#### Abstract

We give an operator-algebraic treatment of theory of p-approximate Schuader frames which includes the theory of operator-valued frames by Kaftal, Larson, and Zhang [Trans. AMS., 2009], Gframes by Sun [JMAA, 2006], factorable weak operator-valued frames by Krishna and Johnson [Annals of FA, 2022] and p-approximate Schauder frames by Krishna and Johnson [J. Pseudo-Differ. Oper. Appl, 2021] as particular cases. We show that a sufficiently rich theory can be developed even for Banach spaces. We achieve this by defining various concepts and characterizations in Banach spaces. These include duality, approximate duality, equivalence, orthogonality and stability.

Keywords: Frame, operator-valued frame, p-approximate Schauder frame.

## 1. Introduction

Both theoretically and practically successful theory of frames for Hilbert spaces which originated from the seminal work of Duffin and Schaeffer [27, 34, 37, 54, 85] demanded the development of frame theory for Banach spaces. It was in 1991, when Grochenig [48] introduced the notion of frames for Banach spaces, called as Banach frames, in connection with the theory of atomic decompositions [38-40]. In the sequel $\mathcal{X}, \mathcal{Y}$ always denote Banach spaces. Dual of $\mathcal{X}$ is denoted by $\mathcal{X}^{*}$. The identity operator on $\mathcal{X}$ is denoted
by $I_{\mathcal{X}}$. Field real or complex numbers is denoted by $\mathbb{K}$. The space of all bounded linear operators from $\mathcal{X}$ to $\mathcal{Y}$ is denoted by $\mathcal{B}(\mathcal{X}, \mathcal{Y})$. We set $\mathcal{B}(\mathcal{X}):=\mathcal{B}(\mathcal{X}, \mathcal{X})$.

Definition 1.1. 48 Let $\mathcal{X}$ be a Banach space, $\mathcal{X}_{d}$ be an associated BK-space, $S: \mathcal{X}_{d} \rightarrow \mathcal{X}$ be a bounded linear operator and $\left\{f_{n}\right\}_{n}$ be a collection in $\mathcal{X}^{*}$. The pair $\left(\left\{f_{n}\right\}_{n}, S\right)$ is said to be a Banach frame for $\mathcal{X}$ if the following conditions hold.
(i) $\left\{f_{n}(x)\right\}_{n} \in \mathcal{X}_{d}$, for each $x \in \mathcal{X}$.
(ii) There are $a, b>0$ such that

$$
a\|x\| \leq\left\|\left\{f_{n}(x)\right\}_{n}\right\| \leq b\|x\|, \quad \forall x \in \mathcal{X}
$$

Constants $a$ and b are called as Banach frame lower and upper bounds, respectively.
(iii) $S\left\{f_{n}(x)\right\}_{n}=x$, for each $x \in \mathcal{X}$.

Definition 1.2. 48 Let $\mathcal{X}$ be a Banach space, $\mathcal{X}_{d}$ be an associated BK-space, $\left\{\tau_{n}\right\}_{n}$ be a collection in $\mathcal{X}$ and $\left\{f_{n}\right\}_{n}$ be a collection in $\mathcal{X}^{*}$. The pair $\left(\left\{f_{n}\right\}_{n},\left\{\tau_{n}\right\}_{n}\right)$ is said to be an atomic decomposition for $\mathcal{X}$ if the following conditions hold.
(i) $\left\{f_{n}(x)\right\}_{n} \in \mathcal{X}_{d}$, for each $x \in \mathcal{X}$.
(ii) There are $a, b>0$ such that

$$
a\|x\| \leq\left\|\left\{f_{n}(x)\right\}_{n}\right\| \leq b\|x\|, \quad \forall x \in \mathcal{X}
$$

Constants $a$ and $b$ are called as lower and upper atomic bounds, respectively.
(iii) $\sum_{n=1}^{\infty} f_{n}(x) \tau_{n}=x$, for each $x \in \mathcal{X}$.

Hilbert space frame theory mainly concentrates around representing every element of the space using frames as a series but this is missing in the definition of Banach frames. After a decade from the work of Grochenig, it is Aldroubi, Sun, Tang, Han, Larson, Casazza, Christensen, and Stoeva [2, 10, 15, 30, analyzed when it is possible to write every element as a series by using a sequence in the space or in the dual space. In [10], it was particularly analyzed the series representation only by using first two conditions in Definition 1.1. Moreover, using the approximation properties of Banach space [11], it was proved by Casazza and Christensen [12] that there are Banach spaces $\mathcal{X}$ such that there is no collection $\left\{f_{n}\right\}_{n}$ in $\mathcal{X}^{*}$ and no collection in $\left\{\tau_{n}\right\}_{n}$ in $\mathcal{X}$ satisfying

$$
x=\sum_{n=1}^{\infty} f_{n}(x) \tau_{n}, \quad \forall x \in \mathcal{X}
$$

Motivated from the dilation theory of frames [32,50,58], in 1999, Casazza, Han, and Larson [15] introduced three other notions of frames for Banach spaces called as framing or unconditional framing, projective frame and modeled frame. It is then proved in [15] that all these three notions are equivalent. Around the same time, Terekhin also introduced another notion of frames for Banach spaces, again using dilation viewpoint [79 81].
Important paper of Daubechies and DeVore [33] led Casazza, Dilworth, Odell, Schlumprecht, and Zsak [9] to weaken the unconditional convergence condition in the definition of framing and they defined Schauder frames for Banach spaces as follows.

Definition 1.3. [9] Let $\left\{\tau_{n}\right\}_{n}$ be a collection in $\mathcal{X}$ and $\left\{f_{n}\right\}_{n}$ be a collection in $\mathcal{X}^{*}$. The pair $\left(\left\{f_{n}\right\}_{n},\left\{\tau_{n}\right\}_{n}\right)$ is said to be a Schauder frame for $\mathcal{X}$ if

$$
x=\sum_{n=1}^{\infty} f_{n}(x) \tau_{n}, \quad \forall x \in \mathcal{X}
$$

Definition 1.3 has been extended by Thomas, Freeman, Odell, Schlumprecht, and Zsak in 2014 44, 82 .
Definition 1.4. 44,82 Let $\left\{\tau_{n}\right\}_{n}$ be a collection in $\mathcal{X}$ and $\left\{f_{n}\right\}_{n}$ be a collection in $\mathcal{X}^{*}$. The pair $\left(\left\{f_{n}\right\}_{n},\left\{\tau_{n}\right\}_{n}\right)$ is said to be an approximate Schauder frame (ASF) for $\mathcal{X}$ if

$$
S_{f, \tau}: \mathcal{X} \ni x \mapsto S_{f, \tau} x:=\sum_{n=1}^{\infty} f_{n}(x) \tau_{n} \in \mathcal{X}
$$

is a well-defined bounded linear, invertible operator.
Again looking back to the theory of frames for Hilbert spaces, following generalizations have been proposed.
(i) frames for subspaces/fusion frames [18, 19].
(ii) outer frames [1].
(iii) oblique frames [24].
(iv) pseudo frames [69].
(v) quasi-projectors 43.

In 2009, Kaftal, Larson, Zhang [57 introduced the notion of operator-valued frames which unified all the notions mentioned earlier.

Definition 1.5. 557 Let $\mathcal{H}, \mathcal{H}_{0}$ be Hilbert spaces. A collection $\left\{A_{n}\right\}_{n}$ in $\mathcal{B}\left(\mathcal{H}, \mathcal{H}_{0}\right)$ is said to be an operator-valued frame in $\mathcal{B}\left(\mathcal{H}, \mathcal{H}_{0}\right)$ if the series

$$
S_{A}:=\sum_{n=1}^{\infty} A_{n}^{*} A_{n}
$$

converges in the strong-operator topology on $\mathcal{B}(\mathcal{H})$ to a bounded invertible operator.
In 2006, Sun 78 introduced G-frames which is equivalent to the notion of operator-valued frames.
Definition 1.6. 788 Let $\mathcal{H}, \mathcal{H}_{n}$ be Hilbert spaces and let $A_{n} \in \mathcal{B}\left(\mathcal{H}, \mathcal{H}_{n}\right)$, for each $n \in \mathbb{N}$. The collection $\left\{A_{n}\right\}_{n}$ is said to be a $\boldsymbol{G}$-frame if there are $a, b>0$ such that

$$
a\|h\|^{2} \leq \sum_{n=1}^{\infty}\left\|A_{n} h\right\|^{2} \leq b\|h\|^{2}, \quad \forall h \in \mathcal{H}
$$

It is noticed by the authors of this paper that there are some other notions of frames even for Hilbert spaces, which will not include in the theory of operator-valued frames. These notions are as follow.
(i) Framings for Hilbert spaces [15].
(ii) Schauder frames and approximate Schauder frames for Hilbert spaces [9, 44, 82 ].
(iii) Atomic decompositions for Hilbert spaces [15].
(iv) cb-frames for Hilbert spaces [73].
(v) Signed frames for Hilbert spaces 75].
(vi) Pair frames for Hilbert space 42.
(vii) Controlled frames for Hilbert spaces [8].
(viii) K-frames for Hilbert spaces 45]
(ix) Semi-frames for Hilbert spaces [4.

To include most of the notions of frames for Hilbert spaces, the notion of weak operator-valued frames for Hilbert spaces has been introduced in 66]. Unfortunately, the frame operator in this case may not split and to get a reasonable theory like that of Hilbert space frames, a proper subclass of weak operator-valued frames called as factorable weak operator-valued frames has been introduced and is defined as follows.

Definition 1.7. [66] Given $n \in \mathbb{N}$, define

$$
L_{n}: \mathcal{H}_{0} \ni h \mapsto L_{n} h:=e_{n} \otimes h \in \ell^{2}(\mathbb{N}) \otimes \mathcal{H}_{0}
$$

where $\left\{e_{n}\right\}_{n}$ is the standard orthonormal basis for $\ell^{2}(\mathbb{N})$. Let $\left\{A_{n}\right\}_{n}$ and $\left\{\Psi_{n}\right\}_{n}$ be collections in $\mathcal{B}\left(\mathcal{H}, \mathcal{H}_{0}\right)$. The pair $\left(\left\{A_{n}\right\}_{n},\left\{\Psi_{n}\right\}_{n}\right)$ is said to be a factorable weak operator-valued frame in $\mathcal{B}\left(\mathcal{H}, \mathcal{H}_{0}\right)$ if the following conditions hold.
(i) The series

$$
S_{A, \Psi}:=\sum_{n=1}^{\infty} \Psi_{n}^{*} A_{n}
$$

converges in the strong-operator topology on $\mathcal{B}(\mathcal{H})$ to a bounded invertible operator.
(ii) The map

$$
\theta_{A}: \mathcal{H} \ni h \mapsto \theta_{A} h:=\sum_{n=1}^{\infty} L_{n} A_{n} h \in \ell^{2}(\mathbb{N}) \otimes \mathcal{H}_{0}
$$

is a well-defined bounded linear operator.
(iii) The map

$$
\theta_{A}: \mathcal{H} \ni h \mapsto \theta_{A} h:=\sum_{n=1}^{\infty} L_{n} \Psi_{n} h \in \ell^{2}(\mathbb{N}) \otimes \mathcal{H}_{0}
$$

is a well-defined bounded linear operator.
Earlier, we listed various notions of frames for Hilbert spaces. There are corresponding notions for Banach spaces.
(i) Framings for Banach spaces [15].
(ii) Schauder frames and approximate Schauder frames for Banach spaces [9, 44, 82].
(iii) Atomic decompositions for Banach spaces [15].
(iv) cb-frames for operator spaces [73].
(v) p-frames for Banach spaces [2,30]
(vi) p-approximate Schauder frames for Banach spaces 64].
(vii) pseudo-Schauder frames for Banach spaces 71].
(viii) K-frames for Banach spaces 46].
(ix) Hilbert-Schauder frames for Banach spaces [72].

Most of the results in frame theory for Hilbert spaces arise by doing analysis in the standard separable Hilbert space $\ell^{2}(\mathbb{N})$ and switching between a given Hilbert space and $\ell^{2}(\mathbb{N})$. Therefore a natural space to work for Banach spaces is the classical sequence space $\ell^{p}(\mathbb{N})$ for $p \in[1, \infty)$. This is the main motivation for the introduction of p-approximate Schauder frames for Banach spaces.

Definition 1.8. 64] An $A S F\left(\left\{f_{n}\right\}_{n},\left\{\tau_{n}\right\}_{n}\right)$ for $\mathcal{X}$ is said to be a p-approximate Schauder frame (written as $p$-ASF), $p \in[1, \infty$ ) if both the maps

$$
\begin{aligned}
& \theta_{f}: \mathcal{X} \ni x \mapsto \theta_{f} x:=\left\{f_{n}(x)\right\}_{n} \in \ell^{p}(\mathbb{N}) \text { and } \\
& \theta_{\tau}: \ell^{p}(\mathbb{N}) \ni\left\{a_{n}\right\}_{n} \mapsto \theta_{\tau}\left\{a_{n}\right\}_{n}:=\sum_{n=1}^{\infty} a_{n} \tau_{n} \in \mathcal{X}
\end{aligned}
$$

are well-defined bounded linear operators.
In this paper, we give operator-algebraic version of both factorable weak operator-valued frames and p-approximate Schauder frames in the setting of Banach spaces. In Section 2 we define the notion of operator-valued p-approximate Schauder frames and then show that our notion includes factorable weak operator-valued frames, operator-valued frames/G-frames and p-approximate Schauder frames. We also introduce the notion of operator-valued p-Riesz bases. Through an explicit construction we show that influential Naimark-Han-Larson dilation result can be proved even for the operator-version. We then show that a result based on the result of Holub for Hilbert spaces can be derived for Banach spaces which characterizes operator-valued p-approximate Schauder frames. In Section 3 we study two important notions associated with a given frame, namely, duality and orthogonality. We characterize dual frames and use orthogonality to generate new frames. In Section 4, we study the notion of approximate duality and characterize them. Section 5 describes equivalence of frames with an explicit description of operator giving similarity. Section 6 derives perturbation results. Section 7 states some conjectures.

## 2. Operator-valued p-approximate Schauder frames and their characterizations

Let $\mathcal{X}, \mathcal{Y}$ be Banach spaces and $p \in[1, \infty)$. By $\ell^{p}(\mathbb{N}) \otimes \mathcal{Y}$, we mean the Banach space obtained by tensoring $\ell^{p}(\mathbb{N})$ and $\mathcal{Y}$ w.r.t. any cross norm (see [35, 36, 76] for the tensor product of Banach spaces). In the development of paper [57], certain collection of operators played important role. Here we define corresponding operators for Banach spaces. Given $n \in \mathbb{N}$, we define

$$
L_{n}: \mathcal{Y} \ni x \mapsto L_{n} x:=e_{n} \otimes x \in \ell^{p}(\mathbb{N}) \otimes \mathcal{Y}
$$

where $\left\{e_{n}\right\}_{n}$ is the standard Schauder basis for $\ell^{p}(\mathbb{N})$. Since the norm is a cross norm, it then follows that $L_{n}$ 's are isometries from $\mathcal{Y}$ to $\ell^{p}(\mathbb{N}) \otimes \mathcal{Y}$. We also define $\Gamma_{n}$ as the (unique) tensor product of bounded linear operators

$$
\ell^{p}(\mathbb{N}) \ni\left\{a_{m}\right\}_{m} \mapsto a_{n} \in \mathbb{K}, \quad \mathcal{Y} \ni y \mapsto y \in \mathcal{Y}
$$

Since $\mathbb{K} \otimes \mathcal{Y}$ is isometrically isomorphic to $\mathcal{Y}$, we write codomain of $\Gamma_{n}$ as $\mathcal{Y}$. We also note that $a_{n} \otimes y=a_{n} y$. Hence

$$
\Gamma_{n}\left(\left\{a_{m}\right\}_{m} \otimes y\right)=a_{n} y, \quad \forall\left\{a_{m}\right\}_{m} \in \ell^{p}(\mathbb{N}), \forall y \in \mathcal{Y}, \forall n \in \mathbb{N}
$$

Therefore, for $n, m \in \mathbb{N}$ we have

$$
\Gamma_{n} L_{m}=\left\{\begin{array}{ll}
I_{\mathcal{Y}} & \text { if } n=m  \tag{1}\\
0 & \text { if } n \neq m
\end{array} \quad \text { and } \quad \sum_{n=1}^{\infty} L_{n} \Gamma_{n} z=z, \quad \forall z \in \ell^{p}(\mathbb{N}) \otimes \mathcal{Y}\right.
$$

We now introduce the notion of operator-valued p-approximate Schauder frames and demonstrate that it includes all known notions of frames for which frame operator factors.

Definition 2.1. Let $\left\{A_{n}\right\}_{n}$ be collection in $\mathcal{B}(\mathcal{X}, \mathcal{Y})$ and $\left\{\Psi_{n}\right\}_{n}$ be a collection in $\mathcal{B}(\mathcal{Y}, \mathcal{X})$. The pair $\left(\left\{A_{n}\right\}_{n},\left\{\Psi_{n}\right\}_{n}\right)$ is said to be an operator-valued p-approximate Schauder frame (we write operatorvalued $\boldsymbol{p}$ - $\boldsymbol{A S F}$ ) in $\mathcal{B}(\mathcal{X}, \mathcal{Y})$ if the following conditions hold.
(i) The frame operator

$$
S_{A, \Psi}: \mathcal{X} \ni x \mapsto \sum_{n=1}^{\infty} \Psi_{n} A_{n} x \in \mathcal{X}
$$

is a well-defined bounded linear invertible operator. Constants $a, b>0$ satisfying

$$
a\|x\| \leq\left\|\sum_{n=1}^{\infty} \Psi_{n} A_{n} x\right\| \leq b\|x\|, \quad \forall x \in \mathcal{X}
$$

are called as lower and upper frame bounds, respectively.
(ii) The analysis operator

$$
\theta_{A}: \mathcal{X} \ni x \mapsto \theta_{A} x:=\sum_{n=1}^{\infty} L_{n} A_{n} x \in \ell^{p}(\mathbb{N}) \otimes \mathcal{Y}
$$

is a well-defined bounded linear operator. Constant $c>0$ satisfying

$$
\left\|\sum_{n=1}^{\infty} L_{n} A_{n} x\right\| \leq c\|x\|, \quad \forall x \in \mathcal{X}
$$

is called as analysis bound.
(iii) The synthesis operator

$$
\theta_{\Psi}: \ell^{p}(\mathbb{N}) \otimes \mathcal{Y} \ni z \mapsto \theta_{\Psi} z:=\sum_{n=1}^{\infty} \Psi_{n} \Gamma_{n} z \in \mathcal{X}
$$

is a well-defined bounded linear operator. Constant $d>0$ satisfying

$$
\left\|\sum_{n=1}^{\infty} \Psi_{n} \Gamma_{n} z\right\| \leq c\|z\|, \quad \forall z \in \ell^{p}(\mathbb{N}) \otimes \mathcal{Y}
$$

is called as synthesis bound.
If $S_{A, \Psi}=I_{\mathcal{X}}$, then the frame is called as a Parseval operator-valued $\boldsymbol{p} \boldsymbol{- A S F}$. If we do not demand the invertibility of $S_{A, \Psi}$, then we say that $\left(\left\{A_{n}\right\}_{n},\left\{\Psi_{n}\right\}_{n}\right)$ is an operator-valued p-approximate Bessel sequence (we write operator-valued $\boldsymbol{p}-\boldsymbol{A B S}$ ).

Example 2.2. (i) Let $\mathcal{H}, \mathcal{H}_{0}$ be Hilbert spaces and $\left(\left\{A_{n}\right\}_{n},\left\{\Psi_{n}\right\}_{n}\right)$ be a factorable weak-OVF in $\mathcal{B}\left(\mathcal{H}, \mathcal{H}_{0}\right)$. Define

$$
B_{n}:=A_{n}, \Phi_{n}:=\Psi_{n}^{*}, \quad \forall n \in \mathbb{N} .
$$

Then $\left(\left\{B_{n}\right\}_{n},\left\{\Phi_{n}\right\}_{n}\right)$ is an operator-valued $p-A S F$ in $\mathcal{B}\left(\mathcal{H}, \mathcal{H}_{0}\right)$. Note that $\Gamma_{n}=L_{n}^{*}, \forall n \in \mathbb{N}$.
(ii) Let $\mathcal{X}$ be a Banach space and $\left(\left\{f_{n}\right\}_{n},\left\{\tau_{n}\right\}_{n}\right)$ be a $p$-ASF for $\mathcal{X}$. Define

$$
A_{n}:=f_{n}, \Psi_{n}: \mathbb{K} \ni \alpha \mapsto \Psi_{n} \alpha:=\alpha \tau_{n} \in \mathcal{X}, \quad \forall n \in \mathbb{N}
$$

Then

$$
\sum_{n=1}^{\infty} \Psi_{n} A_{n} x=\sum_{n=1}^{\infty} \Psi_{n} f_{n}(x)=\sum_{n=1}^{\infty} f_{n}(x) \tau_{n}, \quad \forall x \in \mathcal{X}
$$

Hence $\left(\left\{A_{n}\right\}_{n},\left\{\Psi_{n}\right\}_{n}\right)$ is an operator-valued $p$ - $A S F$ in $\mathcal{B}(\mathcal{X}, \mathbb{K})$.
(iii) Let $\mathcal{X}$, $\mathcal{Y}$ be Banach spaces and $U: \mathcal{X} \rightarrow \ell^{p}(\mathbb{N}) \otimes \mathcal{Y}$ and $V: \ell^{p}(\mathbb{N}) \otimes \mathcal{Y} \rightarrow \mathcal{X}$ be bounded linear operators such that $V U$ is bounded invertible. Define

$$
A_{n}=\Gamma_{n} U, \quad \Psi_{n}=V L_{n}, \quad \forall n \in \mathbb{N}
$$

Then

$$
\sum_{n=1}^{\infty} \Psi_{n} A_{n} x=\sum_{n=1}^{\infty} V L_{n} \Gamma_{n} U x=V\left(\sum_{n=1}^{\infty} L_{n} \Gamma_{n}\right) U x=V U x, \quad \forall x \in \mathcal{X}
$$

Hence $\left(\left\{A_{n}\right\}_{n},\left\{\Psi_{n}\right\}_{n}\right)$ is an operator-valued $p$ - $A S F$ in $\mathcal{B}(\mathcal{X}, \mathcal{Y})$.
(iv) This example is motivated from the Cuntz algebra [31]. Let $\mathcal{X}$ be a Banach space, $n \in \mathbb{N}$ and $A_{1}, \ldots, A_{n}, \Psi_{1}, \ldots, \Psi_{n}: \mathcal{X} \rightarrow \mathcal{X}$ be bounded linear operators such that $\sum_{j=1}^{n} \Psi_{n} A_{n}=I_{\mathcal{X}}$. Then $\left(\left\{A_{j}\right\}_{j=1}^{n},\left\{\Psi_{j}\right\}_{j=1}^{n}\right)$ is an operator-valued $p-A S F$ in $\mathcal{B}(\mathcal{X})$.

It is clear that an operator-valued p-ABS need not be an operator-valued p-ASF. Therefore the next attempt is to see that whether we can convert an operator-valued p-ABS to operator-valued p-ASF. In the case of Hilbert spaces, it was Li and Sun 67] who showed it is possible to expand every G-Bessel sequence to a G-frame just by adding one element (for a proof in finite dimensional Hilbert spaces, see [20]). Surprisingly, using a result of Casazza and Christensen [12], it is proved in [65] that for Banach spaces one may not able to convert Bessel sequences to frames. Here is a partial answer for operator-valued p-ASFs.

Theorem 2.3. Let $\left(\left\{A_{n}\right\}_{n},\left\{\Psi_{n}\right\}_{n}\right)$ be an operator-valued $p-A B S$ in $\mathcal{B}(\mathcal{X}, \mathcal{Y})$. If there are $B \in \mathcal{B}(\mathcal{X}, \mathcal{Y})$ and $\Phi \in \mathcal{B}(\mathcal{Y}, \mathcal{X})$ such that $I_{\mathcal{X}}-S_{A, \Psi}=\Phi B$, then

$$
\left(\left\{A_{n}\right\}_{n} \cup\{B\},\left\{\Psi_{n}\right\}_{n} \cup\{\Phi\}\right)
$$

is a Parseval operator-valued $p-A S F$ in $\mathcal{B}(\mathcal{X}, \mathcal{Y})$. In particular, if $\mathcal{Y}=\mathcal{X}$ and $I_{\mathcal{X}}-S_{A, \Psi}$ is a square, then every operator-valued $p-A B S$ can be turned into an operator-valued $p-A S F$.

Proof. We only need to observe that

$$
\sum_{n=1}^{\infty} \Psi_{n} A_{n} x+\Phi B x=S_{A, \Psi} x+\left(I_{\mathcal{X}}-S_{A, \Psi}\right) x=x, \quad \forall x \in \mathcal{X}
$$

In general, it is well known in Hilbert space frame theory that it is difficult to invert frame operator and get an expansion of every element of the Hilbert space using frame. Thus one needs an algorithm to approximate every element using frames but without using invertibility of frame operator. First such an algorithm was given by Duffin and Schaeffer 37] and later two more algorithms were given by Grochenig 47. We now derive an algorithm for operator-valued p-ASFs under a condition.

Proposition 2.4. Let $\left(\left\{A_{n}\right\}_{n},\left\{\Psi_{n}\right\}_{n}\right)$ be an operator-valued $p-A S F$ in $\mathcal{B}(\mathcal{X}, \mathcal{Y})$ with bounds a and $b$. For $x \in \mathcal{X}$, define

$$
x_{0}:=0, x_{n}:=x_{n-1}+\frac{2}{a+b} S_{A, \Psi}\left(x-x_{n-1}\right), \quad \forall n \geq 1
$$

If $\left\|I_{\mathcal{X}}-\frac{2}{b+a} S_{A, \Psi}\right\| \leq \frac{b-a}{b+a}$, then

$$
\left\|x_{n}-x\right\| \leq\left(\frac{b-a}{b+a}\right)^{n}\|x\|, \quad \forall n \geq 1
$$

In particular, $x_{n} \rightarrow x$ as $n \rightarrow \infty$.

Proof. We observe

$$
\begin{aligned}
x-x_{n} & =x-x_{n-1}-\frac{2}{a+b} S_{A, \Psi}\left(x-x_{n-1}\right) \\
& =\left(I_{\mathcal{X}}-\frac{2}{b+a} S_{A, \Psi}\right)\left(x-x_{n-1}\right) \\
& =\cdots=\left(I_{\mathcal{X}}-\frac{2}{b+a} S_{A, \Psi}\right)^{n} x, \quad \forall x \in \mathcal{X}, \forall n \geq 1 .
\end{aligned}
$$

Hence

$$
\left\|x_{n}-x\right\| \leq\left\|I_{\mathcal{X}}-\frac{2}{b+a} S_{A, \Psi}\right\|^{n}\|x\| \leq\left(\frac{b-a}{b+a}\right)^{n}\|x\|, \quad \forall n \geq 1
$$

Most important result in the development of theory is the following result.
Theorem 2.5. Let $\left(\left\{A_{n}\right\}_{n},\left\{\Psi_{n}\right\}_{n}\right)$ be an operator-valued $p-A S F$ in $\mathcal{B}(\mathcal{X}, \mathcal{Y})$.
(i) The analysis operator $\theta_{A}: \mathcal{X} \ni x \mapsto \theta_{A} x=\sum_{n=1}^{\infty} L_{n} A_{n} x \in \ell^{p}(\mathbb{N}) \otimes \mathcal{Y}$ is injective.
(ii) The synthesis operator $\theta_{\Psi}: \ell^{p}(\mathbb{N}) \otimes \mathcal{Y} \ni z \mapsto \sum_{n=1}^{\infty} \Psi_{n} \Gamma_{n} z \in \mathcal{X}$ surjective.
(iii) $\left(\left\{A_{n} S_{A, \Psi}^{-1}\right\}_{n},\left\{S_{A, \Psi}^{-1} \Psi_{n}\right\}_{n}\right)$ is an operator-valued $p-A S F$ in $\mathcal{B}(\mathcal{X}, \mathcal{Y})$.
(iv) Frame operator factors as $S_{A, \Psi}=\theta_{\Psi} \theta_{A}$.
(v) $P_{A, \Psi}:=\theta_{A} S_{A, \Psi}^{-1} \theta_{\Psi}: \ell^{p}(\mathbb{N}) \otimes \mathcal{Y} \rightarrow \ell^{p}(\mathbb{N}) \otimes \mathcal{Y}$ is a projection onto $\theta_{A}(\mathcal{X})$.

Proof. Since $S_{A, \Psi}$ is invertible, we get (i), (ii) and (iii). For (iv), we use Equation (11) and get

$$
\begin{aligned}
\theta_{\Psi} \theta_{A} x & =\left(\sum_{n=1}^{\infty} \Psi_{n} \Gamma_{n}\right)\left(\sum_{k=1}^{\infty} L_{k} A_{k} x\right)=\sum_{n=1}^{\infty} \Psi_{n}\left(\sum_{k=1}^{\infty} \Gamma_{n} L_{k} A_{k} x\right) \\
& =\sum_{n=1}^{\infty} \Psi_{n} A_{n} x=S_{A, \Psi} x, \quad \forall x \in \mathcal{X}
\end{aligned}
$$

For (v),

$$
P_{A, \Psi}^{2}=\theta_{A} S_{A, \Psi}^{-1} \theta_{\Psi} \theta_{A} S_{A, \Psi}^{-1} \theta_{\Psi}=\theta_{A} S_{A, \Psi}^{-1} I_{\mathcal{X}} \theta_{\Psi}=P_{A, \Psi}
$$

In the next result we are proving that projections give frames to subspaces.
Theorem 2.6. Let $\mathcal{Z}$ be a closed complementable subspace of $\mathcal{X}$ and $P: \mathcal{X} \rightarrow \mathcal{Z}$ be an onto projection.
(i) If $\left(\left\{A_{n}\right\}_{n},\left\{\Psi_{n}\right\}_{n}\right)$ is a Parseval operator-valued $p$-ASF in $\mathcal{B}(\mathcal{X}, \mathcal{Y})$, then $\left(\left\{A_{n} P\right\}_{n},\left\{P \Psi_{n}\right\}_{n}\right)$ is a Parseval operator-valued $p-A S F$ in $\mathcal{B}(\mathcal{Z}, \mathcal{Y})$.
(ii) If $\left(\left\{A_{n}\right\}_{n},\left\{\Psi_{n}\right\}_{n}\right)$ is an operator-valued $p-A S F$ in $\mathcal{B}(\mathcal{X}, \mathcal{Y})$, then $\left(\left\{A_{n} P\right\}_{n},\left\{P \Psi_{n}\right\}_{n}\right)$ is an operatorvalued $p-A S F$ in $\mathcal{B}(\mathcal{Z}, \mathcal{Y})$.

Proof. (i) We have to show that the frame operator for $\left(\left\{A_{n} P\right\}_{n},\left\{P \Psi_{n}\right\}_{n}\right)$ is the identity on $\mathcal{Z}$. Let $z \in \mathcal{Z}$. Then

$$
\sum_{n=1}^{\infty} P \Psi_{n} A_{n} P z=P\left(\sum_{n=1}^{\infty} \Psi_{n} A_{n} z\right)=P z=z
$$

(ii) We observe that the frame operator $S_{A P, P \Psi}$ is $P S_{A, \Psi} P$. Since $S_{A, \Psi}$ is invertible on $\mathcal{X}, P S_{A, \Psi} P$ is invertible on $\mathcal{Z}$ with inverse $P S_{A, \Psi}^{-1} P$.

In the theory of Hilbert space frames, the notion which is stronger than frames is that of Riesz basis. We next define the notion of Riesz operator-valued p-ASF. For OVFs, this notion was defined by Kaftal, Larson, and Zhang [57] and Sun [78] and for p-ASFs, this notion was defined in 62]. There is also a notion of Riesz basis for Banach spaces defined in [2].

Definition 2.7. (i) An operator-valued $p-A S F\left(\left\{A_{n}\right\}_{n},\left\{\Psi_{n}\right\}_{n}\right)$ in $\mathcal{B}(\mathcal{X}, \mathcal{Y})$ is said to be an operatorvalued p-approximate Riesz basis (we write operator-valued p-ARB) if $P_{A, \Psi}=I_{\ell^{p}(\mathbb{N})} \otimes I_{\mathcal{Y}}$.
(ii) A collection $\left(\left\{A_{n}\right\}_{n},\left\{\Psi_{n}\right\}_{n}\right)$ in $\mathcal{B}(\mathcal{X}, \mathcal{Y})$ is said to be an operator-valued p-approximate Riesz sequence if it is an operator-valued $p-A R B$ in $\mathcal{B}(\mathcal{Z}, \mathcal{Y})$, where

$$
\mathcal{Z}:=\overline{\operatorname{span}} \cup_{n=1}^{\infty} \Psi_{n}(\mathcal{Y})
$$

Riesz bases play important role in the dilation theory of frames. First dilation result of frames was obtained independently by Han and Larson [50] and Kashin and Kulikova 58] (see 32] for the history of this theorem). The result was also known to Daubechies [17. Dilation of framings for Banach spaces were obtained in [15]. This work later led to the notion of general dilation theory of operator-valued measures in [51,52]. For p-ASFs, dilation theorem is derived in [62]. For OVFs, general Naimark-Han-Larson dilation theorem was obtained in [53. Here we obtain dilation result for operator-valued p-ASFs. This is basically a kind of converse to Theorem 2.6.

Theorem 2.8. (Dilation theorem) Let $\left(\left\{A_{n}\right\}_{n},\left\{\Psi_{n}\right\}_{n}\right)$ be an operator-valued $p$ - $A S F$ in $\mathcal{B}(\mathcal{X}, \mathcal{Y})$. Then there exist a Banach space $\mathcal{X}_{1}$ which contains $\mathcal{X}$ isometrically and bounded linear operators $B_{n}: \mathcal{X}_{1} \rightarrow \mathcal{Y}$, $\Phi_{n}: \mathcal{Y} \rightarrow \mathcal{X}_{1}, \forall n$ such that $\left(\left\{B_{n}\right\}_{n},\left\{\Phi_{n}\right\}_{n}\right)$ is an operator-valued $p-A R B$ in $\mathcal{B}\left(\mathcal{X}_{1}, \mathcal{Y}\right)$ and $\left.B_{n}\right|_{\mathcal{X}}=$ $A_{n}, \forall n \in \mathbb{N}$.

Proof. Since $I_{\ell^{p}(\mathbb{N}) \otimes \mathcal{Y}}-P_{A, \Psi}$ is idempotent, $\left(I_{\ell^{p}(\mathbb{N}) \otimes \mathcal{Y}}-P_{A, \Psi}\right)(\mathcal{X})$ is a Banach space. Define

$$
\mathcal{X}_{1}:=\mathcal{X} \oplus\left(I_{\ell^{p}(\mathbb{N}) \otimes \mathcal{Y}}-P_{A, \Psi}\right)(\mathcal{X})
$$

Then the map $\mathcal{X} \ni x \mapsto x \oplus 0 \in \mathcal{X}_{1}$ is an isometry. Now define

$$
\begin{aligned}
& B_{n}: \mathcal{X}_{1} \ni x \oplus y \mapsto A_{n} x+\Gamma_{n}\left(I_{\ell^{p}(\mathbb{N}) \otimes \mathcal{Y}}-P_{A, \Psi}\right) y \in \mathcal{Y}, \\
& \Phi_{n}: \mathcal{Y} \ni y \mapsto \Psi_{n} y \oplus\left(I_{\ell^{p}(\mathbb{N}) \otimes \mathcal{Y}}-P_{A, \Psi}\right) L_{n} y \in \mathcal{X}_{1}, \quad \forall n \in \mathbb{N} .
\end{aligned}
$$

Then we have $\left.B_{n}\right|_{\mathcal{X}}=A_{n}, \forall n \in \mathbb{N}$. We now find

$$
\begin{aligned}
\theta_{B}(x \oplus y) & =\sum_{n=1}^{\infty} L_{n} A_{n} x+\sum_{n=1}^{\infty} L_{n} \Gamma_{n}\left(I_{\ell^{p}(\mathbb{N}) \otimes \mathcal{Y}}-P_{A, \Psi}\right) y \\
& =\theta_{A} x+\left(I_{\ell^{p}(\mathbb{N}) \otimes \mathcal{Y}}-P_{A, \Psi}\right) y, \quad \forall x \oplus y \in \mathcal{X}_{1}
\end{aligned}
$$

and

$$
\begin{aligned}
\theta_{\Phi} z & =\sum_{n=1}^{\infty} \Psi_{n} \Gamma_{n} z \oplus \sum_{n=1}^{\infty}\left(I_{\ell^{p}(\mathbb{N}) \otimes \mathcal{Y}}-P_{A, \Psi}\right) L_{n} \Gamma_{n} z \\
& =\theta_{\Psi} z \oplus\left(I_{\ell^{p}(\mathbb{N}) \otimes \mathcal{Y}}-P_{A, \Psi}\right) z, \quad \forall z \in \ell^{p}(\mathbb{N}) \otimes \mathcal{Y}
\end{aligned}
$$

We also notice

$$
\left(I_{\ell^{p}(\mathbb{N}) \otimes \mathcal{Y}}-P_{A, \Psi}\right) \theta_{A}=\theta_{A}-\theta_{A} S_{A, \Psi}^{-1} \theta_{\Psi} \theta_{A}=\theta_{A}-\theta_{A}=0
$$

and

$$
\theta_{\Psi}\left(I_{\ell^{p}(\mathbb{N}) \otimes \mathcal{Y}}-P_{A, \Psi}\right)=\theta_{\Psi}-\theta_{\Psi} \theta_{A} S_{A, \Psi}^{-1} \theta_{\Psi}=\theta_{\Psi}-\theta_{\Psi}=0 .
$$

Using these expressions we get the frame operator of $\left(\left\{B_{n}\right\}_{n},\left\{\Phi_{n}\right\}_{n}\right)$ as

$$
\begin{aligned}
S_{B, \Phi}(x \oplus y) & =\theta_{\Phi} \theta_{B}(x \oplus y)=\theta_{\Phi}\left(\theta_{A} x+\left(I_{\ell^{p}(\mathbb{N}) \otimes \mathcal{Y}}-P_{A, \Psi}\right) y\right) \\
& =\theta_{\Psi}\left(\theta_{A} x+\left(I_{\ell^{p}(\mathbb{N}) \otimes \mathcal{Y}}-P_{A, \Psi} y\right) \oplus\left(I_{\ell^{p}}(\mathbb{N}) \otimes \mathcal{Y}-P_{A, \Psi}\right)\left(\theta_{A} x+\left(I_{\ell^{p}}(\mathbb{N}) \otimes \mathcal{Y}-P_{A, \Psi}\right) y\right)\right. \\
& =\left(\theta_{\Psi} \theta_{A} x+\theta_{\Psi}\left(I_{\ell^{p}}(\mathbb{N}) \otimes \mathcal{Y}-P_{A, \Psi}\right) y\right) \oplus\left(\left(I_{\ell^{p}(\mathbb{N}) \otimes \mathcal{Y}}-P_{A, \Psi}\right) \theta_{A} x+\left(I_{\ell^{p}(\mathbb{N}) \otimes \mathcal{Y}}-P_{A, \Psi}\right)^{2} y\right) \\
& =\left(S_{A, \Psi} x+0\right) \oplus\left(0+\left(I_{\ell^{p}(\mathbb{N}) \otimes \mathcal{Y}}-P_{A, \Psi}\right) y\right) \\
& =\left(S_{A, \Psi} \oplus\left(I_{\ell^{p}(\mathbb{N}) \otimes \mathcal{Y}}-P_{A, \Psi}\right)\right)(x \oplus y), \quad \forall x \oplus y \in \mathcal{X}_{1} .
\end{aligned}
$$

Therefore $S_{B, \Phi}$ invertible with inverse $S_{A, \Psi}^{-1} \oplus\left(I_{\ell^{p}(\mathbb{N}) \otimes \mathcal{Y}}-P_{A, \Psi}\right)$. Hence $\left(\left\{B_{n}\right\}_{n},\left\{\Phi_{n}\right\}_{n}\right)$ is an operatorvalued p-ASF. Next we need to show that it is Riesz. Let $z \in \ell^{p}(\mathbb{N}) \otimes \mathcal{Y}$. Then

$$
\begin{aligned}
P_{B, \Phi} z & =\theta_{B} S_{B, \Phi}^{-1} \theta_{\Phi} z=\theta_{B} S_{B, \Phi}^{-1}\left(\theta_{\Psi} z \oplus\left(I_{\ell^{p}}(\mathbb{N}) \otimes \mathcal{Y}-P_{A, \Psi}\right) z\right) \\
& =\theta_{B}\left(S_{A, \Psi}^{-1} \oplus\left(I_{\ell^{p}(\mathbb{N}) \otimes \mathcal{Y}}-P_{A, \Psi}\right)\right)\left(\theta_{\Psi} z \oplus\left(I_{\ell^{p}(\mathbb{N}) \otimes \mathcal{Y}}-P_{A, \Psi}\right) z\right) \\
& =\theta_{B}\left(S_{A, \Psi}^{-1} \theta_{\Psi} z \oplus\left(I_{\ell^{p}(\mathbb{N}) \otimes \mathcal{Y}}-P_{A, \Psi}\right) z\right) \\
& =\theta_{A} S_{A, \Psi}^{-1} \theta_{\Psi} z+\left(I_{\ell^{p}(\mathbb{N}) \otimes \mathcal{Y}}-P_{A, \Psi}\right)^{2} z \\
& =P_{A, \Psi} z+\left(I_{\ell^{p}(\mathbb{N}) \otimes \mathcal{Y}}-P_{A, \Psi}\right) z=z .
\end{aligned}
$$

It is possible to characterize frames for Hilbert spaces using the standard orthonormal basis $\left\{e_{n}\right\}_{n}$ for $\ell^{2}(\mathbb{N})$ [56]. This result has been extended in [64] which shows that p-ASFs can be characterized using the standard Schauder basis $\left\{e_{n}\right\}_{n}$ for $\ell^{p}(\mathbb{N})$. We further generalize this result for operator-valued p-ASFs.

Theorem 2.9. A pair $\left(\left\{A_{n}\right\}_{n},\left\{\Psi_{n}\right\}_{n}\right)$ is an operator-valued $p$ - $A S F$ in $\mathcal{B}(\mathcal{X}, \mathcal{Y})$ if and only if

$$
A_{n}=\Gamma_{n} U, \quad \Psi_{n}=V L_{n}, \quad \forall n \in \mathbb{N},
$$

where $U: \mathcal{X} \rightarrow \ell^{p}(\mathbb{N}) \otimes \mathcal{Y}$ and $V: \ell^{p}(\mathbb{N}) \otimes \mathcal{Y} \rightarrow \mathcal{X}$ are bounded linear operators such that $V U$ is bounded invertible.

Proof. $(\Leftarrow)$ Given $x \in \mathcal{X}$, Equation (11) gives

$$
S_{A, \Psi} x=\sum_{n=1}^{\infty} \Psi_{n} A_{n} x=\sum_{n=1}^{\infty} V L_{n} \Gamma_{n} U x=V\left(\sum_{n=1}^{\infty} L_{n} \Gamma_{n}\right) U x=V U x .
$$

Therefore $S_{A, \Psi}$ is bounded invertible which says $\left(\left\{A_{n}\right\}_{n},\left\{\Psi_{n}\right\}_{n}\right)$ is an operator-valued p-ASF in $\mathcal{B}(\mathcal{X}, \mathcal{Y})$. $(\Rightarrow)$ Define $U x:=\sum_{n=1}^{\infty} L_{n} A_{n} x, \forall x \in \mathcal{X}, V z:=\sum_{n=1}^{\infty} \Psi_{n} \Gamma_{n} z, \forall z \in \ell^{p}(\mathbb{N}) \otimes \mathcal{Y}$. Then

$$
\Gamma_{n} U x=\Gamma_{n}\left(\sum_{k=1}^{\infty} L_{k} A_{k} x\right)=\sum_{k=1}^{\infty} \Gamma_{n} L_{k} A_{k} x=A_{n} x, \quad \forall x \in \mathcal{X}, \forall n \in \mathbb{N}
$$

and

$$
V L_{n} z=\sum_{k=1}^{\infty} \Psi_{k} \Gamma_{k} L_{n} z=\Psi_{n} z, \quad \forall z \in \ell^{p}(\mathbb{N}) \otimes \mathcal{Y}, \forall n \in \mathbb{N}
$$

We are left with showing that $V U$ is invertible. For this we find

$$
V U x=\left(\sum_{n=1}^{\infty} \Psi_{n} \Gamma_{n}\right)\left(\sum_{k=1}^{\infty} L_{k} A_{k} x\right)=\sum_{n=1}^{\infty} \Psi_{n} A_{n} x=S_{A, \Psi} x, \quad \forall x \in \mathcal{X}
$$

which says $V U$ is invertible.
Corollary 2.10. A pair $\left(\left\{A_{n}\right\}_{n},\left\{\Psi_{n}\right\}_{n}\right)$ is an operator-valued $p-A B S$ in $\mathcal{B}(\mathcal{X}, \mathcal{Y})$ if and only if

$$
A_{n}=\Gamma_{n} U, \quad \Psi_{n}=V L_{n}, \quad \forall n \in \mathbb{N}
$$

where $U: \mathcal{X} \rightarrow \ell^{p}(\mathbb{N}) \otimes \mathcal{Y}$ and $V: \ell^{p}(\mathbb{N}) \otimes \mathcal{Y} \rightarrow \mathcal{X}$ are bounded linear operators.
Corollary 2.11. A pair $\left(\left\{A_{n}\right\}_{n},\left\{\Psi_{n}\right\}_{n}\right)$ is an operator-valued $p-A R B$ in $\mathcal{B}(\mathcal{X}, \mathcal{Y})$ if and only if

$$
A_{n}=\Gamma_{n} U, \quad \Psi_{n}=V L_{n}, \quad \forall n \in \mathbb{N}
$$

where $U: \mathcal{X} \rightarrow \ell^{p}(\mathbb{N}) \otimes \mathcal{Y}$ and $V: \ell^{p}(\mathbb{N}) \otimes \mathcal{Y} \rightarrow \mathcal{X}$ are bounded linear operators such that $V U$ is bounded invertible and $U(V U)^{-1} V=I_{\ell^{p}(\mathbb{N}) \otimes \mathcal{Y}}$.

## 3. Duality and orthogonality

Given an operator-valued p-ASF $\left(\left\{A_{n}\right\}_{n},\left\{\Psi_{n}\right\}_{n}\right)$, consider the frame $\left(\left\{B_{n}:=A_{n} S_{A, \Psi}^{-1}\right\}_{n},\left\{\Phi_{n}:=S_{A, \Psi}^{-1} \Psi_{n}\right\}_{n}\right)$ in (iii) of Theorem 2.5. This frame has the property that $\theta_{\Psi} \theta_{B}=\theta_{\Phi} \theta_{A}=I_{\mathcal{X}}$. In general, there are other frames satisfying this property. This brings us to the notion of dual frames.

Definition 3.1. An operator-valued $p-A S F\left(\left\{B_{n}\right\}_{n},\left\{\Phi_{n}\right\}_{n}\right)$ in $\mathcal{B}(\mathcal{X}, \mathcal{Y})$ is said to be a dual for an operator-valued $p-A S F\left(\left\{A_{n}\right\}_{n},\left\{\Psi_{n}\right\}_{n}\right)$ in $\mathcal{B}(\mathcal{X}, \mathcal{Y})$ if

$$
\theta_{\Psi} \theta_{B}=\theta_{\Phi} \theta_{A}=I_{\mathcal{X}}
$$

If both $\left(\left\{B_{n}\right\}_{n},\left\{\Phi_{n}\right\}_{n}\right)$ and $\left(\left\{A_{n}\right\}_{n},\left\{\Psi_{n}\right\}_{n}\right)$ are operator-valued $p$ - $A B S$, then we say that they are dual operator-valued $p-A B S s$.

By using the definition of analysis and synthesis operators we will have the following result.
Proposition 3.2. An operator-valued p-ASF $\left(\left\{B_{n}\right\}_{n},\left\{\Phi_{n}\right\}_{n}\right)$ in $\mathcal{B}(\mathcal{X}, \mathcal{Y})$ is a dual for an operator-valued $p$-ASF $\left(\left\{A_{n}\right\}_{n},\left\{\Psi_{n}\right\}_{n}\right)$ in $\mathcal{B}(\mathcal{X}, \mathcal{Y})$ if and only if

$$
\sum_{n=1}^{\infty} \Psi_{n} B_{n} x=\sum_{n=1}^{\infty} \Phi_{n} A_{n} x=x, \quad \forall x \in \mathcal{X}
$$

The frame $\left(\left\{A_{n} S_{A, \Psi}^{-1}\right\}_{n},\left\{S_{A, \Psi}^{-1} \Psi_{n}\right\}_{n}\right)$ is called as the canonical dual for $\left(\left\{A_{n}\right\}_{n},\left\{\Psi_{n}\right\}_{n}\right)$. They have the following simple property whose proof follows from the calculation of its frame operator and we leave the proof.

Theorem 3.3. Let $\left(\left\{A_{n}\right\}_{n},\left\{\Psi_{n}\right\}_{n}\right)$ be an operator-valued $p-A S F$ in $\mathcal{B}(\mathcal{X}, \mathcal{Y})$ with frame bounds $a$ and $b$. Then
(i) The canonical dual for the canonical dual for $\left(\left\{A_{n}\right\}_{n},\left\{\Psi_{n}\right\}_{n}\right)$ is itself.
(ii) $\frac{1}{b}, \frac{1}{a}$ are frame bounds for the canonical dual of $\left(\left\{A_{n}\right\}_{n},\left\{\Psi_{n}\right\}_{n}\right)$.
(iii) If $a, b$ are optimal frame bounds for $\left(\left\{A_{n}\right\}_{n},\left\{\Psi_{n}\right\}_{n}\right)$, then $\frac{1}{b}, \frac{1}{a}$ are optimal frame bounds for its canonical dual.

Complete description of dual frames for Hilbert spaces was described Li 68. This description has been generalized in the context of factorable weak OVFs in [66] and p-ASFs in [64]. Here we describe duals which cover all of them.

Lemma 3.4. Let $\left(\left\{A_{n}\right\}_{n},\left\{\Psi_{n}\right\}_{n}\right)$ be an operator-valued $p-A S F$ in $\mathcal{B}(\mathcal{X}, \mathcal{Y})$. Then an operator-valued p-ASF $\left(\left\{B_{n}\right\}_{n},\left\{\Phi_{n}\right\}_{n}\right)$ in $\mathcal{B}(\mathcal{X}, \mathcal{Y})$ is a dual for $\left(\left\{A_{n}\right\}_{n},\left\{\Psi_{n}\right\}_{n}\right)$ if and only if

$$
B_{n}=\Gamma_{n} U, \quad \Phi_{n}=V L_{n}, \quad \forall n \in \mathbb{N}
$$

where $U: \mathcal{H} \rightarrow \ell^{p}(\mathbb{N}) \otimes \mathcal{Y}$ is a bounded right-inverse of $\theta_{\Psi}, V: \ell^{p}(\mathbb{N}) \otimes \mathcal{Y} \rightarrow \mathcal{X}$ is a bounded left-inverse of $\theta_{A}$ such that $V U$ is bounded invertible.

Proof. $(\Rightarrow)$ Let $\left(\left\{B_{n}\right\}_{n},\left\{\Phi_{n}\right\}_{n}\right)$ be a dual operator-valued p-ASF for $\left(\left\{A_{n}\right\}_{n},\left\{\Psi_{n}\right\}_{n}\right)$. Then $\theta_{\Psi} \theta_{B}=I_{\mathcal{X}}=$ $\theta_{\Phi} \theta_{A}$. Define $U:=\theta_{B}, V:=\theta_{\Phi}$. Then $U: \mathcal{X} \rightarrow \ell^{p}(\mathbb{N}) \otimes \mathcal{Y}$ is a right-inverse of $\theta_{\Psi}, V: \ell^{p}(\mathbb{N}) \otimes \mathcal{Y} \rightarrow \mathcal{X}$ is a left-inverse of $\theta_{A}$ such that $V U=\theta_{\Phi} \theta_{B}=S_{B, \Phi}$ is invertible. We find

$$
\begin{aligned}
& \Gamma_{n} U x=\Gamma_{n}\left(\sum_{k=1}^{\infty} L_{k} B_{k} x\right)=B_{n} x, \quad \forall x \in \mathcal{X}, \\
& V L_{n} z=\sum_{k=1}^{\infty} \Phi_{k} \Gamma_{k} L_{n} z=\Phi_{n} z, \quad \forall z \in \ell^{p}(\mathbb{N}) \otimes \mathcal{Y}, \forall n \in \mathbb{N} .
\end{aligned}
$$

$(\Leftarrow)$ It is clear that $\left(\left\{B_{n}\right\}_{n},\left\{\Phi_{n}\right\}_{n}\right)$ is an operator-valued p-ASF in $\mathcal{B}(\mathcal{X}, \mathcal{Y})$ and a calculation gives $\theta_{B}=U, \theta_{\Phi}=V$. For duality, $\theta_{\Phi} \theta_{A}=V \theta_{A}=I_{\mathcal{X}}, \theta_{\Psi} \theta_{B}=\theta_{\Psi} U=I_{\mathcal{X}}$.

Lemma 3.5. Let $\left(\left\{A_{n}\right\}_{n},\left\{\Psi_{n}\right\}_{n}\right)$ be an operator-valued $p$ - $A S F$ in $\mathcal{B}(\mathcal{X}, \mathcal{Y})$. Then
(i) $R: \mathcal{X} \rightarrow \ell^{p}(\mathbb{N}) \otimes \mathcal{Y}$ is a bounded right-inverse of $\theta_{\Psi}$ if and only if

$$
R=\theta_{A} S_{A, \Psi}^{-1}+\left(I_{\ell^{p}(\mathbb{N}) \otimes \mathcal{Y}}-\theta_{A} S_{A, \Psi}^{-1} \theta_{\Psi}\right) U
$$

where $U: \mathcal{X} \rightarrow \ell^{p}(\mathbb{N}) \otimes \mathcal{Y}$ is a bounded linear operator.
(ii) $L: \ell^{p}(\mathbb{N}) \otimes \mathcal{Y} \rightarrow \mathcal{X}$ is a bounded left-inverse of $\theta_{A}$ if and only if

$$
L=S_{A, \Psi}^{-1} \theta_{\Psi}+V\left(I_{\ell^{p}(\mathbb{N}) \otimes \mathcal{Y}}-\theta_{A} S_{A, \Psi}^{-1} \theta_{\Psi}\right)
$$

where $V: \ell^{p}(\mathbb{N}) \otimes \mathcal{Y} \rightarrow \mathcal{X}$ is a bounded linear operator.
Proof. (i) $(\Leftarrow)$ Let $U: \mathcal{X} \rightarrow \ell^{p}(\mathbb{N}) \otimes \mathcal{Y}$ be a bounded linear operator. Then $\theta_{\Psi}\left(\theta_{A} S_{A, \Psi}^{-1}+\left(I_{\ell^{p}(\mathbb{N}) \otimes \mathcal{Y}}-\right.\right.$ $\left.\left.\theta_{A} S_{A, \Psi}^{-1} \theta_{\Psi}\right) U\right)=I_{\mathcal{X}}+\theta_{\Psi} U-\theta_{\Psi} U=I_{\mathcal{X}}$. Therefore $R:=\theta_{A} S_{A, \Psi}^{-1}+\left(I_{\ell^{p}(\mathbb{N}) \otimes \mathcal{Y}}-\theta_{A} S_{A, \Psi}^{-1} \theta_{\Psi}\right) U$ is a bounded right-inverse of $\theta_{\Psi}$.
$(\Rightarrow)$ Let $R: \mathcal{X} \rightarrow \ell^{p}(\mathbb{N}) \otimes \mathcal{Y}$ be a bounded right-inverse of $\theta_{\Psi}$. Define $U:=R$. Then $\theta_{A} S_{A, \Psi}^{-1}+$ $\left(I_{\ell^{p}(\mathbb{N}) \otimes \mathcal{Y}}-\theta_{A} S_{A, \Psi}^{-1} \theta_{\Psi}\right) U=\theta_{A} S_{A, \Psi}^{-1}+\left(I_{\ell^{p}(\mathbb{N}) \otimes \mathcal{Y}}-\theta_{A} S_{A, \Psi}^{-1} \theta_{\Psi}\right) R=\theta_{A} S_{A, \Psi}^{-1}+R-\theta_{A} S_{A, \Psi}^{-1}=R$.
(ii) $(\Leftarrow)$ Let $V: \ell^{p}(\mathbb{N}) \otimes \mathcal{Y} \rightarrow \mathcal{X}$ be a bounded linear operator. Then $\left(S_{A, \Psi}^{-1} \theta_{\Psi}+V\left(I_{\ell^{p}(\mathbb{N}) \otimes \mathcal{Y}}-\right.\right.$ $\left.\left.\theta_{A} S_{A, \Psi}^{-1} \theta_{\Psi}\right)\right) \theta_{A}=I_{\mathcal{X}}+V \theta_{A}-V \theta_{A} I_{\mathcal{X}}=I_{\mathcal{X}}$. Therefore $V:=S_{A, \Psi}^{-1} \theta_{\Psi}+V\left(I_{\ell^{p}(\mathbb{N}) \otimes \mathcal{Y}}-\theta_{A} S_{A, \Psi}^{-1} \theta_{\Psi}\right)$ is a bounded left-inverse of $\theta_{A}$.
$(\Rightarrow)$ Let $L: \ell^{p}(\mathbb{N}) \otimes \mathcal{Y} \rightarrow \mathcal{X}$ be a bounded left-inverse of $\theta_{A}$. Define $V:=L$. Then $S_{A, \Psi}^{-1} \theta_{\Psi}+$ $V\left(I_{\ell^{p}(\mathbb{N}) \otimes \mathcal{Y}}-\theta_{A} S_{A, \Psi}^{-1} \theta_{\Psi}\right)=S_{A, \Psi}^{-1} \theta_{\Psi}+L\left(I_{\ell^{p}(\mathbb{N}) \otimes \mathcal{Y}}-\theta_{A} S_{A, \Psi}^{-1} \theta_{\Psi}\right)=S_{A, \Psi}^{-1} \theta_{\Psi}+L-I_{\mathcal{X}} S_{A, \Psi}^{-1} \theta_{\Psi}=L$.

Theorem 3.6. Let $\left(\left\{A_{n}\right\}_{n},\left\{\Psi_{n}\right\}_{n}\right)$ be an operator-valued $p-A S F$ in $\mathcal{B}(\mathcal{X}, \mathcal{Y})$. Then an operator-valued $p-A S F\left(\left\{B_{n}\right\}_{n},\left\{\Phi_{n}\right\}_{n}\right)$ in $\mathcal{B}(\mathcal{X}, \mathcal{Y})$ is a dual for $\left(\left\{A_{n}\right\}_{n},\left\{\Psi_{n}\right\}_{n}\right)$ if and only if

$$
\begin{aligned}
& B_{n}=A_{n} S_{A, \Psi}^{-1}+\Gamma_{n} U-A_{n} S_{A, \Psi}^{-1} \theta_{\Psi} U \\
& \Phi_{n}=S_{A, \Psi}^{-1} \Psi_{n}+V L_{n}-V \theta_{A} S_{A, \Psi}^{-1} \Psi_{n}, \quad \forall n \in \mathbb{N}
\end{aligned}
$$

such that the operator

$$
S_{A, \Psi}^{-1}+V U-V \theta_{A} S_{A, \Psi}^{-1} \theta_{\Psi} U
$$

is bounded invertible, where $U: \mathcal{X} \rightarrow \ell^{p}(\mathbb{N}) \otimes \mathcal{Y}$ and $V: \ell^{p}(\mathbb{N}) \otimes \mathcal{Y} \rightarrow \mathcal{X}$ are bounded linear operators.
Proof. Lemmas 3.4 and 3.5 give the characterization of dual operator-valued p-ASF for $\left(\left\{A_{n}\right\}_{n},\left\{\Psi_{n}\right\}_{n}\right)$ as

$$
\begin{aligned}
& B_{n}=\Gamma_{n}\left(\theta_{A} S_{A, \Psi}^{-1}+\left(I_{\ell^{p}(\mathbb{N}) \otimes \mathcal{Y}}-\theta_{A} S_{A, \Psi}^{-1} \theta_{\Psi}\right) U\right)=A_{n} S_{A, \Psi}^{-1}+\Gamma_{n} U-A_{n} S_{A, \Psi}^{-1} \theta_{\Psi} U \\
& \Phi_{n}=\left(S_{A, \Psi}^{-1} \theta_{\Psi}+V\left(I_{\ell^{p}(\mathbb{N}) \otimes \mathcal{Y}}-\theta_{A} S_{A, \Psi}^{-1} \theta_{\Psi}\right)\right) L_{n}=S_{A, \Psi}^{-1} \Psi_{n}+V L_{n}-V \theta_{A} S_{A, \Psi}^{-1} \Psi_{n}, \quad \forall n \in \mathbb{N}
\end{aligned}
$$

such that the operator

$$
\left(S_{A, \Psi}^{-1} \theta_{\Psi}+V\left(I_{\ell^{p}(\mathbb{N}) \otimes \mathcal{Y}}-\theta_{A} S_{A, \Psi}^{-1} \theta_{\Psi}\right)\right)\left(\theta_{A} S_{A, \Psi}^{-1}+\left(I_{\ell^{p}(\mathbb{N}) \otimes \mathcal{Y}}-\theta_{A} S_{A, \Psi}^{-1} \theta_{\Psi}\right) U\right)
$$

is bounded invertible, where $U: \mathcal{X} \rightarrow \ell^{p}(\mathbb{N}) \otimes \mathcal{Y}$ and $V: \ell^{p}(\mathbb{N}) \otimes \mathcal{Y} \rightarrow \mathcal{X}$ are bounded linear operators. We make an expansion and get

$$
\begin{aligned}
& \left(S_{A, \Psi}^{-1} \theta_{\Psi}+V\left(I_{\ell^{p}(\mathbb{N}) \otimes \mathcal{Y}}-\theta_{A} S_{A, \Psi}^{-1} \theta_{\Psi}\right)\right)\left(\theta_{A} S_{A, \Psi}^{-1}+\left(I_{\ell^{p}(\mathbb{N}) \otimes \mathcal{Y}}-\theta_{A} S_{A, \Psi}^{-1} \theta_{\Psi}\right) U\right) \\
& \quad=S_{A, \Psi}^{-1}+V U-V \theta_{A} S_{A, \Psi}^{-1} \theta_{\Psi} U
\end{aligned}
$$

Notion which is opposite to the notion of duality is the notion of orthogonality of frames which is very useful in the construction of new frames from two frames. Balan [7] introduced this notion and later studied by Han and Larson [50. A detailed study in the finite dimensional case can be found in 49]. Orthogonality will be defined as follows based in Definition 3.1.

Definition 3.7. An operator-valued p-ASF $\left(\left\{B_{n}\right\}_{n},\left\{\Phi_{n}\right\}_{n}\right)$ in $\mathcal{B}(\mathcal{X}, \mathcal{Y})$ is said to be orthogonal to an operator-valued $p-A S F\left(\left\{A_{n}\right\}_{n},\left\{\Psi_{n}\right\}_{n}\right)$ in $\mathcal{B}(\mathcal{X}, \mathcal{Y})$ if

$$
\theta_{\Psi} \theta_{B}=\theta_{\Phi} \theta_{A}=0
$$

Similar to Proposition 3.2, we have the following result for orthogonality.
Proposition 3.8. An operator-valued p-ASF $\left(\left\{B_{n}\right\}_{n},\left\{\Phi_{n}\right\}_{n}\right)$ in $\mathcal{B}(\mathcal{X}, \mathcal{Y})$ is orthogonal to an operatorvalued $p-A S F\left(\left\{A_{n}\right\}_{n},\left\{\Psi_{n}\right\}_{n}\right)$ in $\mathcal{B}(\mathcal{X}, \mathcal{Y})$ if and only if

$$
\sum_{n=1}^{\infty} \Psi_{n} B_{n} x=\sum_{n=1}^{\infty} \Phi_{n} A_{n} x=0, \quad \forall x \in \mathcal{X}
$$

As mentioned earlier, we can get new frames using orthogonal frames. Following two results will describe them.

Proposition 3.9. Let $\left(\left\{A_{n}\right\}_{n},\left\{\Psi_{n}\right\}_{n}\right)$ and $\left(\left\{B_{n}\right\}_{n},\left\{\Phi_{n}\right\}_{n}\right)$ be two Parseval operator-valued $p$ - $A S F$ in $\mathcal{B}(\mathcal{X}, \mathcal{Y})$ which are orthogonal. If $C, D, E, F \in \mathcal{B}(\mathcal{X})$ are such that $E C+F D=I_{\mathcal{X}}$, then

$$
\left(\left\{A_{n} C+B_{n} D\right\}_{n},\left\{E \Psi_{n}+F \Phi_{n}\right\}_{n}\right)
$$

is a Parseval operator-valued $p-A S F$ in $\mathcal{B}(\mathcal{X}, \mathcal{Y})$. In particular, if scalars $c, d, e, f$ satisfy $c e+d f=1$, then $\left(\left\{c A_{n}+d B_{n}\right\}_{n},\left\{e \Psi_{n}+f \Phi_{n}\right\}_{n}\right)$ is a Parseval operator-valued $p-A S F$.

Proof. For each $x \in \mathcal{X}$,

$$
\begin{aligned}
S_{A C+B D, E \Psi+F \Phi} x & =\sum_{n=1}^{\infty}\left(E \Psi_{n}+F \Phi_{n}\right)\left(A_{n} C+B_{n} D\right) x \\
& =E S_{A, \Psi} C x+E\left(\sum_{n=1}^{\infty} \Psi_{n} B_{n}\right) D x+F\left(\sum_{n=1}^{\infty} \Phi_{n} A_{n}\right) C x+F S_{B, \Phi} D x \\
& =E C x+0+0+F D x=x
\end{aligned}
$$

Proposition 3.10. If $\left(\left\{A_{n}\right\}_{n},\left\{\Psi_{n}\right\}_{n}\right)$ and $\left(\left\{B_{n}\right\}_{n},\left\{\Phi_{n}\right\}_{n}\right)$ are orthogonal operator-valued $p$-ASFs in $\mathcal{B}(\mathcal{X}, \mathcal{Y})$, then $\left(\left\{A_{n} \oplus B_{n}\right\}_{n},\left\{\Psi_{n} \oplus \Phi_{n}\right\}_{n}\right)$ is an operator-valued $p-A S F$ in $\mathcal{B}(\mathcal{X} \oplus \mathcal{X}, \mathcal{Y})$. Further, if both $\left(\left\{A_{n}\right\}_{n},\left\{\Psi_{n}\right\}_{n}\right)$ and $\left(\left\{B_{n}\right\}_{n},\left\{\Phi_{n}\right\}_{n}\right)$ are Parseval, then $\left(\left\{A_{n} \oplus B_{n}\right\}_{n},\left\{\Psi_{n} \oplus \Phi_{n}\right\}_{n}\right)$ is Parseval.

Proof. Let $x \oplus x_{1} \in \mathcal{X} \oplus \mathcal{X}$. Then

$$
\begin{aligned}
S_{A \oplus B, \Psi \oplus \Phi}\left(x \oplus x_{1}\right) & =\sum_{n=1}^{\infty}\left(\Psi_{n} \oplus \Phi_{n}\right)\left(A_{n} \oplus B_{n}\right)\left(x \oplus x_{1}\right)=\sum_{n=1}^{\infty}\left(\Psi_{n} \oplus \Phi_{n}\right)\left(A_{n} x+B_{n} x_{1}\right) \\
& =\sum_{n=1}^{\infty}\left(\Psi_{n}\left(A_{n} x+B_{n} x_{1}\right) \oplus \Phi_{n}\left(A_{n} x+B_{n} x_{1}\right)\right) \\
& =\left(\sum_{n=1}^{\infty} \Psi_{n} A_{n} x+\sum_{n=1}^{\infty} \Psi_{n} B_{n} x_{1}\right) \oplus\left(\sum_{n=1}^{\infty} \Phi_{n} A_{n} x+\sum_{n=1}^{\infty} \Phi_{n} B_{n} x_{1}\right) \\
& =\left(S_{A, \Psi} x+0\right) \oplus\left(0+S_{B, \Phi} x_{1}\right)=\left(S_{A, \Psi} \oplus S_{B, \Phi}\right)\left(x \oplus x_{1}\right) .
\end{aligned}
$$

In the case of Hilbert spaces, it is known that orthogonal operator-valued frames have a common dual operator-valued frame. However, for Banach spaces, we have the following weaker result.

Proposition 3.11. Two orthogonal operator-valued $p$-ASFs have a common dual operator-valued $p-A B S$.
Proof. Let $\left(\left\{A_{n}\right\}_{n},\left\{\Psi_{n}\right\}_{n}\right)$ and $\left(\left\{B_{n}\right\}_{n},\left\{\Phi_{n}\right\}_{n}\right)$ be orthogonal operator-valued p-ASFs in $\mathcal{B}(\mathcal{X}, \mathcal{Y})$. Define

$$
C_{n}:=A_{n} S_{A, \Psi}^{-1}+B_{n} S_{B, \Phi}^{-1}, \quad \Xi_{n}:=S_{A, \Psi}^{-1} \Psi_{n}+S_{B, \Phi}^{-1} \Phi_{n} \quad \forall n \in \mathbb{N}
$$

Clearly $\left(\left\{C_{n}\right\}_{n},\left\{\Xi_{n}\right\}_{n}\right)$ is an operator-valued p-ABS in $\mathcal{B}(\mathcal{X}, \mathcal{Y})$. We need to show that this is a common dual for $\left(\left\{A_{n}\right\}_{n},\left\{\Psi_{n}\right\}_{n}\right)$ and $\left(\left\{B_{n}\right\}_{n},\left\{\Phi_{n}\right\}_{n}\right)$. Let $x \in \mathcal{X}$. Then

$$
\begin{aligned}
& \sum_{n=1}^{\infty} \Xi_{n} A_{n} x=\sum_{n=1}^{\infty}\left(S_{A, \Psi}^{-1} \Psi_{n}+S_{B, \Phi}^{-1} \Phi_{n}\right) A_{n} x=x+0=x, \\
& \sum_{n=1}^{\infty} \Psi_{n} C_{n} x=\sum_{n=1}^{\infty} \Psi_{n}\left(A_{n} S_{A, \Psi}^{-1}+B_{n} S_{B, \Phi}^{-1}\right) x=x+0=x, \\
& \sum_{n=1}^{\infty} \Xi_{n} B_{n} x=\sum_{n=1}^{\infty}\left(S_{A, \Psi}^{-1} \Psi_{n}+S_{B, \Phi}^{-1} \Phi_{n}\right) B_{n} x=0+x=x, \\
& \sum_{n=1}^{\infty} \Phi_{n} C_{n} x=\sum_{n=1}^{\infty} \Phi_{n}\left(A_{n} S_{A, \Psi}^{-1}+B_{n} S_{B, \Phi}^{-1}\right) x=0+x=x .
\end{aligned}
$$

We end this section by showing that there is no need of any conditions on two operator-valued p-ASFs to make the tensor product as an operator-valued p-ASFs. For frames for Hilbert spaces, this result was proved by Feichtinger and Grochenig [41].

Proposition 3.12. If $\left(\left\{A_{n}\right\}_{n},\left\{\Psi_{n}\right\}_{n}\right)$ and $\left(\left\{B_{n}\right\}_{n},\left\{\Phi_{n}\right\}_{n}\right)$ are operator-valued p-ASFs in $\mathcal{B}(\mathcal{X}, \mathcal{Y})$, then $\left(\left\{A_{n} \otimes B_{m}\right\}_{n, m},\left\{\Psi_{n} \otimes \Phi_{m}\right\}_{n, m}\right)$ is an operator-valued $p$-ASF in $\mathcal{B}(\mathcal{X} \otimes \mathcal{X}, \mathcal{Y})$. Further, if both $\left(\left\{A_{n}\right\}_{n},\left\{\Psi_{n}\right\}_{n}\right)$ and $\left(\left\{B_{n}\right\}_{n},\left\{\Phi_{n}\right\}_{n}\right)$ are Parseval, then $\left(\left\{A_{n} \otimes B_{m}\right\}_{n, m},\left\{\Psi_{n} \otimes \Phi_{m}\right\}_{n, m}\right)$ is Parseval.

Proof. We need to show that the frame operator for the tensor product is invertible. We first find it at elementary tensors as follows.

$$
\begin{aligned}
S_{A \otimes B, \Psi \otimes \Phi}\left(x \otimes x_{1}\right) & =\sum_{n, m=1}^{\infty}\left(\Psi_{n} \otimes \Phi_{m}\right)\left(A_{n} \otimes B_{m}\right)\left(x \otimes x_{1}\right) \\
& =\sum_{n, m=1}^{\infty}\left(\Psi_{n} A_{n} x \otimes \Phi_{m} B_{m} x_{1}\right)=\left(\sum_{n=1}^{\infty} \Psi_{n} A_{n} x\right) \otimes\left(\sum_{m=1}^{\infty} \Phi_{m} B_{m} x_{1}\right) \\
& =S_{A, \Psi} x \otimes S_{B, \Phi} x_{1}=\left(S_{A, \Psi} \otimes S_{B, \Phi}\right)\left(x \otimes x_{1}\right), \quad \forall x, x_{1} \in \mathcal{X} .
\end{aligned}
$$

We therefore have $S_{A \otimes B, \Psi \otimes \Phi}=S_{A, \Psi} \otimes S_{B, \Phi}$ which completes the proof.

## 4. Approximate duality

Even though all duals for an operator-valued p-ASF are characterized completely in the previous section, even in the case of Hilbert spaces, it is known that given a collection, it is difficult to verify whether it is a dual of a frame. This led Christensen and Laugesen [29] to introduce the notion of approximate duals (also see [70]). This notion has then been introduced and characterized for Banach spaces in 61. Here we give operator-valued version of those results for Banach spaces.

Definition 4.1. Let $\left(\left\{A_{n}\right\}_{n},\left\{\Psi_{n}\right\}_{n}\right)$ and $\left(\left\{B_{n}\right\}_{n},\left\{\Phi_{n}\right\}_{n}\right)$ be operator-valued $p$-ABSs in $\mathcal{B}(\mathcal{X}, \mathcal{Y})$. We say that they are approximately dual $\boldsymbol{p}-\mathbf{A B S s}$ if

$$
\left\|I_{\mathcal{X}}-\theta_{\Phi} \theta_{A}\right\|<1 \quad \text { and } \quad\left\|I_{\mathcal{X}}-\theta_{\Psi} \theta_{B}\right\|<1 .
$$

In addition, if $\left(\left\{A_{n}\right\}_{n},\left\{\Psi_{n}\right\}_{n}\right)$ and $\left(\left\{B_{n}\right\}_{n},\left\{\Phi_{n}\right\}_{n}\right)$ are $p$-ASFs in $\mathcal{B}(\mathcal{X}, \mathcal{Y})$, then we say that they are approximately dual p-ASFs.

Definition 4.1 gives the approximate duality using analysis and synthesis operators but the following proposition says that expansion of elements using approximate duals is close to the expansion using duals as described in Proposition 3.2.

Proposition 4.2. If $\left(\left\{A_{n}\right\}_{n},\left\{\Psi_{n}\right\}_{n}\right)$ and $\left(\left\{B_{n}\right\}_{n},\left\{\Phi_{n}\right\}_{n}\right)$ are approximately dual operator-valued $p$-ABSs in $\mathcal{B}(\mathcal{X}, \mathcal{Y})$, then

$$
\left\|x-\sum_{n=1}^{\infty} \Phi_{n} A_{n} x\right\|<\|x\| \quad \text { and } \quad\left\|x-\sum_{n=1}^{\infty} \Psi_{n} B_{n} x\right\|<\|x\|, \quad \forall x \in \mathcal{X} \backslash\{0\}
$$

Proof. Given $x \in \mathcal{X} \backslash\{0\}$,

$$
\begin{aligned}
& \left\|x-\sum_{n=1}^{\infty} \Phi_{n} A_{n} x\right\|=\left\|I_{\mathcal{X}} x-\theta_{\Phi} \theta_{A} x\right\| \leq\left\|I_{\mathcal{X}}-\theta_{\Phi} \theta_{A}\right\|\|x\|<\|x\| \\
& \left\|x-\sum_{n=1}^{\infty} \Psi_{n} B_{n} x\right\|=\left\|I_{\mathcal{X}} x-\theta_{\Psi} \theta_{B} x\right\| \leq\left\|I_{\mathcal{X}}-\theta_{\Psi} \theta_{B}\right\|\|x\|<\|x\|
\end{aligned}
$$

One of the most important properties associated with approximate duals is that they generate duals.
Proposition 4.3. Let $\left(\left\{A_{n}\right\}_{n},\left\{\Psi_{n}\right\}_{n}\right)$ and $\left(\left\{B_{n}\right\}_{n},\left\{\Phi_{n}\right\}_{n}\right)$ be approximately dual operator-valued pABSs in $\mathcal{B}(\mathcal{X}, \mathcal{Y})$. Then $\left(\left\{B_{n} S_{B, \Psi}^{-1}\right\}_{n},\left\{S_{A, \Phi}^{-1} \Phi_{n}\right\}_{n}\right)$ is a dual operator-valued p-ABS for $\left(\left\{A_{n}\right\}_{n},\left\{\Psi_{n}\right\}_{n}\right)$ and $\left(\left\{A_{n} S_{A, \Phi}^{-1}\right\}_{n},\left\{S_{B, \Psi}^{-1} \Psi_{n}\right\}_{n}\right)$ is a dual operator-valued $p-A B S$ for $\left(\left\{B_{n}\right\}_{n},\left\{\Phi_{n}\right\}_{n}\right)$.

Proof. Let $x \in \mathcal{X}$. Then

$$
\begin{array}{ll}
\sum_{n=1}^{\infty} \Psi_{n} B_{n} S_{B, \Psi}^{-1} x=S_{B, \Psi} S_{B, \Psi}^{-1} x=x, & \sum_{n=1}^{\infty} S_{A, \Phi}^{-1} \Phi_{n} A_{n} x=S_{A, \Phi}^{-1} S_{A, \Phi} x=x \\
\sum_{n=1}^{\infty} \Phi_{n} A_{n} S_{A, \Phi}^{-1} x=S_{A, \Phi} S_{A, \Phi}^{-1} x=x, & \sum_{n=1}^{\infty} S_{B, \Psi}^{-1} \Psi_{n} B_{n} x=S_{B, \Psi}^{-1} S_{B, \Psi} x=x
\end{array}
$$

Motivated from a characterization of duals, we try to get an operator-theoretic characterization of approximate duality.

Theorem 4.4. Let $\left(\left\{A_{n}\right\}_{n},\left\{\Psi_{n}\right\}_{n}\right)$ be an operator-valued $p-A B S$ in $\mathcal{B}(\mathcal{X}, \mathcal{Y})$. An operator-valued $p-A B S$ $\left(\left\{B_{n}\right\}_{n},\left\{\Phi_{n}\right\}_{n}\right)$ in $\mathcal{B}(\mathcal{X}, \mathcal{Y})$ is an approximately dual operator-valued $p$-ABS for $\left(\left\{A_{n}\right\}_{n},\left\{\Psi_{n}\right\}_{n}\right)$ if and only if there exist bounded linear operators $U, V: \mathcal{X} \rightarrow \mathcal{X}$ satisfying $\left\|I_{\mathcal{X}}-U\right\|<1$ and $\left\|I_{\mathcal{X}}-V\right\|<1$ such that $\left(\left\{C_{n}:=B_{n} U^{-1}\right\}_{n},\left\{\Xi_{n}:=V^{-1} \Phi_{n}\right\}_{n}\right)$ is a dual for $\left(\left\{A_{n}\right\}_{n},\left\{\Psi_{n}\right\}_{n}\right)$. Statement holds even if $p-A B S$ is replaced by $p-A S F$.

Proof. $(\Rightarrow)$ Define $U:=\theta_{\Psi} \theta_{B}$ and $V:=\theta_{\Phi} \theta_{A}$. We then have $\left\|I_{\mathcal{X}}-U\right\|<1$ and $\left\|I_{\mathcal{X}}-V\right\|<1$ which say that $U$ and $V$ are invertible, and hence

$$
\begin{aligned}
& \sum_{n=1}^{\infty} \Psi_{n} C_{n} x=\sum_{n=1}^{\infty} \Psi_{n} B_{n} U^{-1} x=\theta_{\Psi} \theta_{B} U^{-1} x=U U^{-1} x=x \\
& \sum_{n=1}^{\infty} \Xi_{n} A_{n} x=\sum_{n=1}^{\infty} V^{-1} \Phi_{n} A_{n} x=V^{-1} \theta_{\Phi} \theta_{A} x=V^{-1} V x=x, \quad \forall x \in \mathcal{X}
\end{aligned}
$$

Hence $\left(\left\{C_{n}\right\}_{n},\left\{\Xi_{n}\right\}_{n}\right)$ is a dual for $\left(\left\{A_{n}\right\}_{n},\left\{\Psi_{n}\right\}_{n}\right)$.
$(\Leftarrow)$ We see that $\theta_{C}=\theta_{B} U^{-1}$ and $\theta_{\Xi}=V^{-1} \theta_{\Phi}$. Since $\left(\left\{C_{n}\right\}_{n},\left\{\Xi_{n}\right\}_{n}\right)$ is a dual for $\left(\left\{A_{n}\right\}_{n},\left\{\Psi_{n}\right\}_{n}\right)$, we get that

$$
\begin{aligned}
\left\|I_{\mathcal{X}}-\theta_{\Phi} \theta_{A}\right\| & =\left\|I_{\mathcal{X}}-V \theta_{\Xi} \theta_{A}\right\|=\left\|I_{\mathcal{X}}-V\right\|<1 \\
\left\|I_{\mathcal{X}}-\theta_{\Psi} \theta_{B}\right\| & =\left\|I_{\mathcal{X}}-\theta_{\Psi} \theta_{C} U\right\|=\left\|I_{\mathcal{X}}-U\right\|<1
\end{aligned}
$$

Hence $\left(\left\{B_{n}\right\}_{n},\left\{\Phi_{n}\right\}_{n}\right)$ is an approximately dual operator-valued p-ABS for $\left(\left\{A_{n}\right\}_{n},\left\{\Psi_{n}\right\}_{n}\right)$.
Theorem 4.4 combined with Theorem 3.6 gives the following result.
Theorem 4.5. Let $\left(\left\{A_{n}\right\}_{n},\left\{\Psi_{n}\right\}_{n}\right)$ be an operator-valued $p-A S F$ in $\mathcal{B}(\mathcal{X}, \mathcal{Y})$. An operator-valued $p-A S F$ $\left(\left\{B_{n}\right\}_{n},\left\{\Phi_{n}\right\}_{n}\right)$ in $\mathcal{B}(\mathcal{X}, \mathcal{Y})$ is an approximately dual operator-valued $p$-ASF for $\left(\left\{A_{n}\right\}_{n},\left\{\Psi_{n}\right\}_{n}\right)$ if and only if there exist bounded linear operators $U, V: \mathcal{X} \rightarrow \mathcal{X}, A: \mathcal{X} \rightarrow \ell^{p}(\mathbb{N}), B: \ell^{p}(\mathbb{N}) \rightarrow \mathcal{X}$ satisfying $\left\|I_{\mathcal{X}}-U\right\|<1,\left\|I_{\mathcal{X}}-V\right\|<1$,

$$
\begin{aligned}
& B_{n}=A_{n} S_{A, \Psi}^{-1} U+\Gamma_{n} A U-A_{n} S_{A, \Psi}^{-1} \theta_{\Psi} A U \\
& \Phi_{n}=V S_{A, \Psi}^{-1} \Psi_{n}+V B L_{n}-V B \theta_{A} S_{A, \Psi}^{-1} \Psi_{n}, \quad \forall n \in \mathbb{N}
\end{aligned}
$$

such that the operator

$$
S_{A, \Psi}^{-1}+B A-B \theta_{A} S_{A, \Psi}^{-1} \theta_{\Psi} A
$$

is bounded invertible, where $A: \mathcal{X} \rightarrow \ell^{p}(\mathbb{N}) \otimes \mathcal{Y}$ and $B: \ell^{p}(\mathbb{N}) \otimes \mathcal{Y} \rightarrow \mathcal{X}$ are bounded linear operators.
In [29, Christensen and Laugesen gave a method to construct approximately duals iteratively. In 61, this result was derived for Banach spaces. Here we have a similar result for operator-valued p-ABSs.

Theorem 4.6. Let $\left(\left\{A_{n}\right\}_{n},\left\{\Psi_{n}\right\}_{n}\right)$ be an operator-valued $p-A B S$ in $\mathcal{B}(\mathcal{X}, \mathcal{Y})$ and $\left(\left\{B_{n}\right\}_{n},\left\{\Phi_{n}\right\}_{n}\right)$ be an operator-valued $p-A B S$ in $\mathcal{B}(\mathcal{X}, \mathcal{Y})$ which is an approximately dual for $\left(\left\{A_{n}\right\}_{n},\left\{\Psi_{n}\right\}_{n}\right)$.
(i) The dual operator-valued $p-A B S\left(\left\{B_{n} S_{B, \Psi}^{-1}\right\}_{n},\left\{S_{A, \Phi}^{-1} \Phi_{n}\right\}_{n}\right)$ for $\left(\left\{A_{n}\right\}_{n},\left\{\Psi_{n}\right\}_{n}\right)$ can be written as

$$
\begin{aligned}
& B_{n} S_{B, \Psi}^{-1}=B_{n}+\sum_{m=1}^{\infty} B_{n}\left(I_{\mathcal{X}}-S_{B, \Psi}\right)^{m} \\
& S_{A, \Phi}^{-1} \Phi_{n}=\Phi_{n}+\sum_{m=1}^{\infty}\left(I_{\mathcal{X}}-S_{A, \Phi}\right)^{m} \Phi_{n}, \quad \forall n \in \mathbb{N}
\end{aligned}
$$

(ii) For $N \in \mathbb{N}$, define

$$
\begin{aligned}
C_{n}^{(N)} & :=B_{n}+\sum_{m=1}^{N} B_{n}\left(I_{\mathcal{X}}-S_{B, \Psi}\right)^{m} \\
\Xi_{n}^{(N)} & :=\Phi_{n}+\sum_{m=1}^{N}\left(I_{\mathcal{X}}-S_{A, \Phi}\right)^{m} \Phi_{n}, \quad \forall n \in \mathbb{N}
\end{aligned}
$$

Then $\left(\left\{C_{n}^{(N)}\right\}_{n},\left\{\Xi_{n}^{(N)}\right\}_{n}\right)$ is an operator-valued $p-A B S$ and is an approximately dual for $\left(\left\{A_{n}\right\}_{n}\right.$, $\left.\left\{\Psi_{n}\right\}_{n}\right)$, for each $N \in \mathbb{N}$. Moreover,

$$
\begin{aligned}
\left\|I_{\mathcal{X}}-\theta_{\Xi}^{(N)} \theta_{A}\right\| \leq\left\|I_{\mathcal{X}}-S_{A, \Phi}\right\|^{N+1} \rightarrow 0 & \text { as } N \rightarrow \infty \\
\left\|I_{\mathcal{X}}-\theta_{\Psi} \theta_{C}^{(N)}\right\| \leq\left\|I_{\mathcal{X}}-S_{B, \Psi}\right\|^{N+1} \rightarrow 0 & \text { as } N \rightarrow \infty
\end{aligned}
$$

Proof. (i) We get these from the Neumann series expansion

$$
S_{B, \Psi}^{-1}=\sum_{m=0}^{\infty}\left(I_{\mathcal{X}}-S_{B, \Psi}\right)^{m}, \quad S_{A, \Phi}^{-1}=\sum_{m=0}^{\infty}\left(I_{\mathcal{X}}-S_{A, \Phi}\right)^{m}
$$

(ii) Clearly $\left(\left\{C_{n}^{(N)}\right\}_{n},\left\{\Xi_{n}^{(N)}\right\}_{n}\right)$ is an operator-valued p-ABS. Now consider

$$
\begin{aligned}
\theta_{\Xi}^{(N)} \theta_{A} x & =\sum_{n=1}^{\infty} \Xi_{n}^{(N)} A_{n} x=\sum_{n=1}^{\infty} \sum_{m=0}^{N}\left(I_{\mathcal{X}}-S_{A, \Phi}\right)^{m} \Phi_{n} A_{n} x \\
& =\sum_{m=0}^{N} \sum_{n=1}^{\infty}\left(I_{\mathcal{X}}-S_{A, \Phi}\right)^{m} \Phi_{n} A_{n} x=\sum_{m=0}^{N}\left(I_{\mathcal{X}}-S_{A, \Phi}\right)^{m} \sum_{n=1}^{\infty} \Phi_{n} A_{n} x \\
& =\sum_{m=0}^{N}\left(I_{\mathcal{X}}-S_{A, \Phi}\right)^{m} S_{A, \Phi} x=\sum_{m=0}^{N}\left(I_{\mathcal{X}}-S_{A, \Phi}\right)^{m}\left(I_{\mathcal{X}}-\left(I_{\mathcal{X}}-S_{A, \Phi}\right)\right) x \\
& =x-\left(I_{\mathcal{X}}-S_{A, \Phi}\right)^{N+1} x, \quad \forall x \in \mathcal{X} \\
& \Longrightarrow\left\|I_{\mathcal{X}}-\theta_{\Xi}^{(N)} \theta_{A}\right\| \leq\left\|I_{\mathcal{X}}-S_{A, \Phi}\right\|^{N+1}
\end{aligned}
$$

and

$$
\begin{aligned}
\theta_{\Psi} \theta_{C}^{(N)} x & =\sum_{n=1}^{\infty} \Psi_{n} C_{n}^{(N)} x=\sum_{n=1}^{\infty} \sum_{m=0}^{N} \Psi_{n} B_{n}\left(I_{\mathcal{X}}-S_{B, \Psi}\right)^{m} x \\
& =\sum_{m=0}^{N} \sum_{n=1}^{\infty} \Psi_{n} B_{n}\left(I_{\mathcal{X}}-S_{B, \Psi}\right)^{m} x=\sum_{m=0}^{N} S_{B, \Psi}\left(I_{\mathcal{X}}-S_{B, \Psi}\right)^{m} x \\
& =\sum_{m=0}^{N}\left(I_{\mathcal{X}}-\left(I_{\mathcal{X}}-S_{B, \Psi}\right)\right)\left(I_{\mathcal{X}}-S_{B, \Psi}\right)^{m} x=x-\left(I_{\mathcal{X}}-S_{B, \Psi}\right)^{N+1} x, \quad \forall x \in \mathcal{X} \\
& \Longrightarrow\left\|I_{\mathcal{X}}-\theta_{\Psi} \theta_{C}^{(N)}\right\| \leq\left\|I_{\mathcal{X}}-S_{B, \Psi}\right\|^{N+1}
\end{aligned}
$$

Since $\left\|I_{\mathcal{X}}-S_{A, \Phi}\right\|<1$ and $\left\|I_{\mathcal{X}}-S_{B, \Psi}\right\|<1,\left(\left\{C_{n}^{(N)}\right\}_{n},\left\{\Xi_{n}^{(N)}\right\}_{n}\right)$ is an approximately dual for $\left(\left\{A_{n}\right\}_{n},\left\{\Psi_{n}\right\}_{n}\right)$.

In [29, it is also showed by Christensen and Laugesen that by perturbing frame we can get approximate duals. In 61, it is showed that this result is valid for Banach spaces. Here is the operator-valued version of that result.

Theorem 4.7. Let $\left\{A_{n}\right\}_{n}$ be a collection in $\mathcal{B}(\mathcal{X}, \mathcal{Y})$ and $\left\{\Psi_{n}\right\}_{n}$ be a collection in $\mathcal{B}(\mathcal{Y}, \mathcal{X})$. Let $\left(\left\{C_{n}\right\}_{n},\left\{\Xi_{n}\right\}_{n}\right)$ be an operator-valued $p-A S F$ in $\mathcal{B}(\mathcal{X}, \mathcal{Y})$ such that for some $R>0, Q>0$

$$
\begin{equation*}
\left\|\sum_{n=1}^{\infty} L_{n}\left(A_{n}-C_{n}\right) x\right\| \leq R\|x\|, \quad \forall x \in \mathcal{X} \tag{2}
\end{equation*}
$$

and

$$
\begin{equation*}
\left\|\sum_{n=1}^{\infty}\left(\Xi_{n}-\Psi_{n}\right) \Gamma_{n} z\right\| \leq Q\|z\|, \quad \forall z \in \ell^{p}(\mathbb{N}) \otimes \mathcal{Y} \tag{3}
\end{equation*}
$$

Let $\left(\left\{B_{n}\right\}_{n},\left\{\Phi_{n}\right\}_{n}\right)$ be a dual frame for $\left(\left\{C_{n}\right\}_{n},\left\{\Xi_{n}\right\}_{n}\right)$ with analysis bound $c$ and synthesis bound d. If $d R<1, c Q<1$, then $\left(\left\{B_{n}\right\}_{n},\left\{\Phi_{n}\right\}_{n}\right)$ is an approximately dual for $\left(\left\{A_{n}\right\}_{n},\left\{\Psi_{n}\right\}_{n}\right)$.

Proof. Inequalities (2) and (3) say that $\left(\left\{A_{n}\right\}_{n},\left\{\Psi_{n}\right\}_{n}\right)$ is an operator-valued p-ABS in $\mathcal{B}(\mathcal{X}, \mathcal{Y})$. Now Inequality (2) can be written as $\left\|\theta_{A} x-\theta_{C} x\right\| \leq R\|x\|, \forall x \in \mathcal{X}$. Similarly, Inequality (3) can be written

$$
\left\|I_{\mathcal{X}}-\theta_{\Phi} \theta_{A}\right\|=\left\|\theta_{\Phi} \theta_{C}-\theta_{\Phi} \theta_{A}\right\| \leq\left\|\theta_{\Phi}\right\|\left\|\theta_{C}-\theta_{A}\right\| \leq d R<1
$$

and

$$
\left\|I_{\mathcal{X}}-\theta_{\Psi} \theta_{B}\right\|=\left\|\theta_{\Xi} \theta_{B}-\theta_{\Psi} \theta_{B}\right\| \leq\left\|\theta_{\Xi}-\theta_{\Psi}\right\|\left\|\theta_{B}\right\| \leq c Q<1
$$

## 5. Equivalence

Given two frames for Hilbert space, one tries to get one from another. It is also clear that action of every element of frame by a fixed invertible bounded linear operator again gives a frame. This led Balan to introduce the notion of similarity or equivalence for frames for Hilbert spaces 6]. This notion has been generalized in 57] for operator-valued frames, in [66] for factorable weak-OVFs and in 64] for p-ASFs. Here we define the same notion for operator-valued p-ASFs.

Definition 5.1. An operator-valued $p-A S F\left(\left\{B_{n}\right\}_{n},\left\{\Phi_{n}\right\}_{n}\right)$ in $\mathcal{B}(\mathcal{X}, \mathcal{Y})$ is said to be similar or equivalent to an operator-valued $p-A S F\left(\left\{A_{n}\right\}_{n},\left\{\Psi_{n}\right\}_{n}\right)$ in $\mathcal{B}(\mathcal{X}, \mathcal{Y})$ if there exist invertible operators $R_{A, B}, L_{\Psi, \Phi}$ $\in \mathcal{B}(\mathcal{X})$ such that

$$
B_{n}=A_{n} R_{A, B}, \quad \Phi_{n}=L_{\Psi, \Phi} \Psi_{n}, \quad \forall n \in \mathbb{N}
$$

We first observe that for every operator-valued p-ASF $\left(\left\{A_{n}\right\}_{n},\left\{\Psi_{n}\right\}_{n}\right)$, each of operator-valued p-ASF $\left(\left\{A_{n} S_{A, \Psi}^{-1}\right\}_{n},\left\{\Psi_{n}\right\}_{n}\right)$ and $\left(\left\{A_{n}\right\}_{n},\left\{S_{A, \Psi}^{-1} \Psi_{n}\right\}_{n}\right)$ is a Parseval operator-valued p-ASF which is similar to $\left(\left\{A_{n}\right\}_{n},\left\{\Psi_{n}\right\}_{n}\right)$. Like in the case of Hilbert spaces, since $R_{A, B}, R_{\Psi, \Phi}$ are bounded invertible, the relation "similarity" is an equivalence relation on the set

$$
\left\{\left(\left\{A_{n}\right\}_{n},\left\{\Psi_{n}\right\}_{n}\right):\left(\left\{A_{n}\right\}_{n},\left\{\Psi_{n}\right\}_{n}\right) \text { is an operator-valued p-ASF in } \mathcal{B}(\mathcal{X}, \mathcal{Y})\right\}
$$

Next lemma shows that we can easily get analysis, synthesis and frame operators of similar frames from one another.

Lemma 5.2. Let $\left(\left\{A_{n}\right\}_{n},\left\{\Psi_{n}\right\}_{n}\right)$ and $\left(\left\{B_{n}\right\}_{n},\left\{\Phi_{n}\right\}_{n}\right)$ be similar operator-valued $p$-ASFs in $\mathcal{B}(\mathcal{X}, \mathcal{Y})$ and $B_{n}=A_{n} R_{A, B}, \Phi_{n}=L_{\Psi, \Phi} \Psi_{n}, \forall n \in \mathbb{N}$, for some invertible $R_{A, B}, L_{\Psi, \Phi} \in \mathcal{B}(\mathcal{X})$. Then
(i) $\theta_{B}=\theta_{A} R_{A, B}, \theta_{\Phi}=L_{\Psi, \Phi} \theta_{\Psi}$.
(ii) $S_{B, \Phi}=L_{\Psi, \Phi} S_{A, \Psi} R_{A, B}$.
(iii) $P_{B, \Phi}=P_{A, \Psi}$.

Proof. Let $x \in \mathcal{X}$ and $z \in \ell^{p}(\mathbb{N}) \otimes \mathcal{Y}$. Then $\theta_{B} x=\sum_{n=1}^{\infty} L_{n} B_{n} x=\sum_{n=1}^{\infty} L_{n} A_{n} R_{A, B} x=\theta_{A} R_{A, B} x$ and $\theta_{\Phi} z=\sum_{n=1}^{\infty} \Phi_{n} \Gamma_{n} z=\sum_{n=1}^{\infty} L_{\Psi, \Phi} \Psi_{n} \Gamma_{n} z=L_{\Psi, \Phi} \theta_{\Psi} z$. Therefore

$$
S_{B, \Phi}=\theta_{\Phi} \theta_{B}=L_{\Psi, \Phi} \theta_{\Psi} \theta_{A} R_{A, B}=L_{\Psi, \Phi} S_{A, \Psi} R_{A, B}
$$

and

$$
P_{B, \Phi}=\theta_{B} S_{B, \Phi}^{-1} \theta_{\Phi}=\left(\theta_{A} R_{A, B}\right)\left(L_{\Psi, \Phi} S_{A, \Psi} R_{A, B}\right)^{-1}\left(L_{\Psi, \Phi} \theta_{\Psi}\right)=P_{A, \Psi}
$$

In the next result we characterize similarity using operators which do not depend on natural numbers. Further, we give a formula for operators which give similarity.

Theorem 5.3. For two operator-valued p-ASFs $\left(\left\{A_{n}\right\}_{n},\left\{\Psi_{n}\right\}_{n}\right)$ and $\left(\left\{B_{n}\right\}_{n},\left\{\Phi_{n}\right\}_{n}\right)$ in $\mathcal{B}(\mathcal{X}, \mathcal{Y})$, the following are equivalent.
(i) $B_{n}=A_{n} R_{A, B}, \Phi_{n}=L_{\Psi, \Phi} \Psi_{n}, \forall n \in \mathbb{N}$, for some invertible $R_{A, B}, L_{\Psi, \Phi} \in \mathcal{B}(\mathcal{X})$.
(ii) $\theta_{B}=\theta_{A} R_{A, B}, \theta_{\Phi}=L_{\Psi, \Phi} \theta_{\Psi}$ for some invertible $R_{A, B}, L_{\Psi, \Phi} \in \mathcal{B}(\mathcal{X})$.
(iii) $P_{B, \Phi}=P_{A, \Psi}$.

If one of the above conditions is satisfied, then invertible operators in (i) and (ii) are unique and are given by $R_{A, B}=S_{A, \Psi}^{-1} \theta_{\Psi} \theta_{B}, L_{\Psi, \Phi}=\theta_{\Phi} \theta_{A} S_{A, \Psi}^{-1}$. In the case that $\left(\left\{A_{n}\right\}_{n},\left\{\Psi_{n}\right\}_{n}\right)$ is Parseval, then ( $\left\{B_{n}\right\}_{n},\left\{\Phi_{n}\right\}_{n}$ ) is Parseval if and only if $R_{\Psi, \Phi} L_{A, B}=I_{\mathcal{X}}$ if and only if $L_{A, B} R_{\Psi, \Phi}=I_{\mathcal{X}}$.
Proof. Lemma 5.2 gives (i) $\Rightarrow$ (ii) $\Rightarrow$ (iii). We show (ii) $\Rightarrow$ (i). Assume (ii). We try to recover $B_{n}$ and $\Phi_{n}$. Using Equation (1),

$$
\begin{aligned}
& B_{n} x=\Gamma_{n} \theta_{B} x=\Gamma_{n} \theta_{A} R_{A, B} x=A_{n} R_{A, B} x, \quad \forall x \in \mathcal{X}, \forall n \in \mathbb{N} \\
& \Phi_{n} z=\theta_{\Phi} L_{n} z=L_{\Psi, \Phi} \theta_{\Psi} L_{n} z=L_{\Psi, \Phi} \Psi_{n}, \quad \forall n \in \mathbb{N}, \forall z \in \ell^{p}(\mathbb{N}) \otimes \mathcal{Y}
\end{aligned}
$$

We show (iii) $\Rightarrow$ (ii). Assume (iii). A calculation says that $\theta_{B}=P_{B, \Phi} \theta_{B}$ and $\theta_{\Phi}=\theta_{\Phi} P_{B, \Phi}$. This observation says that

$$
\begin{aligned}
& \theta_{B}=P_{B, \Phi} \theta_{B}=P_{A, \Psi} \theta_{B}=\theta_{A}\left(S_{A, \Psi}^{-1} \theta_{\Psi} \theta_{B}\right) \\
& \theta_{\Phi}=\theta_{\Phi} P_{B, \Phi}=\theta_{\Phi} P_{A, \Psi}=\left(\theta_{\Phi} \theta_{A} S_{A, \Psi}^{-1}\right) \theta_{\Psi}
\end{aligned}
$$

To obtain (ii) it suffices to show that both $S_{A, \Psi}^{-1} \theta_{\Psi} \theta_{B}$ and $\theta_{\Phi} \theta_{A} S_{A, \Psi}^{-1}$ are invertible. For,

$$
\begin{aligned}
& \left(S_{A, \Psi}^{-1} \theta_{\Psi} \theta_{B}\right)\left(S_{B, \Phi}^{-1} \theta_{\Phi} \theta_{A}\right)=S_{A, \Psi}^{-1} \theta_{\Psi} P_{B, \Phi} \theta_{A}=S_{A, \Psi}^{-1} \theta_{\Psi} P_{A, \Psi} \theta_{A}=S_{A, \Psi}^{-1} \theta_{\Psi} \theta_{A}=I_{\mathcal{X}} \\
& \left(S_{B, \Phi}^{-1} \theta_{\Phi} \theta_{A}\right)\left(S_{A, \Psi}^{-1} \theta_{\Psi} \theta_{B}\right)=S_{B, \Phi}^{-1} \theta_{\Phi} P_{A, \Psi} \theta_{B}=S_{B, \Phi}^{-1} \theta_{\Phi} P_{B, \Phi} \theta_{B}=S_{B, \Phi}^{-1} \theta_{\Phi} \theta_{B}=I_{\mathcal{X}}
\end{aligned}
$$

and

$$
\begin{aligned}
& \left(\theta_{\Phi} \theta_{A} S_{A, \Psi}^{-1}\right)\left(\theta_{\Psi} \theta_{B} S_{B, \Phi}^{-1}\right)=\theta_{\Phi} P_{A, \Psi} \theta_{B} S_{B, \Phi}^{-1}=\theta_{\Phi} P_{B, \Phi} \theta_{B} S_{B, \Phi}^{-1}=\theta_{\Phi} \theta_{B} S_{B, \Phi}^{-1}=I_{\mathcal{X}} \\
& \left(\theta_{\Psi} \theta_{B} S_{B, \Phi}^{-1}\right)\left(\theta_{\Phi} \theta_{A} S_{A, \Psi}^{-1}\right)=\theta_{\Psi} P_{B, \Phi} \theta_{A} S_{A, \Psi}^{-1}=\theta_{\Psi} P_{A, \Psi} \theta_{A} S_{A, \Psi}^{-1}=\theta_{\Psi} \theta_{A} S_{A, \Psi}^{-1}=I_{\mathcal{X}}
\end{aligned}
$$

Let $R_{A, B}, L_{\Psi, \Phi} \in \mathcal{B}(\mathcal{X})$ be invertible. We saw that $R_{A, B}$ and $L_{\Psi, \Phi}$ satisfy (i) if and only if they satisfy (ii). Let $B_{n}=A_{n} R_{A, B}, \Phi_{n}=L_{\Psi, \Phi} \Psi_{n}, \forall n \in \mathbb{N}$. Using (ii) $\theta_{B}=\theta_{A} R_{A, B}, \theta_{\Phi}=L_{\Psi, \Phi} \theta_{\Psi}$. Therefore $\theta_{\Psi} \theta_{B}=$ $\theta_{\Psi} \theta_{A} R_{A, B}=S_{A, \Psi} R_{A, B}$ and $\theta_{\Phi} \theta_{A}=L_{\Psi, \Phi} \theta_{\Psi} \theta_{A}=L_{\Psi, \Phi} S_{A, \Psi}$ which give the required formulas.

Corollary 5.4. For any given operator-valued p-ASF $\left(\left\{A_{n}\right\}_{n},\left\{\Psi_{n}\right\}_{n}\right)$, the canonical dual of $\left(\left\{A_{n}\right\}_{n}\right.$, $\left.\left\{\Psi_{n}\right\}_{n}\right)$ is the only dual operator-valued $p-A S F$ that is similar to $\left(\left\{A_{n}\right\}_{n},\left\{\Psi_{n}\right\}_{n}\right)$.
Proof. Let $\left(\left\{B_{n}\right\}_{n},\left\{\Phi_{n}\right\}_{n}\right)$ be an operator-valued p-ASF which is both dual and similar to $\left(\left\{A_{n}\right\}_{n},\left\{\Psi_{n}\right\}_{n}\right)$. Then we have $\theta_{\Psi} \theta_{B}=I_{\mathcal{X}}=\theta_{\Phi} \theta_{A}$ and there exist invertible $R_{A, B}, L_{\Psi, \Phi} \in \mathcal{B}(\mathcal{X})$ such that $B_{n}=$ $A_{n} R_{A, B}, \Phi_{n}=L_{\Psi, \Phi} \Psi_{n}, \forall n \in \mathbb{N}$. Theorem 5.3 gives $R_{A, B}=S_{A, \Psi}^{-1} \theta_{\Psi} \theta_{B}, L_{\Psi, \Phi}=\theta_{\Phi} \theta_{A} S_{A, \Psi}^{-1}$. But then $R_{A, B}=S_{A, \Psi}^{-1} I_{\mathcal{X}}=S_{A, \Psi}^{-1}, L_{\Psi, \Phi}=I_{\mathcal{X}} S_{A, \Psi}^{-1}=S_{A, \Psi}^{-1}$. Therefore $\left(\left\{B_{n}\right\}_{n},\left\{\Phi_{n}\right\}_{n}\right)$ is the canonical dual for $\left(\left\{A_{n}\right\}_{n},\left\{\Psi_{n}\right\}_{n}\right)$.
Corollary 5.5. Two similar operator-valued $p$-ASFs cannot be orthogonal.
Proof. Let an operator-valued p-ASF $\left(\left\{B_{n}\right\}_{n},\left\{\Phi_{n}\right\}_{n}\right)$ be similar to $\left(\left\{A_{n}\right\}_{n},\left\{\Psi_{n}\right\}_{n}\right)$. Then there are invertible $R_{A, B}, L_{\Psi, \Phi} \in \mathcal{B}(\mathcal{X})$ such that $B_{n}=A_{n} R_{A, B}, \Phi_{n}=L_{\Psi, \Phi} \Psi_{n}, \forall n \in \mathbb{N}$. Using Theorem 5.3 and
the invertibility of $R_{A, B}$ and $S_{A, \Psi}$, we have

$$
\theta_{\Psi} \theta_{B}=\theta_{\Psi} \theta_{A} R_{A, B}=S_{A, \Psi} R_{A, B} \neq 0
$$

## 6. Perturbations

Most useful Paley-Wiener theorem [5] in Hilbert spaces says that sequences which are close to orthonormal bases are Riesz bases and in Banach spaces it states that sequences which are close to Schauder bases are again Schauder bases. This motivated the perturbation of frames for Hilbert spaces. First result about stability of frames for Hilbert spaces was derived by Christensen in [25] and improved in papers [22, 26]. For Banach frames, framings and Schauder frames, stability results are derived in [23, 28, 77, 86, We obtained stability of p-ASFs in [63]. Here we derive stability results of operator-valued p-ASFs. First we recall a result which is an improvement of result of Hilding [55].

Theorem 6.1. [16, 22, 83] Let $\mathcal{X}, \mathcal{Y}$ be Banach spaces, $U: \mathcal{X} \rightarrow \mathcal{Y}$ be a bounded invertible operator. If a bounded linear operator $V: \mathcal{X} \rightarrow \mathcal{Y}$ is such that there exist $\alpha, \beta \in[0,1)$ with

$$
\|U x-V x\| \leq \alpha\|U x\|+\beta\|V x\|, \quad \forall x \in \mathcal{X}
$$

then $V$ is bounded invertible and

$$
\begin{aligned}
& \frac{1-\alpha}{1+\beta}\|U x\| \leq\|V x\| \leq \frac{1+\alpha}{1-\beta}\|U x\|, \quad \forall x \in \mathcal{X} ; \\
& \frac{1-\beta}{1+\alpha} \frac{1}{\|U\|}\|y\| \leq\left\|V^{-1} y\right\| \leq \frac{1+\beta}{1-\alpha}\left\|U^{-1}\right\|\|y\|, \quad \forall y \in \mathcal{Y} .
\end{aligned}
$$

Theorem 6.2. Let $\left(\left\{A_{n}\right\}_{n},\left\{\Psi_{n}\right\}_{n}\right)$ be an operator-valued $p-A S F$ in $\mathcal{B}(\mathcal{X}, \mathcal{Y})$. Assume that a collection $\left\{\Psi_{n}\right\}_{n}$ in $\mathcal{B}(\mathcal{Y}, \mathcal{X})$ is such that there exist $\alpha, \beta, \gamma \geq 0$ with $\max \left\{\alpha+\frac{\gamma}{\sqrt{a}}, \beta\right\}<1$ and

$$
\begin{equation*}
\left\|\sum_{n=1}^{m}\left(\Psi_{n}-\Phi_{n}\right) \Gamma_{n} z\right\| \leq \alpha\left\|\sum_{n=1}^{m} \Psi_{n} \Gamma_{n} z\right\|+\gamma\|z\|+\beta\left\|\sum_{n=1}^{m} \Phi_{n} \Gamma_{n} z\right\|, \quad \forall z \in \ell^{p}(\mathbb{N}) \otimes \mathcal{Y}, m=1, \ldots \tag{4}
\end{equation*}
$$

Then $\left(\left\{A_{n}\right\}_{n},\left\{\Phi_{n}\right\}_{n}\right)$ is an operator-valued $p-A S F$ in $\mathcal{B}(\mathcal{X}, \mathcal{Y})$ with frame bounds

$$
\frac{\left\|S_{A, \Psi}^{-1}\right\|(1+\beta)}{1-\left(\alpha+\gamma\left\|\theta_{A} S_{A, \Psi}^{-1}\right\|\right)} \quad \text { and } \quad \frac{\left\|\theta_{A}\right\|\left((1+\alpha)\left\|\theta_{\Psi}\right\|+\gamma\right)}{1-\beta}
$$

Proof. For $m=1, \ldots$,

$$
\begin{aligned}
\left\|\sum_{n=1}^{m} \Phi_{n} \Gamma_{n} z\right\| & \leq\left\|\sum_{n=1}^{m}\left(\Phi_{n}-\Psi_{n}\right) \Gamma_{n} z\right\|+\left\|\sum_{n=1}^{m} \Psi_{n} \Gamma_{n} z\right\| \\
& \leq(1+\alpha)\left\|\sum_{n=1}^{m} \Psi_{n} \Gamma_{n} z\right\|+\beta\left\|\sum_{n=1}^{m} \Phi_{n} \Gamma_{n} z\right\|+\gamma\|z\|, \quad \forall z \in \ell^{p}(\mathbb{N}) \otimes \mathcal{Y}
\end{aligned}
$$

Hence

$$
\left\|\sum_{n=1}^{m} \Phi_{n} \Gamma_{n} z\right\| \leq \frac{1+\alpha}{1-\beta}\left\|\sum_{n=1}^{m} \Psi_{n} \Gamma_{n} z\right\|+\frac{\gamma}{1-\beta}\|z\|, \quad \forall z \in \ell^{p}(\mathbb{N}) \otimes \mathcal{Y}, m=1, \ldots
$$

Therefore $\theta_{\Phi}$ is a well-defined bounded linear operator with norm estimate

$$
\left\|\theta_{\Phi}\right\| \leq \frac{1+\alpha}{1-\beta}\left\|\theta_{\Psi}\right\|+\frac{\gamma}{1-\beta}
$$

Now Equation (4) gives

$$
\left\|\sum_{n=1}^{\infty}\left(\Psi_{n}-\Phi_{n}\right) \Gamma_{n} z\right\| \leq \alpha\left\|\sum_{n=1}^{\infty} \Psi_{n} \Gamma_{n} z\right\|+\gamma\|z\|+\beta\left\|\sum_{n=1}^{\infty} \Phi_{n} \Gamma_{n} z\right\|, \quad \forall z \in \ell^{p}(\mathbb{N}) \otimes \mathcal{Y}
$$

This is same as

$$
\begin{equation*}
\left\|\theta_{\Psi} z-\theta_{\Phi} z\right\| \leq \alpha\left\|\theta_{\Psi} z\right\|+\gamma\|z\|+\beta\left\|\theta_{\Phi} z\right\|, \quad \forall z \in \ell^{p}(\mathbb{N}) \otimes \mathcal{Y} \tag{5}
\end{equation*}
$$

For every $x \in \mathcal{X}$, by taking $z=\theta_{A} S_{A, \Psi}^{-1} x$ in Equation (5), we get

$$
\left\|\theta_{\Psi} \theta_{A} S_{A, \Psi}^{-1} x-\theta_{\Phi} \theta_{A} S_{A, \Psi}^{-1} x\right\| \leq \alpha\left\|\theta_{\Psi} \theta_{A} S_{A, \Psi}^{-1} x\right\|+\gamma\left\|\theta_{A} S_{A, \Psi}^{-1} x\right\|+\beta\left\|\theta_{\Phi} \theta_{A} S_{A, \Psi}^{-1} x\right\|, \quad \forall x \in \mathcal{X}
$$

That is,

$$
\begin{aligned}
\left\|x-\theta_{\Phi} \theta_{A} S_{A, \Psi}^{-1} x\right\| & \leq \alpha\|x\|+\gamma\left\|\theta_{A} S_{A, \Psi}^{-1} x\right\|+\beta\left\|\theta_{\Phi} \theta_{A} S_{A, \Psi}^{-1} x\right\| \\
& \leq\left(\alpha+\gamma\left\|\theta_{A} S_{A, \Psi}^{-1}\right\|\right)\|x\|+\beta\left\|\theta_{\Phi} \theta_{A} S_{A, \Psi}^{-1} x\right\|, \quad \forall x \in \mathcal{X}
\end{aligned}
$$

Since $\max \left\{\alpha+\gamma\left\|\theta_{A} S_{A, \Psi}^{-1}\right\|, \beta\right\}<1$, Theorem 6.1 says that operator $S_{A, \Phi} S_{A, \Psi}^{-1}$ is invertible and

$$
\left\|\left(S_{A, \Phi} S_{A, \Psi}^{-1}\right)^{-1}\right\| \leq \frac{1+\beta}{1-\left(\alpha+\gamma\left\|\theta_{A} S_{A, \Psi}^{-1}\right\|\right)}
$$

Hence the operator $S_{A, \Phi}=\left(S_{A, \Phi} S_{A, \Psi}^{-1}\right) S_{A, \Psi}$ is invertible. Therefore $\left(\left\{A_{n}\right\}_{n},\left\{\Phi_{n}\right\}_{n}\right)$ is an operator-valued p-ASF in $\mathcal{B}(\mathcal{X}, \mathcal{Y})$. To get frame bounds we calculate:

$$
\begin{aligned}
& \left\|S_{A, \Phi}^{-1}\right\| \leq\left\|S_{A, \Psi}^{-1}\right\|\left\|S_{A, \Psi} S_{A, \Phi}^{-1}\right\| \leq \frac{\left\|S_{A, \Psi}^{-1}\right\|(1+\beta)}{1-\left(\alpha+\gamma\left\|\theta_{A} S_{A, \Psi}^{-1}\right\|\right)} \quad \text { and } \\
& \left\|S_{A, \Phi}\right\| \leq\left\|\theta_{\Phi}\right\|\left\|\theta_{A}\right\| \leq \frac{\left\|\theta_{A}\right\|\left((1+\alpha)\left\|\theta_{\Psi}\right\|+\gamma\right)}{1-\beta}
\end{aligned}
$$

Theorem 6.3. Let $\left(\left\{A_{n}\right\}_{n},\left\{\Psi_{n}\right\}_{n}\right)$ be an operator-valued $p-A S F$ in $\mathcal{B}(\mathcal{X}, \mathcal{Y})$. Assume that a collection $\left\{B_{n}\right\}_{n}$ in $\mathcal{B}(\mathcal{X}, \mathcal{Y})$ and a collection $\left\{\Phi_{n}\right\}_{n}$ in $\mathcal{B}(\mathcal{Y}, \mathcal{X})$ are such that there exist $r, s, t, \alpha, \beta, \gamma \geq 0$ with $\max \{\beta, s\}<1$ and

$$
\begin{aligned}
& \left\|\sum_{n=1}^{m} L_{n}\left(A_{n}-B_{n}\right) x\right\| \leq r\left\|\sum_{n=1}^{m} L_{n} A_{n} x\right\|+t\|x\|+s\left\|\sum_{n=1}^{m} L_{n} B_{n} x\right\|, \quad \forall x \in \mathcal{X}, m=1, \ldots, \\
& \left\|\sum_{n=1}^{m}\left(\Psi_{n}-\Phi_{n}\right) \Gamma_{n} z\right\| \leq \alpha\left\|\sum_{n=1}^{m} \Psi_{n} \Gamma_{n} z\right\|+\gamma\|z\|+\beta\left\|\sum_{n=1}^{m} \Phi_{n} \Gamma_{n} z\right\|, \quad \forall z \in \ell^{p}(\mathbb{N}) \otimes \mathcal{Y}, m=1, \ldots
\end{aligned}
$$

Assume that one of the following holds.
(1) $\sum_{n=1}^{\infty}\left\|\left(\Psi_{n} A_{n}-\Phi_{n} B_{n}\right) S_{A, \Psi}^{-1}\right\|<1$.
(2) $\sum_{n=1}^{\infty}\left\|S_{A, \Psi}^{-1}\left(\Psi_{n} A_{n}-\Phi_{n} B_{n}\right)\right\|<1$.
(3) $\sum_{n=1}^{\infty}\left\|S_{A, \Psi}^{-1} \Psi_{n} A_{n}-\Phi_{n} B_{n} S_{A, \Psi}^{-1}\right\|<1$.
(4) $\sum_{n=1}^{\infty}\left\|\Psi_{n} A_{n} S_{A, \Psi}^{-1}-S_{A, \Psi}^{-1} \Phi_{n} B_{n}\right\|<1$.

Then $\left(\left\{B_{n}\right\}_{n},\left\{\Phi_{n}\right\}_{n}\right)$ is an operator-valued $p-A S F$ in $\mathcal{B}(\mathcal{X}, \mathcal{Y})$. Moreover, an upper frame bound is

$$
\left(\frac{1+\alpha}{1-\beta}\left\|\theta_{\Psi}\right\|+\frac{\gamma}{1-\beta}\right)\left(\frac{1+r}{1-s}\left\|\theta_{A}\right\|+\frac{t}{1-s}\right)
$$

Proof. Similar to the arguments given in the beginning of proof of Theorem 6.2, we see that $\theta_{B}$ and $\theta_{\Phi}$ are well-defined bounded linear operators. We deal with four cases.

Assume (1). Then

$$
\begin{aligned}
\left\|x-\sum_{n=1}^{\infty} \Phi_{n} B_{n} S_{A, \Psi}^{-1} x\right\| & =\left\|\sum_{n=1}^{\infty} \Psi_{n} A_{n} S_{A, \Psi}^{-1} x-\sum_{n=1}^{\infty} \Phi_{n} B_{n} S_{A, \Psi}^{-1} x\right\| \\
& =\left\|\sum_{n=1}^{\infty}\left(\Psi_{n} A_{n} S_{A, \Psi}^{-1}-\Phi_{n} B_{n} S_{A, \Psi}^{-1}\right) x\right\| \\
& \leq \sum_{n=1}^{\infty}\left\|\left(\Psi_{n} A_{n}-\Phi_{n} B_{n}\right) S_{A, \Psi}^{-1}\right\|\|x\|, \quad \forall x \in \mathcal{X} .
\end{aligned}
$$

Therefore the operator $S_{B, \Phi} S_{A, \Psi}^{-1}$ is invertible.
Assume (2). Then

$$
\begin{aligned}
\left\|x-\sum_{n=1}^{\infty} S_{A, \Psi}^{-1} \Phi_{n} B_{n} x\right\| & =\left\|\sum_{n=1}^{\infty} S_{A, \Psi}^{-1} \Psi_{n} A_{n} x-\sum_{n=1}^{\infty} S_{A, \Psi}^{-1} \Phi_{n} B_{n} x\right\| \\
& =\left\|\sum_{n=1}^{\infty}\left(S_{A, \Psi}^{-1} \Psi_{n} A_{n}-S_{A, \Psi}^{-1} \Phi_{n} B_{n}\right) x\right\| \\
& \leq \sum_{n=1}^{\infty}\left\|S_{A, \Psi}^{-1}\left(\Psi_{n} A_{n}-\Phi_{n} B_{n}\right)\right\|\|x\|, \quad \forall x \in \mathcal{X} .
\end{aligned}
$$

Therefore the operator $S_{A, \Psi}^{-1} S_{B, \Phi}$ is invertible.
Assume (3). Then

$$
\begin{aligned}
\left\|x-\sum_{n=1}^{\infty} \Phi_{n} B_{n} S_{A, \Psi}^{-1} x\right\| & =\left\|\sum_{n=1}^{\infty} S_{A, \Psi}^{-1} \Psi_{n} A_{n} x-\sum_{n=1}^{\infty} \Phi_{n} B_{n} S_{A, \Psi}^{-1} x\right\| \\
& =\left\|\sum_{n=1}^{\infty}\left(S_{A, \Psi}^{-1} \Psi_{n} A_{n}-\Phi_{n} B_{n} S_{A, \Psi}^{-1}\right) x\right\| \\
& \leq \sum_{n=1}^{\infty}\left\|S_{A, \Psi}^{-1} \Psi_{n} A_{n}-\Phi_{n} B_{n} S_{A, \Psi}^{-1}\right\|\|x\|, \quad \forall x \in \mathcal{X} .
\end{aligned}
$$

Therefore the operator $S_{B, \Phi} S_{A, \Psi}^{-1}$ is invertible.
Assume (4). Then

$$
\begin{aligned}
\left\|x-\sum_{n=1}^{\infty} S_{A, \Psi}^{-1} \Phi_{n} B_{n} x\right\| & =\left\|\sum_{n=1}^{\infty} \Psi_{n} A_{n} S_{A, \Psi}^{-1} x-\sum_{n=1}^{\infty} S_{A, \Psi}^{-1} \Phi_{n} B_{n} x\right\| \\
& =\left\|\sum_{n=1}^{\infty}\left(\Psi_{n} A_{n} S_{A, \Psi}^{-1}-S_{A, \Psi}^{-1} \Phi_{n} B_{n}\right) x\right\| \\
& \leq \sum_{n=1}^{\infty}\left\|\Psi_{n} A_{n} S_{A, \Psi}^{-1}-S_{A, \Psi}^{-1} \Phi_{n} B_{n}\right\|\|x\|, \quad \forall x \in \mathcal{X} .
\end{aligned}
$$

Therefore the operator $S_{A, \Psi}^{-1} S_{B, \Phi}$ is invertible.

## 7. Operator-valued Feichtinger conjectures

Recently first author formulated a variety of conjectures and problems for p-approximate Schauder frames for Banach spaces [59,60. Here we present operator-valued versions of some of them.

Conjecture 7.1. (Feichtinger conjecture for operator-valued p-ASFs) Let $\left(\left\{A_{n}\right\}_{n},\left\{\Psi_{n}\right\}_{n}\right)$ be an operator-valued $p-\boldsymbol{A S F}$ in $\mathcal{B}(\mathcal{X}, \mathcal{Y})$ such that

$$
0<\inf _{n \in \mathbb{N}}\left\|\Psi_{n}\right\| \leq \sup _{n \in \mathbb{N}}\left\|\Psi_{n}\right\|<\infty \quad \text { and } \quad 0<\inf _{n \in \mathbb{N}}\left\|A_{n}\right\| \leq \sup _{n \in \mathbb{N}}\left\|A_{n}\right\|<\infty
$$

Then $\left(\left\{A_{n}\right\}_{n},\left\{\Psi_{n}\right\}_{n}\right)$ can be partitioned into a finite union of operator-valued p-approximate Riesz sequences. Moreover, what is the number of partitions required?

Conjecture 7.2. (Feichtinger conjecture for operator-valued p-ABSs) Let $\left(\left\{A_{n}\right\}_{n},\left\{\Psi_{n}\right\}_{n}\right)$ be an operator-valued $\boldsymbol{p}-\boldsymbol{A B S}$ in $\mathcal{B}(\mathcal{X}, \mathcal{Y})$ such that

$$
0<\inf _{n \in \mathbb{N}}\left\|\Psi_{n}\right\| \leq \sup _{n \in \mathbb{N}}\left\|\Psi_{n}\right\|<\infty \quad \text { and } \quad 0<\inf _{n \in \mathbb{N}}\left\|A_{n}\right\| \leq \sup _{n \in \mathbb{N}}\left\|A_{n}\right\|<\infty
$$

Then $\left(\left\{A_{n}\right\}_{n},\left\{\Psi_{n}\right\}_{n}\right)$ can be partitioned into a finite union of operator-valued p-approximate Riesz sequences. Moreover, what is the number of partitions required?

Definition 7.3. A operator-valued $p-A S F\left(\left\{A_{n}\right\}_{n},\left\{\Psi_{n}\right\}_{n}\right)$ in $\mathcal{B}(\mathcal{X}, \mathcal{Y})$ is said to be p-scalable if there exist sequences of operators $\left\{T_{n}\right\}_{n}$ and $\left\{S_{n}\right\}_{n}$ in $\mathcal{B}(\mathcal{X})$ such that

$$
\left(\left\{T_{n} C_{n}\right\}_{n},\left\{S_{n} \Psi_{n}\right\}_{n}\right) \text { is a Parseval operator-valued } p \text { - } A S F \text { in } \mathcal{B}(\mathcal{X}, \mathcal{Y})
$$

Problem 7.4. (Scaling problem for Banach spaces) For given Banach spaces $\mathcal{X}$, $\mathcal{Y}$, classify operator-valued p-ASFs $\left(\left\{A_{n}\right\}_{n},\left\{\Psi_{n}\right\}_{n}\right)$ in $\mathcal{B}(\mathcal{X}, \mathcal{Y})$ so that there are sequences of operators $\left\{T_{n}\right\}_{n},\left\{S_{n}\right\}_{n}$ in $\mathcal{B}(\mathcal{X})$ such that $\left(\left\{A_{n} T_{n}\right\}_{n},\left\{S_{n} \Psi_{n}\right\}_{n}\right)$ is a Parseval operator-valued $\boldsymbol{p}$ - $\boldsymbol{A S F}$ in $\mathcal{B}(\mathcal{X}, \mathcal{Y})$, i.e., $\left(\left\{A_{n}\right\}_{n},\left\{\Psi_{n}\right\}_{n}\right)$ is $p$-scalable.

Note that, due to Theorem 3.1 in [78] (and due to the fundamental works of Marcus, Spielman, Srivastava, Casazza, Edidin, Weaver, Fickus, Tremain, Vershynin, Anderson, and Weber $[3,13,14,21,74,84]$ ), operator-valued Feichtinger conjectures for operator-valued frames/G-frames are true for Hilbert spaces.

## 8. Acknowledgements

First author thanks Prof. B. V. Rajarama Bhat for the Post Doc position through his J. C. Bose Fellowship (SERB).
