} A'_i(x) \phi(x)^i, \quad A'_i(x) \in \mathbb{Z}[x],
\]

be a \( \phi \)-expansion of \( F(x) \), not necessarily \( \deg(A'_i) \) less than \( \deg(\phi) \). Take \( u'_i = v_p(A'_i(x)) \), for all \( i = 0, \ldots, n \), and let \( N' \) be the lower boundary convex envelope of the set of points \( \{(i, u'_i) \mid 0 \leq i \leq n, u'_i \neq \infty\} \). To any \( i = 0, \ldots, n \), we attach the residue coefficient as follows:

\[
    c'_i = \begin{cases} 
    0, & \text{if } (i, u'_i) \text{ lies above } N', \\
    \left( \frac{A'_i(x)}{p^{u'_i}} \right) \mod (p, \phi(x)), & \text{if } (i, u'_i) \text{ lies on } N'.
    \end{cases}
\]

Likewise, for any side \( S \) of \( N' \), we can define the residual polynomial attached to \( S \) and denoted \( R'_i(F)(y) \) (similar to the residual polynomial \( R_i(F)(y) \) from the \( \phi \)-adic expansion). We say that the \( \phi \)-expansion (1) is admissible if \( c'_i \neq 0 \) for each abscissa \( i \) of a vertex of \( N' \). For more details, we refer to [20].

**Lemma 3.5.** ([20] Lemma 1.12])

If a \( \phi \)-expansion of \( F(x) \) is admissible, then \( N' = N_{\phi}(F) \) and \( c'_i = c_i \). In particular, for any side \( S \) of \( N' \) we have \( R'_i(F)(y) = R_i(F)(y) \) up to multiply by a nonzero coefficient of \( \mathbb{F}_{\phi} \).
4. Proofs of Main Results

**Proof of Theorem 2.1** The proof of this theorem can be concluded by Dedekind’s criterion. But as the other results are based on Newton polygons, let us use theorem of index with “if and only if” as it is given in [20, Theorem 4.1], which says that a necessary and sufficient condition to have \( v_\phi(Z_K : Z[\alpha]) = 0 \) is that \( ind_\phi(F) = 0 \), where \( ind_1(F) \) is the index obtained by Ore’s index in Theorem 3.3. Since \( \Delta(F) = \mp 60^6 \cdot m^{59} \), thanks to the known formula \( v_\phi(\Delta(F)) = v_\phi(d_K) + 2v_\phi(ind(\alpha)) \), \( Z[\alpha] \) is the ring of integers of \( K \) if and only if \( p \) does not divide \( (Z_K : Z[\alpha]) \) for every rational prime \( p \) dividing \( 30 \cdot m \). Let \( p \) be a rational prime dividing \( m \), then \( F(x) \equiv x^{60} \pmod{p} \). Let \( \phi = x \).

As \( m \) is square free integer, then \( v_\phi(m) = 1 \), and so \( N_\phi(F) = S \) has a single side of height 1. Thus \( R_3(F)(y) \) is irreducible over \( F_\phi \) as it is of degree 1. By Corollary 3.4, we get \( v_\phi((Z_K : Z[\alpha])) = 0 \); \( p \) does not divide \( (Z_K : Z[\alpha]) \). For \( p = 2 \) and 2 does not divide \( m \), we have \( F(x) \equiv x^{60} - 1 \equiv (x^{15} - 1)^4 \pmod{2} \). Let \( \phi \in Z[x] \) be a monic polynomial, whose reduction modulo 2 is an irreducible factor of \( F(x) \). Then \( \phi \) divides \( x^{15} - 1 \) in \( F_2[x] \). Let \( x^{15} - 1 = Q(x)\phi(x) + T(x) \), with \( (Q, T) \in Z[x]^2 \) and \( v_0(T) \geq 1 \). Since \( x^{15} - 1 \) is separable over \( F_2 \), \( \phi \) does not divide \( Q \). Let \( F(x) = (x^{15} - 1)^4 + 4(x^{15} - 1)^3 + 6(x^{15} - 1)^2 + 4(x^{15} - 1) + 1 - m = Q(x)^4\phi^4 + 4Q(x)^3\phi^3 + 6Q(x)^2\phi^2 + 4Q(x)\phi + r_0 + 1 - m \), where \( r_0 \) is the remainder upon the Euclidean division of \( F(x) - (Q(x)^4\phi^4 + 4Q(x)^3\phi^3 + 6Q(x)^2\phi^2 + 4Q(x)\phi + 1 - m) = 2T(x)K(x) \) for some \( K \in Z[x] \), we conclude that \( v_2(r_0) \geq 2 \). Since \( \phi \) does not divide \( Q \), the previous \( \phi \)-expansion is admissible, and by Lemma 3.5 \( ind_\phi(F) = 0 \) if and only if \( v_2(1 - m) = 1 \); \( m \equiv 1 \pmod{4} \).

Similarly, for \( p = 3 \) and 3 does not divide \( m \), we have \( F(x) \equiv x^{60} - m \equiv (x^{20} - m)^3 \pmod{3} \). Let \( \phi \in Z[x] \) be a monic polynomial, whose reduction modulo 3 is an irreducible factor of \( F(x) \). Then \( \phi \) divides \( x^{20} - m \) in \( F_3[x] \). Let \( x^{20} - m = Q(x)\phi(x) + T(x) \), with \( (Q, T) \in Z[x]^2 \) and \( v_3(T) \geq 1 \). Since \( x^{20} - m \) is separable over \( F_3 \), \( \phi \) does not divide \( Q \). Let \( F(x) = (x^{20} - m)^3 + 3m(x^{15} - m)^2 + 3m^2(x^{15} - m) + m^3 - m = Q(x)^3\phi^3 + 3mQ(x)^2\phi^2 + 3m^2Q(x)\phi + r_0 + m^3 - m \), where \( r_0 \) is the remainder upon the Euclidean division of \( F(x) - (Q(x)^3\phi^3 + 3mQ(x)^2\phi^2 + 3m^2Q(x)\phi + m^3 - m) = 3T(x)K(x) \) for some \( K \in Z[x] \), we conclude that \( v_3(r_0) \geq 2 \). Since \( \phi \) does not divide \( Q \), the previous \( \phi \)-expansion is admissible, and by Lemma 3.5 \( ind_\phi(F) = 0 \) if and only if \( v_3(m^2 - 1) = 1 \); \( m^2 \equiv 1 \pmod{9} \).

For \( p = 5 \) and 5 does not divide \( m \), let \( \phi \in Z[x] \) be a monic polynomial, whose reduction modulo 5 is an irreducible factor of \( F(x) \). Then \( \phi \) divides \( x^{12} - m \) in \( F_5[x] \). Let \( x^{12} - m = Q(x)\phi(x) + T(x) \), with \( (Q, T) \in Z[x]^2 \) and \( v_5(T) \geq 1 \). Since \( x^{12} - m \) is separable over \( F_5 \), \( \phi \) does not divide \( Q \). Let \( F(x) = (x^{12} - m)^5 + 5m(x^{11} - m)^4 + 10m^2(x^{10} - m)^3 + 10m^3(x^{12} - m)^2 + 5m^4(x^{12} - m) + m^3 - m = Q(x)^5\phi^5 + 5mQ(x)^4\phi^4 + 10m^2Q(x)^3\phi^3 + 10m^4Q(x)^2\phi^2 + 5m^4Q(x)\phi + r_0 + m^3 - m \), where \( r_0 \) is the remainder upon the Euclidean division of \( F(x) - (Q(x)^5\phi^5 + 5mQ(x)^4\phi^4 + 10m^2Q(x)^3\phi^3 + 10m^4Q(x)^2\phi^2 + 5m^4Q(x)\phi + m^3 - m) = 5T(x)K(x) \) for some \( K \in Z[x] \), we conclude that \( v_5(r_0) \geq 2 \). Since \( \phi \) does not divide \( Q \), the previous \( \phi \)-expansion is admissible, and by Lemma 3.5 \( ind_\phi(F) = 0 \) if and only if
\[ v_5(m^4 - 1) = 1; \, m \not\equiv \pm 1, \pm 7 \pmod{25}. \]

The index of a field \( K \) is defined by \( i(K) = \gcd([\mathbb{Z}_K : \mathbb{Z}[\theta]] \mid K = \mathbb{Q}(\theta) \) and \( \theta \in \mathbb{Z}_K \). A rational prime \( p \) dividing \( i(K) \) is called a prime common index divisor of \( K \). If \( \mathbb{Z}_K \) has a power integral basis, then \( i(K) = 1 \). Therefore a field having a prime common index divisor is not monogenic. For the proof of Theorem 2.2 we need the following lemma and its proof is an immediate consequence of Dedekind’s theorem.

**Lemma 4.1.** Let \( p \) be a rational prime integer and \( K \) be a number field. For every positive integer \( f \), let \( P_f \) be the number of distinct prime ideals of \( \mathbb{Z}_K \) lying above \( p \) with residue degree \( f \) and \( N_f \) be the number of monic irreducible polynomials of \( \mathbb{F}_p[x] \) of degree \( f \). If \( P_f > N_f \) for some positive integer \( f \), then \( p \) is a prime common index divisor of \( K \).

To apply the last Lemma one has to know the number \( N_f(p) \) of monic irreducible polynomials over \( \mathbb{F}_p \) of degree \( f \). This number was found by Gauss, which is given by the following proposition:

**Proposition 4.2.** ([28, Chapter 4, Proposition 4.35])

*For every prime \( p \) and \( f \geq 1 \) one has*

\[ N_f(p) = \frac{1}{f} \sum_{d \mid f} \mu(d)p^{f/d}, \]

*where \( \mu(d) \) is the familiar Möbius function.*

**Proof of Theorem 2.2** In every case, let us show that \( i(K) > 1 \), and so \( K \) is not monogenic.

1. \( m \equiv 1 \pmod{4} \). Then \( F(x) = (x^{15} - 1)^4 = (x - 1)(x^2 + x + 1)U(x)^4 \) in \( \mathbb{F}_2[x] \). Let \( \phi(x) = x^2 + x + 1 \) and \( v = v_5(1 - m) \). Since \( F(x) = \cdots + (-48165 - 42465x)\phi(x)^4 + (3610 + 6840x)\phi(x)^3 - 570x\phi(x)^2 + (-20 + 20x)\phi(x) + 1 - m \), if \( v \geq 4 \), then \( N_5^-(F) \) has 3 sides joining (0, \( v \)), (1, 2), (2, 1), and (4, 0). Thus every side of \( N_5^-(F) \) has degree 1 (see Figure 2, \( v \geq 4 \)). Thus by Theorem 3.3, \( \phi \) provides 3 prime ideals of \( \mathbb{Z}_K \) of residue degree 2 each one. As there are only one monic irreducible polynomial of degree 2 in \( \mathbb{F}_2[x] \) namely \( \phi(x) \), by Lemma 4.1, 2 is a common index divisor of \( K \), and so \( K \) is not monogenic. If \( v = 2 \), \( N_5^-(F) = S \) is one sided of degree 2 such that \( R_5(F)(y) = (x + 1)^2 + xy + 1 = ((x + 1)y + 1)(y + 1) \in \mathbb{F}_5[y] \) (see Figure 2, \( v = 2 \)). So, by Theorem 3.3, \( \phi \) provides 2 prime ideals of \( \mathbb{Z}_K \) lying above 2 with residue degree 2 each one, and so there are at least 2 prime ideals of \( \mathbb{Z}_K \) lying above 2 with residue degree 2 each one. As there are only one monic irreducible polynomial of degree 2 in \( \mathbb{F}_2[x] \) namely \( \phi(x) \), by Lemma 4.1, 2 is a common index divisor of \( K \), and so \( K \) is not monogenic. If \( v = 3 \), then \( N_5^-(F) = S_1 + S_2 \) has two sides with degrees \( d(S_1) = 2 \) and \( d(S_2) = 1 \) such that \( R_5(F)(y) = xy^2 + (1 + x)y + 1 = (y + 1)(xy + 1) \in \mathbb{F}_5[y] \) (see Figure 2, \( v = 3 \)). Thus, by Theorem 3.3, \( \phi \) provides 3 prime ideals of \( \mathbb{Z}_K \)
lying above 2 with residue degree 2 each one. As there are only one monic irreducible polynomial of degree 2 in \( F_2[x] \), 2 is a common index divisor of \( K \), and so \( K \) is not monogenic.

![Figure 2. The principal \( \phi \)-Newton polygon of \( F(x) \).](image)

(2) \( m \equiv \mp 1 \pmod{9} \).

For \( m \equiv 1 \pmod{9} \), since \( F(x) = \phi_1(x)\phi_2(x)U(x)^3 \) in \( F_3[x] \), with \( \phi_1(x) = x - 1 \), \( \phi_2(x) = x + 1 \) and \( \phi_k \) does not divide \( U(x) \) in \( F_3[x] \) for every \( k = 1, 2 \). Consider the following expansions: \( F(x) = \cdots + 34220\phi_1(x)^3 + 1770\phi_1(x)^2 + 60\phi_1(x) + 1 - m \) and \( F(x) = \cdots - 34220\phi_2(x)^3 + 1770\phi_2(x)^2 - 60\phi_2(x) + 1 - m \). We conclude that if \( m \equiv 1 \pmod{9} \), then \( N_{\phi_k}^{-}(F) = S_{k1} + S_{k2} \) has 2 sides joining \((0, V), (1, 1), \) and \((3, 0)\) with \( V = v_{2}(1 - m) \geq 2 \). Thus the degree of each side is 1. Therefore, \( \phi_k \) provides 2 prime ideals of \( \mathbb{Z}_K \) lying above 3 with residue degree 1 each one. As there are only 3 monic irreducible polynomials of degree 1 in \( F_3[x] \), 3 is a common index divisor of \( K \) and so \( K \) is not monogenic.

For \( m \equiv -1 \pmod{9} \), we have since \( \overline{F(x)} = (x^{20} + 1)^3 \equiv \phi_1(x)\phi_2(x)U(x)^3 \pmod{3} \) with \( \phi_1(x) = x^2 + x - 1 \), \( \phi_2(x) = x^2 - x - 1 \), and \( \phi_k \) does not divide \( U(x) \) in \( F_3[x] \) for every \( k = 1, 2 \). Consider the following expansions: \( F(x) = \cdots + a_3(x)\phi_1(x)^3 + a_2(x)\phi_1(x)^2 + a_1(x)\phi_1(x) + a_0(x) \) and \( F(x) = \cdots + b_3(x)\phi_2(x)^3 + b_2(x)\phi_2(x)^2 + b_1(x)\phi_2(x) + b_0(x) \), where \( a_1(x) = 16175489617620 - 25052342327220x, a_0(x) = -1548008755920x + 956722026041 - m, b_1(x) = 16175489617620 + 25052342327220x, \) and \( b_0(x) = 1548008755920x + 956722026041 - m \). Since \( v_3(a_3(x)b_3(x)) = 0, v_3(a_2(x)) \geq 1, v_3(b_2(x)) \geq 1, v_3(a_1(x)) = v_3(b_1(x)) = 1 \), we conclude that if \( m \equiv -1 \pmod{9} \), then \( v_3(a_0(x)) \geq 2 \) and \( v_3(b_0(x)) \geq 2 \), and so \( N_{\phi_k}^{-}(F) = S_{k1} + S_{k2} \) has 2 sides joining \((0, V_k), (1, 1), \) and \((3, 0)\) with \( V_1 = v_3(a_0(x)) \geq 2 \) and \( V_2 = v_3(b_0(x)) \geq 2 \). Thus the degree of each side is 1. Therefore, \( \phi_k \) provides 2 prime ideals of \( \mathbb{Z}_K \) lying above 3 with residue degree 2 each one. The total is then, there are 4 prime ideals of \( \mathbb{Z}_K \) lying above 3 of residue degree 2 each one. As the are only 3 monic irreducible polynomials of degree 2 in \( F_3[x] \) namely \( \phi_1(x), \phi_2(x) \) and \( x^2 + 1, 3 \) is a common index divisor, and so \( K \) is not monogenic.
The following example shows that this claim is not correct. Contrary to the claim, which says that it will be the convex envelope of the set of points \(\{a, b, c, d\}\) with \(a \equiv 1 \pmod{25}\), we have \(F(x) = x^2 + 1\). If \(m \equiv -1 \pmod{25}\), then \(F(x) = x^2 + 1\) and \(F(x)\) does not divide \(U(x)\) in \(\mathbb{F}_5[x]\). Similarly, by considering the \(\phi_k\)-expansion of \(F(x)\), if \(v_\phi(m - 1) \geq 2\), then \(N_\phi(F) = S_{k_1} + S_{k_2}\) has 2 sides joining \((0, V_k)\), \((1, 1)\) and \((5, 0)\), with \(V_k \geq 2\). Thus each side of \(N_\phi(F)\) is of degree 1. Therefore \(\phi_k\) provides 2 prime ideals of \(\mathbb{Z}_k\) lying above 5 with residue degree 1 each one. Apply this for every \(k = 1, \ldots, 4\), we conclude that there are 8 prime ideals of \(\mathbb{Z}_k\) lying above 5 of residue degree 1 each one. As there are only 5 monic irreducible polynomials of degree 1 in \(\mathbb{F}_5[x]\), by Lemma 4.1, 5 is a common index divisor, and so \(K\) is not monogenic.

Remark 1. Let \(F(x) = x^n - m \in \mathbb{Z}[x]\) be an irreducible polynomial over \(\mathbb{Q}\) and \(K = \mathbb{Q}(\alpha)\) with \(\alpha\) a complex root of \(F(x)\). Let \(p\) be a prime integer dividing \(n\) and does not divide \(m\), and let \(r = \nu_p(n)\). In [21], Gassert claimed that \(N_\phi(F)\) is the convex envelope of the set of points \(\{(0, \nu_p(m^r - m))\} \cup \{(k, \nu_p(p^k))\}, k = 1, \ldots, r\).

The following example shows that this claim is not correct. Let \(F(x) = x^60 - m\) with \(m \not\equiv \pm 1 \pmod{25}\) a square free integer such that \(m \equiv -1 \pmod{25}\). Then for \(p = 3\) and \(\phi = x^2 + x - 1\), we have \(F(x) = x^2 + x - 1\). Then \(\theta = \frac{a_x}{a_y}\). Then \(\theta^60 = \frac{a_x^{60y}}{a_y} = a^{ux - 60y} = a\). Since \(g(x) = x^60 - a \in \mathbb{Z}[x]\) is an Eisenstein polynomial, \(g(x)\) is irreducible over \(\mathbb{Q}\). As \(\theta \in K\)

**Proof of Theorem 2.3** As \(\gcd(u, 30) = 1\), let \((x, y) 
\in \mathbb{Z}^2\) be the unique solution of \(ux - 60y = 1\) with \(0 \leq y < u\) and let \(\theta = \frac{a^x}{a^y}\). Then \(\theta^60 = \frac{a_x^{60y}}{a_y} = a^{ux - 60y} = a\). Since \(g(x) = x^60 - a \in \mathbb{Z}[x]\) is an Eisenstein polynomial, \(g(x)\) is irreducible over \(\mathbb{Q}\). As \(\theta \in K\)
and \([K : \mathbb{Q}] = \deg(g)\), we conclude that \(K = \mathbb{Q}(\theta)\). Therefore, \(K\) is generated by a root of the polynomial \(g(x) = x^{60} - a\) with \(a \neq \pm 1\) a square free integer. The proof is therefore an application of Theorem 2.1 and Theorem 2.2.

\[ \square \]

In order to illustrate the efficiency of our results, we finalize the paper by the following numerical examples.

**Example.** Let \(F(x) \in \mathbb{Z}[x]\) be a monic irreducible polynomial and \(K\) the number field generated by a complex root of \(F(x)\).

1. If \(F(x) = x^{60} - 67\), then \(F(x)\) is irreducible because it is 67-Eisenstein. Since \(m \equiv 2 \pmod{4}\), \(m \equiv 4 \pmod{9}\) and \(m \equiv 6 \pmod{25}\), by Theorem 2.1 \(K\) is monogenic.
2. If \(F(x) = x^{60} - 302\), then \(F(x)\) is irreducible because it is 2-Eisenstein. Since \(m \equiv 2 \pmod{4}\), \(m \equiv 5 \pmod{9}\) and \(m \equiv 6 \pmod{25}\), by Theorem 2.1 \(K\) is monogenic.
3. If \(F(x) = x^{60} - 106\), then \(F(x)\) is irreducible because it is 2-Eisenstein. Since \(m \equiv 1 \pmod{5}\), Theorem 2.2 \(K\) is not monogenic.
4. If \(F(x) = x^{60} - 226\), then \(F(x)\) is irreducible because it is 2-Eisenstein. Since \(m \equiv 1 \pmod{9}\), by Theorem 2.2 \(K\) is not monogenic.
5. If \(F(x) = (x - 5)^{60} - 70^{13}\), then \(F(x) \equiv x^{60} \pmod{5}\). As \(70 \equiv 2 \pmod{4}\), \(70 \equiv 7 \pmod{9}\) and \(70 \equiv -5 \pmod{25}\), by Theorem 2.3 \(K\) is monogenic.
6. If \(F(x) = (x - 4)^{60} - 26^{31}\), then \(F(x) \equiv x^{60} \pmod{2}\). As \(26 \equiv 1 \pmod{25}\), by Theorem 2.3 \(K\) is not monogenic.

**Remark 2.** In all calculations of \(\phi\)-expansions, we used Maple 12.
