## ABSTRACT

Humans have a major challenge: how to share knowledge effectively. People often need quick informational help, like health/legal advice, shopping/cooking tips, insider opinion, etc. The needs are important and ubiquitous, and most could be satisfied via quick chats with others, who may or may not be experts. In fact, knowledge common to some is often sought by others; every human, expert or non-expert, young or old, has helpful values. Yet, the reality is that people usually cannot find helpers easily, end up spending much more time and money, or even get no answer at all. This signifies a critical issue: the current labour market, called by this paper the Conventional Market (CM), massively fails such Burst Jobs, leading to huge job opportunity losses and human intelligence underutilization. This paper attributes the failure to high transaction costs due to technology constraints. Thus, this paper proposes creating an online Burst Market (BM) letting people sell any services at their own price via video or audio chats lasting as short as a few seconds or minutes. The solution is feasible and lucrative thanks to technology progress. It will empower all people, including not only professionals but also the vast ordinary individuals, and create enormous part-time and full-time jobs. As a result, it will aid in poverty lifting and alleviate aging society problem as people will be able to earn income more easily, reduce AI-led unemployment through the highly intelligent BM jobs, maximize human values through the easy acquisition and sale of skills with Life-Long Working, and increase prosperity and human achievements thanks to the collaboration breakthrough. The BM will also reshape industries, and may cause a global power reshuffle or even the ultimate destruction of nations. In short, this paper proposes the concept of the BM and asserts that it will invoke the next leap for humanity.

## 1 INTRODUCTION

Up until now, humans have faced a significant challenge: how to efficiently share knowledge and skills. On the one hand, several breakthroughs have been achieved; for example, the advent of capitalism facilitated more efficient collaborations, and the invention of the internet made information-sharing easier. On the other hand, however, the challenge remains, all the progress notwithstanding. The billions of minds in the world contain a vast quantity of information that cannot be efficiently shared with each other.

In particular, people frequently want rapid advice or information, such as health/legal advice, shopping/cooking/travel tips, insider opinion, etc. The needs are important and ubiquitous; ideally, most could be satisfied in a few seconds or minutes through brief talks with others. However, in practice, the process of information-sharing is not always that straightforward.

### 1.1 Limitations of current knowledge-sharing methods

There are several ways for individuals to obtain advice or information. The methods may be categorized as either free or paid, as well as static or dynamic. Based on the two types of divisions, the following four categories can be derived.

#### 1.1.1 Analysis of knowledge-sharing methods

The first category of information-acquisition methods consists of free static ones. Internet searches and YouTube videos are the main examples that often provide useful information. However, they have a number of disadvantages.

Firstly, the content on the internet or YouTube is not interactive; hence, it cannot address any follow-up questions that readers and viewers may have. Secondly, they mostly supply general information and are unable to answer customized queries, such as a tax inquiry involving a complex personal situation. Thirdly, because the information is mostly free, its quality is unscrutinised by market competition.

The second category consists of free interactive methods, such as asking acquaintances. However, its flaw is evident: the acquaintance circle is quite narrow.

The third category consists of paid static methods, such as paid online information. However, the method shares many limitations of the first category, such as lack of interactivity and inability to meet individualized requirements.

The fourth category consists of paid interactive methods, which are essentially information-sharing activities through the labour market, such as a client hiring a lawyer for legal advice. People seeking information represent the supply side of the labour market, whereas those looking to offer advice represent the demand side.

Thereafter, this paper refers to the current labour market as the “Conventional Market (CM)”. It is in contrast to the term “Burst Market”, which is introduced in the paper later.

A main issue with the CM in terms of information-sharing is that it incurs heavy overheads. In order to establish a contract between a lawyer and a client, for example, further steps such as advertising, an interview or free consultation, contract negotiation, payment processing, etc., are typically required.

Such overheads impose two restrictions on the CM. Firstly, the CM primarily supports rather time-consuming jobs that last more than a few seconds or minutes. Secondly, the CM mainly facilitates costly professional jobs that can afford the expense of the hefty overheads.

### 1.1.2 Burst Requirement examples

In contrast to the jobs in the CM, however, many informational demands in people’s daily lives are brief and do not always necessitate expertise.

Thereafter, the term “Burst” will be used to refer to a very short span of time, such as a few seconds or minutes. For instance, needs requiring only a few seconds or minutes are referred to as Burst Requirements.

Below are Burst Requirement examples. They reveal the limitations of the CM as well as other categories of information-sharing methods mentioned previously.

- Expert help
  - “I need help with my car/computer/health/plumbing/legal issue, and I want prompt advice or guidance.”
    - Note: In many cases, a quick chat for a few minutes with an expert can suffice or provide essential guidance, but the CM incurs heavy overheads and raises the price.
  - “I have a job/business-related question.”
  - “I have a tax-related inquiry.”
    - Note: Such questions frequently entail intricate personal circumstances for which there are no straightforward online responses.
  - “How can I translate this word/sentence? The machine translation is not particularly accurate.”
    - Note: A chat for a few seconds or minutes may suffice.
  - “I need help with my study question.”
  - “I want someone to search the internet for me, report the results, and then answer any follow-up questions I may have by conducting more searches in an interactive manner.”
    - Note: A person may lack online searching proficiency or simply be lethargic. A search expert can help with the request. However, the CM is unable to let strangers from the demand and supply sides of the Burst job meet each other and efficiently complete the task in just a few seconds or minutes.
- Know-how
  - “How to register a patent, and what are the tips?”
    - Note: Frequently, one still has unresolved questions after conducting an Internet search.
  - “How to make a certain meal?”
    - Note: Like many other examples on the list, the asker does not necessarily require the assistance of an expert. Knowledge or skills common to some people, such as cooking a certain meal, is frequently beneficial to others. All humans, whether expert or non-expert, young or old, have helpful values. However, the CM is unable to facilitate such quick non-professional requirements.
  - “How to build a website?”
  - “How to publish a book?”
  - “What are the tips for doing a garage sale?”
    - Note: These requirements are not professional-related; thus, the CM failed them. It is difficult to find experienced people and pay for their advice on the question. Unfortunately, many tips are locked in people’s minds.
  - “What are the steps and tips for obtaining a flight pilot/gun ownership license?”
- Leisure
  - “I am seeking information on traveling to a specific destination.”

- Note: Both expert and non-expert can help.
  - “Can someone tell me a joke?”
    - Note: The request does not necessarily need expert’s help.
  - “I am seeking an idea for a birthday party/Christmas activity/another occasion.”
    - Note: The request does not necessarily need expert’s help.
  - “Can someone recommend a good book/movie/video game/other activity?”
    - Note: The request does not necessarily need expert’s help.
- Insider information
  - “I am considering sending my child to school X, therefore I want to talk to some students there to know more about it.”
    - Note: Any student in the school can help. However, it is difficult for parents to find one, and the CM fails the crucial task. It is also an example of the lost job opportunities of young people due to the CM’s limitations. Relevant to the issue, this paper proposes the concept of “Life-Long Working” in a later section.
  - “I want to talk to someone working in institution X to know more about it.”
    - Note: This is another example of a non-expert-related requirement. Any person with a relevant profile can help in a few seconds or minutes. However, the request is failed by the CM.
  - “What does life look like as an accountant/senior citizen/homeless person/musician?”
    - Note: This is another example of a non-expert-related requirement. Any person with a relevant profile can help in a few seconds or minutes. However, the request is failed by the CM.
- Daily life questions
  - “I am seeking a gift idea.”
    - Note: The request does not necessarily need expert’s help.
  - “How to teach my children?”
    - Note: This is a very personalized question.
- Discussion
  - “I have an idea of X, and I want to discuss it with relevant people.”
  - “I enjoyed a book/article/movie, and I want to chat with the author.”
    - Note: Often, authors are unable to react to every reader’s correspondence. They lack a method for efficiently identifying the most important ones. Moreover, particularly eager readers are unable to contact the authors effectively, underlining the limitations of the CM.
  - “I am a fan of movie X/sports team X, and I want to chat with fellow enthusiasts.”
- Celebrity meetup
  - “I desire to see/speak with celebrity X.”
  - A celebrity wants to meet fans and raise funds.
    - Note: Selling/auctioning video chat sessions with fans will be a more efficient way than the conventional approach of hosting a luncheon.
- Situational advice
  - “I just arrived in city X. Can someone suggest a three-hour tour itinerary?”
    - Note: This is a personalized question.
- Shopping advice
  - “I intend to buy a drone/3D printer. Can someone provide an introduction and advice on the best model/price/store suitable for me?”
  - “I am looking for a renovation contractor/piano teacher/real estate agent/bank/doctor. Can someone offer recommendations?”
    - Note: This is a non-expert-question.
  - “Can someone propose a restaurant for me?”
    - Note: This is a non-expert-question.
  - “I need assistance selecting a summer camp for my child.”
    - Note: This is a non-expert-question.
- Meeting random individuals
  - “We are seeking the thoughts of random individuals on our new product design.”
    - Although random people are abundant, the CM lacks a means for them to indicate their availability. It often takes much effort to organize an interview with random individuals.
  - A psychologist seeking random participants for an experiment.

These examples are just a small set of vast possible topics. The Burst Requests are important and ubiquitous to daily life. Many of them are not difficult and there are people who are able to help. In addition, many do not need an expert,

as certain knowledge or experience lacking by some may be common to others. For some needs, such as insider information or meeting random individuals, the helper does not need to have any special skills at all.

### **1.1.3 Conventional Market (CM) failure explained by transaction cost theory**

The reality, however, is that those in need of Burst Help often end up having to either search for the answer on their own, or, in some cases, go through arduous procedures to identify and pick a provider while paying a high price for the advice. Either way, it takes much more than a few seconds or minutes and may be costly. Sometimes, the askers may not be able to find answers at all.

In a free economy, the labour market is intended to solve the problem of matching demand and supply, and it generally performs effectively. However, it apparently fails Burst Jobs. As such, this paper uses the transaction cost theory to explain the phenomenon.

Transaction cost is a cost incurred in making any economic trade when participating in a market. John R. Commons introduced the concept in 1931 [1]. Oliver E. Williamson's Transaction Cost Economics [2] brought transaction cost arguments to widespread attention. Dahlman contends that transaction costs fall into three major categories: search and information costs, bargaining and decision costs, and policing and enforcement costs [3].

Today, transaction cost economics is used to explain a variety of behaviours. Examples include the study of business operations [4, 5], platform economy [6], freelancing [7], farm economy [8, 9], and rental economy [10]. However, the subject of Burst Needs in the labour market is rarely addressed yet.

This paper asserts that, due to technological constraints, the transaction cost of Burst Jobs is relatively too high to allow the CM to facilitate them. In other words, the overheads of Burst Jobs are too heavy.

Specifically, it is difficult for those who wish to sell their knowledge or skills to advertise, for those with Burst Needs to locate and pick providers, and for both sides to meet up, deliver the service, and make payment. Therefore, the relatively high transaction cost precludes the facilitation of Burst Jobs, which generate little profit and need only a few seconds or minutes.

## **1.2 Consequences of the CM problem**

The loss of Burst Job opportunities by the CM has substantial consequences, including the followings.

### **1.2.1 Insufficient mental collaborations and human intelligence underutilization**

Minds are the most valuable resource for innovation and growth. Therefore, mental collaborations are crucial. The lost opportunities on Burst Requirements pertain to information- or knowledge-sharing; this results in the suppression of mental collaborations and the underutilization of human intelligence. Consequently, knowledge and skills are wasted, and productivity is hindered.

Furthermore, according to the Law of Diminishing Returns, collaboration is often quite productive at first, but its value diminishes with time. This is consistent with the case of Burst Jobs. Often, a few seconds or minutes of conversation is sufficient to resolve the issue, and lengthy chats may not be necessary. Therefore, the issue of lost opportunities on Burst Collaborations is crucial.

### **1.2.2 Knowledge waste of vast ordinary population**

Humans are diverse; everyone, including the vast ordinary people, possesses valuable information for others. It often happens that certain knowledge or skills common to some people is avidly sought by others. In the preceding examples of Burst Requirements, a young student, as a school insider, naturally possesses knowledge about the institution, which is critical for those who wish to learn more about the school. Meanwhile, the young individual does not need to have any special expertise.

However, the CM fails to unlock the knowledge of the vast non-expert population. Although the CM facilitates relatively long-term professional jobs, Burst Requirements failed by it are more frequent and cover a far larger range of topics. In fact, the issue of unsatisfied Burst Requirement occurs so often that people have become accustomed to it and even oblivious to it.

### **1.2.3 Lost opportunities for a second job based on people's main expertise**

For people who are employed, it is not easy for them to earn supplemental income based on their main expertise by offering services outside of work. This is because it is not easy to advertise services as a second job to a broad audience, among other reasons.

For example, an assistant at a hardware store with extensive home hardware knowledge may want to help people with plumbing questions and earn extra income outside of work. However, because the expert lacks a means to advertise to a broad audience, those in need of plumbing assistance are unaware of the potential service, resulting in a benefit loss for both parties.

### **1.2.4 Lost job opportunities on people's additional expertise**

Humans are versatile with many facets of knowledge and skills. However, most people can only work at one profession based on their primary expertise and cannot sell their other, comparatively weaker skills. Therefore, many aspects of knowledge and skills are squandered from an economic standpoint.

For example, a worker may have travel experience, but it is difficult for the worker to profit from the trip experience because finding a job in the travel industry involves a considerable time commitment and excellent skills. However, the individual's travel experience may be valuable if shared with some people through quick chats. Nonetheless, such Burst Jobs are not facilitated.

### **1.2.5 Lost job opportunities for unemployed people**

Obtaining a job in the CM requires commitment and strong skills, resulting in unemployment for those who are unable to compete. However, unemployed people often possess valuable skills or experiences. For example, they may be able to provide cooking advice, help with computer/car issues, share amusing jokes, and homeless individuals may recount their own life stories if people are interested.

Their skills are insufficient for long-term jobs in the CM, yet can still be useful to others. However, they have difficulties selling their services and earning income. In particular, the lost Burst Job opportunities for unemployed people are even more serious, as they do not have any means of income yet.

### **1.2.6 AI-led unemployment**

People are concerned that the advent of Artificial Intelligence (AI) would lead to job losses. It appears that AI can do a variety of tasks, displacing people whose knowledge is becoming less important. However, human intelligence is far from being fully realized. In the field of conversational services, the jobs are highly intelligent, as they demand advanced conversational skills, context recognition abilities, broad life experience, human empathy, etc. Such skills are innate for humans but extremely challenging for AI.

In computer science, the Turing Test analyzes a machine's capacity to display intelligent behaviour comparable to or indistinguishable from human intelligence [11]. The AI is making progress in the field [12, 13, 14], but it does not pass the "imitation game" [15]. In addition, the standards for conversational jobs are considerably more stringent, often requiring problem solving abilities, creativity, etc., in addition to mimicry. Therefore, it is extremely challenging for AI to fill these jobs [16, 17]. However, the quick conversational jobs are not facilitated by the CM.

### **1.2.7 Aging society problem**

A rapidly aging population is causing concerns in modern societies. Retired people do not have income and become a financial strain on the young. However, senior citizens have troves of experiences. They can counsel the young, share experiences, and earn income for exchange. Nonetheless, the reality is that the majority of people's skills and experiences are wasted after retirement, and the elderly lose their financial independence due to the limitations of the CM.

## **2 METHODOLOGY**

Apparently, the solution to the CM problem lies in reducing transaction costs. We are fortunate to be on the verge of a solution, thanks to technological advancement.

## 2.1 Solution: the Burst Market (BM)

### 2.1.1 Solution introduction

This paper proposes a solution: the creation of an online Burst Market (BM) that allows people to sell any services via video or audio conversations with buyers, lasting as short as a few seconds or minutes, at the sellers' own price, and at the time of the sellers' convenience.

Specifically, the BM is an online platform serving as a virtual marketplace where sellers can easily advertise conversational services, and any buyer can easily find providers, along with their ratings and reviews from previous customers, making it easy to choose from the suppliers. The services will be delivered through quick online video or audio conversations. Payment will be completed instantly via the online platform, providing both parties with ease and security.

The BM eliminates the high transaction costs in the CM, such as advertisement, job interviews, and the technological constraints on remote chatting. In contrast, the transaction costs in the BM will be much lower in many aspects. The sellers can easily advertise their Burst Services, and the buyers can easily find and evaluate them. More importantly, the services can be delivered through video or audio chatting on the virtual platform, which is made possible by technological advancements. Ultimately, Burst Jobs are made possible thanks to the low transaction costs.

### 2.1.2 Solution examples

The following are sample solutions to the preceding Burst Requirement examples.

- Expert help
  - “I need help with my car/computer/health/plumbing/legal problem, and I want quick advice or guidance.”
    - Solution: Experts can declare their services and rates on the platform; they can provide advice immediately upon requests through video or audio chats. The askers do not need to wait for a call-back or speak to a receptionist before reaching the experts. In many cases, quick chats lasting for just a few seconds or minutes can suffice or provide the necessary guidance. The payment will be made automatically upon completion.
  - “I have a job/business-related question.”
    - Solution: Experts and experienced workers can sell advice on the platform. Unlike consulting firms whose services are costly and involve heavy overheads, the individual sellers on the platform can offer quick and effective advice on specific questions at a much lower price.
  - “I have a tax-related inquiry.”
    - Solution: Such questions often involve complex personal situations for which there are no straightforward online responses. Thanks to the platform, interactive dialogues with helpers will be highly beneficial.
  - “How can I translate this word/sentence? The machine translation is not particularly accurate.”
    - Solution: A few seconds or minutes of conversation with an expert on the platform will suffice.
  - “I need help with my study question.”
    - Solution: Experts and fellow students can offer help via the platform.
  - “I want someone to search the internet for me, report the results, and then answer any follow-up questions I may have by conducting more searches in an interactive manner.”
    - Solution: Search experts can offer help through the platform and significantly increase the value of the internet.
- Know-how
  - “How to register a patent, and what are the tips?”
    - Solution: Frequently, one still has unresolved questions after conducting an Internet search. Experts or experienced patent holders can offer advice and answer personalized questions effectively via the platform.
  - “How to make a certain meal?”
    - Solution: Like many other examples on the list, the asker does not necessarily need an expert to help. People with relevant experience or skills can offer help via the platform.
  - “How to build a website?”
    - Solution: Experts or experienced people can offer help via the platform.
  - “How to publish a book?”
    - Solution: Experts or experienced people can offer help via the platform.

- “What are the tips for doing a garage sale?”
  - Solution: Such requirements are not expert-related; thus, the CM failed them. Thanks to the BM, experienced individuals can share tips and unlock the knowledge through the platform.
- “What are the steps and tips for obtaining a flight pilot/gun ownership license?”
  - Solution: Experts or experienced people can offer help via the platform.
- Leisure
  - “I am seeking information on traveling to a specific destination.”
    - Solution: Both experts and non-experts can offer travel advice via the platform.
  - “Can someone tell me a joke?”
    - Solution: It is difficult for people to earn a living by telling amusing jokes as a career in the CM. However, the BM makes it a lot easier to earn income by telling jokes in a quick and sporadic manner.
  - “I am seeking an idea for a birthday party/Christmas activity/another occasion.”
    - Solution: Anyone with creative ideas can offer help via the platform. This is one of many examples demonstrating the inclusive nature of the BM.
  - “Can someone recommend a good book/movie/video game/other activity?”
    - Solution: Anyone with pertinent ideas can offer help via the platform. This is one of many examples demonstrating the inclusive nature of the BM.
- Insider information
  - “I am considering sending my child to school X, therefore I want to talk to some students there to know more about it.”
    - Solution: Any student in the school can declare and offer help via the platform. This example demonstrates the inclusiveness of the BM. In addition, it illustrates the concept of “Life-Long Working,” which will be introduced in a later section.
  - “I want to talk to someone working in institution X to know more about it.”
    - Solution: Anyone working in the institution can offer help via the platform. This example demonstrates the inclusiveness of the BM.
  - “What does life look like as an accountant/senior citizen/homeless person/musician?”
    - Solution: People of a relevant profile can offer help via the platform. This example demonstrates the inclusiveness of the BM.
- Daily life questions
  - “I am seeking a gift idea.”
    - Solution: Anyone with creative ideas can offer help via the platform. This is one of many examples demonstrating the inclusive nature of the BM.
  - “How to teach my children?”
    - Solution: This is a very personalized question. Interactive advice shared by experts or fellow parents through the platform will be beneficial.
- Discussion
  - “I have an idea of X, and I want to discuss it with relevant people.”
    - Solution: Experts or experienced individuals can offer help on the platform to evaluate the idea and provide advice for its realization.
  - “I enjoyed a book/article/video, and I want to chat with the author.”
    - Solution: Thanks to the BM, authors can share a link to the platform where they offer to chat with readers for a fee. (Meanwhile, they can still reply to readers’ correspondences in the traditional way.) In fact, the fee acts as an efficient filter for the authors to pick up valuable requests, and it also offers a practical means for enthusiastic readers to reach the authors.
  - “I am a fan of movie X/sports team X, and I want to chat with fellow enthusiasts.”
    - Solution: Fellow fans can offer chat on the platform. The CM does not facilitate these services.
- Celebrity meetup
  - “I desire to see/speak with celebrity X.”
    - Solution: Celebrities can sell video chat sessions with fans on the platform. It will be more efficient and much cheaper than traditional means, such as hosting a charity lunch.
  - A celebrity wants to meet fans and raise funds.
    - Solution: The same as above, and both celebrities and fans can benefit.
- Situational advice
  - “I just arrived at city X. Can someone suggest a three-hour tour itinerary?”
    - Solution: This is a personalized question. Both experts and non-experts can offer help through the platform.
- Shopping advice

- “I intend to buy a drone/3D printer. Can someone provide an introduction and advice on the best model/price/store suitable for me?”
  - Solution: People can offer advice via the platform. A buyer will receive more tailored and compelling guidance by chatting with helpers than searching online. The assistant can even sell the product directly via the chat.
- “I am looking for a renovation contractor/piano teacher/real estate agent/bank/doctor. Can someone offer recommendations?”
  - Solution: The platform facilitates efficient knowledge-sharing. Buyers will find chatting with experienced people more customized and compelling than searching online.
- “Can someone propose a suitable restaurant for me?”
  - Solution: This is a non-expert question. Anyone with relevant knowledge or experience can offer help through the platform.
- “I need assistance selecting a summer camp for my child.”
  - Solution: This is a non-expert question. Anyone with relevant knowledge or experience can offer help through the platform.
- Meeting random individuals
  - “We are seeking the thoughts of random individuals on our new product design.”
    - Solution: Any people, regardless of skills or knowledge, can announce their availability and price for such services on the platform. The business can then easily contact them for a market survey.
  - A psychologist seeking random participants for an experiment.
    - Solution: Any people can announce their availability and price on the platform. The psychologist can then contact and pick subjects with ease.

## 2.2 Successful factors

There are important factors supporting the success of the BM.

### 2.2.1 Comprehensive seller inclusion

The platform empowers anyone to sell; it is not limited to experts. This is because humans are versatile and everyone possesses knowledge and skills that are beneficial to others; certain knowledge common to some are often sought by others. In addition to selling professional expertise, as demonstrated in the preceding section, being able to offer travel advice, share shopping tips and product usage experience, tell an entertaining joke, or simply being an insider at an institution can be helpful to others. Furthermore, anyone can fulfill some requests, such as a business seeking random individuals for their thoughts on a new product design.

Although such Burst Jobs are not facilitated by the CM, the situation will be fundamentally changed by the BM, which is highly accessible and will empower people to sell any knowledge and skills on a universal scale, thanks to the drastically reduced job barriers in terms of time commitment, work location flexibility, and skill requirement.

In fact, in terms of people’s financial lives, on the one hand, there are many ways to reduce expenses, such as coupons, group buying, and campaign discounts; on the other hand, however, there are very few ways to increase income, such as being a part-time driver, which has stringent requirements on time commitment, tool availability, etc. Nonetheless, the BM will make making a living much simpler; hence, it will be quite appealing, thanks to its comprehensive inclusivity.

### 2.2.2 Instant financial benefit

The instant financial benefit will incentivize sellers. It differs from existing knowledge-sharing platforms, such as YouTube, where information is provided primarily for free. It requires a high level of expertise, efforts, and often investments for a YouTuber to produce high-quality videos and gradually earn income at an uncontrollable rate. In fact, few individuals can surpass the threshold.

The solution of the BM, however, is different. The sellers instantly receive payment at their own rate. Moreover, the BM requires no investment from the sellers. Therefore, the incentives will encourage many people to advertise their skills and offer Burst Services.

In fact, the price tags set by the BM sellers serve as a bridge connecting buyers and sellers, as they alert potential buyers to the existence of the sellers. In contrast, the CM lacks it.

### **2.2.3 Burst manner**

The Burst manner will make services quite affordable in terms of both finance and time. A typical BM chat session lasts for just a few seconds or minutes. Consequently, the price would be affordable for the buyers. It is very different from the expensive yearly or hourly contracts in the CM.

Additionally, both sellers and buyers can interact with minimum time investment. Therefore, in addition to normal people, it will entice busy and well-off individuals, such as celebrities and senior professionals, to sell; similarly, buyers can try a service without time concerns.

Furthermore, the normalized price of BM services will be relatively high. In other words, if the price of a BM job is converted to an hourly rate, it will be often higher than comparable hourly-based services. This also attracts sellers.

In fact, the burst manner is gaining popularity in all facets of contemporary life, and most informational needs can be satisfied in a short period of time. For example, the success of Twitter and Instagram relies on burst strategy, which allows users to share quick information. The human attention span is shortening, and the BM conforms to the trend.

### **2.2.4 Human interaction**

The services provided in the BM are through video or audio conversations, as opposed to static contents like internet articles. A few minutes of interactive chat are far more productive. Moreover, many kinds of services, such as entertainment and emotional support, are best provided through human interaction.

In addition, there are no internet-based responses accessible for highly specialized questions, such as a query regarding a particular taxation circumstance. The solutions must be obtained through engaging interactions. Therefore, the interactive talks will entice purchasers.

### **2.2.5 Quality service scrutinized by competition**

The BM follows the principle of free market, where economic incentives stimulate competitions and increase the service quality. As a result, the BM will attract and convince information-seekers.

### **2.2.6 Comprehensive service coverage**

The BM allows for all kinds of services. It is like Amazon or eBay in this regard, where the spectrum of services is so comprehensive that buyers would not need to visit any other markets. Therefore, the BM is able to maximize its appeal.

### **2.2.7 Technical feasibility**

Building the BM is technically viable. It is comparable to building online marketplaces like Amazon and eBay. Furthermore, the BM has no logistical concerns, making construction considerably simpler in this sense.

On the other hand, it needs to facilitate video conversations on the platform, which Amazon lacks. Fortunately, the video chatting function is possible thanks to the advancement of technology. Therefore, building the BM is very feasible.

### **2.2.8 Huge rewards for platform builders**

The BM owners will reap huge benefits from their roles as world-transformers, which will necessitate the implementation of the solution. This will be elaborated upon in a subsequent section.

## **2.3 Solution plan**

In general, the BM interfaces with users via a smartphone application or a web browser. Basic functions include allowing sellers to advertise their Burst Services at their own price, allowing buyers to easily find sellers, letting both parties chat through video or audio conversations to fulfill the service, processing payments, allowing buyers to rate the services received, and allowing the platform owner to obtain commissions or other forms of financial benefits from the transactions. This paper proposes the following design.

### **2.3.1 Video and audio conversation**

Thanks to technological progress, it is now easy to integrate video and audio chat functions into a platform. For environment-relevant services, such as advice on an automobile problem, it will be beneficial to use video chat to demonstrate the issue. In some other cases, users may prefer audio chat.

### **2.3.2 Burst service and pricing**

Sellers can declare any kind of Burst Services and set their own per-minute (or per-second) rates. The charge of a service will be determined by the length of the chat, which will be typically a few seconds or minutes. Pricing on a per-case basis or auction may also be possible. Conversely, the platform may also allow prospect buyers to advertise the services they are seeking.

### **2.3.3 Fraud prevention**

Users will need to register their financial accounts, such as credit cards or bank accounts, on the platform. In addition to facilitate payment, this measure can prevent fraudsters from creating excessive BM accounts.

### **2.3.4 Service time flexibility**

Sellers can decide the time when they offer services. During the time period, they can select from the following three Service Levels.

Service Level 1: Unconditional real-time availability. This is the most responsive level. The seller immediately responds to a buyer's real-time request and is unable to decline the call. It is comparable to a reliable call center that always accepts calls.

Service Level 2: Conditional real-time availability. Upon receiving a real-time request, the seller has the option to accept or reject the call.

Service Level 3: By appointment. Appointments are required for the service.

Sellers can choose different Service Levels for different time periods and services. The higher the Service Level, the more freedom the sellers will enjoy at the expense of their attractiveness, and vice versa.

It can be expected that for common services, such as help with computer problems, intense competition will occur, therefore resulting in many sellers offering Service Level 1. In contrast, for services that are rarely accessible, such as celebrity chats, sellers will generally select Service Level 3. Meanwhile, Service Level 2 may attract casual sellers.

### **2.3.5 Ratings and reviews**

The buyers can rate sellers and provide feedback on the services received. It encourages competition and helps to improve service quality. Electronic Word Of Mouth (eWOM) simplifies the provider selection process for buyers and reduces transaction costs.

### **2.3.6 AI-enhanced request matching**

Thanks to technological advancement, a buyer can simply make a request in natural language, and the platform will automatically discover matching sellers based on AI technology. The efficient matching process further reduces the transaction cost.

## **2.4 Typical workflows**

To further clarify the BM concept, typical workflows of a seller and a buyer are described as follows.

### **2.4.1 Typical workflow of a seller**

Step 1. The seller creates an account on the platform. It is associated with a financial account, such as a bank account or a credit card.

Step 2. The seller declares one or multiple Burst Services and pricings they want to offer, as well as any extra details such as availability.

Step 3. Upon a buyer's request, the seller provides the service by entering a video or audio conversation with the buyer.

Step 4. The seller automatically receives the payment from the buyer.

#### **2.4.2 Typical workflow of a buyer**

Step 1. The buyer creates an account. In fact, every user is encouraged to register as both a buyer and a seller, and can share the same account.

Step 2. The buyer has a requirement and searches the platform accordingly. The AI swiftly recommends matching sellers, and the buyer chooses one based on the seller's rating, price, etc.

Step 3. The buyer enters a video or audio conversation with the seller, hence receives the service.

Step 4. The platform immediately transfers funds from the seller to the buyer at the end of the call, and retains a commission fee for itself.

Step 5. The buyer rates the seller and leaves a review.

### **3 EXPECTED RESULTS**

The BM will be a collaboration breakthrough, drastically decreasing the transaction costs for Burst Jobs. As a result, it will unleash human potential and make significant impacts.

#### **3.1 Main benefits**

The BM will bring the following key benefits.

##### **3.1.1 Empowerment of whole population and massive job creation**

Currently, most online marketplaces are limited to expert services such as advice on medical, business, and legal matters; yet, the vast majority of non-professionals are excluded from selling knowledge. In contrast, the BM will empower the whole population. Everyone, whether expert or non-experts, young or old, will be able to sell information and skills. As a result, potentially billions of part-time and full-time jobs will be created.

##### **3.1.2 Poverty lifting**

The most pervasive reason for poverty is unemployment. While it is difficult to obtain a job in the CM due to its strict requirements on skills and time commitment, the BM has much lower requirements on skills, and the work schedule and location are very flexible. In addition, those living in poverty often have a narrow social circle, which minimizes their employment opportunities. In contrast, the BM makes it easy to advertise and sell skills.

As a result, the BM opens a door for unemployed people. For example, according on a simple calculation, if an impoverished person is able to sell any service for just a little over three hours per day at a rate of one dollar per minute, all on a flexible schedule and at the convenience of working from home, the Burst Income will catapult the individual out of poverty and into the middle class.

In addition, people living in low-income countries will be more benefited, as the BM exposes those individuals to customers across the world, hence bringing more sales opportunities to clients from rich countries.

##### **3.1.3 Alleviation of AI-led unemployment**

There are concerns about unemployment caused by AI. However, human intelligence is far from being fully utilized. In the BM, the conversational jobs are highly intelligent and will hardly be replaced by AI.

The BM jobs demand excellent skills on conversation, context understanding, facial expression, broad life experience, human empathy, etc. Such qualities are natural to humans but exceedingly challenging to AI. As a result, people will migrate to the BM, where jobs will not be displaced by AI.

### **3.1.4 Relief of the aging society problem**

The aging population is a growing problem in contemporary societies. In particular, senior citizens lose the ability to earn income after retiring from the workforce, thereby becoming financial burdens on the younger generation.

However, retired people have a wealth of experience. Thanks to the BM, they can continue to contribute to society and earn income by advising the young and sharing their valuable insights. Therefore, the BM will help alleviate the aging society problem.

### **3.1.5 Human value maximization**

Thanks to the BM, acquiring skills and knowledge will be faster and cheaper. Similar to the internet, which has enhanced information-sharing and enriched people's lives, the BM will make it easier for people to acquire knowledge and develop skills. As a result, more scientists, artists, etc., will be created. On the other hand, people will find it easier to redeem their values by selling all kinds of skills in the BM. Consequently, the BM will contribute to human value maximization.

### **3.1.6 Increase in prosperity, innovations, and human achievements**

The BM will lead to a collaboration breakthrough just like the historical advent of capitalism, the invention of stock market, the internet, and so forth. Each of these breakthroughs brought prosperity, innovations, and significant human achievements. The BM will do it once again.

In fact, although most transactions on the BM may not generate extraordinary rewards, the frequent benefits will accumulate and make lives far more productive and convenient on a massive scale. The advantages and time savings will profoundly transform the world. Therefore, facilitating mind collaborations, which are the ultimate source of productivity, the BM will be the next pursued industry.

### **3.1.7 Enhancement of social communications**

Nowadays, much of the social communications are facilitated by social media, such as Facebook and Twitter. However, for many people, especially those who are famous or busy, social media largely can only serve as a "one-way" channel. That is, those individuals can easily pass messages to their followers through the media, but the public cannot effectively reach them. For example, a celebrity cannot manage the volume of incoming communications from numerous enthusiasts.

The BM will alter the situation. It allows people to offer a price for quick chats with fans at the seller's convenience. In fact, the price acts as an automatic filter for valuable requests. As a result, everyone who wishes to be reached by the public can be truly contacted.

Therefore, a phenomenon will appear that book/article authors, YouTubers, celebrities, etc. will provide their links to the BM where they offer paid chats with fans, in addition to their social media links. The BM fosters contacts from fans to celebrities, and the social media facilitates the opposite direction. Consequently, both work together and complete social communications.

## **3.2 Other impacts**

In addition to the benefits listed above, the BM will bring more profound changes to the world.

### **3.2.1 Workforce shift from the CM to the BM**

Workers will find the BM very accessible and attractive. There are low job barriers, making it easy to sell any knowledge and skills. The work schedule is flexible, and sellers are boss-free while conveniently working from home. As a result, many will work either part-time or full-time in the BM. In addition, many people whose jobs are replaced by AI will be driven there. Consequently, a significant workforce shift from the CM to the BM will happen.

### **3.2.2 Life-Long Working**

This paper proposes the concept of "Life-Long Working," which is parallel to the widely accepted concept of Life-Long Learning. The former means that people will be accustomed to and benefit from working flexibly at any time at their convenience. The new concept has two aspects. Firstly, people will be able to work at any time of the day or night as

opposed to being restricted to a fixed schedule. Secondly, people will be able to work at almost any stage of life, whether young or old.

As previously stated, a young person already has many helpful values, such as sharing school experience with other parents who are considering enrolling their own children. The young individual can also teach others on how to play video games, etc. In fact, the new generation will possibly invent many kinds of services that we have never seen.

On the opposite end of the age spectrum, senior citizens possess rich experiences. They will be able to sell knowledge to the young. Therefore, thanks to the BM, people will engage in Life-Long Working and contribute much more to society, all in exchange for earning more income.

### **3.2.3 Decentralization and monopoly reduction**

Thanks to the technology improvements that reduce transaction costs, firm boundaries are minimized in the BM, where sellers interact directly with customers in a decentralized manner. Since individuals can only work limited hours per day, their market share will be limited. Therefore, large monopolies will be unlikely there.

### **3.2.4 The role of the BM as a portal to the CM**

Currently, internet search engines play a vital role as information sources. However, they have limitations as stated previously.

The BM, in contrast, will be able to provide better services thanks to its interactivity and competition. Therefore, the BM will become another popular source of information. People may use the BM as a fine-tuned portal to the products and services in the CM.

Furthermore, sellers in the BM can create an end-to-end shopping pipeline, hence influencing the CM. In other words, BM vendors may be able to sell things directly via Burst Conversations, in addition to providing buyers with requested product recommendations. This is like affiliate marketing while the BM sellers are neutral as a portal.

As a result, businesses in the CM will need to dedicate marketing resources to cater BM sellers, and the BM will exert impact over the CM.

### **3.2.5 Enhanced CM competition and consumer benefits**

Motivated by desire for income, sellers in the BM will polish their skills and provide accurate comparisons and recommendations of products in the CM, upon buyer requests. Their advice will be more personalized and superior to free static contents, such as internet articles or YouTube videos. Consequently, the advantages and disadvantages of CM products and services will be more exposed, resulting in more competitions in the CM and increased consumer benefits.

### **3.2.6 Industrial reshaping**

The BM will make varying impacts on various industries. Some sectors will profit from its rise. For example, telecom and cloud service companies supporting the BM will benefit. Some other sectors, however, will suffer as a result of intensified competitions and the workforce shift from the CM to the BM.

In addition, new forms of jobs may arise, a phenomenon that always occurred following collaboration breakthroughs in history. For example, jobs related to quick entertainment or empathy may emerge due to the rise of the BM.

### **3.2.7 Potential reshaping of some economic concepts**

Some basic economic terms, such as “employment” and “unemployment rate”, have trouble applying to individuals working by themselves. As such, the term “self-employment” was coined. However, it still emphasises the traditional concept of “hiring,” despite the fact that no “hiring” is happening. Nonetheless, since there are few “self-employed”, the issue is insignificant.

However, given that a large number of people will be “self-employed” in the BM, the issue will become more important. Therefore, perhaps simply using the words “work” and “work rate” will be more appropriate in the future.

### **3.2.8 Potential global power reshuffle**

As a new powerhouse of collaborative efficiency and productivity, the BM will be in the spotlight of state competitions for global leadership. The nations with strong development of the BM will have a competitive advantage, and this may cause a global power reshuffle. Such phenomena often happened along with collaboration breakthroughs in history.

### **3.2.9 Potential more language unification and ultimate destruction of nations**

People in the world have largely unknown to each other until now. However, the BM will change the situation by facilitating frequent and direct human contacts. As a result, language skills will be more sought than ever, and the world will be potentially more unified by main languages. Never before have there been such intensive video conversations and value transfers between strangers throughout the world. It may render state borders irrelevant and ultimately lead to the destruction of nations.

## **3.3 Embracing the BM**

### **3.3.1 Incentives for the BM creators**

It will be lucrative to build the BM platform. Like owners of other virtual marketplaces such as Amazon, the owner of the BM platform can collect transaction-based commissions and other benefits. Building the BM is easier than building the Amazon thanks to the absence of logistical concerns. Furthermore, unlike Amazon, where only people having products can sell there, the BM's potential seller base will include all population, and therefore bring in much more profit.

In addition, a phenomenon of "multi-selling" may occur. That is, since BM services are quick and affordable, a buyer may seek information from multiple sellers for diverse perspectives on the same need. The multi-selling will bring more benefits to the BM owner.

Moreover, the BM will become an extraordinary advertising platform. This is because the BM will act as a superior search engine and information portal, as stated previously. It will therefore be able to store an enormous amount of user profiles, search histories, needs, etc., and hence be effective in making targeted advertisements. Given that Google, the comparable IT giant, derives the majority of its revenue from advertising, and that the BM's search results and services will be possibly even more accurate and convincing than Google's static contents, the BM will be able to generate huge revenues from its advertisements.

Also, in terms of searching and recommendations, the successful BM owners will inevitably transform their businesses into leading AI companies to efficiently support searches, deliver tailored service suggestions, etc.

Finally, and most importantly, the BM will bring even greater rewards for its crucial role in the world transformation. For example, along with the workforce shift from the CM to the BM, a massive amount of investment will follow and benefit the BM owners. Therefore, this paper concludes that the BM will inevitably be built and enormously reward the builders.

### **3.3.2 Role of the governments**

Governments can play a role in fostering the BM for people's benefit. For example, governments may provide low-income individuals with smartphones and internet access to enable them earn a living in the BM. Governments may also help people open bank accounts to facilitate their registration and making payments on the BM.

For example, a government can lend people smartphones and internet capacity, in order to facilitate their sales of any services on the BM. According to a simple calculation, if a borrower can sell just ten minutes of services per day at a rate of one dollar per minute, the government can easily recoup the loan in just two months and set the individual on a track to financial self-sufficiency.

## **4 CONCLUSION**

This paper reveals the problems with the current labour market (Conventional Market, CM) that prevent humans from rising to their full potential. The main issue is the high transaction costs hindering Burst Jobs, which take only a few seconds or minutes to complete. It leads to significant job opportunities losses and human intelligence underutilization.

Consequently, this paper proposes a solution based on technological improvements, which is the creation of a virtual Burst Market (BM) that allows people to sell any services via video or audio conversations with buyers, lasting as short

as a few seconds or minutes, at their own price, and at their own time. Leveraging economic incentives, the BM will motivate people to provide all kinds of Burst Services.

This paper asserts that the BM will transform the world in many ways, including the creation of a vast number of jobs, the alleviation of poverty, the reduction of unemployment caused by artificial intelligence, the mitigation of the aging society problem, the maximization of human values, the reshaping of the industrial landscape, etc. The BM may also influence the global power competition and potentially lead to the ultimate destruction of nations. Both private and public sectors can play important roles in embracing the BM.

In conclusion, this paper asserts that the BM will invoke the next leap for humanity.

Further work on this topic could include in-depth studies of the BM's industrial impacts, and interactions between the BM and the CM.
