December 1, 2021

#### Abstract

Sets of bilinear constraints are important in various machine learning models. Mathematically, they are hyperbolas in a product space. In this paper, we give a complete formula for projections onto sets of bilinear constraints or hyperbolas in a general Hilbert space.

2020 Mathematics Subject Classification: Primary 41A50, 90C26; Secondary 90C20,
46C05.
Keywords: bilinear constraint set, hyperbola, orthogonal projection, nonconvex minimization, prox-regularity.

## 1 Introduction

Throughout this paper, we assume that

$$
\begin{equation*}
X \text { is a Hilbert space with inner product }\langle\cdot, \cdot\rangle: X \times X \rightarrow \mathbb{R}, \tag{1}
\end{equation*}
$$

[^0]and induced norm $\|\cdot\|$. In various learning models [9,10], Elser utilizes projections onto the bilinear constraint set:
\[

$$
\begin{equation*}
C_{\gamma}:=\{(x, y) \in X \times X \mid\langle x, y\rangle=\gamma\} \tag{2}
\end{equation*}
$$

\]

where $\gamma \in \mathbb{R}$ is a fixed constant. Mathematically speaking, up to a rotation, this is just a hyperbola or quadratic surface in $X \times X$. Finding projections onto quadratic curves or surfaces algorithmically have many practical applications; see, e.g., [6, 7, 9, 10]. If $\gamma=0$ in $C_{\gamma}$, then $C_{0}$ becomes the set 'cross' in $X \times X$. The projection formula for the 'cross' has been thoroughly investigated [2]. In [9,10], although Elser has provided some results on projections onto $C_{\gamma}$ only when $X=\mathbb{R}^{n}$, complete mathematical details are not presented.

The goal of this paper is to give a complete analysis of the projection onto the set $C_{\gamma}$ with $\gamma \neq 0$, and extend the results to a general Hilbert space.

The remainder of the paper is organized as follows. Section 2 gives some general properties of bilinear constraint sets. In Section 3 we focus on full mathematical details for the existence and explicit formula of projections onto hyperbolas. Using results from Section 3, in Sections 4-5 we provide explicit formulas for projections onto sets of bilinear constraints. Our notation is standard and follows largely [1, 13].

## 2 General properties of $C_{\gamma}$

In an infinite-dimensional space, the existence of projection onto a set often requires the weak closedness of the set. Our first result says that although the set $C_{\gamma}$ is norm closed it is not weakly closed in $X \times X$.
Proposition 2.1. The set $C_{\gamma}$ is closed in the norm topology but not closed in the weak topology in $X \times X$. In fact, ${\overline{C_{\gamma}}}^{\text {weak }}=X \times X$.

Proof. Evidently, $C_{\gamma}$ is norm closed. We show that ${\overline{C_{\gamma}}}^{\text {weak }}=X \times X$. Let $(x, y) \in X \times X$. Consider $S=\operatorname{span}\{x, y\}$. The orthogonal decomposition theorem gives $X=S \oplus S^{\perp}$. Because $X$ is infinite-dimensional and $S$ is at most two-dimensional, $S^{\perp}$ is infinite dimensional, so any orthonormal base of $S^{\perp}$ must have a sequence $\left(e_{n}\right)_{n \in \mathbb{N}}$ which converges weakly to 0 , i.e., $e_{n} \rightharpoonup 0$; see, e.g., [11]. Also $e_{n} \perp x$ and $e_{n} \perp y$. Set $\xi=\gamma-\langle x, y\rangle$. Then

$$
\begin{align*}
\left\langle x-\xi e_{n}, y-e_{n}\right\rangle & =\langle x, y\rangle-\left\langle x, e_{n}\right\rangle-\xi\left\langle e_{n}, y\right\rangle+\xi\left\langle e_{n}, e_{n}\right\rangle  \tag{3}\\
& =\langle x, y\rangle+\xi=\gamma \tag{4}
\end{align*}
$$

so $\left(x-\xi e_{n}, y-e_{n}\right) \in C_{\gamma}$. Since $\left(x-\xi e_{n}, y-e_{n}\right) \rightharpoonup(x, y)$, we have $(x, y) \in{\overline{C_{\gamma}}}^{\text {weak }}$. Because $(x, y) \in X \times X$ was arbitrary, we conclude that $X \times X \subseteq \bar{C}^{\text {weak }}$.

Proposition 2.1 indicates that finding $P_{C_{\gamma}}$, i.e., projections onto $C_{\gamma}$, might be complicated in a general Hilbert space. This seemingly difficult issue can be completely avoided by utilizing the structures of the optimization problem. See Subsection 3.1 below.

Our next result says that when $\gamma \neq 0$, locally around the set $C_{\gamma}$ the projection onto the set is always single-valued.
Proposition 2.2. Let $\gamma \neq 0$, and $C_{\gamma}=\{(x, y) \in X \times X \mid\langle x, y\rangle=\gamma\}$. For every $(x, y) \in C_{\gamma}$, the the following hold:
(i) $C_{\gamma}$ is prox-regular at $(x, y)$.
(ii) There exists a neighborhood of $(x, y)$ on which the projection mapping onto $C_{\gamma}$ is monotone and Lipschitz continuous.

Proof. (i): Write $\iota_{C_{\gamma}}(x, y)=\iota_{\{\gamma\}}(h(x, y))$ where $h(x, y)=\langle x, y\rangle$. Let $(x, y) \in C_{\gamma}$. Then $\nabla h(x, y)=(y, x) \neq(0,0)$ because of $\gamma \neq 0$. Being a composition of a convex function $\iota_{\{\gamma\}}$ and a twice differentiable function $h$ that is qualified at $(x, y),[3$, Proposition 2.4] shows that $\iota_{C_{\gamma}}$ is prox-regular at $(x, y)$, so is $C_{\gamma}$.
(ii): Apply (i) and [3, Proposition 4.4].

Observe that Proposition 2.2 also follow from [13, Proposition 13.32] and [13, Exercise 13.38] when $X=\mathbb{R}^{n}$; and that when $\gamma=0, C_{0}$ is not prox-regular at $(0,0)$. Although the projection exists locally around $C_{\gamma}$, it is still not clear for the global existence.

## 3 Projections onto hyperbolas

For ease of analysis, we start with

$$
C_{\gamma}:=\{(x, y) \in X \times X \mid h(x, y):=\langle x, y\rangle-\gamma=0\}
$$

where $\gamma>0$. Our goal is to find the projection formula $P_{C_{\gamma}}\left(x_{0}, y_{0}\right)$ for every $\left(x_{0}, y_{0}\right) \in$ $X \times X$. That is,

$$
\begin{equation*}
\operatorname{minimize} f(x, y):=\left\|x-x_{0}\right\|^{2}+\left\|y-y_{0}\right\|^{2} \quad \text { subject to } \quad(x, y) \in C_{\gamma} \tag{P}
\end{equation*}
$$

### 3.1 Auxiliary problems and existence of projections

To determine the projection operator $P_{C_{\gamma}}$ of the set $C_{\gamma}$, we shall introduce two equivalently reformulated problems. First, for every $\left(u_{0}, v_{0}\right) \in X \times X$, we solve the problem

$$
\begin{equation*}
\operatorname{minimize} f_{1}(u, v):=\left\|u-u_{0}\right\|^{2}+\left\|v-v_{0}\right\|^{2} \quad \text { subject to } \quad(u, v) \in \tilde{C}_{1}, \tag{P}
\end{equation*}
$$

where $\tilde{C}_{1}:=\left\{(u, v) \in X \times X \mid h_{1}(u, v):=\|u\|^{2}-\|v\|^{2}-2=0\right\}$. Next, for every $\left(\tilde{u}_{0}, \tilde{v}_{0}\right) \in$ $X \times X$ we solve the problem

$$
\operatorname{minimize} \quad f_{\gamma}(\tilde{u}, \tilde{v}):=\left\|\tilde{u}-\tilde{u}_{0}\right\|^{2}+\left\|\tilde{v}-\tilde{v}_{0}\right\|^{2} \quad \text { subject to } \quad(\tilde{u}, \tilde{v}) \in \tilde{C}_{\gamma}, \quad\left(\tilde{P}_{\gamma}\right)
$$

where $\tilde{C}_{\gamma}:=\left\{(\tilde{u}, \tilde{v}) \in X \times X \mid h_{\gamma}(\tilde{u}, \tilde{v}):=\|\tilde{u}\|^{2}-\|\tilde{v}\|^{2}-2 \gamma=0\right\}$. Both $\tilde{C}_{1}$ and $\tilde{C}_{\gamma}$ are hyperbolas. $\tilde{P}_{1}$ and $\tilde{P}_{\gamma}$ solve for projections $P_{\tilde{C}_{1}}$ and $P_{\tilde{C}_{\gamma}}$ respectively, and their connections to $P_{C_{\gamma}}$ are given by the Proposition 3.2 below. Recall

Definition 3.1 (Rotation with an angle $\phi$ ). A change of coordinates $(u, v) \in X \times X$, by rotation through an angle $\phi$, is defined by

$$
\left[\begin{array}{l}
x \\
y
\end{array}\right]=\left[\begin{array}{cc}
\cos \phi \mathrm{Id} & -\sin \phi \mathrm{Id} \\
\sin \phi \mathrm{Id} & \cos \phi \mathrm{Id}
\end{array}\right]\left[\begin{array}{l}
u \\
v
\end{array}\right] .
$$

Put

$$
A_{\phi}:=\left[\begin{array}{cc}
\cos \phi \mathrm{Id} & -\sin \phi \mathrm{Id} \\
\sin \phi \mathrm{Id} & \cos \phi \mathrm{Id}
\end{array}\right]
$$

Then $A_{\phi} A_{-\phi}=\mathrm{Id}=A_{-\phi} A_{\phi}$ and $A_{\phi}^{-1}=A_{-\phi}$. The relationships among $P_{C_{\gamma}}, P_{\tilde{C}_{\gamma}}$ and $P_{\tilde{C}_{1}}$ are summarized below.

Proposition 3.2. The following hold:
(i) $P_{\tilde{C}_{\gamma}}=\sqrt{\gamma} P_{\tilde{C}_{1}}(\operatorname{Id} / \sqrt{\gamma})$.
(ii) $P_{C_{\gamma}}=A_{\pi / 4} P_{\tilde{C}_{\gamma}} A_{-\pi / 4}$.

Proof. (i): $\left(\tilde{P}_{1}\right)$ is equivalent to $\left(\tilde{P}_{\gamma}\right)$ by a change of variables of scaling Id $/ \sqrt{\gamma}$. Indeed, using

$$
\left[\begin{array}{l}
u \\
v
\end{array}\right]=\frac{1}{\sqrt{\gamma}}\left[\begin{array}{l}
\tilde{u} \\
\tilde{v}
\end{array}\right] \text {, and }\left[\begin{array}{l}
u_{0} \\
v_{0}
\end{array}\right]=\frac{1}{\sqrt{\gamma}}\left[\begin{array}{l}
\tilde{u}_{0} \\
\tilde{v}_{0}
\end{array}\right]
$$

$h_{\gamma}(\tilde{u}, \tilde{v})=0$ becomes $h_{1}(u, v)=0$, and $f_{\gamma}(\tilde{u}, \tilde{v})$ becomes $\gamma f_{1}(u, v)=\gamma\left(\left\|u-u_{0}\right\|^{2}+\| v-\right.$ $\left.v_{0} \|^{2}\right)$.
(ii): $(P)$ is equivalent to $\left(\tilde{P}_{\gamma}\right)$ by a change of variables of rational $A_{\pi / 4}$. Indeed, with

$$
\left[\begin{array}{l}
x \\
y
\end{array}\right]=A_{\pi / 4}\left[\begin{array}{c}
\tilde{u} \\
\tilde{v}
\end{array}\right] \text {, and }\left[\begin{array}{l}
x_{0} \\
y_{0}
\end{array}\right]=A_{\pi / 4}\left[\begin{array}{c}
\tilde{u}_{0} \\
\tilde{v}_{0}
\end{array}\right]
$$

the objective $f(x, y)=\left\|x-x_{0}\right\|^{2}+\left\|y-y_{0}\right\|^{2}=\left\|(x, y)-\left(x_{0}, y_{0}\right)\right\|^{2}$ can be rewritten as

$$
\begin{aligned}
f(x, y) & =\left\|A_{\frac{\pi}{4}}\left[\begin{array}{l}
\tilde{u}-\tilde{u}_{0} \\
\tilde{v}-\tilde{v}_{0}
\end{array}\right]\right\|^{2}=\left[\begin{array}{l}
\tilde{u}-\tilde{u}_{0} \\
\tilde{v}-\tilde{v}_{0}
\end{array}\right]^{T} A_{\frac{\pi}{4}}^{T} A_{\frac{\pi}{4}}\left[\begin{array}{l}
\tilde{u}-\tilde{u}_{0} \\
\tilde{v}-\tilde{v}_{0}
\end{array}\right] \\
& =\left\|\tilde{u}-\tilde{u}_{0}\right\|^{2}+\left\|\tilde{v}-\tilde{v}_{0}\right\|^{2},
\end{aligned}
$$

and $h(x, y)=\langle x, y\rangle-\gamma=0$ becomes $h_{\gamma}(\tilde{u}, \tilde{v})=\|\tilde{u}\|^{2}-\|\tilde{v}\|^{2}-2 \gamma=0$.
In view of Proposition 3.2(ii), to see that $P_{C_{\gamma}}(x, y) \neq \varnothing$ for every $(x, y) \in X \times X$, the following observation is crucial.

Proposition 3.3. For every $\left(\tilde{u}_{0}, \tilde{v}_{0}\right) \in X \times X$, the minimization problem

$$
\begin{array}{ll}
\operatorname{minimize} & f_{\gamma}(\tilde{u}, \tilde{v})=\left\|\tilde{u}-\tilde{u}_{0}\right\|^{2}+\left\|\tilde{v}-\tilde{v}_{0}\right\|^{2} \\
\text { subject to } & h_{\gamma}(\tilde{u}, \tilde{v})=\|\tilde{u}\|^{2}-\|\tilde{v}\|^{2}-2 \gamma=0 \tag{6}
\end{array}
$$

always has a solution, i.e., $P_{\tilde{C}_{\gamma}}\left(\tilde{u}_{0}, \tilde{v}_{0}\right) \neq \varnothing$.
Proof. We shall illustrate only the case $\tilde{u}_{0} \neq 0, \tilde{v}_{0} \neq 0$, since the other cases are similar. We claim that the optimization problem is essentially 2-dimensional. To this end, we expand

$$
\begin{equation*}
f_{\gamma}(\tilde{u}, \tilde{v})=\underbrace{\|\tilde{u}\|^{2}-2\left\langle\tilde{u}, \tilde{u}_{0}\right\rangle+\left\|\tilde{u}_{0}\right\|^{2}}+\underbrace{\|\tilde{v}\|^{2}-2\left\langle\tilde{v}, \tilde{v}_{0}\right\rangle+\left\|\tilde{v}_{0}\right\|^{2}} . \tag{7}
\end{equation*}
$$

The constraint

$$
h_{\gamma}(\tilde{u}, \tilde{v}):=\|\tilde{u}\|^{2}-\|\tilde{v}\|^{2}-2 \gamma=0
$$

means that only the norms $\|\tilde{u}\|$ and $\|\tilde{v}\|$ matter. With $\|\tilde{u}\|$ fixed, the Cauchy-Schwarz inequality in a Hilbert space, see, e.g., [11], shows that $\tilde{u} \mapsto\left\langle\tilde{u}, \tilde{u}_{0}\right\rangle$ will be larger so that the first underlined part in $f_{\gamma}$ will be smaller when $\tilde{u}$ and $\tilde{u}_{0}$ are positively co-linear, i.e, $\tilde{u}=\alpha \tilde{u}_{0}$ for some $\alpha \geq 0$. Similarly, for fixed $\|v\|$ the second underlined part in $f_{\gamma}$ will be smaller when $\tilde{v}=\beta \tilde{v}_{0}$ for some $\beta \geq 0$. It follows that the optimization problem given by (5)-(6) is equivalent to

$$
\begin{array}{ll}
\operatorname{minimize} & g(\alpha, \beta):=(1-\alpha)^{2}\left\|\tilde{u}_{0}\right\|^{2}+(1-\beta)^{2}\left\|\tilde{v}_{0}\right\|^{2} \\
\text { subject to } & g_{1}(\alpha, \beta):=\alpha^{2}\left\|\tilde{u}_{0}\right\|^{2}-\beta^{2}\left\|\tilde{v}_{0}\right\|^{2}-2 \gamma=0, \alpha \geq 0, \beta \geq 0 \tag{9}
\end{array}
$$

Because $g: \mathbb{R}^{2} \rightarrow \mathbb{R}$ is continuous and coercive, and $g_{1}: \mathbb{R}^{2} \rightarrow \mathbb{R}$ is continuous, we conclude that the optimization problem given by (8)-(9) has a solution.

We are now ready for the investigation of projections onto $\tilde{C}_{1}, \tilde{C}_{\gamma}$ and $C_{\gamma}$.

### 3.2 Finding the projection $P_{\tilde{C}_{1}}$

Note that

$$
\begin{equation*}
\nabla f_{1}(u, v)=\left(2\left(u-u_{0}\right), 2\left(v-v_{0}\right)\right) \quad \text { and } \quad \nabla h_{1}(u, v)=(2 u,-2 v) \tag{10}
\end{equation*}
$$

By [4, Proposition 4.1.1], every solution of $\left(\tilde{P}_{1}\right)$ satisfies the necessarily conditions, i.e., the KKT system of $\left(\tilde{P}_{1}\right)$, given by

$$
\begin{align*}
(1+\lambda) u & =u_{0}  \tag{11}\\
(1-\lambda) v & =v_{0}  \tag{12}\\
\|u\|^{2}-\|v\|^{2}-2 & =0 \tag{13}
\end{align*}
$$

Lemma 3.4. Let $u_{0} \neq 0, v_{0} \neq 0$. If $(u, v, \lambda)$ verifies (11)-(13) and $(u, v)$ is an optimal solution of problem $\left(\tilde{P}_{1}\right)$, then the Lagrange multiplier $\lambda$ satisfies $|\lambda|<1$.

Proof. The constraint set

$$
\|u\|^{2}-\|v\|^{2}=2
$$

has a special structure: replacing $u$ by $-u$, or $v$ by $-v$ the constraint is still verified. Also consider

$$
f(u, v)=\left\|u-u_{0}\right\|^{2}+\left\|v-v_{0}\right\|^{2}=\left\|u_{0}\right\|^{2}-2\left\langle u_{0}, u\right\rangle+\|u\|^{2}+\left\|v_{0}\right\|^{2}-2\left\langle v_{0}, v\right\rangle+\|v\|^{2}
$$

Given $u_{0}$ and $v_{0}$, for fixed $\|u\|$ and $\|v\|, f(u, v)$ becomes smaller if one choose $\left\langle u_{0}, u\right\rangle \geq 0$, and $\left\langle v_{0}, v\right\rangle \geq 0$. Indeed, one can do so by replacing $u$ by $-u$ or $v$ by $-v$ if needed. Now by (11) and (12),

$$
(1+\lambda)\left\langle u_{0}, u\right\rangle=\left\|u_{0}\right\|^{2}, \text { and }(1-\lambda)\left\langle v_{0}, v\right\rangle=\left\|v_{0}\right\|^{2}
$$

Because $u_{0} \neq 0, v_{0} \neq 0$, we have $\left\langle u_{0}, u\right\rangle>0,\left\langle v_{0}, v\right\rangle>0$ so that $1+\lambda>0,1-\lambda>0$. Hence $|\lambda|<1$.
Proposition 3.5. Let $u_{0} \neq 0, v_{0} \neq 0$. Define $p:=\left\|u_{0}\right\|^{2}-\left\|v_{0}\right\|^{2}$ and $q:=\left\|u_{0}\right\|^{2}+\left\|v_{0}\right\|^{2}$. Suppose that $u, v \in X$ and $\lambda \in \mathbb{R}$ verify (11)-(13) and $(u, v)$ is an optimal solution to ( $\tilde{P}_{1}$ ). Then the following hold:
(i) $u=\frac{u_{0}}{(1+\lambda)}, v=\frac{v_{0}}{(1-\lambda)}$, and $(1-\lambda)^{2}\left\|u_{0}\right\|^{2}-(1+\lambda)^{2}\left\|v_{0}\right\|^{2}=2\left(1-\lambda^{2}\right)^{2}$.
(ii) The objective function has $f_{1}(u, v)=\lambda^{2}\left(\frac{\left\|u_{0}\right\|^{2}}{(1+\lambda)^{2}}+\frac{\left\|v_{0}\right\|^{2}}{(1-\lambda)^{2}}\right)$.
(iii) $\lambda$ is the unique solution of

$$
\begin{equation*}
H(\lambda):=\frac{\left(\lambda^{2}+1\right) p-2 \lambda q}{2\left(1-\lambda^{2}\right)^{2}}-1=0 \tag{14}
\end{equation*}
$$

in $]-1,1$.

Proof. (i): Because $u_{0} \neq 0, v_{0} \neq 0$, we obtain $|\lambda|<1, u=\frac{u_{0}}{(1+\lambda)}$ and $v=\frac{v_{0}}{(1-\lambda)}$ by Lemma 3.4 and (11)-(12). Then we have the following equivalences

$$
\begin{align*}
\|u\|^{2}-\|v\|^{2}=2 & \Leftrightarrow \frac{\left\|u_{0}\right\|^{2}}{(1+\lambda)^{2}}-\frac{\left\|v_{0}\right\|^{2}}{(1-\lambda)^{2}}=2  \tag{15}\\
& \Leftrightarrow(1-\lambda)^{2}\left\|u_{0}\right\|^{2}-(1+\lambda)^{2}\left\|v_{0}\right\|^{2}=2(1-\lambda)^{2}(1+\lambda)^{2}  \tag{16}\\
& \Leftrightarrow(1-\lambda)^{2}\left\|u_{0}\right\|^{2}-(1+\lambda)^{2}\left\|v_{0}\right\|^{2}=2\left(1-\lambda^{2}\right)^{2} . \tag{17}
\end{align*}
$$

(ii): Substitute $u=\frac{u_{0}}{(1+\lambda)}$ and $v=\frac{v_{0}}{(1-\lambda)}$ in $f_{1}$.
(iii): By (i), we have

$$
\begin{equation*}
(1-\lambda)^{2}\left\|u_{0}\right\|^{2}-(1+\lambda)^{2}\left\|v_{0}\right\|^{2}=2\left(1-\lambda^{2}\right)^{2} . \tag{18}
\end{equation*}
$$

Since

$$
\begin{align*}
(1-\lambda)^{2} & \left\|u_{0}\right\|^{2}-(1+\lambda)^{2}\left\|v_{0}\right\|^{2}  \tag{19}\\
& =\left(1+\lambda^{2}-2 \lambda\right)\left\|u_{0}\right\|^{2}-\left(1+\lambda^{2}+2 \lambda\right)\left\|v_{0}\right\|^{2}  \tag{20}\\
& =\lambda^{2}\left(\left\|u_{0}\right\|^{2}-\left\|v_{0}\right\|^{2}\right)+\left(\left\|u_{0}\right\|^{2}-\left\|v_{0}\right\|^{2}\right)-2 \lambda\left(\left\|u_{0}\right\|^{2}+\left\|v_{0}\right\|^{2}\right)  \tag{21}\\
& =\lambda^{2} p+p-2 \lambda q \tag{22}
\end{align*}
$$

using (22) on left side of (18), we obtain $\lambda^{2} p+p-2 \lambda q=2\left(1-\lambda^{2}\right)^{2}$, a univariate quartic equation in $\lambda$, equivalently,

$$
\begin{equation*}
H(\lambda):=\frac{\left(\lambda^{2}+1\right) p-2 \lambda q}{2\left(1-\lambda^{2}\right)^{2}}-1=0 \tag{23}
\end{equation*}
$$

We show that (23) has a unique solution in $]-1,1\left[\right.$. Because $u_{0} \neq 0, v_{0} \neq 0$, we know that $q>|p|$, and using it along-with $|\lambda|<1$ from Lemma 3.4, we get $p \lambda \leq|p||\lambda| \leq q|\lambda|$, and

$$
\begin{align*}
H^{\prime}(\lambda) & =\frac{1}{\left(1-\lambda^{2}\right)^{3}}\left(-q\left(1+3 \lambda^{2}\right)+p\left(\lambda^{3}+3 \lambda\right)\right)  \tag{24}\\
& \leq \frac{1}{\left(1-\lambda^{2}\right)^{3}}\left(-q\left(1+3 \lambda^{2}\right)+|p||\lambda|\left(\lambda^{2}+3\right)\right)  \tag{25}\\
& \leq \frac{1}{\left(1-\lambda^{2}\right)^{3}}\left(-q\left(1+3 \lambda^{2}\right)+q|\lambda|\left(\lambda^{2}+3\right)\right)  \tag{26}\\
& =\frac{q}{\left(1-\lambda^{2}\right)^{3}}\left((|\lambda|-1)^{3}\right)  \tag{27}\\
& =\frac{-q}{((1-|\lambda|)(1+|\lambda|))^{3}}\left((1-|\lambda|)^{3}\right)  \tag{28}\\
& =\frac{-q}{(1+|\lambda|)^{3}} . \tag{29}
\end{align*}
$$

Since $q=\left\|u_{0}\right\|^{2}+\left\|v_{0}\right\|^{2}>0$ and $(1+|\lambda|)^{3}>0$, we have $H^{\prime}(\lambda)<0$ on $]-1,1[$, which implies $H(\lambda)$ is strictly decreasing on $]-1,1[$. Notice that $\lambda= \pm 1$ are vertical asymptotes because at $\lambda= \pm 1$ the numerator of $H(\lambda)$ is, $H(-1)=2(p+q)=4\left\|u_{0}\right\|^{2}>0$ and $H(1)=$ $2(p-q)=-4\left\|v_{0}\right\|^{2}<0$, so that $\lim _{\lambda \rightarrow 1^{-}} H(\lambda)=-\infty$ and $\lim _{\lambda \rightarrow-1^{+}} H(\lambda)=+\infty$. Since $H$ is continuous, strictly decreasing, and its range is ] $-\infty, \infty[$, we conclude that $H(\lambda)=0$ has a unique zero in ] $-1,1$ [.

Remark 3.6. As indicated in [9], an approximate solution to (14) can be found by the Bisection method, Newton's method, or a combined version. See also [5, 8].

Theorem 3.7. Let $u_{0}, v_{0} \in X, u_{0} \neq 0, v_{0} \neq 0$. Then $P_{\tilde{C}_{1}}\left(u_{0}, v_{0}\right)$ is a singleton, and

$$
P_{\tilde{C}_{1}}\left(u_{0}, v_{0}\right)=\left\{\left[\begin{array}{c}
\frac{u_{0}}{1+\lambda} \\
\frac{v_{0}}{1-\lambda}
\end{array}\right]\right\}
$$

in which $\lambda$ is the unique root of $H(\lambda)=0$ in $]-1,1$ [ where

$$
\begin{array}{r}
H(\lambda)=\frac{\left(\lambda^{2}+1\right) p-2 \lambda q}{2\left(1-\lambda^{2}\right)^{2}}-1, \text { and } \\
p=\left\|u_{0}\right\|^{2}-\left\|v_{0}\right\|^{2}, \quad q=\left\|u_{0}\right\|^{2}+\left\|v_{0}\right\|^{2} .
\end{array}
$$

Proof. Apply Proposition 3.5.
Theorem 3.8. Let $u_{0}, v_{0} \in X$ with either $u_{0}=0$ or $v_{0}=0$.
(i) When $u_{0}=0$, we have

$$
P_{\tilde{C}_{1}}\left(0, v_{0}\right)=\left\{\left.\left[\begin{array}{c}
u  \tag{30}\\
\frac{v_{0}}{2}
\end{array}\right] \right\rvert\,\|u\|^{2}=2+\frac{\left\|v_{0}\right\|^{2}}{4}\right\} .
$$

(ii) a) When $v_{0}=0$ and $\left\|u_{0}\right\| \geq 2 \sqrt{2}$, we have

$$
P_{\tilde{C}_{1}}\left(u_{0}, 0\right)=\left\{\left.\left[\begin{array}{c}
\frac{u_{0}}{2}  \tag{31}\\
v
\end{array}\right] \right\rvert\,\|v\|^{2}=\frac{\left\|u_{0}\right\|^{2}}{4}-2\right\} .
$$

b) When $v_{0}=0$ and $0<\left\|u_{0}\right\|<2 \sqrt{2}$, we have

$$
P_{\tilde{C}_{1}}\left(u_{0}, 0\right)=\left\{\left[\begin{array}{c}
\sqrt{2} \frac{u_{0}}{\| u_{0} \pi}  \tag{32}\\
0
\end{array}\right]\right\} .
$$

Proof. By (11)-(13), $(u, v) \in P_{\tilde{C}_{1}}\left(u_{0}, v_{0}\right)$ satisfies:

$$
\begin{align*}
(1+\lambda) u & =u_{0}  \tag{33}\\
(1-\lambda) v & =v_{0}  \tag{34}\\
\|u\|^{2}-\|v\|^{2} & =2 \tag{35}
\end{align*}
$$

for some $\lambda \in \mathbb{R}$.
(i): $u_{0}=0, v_{0} \neq 0$. (33) yields $(1+\lambda) u=0 \Rightarrow$ either $1+\lambda=0$ or $u=0$. We consider two cases.

Case 1: $1+\lambda=0$, i.e., $\lambda=-1$. By (34), $2 v=v_{0} \Rightarrow v=\frac{v_{0}}{2}$ and then by (35), $\|u\|^{2}-$ $\left\|\frac{v_{0}}{2}\right\|^{2}=2 \Rightarrow\|u\|^{2}=2+\frac{\left\|v_{0}\right\|^{2}}{4}$. So, $(u, v)=\left(u, \frac{v_{0}}{2}\right)$ and $\|u\|^{2}=2+\frac{\left\|v_{0}\right\|^{2}}{4}$. The objective function is

$$
f(u, v)=\left\|u-u_{0}\right\|^{2}+\left\|v-v_{0}\right\|^{2}=\|u\|^{2}+\left\|\frac{v_{0}}{2}\right\|^{2}=2+\frac{\left\|v_{0}\right\|^{2}}{4}+\frac{\left\|v_{0}\right\|^{2}}{4}=2+\frac{\left\|v_{0}\right\|^{2}}{2}
$$

Case 2: $u=0$. By (35), $\left(0-\|v\|^{2}\right)=2$, which is impossible.
Combining both cases we have the formula (30).
(ii): $u_{0} \neq 0$, but $v_{0}=0$, which implies $(1-\lambda) v=0$ by (34). We consider two cases:

Case 1: $1-\lambda=0$, i.e., $\lambda=1$. By (33), $2 u=u_{0} \Rightarrow u=\frac{u_{0}}{2}$ and then by (35), $\|v\|^{2}=$ $\frac{\left\|u_{0}\right\|^{2}}{4}-2 \Rightarrow \frac{\left\|u_{0}\right\|^{2}}{4}-2 \geq 0 \Rightarrow\left\|u_{0}\right\|^{2} \geq 8$. Thus, $(u, v)=\left(\frac{u_{0}}{2}, v\right)$ with $\|v\|^{2}=\frac{\left\|u_{0}\right\|^{2}}{4}-2$, where the objective is

$$
f(u, v)=\left\|u-u_{0}\right\|^{2}+\left\|v-v_{0}\right\|^{2}=\frac{\left\|u_{0}\right\|^{2}}{4}+\frac{\left\|u_{0}\right\|^{2}}{4}-2=\frac{\left\|u_{0}\right\|^{2}}{2}-2 .
$$

Note that Case 1 needs $\left\|u_{0}\right\| \geq 2 \sqrt{2}$.
Case 2: $v=0$. Then $\|u\|^{2}=2 \Rightarrow\|u\|=\sqrt{2}$ by (35). By (33), $|1+\lambda|\|u\|=\left\|u_{0}\right\| \Rightarrow$ $|1+\lambda|=\frac{\left\|u_{0}\right\|}{\sqrt{2}} \Rightarrow 1+\lambda= \pm \frac{\left\|u_{0}\right\|}{\sqrt{2}}$.
Subcase 1: $1+\lambda=-\frac{\left\|u_{0}\right\|}{\sqrt{2}}$. By (33), $u=\frac{u_{0}}{\left(-\frac{\left\|u_{0}\right\|}{\sqrt{2}}\right)}=-\frac{\sqrt{2} u_{0}}{\left\|u_{0}\right\|}$. Then

$$
f(u, 0)=\left\|u-u_{0}\right\|^{2}+\left\|0-v_{0}\right\|^{2}=\left\|-\frac{\sqrt{2} u_{0}}{\left\|u_{0}\right\|}-u_{0}\right\|^{2}=\left(\left\|u_{0}\right\|+\sqrt{2}\right)^{2}
$$

Subcase 2: $1+\lambda=\frac{\left\|u_{0}\right\|}{\sqrt{2}}$. By (33), $u=\frac{\sqrt{2} u_{0}}{\left\|u_{0}\right\|}$. Then

$$
f(u, 0)=\left\|u-u_{0}\right\|^{2}+\left\|0-v_{0}\right\|^{2}=\left\|u_{0}-\frac{\sqrt{2} u_{0}}{\left\|u_{0}\right\|}\right\|^{2}=\left(\left\|u_{0}\right\|-\sqrt{2}\right)^{2}
$$

Comparing Subcase 1 and Subcase 2, we obtain $\left|\left\|u_{0}\right\|-\sqrt{2}\right|<\left\|u_{0}\right\|+\sqrt{2}$ because $\left\|u_{0}\right\| \neq$ 0 . That is, Subcase 2 gives a smaller value at $(u, 0)$ with $u=\sqrt{2} \frac{u_{0}}{\left\|u_{0}\right\|}$. We need to compare it to Case 1 whenever it happens. Note that

$$
\frac{\left\|u_{0}\right\|^{2}}{2}-2<\left(\left\|u_{0}\right\|-\sqrt{2}\right)^{2} \quad \text { whenever } \quad\left\|u_{0}\right\| \neq 2 \sqrt{2}
$$

Indeed, we have
$\frac{\left\|u_{0}\right\|^{2}}{2}-2<\left\|u_{0}\right\|^{2}-2 \sqrt{2}\left\|u_{0}\right\|+2 \Longleftrightarrow \frac{\left\|u_{0}\right\|^{2}}{2}-2 \sqrt{2}\left\|u_{0}\right\|+4>0 \Longleftrightarrow\left(\left\|u_{0}\right\|-2 \sqrt{2}\right)^{2}>0$,
which always holds if $\left\|u_{0}\right\| \neq 2 \sqrt{2}$. Hence, the nearest points are given by

$$
\begin{gather*}
\left(\frac{u_{0}}{2}, v\right) \quad \text { with } \quad\|v\|^{2}=\frac{\left\|u_{0}\right\|^{2}}{4}-2, \quad \text { when } \quad\left\|u_{0}\right\| \neq 2 \sqrt{2}  \tag{36}\\
\left(\frac{u_{0}}{2}, 0\right)=\left(\sqrt{2} \frac{u_{0}}{\left\|u_{0}\right\|^{\prime}}, 0\right), \quad \text { when } \quad\left\|u_{0}\right\|=2 \sqrt{2} . \tag{37}
\end{gather*}
$$

However, Case 1 occurs only when $\left\|u_{0}\right\| \geq 2 \sqrt{2}$. Hence, when $\left\|u_{0}\right\| \geq 2 \sqrt{2}$ the nearest points are given by

$$
\left(\frac{u_{0}}{2}, v\right) \quad \text { with } \quad\|v\|^{2}=\frac{\left\|u_{0}\right\|^{2}}{4}-2
$$

When $\left\|u_{0}\right\|<2 \sqrt{2}$, Case 1 is impossible. Then we only need to compare Subcase 1 and Subcase 2. Hence, the nearest point is

$$
\left(\sqrt{2} \frac{u_{0}}{\left\|u_{0}\right\|}, 0\right) \quad \text { when } \quad\left\|u_{0}\right\|<2 \sqrt{2}
$$

Finally, since $\left\|u_{0}\right\|=2 \sqrt{2} \Rightarrow\|v\|^{2}=2-2=0$, (36) gives $\left(\frac{u_{0}}{2}, 0\right)$. Also $\frac{\sqrt{2}}{\left\|u_{0}\right\|}=\frac{1}{2}$, therefore $\sqrt{2} \frac{u_{0}}{\left\|u_{0}\right\|}=\frac{1}{2} u_{0}$. It follows that $\left(\frac{u_{0}}{2}, 0\right)=\left(\sqrt{2} \frac{u_{0}}{\left\|u_{0}\right\|}, 0\right)$ when $\left\|u_{0}\right\|=2 \sqrt{2}$, which implies that (37) can be obtained from (36) when $\left\|u_{0}\right\|=2 \sqrt{2}$. Hence formulas (31) and (32) hold.

### 3.3 Finding the projection $P_{\tilde{C}_{\gamma}}$

$P_{\tilde{C}_{\gamma}}$ can be found via $P_{\tilde{C}_{1}}$.
Theorem 3.9. Let $\gamma>0, \tilde{u}_{0}, \tilde{v}_{0} \in X$, and $\tilde{C}_{\gamma}=\left\{(\tilde{u}, \tilde{v}) \in X \times X \mid\|\tilde{u}\|^{2}-\|\tilde{v}\|^{2}=2 \gamma\right\}$. Then the following hold:
(i) When $\tilde{u}_{0} \neq 0$ and $\tilde{v}_{0} \neq 0$, we have

$$
P_{\tilde{C}_{\gamma}}\left(\tilde{u}_{0}, \tilde{v}_{0}\right)=\left\{\left[\begin{array}{c}
\frac{\tilde{u}_{0}}{1+\lambda} \\
\frac{\tilde{v}_{0}}{1-\lambda}
\end{array}\right]\right\},
$$

in which $\lambda$ is the unique root of $H(\lambda)=0$ in $]-1,1[$, where

$$
H(\lambda)=\frac{\left(\lambda^{2}+1\right) p-2 \lambda q}{2\left(1-\lambda^{2}\right)^{2}}-\gamma, p=\left\|\tilde{u}_{0}\right\|^{2}-\left\|\tilde{v}_{0}\right\|^{2}, q=\left\|\tilde{u}_{0}\right\|^{2}+\left\|\tilde{v}_{0}\right\|^{2}
$$

(ii) When $\tilde{u}_{0}=0$, we have

$$
P_{\tilde{C}_{\gamma}}\left(0, \tilde{v}_{0}\right)=\left\{\left.\left[\begin{array}{c}
\tilde{u}  \tag{38}\\
\frac{\tilde{v}_{0}}{2}
\end{array}\right] \right\rvert\,\|\tilde{u}\|^{2}=2 \gamma+\frac{\left\|\tilde{v}_{0}\right\|^{2}}{4}\right\} .
$$

(iii) a) When $\tilde{v}_{0}=0$ and $\left\|\tilde{u}_{0}\right\| \geq 2 \sqrt{2 \gamma}$, we have

$$
P_{\tilde{C}_{\gamma}}\left(\tilde{u}_{0}, 0\right)=\left\{\left.\left[\begin{array}{c}
\frac{\tilde{u}_{0}}{2}  \tag{39}\\
\tilde{v}
\end{array}\right] \right\rvert\,\|\tilde{v}\|^{2}=\frac{\left\|\tilde{u}_{0}\right\|^{2}}{4}-2 \gamma\right\} .
$$

b) When $\tilde{v}_{0}=0$ and $0<\left\|\tilde{u}_{0}\right\|<2 \sqrt{2 \gamma}$, we have

$$
P_{\tilde{C}_{\gamma}}\left(\tilde{u}_{0}, 0\right)=\left\{\left[\begin{array}{c}
\sqrt{2 \gamma} \frac{\tilde{u}_{0}}{\left\|\tilde{u}_{0}\right\|}  \tag{40}\\
0
\end{array}\right]\right\} .
$$

Proof. Proposition 3.2(i) states

$$
P_{\tilde{C}_{\gamma}}\left(\tilde{u}_{0}, \tilde{v}_{0}\right)=\sqrt{\gamma} P_{\tilde{C}_{1}}\left(\frac{\tilde{u}_{0}}{\sqrt{\gamma}}, \frac{\tilde{v}_{0}}{\sqrt{\gamma}}\right) .
$$

Apply Theorem 3.7 and Theorem 3.8.

## 4 Projections onto bilinear constraint set $C_{\gamma}$ when $\gamma>0$

$P_{C_{\gamma}}$ can be found via $P_{\tilde{C}_{\gamma}}$, which is the main result of this section.
Theorem 4.1. Let $\gamma>0, x_{0}, y_{0} \in X$, and $C_{\gamma}=\{(x, y) \in X \times X \mid\langle x, y\rangle=\gamma\}$. Then the following hold:
(i) When $x_{0} \neq \pm y_{0}$, the projection is a singleton:

$$
P_{C_{\gamma}}\left(x_{0}, y_{0}\right)=\left\{\left[\begin{array}{c}
\frac{x_{0}-\lambda y_{0}}{1-\lambda^{2}} \\
\frac{y_{0}-\lambda x_{0}}{1-\lambda^{2}}
\end{array}\right]\right\}
$$

in which $\lambda$ is the unique solution of $H(\lambda)=0$ in $]-1,1[$, where

$$
H(\lambda)=\frac{\left(\lambda^{2}+1\right) p-2 \lambda q}{2\left(1-\lambda^{2}\right)^{2}}-\gamma, p=2\left\langle x_{0}, y_{0}\right\rangle, \text { and } q=\left\|x_{0}\right\|^{2}+\left\|y_{0}\right\|^{2}
$$

(ii) When $x_{0}=-y_{0}$, the projection is a set:

$$
P_{C_{\gamma}}\left(x_{0},-x_{0}\right)=\left\{\left.\left[\begin{array}{c}
\frac{x_{0}}{2}+\frac{\tilde{u}}{\sqrt{2}} \\
-\frac{x_{0}}{2}+\frac{\tilde{u}}{\sqrt{2}}
\end{array}\right] \right\rvert\,\|\tilde{u}\|^{2}=2 \gamma+\frac{\left\|x_{0}\right\|^{2}}{2}, \tilde{u} \in X\right\} .
$$

(iii) a) When $x_{0}=y_{0}$ and $\left\|x_{0}\right\| \geq 2 \sqrt{\gamma}$, the projection is a set:

$$
P_{C_{\gamma}}\left(x_{0}, x_{0}\right)=\left\{\left.\left[\begin{array}{c}
\frac{x_{0}}{2}-\frac{\tilde{v}}{\sqrt{2}} \\
\frac{x_{0}}{2}+\frac{\tilde{v}}{\sqrt{2}}
\end{array}\right] \right\rvert\,\|\tilde{v}\|^{2}=\frac{\left\|x_{0}\right\|^{2}}{2}-2 \gamma, \tilde{v} \in X\right\} .
$$

b) When $x_{0}=y_{0}$ and $0<\left\|x_{0}\right\|<2 \sqrt{\gamma}$, the projection is a singleton:

$$
P_{C_{\gamma}}\left(x_{0}, x_{0}\right)=\left\{\sqrt{\gamma}\left[\begin{array}{c}
\frac{x_{0}}{\left\|x_{0}\right\|} \\
\frac{x_{0}}{\left\|x_{0}\right\|}
\end{array}\right]\right\} .
$$

Proof. Proposition 3.2(ii) states

$$
\begin{equation*}
P_{C_{\gamma}}\left(x_{0}, y_{0}\right)=A_{\frac{\pi}{4}} P_{\tilde{C}_{\gamma}} A_{-\frac{\pi}{4}}\left(x_{0}, y_{0}\right) . \tag{41}
\end{equation*}
$$

It suffices to apply Theorem 3.9. Indeed, with

$$
\left[\begin{array}{l}
\tilde{u}_{0}  \tag{42}\\
\tilde{v}_{0}
\end{array}\right]=A_{-\pi / 4}\left[\begin{array}{l}
x_{0} \\
y_{0}
\end{array}\right]=\left[\begin{array}{c}
\frac{x_{0}+y_{0}}{\sqrt{2}} \\
\frac{-x_{0}+y_{0}}{\sqrt{2}}
\end{array}\right]
$$

using (41) and (42) Theorem 3.9 gives:
(i): When $x_{0} \neq \pm y_{0}$, we have $\tilde{u}_{0} \neq 0, \tilde{v}_{0} \neq 0$. By Theorem 3.9(i), we get $P_{\tilde{C}_{\gamma}}\left(\tilde{u}_{0}, \tilde{v}_{0}\right)=$ $\left[\frac{\tilde{u}_{0}}{(1+\lambda)}, \frac{\tilde{v}_{0}}{(1-\lambda)}\right]^{T}$, so

$$
\begin{aligned}
P_{C_{\gamma}}\left(x_{0}, y_{0}\right) & =\left[\begin{array}{cc}
\frac{1}{\sqrt{2}} \operatorname{Id} & -\frac{1}{\sqrt{2}} \operatorname{Id} \\
\frac{1}{\sqrt{2}} \operatorname{Id} & \frac{1}{\sqrt{2}} \operatorname{Id}
\end{array}\right]\left[\begin{array}{cc}
\frac{1}{1+\lambda} \operatorname{Id} & 0 \\
0 & \frac{1}{1-\lambda} \operatorname{Id}
\end{array}\right]\left[\begin{array}{cc}
\frac{1}{\sqrt{2}} \operatorname{Id} & \frac{1}{\sqrt{2}} \operatorname{Id} \\
-\frac{1}{\sqrt{2}} \operatorname{Id} & \frac{1}{\sqrt{2}} \operatorname{Id}
\end{array}\right]\left[\begin{array}{l}
x_{0} \\
y_{0}
\end{array}\right] \\
& =\left[\begin{array}{cc}
\frac{1}{1-\lambda^{2}} \operatorname{Id} & \frac{-\lambda}{1-\lambda^{2}} \operatorname{Id} \\
\frac{-\lambda}{1-\lambda^{2}} \operatorname{Id} & \frac{1}{1-\lambda^{2}} \operatorname{Id}
\end{array}\right]\left[\begin{array}{l}
x_{0} \\
y_{0}
\end{array}\right] .
\end{aligned}
$$

Also, $\|p\|=\left\|\tilde{u}_{0}\right\|^{2}-\left\|\tilde{v}_{0}\right\|^{2}=2\left\langle x_{0}, y_{0}\right\rangle$, and $\|q\|=\left\|\tilde{u}_{0}\right\|^{2}+\left\|\tilde{v}_{0}\right\|^{2}=\left\|x_{0}\right\|^{2}+\left\|y_{0}\right\|^{2}$.
(ii): For $x_{0}=-y_{0}$, we have $\tilde{u}_{0}=0, \tilde{v}_{0}=-\sqrt{2} x_{0}$, so

$$
\begin{aligned}
P_{C_{\gamma}}\left(x_{0},-x_{0}\right) & =A_{\frac{\pi}{4}} P_{\tilde{C}_{\gamma}}\left(0,-\sqrt{2} x_{0}\right) \\
& =\left\{A_{\frac{\pi}{4}}\left[\begin{array}{c}
\tilde{u} \\
\frac{-x_{0}}{\sqrt{2}}
\end{array}\right] \left\lvert\,\|\tilde{u}\|^{2}=2 \gamma+\frac{\left\|-\sqrt{2} x_{0}\right\|^{2}}{4}=2 \gamma+\frac{\left\|x_{0}\right\|^{2}}{2}\right., \tilde{u} \in X\right\} .
\end{aligned}
$$

(iii): When $x_{0} \neq-y_{0}$, and $x_{0}=y_{0}$, we have $x_{0} \neq 0,\left(x_{0}, y_{0}\right)=\left(x_{0}, x_{0}\right)$, so that $\tilde{v}_{0}=0$ and $\tilde{u}_{0}=\frac{x_{0}+y_{0}}{\sqrt{2}}=\sqrt{2} x_{0}$. Then $\left\|\tilde{u}_{0}\right\| \geq 2 \sqrt{2 \gamma} \Leftrightarrow\left\|x_{0}\right\| \geq 2 \sqrt{\gamma}$.
a) When $\left\|x_{0}\right\| \geq 2 \sqrt{\gamma}$, we have

$$
\begin{aligned}
P_{C_{\gamma}}\left(x_{0}, x_{0}\right) & =A_{\frac{\pi}{4}} P_{\tilde{C}_{\gamma}}\left(\sqrt{2} x_{0}, 0\right) \\
& =A_{\frac{\pi}{4}}\left\{\left[\begin{array}{c}
\frac{x_{0}}{\sqrt{2}} \\
\tilde{v}
\end{array}\right] \left\lvert\,\|\tilde{v}\|^{2}=\frac{\left\|\sqrt{2} x_{0}\right\|^{2}}{4}-2 \gamma=\frac{\left\|x_{0}\right\|^{2}}{2}-2 \gamma\right., \tilde{v} \in X\right\} .
\end{aligned}
$$

b) When $0<\left\|x_{0}\right\|<2 \sqrt{\gamma}$, we have $\left\|\tilde{u}_{0}\right\|<2 \sqrt{2 \gamma}$, so

$$
P_{C_{\gamma}}\left(x_{0}, x_{0}\right)=A_{\frac{\pi}{4}} P_{\tilde{C}_{\gamma}}\left(\sqrt{2} x_{0}, 0\right)=A_{\frac{\pi}{4}}\left[\begin{array}{c}
\sqrt{2 \gamma} \frac{\sqrt{2} x_{0}}{\left\|\sqrt{2} x_{0}\right\|} \\
0
\end{array}\right]=A_{\frac{\pi}{4}}\left[\begin{array}{c}
\sqrt{2 \gamma} \frac{x_{0}}{\left\|x_{0}\right\|} \\
0
\end{array}\right] .
$$

## 5 Projections onto hyperbola $\tilde{C}_{\gamma}$ and bilinear constraint set $C_{\gamma}$ when $\gamma<0$

Armed with the results in Sections 3 and 4, we can study $P_{\tilde{C}_{\gamma}}$ and $P_{C_{\gamma}}$ when $\gamma<0$. Define

$$
\begin{gathered}
T_{1}: X \times X \rightarrow X \times X:(x, y) \mapsto(y, x), \text { and } \\
T_{2}: X \times X \rightarrow X \times X:(x, y) \mapsto(x,-y)
\end{gathered}
$$

Theorem 5.1. Let $\gamma<0, \tilde{u}_{0}, \tilde{v}_{0} \in X$, and $\tilde{C}_{\gamma}=\left\{(u, v) \in X \times X \mid\|u\|^{2}-\|v\|^{2}=2 \gamma\right\}$. Then the following hold:
(i) When $\tilde{u}_{0} \neq 0, \tilde{v}_{0} \neq 0$, we have

$$
P_{\tilde{C}_{\gamma}}\left(\tilde{u}_{0}, \tilde{v}_{0}\right)=\left\{\left[\begin{array}{c}
\frac{\tilde{u}_{0}}{1-\lambda} \\
\frac{\tilde{v}_{0}}{1+\lambda}
\end{array}\right]\right\}
$$

in which $\lambda$ is the unique root of $H(\lambda)=0$ in $]-1,1[$, where

$$
H(\lambda)=\frac{\left(\lambda^{2}+1\right) p-2 \lambda q}{2\left(1-\lambda^{2}\right)^{2}}+\gamma, p=\left\|\tilde{v}_{0}\right\|^{2}-\left\|\tilde{u}_{0}\right\|^{2}, \text { and } q=\left\|\tilde{u}_{0}\right\|^{2}+\left\|\tilde{v}_{0}\right\|^{2}
$$

(ii) When $\tilde{v}_{0}=0$, we have

$$
P_{\tilde{C}_{\gamma}}\left(\tilde{u}_{0}, 0\right)=\left\{\left.\left[\begin{array}{c}
\frac{\tilde{u}_{0}}{2}  \tag{43}\\
\tilde{v}
\end{array}\right] \right\rvert\,\|\tilde{v}\|^{2}=\frac{\left\|\tilde{u}_{0}\right\|^{2}}{4}-2 \gamma\right\} .
$$

(iii) a) When $\tilde{u}_{0}=0$ and $\left\|\tilde{v}_{0}\right\| \geq 2 \sqrt{2(-\gamma)}$, we have

$$
P_{\tilde{C}_{\gamma}}\left(0, \tilde{v}_{0}\right)=\left\{\left.\left[\begin{array}{c}
\tilde{u}  \tag{44}\\
\frac{\tilde{v}_{0}}{2}
\end{array}\right] \right\rvert\,\|\tilde{u}\|^{2}=\frac{\left\|\tilde{v}_{0}\right\|^{2}}{4}+2 \gamma\right\} .
$$

b) When $\tilde{u}_{0}=0$ and $0<\left\|\tilde{v}_{0}\right\|<2 \sqrt{2(-\gamma)}$, we have

$$
P_{\tilde{C}_{\gamma}}\left(0, \tilde{v}_{0}\right)=\left\{\left[\begin{array}{c}
0  \tag{45}\\
\left.\sqrt{2(-\gamma)} \frac{\tilde{v}_{0}}{\left\|\tilde{v}_{0}\right\|}\right]
\end{array}\right] .\right.
$$

Proof. Since

$$
\operatorname{minimize}\left\|\tilde{u}-\tilde{u}_{0}\right\|^{2}+\left\|\tilde{v}-\tilde{v}_{0}\right\|^{2} \quad \text { subject to } \quad\|\tilde{u}\|^{2}-\|\tilde{v}\|^{2}=2 \gamma
$$

is equivalent to

$$
\operatorname{minimize}\left\|\tilde{v}-\tilde{v}_{0}\right\|^{2}+\left\|\tilde{u}-\tilde{u}_{0}\right\|^{2} \quad \text { subject to } \quad\|\tilde{v}\|^{2}-\|\tilde{u}\|^{2}=2(-\gamma),
$$

we have $P_{\tilde{C}_{\gamma}}=T_{1} P_{\tilde{C}_{-\gamma}} T_{1}$. It suffices to apply Theorem 3.9.
Theorem 5.2. Let $\gamma<0, x_{0}, y_{0} \in X$, and $C_{\gamma}=\{(x, y) \in X \times X \mid\langle x, y\rangle=\gamma\}$. Then the following hold:
(i) When $x_{0} \neq \pm y_{0}$, the projection is a singleton:

$$
P_{C_{\gamma}}\left(x_{0}, y_{0}\right)=\left\{\left[\begin{array}{c}
\frac{x_{0}+\lambda y_{0}}{1-\lambda^{2}} \\
\frac{y_{0}+\lambda x_{0}}{1-\lambda^{2}}
\end{array}\right]\right\}
$$

in which $\lambda$ is the unique solution of $H(\lambda)=0$ in $]-1,1[$, where

$$
H(\lambda)=\frac{\left(\lambda^{2}+1\right) p-2 \lambda q}{2\left(1-\lambda^{2}\right)^{2}}+\gamma, p=-2\left\langle x_{0}, y_{0}\right\rangle, \text { and } q=\left\|x_{0}\right\|^{2}+\left\|y_{0}\right\|^{2}
$$

(ii) When $x_{0}=y_{0}$, the projection is a set:

$$
P_{C_{\gamma}}\left(x_{0}, x_{0}\right)=\left\{\left.\left[\begin{array}{c}
\frac{x_{0}}{2}+\frac{\tilde{u}}{\sqrt{2}} \\
\frac{x_{0}}{2}-\frac{\tilde{u}}{\sqrt{2}}
\end{array}\right] \right\rvert\,\|\tilde{u}\|^{2}=-2 \gamma+\frac{\left\|x_{0}\right\|^{2}}{2}, \tilde{u} \in X\right\} .
$$

(iii) a) When $x_{0}=-y_{0}$ and $\left\|x_{0}\right\| \geq 2 \sqrt{-\gamma}$, the projection is a set:

$$
P_{C_{\gamma}}\left(x_{0},-x_{0}\right)=\left\{\left.\left[\begin{array}{c}
\frac{x_{0}}{2}-\frac{\tilde{v}}{\sqrt{2}} \\
\frac{-x_{0}}{2}-\frac{\tilde{v}}{\sqrt{2}}
\end{array}\right] \right\rvert\,\|\tilde{v}\|^{2}=\frac{\left\|x_{0}\right\|^{2}}{2}+2 \gamma, \tilde{v} \in X\right\} .
$$

b) When $x_{0}=-y_{0}$ and $0<\left\|x_{0}\right\|<2 \sqrt{-\gamma}$, the projection is a singleton:

$$
P_{C_{1}}\left(x_{0},-x_{0}\right)=\left\{\sqrt{-\gamma}\left[\begin{array}{c}
\frac{x_{0}}{\left\|x_{0}\right\|} \\
\frac{-x_{0}}{\left\|x_{0}\right\|}
\end{array}\right]\right\} .
$$

Proof. Since

$$
\operatorname{minimize}\left\|x-x_{0}\right\|^{2}+\left\|y-y_{0}\right\|^{2} \quad \text { subject to } \quad\langle x, y\rangle=\gamma
$$

is equivalent to

$$
\operatorname{minimize}\left\|x-x_{0}\right\|^{2}+\left\|z-\left(-y_{0}\right)\right\|^{2} \quad \text { subject to } \quad\langle x, z\rangle=-\gamma
$$

we have $P_{C_{\gamma}}=T_{2} P_{C_{-\gamma}} T_{2}$. It remains to apply Theorem 4.1.
