# North-South type dynamics of relative atoroidal automorphisms of free groups on a relative space of currents 

Yassine Guerch

March 9, 2022

#### Abstract

This paper, which is the second of a series of three papers, studies dynamical properties of elements of $\operatorname{Out}\left(F_{\mathrm{n}}\right)$, the outer automorphism group of a nonabelian free group $F_{\mathrm{n}}$. We prove that, for every exponentially growing outer automorphism of $F_{\mathrm{n}}$, there exists a preferred compact topological space, the space of currents relative to a malnomal subgroup system, on which $\phi$ acts by homeomorphism with a North-South dynamics behavior.

## 1 Introduction

Let $\mathrm{n} \geqslant 2$. This paper is the second of a sequence of three papers where we study the growth of the conjugacy classes of elements of $F_{\mathrm{n}}$ under iterations of elements of $\operatorname{Out}\left(F_{\mathrm{n}}\right)$, the outer automorphism group of a nonabelian free group of rank n . An outer automorphism $\phi \in \operatorname{Out}\left(F_{\mathrm{n}}\right)$ is exponentially growing if there exist $g \in F_{\mathrm{n}}$, a representative $\Phi$ of $\phi$, a free basis $\mathfrak{B}$ of $F_{\mathrm{n}}$ and a constant $K>0$ such that, for every $m \in \mathbb{N}^{*}$, we have

$$
\ell_{\mathfrak{B}}\left(\Phi^{m}(g)\right) \geqslant e^{K m},
$$

where $\ell_{\mathfrak{B}}\left(\Phi^{m}(g)\right)$ denotes the length of $\Phi^{m}(g)$ in the basis $\mathfrak{B}$. Such an element $g$ is said to be exponentially growing under iteration of $\phi$ and the set of elements of $F_{\mathrm{n}}$ which have exponential growth under iteration of $\phi$ is the pure exponential part of $\phi$. It is known, using for instance the train track technology of Bestvina and Handel (see [BH]), that every element $g$ of $F_{\mathrm{n}}$ which is not exponentially growing under iteration of $\phi$ is polynomially growing under iteration of $\phi$, that is, there exist $\Phi \in \phi$ and an integer $K \in \mathbb{N}$ such that, for every $m \in \mathbb{N}^{*}$, we have $\ell_{\mathfrak{B}}\left(\Phi^{m}(g)\right) \leqslant(m+1)^{K}$.

Initiated by Švarc, Milnor and Wolf, and particularly developped by Guivarc'h, Gromov and Grigorchuk, growth problems in groups is a major field of study in geometric and dynamical group theory, see for instance [LS, Man, Hel. Many works study the subfield of the element growths under iteration of group automorphisms (see for

[^0]instance (BFH1, Lev, CU]), for instance in the context of hyperbolic groups. See in particular Cou for examples of intermediate growth rates. As another example, Dahmani and Krishna [DS] found a sufficient condition for the suspension of an automorphism of a hyperbolic group to be relatively hyperbolic, and this condition is linked with the structure of the set of all elements of the hyperbolic group which have polynomial growth under iterations of the considered automorphism. Such exponentially growing outer automorphisms of $F_{\mathrm{n}}$ were already studied in distinct contexts. For instance, Bestvina, Feighn and Handel [BFH1] used them to prove the Tits alternative for $\operatorname{Out}\left(F_{\mathrm{n}}\right)$.

If $\phi \in \operatorname{Out}\left(F_{\mathrm{n}}\right)$, we denote by $\operatorname{Poly}(\phi)$ the set of elements $g$ of $F_{\mathrm{n}}$ such that $g$ is polynomially growing under iteration of $\phi$. Let $\operatorname{Poly}(H)=\bigcap_{\phi \in H} \operatorname{Poly}(\phi)$. The aim of this series of papers is to prove the following theorem.
Theorem 1.1. Let $\mathrm{n} \geqslant 3$ and let $H$ be a subgroup of $\operatorname{Out}\left(F_{\mathrm{n}}\right)$. There exists $\phi \in H$ such that $\operatorname{Poly}(\phi)=\operatorname{Poly}(H)$.

Informally, Theorem 1.1 shows that the exponential growth of a subgroup $H$ of $\operatorname{Out}\left(F_{\mathrm{n}}\right)$ is encaptured by the exponential growth of a single element of $H$. Indeed, if $g \in F_{\mathrm{n}}$ has exponential growth for some element $\psi \in H$, then $g$ has exponential growth for an element $\phi \in H$ given by Theorem 1.1. The proof relies on dynamical properties of the action of outer automorphisms on some preferred topological space. In this article, we study the dynamical properties of the elements of the subgroup $H$ of $F_{\mathrm{n}}$ that will be used in Gue2 in order to construct an element $\phi \in H$ given by Theorem 1.1.

Let $\phi \in \operatorname{Out}\left(F_{\mathrm{n}}\right)$ be an exponentially growing outer automorphism. In this article, we construct natural (compact, metrizable) topological spaces $X$ on which a subgroup of $\operatorname{Out}\left(F_{\mathrm{n}}\right)$ containing $\phi$ acts by homeomorphisms with the additional property that $\phi$ acts with North-South dynamics: there exist two proper disjoint closed subsets of $X$ such that every point of $X$ which is not contained in these subsets converges to one of the two subsets under positive or negative iteration of $\phi$. North-South dynamics are preferred tools to apply ping-pong arguments similar to the ones of Tits Tit] and are used to obtain structural properties of some groups.

The topological space $X$ that we use in the proof of Theorem 1.1 is constructed in such a way that it allows us to create a dictionnary between dynamical properties of the action of $\phi$ on $X$ and growth properties of elements of $F_{\mathrm{n}}$ under iterations of $\phi$. In order to construct $X$, we first need to detect all the elements $g$ of $F_{\mathrm{n}}$ such that the length of [g] with respect to any basis of $F_{\mathrm{n}}$ grows at most polynomially fast fast under iteration of $\phi$. Levitt [Lev proved that there exist finitely many finitely generated subgroups $H_{1}, \ldots, H_{k}$ of $F_{\mathrm{n}}$ such that the conjugacy class of an element $g$ of $F_{\mathrm{n}}$ is not exponentially growing under iteration of $\phi$ if and only if $g$ is contained in a conjugate of some $H_{i}$ for $i \in$ $\{1, \ldots, k\}$. Moreover, the set $\mathcal{A}(\phi)=\left\{\left[H_{1}\right], \ldots,\left[H_{k}\right]\right\}$ is a malnormal subgroup system: for every $i \in\{1, \ldots, k\}$, the group $H_{i}$ is a malnormal subgroup of $F_{\mathrm{n}}$ and for every distinct subgroups $A$ and $B$ such that $[A],[B] \in \mathcal{A}(\phi)$, we have $A \cap B=\{e\}$. Every element of $F_{\mathrm{n}}$ which is contained in a conjugate of some $H_{i}$ with $i \in\{1, \ldots, k\}$ has polynomial growth under iteration of $\phi$. Moreover, we have $\operatorname{Poly}(\phi)=\bigcup_{i=1}^{r} \bigcup_{g \in F_{\mathrm{n}}} g H_{i} g^{-1}$.

In Gue1, we construct a compact, metrizable space, called the space of projectivised currents relative to $\mathcal{A}(\phi)$, denoted by $\operatorname{PCurr}\left(F_{\mathrm{n}}, \mathcal{A}(\phi)\right)$, which is the space of projectivised

Radon measures on the double boundary of $F_{\mathrm{n}}$ relative to $\mathcal{A}(\phi)$, equipped with the weak-star topology (see Section [2.4 for precise definitions). In [Gue1], we proved that the set of currents associated with $\mathcal{A}(\phi)$-nonperipheral conjugacy classes of elements of $g$ of $F_{\mathrm{n}}$, that is, such that $g$ is not contained in the conjugacy class of some $H_{i}$ with $i \in\{1, \ldots, k\}$, is dense in $\mathbb{P C u r r}\left(F_{\mathrm{n}}, \mathcal{A}(\phi)\right)$. Thus, the set of conjugacy classes of elements of $F_{\mathrm{n}}$ whose length grows exponentially fast under iteration of $\phi$ is dense in $\mathbb{P} \operatorname{Curr}\left(F_{\mathrm{n}}, \mathcal{A}(\phi)\right)$. If we denote by $\operatorname{Out}\left(F_{\mathrm{n}}, \mathcal{A}(\phi)\right)$ the subgroup of $\operatorname{Out}\left(F_{\mathrm{n}}\right)$ consisting in every element $\psi \in \operatorname{Out}\left(F_{\mathrm{n}}\right)$ such that $\psi(\mathcal{A}(\phi))=\mathcal{A}(\phi)$, the group $\operatorname{Out}\left(F_{\mathrm{n}}, \mathcal{A}(\phi)\right)$ acts by homeomorphisms on $\mathbb{P C u r r}\left(F_{\mathrm{n}}, \mathcal{A}(\phi)\right)$ by pushing forward the measures. In this article, we prove the following theorem.

Theorem 1.2 (see Theorem 5.1). Let $\mathrm{n} \geqslant 3$ and let $\phi$ be an exponentially growing outer automorphism. The outer automorphism $\phi$ acts with North-South dynamics on the space $\mathbb{P C u r r}\left(F_{\mathrm{n}}, \mathcal{A}(\phi)\right)$.

In fact, we prove a slightly stronger result since we prove a uniform North-South dynamics result, that is, the convergence in the North-South dynamics statement can be made uniform on compact subsets of $\mathbb{P C u r r}\left(F_{\mathrm{n}}, \mathcal{A}(\phi)\right)$. As explained above, North-South dynamics results given by Theorem 1.2 will be a key point in the proof of Theorem 1.1.

Such dynamical results already appear in similar contexts. For instance, Tits proved in Tit] its alternative for linear groups using North-South dynamics and ping-pong arguments. In the context of the mapping class group $\operatorname{Mod}(S)$ of a compact connected orientable surface $S$ of genus at least 2, pseudo-Anosov elements acts with North-South dynamics on the space of projectivised measured foliations (Thu, see also the work of Ivanov [Iva]) or the curve complex [MM]. Using this North-South dynamics, Ivanov [iva] (see also the work of McCarthy [McC]) later proved a Tits alternative for subgroups of $\operatorname{Mod}(S)$. Similarly, North-South dynamics results were obtained for certain classes of outer automorphisms of $F_{\mathrm{n}}$. For instance, fully irreducible outer automorphisms act on the compactified Outer space $\mathbf{L L}$ ) or the space of projectivised currents ( Mar , see also the work of Uyanik [Uya1) with a North-South dynamics and atoroidal outer automorphisms act on the space of projectivsed currents with a North-South dynamics [LU2, Uya2. Clay and Uyanik [CU] applied this result in the proof of the fact that, for every subgroup $H$ of $\operatorname{Out}\left(F_{\mathrm{n}}\right)$, either $H$ contains an atoroidal outer automorphism or there exists a nontrivial element $g$ of $F_{\mathrm{n}}$ such that, for every element $\phi \in H$, there exists $k \in \mathbb{N}^{*}$ such that we have $\phi^{k}([g])=[g]$. Such dynamical results were later extended to relative contexts by Gupta Gup1, Gup2.

In order to prove Theorem [1.1, we will need a slightly stronger result than Theorem 1.2. Indeed, let $\phi \in \operatorname{Out}\left(F_{\mathrm{n}}\right)$ and let $\mathcal{A}(\phi)=\left\{\left[H_{1}\right], \ldots,\left[H_{k}\right]\right\}$. Suppose that $\phi$ preserves the conjugacy class of a corank one free factor $A$ of $F_{\mathrm{n}}$. Let $\mathcal{A}(\phi) \wedge A$ be the malnormal subgroup system consisting in the conjugacy classes of the intersection of the conjugates of the subgroups $H_{i}$ with $i \in\{1, \ldots, k\}$ with $A$. Note that, by Theorem 1.2, there exist closed disjoint subsets $\Delta_{ \pm}\left(\left.\phi\right|_{A}\right)$ such that the outer automorphism $\left.\phi\right|_{A} \in$ $\operatorname{Out}(A, \mathcal{A}(\phi) \wedge A)$ acts with North-South dynamics on $\mathbb{P} \operatorname{Curr}(A, \mathcal{A}(\phi) \wedge A)$ with respect to $\Delta_{ \pm}\left(\left.\phi\right|_{A}\right)$. There is a canonical embedding $\mathbb{P C u r r}(A, \mathcal{A}(\phi) \wedge A) \hookrightarrow \mathbb{P} \operatorname{Curr}\left(F_{\mathrm{n}}, \mathcal{A}(\phi) \wedge A\right)$,
and we denote by $\Delta_{ \pm}(\phi)$ the image of $\Delta_{ \pm}\left(\left.\phi\right|_{A}\right)$ in $\mathbb{P C u r r}\left(F_{\mathrm{n}}, \mathcal{A}(\phi) \wedge A\right)$. We will need to understand the dynamics of $\phi$ on the space $\mathbb{P} \operatorname{Curr}\left(F_{\mathrm{n}}, \mathcal{A}(\phi) \wedge A\right)$. As there might exist elements in $F_{\mathrm{n}}$ which have polynomial growth under iterations of $\phi$ and which are not contained in a conjugate of $A$, one cannot apply Theorem 1.2 to obtain a North-South dynamics result. However, we obtain the following result.

Theorem 1.3 (see Theorem (6.4). Let $\mathrm{n} \geqslant 3$ and let $\phi \in \operatorname{Out}\left(F_{\mathrm{n}}\right)$ be an exponentially growing outer automorphism which preserves a corank one free factor $A$. There exist two convex compact subsets $\widehat{\Delta}_{ \pm}(\phi)$ of $\mathbb{P} \operatorname{Curr}\left(F_{\mathrm{n}}, \mathcal{A}(\phi) \wedge A\right)$ such that the following holds. Let $U_{ \pm}$be open neighborhoods of $\Delta_{ \pm}(\phi)$ in $\mathbb{P C u r r}\left(F_{\mathrm{n}}, \mathcal{A}(\phi) \wedge A\right)$ and $\hat{V}_{ \pm}$be open neighborhoods of $\widehat{\Delta}_{ \pm}(\phi)$ in $\mathbb{P} \operatorname{Curr}\left(F_{\mathrm{n}}, \mathcal{A}(\phi) \wedge A\right)$. There exists $M \in \mathbb{N}^{*}$ such that for every $n \geqslant M$, we have

$$
\phi^{ \pm n}\left(\mathbb{P} \operatorname{Curr}\left(F_{\mathrm{n}}, \mathcal{A}(\phi) \wedge A\right)-\hat{V}_{\mp}\right) \subseteq U_{ \pm} .
$$

In [CU, Theorem 4.15], Clay and Uyanik proved an analogue of Theorem 1.3 in the context of atoroidal outer automorphisms of $F_{\mathrm{n}}$. In Theorem [1.3, the two convex subsets $\widehat{\Delta}_{ \pm}(\phi)$ have nonempty intersection, so that Theorem 1.3 is not a North-South dynamics result as defined above. However, Theorem 1.3 gives a sufficiently precise description of the dynamics of $\phi$ for our considerations. The intersection $\widehat{\Delta}_{+}(\phi) \cap \widehat{\Delta}_{-}(\phi)$ corresponds informally to the polynomial growth part of $\phi$. This intersection, denoted by $K_{P G}$ in the rest of the article, is the closure in $\mathbb{P C u r r}\left(F_{\mathrm{n}}, \mathcal{A}(\phi) \wedge A\right)$ of the $(\mathcal{A}(\phi) \wedge A)$-nonperipheral elements of $F_{\mathrm{n}}$ which have polynomial growth under iteration of $\phi$. In Section 3.3, we give a complete study of the subspace $K_{P G}$ in a more general context.

In fact, Section 3 is devoted to the study of the polynomial growth of an exponentially growing outer automorphism. Following the works of Bestvina, Feighn and Handel [BFH1, BFH2], of Feighn and Handel [FH] and of Handel and Mosher [HM], we use appropriate relative train track representatives of a power of an exponentially growing outer automorphism $\phi$ in order to describe $\mathcal{A}(\phi)$ geometrically. It gives rise to a (not necessarily connected) topological graph $G^{*}$ such that the fundamental group of every connected component $G_{c}^{*}$ of $G^{*}$ injects into $F_{\mathrm{n}}$ and such that the set $\left\{\left[\pi_{1}\left(G_{c}^{*}\right)\right]\right\}_{G_{c}^{*} \in \pi_{0}\left(G^{*}\right)}$ where $\pi_{1}\left(G_{c}^{*}\right)$ is viewed as a subgroup of $F_{\mathrm{n}}$ is equal to $\mathcal{A}(\phi)$ (see Proposition 3.13). We then use this characterization of $\mathcal{A}(\phi)$ in Section 3.3 in order to describe the subset $K_{P G}$.

We now sketch a proof of Theorem 1.2. The proofs of Theorem 1.2 and Theorem 1.3 given in this paper are long and quite technical, this is why we postpone the proof of Theorem 1.1 in [Gue2]. Let $\phi \in \operatorname{Out}\left(F_{\mathrm{n}}\right)$ be exponentially growing. The first step is to construct the closed subsets $\Delta_{ \pm}(\phi)$ associated with $\phi$ as defined in Therorem 1.2, This is done in Section 4. In order to construct them, we use as inspiration the construction given by Lustig and Uyanik in LU2] (see also Uya2, Gup1). We choose an appropriate relative train track representative $f: G \rightarrow G$ of a power of $\phi$, where $G$ is a graph whose fundamental group is isomorphic to $F_{\mathrm{n}}$. A current of $\Delta_{+}(\phi)$ is then constructed by considering occurrences of paths in $\lim _{m \rightarrow \infty} f^{m}(e)$, where $e$ is an edge in $G$ whose length grows exponentially fast under iteration of $f$ (see Proposition 4.4). Currents of $\Delta_{-}(\phi)$ are then defined similarly using a representative of a power of $\phi^{-1}$. We then prove Theorem 1.2 in Section [5, Let $[\mu] \in \mathbb{P} \operatorname{Curr}\left(F_{\mathrm{n}}, \mathcal{A}(\phi)\right)-\Delta_{ \pm}(\phi)$ be the current associated
with a $\mathcal{A}(\phi)$-nonperipheral conjugacy class $[w] \in F_{\mathrm{n}}$. Then $[w]$ is represented by a circuit $\gamma_{w}$ in the graph $G$. In order to show that we have $\lim _{m \rightarrow \infty} \phi^{m}([\mu]) \in \Delta_{+}(\phi)$, we prove that the proportion of the path $f^{m}\left(\gamma_{g}\right)$ which grows exponentially fast under iteration of $f$ tends to 1 as $m$ goes to infinity. This fact is sufficient to prove that

$$
\lim _{m \rightarrow \infty} \phi^{m}([\mu]) \in \Delta_{+}(\phi)
$$

(see Lemma 5.20). We then conclude the proof using the density of currents associated with nonperipheral elements in $F_{\mathrm{n}}$ proved in [Gue1]. Theorem 1.3 is then proved in Section 6 using a combination of Theorem 1.2 and the description of the space $K_{P G}$.

Acknowledgments. I warmly thank my advisors, Camille Horbez and Frédéric Paulin, for their precious advices and for carefully reading the different versions of this article.

## 2 Preliminaries

### 2.1 Malnormal subgroup systems of $F_{\mathrm{n}}$

Let n be an integer greater than 1 and let $F_{\mathrm{n}}$ be a free group of rank n . A subgroup system of $F_{\mathrm{n}}$ is a finite (possibly empty) set $\mathcal{A}$ whose elements are conjugacy classes of nontrivial (that is distinct from \{1\}) finite rank subgroups of $F_{\mathrm{n}}$. There exists a partial order on the set of subgroup systems of $F_{\mathrm{n}}$, where $\mathcal{A}_{1} \leqslant \mathcal{A}_{2}$ if for every subgroup $A_{1}$ of $F_{\mathrm{n}}$ such that $\left[A_{1}\right] \in \mathcal{A}_{1}$, there exists a subgroup $A_{2}$ of $F_{\mathrm{n}}$ such that $\left[A_{2}\right] \in \mathcal{A}_{2}$ and $A_{1}$ is a subgroup of $A_{2}$. The stabilizer in $\operatorname{Out}\left(F_{\mathrm{n}}\right)$ of a subgroup system $\mathcal{A}$, denoted by $\operatorname{Out}\left(F_{\mathrm{n}}, \mathcal{A}\right)$, is the set of all elements $\phi \in \operatorname{Out}\left(F_{\mathrm{n}}\right)$ such that $\phi(\mathcal{A})=\mathcal{A}$.

Recall that a subgroup $A$ of $F_{\mathrm{n}}$ is malnormal if for every element $x \in F_{\mathrm{n}}-A$, we have $x A x^{-1} \cap A=\{e\}$. A subgroup system $\mathcal{A}$ is said to be malnormal if every subgroup $A$ of $F_{\mathrm{n}}$ such that $[A] \in \mathcal{A}$ is malnormal and, for all subgroups $A_{1}, A_{2}$ of $F_{\mathrm{n}}$ such that $\left[A_{1}\right],\left[A_{2}\right] \in \mathcal{A}$, if $A_{1} \cap A_{2}$ is nontrivial then $A_{1}=A_{2}$. An element $g \in F_{\mathrm{n}}$ is $\mathcal{A}$-peripheral (or simply peripheral if there is no ambiguity) if it is trivial or conjugate into one of the subgroups of $\mathcal{A}$, and $\mathcal{A}$-nonperipheral otherwise.

An important class of examples of malnormal subgroup systems is given by the free factor systems. A free factor system of $F_{\mathrm{n}}$ is a (possibly empty) set $\mathcal{F}$ of conjugacy classes $\left\{\left[A_{1}\right], \ldots,\left[A_{r}\right]\right\}$ of nontrivial subgroups $A_{1}, \ldots, A_{r}$ of $F_{\mathrm{n}}$ such that there exists an integer $k \in \mathbb{N}$ with $F_{\mathrm{n}}=A_{1} * \ldots * A_{r} * F_{k}$. The free factor system $\mathcal{F}$ is sporadic if $(k+r, k) \leqslant(2,1)$ for the lexicographic order, and is nonsporadic otherwise. Therefore, the sporadic free factor systems are those of the form $\{[C]\}$ where $C$ has rank at least equal to $n-1$ and those of the form $\{[A],[B]\}$ with $F_{\mathrm{n}}=A * B$. An ascending sequence of free factor systems $\mathcal{F}_{1} \leqslant \ldots \leqslant \mathcal{F}_{i}=\left\{\left[F_{\mathrm{n}}\right]\right\}$ of $F_{\mathrm{n}}$ is called a filtration of $F_{\mathrm{n}}$.

Given a free factor system $\mathcal{F}$ of $F_{\mathrm{n}}$, a free factor of $\left(F_{\mathrm{n}}, \mathcal{F}\right)$ is a subgroup $A$ of $F_{\mathrm{n}}$ such that there exists a free factor system $\mathcal{F}^{\prime}$ of $F_{\mathrm{n}}$ with $[A] \in \mathcal{F}^{\prime}$ and $\mathcal{F} \leqslant \mathcal{F}^{\prime}$. When $\mathcal{F}=\varnothing$, we say that $A$ is a free factor of $F_{\mathrm{n}}$. A free factor of $\left(F_{\mathrm{n}}, \mathcal{F}\right)$ is proper if it is nontrivial, not equal to $F_{\mathrm{n}}$ and if its conjugacy class does not belong to $\mathcal{F}$.

Another class of examples of malnormal subgroup systems is the following one. An outer automorphism $\phi \in \operatorname{Out}\left(F_{\mathrm{n}}\right)$ is exponentially growing if there exists $g \in F_{\mathrm{n}}$ such that
the length of the conjugacy class $[g]$ of $g$ in $F_{\mathrm{n}}$ with respect to some basis of $F_{\mathrm{n}}$ grows exponentially fast under iteration of $\phi$. If $\phi \in \operatorname{Out}\left(F_{\mathrm{n}}\right)$ is not exponentially growing, then $\phi$ is polynomially growing. For an automorphism $\alpha \in \operatorname{Aut}\left(F_{\mathrm{n}}\right)$, we say that $\alpha$ is exponentially growing if there exists $g \in F_{\mathrm{n}}$ such that the length of $g$ grows exponentially fast under iteration of $\phi$. Otherwise, $\alpha$ is polynomially growing. Let $\phi \in \operatorname{Out}\left(F_{\mathrm{n}}\right)$ be exponentially growing. A subgroup $P$ of $F_{\mathrm{n}}$ is a polynomial subgroup of $\phi$ if there exist $k \in \mathbb{N}^{*}$ and a representative $\alpha$ of $\phi^{k}$ such that $\alpha(P)=P$ and $\left.\alpha\right|_{P}$ is polynomially growing. By [Lev, Proposition 1.4], there exist finitely many conjugacy classes $\left[H_{1}\right], \ldots,\left[H_{k}\right]$ of maximal polynomial subgroups of $\phi$. Moreover, the proof of [Lev, Proposition 1.4] implies that the set $\mathcal{H}=\left\{\left[H_{1}\right], \ldots,\left[H_{k}\right]\right\}$ is a malnormal subgroup system. Indeed, Levitt shows that there exists a nontrivial $\mathbb{R}$-tree $T$ in the boundary of Culler and Vogtmann Outer space [CV] on which $F_{\mathrm{n}}$ acts with trivial arc stabilizers, such that $\phi$ preserves the homothety class of $T$ and such that the groups $H_{1} \ldots, H_{k}$ are elliptic in $T$. If two distinct subgroups $A, B$ of $F_{\mathrm{n}}$ such that $[A],[B] \in \mathcal{H}$ fix distinct points in $T$, then their intersection is trivial. If $A$ and $B$ fix the same point $x$ in $T$, then (up to taking a power of $\phi) \phi$ preserves $[\operatorname{Stab}(x)]$ and an inductive argument on the rank using $\left.\phi\right|_{\operatorname{Stab}(x)}$ (the rank of $\operatorname{Stab}(x)$ is less than n by a result of Gaboriau-Levitt [GL]) shows that the intersection of $A$ and $B$ is trivial. We denote this malnormal subgroup system by $\mathcal{A}(\phi)$. Note that, if $H$ is a subgroup of $F_{\mathrm{n}}$ such that $[H] \in \mathcal{A}(\phi)$, there exists $\Phi^{-1} \in \phi^{-1}$ such that $\Phi^{-1}(H)=H$ and $\left.\Phi^{-1}\right|_{H}$ is polynomially growing. Hence we have $\mathcal{A}(\phi) \leqslant \mathcal{A}\left(\phi^{-1}\right)$. By symmetry, we have

$$
\begin{equation*}
\mathcal{A}(\phi)=\mathcal{A}\left(\phi^{-1}\right) \tag{1}
\end{equation*}
$$

Let $\mathcal{A}$ be a malnormal subgroup system and let $\phi \in \operatorname{Out}\left(F_{\mathrm{n}}, \mathcal{A}\right)$ be a relative outer automorphism. We say that $\phi$ is atoroidal relative to $\mathcal{A}$ if, for every $k \in \mathbb{N}^{*}$, the element $\phi^{k}$ does not preserve the conjugacy class of any $\mathcal{A}$-nonperipheral element. We say that $\phi$ is expanding relative to $\mathcal{A}$ if $\mathcal{A}(\phi) \leqslant \mathcal{A}$. Note that an expanding outer automorphism relative to $\mathcal{A}$ is in particular atoroidal relative to $\mathcal{A}$. When $\mathcal{A}=\varnothing$, then the outer automorphism $\phi$ is expanding relative to $\mathcal{A}$ if and only if for every nontrivial element $g \in F_{\mathrm{n}}$, the length of the conjugacy class $[g]$ of $g$ in $F_{\mathrm{n}}$ with respect to some basis of $F_{\mathrm{n}}$ grows exponentially fast under iteration of $\phi$. Therefore, by a result of Levitt [Lev, Corollary 1.6], the outer automorphism $\phi$ is expanding relative to $\mathcal{A}=\varnothing$ if and only if $\phi$ is atoroidal relative to $\mathcal{A}=\varnothing$.

Let $\mathcal{A}=\left\{\left[A_{1}\right], \ldots,\left[A_{r}\right]\right\}$ be a malnormal subgroup system and let $\mathcal{F}$ be a free factor system. Let $i \in\{1, \ldots, r\}$. By [SW, Theorem 3.14] for the action of $A_{i}$ on one of its Cayley graphs, there exist finitely many subgroups $A_{i}^{(1)}, \ldots, A_{i}^{\left(k_{i}\right)}$ of $A_{i}$ such that:
(1) for every $j \in\left\{1, \ldots, k_{i}\right\}$, there exists a subgroup $B$ of $F_{\mathrm{n}}$ such that $[B] \in \mathcal{F}$ and $A_{i}^{(j)}=B \cap A_{i} ;$
(2) for every subgroup $B$ of $F_{\mathrm{n}}$ such that $[B] \in \mathcal{F}$ and $B \cap A_{i} \neq\{e\}$, there exists $j \in\left\{1, \ldots, k_{i}\right\}$ such that $A_{i}^{(j)}=B \cap A_{i}$;
(3) the subgroup $A_{i}^{(1)} * \ldots * A_{i}^{\left(k_{i}\right)}$ is a free factor of $A_{i}$.

Thus, one can define a new subgroup system as

$$
\mathcal{F} \wedge \mathcal{A}=\bigcup_{i=1}^{r}\left\{\left[A_{i}^{(1)}\right], \ldots,\left[A_{i}^{\left(k_{i}\right)}\right]\right\} .
$$

Since $\mathcal{A}$ is malnormal, and since, for every $i \in\{1, \ldots, r\}$, the group $A_{i}^{(1)} * \ldots * A_{i}^{\left(k_{i}\right)}$ is a free factor of $A_{i}$, it follows that the subgroup system $\mathcal{F} \wedge \mathcal{A}$ is a malnormal subgroup system of $F_{\mathrm{n}}$. We call it the meet of $\mathcal{F}$ and $\mathcal{A}$.

### 2.2 Graphs, markings and filtrations

Let $\mathrm{n} \geqslant 2$. A marked graph is a pointed (at a vertex *), connected, finite graph $G$ (in the sense of $[\mathrm{Ser}]$ ) whose fundamental group is isomorphic to $F_{\mathrm{n}}$ which is equipped with a marking, that is an isomorphism $\rho: F_{\mathrm{n}} \rightarrow \pi_{1}(G, *)$.

We denote by $V G$ (resp. $\vec{E} G$ ) the set of vertices (resp. edges) of $G$. Given an edge $e$ of $G$, we denote by $o(e)$ the origin of $e$, by $t(e)$ the terminal point of $e$ and by $e^{-1}$ the edge of $G$ such that $o\left(e^{-1}\right)=t(e)$ and $t\left(e^{-1}\right)=o(e)$. An edge path $\gamma$ of length $m$ is a concatenation of $m$ edges $\gamma=e_{1} e_{2} \ldots e_{m}$ such that for every $i \in\{1, \ldots, m-1\}$, we have $t\left(e_{i}\right)=o\left(e_{i+1}\right)$. The length of $\gamma$ is denoted by $\ell(\gamma)$. The edge path $\gamma$ is reduced if for every $i \in\{1, \ldots, m-1\}$, we have $e_{i} \neq e_{i+1}^{-1}$. A reduced edge path is cyclically reduced if $t\left(e_{m}\right)=o\left(e_{1}\right)$ and $e_{m} \neq e_{1}^{-1}$. A cyclically reduced edge path is also called a circuit. For any edge path $\gamma$, there exists a unique reduced edge path homotopic to $\gamma$ relatively to endpoints, we denote it by $[\gamma]$.

Let $G$ and $G^{\prime}$ be two marked graphs. A graph map is a pointed homotopy equivalence $f: G \rightarrow G^{\prime}$ such that $f(V G) \subseteq V G^{\prime}$ and such that the restriction of $f$ to the interior of an edge is an immersion. Thus, for every edge $e \in \vec{E} G$, the image $f(e)$ determines a reduced edge path $[f(e)]$. Given $\phi \in \operatorname{Out}\left(F_{\mathrm{n}}\right)$ and $(G, \rho)$ a marked graph, a topological representative of $\phi$ is a graph map $f: G \rightarrow G$ such that the outer automorphism class of $\rho^{-1} \circ f_{*} \circ \rho \in \operatorname{Aut}\left(F_{\mathrm{n}}\right)$ is $\phi$.

Let $f: G \rightarrow G$ be a topological representative. Let $w \in F_{\mathrm{n}}$. We denote by $\gamma_{w}$ the unique circuit in $G$ which represents the conjugacy class of $w$.

Let $f: G \rightarrow G$ be a topological representative. A filtration for $G$ is an increasing sequence of $f$-invariant (not necessarily connected) subgraphs $\varnothing=G_{0} \subsetneq G_{1} \subsetneq \ldots \subsetneq$ $G_{k}=G$. Let $r \in\{1, \ldots, k\}$. The $r$-th stratum in this filtration, denoted by $H_{r}$ is the (not necessarily connected) closure of $G_{r}-G_{r-1}$. For every $r \in\{1, \ldots, k\}$, there exists a square matrix $M_{r}$ associated with the stratum $H_{r}$ called the transition matrix of $H_{r}$. The rows and columns of $M_{r}$ are indexed by the nonoriented edges in $H_{r}$ and the entry associated with the pair of nonoriented edges defined by $\left(e, e^{\prime}\right) \in\left(E H_{r}\right)^{2}$ is the number of occurrences of $e^{\prime}$ and $e^{\prime-1}$ in $[f(e)]$.

Recall that a nonnegative square matrix $M=\left(M_{i, j}\right)_{i, j}$ is irreducible if for every $(i, j)$, there exists $p=p(i, j)$ such that $M_{i, j}^{p}>0$ and that $M$ is primitive if there exists $p \in \mathbb{N}^{*}$ such that every entry of $M^{p}$ is positive. For $r \in\{1, \ldots, k\}$, we say that the stratum $H_{r}$ is irreducible if its associated matrix is irreducible and we say that $H_{r}$ is primitive if its associated matrix is primitive. Let $r \in\{1, \ldots, k\}$ and suppose that $M_{r}$ is irreducible.

Then it has a unique real eigenvalue $\lambda_{r} \geqslant 1$ called the Perron-Frobenius eigenvalue. Let $H_{r}$ be an irreducible stratum. Then $H_{r}$ is exponentially growing ( $E G$ ) if $\lambda_{r}>1$ and is nonexponentially growing ( $N E G$ ) otherwise. Finally, if the matrix associated with the stratum $H_{r}$ is the zero matrix, then $H_{r}$ is called a zero stratum.

Let $G$ be a marked graph of $F_{\mathrm{n}}$ and let $K$ be a (possibly disconnected) subgraph of $G$. The subgraph $K$ determines a free factor system $\mathcal{F}(K)$ of $F_{\mathrm{n}}$ as follows. Let $C_{1}, \ldots, C_{k}$ be the noncontractible connected components of $K$. Then, for every $i \in\{1, \ldots, k\}$, the connected component $C_{i}$ determines the conjugacy class $\left[A_{i}\right]$ of a subgroup $A_{i}$ of $\pi_{1}(G)$. Then the set $\left\{\left[A_{1}\right], \ldots,\left[A_{k}\right]\right\}$ is a free factor system $\mathcal{F}(K)$ of $F_{\mathrm{n}}$.

Let $\mathcal{F}_{1} \leqslant \ldots \leqslant \mathcal{F}_{i}=\left\{\left[F_{\mathrm{n}}\right]\right\}$ be a filtration of $F_{\mathrm{n}}$. A geometric realization of the filtration is a marked graph $G$ equipped with an increasing sequence

$$
\varnothing=G_{0} \subsetneq G_{1} \subsetneq \ldots \subsetneq G_{j}=G
$$

of subgraphs of $G$ such that for every $k \in\{1, \ldots, i\}$ there exists $\ell \in\{1, \ldots, j\}$ such that $\mathcal{F}_{k}=\mathcal{F}\left(G_{\ell}\right)$.

### 2.3 Train tracks and CTs

In this section we introduce the technology of train tracks. Train tracks are a type of graph maps introduced by Bestvina and Handel ( $\overline{\mathrm{BH}]) \text {. Even though there exist outer }}$ automorphisms of $F_{\mathrm{n}}$ which do not have a topological representative which is a train track, every outer automorphism has a power which has a topological representative called a completely split train track map (CT). CT maps were introduced by Feighn and Handel ([FH]). The definition of a CT map being quite technical, we will only state the relevant properties needed for the rest of the article. First we need some preliminary definitions.

Let $G$ be a marked graph of $F_{\mathrm{n}}$ and let $f: G \rightarrow G$ be a graph map. The map $f$ induces a derivative map $D f: \vec{E} G \rightarrow \vec{E} G$ on the set of edges as follows. For every $e \in \vec{E} G$, the map $D f(e)$ is equal to the first edge of the edge path $f(e)$. A turn in $G$ is an unordered pair $\left\{e_{1}, e_{2}\right\}$ of edges in $G$ with $o\left(e_{1}\right)=o\left(e_{2}\right)$. A turn $\left\{e_{1}, e_{2}\right\}$ is degenerate if $e_{1}=e_{2}$, and is nondegenerate otherwise. A turn $\left\{e_{1}, e_{2}\right\}$ is illegal if there exists $k \in \mathbb{N}^{*}$ such that $\left\{(D f)^{k}\left(e_{1}\right),(D f)^{k}\left(e_{2}\right)\right\}$ is degenerate, and is legal otherwise. An edge path $\gamma=e_{1} e_{2} \ldots e_{i}$ is legal if for every $j \in\{1, \ldots, i\}$, the turn $\left\{e_{j}^{-1}, e_{j+1}\right\}$ is legal.

In order to deal with relative outer automorphisms, we also need a notion of relative legal paths. Let $\varnothing=G_{0} \subsetneq G_{1} \subsetneq \ldots \subsetneq G_{j}=G$ be the geometric realization of some filtration of $F_{\mathrm{n}}$ which is $f$-invariant and let $r \in\{1, \ldots, j\}$. We say that a turn $\left\{e_{1}, e_{2}\right\}$ is contained in the stratum $H_{r}$ if $\left\{e_{1}, e_{2}\right\} \subseteq \vec{E} H_{r}$. An edge path $\gamma$ of $G$ is $r$-legal if every turn in $\gamma$ that is contained in $H_{r}$ is legal. A connecting path for $H_{r}$ is a nontrivial reduced path $\gamma$ in $G_{r-1}$ whose endpoints are in $G_{r-1} \cap H_{r}$. A path $\gamma$ in $G$ is $r$-taken (or taken if $\gamma$ is $r$-taken for some $r$ ) if it is contained in the reduced image of an iterate of an edge $e \in \vec{E} H_{r}$, where $H_{r}$ is an irreducible stratum. The height of a path $\gamma$ is the maximal $r$ such that $\gamma$ contains an edge of $H_{r}$. We can now define the notion of a relative train track map due to Bestvina and Handel $([\mathrm{BH}])$.

Definition 2.1. Let $\mathrm{n} \geqslant 3$. Let $G$ be a marked graph and let $f: G \rightarrow G$ be a graph map equipped with a $f$-invariant filtration $\varnothing=G_{0} \subsetneq G_{1} \subsetneq \ldots \subsetneq G_{j}=G$. The map $f$ is a relative train track map if, for each exponentially growing stratum $H_{r}$, the following holds:
(1) for every edge $e \in \vec{E} H_{r}$ and every $k \in \mathbb{N}^{*}$, we have $(D f)^{k}(e) \in \vec{E} H_{r}$;
(2) for every connecting path $\gamma$ for $H_{r}$, the reduced path $[f(\gamma)]$ is also a connecting path for $H_{r}$;
(3) if $\gamma$ is a height $r$ reduced edge path which is $r$-legal, then so is $[f(\gamma)]$.

In order to explain the properties of CT maps that we will use in this paper, we will need some further definitions regarding edge paths in a graph.

Definition 2.2. Let $\mathrm{n} \geqslant 3$ and let $G$ be a marked graph of $F_{\mathrm{n}}$ equipped with an $f$-invariant filtration $\varnothing=G_{0} \subsetneq G_{1} \subsetneq \ldots \subsetneq G_{j}=G$. Let $\gamma$ be an edge path of $G$.
(1) The path $\gamma$ is a periodic Nielsen path if there exists $k \in \mathbb{N}^{*}$ such that $\left[f^{k}(\gamma)\right]=\gamma$. The minimal such $k$ is the period, and if $k=1$, then $\gamma$ is a Nielsen path.
(2) A (periodic) indivisible Nielsen path ( $(p) I N P)$ is a (periodic) Nielsen path that cannot be written as a nontrivial concatenation of (periodic) Nielsen paths.
(3) The path $\gamma$ is an exceptional path if there exist a cyclically reduced Nielsen path $w$, edges $e_{1}, e_{2} \in \vec{E} G$ and integers $d_{1}, d_{2}, p \in \mathbb{Z}^{*}$ such that for every $i \in\{1,2\}$, we have $f\left(e_{i}\right)=e_{i} w^{d_{i}}$ and $\gamma=e_{1} w^{p} e_{2}^{-1}$. The value $|p|$ is called the width of $\gamma$.
Definition 2.3. Let $n \geqslant 3$, let $G$ be a marked graph of $F_{\mathrm{n}}$ and let $f: G \rightarrow G$ be a relative train track map equipped with a filtration $\varnothing=G_{0} \subsetneq G_{1} \subsetneq \ldots \subsetneq G_{j}=G$. Let $\gamma$ be a reduced edge path or a circuit of $G$.
(1) A splitting of $\gamma$ is a decomposition of $\gamma$ into edge subpaths $\gamma=\gamma_{1} \gamma_{2} \ldots \gamma_{i}$ such that for every $k \in \mathbb{N}^{*}$, we have

$$
\left[f^{k}(\gamma)\right]=\left[f^{k}\left(\gamma_{1}\right)\right] \ldots\left[f^{k}\left(\gamma_{i}\right)\right]
$$

that is one can tighten the image of $f^{k}(\gamma)$ by tightening the image of every $f^{k}\left(\gamma_{j}\right)$ (where $o(\gamma)$ is the base point in the case where $\gamma$ is a circuit).
(2) Let $\gamma$ be a circuit. A circuital splitting is a splitting $\gamma=\gamma_{1} \ldots \gamma_{i}$ of $\gamma$ such that for every $k \in \mathbb{N}^{*}$, the concatenation $\left[f^{k}\left(\gamma_{1}\right)\right] \ldots\left[f^{k}\left(\gamma_{i}\right)\right]$ defines a path whose initial and terminal directions are distinct.
(3) Let $\gamma=\gamma_{1} \gamma_{2} \ldots \gamma_{i}$ be a splitting of $\gamma$. The splitting is complete if for every $j \in\{1, \ldots, i\}$, the subpath $\gamma_{j}$ is one of the following:

- an edge in an irreducible stratum;
- an INP;
- an exceptional path;
- a connecting path in a zero stratum that is both maximal (for the inclusion in $\gamma$ ) and taken.

Let $\mathrm{n} \geqslant 2$, let $G$ be a marked graph of $F_{\mathrm{n}}$ and let $f: G \rightarrow G$ be a relative train track map with respect to a filtration $\varnothing=G_{0} \subsetneq G_{1} \subsetneq \ldots \subsetneq G_{j}=G$. Let $\gamma$ be an edge path of $G$. Such paths in the above list are called splitting units. When $\gamma$ has a complete splitting, we say that $\gamma$ is completely split.

Definition 2.4. [HM, Fact 2.16] Let $p \in\{0, \ldots, j\}$. Let $\gamma=\gamma_{1} \gamma_{2} \ldots \gamma_{i}$ be a splitting of $\gamma$. This splitting is complete relatively to $G_{p}$, or relatively complete if there is no ambiguity, if for every $j \in\{1, \ldots, i\}$, the subpath $\gamma_{j}$ is one of the following:

- a splitting unit of height at least equal to $p+1$;
- a subpath in $G_{p}$.

We now describe some properties of CT maps whose complete definition can be found in [FH, Definition 4.7].

Proposition 2.5. Let $\mathrm{n} \geqslant 3$ and let $G$ be a marked graph of $F_{\mathrm{n}}$. Let $f: G \rightarrow G$ be a completely split train track (CT) map. Then $f$ satisfies the following properties.
(1) The map $f$ is a relative train track map and every stratum in $G$ is either irreducible or a zero stratum ([ $\overline{F H}$, Definition 4.7]).
(2) If $H_{r}$ is an NEG stratum, then $H_{r}$ consists of a single edge $e_{r}$. Moreover, either $e_{r}$ is fixed by $f$ or $f\left(e_{r}\right)=e_{r} u_{r}$ where $u_{r}$ is a nontrivial completely split circuit in $G_{r-1}$. The terminal endpoint of each NEG stratum is fixed ([FH, Lemma 4.21]).
(3) For every filtration element $G_{r}$, the stratum $H_{r}$ is a zero stratum if and only if $H_{r}$ is a contractible component of $G_{r}$ ([FH, Lemma 4.15]).
(4) For every zero stratum $H_{r}$, there exists a unique $\ell>r$ such that $H_{\ell}$ is an $E G$ stratum and, for every vertex $v \in V H_{r}$, we have $v \in V H_{r} \cap V H_{\ell}$ and the link of $v$ is contained in $V H_{r} \cup V H_{\ell}([F H$, Definition 4.7]).
(5) Every periodic Nielsen path has period one ([FH, Lemma 4.13]).
(6) For every edge e in an irreducible stratum, the reduced path $f(e)$ is completely split. For every taken connecting path $\gamma$ in a zero stratum, $[f(\gamma)]$ is completely split.
(7) Every completely split path or circuit has a unique complete splitting.
(8) If $\gamma$ is an edge path, there exists $k_{0} \in \mathbb{N}^{*}$ such that for every $k \geqslant k_{0}$, the reduced path $\left[f^{k}(\gamma)\right]$ is completely split ([FH, Lemma 4.25]).
(9) If $H_{r}$ is an EG stratum, there is at most one INP $\rho_{r}$ of height $r$. The initial edges of $\rho_{r}$ and $\rho_{r}^{-1}$ are distinct oriented edges in $H_{r}$ ([FH, Corollary 4.19]).
(10) If $H_{r}$ is a zero stratum, no Nielsen path intersects $H_{r}$ in at least one edge ([HM, Fact I.1.43]).
(11) Let $H_{r}$ be an NEG stratum such that $H_{r}=\left\{e_{r}\right\}$, such that $f\left(e_{r}\right)=e_{r} u_{r}$ and such that $u_{r}$ is not trivial. There exists an INP $\sigma$ which intersects $H_{r}$ nontrivially if and only if $u_{r}$ is a Nielsen path and there exists $s \in \mathbb{Z}$ such that $\sigma=e_{r} u_{r}^{s} e_{r}^{-1}$ ([FH], Definition 4.7]).

Definition 2.6. Let $\mathrm{n} \geqslant 2$ and let $G$ be a marked graph of $F_{\mathrm{n}}$. Let $f: G \rightarrow G$ be a completely split train track (CT) map. Let $H_{r}$ be an NEG stratum and let $e_{r}$ be the edge of $H_{r}$. Let $u_{r}$ be such that $f\left(e_{r}\right)=e_{r} u_{r}$. The edge $e_{r}$ is called a fixed edge if $u_{r}$ is trivial, a linear edge if $u_{r}$ is a Nielsen path and a superlinear edge otherwise.

Lemma 2.7. [HM, Fact 1.39] Let $\mathrm{n} \geqslant 2$ and let $G$ be a marked graph of $F_{\mathrm{n}}$. Let $f: G \rightarrow G$ be a CT map. Let $\gamma$ be a Nielsen path. Then $\gamma$ is completely split, and all terms in the complete splitting of $\gamma$ are fixed edges and INPs.

Lemma 2.8. HM, Fact 1.41] Let $\mathrm{n} \geqslant 2$ and let $G$ be a marked graph of $F_{\mathrm{n}}$. Let $f: G \rightarrow G$ be a CT map.
(1) Let $H_{r}$ be a zero stratum and let $H_{\ell}$ be the EG stratum given by Proposition 2.5 (4). There does not exist an INP of height $\ell$.
(2) Let $H_{r}$ be an EG stratum and let $\rho_{r}$ be an INP of height $r$. Then $\rho_{r}$ has a decomposition $\rho_{r}=a_{0} b_{1} a_{1} \ldots b_{k} a_{k}$ where, for every $i \in\{0, \ldots, k\}$, the subpath $a_{i}$ is $a$ nontrivial path contained in $H_{r}$ and for every $i \in\{1, \ldots, k\}$, the subpath $b_{i}$ is a Nielsen path contained in $G_{r-1}$.

An INP is an EG INP if the maximal stratum it intersects is an EG stratum and is an NEG INP otherwise. Note that, by Proposition 2.5 (9), there exists only finitely many EG INPs.

Lemma 2.9. Let $\mathrm{n} \geqslant 2$. Let $\phi \in \operatorname{Out}\left(F_{\mathrm{n}}\right)$. Suppose that there exists a $C T$ map $f: G \rightarrow G$ representing a power of $\phi$. Let $\gamma^{\prime}$ be a nontrivial path in a zero stratum. There does not exist a reduced edge path $\gamma=\alpha \gamma^{\prime}$ where $\alpha$ is either an INP or a fixed edge.

Proof. Suppose towards a contradiction that such a path $\gamma=\alpha \gamma^{\prime}$ exists. Let $H_{r}$ be the zero stratum containing $\gamma^{\prime}$. Note that, by Proposition 2.5 (10), the path $\alpha$ does not contain edges in $H_{r}$. By Proposition 2.5 (4), there exists $\ell>r$ such that $H_{\ell}$ is an EG stratum and such that any edge adjacent to a vertex in $H_{r}$ and not contained in $H_{r}$ is in $H_{\ell}$. Hence $\alpha$ has height at least $\ell$. Since $H_{\ell}$ is an EG stratum, the path $\alpha$ is not a fixed edge. Hence $\alpha$ is an INP. By Lemma 2.8 (1), the height of $\alpha$ is not equal to $\ell$. Let $j>\ell$ be the height of $\alpha$. We distinguish between three cases according to the nature of the stratum $H_{j}$. By Proposition $2.5(10)$, the stratum $H_{j}$ is not a zero stratum. Hence, by Proposition 2.5 (1), the stratum $H_{j}$ is irreducible. By Proposition 2.5 (11), if $H_{j}$ is an NEG stratum, then $\alpha$ is of the form $\alpha=e_{j} w^{k} e_{j}^{-1}$, where $e_{j} \in H_{j}, k$ is an integer and $w$ is a closed Nielsen path in $G_{j-1}$. But then $e_{j}^{-1}$ is adjacent to a vertex in $H_{r}$. This contradicts Proposition 2.5 (4) since $j>\ell$. If $H_{j}$ is an EG stratum, then by Lemma 2.8 (2), the path $\alpha$ is the concatenation of subpaths in $H_{j}$ and Nielsen paths of height at most $j-1$, and $\alpha$ ends with an edge in $H_{j}$. By Proposition 2.5 (4), we see that $j=\ell$. This contradicts Lemma 2.8 (1).

The next theorem due to Feighn and Handel is the main existence theorem of the CT maps.

Theorem 2.10. $[F H$, Theorem 4.28, Lemma 4.42] Let $\mathrm{n} \geqslant 3$. There exists a uniform constant $M=M(n) \geqslant 1$ such that for every $\phi \in \operatorname{Out}\left(F_{\mathrm{n}}\right)$ and every $\phi^{M}$-invariant filtration $\mathcal{C}$ of $F_{\mathrm{n}}$, there exists a $C T$ map $f: G \rightarrow G$ that represents $\phi^{M}$ and realizes $\mathcal{C}$.

### 2.4 Relative currents

In this section, we define the notion of currents of $F_{\mathrm{n}}$ relative to a malnormal subgroup system. The section follows Gue1 (see the work of Gupta Gup1 for the particular case of free factor systems and Guirardel and Horbez [GH] in the context of free products of groups). It is closely related to the notion of conjugacy classes of $\mathcal{A}$-nonperipheral elements of $F_{\mathrm{n}}$.

Let $\partial_{\infty} F_{\mathrm{n}}$ be the Gromov boundary of $F_{\mathrm{n}}$. The double boundary of $F_{\mathrm{n}}$ is the quotient topological space

$$
\partial^{2} F_{\mathrm{n}}=\left(\partial_{\infty} F_{\mathrm{n}} \times \partial_{\infty} F_{\mathrm{n}} \backslash \Delta\right) / \sim,
$$

where $\sim$ is the equivalence relation generated by the flip relation $(x, y) \sim(y, x)$ and $\Delta$ is the diagonal, endowed with the diagonal action of $F_{\mathrm{n}}$. We denote by $\{x, y\}$ the equivalence class of $(x, y)$.

Let $T$ be the Cayley graph of $F_{\mathrm{n}}$ with respect to a free basis $\mathfrak{B}$. The boundary of $T$ is naturally homeomorphic to $\partial_{\infty} F_{\mathrm{n}}$ and the set $\partial^{2} F_{\mathrm{n}}$ is then identified with the set of unoriented bi-infinite geodesics in $T$. Let $\gamma$ be a finite geodesic path in $T$. The path $\gamma$ determines a subset in $\partial^{2} F_{\mathrm{n}}$ called the cylinder set of $\gamma$, denoted by $C(\gamma)$, which consists in all unoriented bi-infinite geodesics in $T$ that contain $\gamma$. Such cylinder sets form a basis for a topology on $\partial^{2} F_{\mathrm{n}}$, and in this topology, the cylinder sets are both open and closed, hence compact. The action of $F_{\mathrm{n}}$ on $\partial^{2} F_{\mathrm{n}}$ has a dense orbit.

For every nontrivial subgroup $A$ of $F_{\mathrm{n}}$, let $T_{A}$ be the minimal $A$-invariant subtree of $T$. Let $\mathcal{A}=\left\{\left[A_{1}\right], \ldots,\left[A_{r}\right]\right\}$ be a malnormal subgroup system of $F_{\mathrm{n}}$. By malnormality of $\mathcal{A}$, there exists $L \in \mathbb{N}^{*}$ such that for all distinct subgroups $A, B$ of $F_{\mathrm{n}}$ such that $[A],[B] \in \mathcal{A}$, the diameter of the intersection $T_{A} \cap T_{B}$ is at most $L$ (see for instance [HM, Section I.1.1.2]). Let $i \in\{1, \ldots, r\}$. Let $\Gamma_{i}$ be the set of subgroups $B$ of $F_{\mathrm{n}}$ such that there exists $g_{B} \in F_{\mathrm{n}}$ such that $B=g_{B} A_{i} g_{B}^{-1}$ and the tree $T_{B}$ contains the base point $e$ of $T$. Note that, by malnormality of $\mathcal{A}$, for every $i \in\{1, \ldots, r\}$, the set $\Gamma_{i}$ is finite. For an element $w \in F_{\mathrm{n}}$, let $\widehat{\gamma_{w}}$ be the geodesic path in $T$ starting at $e$ and labeled by $w$. Let $C_{i}$ be the set of elements $w$ of $F_{\mathrm{n}}$ such that the length of $\widehat{\gamma_{w}}$ is equal to $L+2$ and, for every $B \in \Gamma_{i}$, the path $\widehat{\gamma_{w}}$ is not contained in $T_{B}$. Let $\mathscr{C}=\bigcap_{i=1}^{r} C_{i}$. Since we are looking at geodesic paths of length equal to $L+2$, the set $\mathscr{C}$ is finite. Moreover, it only depends on the choice of $\mathcal{A}, \mathfrak{B}$ and $L$.

Lemma 2.11. Gue1, Lemma 2.3] Let $\mathfrak{B}, T, \mathcal{A}=\left\{\left[A_{1}\right], \ldots,\left[A_{r}\right]\right\}, L \in \mathbb{N}^{*}, \Gamma_{1}, \ldots, \Gamma_{r}$, $\mathscr{C}$ be as above. The finite set $\mathscr{C}=\mathscr{C}\left(A_{1}, \ldots, A_{k}\right)$ is nonempty. Moreover, it satisfies the following properties:
(1) every $\mathcal{A}$-nonperipheral cyclically reduced element $g \in F_{\mathrm{n}}$ has a power which contains an element of $\mathscr{C}$ as a subword;
(2) for every $\mathcal{A}$-nonperipheral cyclically reduced element $g \in F_{\mathrm{n}}$, if $c_{g}$ is the geodesic ray in $T$ starting from $e$ obtained by concatenating infinitely many edge paths labeled by $g$, there exists an edge path in $c_{g}$ labeled by a word in $\mathscr{C}$ at distance at most $L+2$ from $\bigcup_{i=1}^{r} \bigcup_{B \in \Gamma_{i}} T_{B}$;
(3) if $\gamma$ is a path in $T$ which contains a subpath labeled by an element of $\mathscr{C}$, then for every $i \in\{1, \ldots, r\}$ and every $g \in F_{\mathrm{n}}$, the path $\gamma$ is not contained in $T_{g A_{i} g^{-1}}$.

Let $A$ be a nontrivial subgroup of $F_{\mathrm{n}}$ of finite rank. The induced $A$-equivariant inclusion $\partial_{\infty} A \hookrightarrow \partial_{\infty} F_{\mathrm{n}}$ induces an inclusion $\partial^{2} A \hookrightarrow \partial^{2} F_{\mathrm{n}}$. Let

$$
\partial^{2} \mathcal{A}=\bigcup_{i=1}^{r} \bigcup_{g \in F_{\mathrm{n}}} \partial^{2}\left(g A_{i} g^{-1}\right)
$$

Let $\partial^{2}\left(F_{\mathrm{n}}, \mathcal{A}\right)=\partial^{2} F_{\mathrm{n}}-\partial^{2} \mathcal{A}$ be the double boundary of $F_{\mathrm{n}}$ relative to $\mathcal{A}$. This subset is invariant under the action of $F_{\mathrm{n}}$ on $\partial^{2} F_{\mathrm{n}}$ and inherits the subspace topology of $\partial^{2} F_{\mathrm{n}}$.

Lemma 2.12. Gue1, Lemma 2.5] Let $\operatorname{Cyl}(\mathscr{C})$ be the set of cylinder sets of the form $C(\gamma)$, where the element of $F_{\mathrm{n}}$ determined by the geodesic edge path $\gamma$ contains an element of $\mathscr{C}$ as a subword. We have

$$
\partial^{2}\left(F_{\mathrm{n}}, \mathcal{A}\right)=\bigcup_{C(\gamma) \in \operatorname{Cyl}(\mathscr{C})} C(\gamma)
$$

In particular, the space $\partial^{2}\left(F_{\mathrm{n}}, \mathcal{A}\right)$ is an open subset of $\partial^{2} F_{\mathrm{n}}$.
Lemma 2.13. Gue1, Lemma 2.6, Lemma 2.7] Let $\mathrm{n} \geqslant 3$ and let $\mathcal{A}$ be a malnormal subgroup system of $F_{\mathrm{n}}$. The space $\partial^{2}\left(F_{\mathrm{n}}, \mathcal{A}\right)$ is locally compact and the action of $F_{\mathrm{n}}$ on $\partial^{2}\left(F_{\mathrm{n}}, \mathcal{A}\right)$ has a dense orbit.

We can now define a relative current. Let $\mathrm{n} \geqslant 3$ and let $\mathcal{A}$ be a malnormal subgroup system of $F_{\mathrm{n}}$. A relative current on $\left(F_{\mathrm{n}}, \mathcal{A}\right)$ is a (possibly zero) $F_{\mathrm{n}}$-invariant Radon measure $\mu$ on $\partial^{2}\left(F_{\mathrm{n}}, \mathcal{A}\right)$. The set $\operatorname{Curr}\left(F_{\mathrm{n}}, \mathcal{A}\right)$ of all relative currents on $\left(F_{\mathrm{n}}, \mathcal{A}\right)$ is equipped with the weak-* topology: a sequence $\left(\mu_{n}\right)_{n \in \mathbb{N}}$ in $\operatorname{Curr}\left(F_{\mathrm{n}}, \mathcal{A}\right)^{\mathbb{N}}$ converges to a current $\mu \in \operatorname{Curr}\left(F_{\mathrm{n}}, \mathcal{A}\right)$ if and only if for all disjoint clopen subsets $S, S^{\prime} \subseteq \partial^{2}\left(F_{\mathrm{n}}, \mathcal{A}\right)$, the sequence $\left(\mu_{n}\left(S \times S^{\prime}\right)\right)_{n \in \mathbb{N}}$ converges to $\mu\left(S \times S^{\prime}\right)$.

The group $\operatorname{Out}\left(F_{\mathrm{n}}, \mathcal{A}\right)$ acts on $\operatorname{Curr}\left(F_{\mathrm{n}}, \mathcal{A}\right)$ as follows. Let $\phi \in \operatorname{Out}\left(F_{\mathrm{n}}, \mathcal{A}\right)$, let $\Phi$ be a representative of $\phi$, let $\mu \in \operatorname{Curr}\left(F_{\mathrm{n}}, \mathcal{A}\right)$ and let $C$ be a Borel subset of $\partial^{2}\left(F_{\mathrm{n}}, \mathcal{A}\right)$. Then, since $\phi$ preserves $\mathcal{A}$, we see that $\Phi^{-1}(C) \in \partial^{2}\left(F_{\mathrm{n}}, \mathcal{A}\right)$. Then we set

$$
\phi(\mu)(C)=\mu\left(\Phi^{-1}(C)\right)
$$

which is well-defined since $\mu$ is $F_{\mathrm{n}}$-invariant.
Every conjugacy class of nonperipheral element $g \in F_{\mathrm{n}}$ determines a relative current $\eta_{[g]}$ as follows. Suppose first that $g$ is root-free, that is $g$ is not a proper power of any element in $F_{\mathrm{n}}$. Let $\gamma$ be a finite geodesic path in the Cayley graph $T$. Then $\eta_{[g]}(C(\gamma))$
is the number of axes in $T$ of conjugates of $g$ that contain the path $\gamma$. If $g=h^{k}$ with $k \geqslant 2$ and $h$ root-free, we set $\eta_{[g]}=k \eta_{[h]}$. Such currents are called rational currents.

Let $G$ be a pointed connected graph whose fundamental group is isomorphic to $F_{\mathrm{n}}$. Let $\widetilde{G}$ be the universal cover of $G$. There exists a (nonunique, but fixed) $F_{\mathrm{n}}$ equivariant quasi-isometry $\widetilde{m}: \widetilde{G} \rightarrow T$ which extends uniquely to a homeomorphism $\widehat{m}: \partial_{\infty} G \rightarrow \partial_{\infty} F_{\mathrm{n}}$. Therefore, if $\widetilde{\gamma}$ is a reduced edge path in $\widetilde{G}$, we can define the cylinder set in $\partial^{2} F_{\mathrm{n}}$ defined by $\tilde{\gamma}$ as

$$
C_{\widetilde{m}}(\widetilde{\gamma})=C([\widetilde{m}(\widetilde{\gamma})])
$$

Let $\gamma$ be a reduced edge path in $G$ and let $\widetilde{\gamma}$ be a lift of $\gamma$ in $\widetilde{G}$. Let $\mu \in \operatorname{Curr}\left(F_{\mathrm{n}}, \mathcal{A}\right)$. We define the number of occurrences of $\gamma$ in $\mu$ as

$$
\begin{equation*}
\langle\gamma, \mu\rangle_{\widetilde{m}}=\mu\left(C_{\widetilde{m}}(\widetilde{\gamma})\right) \tag{2}
\end{equation*}
$$

For every such graph $G$, we fix once and for all the quasi-isometry $\widetilde{m}: \widetilde{G} \rightarrow T$. Therefore, when the graph $G$ is fixed, we will generally omit the mention of $\widetilde{m}$. We also define the simplicial length of $\mu$ as:

$$
\|\mu\|=\sum_{e \in \vec{E} G}\langle e, \mu\rangle .
$$

For any given reduced edge path $\gamma$, the functions $\langle\gamma,$.$\rangle and \|$.$\| are continuous, linear$ functions of $\operatorname{Curr}\left(F_{\mathrm{n}}, \mathcal{A}\right)$.

Let $\mu \in \operatorname{Curr}\left(F_{\mathrm{n}}, \mathcal{A}\right)$. The support of $\mu$, denoted by $\operatorname{Supp}(\mu)$, is the support of the Borel measure $\mu$ on $\partial^{2}\left(F_{\mathrm{n}}, \mathcal{A}\right)$. We recall that $\operatorname{Supp}(\mu)$ is a closed subset of $\partial^{2}\left(F_{\mathrm{n}}, \mathcal{A}\right)$.

In the rest of the article, rather than considering the space of relative currents itself, we will consider the set of projectivized relative currents, denoted by

$$
\mathbb{P} \operatorname{Curr}\left(F_{\mathrm{n}}, \mathcal{A}\right)=\left(\operatorname{Curr}\left(F_{\mathrm{n}}, \mathcal{A}\right)-\{0\}\right) / \sim,
$$

where $\mu \sim \nu$ if there exists $\lambda \in \mathbb{R}_{+}^{*}$ such that $\mu=\lambda \nu$. The projective class of a current $\mu \in \operatorname{Curr}\left(F_{\mathrm{n}}, \mathcal{A}\right)$ will be denoted by $[\mu]$. We have the following properties.

Lemma 2.14. Gue1, Lemma 3.3] Let $\mathrm{n} \geqslant 3$ and let $\mathcal{A}$ be a malnormal subgroup system of $F_{\mathrm{n}}$. The space $\mathbb{P} \operatorname{Curr}\left(F_{\mathrm{n}}, \mathcal{A}\right)$ is compact.

Proposition 2.15. [Gue1, Theorem 1.1] Let $\mathrm{n} \geqslant 3$ and let $\mathcal{A}$ be a malnormal subgroup system of $F_{\mathrm{n}}$. The set of projectivised rational currents about nonperipheral elements of $F_{\mathrm{n}}$ is dense in $\operatorname{PCurr}\left(F_{\mathrm{n}}, \mathcal{A}\right)$.

## 3 The polynomially growing subgraph of a CT map

In this section, let $\mathrm{n} \geqslant 3$ and let $\mathcal{F}$ be a free factor system of $F_{\mathrm{n}}$. Let $\phi \in \operatorname{Out}\left(F_{\mathrm{n}}, \mathcal{F}\right)$. Let $f: G \rightarrow G$ be a CT map with filtration $\varnothing=G_{0} \subsetneq G_{1} \subsetneq \ldots \subsetneq G_{k}=G$ representing a power of $\phi$ and such that there exists $p \in\{1, \ldots, k-1\}$ such that $\mathcal{F}\left(G_{p}\right)=\mathcal{F}$.

We construct a subgraph of $G$, called the polynomially growing subgraph of $G$ and denoted by $G_{P G}$, which encaptures the information regarding polynomial growth in the graph $G$. We then define a notion of length relative to $G_{P G}$, called the exponential length, which measures the time spent by an edge path outside of $G_{P G}$. Finally, we construct a subspace of $\mathbb{P} \operatorname{Curr}\left(F_{\mathrm{n}}, \mathcal{F}\right)$ which consists in the currents whose support maps to $G_{P G}$.

### 3.1 Definitions and first properties

We define in this section the polynomially growing subgraph $G_{P G}$ of $G$ and proves some of its properties.

Definition 3.1. (1) Let $G_{P G}$ be the (not necessarily connected) subgraph of $G$ whose edges are the edges $e$ of $G$ in an NEG stratum such that for every $k \in \mathbb{N}^{*}$, the path $\left[f^{k}(e)\right]$ does not contain a splitting unit which is an edge in an EG stratum.
(2) Let $\mathcal{N}_{P G}^{\prime}$ be the set of all Nielsen paths in $G$.
(3) Let $\mathcal{N}_{P G}$ be the subset of $\mathcal{N}_{P G}^{\prime}$ consisting in all Nielsen paths which are either EG INPs or concatenations of (at least 2) nonclosed EG INPs.
(4) Let $\mathcal{Z}$ be the subgraph of $G$ whose edges are the edges contained in a zero stratum.

Note that, by Lemma 2.7, every path in $\mathcal{N}_{P G}^{\prime}$ (and hence every path in $\mathcal{N}_{P G}$ ) has a complete splitting consisting in fixed edges and INPs. Since a complete splitting is unique by Proposition 2.5 (7), if $\gamma$ is a reduced path in $\mathcal{N}_{P G}$, then the splitting of $\gamma$ given in Definition 3.1 (3) is the complete splitting of $\gamma$. Moreover, $\gamma$ is either an EG INP or the complete splitting of $\gamma$ has at least two splitting units and all of them are nonclosed EG INPs. In particular, the set $\mathcal{N}_{P G}$ does not contain Nielsen paths such that one of their splitting units is either a fixed edge or an NEG INP. Moreover, a Nielsen path which is a concatenation of at least 2 splitting units and such that one of them is a closed EG INP is not in $\mathcal{N}_{P G}$. Excluding such paths from $\mathcal{N}_{P G}$ ensures a finiteness result for $\mathcal{N}_{P G}$ (see Lemma 3.4 (1)). Informally, paths in $\mathcal{N}_{P G}$ play the role of lowdynamics bridges between connected components of $G_{P G}$ (see Figure 1). We will see in Proposition 3.13 that a cycle in $G$ has polynomial growth under iteration of $f$ if and only if is a concatenation of paths in $G_{P G}$ and paths in $\mathcal{N}_{P G}$.

Figure 1: A path $\gamma$ in $\mathcal{N}_{P G}$ between two connected components of $G_{P G}$.
Note that, with $p$ defined at the beginning of Section 3, one can similarly define the polynomially growing subgraph of $G_{p}$, denoted by $G_{P G, \mathcal{F}}$, which is the subgraph
$G_{P G} \cap G_{p}$. We can also define similarly $\mathcal{N}_{P G, \mathcal{F}}^{\prime}, \mathcal{N}_{P G, \mathcal{F}}$ and $\mathcal{Z}_{\mathcal{F}}$ by considering the paths of $\mathcal{N}_{P G}^{\prime}, \mathcal{N}_{P G}$ and $\mathcal{Z}$ contained in $G_{p}$.

We now recall a lemma due to Bestvina and Handel regarding $r$-legal paths.
Lemma 3.2. [BH, Lemma 5.8] Let $f: G \rightarrow G$ be a relative train track map. Let $H_{r}$ be an $E G$ stratum. Suppose that $\sigma=a_{1} b_{1} a_{2} \ldots a_{\ell} b_{\ell}$ is the decomposition of an $r$-legal path into subpaths $a_{j} \subseteq H_{r}$ and $b_{j} \subseteq G_{r-1}$ (where $a_{1}$ and $b_{\ell}$ might be trivial). Then for every $i \in\{1, \ldots, \ell\}$, the path $f\left(a_{\ell}\right)$ is a reduced edge path and

$$
[f(\sigma)]=f\left(a_{1}\right)\left[f\left(b_{1}\right)\right] f\left(a_{2}\right) \ldots f\left(a_{\ell}\right)\left[f\left(b_{\ell}\right)\right] .
$$

Note that, if $H_{r}$ is an EG stratum and if $\sigma=a_{1} b_{1} a_{2} \ldots a_{\ell} b_{\ell}$ is an $r$-legal path as in Lemma 3.2, then for every $i \in\{1, \ldots, \ell\}$, as $a_{i} \subseteq H_{r}$, the path $a_{i}$ grows exponentially fast under iteration of $f$. Hence, by Lemma 3.2 the path $\sigma$ grows exponentially fast under iteration of $f$. We now prove some results regarding paths in $\mathcal{N}_{P G}$.

Lemma 3.3. Let $\sigma$ be an EGINP.
(1) There do not exist nontrivial subpaths $c, d$ of $\sigma$ such that $\sigma=c d c$.
(2) Let $\gamma \in\left\{\sigma^{ \pm 1}\right\}$. There do not exist paths $\gamma_{1}, \gamma_{2}, \gamma_{3}$ such that $\gamma_{2}$ is nontrivial, $\gamma_{1}$ or $\gamma_{3}$ is nontrivial and $\sigma=\gamma_{1} \gamma_{2}$ and $\gamma=\gamma_{2} \gamma_{3}$.

Proof. (1) Let $r$ be the height of $\sigma$. Suppose towards a contradiction that such a decomposition $\sigma=c d c$ exists. By [BH, Lemma 5.11], there exist two distinct $r$-legal paths $\alpha$ and $\beta$ such that $\sigma=\alpha \beta$ and such that the turn $\left\{D f\left(\alpha^{-1}\right), D f(\beta)\right\}$ is the only height $r$ illegal turn. Moreover, there exists a path $\tau$ such that $[f(\alpha)]=\alpha \tau$ and $[f(\beta)]=\tau^{-1} \beta$. Hence $c$ is contained in $\alpha$ and in $\beta$ and is $r$-legal. Thus, there exist two paths $d_{1}$ and $d_{2}$ such that $\alpha=c d_{1}$ and $\beta=d_{2} c$.

First we claim that for every $k \in \mathbb{N}^{*}$, there exists a path $\tau_{k}$ such that $\left[f^{k}(\alpha)\right]=\alpha \tau_{k}$ and $\left[f^{k}(\beta)\right]=\tau_{k}^{-1} \beta$. The proof is by induction on $k$. The base case follows from the existence of $\tau$. Suppose now that $\tau_{k-1}$ exists. We have:

$$
\left[f^{k}(\alpha)\right]=\left[f\left(\alpha \tau_{k-1}\right)\right]=[f(\alpha)]\left[f\left(\tau_{k-1}\right)\right]=\alpha \tau\left[f\left(\tau_{k-1}\right)\right]=\alpha \tau_{k},
$$

where the second equality comes from the fact that $\alpha$ is $r$-legal, that $\alpha$ ends with an edge in $H_{r}$ and from Lemma 3.2, Similarly, we have $\left[f^{k}(\beta)\right]=\tau_{k}^{-1} \beta$. This proves the claim.

We now claim that, up to taking a power of $f$, there exists a cycle $e$ such that $[f(c)]=\alpha e \beta$. Indeed, by Proposition [2.5 (9), the path $\sigma$ starts and ends with an edge in $H_{r}$. Hence the path $c$ starts and ends with an edge in $H_{r}$. Since $c$ is $r$-legal, we see that the length of $\left[f^{k}(c)\right]$ goes to infinity as $k$ goes to infinity by Lemma 3.2, But, for every $k \in \mathbb{N}^{*}$, there exists a path $\tau_{k}$ such that $\left[f^{k}(\alpha)\right]=\alpha \tau_{k}$ and $\left[f^{k}(\beta)\right]=\tau_{k}^{-1} \beta$. By Lemma [3.2, since $c$ is the initial segment of $\alpha$ and since $\alpha$ is $r$-legal, there is no identification between $[f(c)]$ and $\left[f\left(d_{1}\right)\right]$. Thus, there exists $k_{1} \in \mathbb{N}^{*}$ such that $\left[f^{k_{1}}(c)\right]$ starts with $\alpha$. Similarly, there exists $k_{2} \in \mathbb{N}^{*}$ such that $\left[f^{k_{2}}(c)\right]$ ends with $\beta$. Thus, up
to taking a power of $f$, and since the paths $\alpha$ and $\beta$ are $r$-legal, we may suppose that there exists a (reduced) cycle $e$ such that $[f(c)]=\alpha e \beta$.

Finally, we claim that the cycle $e$ is trivial. Indeed, since the paths $\alpha$ and $\beta$ are $r$-legal, and since $c$ starts and ends with an edge in $H_{r}$, we see that

$$
[f(\alpha)]=[f(c)]\left[f\left(d_{1}\right)\right]=\alpha e \beta\left[f\left(d_{1}\right)\right]
$$

and

$$
[f(\beta)]=\left[f\left(d_{2}\right)\right][f(c)]=\left[f\left(d_{2}\right)\right] \alpha e \beta
$$

Recall that there exists $k \in \mathbb{N}^{*}$ such that $[f(\alpha)]=\alpha \tau_{k}$ and $[f(\beta)]=\tau_{k}^{-1} \beta$. This implies that $\tau_{k}=e \beta\left[f\left(d_{1}\right)\right]$ and that $\tau_{k}^{-1}=\left[f\left(d_{2}\right)\right] \alpha e$, that is $\tau_{k}=e^{-1} \alpha^{-1}\left[f\left(d_{2}\right)\right]^{-1}$. This shows that $e=e^{-1}$, that is, $e$ is trivial. This proves the claim.

Therefore, we see that $[f(c)]=\alpha \beta=\sigma$. But $\sigma$ contains a height $r$ illegal turn, whereas $c$ is an $r$-legal path. This contradicts Proposition 2.5(1) and Definition 2.1(3). This concludes the proof of (1).
(2) Let $\sigma, \gamma$ be as in the assertion of the lemma. Suppose towards a contradiction that there exist three paths $\gamma_{1}, \gamma_{2}, \gamma_{3}$ such that $\gamma_{2}$ is nontrivial and $\sigma=\gamma_{1} \gamma_{2}$ and $\gamma=$ $\gamma_{2} \gamma_{3}$. Suppose first that $\gamma=\sigma$. Then either a nontrivial initial segment of $\gamma_{2}$ is its terminal segment or there exists a path $\gamma_{4}$ such that $\sigma=\gamma_{2} \gamma_{4} \gamma_{2}$. The first case is not possible as otherwise $\sigma$ would contain two illegal turns. This contradicts the fact that $\sigma$ contains a unique illegal turn (see [BH, Lemma 5.11]). The second case is not possible by Lemma 3.3 (1). Suppose now that $\gamma=\sigma^{-1}$. But $\sigma^{-1}=\gamma_{2}^{-1} \gamma_{1}^{-1}$. Therefore we see that $\gamma_{2}^{-1}=\gamma_{2}$, that is, $\gamma_{2}$ is trivial. This leads to a contradiction. This concludes the proof.

Lemma 3.4. (1) There are only finitely many paths in $\mathcal{N}_{P G}$.
(2) Let $\gamma, \gamma^{\prime}$ be paths in $\mathcal{N}_{P G}$. Suppose that $\gamma$ has a decomposition $\gamma=\gamma_{1} \gamma_{2}$ such that $\gamma_{2}$ is an initial segment of $\gamma^{\prime}$. Then $\gamma_{1}, \gamma_{2} \in \mathcal{N}_{P G}$ and $\gamma_{1} \gamma^{\prime} \in \mathcal{N}_{P G}$.
(3) Let $\gamma, \gamma^{\prime}$ be paths in $\mathcal{N}_{P G}$. Suppose that $\gamma^{\prime} \subseteq \gamma$. Then one of the following holds:
(a) there exist (possibly trivial) paths $\gamma_{1}, \gamma_{2} \in \mathcal{N}_{P G}$ such that $\gamma=\gamma_{1} \gamma^{\prime} \gamma_{2}$;
(b) there exists an INP $\sigma$ in the complete splitting of $\gamma$ such that $\gamma^{\prime} \subsetneq \sigma$ and $\gamma^{\prime}$ is not an initial or a terminal segment of $\sigma$.
(4) Let $\gamma, \gamma^{\prime}$ be two paths in $\mathcal{N}_{P G}$. Suppose that there exist three paths $\gamma_{1}, \gamma_{2}$ and $\gamma_{3}$ such that $\gamma=\gamma_{1} \gamma_{2}, \gamma^{\prime}=\gamma_{2}^{-1} \gamma_{3}$ and the path $\gamma_{1} \gamma_{3}$ is reduced. Then $\gamma_{2} \in \mathcal{N}_{P G}$ and $\gamma_{1} \gamma_{3} \in \mathcal{N}_{P G}$.

Proof. (1) First note that, since there are only finitely many EG strata in $G$, there are only finitely many EG INPs by Proposition 2.5 (9). Let $\gamma$ be a path in $\mathcal{N}_{P G}$ which is a concatenation of at least 2 nonclosed EG INPs. Let $\gamma=\sigma_{1} \ldots \sigma_{k}$ be the complete splitting of $\gamma$ given by Lemma 2.7. As $\gamma$ is a concatenation of nonclosed EG INPs, every splitting unit of $\gamma$ is a nonclosed EG INP. By Proposition 2.5 (9), an INP contained in the complete splitting of $\gamma$ is entirely determined by the highest stratum $H_{r}$ such
that $\gamma$ contains an edge of $H_{r}$. For every $i \in\{1, \ldots, k\}$, let $r_{i}$ be the height of $\sigma_{i}$. Let $i \in\{2, \ldots, k\}$. Since $\sigma_{i}$ is not closed, by [HM, Fact 1.42(1)(a)], one of the endpoints of $\sigma_{i}$ is not contained in $G_{r_{i}-1}$. Since there exists a unique INP of height $r_{i}$ by Proposition 2.5 (9), either $r_{i-1}<r_{i}$ or $r_{i}<r_{i-1}$. We treat the case $r_{1}<r_{2}$, the case $r_{2}<r_{1}$ being similar. We claim that, for every $i \in\{1, \ldots, k-1\}$, we have $r_{i+1}>r_{i}$. The proof is by induction on $i$. The base case is true by hypothesis. Let $i \in\{2, \ldots, k-1\}$. Since $r_{i-1}<r_{i}$, the origin of $\sigma_{i}$ is contained in $G_{r_{i}-1}$ and the terminal point of $\sigma_{i}$ is not contained in $G_{r_{i}-1}$. Thus, the first edge of $\sigma_{i+1}$ is contained in $\overline{G-G_{r_{i}-1}}$. Since there exists a unique INP of height $r_{i}$ we necessarily have $r_{i}<r_{i+1}$. Thus, the sequence of maximal heights of INPs in $\gamma$ is (strictly) monotonic. Since there are only finitely many EG strata, there are only finitely many paths in $\mathcal{N}_{P G}$. This concludes the proof of (1).
(2) Let $\gamma^{\prime} \in \mathcal{N}_{P G}$ and let $\gamma=\gamma_{1} \gamma_{2}$ be as in the assertion of the lemma. We claim that $\gamma_{2} \in \mathcal{N}_{P G}$ and that the splitting units of $\gamma_{2}$ are splitting units of both $\gamma$ and $\gamma^{\prime}$. This will conclude the proof of Assertion (2) because $\gamma_{1}$ will be a concatenation of splitting units of $\gamma$, that is, it will be either an EG INP or a concatenation of nonclosed EG INPs (cf Definition 3.1 (3)). Hence we will have $\gamma_{1} \in \mathcal{N}_{P G}$ and $\gamma_{1} \gamma^{\prime} \in \mathcal{N}_{P G}$. We show that $\gamma_{2}$ is a concatenation of INPs which are splitting units of $\gamma^{\prime}$. A similar proof will show that the splitting units of $\gamma_{2}$ will also be splitting units of $\gamma$. Indeed, the path $\gamma^{\prime}$ has a splitting $\gamma^{\prime}=\sigma_{1}^{\prime} \sigma_{2}^{\prime} \ldots \sigma_{k}^{\prime}$ which consists in EG INPs. Let $r^{\prime}$ be the height of $\sigma_{1}^{\prime}$. By Proposition 2.5 (9), there exists a unique unoriented INP of height $r^{\prime}$ and this INP starts and ends with an edge in $H_{r^{\prime}}$. Let $\sigma$ be the INP of $\gamma$ which has a decomposition $\sigma=\sigma_{1} \sigma_{2}$, where $\sigma_{2}$ is a nontrivial initial segment of $\gamma^{\prime}$. As every splitting unit of $\gamma$ is an EG INP, so is $\sigma$. Let $r$ be the height of $\sigma$. Since the first edge of $\sigma_{1}^{\prime}$ is of height $r^{\prime}$, we cannot have $r^{\prime}>r$. If $r=r^{\prime}$, then by the uniqueness statement in Proposition 2.5 (9), we have $\sigma_{1}^{\prime} \in\left\{\sigma, \sigma^{-1}\right\}$. Note that, if $\sigma_{1}$ is nontrivial, there exist reduced paths $\tau_{1}, \tau_{2}$ such that $\sigma=\sigma_{1} \tau_{1}$ and $\sigma_{1}^{\prime}=\tau_{1} \tau_{2}$. This contradicts Lemma 3.3 (2) applied to $\sigma$ and $\sigma_{1}^{\prime}$. Thus, we see that $\sigma=\sigma_{1}^{\prime}$ and $\sigma_{1}^{\prime} \subseteq \gamma_{2}$. If $r^{\prime}<r$, then by Lemma 2.8 (2), the path $\sigma$ has a decomposition $\sigma=a_{1} b_{1} \ldots b_{k-1} a_{k}$ such that, for every $i \in\{1, \ldots, k\}$, the path $a_{i}$ is a path in $H_{r}$ and for every $i \in\{1, \ldots, k-1\}$, the path $b_{i}$ is a Nielsen path in $G_{r-1}$. Hence there exists $i \in\{1, \ldots, k-1\}$ such that $\sigma_{1}^{\prime}$ is contained in $b_{i}$. Therefore, we see that $\sigma_{1}^{\prime} \subseteq \sigma \subseteq \gamma$. As $\sigma_{1}^{\prime} \subseteq \gamma^{\prime}$, we see that $\sigma_{1}^{\prime} \subseteq \gamma \cap \gamma^{\prime}=\gamma_{2}$. If $\gamma_{2}=\sigma_{1}^{\prime}$, then we are done. Otherwise, the path $\gamma_{2}$ contains an edge of $\sigma_{2}^{\prime}$. As $\sigma_{2}^{\prime}$ is an EG INP, the same argument as for $\sigma_{1}^{\prime}$ shows that $\sigma_{2}^{\prime} \subseteq \gamma_{2}$, and an inductive argument shows that $\gamma_{2}$ is a concatenation of INPs in the splitting of $\gamma^{\prime}$. Hence $\gamma_{2}$ is a Nielsen path. Therefore, we see that $\gamma_{2} \in \mathcal{N}_{P G}$ and that $\gamma_{2}$ is composed of splitting units of $\gamma^{\prime}$. Similarly, we see that $\gamma_{2}$ is composed of splitting units which are splitting units of both $\gamma$ and $\gamma^{\prime}$. Hence $\gamma_{1}$ is composed of splitting units of $\gamma$. This concludes the proof of (2).
(3) Let $\gamma, \gamma^{\prime}$ be as in the assertion of the lemma. Let $\gamma=\sigma_{1} \ldots \sigma_{k}$ be the complete splitting of $\gamma$ and let $\gamma^{\prime}=\sigma_{1}^{\prime} \ldots \sigma_{m}^{\prime}$ be the complete splitting of $\gamma^{\prime}$, which exist by Lemma 2.7. Recall that every splitting unit of both $\gamma$ and $\gamma^{\prime}$ is an EG INP. There exists $i \in\{1, \ldots, k\}$ such that $\sigma_{i}$ contains an initial segment of $\sigma_{1}^{\prime}$. We claim that $\sigma_{1}^{\prime}$ is either equal to $\sigma_{i}$ or $\gamma^{\prime}$ is strictly contained in $\sigma_{i}$. Indeed, let $r$ be the height of $\sigma_{i}$ and let $r^{\prime}$
be the height of $\sigma_{1}^{\prime}$. Since the first edge of $\sigma_{1}^{\prime}$ is of height $r^{\prime}$, we cannot have $r^{\prime}>r$.
Suppose first that $r^{\prime}<r$. By Lemma [2.8 (2), the path $\sigma_{i}$ has a decomposition $\sigma_{i}=a_{1} b_{1} \ldots b_{p-1} a_{p}$ such that, for every $i \in\{1, \ldots, p\}$, the path $a_{i}$ is a path in $H_{r}$ and for every $j \in\{1, \ldots, p-1\}$, the path $b_{j}$ is a Nielsen path in $G_{r-1}$. Hence there exists $j \in\{1, \ldots, p-1\}$ such that $\sigma_{1}^{\prime}$ is contained in $b_{j}$. We claim that, for every $\ell \in\{1, \ldots, m\}$, the splitting unit $\sigma_{\ell}^{\prime}$ is contained in $b_{j}$. The proof is by induction on $\ell$. For the base case, we already know that $\sigma_{1}^{\prime} \subseteq b_{j}$. Suppose that for some $\ell \in\{2, \ldots, m\}$, the path $\sigma_{\ell-1}^{\prime}$ is contained in $b_{j}$. By Proposition 2.5 (9), the path $\sigma_{i}$ ends with an edge in $H_{r}$. Hence the path $a_{p}$ is nontrivial. Since $\sigma_{\ell-1}^{\prime}$ is contained in $b_{j}$, the path $\sigma_{\ell}^{\prime}$ intersects $\sigma_{i}$ nontrivially. Let $r_{\ell}$ be the height of $\sigma_{\ell}^{\prime}$. Recall that $\sigma_{\ell}^{\prime}$ is an EG INP. By Proposition 2.5 (9), the path $\sigma_{\ell}^{\prime}$ starts with an edge in $H_{r_{\ell}}$. Hence $r_{\ell} \leqslant r$. Suppose towards a contradiction that $r_{\ell}=r$. Then, by the uniqueness statement of Proposition [2.5(9), we see that $\sigma_{\ell}^{\prime} \in\left\{\sigma_{i}^{ \pm 1}\right\}$. As $\sigma_{i}$ contains an initial segment of $\sigma_{\ell}^{\prime}$, there exist three paths $\gamma_{1}, \gamma_{2}$ and $\gamma_{3}$ of $G$ such that $\gamma_{2}$ is nontrivial and $\sigma_{i}=\gamma_{1} \gamma_{2}$ and $\sigma_{\ell}^{\prime}=\gamma_{2} \gamma_{3}$. Since $\sigma_{\ell-1}^{\prime}$ is contained in $\sigma_{i}$, the path $\gamma_{1}$ is nontrivial. This contradicts Lemma 3.3 (2). Therefore we have $r_{\ell}<r$. But then $\sigma_{\ell}^{\prime}$ cannot intersect $a_{j+1}$. This implies that $\sigma_{\ell}^{\prime}$ is contained in $b_{j}$. This proves the claim and the fact that $\gamma^{\prime} \subsetneq \sigma_{i}$ and $\gamma^{\prime}$ is not an initial or a terminal segment of $\sigma_{i}$.

Suppose now that $r=r^{\prime}$. By the uniqueness statement of Proposition 2.5 (9), we see that $\sigma_{1}^{\prime} \in\left\{\sigma_{i}^{ \pm 1}\right\}$. As $\sigma_{i}$ contains an initial segment of $\sigma_{1}^{\prime}$, there exist three paths $\gamma_{1}, \gamma_{2}$ and $\gamma_{3}$ of $G$ such that $\gamma_{2}$ is nontrivial and $\sigma_{i}=\gamma_{1} \gamma_{2}$ and $\sigma_{1}^{\prime}=\gamma_{2} \gamma_{3}$. By Lemma 3.3 (2), we necessarily have that $\gamma_{1}$ and $\gamma_{3}$ are trivial. Thus, we see that $\sigma_{i}=\sigma_{1}^{\prime}$. Therefore, $\gamma^{\prime}$ is an initial segment of $\sigma_{i} \ldots \sigma_{k}$ and is a Nielsen path. By [FH, Corollary 4.12], for every $j \in\{1, \ldots, m\}$, we have $\sigma_{i+j-1}=\sigma_{j}^{\prime}$. Thus, there exist (possibly trivial) paths $\gamma_{1}, \gamma_{2} \in \mathcal{N}_{P G}$ such that $\gamma=\gamma_{1} \gamma^{\prime} \gamma_{2}$. This concludes the proof of (3).
(4) Let $\gamma, \gamma^{\prime}, \gamma_{1}, \gamma_{2}$ and $\gamma_{3}$ be as in the assertion of the lemma. Let $\gamma=\alpha_{1} \ldots \alpha_{k}$ and $\gamma^{\prime}=\beta_{1} \ldots \beta_{\ell}$ be the complete splittings of $\gamma$ and $\gamma^{\prime}$ given by Lemma 2.7. By definition of $\mathcal{N}_{P G}$, every splitting unit of $\gamma$ and $\gamma^{\prime}$ is an EG INP. Let $i \in\{1, \ldots, k\}$ be such that $\alpha_{i}$ contains the first edge of $\gamma_{2}$. Let $j \in\{1, \ldots, \ell\}$ be such that $\beta_{j}$ contains the last edge of $\gamma_{2}^{-1}$. We claim that $\alpha_{i} \subseteq \gamma_{2}$ and that $\beta_{j} \subseteq \gamma_{2}^{-1}$. By [FH, Corollary 4.12] applied to $\gamma_{2}^{-1}$ and $\gamma^{-1}$, there exists a path $\delta_{i}$ contained in $\alpha_{i}$ such that the decomposition $\gamma_{2}=\delta_{i} \alpha_{i+1} \ldots \alpha_{k}$ is a splitting of $\gamma_{2}$. Similarly, there exists a path $\delta_{j}^{\prime}$ in $\beta_{j}$ such that $\gamma_{2}^{-1}=\beta_{1} \ldots \beta_{j-1} \delta_{j}^{\prime}$ is a splitting of $\gamma_{2}^{-1}$. By Proposition 2.5 (9), an EG INP starts with an edge of highest height and an EG INP is entirely determined by its height. Hence $\alpha_{k}=\beta_{1}^{-1}$. Note that the paths $\delta_{i} \alpha_{i+1} \ldots \alpha_{k-1}$ and $\beta_{2} \ldots \beta_{j-1} \delta_{j}^{\prime}$ satisfy the same hypotheses as $\delta_{i} \alpha_{i+1} \ldots \alpha_{k}$ and $\beta_{1} \ldots \beta_{j-1} \delta_{j}^{\prime}$. Applying the same arguments, we see that $i=j$ and for every $s \in\{1, \ldots, j-1\}$, we have $\beta_{s}=\alpha_{k-s+1}^{-1}$. Hence we see that $\delta_{i}=\delta_{j}^{\prime-1}$. Let $r$ be the height of $\alpha_{i}$ and let $r^{\prime}$ be the height of $\beta_{j}$. Note that by Proposition 2.5 (9) applied to $\alpha_{i}$ and $\beta_{j}$, the path $\delta_{i}$ ends with an edge in $H_{r}$ and $\delta_{j}^{\prime-1}$ ends with an edge in $H_{r^{\prime}}$. Therefore, we see that $r=r^{\prime}$. By uniqueness of EG INPs of height $r_{i}$ given by Proposition 2.5 (9), and since $\gamma_{1} \gamma_{3}$ is reduced, we see that $\alpha_{i}=\beta_{j}^{-1}$, that $\alpha_{i} \subseteq \gamma_{2}$ and that $\beta_{j} \subseteq \gamma_{2}^{-1}$. This shows that $\gamma_{2}$ is a path in $\mathcal{N}_{P G}$. By Assertion (2) applied to $\gamma$ and $\gamma_{2}$, the path $\gamma_{1}$ is contained in $\mathcal{N}_{P G}$. Similarly, we see that the path $\gamma_{3}$ is contained in
$\mathcal{N}_{P G}$. Since the path $\gamma_{1} \gamma_{3}$ is reduced, we see that $\gamma_{1} \gamma_{3} \in \mathcal{N}_{P G}$. This concludes the proof.

Lemma 3.5. Let $\gamma$ and $\gamma^{\prime}$ be two reduced edge paths in $G$ which are concatenations of paths in $G_{P G}$ and $\mathcal{N}_{P G}$. Suppose that there exist three paths $\gamma_{1}, \gamma_{2}$ and $\gamma_{3}$ such that $\gamma=\gamma_{1} \gamma_{2}, \gamma^{\prime}=\gamma_{2}^{-1} \gamma_{3}$ and $\gamma_{1} \gamma_{3}$ is reduced. Then $\gamma_{2}$ and $\gamma_{1} \gamma_{3}$ are concatenations of paths in $G_{P G}$ and $\mathcal{N}_{P G}$.

Proof. Let $\gamma=b_{0} a_{1} b_{1} \ldots a_{k} b_{k}$ be the decomposition of the path $\gamma$ such that for every $i \in\{0, \ldots, k\}$, the path $b_{i}$ is in $G_{P G}$ and for every $i \in\{1, \ldots, k\}$, the path $a_{i}$ is a maximal subpath of $\gamma$ contained in $\mathcal{N}_{P G}$. The existence of the paths $a_{i}$ follows from Lemma 3.4 (2). Let $\gamma^{\prime}=d_{0} c_{1} d_{1} \ldots c_{\ell} d_{\ell}$ be the similar decomposition of $\gamma^{\prime}$. Let $e$ be the initial edge of $\gamma_{2}$.

Claim. There exists $i \in\{0, \ldots, k\}$ such that $b_{i}$ contains $e$ if and only if there exists $j \in\{0, \ldots, \ell\}$ such that the edge $e^{-1}$ is contained in $d_{j}$.
Proof. The proof of the two directions being similar, we only prove one direction. Suppose that there exists $i \in\{0, \ldots, k\}$ such that $b_{i}$ contains $e$. Suppose towards a contradiction that there exists $j \in\{1, \ldots, \ell\}$ such that $e^{-1}$ is contained in $c_{j}$. It follows that there exists an EG INP $\sigma$ of $c_{j}$ such that $e^{-1}$ is contained in $\sigma$. Let $r$ be the height of $\sigma$. Let $\delta^{-1}$ be the subpath of $\sigma$ contained in $\gamma_{2}^{-1}$. Note that, as $\gamma_{2}^{-1}$ is an initial segment of $\gamma^{\prime}$, the path $\delta^{-1}$ is an initial segment of $\sigma$. By Proposition 2.5 (9), the path $\delta^{-1}$ starts with an edge in $H_{r}$. As $\delta$ is contained in $\gamma$, the terminal edge of $\delta$ is an edge in an EG stratum. Since every edge in $G_{P G}$ is contained in an NEG stratum, there exists $s \in\{1, \ldots, k\}$ such that $a_{s}$ contains a terminal segment of $\delta$. Since the initial edge $e$ of $\gamma_{2}$ is not contained in $a_{s}$ by hypothesis, the path $\delta$ contains the initial segment $\delta^{\prime}$ of $a_{s}$. Hence the terminal segment $\delta^{\prime-1}$ of $a_{s}^{-1}$ is the initial segment $\delta^{\prime-1}$ of $\sigma$. By Lemma 3.4 (2) applied to $a_{s}^{-1}$ and $\sigma$ and [FH, Corollary 4.12], the path $\delta^{\prime-1}$ is contained in $\mathcal{N}_{P G}$ and is a concatenation of splitting units of $\sigma$. As $\sigma$ contains a unique splitting unit, this implies that $\delta^{\prime}=\sigma$. As $\delta^{\prime} \subseteq \delta^{-1} \subseteq \sigma$, we see that $\delta^{-1}=\sigma$. Note that the edge $\delta^{-1}$ ends with $e^{-1}$. But $\sigma$ ends with an edge in an EG stratum by Proposition (2.5 (9), that is, $e^{-1}$ is an edge in an EG stratum. But every edge in $b_{i}$ is contained in an NEG stratum by definition of $G_{P G}$. This contradicts the fact that $e \subseteq b_{i}$. This concludes the proof of the claim.

Suppose first that there exists $i \in\{1, \ldots, k\}$, such that $e$ is contained in $b_{i}$. By the above claim, there exists $j \in\{0, \ldots, \ell\}$ such that $e^{-1}$ is contained in $d_{j}$. Let $\tau$ and $\tau^{\prime}$ be such that $\gamma=b_{0} a_{1} b_{1} \ldots a_{i} \tau \gamma_{2}$ and $\gamma^{\prime}=\gamma_{2}^{-1} \tau^{\prime} c_{j+1} \ldots d_{\ell}$. Note that $\tau \subseteq b_{i}$ and $\tau^{\prime} \subseteq d_{j}$. Then we have $\gamma_{1}=b_{0} a_{1} b_{1} \ldots a_{i} \tau$ and $\gamma_{3}=\tau^{\prime} c_{j+1} \ldots d_{\ell}$. Since the path $\gamma_{1} \gamma_{3}$ is reduced, so is $\tau \tau^{\prime}$. Moreover the reduced edge path $\tau \tau^{\prime}$ is contained in $G_{P G}$ and $\gamma_{1} \gamma_{3}=b_{0} a_{1} b_{1} \ldots a_{i} \tau \tau^{\prime} c_{j+1} \ldots d_{\ell}$ is a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$. Moreover, let $\delta^{\prime \prime}$ be the maximal subpath of $b_{i}$ contained in $\gamma_{2}$. Then $\gamma_{2}=\delta^{\prime \prime} a_{i+1} \ldots b_{k}$ is a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$.

Suppose now that there exists $i \in\{1, \ldots, k\}$ such that the initial edge $e$ of $\gamma_{2}$ is contained in $a_{i}$. By the above claim, there exists $j \in\{1, \ldots, \ell\}$ such that $e^{-1}$ is contained
in $c_{j}$. Let $\delta^{\prime}$ be the terminal segment of $a_{i}$ contained in $\gamma_{2}$. By Proposition [2.5 (9), the terminal edge $e^{\prime}$ of $\delta^{\prime}$ is an edge in an EG stratum. Since $G_{P G}$ does not contain any edge in an EG stratum, there exists $s \leqslant j$ such that $c_{s}$ contains $e^{\prime-1}$. We claim that $s=j$. Indeed, suppose towards a contradiction that $s<j$. Let $\delta^{-1}$ be the terminal segment of $c_{s}$ whose first edge is $e^{\prime-1}$. Then $\delta$ is a terminal segment of $a_{i}$ and $\delta$ is an initial segment of $c_{s}^{-1}$. By Lemma 3.4 (2) applied to $a_{i}$ and $c_{s}^{-1}$, the path $\delta$ is a concatenation of splitting units of $a_{i}$ and $c_{s}^{-1}$. If $\delta$ is properly contained in $\delta^{\prime}$, there exists an EG INP $\sigma$ which is a splitting unit of $a_{i}$ and such that the last edge of $\sigma$ is the last edge of $\delta^{\prime}$ not contained in $\delta$. But, by Proposition 2.5 (9), the terminal edge $e_{\sigma}$ of $\sigma$ is in an EG stratum. However, the first edge of $d_{s}$ (which is the edge $e_{\sigma}^{-1}$ ) is in $G_{P G}$. This leads to a contradiction. Hence $\delta=\delta^{\prime}$. But $\delta$ intersects $c_{j}$ nontrivially. Hence we have $s=j$.

Therefore, $\delta^{\prime-1}$ is contained in $c_{j}$. We claim that $\delta^{\prime-1}$ is an initial segment of $c_{j}$. Indeed, otherwise let $\epsilon^{\prime}$ be the initial segment of $c_{j}$ whose endpoint is the origin of $\delta^{\prime-1}$. By Proposition 2.5 (9), the first edge of $\epsilon^{\prime}$ is an edge in an EG stratum. Hence there exists $p>i$ such that $a_{p}$ contains the terminal edge of $\epsilon^{\prime-1}$. Let $\epsilon^{-1}$ be the subpath of $\epsilon^{\prime-1}$ contained in $a_{p}$. Then $\epsilon^{-1}$ is an initial segment of $a_{p}$ and $\epsilon$ is an initial segment of $c_{j}$. By Lemma 3.4 (2) applied to $a_{p}^{-1}$ and $c_{j}$, the path $\epsilon$ is a concatenation of splitting units of $a_{p}^{-1}$ and $c_{j}$. But since $\epsilon$ is properly contained in $c_{j}$ as it does not intersect $\delta^{\prime-1}$, the path $\epsilon$ is adjacent to a splitting unit of $c_{j}$. Since an EG INP starts with an edge in an EG stratum by Proposition 2.5 (9), the path $b_{p-1}$ ends with an edge in an EG stratum. This contradicts the fact that $b_{p-1}$ is contained in $G_{P G}$.

Hence $\delta^{\prime-1}$ is an initial segment of $c_{j}$ and $\delta^{\prime}$ is a terminal segment of $a_{i}$. Let $\tau$ and $\tau^{\prime}$ be two paths such that $a_{i}=\tau \delta^{\prime}$ and $c_{j}=\delta^{\prime-1} \tau^{\prime}$. By Lemma 3.4 (4) applied to $a_{i}$ and $c_{j}$, the path $\delta^{\prime}$ is in $\mathcal{N}_{P G}$ and the path $\tau \tau^{\prime}$ is in $\mathcal{N}_{P G}$. Hence $\gamma_{2}=\tau b_{i} a_{i+1} \ldots b_{k}$ and $\gamma_{1} \gamma_{3}=b_{0} a_{1} b_{1} \ldots a_{i} \tau \tau^{\prime} c_{j+1} \ldots d_{\ell}$ are concatenations of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$. This concludes the proof.

Lemma 3.6. Let $\gamma$ be a closed Nielsen path of $G$. Then $\gamma$ is a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$.

Proof. Let $\gamma$ be a closed Nielsen path of $G$. We prove the result by induction on the height $r$ of $\gamma$. If $r=0$, there is nothing to prove. Assume that $r \geqslant 1$. By Lemma 2.7. the path $\gamma$ is completely split, and every splitting unit in its complete splitting is either an INP or a fixed edge. Let $\gamma=\sigma_{1} \ldots \sigma_{k}$ be the complete splitting of $\gamma$. For every $i \in\{1, \ldots, k\}$, let $r_{i}$ be the height of $\sigma_{i}$. We prove that for every $i \in\{1, \ldots, k\}$, the path $\sigma_{i}$ is a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$. Let $i \in\{1, \ldots, k\}$. If $\sigma_{i}$ is a fixed edge, it is contained in $G_{P G}$. Suppose that $\sigma_{i}$ is an NEG INP. By Proposition 2.5 (11), there exists an edge $e_{r_{i}} \in E H_{r_{i}}$, a Nielsen path $w$ in $G_{r_{i}-1}$ and an integer $s \in \mathbb{Z}^{*}$ such that $\sigma_{i}=e_{r_{i}} w^{s} e_{r_{i}}^{-1}$. Moreover, we have $f\left(e_{r_{i}}\right)=e_{r_{i}} w$. Hence for every $j \in \mathbb{N}^{*}$, we have [ $\left.f^{j}\left(e_{r_{i}}\right)\right]=e_{r_{i}} w^{j}$. Since $w$ is a Nielsen path, by Lemma 2.7, the path $w$ is completely split and its complete splitting is made of fixed edges and INPs. Thus, for every $j \in \mathbb{N}^{*}$, the complete splitting of $\left[f^{j}\left(e_{r_{i}}\right)\right]$ does not contain splitting units which are edges in $E G$ strata. By definition of $G_{P G}$, we have $e_{r_{i}} \in \vec{E} G_{P G}$. Moreover, by the induction hypothesis, the path $w^{s}$ is a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$. Hence $\sigma_{i}$ is
a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$. Finally, if $\sigma_{i}$ is an EG INP, then it is contained in $\mathcal{N}_{P G}$. Hence $\gamma$ is a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$.

Lemma 3.7. Let $\gamma$ be either an NEG INP or an exceptional path. Then $\gamma$ is a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$.

Proof. We claim that there exist edges $e_{1}, e_{2}$ and a closed Nielsen path $w$ such that $\gamma=e_{1} w e_{2}^{-1}$ and, for every $i \in\{1,2\}$, we have $f\left(e_{i}\right)=e_{i} w^{d_{i}}$ for some $d_{i} \in \mathbb{Z}^{*}$. If $\gamma$ is an exceptional path, it follows from the definition. If $\gamma$ is an NEG INP, let $r$ be the height of $\gamma$. Then $H_{r}$ is an NEG stratum. As $\gamma$ is a Nielsen path, we can apply Proposition 2.5 (11) to conclude the proof of the claim. Since $e_{1}$ and $e_{2}$ are linear edges, for every $k \in \mathbb{N}^{*}$, the paths $\left[f^{k}\left(e_{1}\right)\right]$ and $\left[f^{k}\left(e_{1}\right)\right]$ do not contain splitting units which are edges in EG strata. Thus $e_{1}$ and $e_{2}$ are contained in $G_{P G}$. By Lemma 3.6, the path $w$ is a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$. Hence $\gamma$ is a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$. This concludes the proof.

Lemma 3.8. Let $\gamma$ be a Nielsen path in $G$. Then $\gamma$ is a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$.

Proof. By Lemma 2.7, the path $\gamma$ is completely split, and every splitting unit in its complete splitting is either an INP or a fixed edge. Let $\gamma=\sigma_{1} \ldots \sigma_{k}$ be the complete splitting of $\gamma$. Let $i \in\{1, \ldots, k\}$. If $\sigma_{i}$ is a fixed edge, then $\sigma_{i}$ is contained in $G_{P G}$. If $\sigma_{i}$ is an NEG INP then, by Lemma 3.7, the path $\sigma_{i}$ is a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$. If $\sigma_{i}$ is an EG INP then, by definition, we have $\sigma_{i} \in \mathcal{N}_{P G}$. Hence $\gamma$ is a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$.

Lemma 3.9. (1) Let $\gamma$ be an edge in $G_{P G}$ (resp. an edge in $G_{P G, \mathcal{F}}$ ). The path $[f(\gamma)]$ is a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$ (resp. a concatenation of paths in $G_{P G, \mathcal{F}}$ and in $\left.\mathcal{N}_{P G, \mathcal{F}}\right)$.
(2) Let $\gamma$ be an edge path contained in $G_{P G}$ (resp. an edge path in $G_{P G, \mathcal{F}}$ ). The path $[f(\gamma)]$ is a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$ (resp. a concatenation of paths in $G_{P G, \mathcal{F}}$ and in $\left.\mathcal{N}_{P G, \mathcal{F}}\right)$.
(3) Let $\gamma$ be an edge path which is a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$ (resp. a concatenation of paths in $G_{P G, \mathcal{F}}$ and in $\left.\mathcal{N}_{P G, \mathcal{F}}\right)$. The path $[f(\gamma)]$ is a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$ (resp. a concatenation of paths in $G_{P G, \mathcal{F}}$ and in $\mathcal{N}_{P G, \mathcal{F}}$ ).

Proof. We prove Assertions (1), (2), (3) for paths in $G_{P G}$ and in $\mathcal{N}_{P G}$, the proofs for paths in $G_{P G, \mathcal{F}}$ and $\mathcal{N}_{P G, \mathcal{F}}$ being similar, using the fact that $f\left(G_{p}\right)=G_{p}$.
(1) Let $\gamma$ be an edge of $G_{P G}$. By definition of $G_{P G}$, the edge $\gamma$ is an edge in an NEG stratum. By Proposition $[2.5(6)$, the path $[f(\gamma)]$ is completely split. Let $[f(\gamma)]=$ $\gamma_{1} \ldots \gamma_{m}$ be the complete splitting of $[f(\gamma)]$. Since $\gamma$ is an edge in an NEG stratum, by Proposition [2.5 (2), we have $\gamma_{1}=\gamma$. Suppose towards a contradiction that $[f(\gamma)]$ is not a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$. It follows that there exists $i \in\{1, \ldots, m\}$ and an edge $e$ of $\gamma_{i}$ which is not contained in $G_{P G}$ and is not contained in a subpath of
[ $f(\gamma)$ ] contained in $\mathcal{N}_{P G}$. Hence $\gamma_{i}$ is not an EG INP nor a fixed edge. By Lemma 3.7, the path $\gamma_{i}$ cannot be an NEG INP or an exceptional path. Hence $\gamma_{i}$ is either an edge in an irreducible stratum or a maximal taken connecting path in a zero stratum. Suppose first that $\gamma_{i}$ is a maximal taken connecting path in a zero stratum. By Proposition 2.5 (4), the path $\gamma_{i}$ cannot be adjacent to an edge in an NEG stratum nor an edge in a zero stratum. As $\gamma_{1}=\gamma$, we see that $i \geqslant 3$ and that $\gamma_{i-1}$ ends with an edge in an EG stratum. By Lemma 2.9 (applied to $\gamma=\gamma_{i-1} \gamma_{i}$ ), the path $\gamma_{i-1}$ is not an EG INP. Therefore we see that $\gamma_{i-1}$ is an edge in an EG stratum. This contradicts the definition of the edges in $G_{P G}$. Hence we are reduced to the case where $\gamma_{i}$ is an edge in an irreducible stratum. Therefore, we have $\gamma_{i}=e$. By definition of $G_{P G}$ and as $e \notin \vec{E} G_{P G}$, there exists $k \in \mathbb{N}^{*}$ such that $\left[f^{k}\left(\gamma_{i}\right)\right]$ contains a splitting unit which is an edge in an EG stratum. This contradicts the fact that $\gamma$ is contained in $G_{P G}$. This concludes the proof of (1).
(2) Let $\gamma$ be a path in $G_{P G}$. We prove by induction on the length of $\gamma$ that $[f(\gamma)]$ is a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$. The case where $\gamma$ is an edge follows from (1). Suppose now that the length of $\gamma$ is at least equal to 2 . Let $e$ be the last edge of $\gamma$ and let $\gamma^{\prime}$ be an edge path such that $\gamma=\gamma^{\prime} e$. Hence $\gamma^{\prime}$ and $e$ are paths in $G_{P G}$. By the induction hypothesis, the paths $\left[f\left(\gamma^{\prime}\right)\right]$ and $[f(e)]$ are concatenations of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$. It remains to show that identifications between $\left[f\left(\gamma^{\prime}\right)\right]$ and $[f(e)]$ do not create paths which are not concatenations of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$. Let $\alpha, \beta$ and $\sigma$ be paths such that $\left[f\left(\gamma^{\prime}\right)\right]=\alpha \sigma,\left[f\left(e^{\prime}\right)\right]=\sigma^{-1} \beta$ and $\alpha \beta$ is reduced. By Lemma 3.5 applied to $\left[f\left(\gamma^{\prime}\right)\right]$ and $\left[f\left(e^{\prime}\right)\right]$, the path $[f(\gamma)]$ is a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$. This concludes the proof of (2).
(3) Let $\gamma$ be a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$. Let $\gamma=\gamma_{0}^{\prime} \gamma_{1} \gamma_{1}^{\prime} \ldots \gamma_{k} \gamma_{k}^{\prime}$ be a decomposition of $\gamma$ such that for every $i \in\{1, \ldots, k\}$, the path $\gamma_{i}$ is a maximal subpath of $\gamma$ in $\mathcal{N}_{P G}$ and for every $i \in\{0, \ldots, k\}$, the path $\gamma_{i}^{\prime}$ is a path in $G_{P G}$. Such a decomposition is possible by Lemma 3.4 (2). We prove the result by induction on $k$. If $k=0$, the proof follows from Assertion (2). Suppose that the result is true for $k^{\prime}<k$. Then the paths $\gamma^{\prime}=\gamma_{0}^{\prime} \gamma_{1} \gamma_{1}^{\prime} \ldots \gamma_{k-1} \gamma_{k-1}^{\prime}$ and $\gamma^{\prime \prime}=\gamma_{k} \gamma_{k}^{\prime}$ satisfy the induction hypothesis. Hence the paths $\left[f\left(\gamma^{\prime}\right)\right]$ and $\left[f\left(\gamma^{\prime \prime}\right)\right]$ are concatenations of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$. Let $\alpha, \beta$ and $\sigma$ be three paths such that $\left[f\left(\gamma^{\prime}\right)\right]=\alpha \beta,\left[f\left(\gamma^{\prime \prime}\right)\right]=\beta^{-1} \sigma$ and $\alpha \beta$ is reduced. By Lemma 3.5, the path $[f(\gamma)]=\alpha \sigma$ is a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$. This concludes the proof.

For the next lemma, we recall a definition due to Bestvina, Feighn and Handel ([BFH1, Section 6], see also [HM, Definition III.1.2]). Let $H_{r_{+}}$be the EG stratum of $G$ of maximal height $r_{+}$. By Proposition 2.5 (9), there exists at most one unoriented INP $\rho_{r_{+}}$of height $r_{+}$(we suppose that $\rho_{r_{+}}$is a point if such a nontrivial INP does not exist). Following [HM, Definition III.1.2], let $Z_{r_{+}}$be the subgraph of $G$ consisting in all edges $e^{\prime}$ such that for every $m \in \mathbb{N}^{*}$ and every splitting unit $\sigma$ of $\left[f^{m}\left(e^{\prime}\right)\right]$, the path $\sigma$ is not an edge in $H_{r_{+}}$. Let $\left\langle Z_{r_{+}}, \rho_{r_{+}}\right\rangle$be the set consisting in the following paths:
(i) paths in $Z_{r_{+}}$;
(ii) paths in $\left\{\rho_{r_{+}}, \rho_{r_{+}}^{-1}\right\}$;
(iii) concatenations of paths in $Z_{r_{+}}$and in $\left\{\rho_{r_{+}}, \rho_{r_{+}}^{-1}\right\}$.

Note that $\left\langle Z_{r_{+}}, \rho_{r_{+}}\right\rangle$contains every path in $G_{r_{+}-1}$.
Lemma 3.10. The set $\left\langle Z_{r_{+}}, \rho_{r_{+}}\right\rangle$contains every path which is a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$.

Proof. It suffices to prove that $\left\langle Z_{r_{+}}, \rho_{r_{+}}\right\rangle$contains every edge of $G_{P G}$ and every EG INP. Let $e$ be an edge in $G_{P G}$. By definition of $G_{P G}$, for every $k \in \mathbb{N}^{*}$, the complete splitting of $\left[f^{k}(e)\right]$ does not contain a splitting unit which is an edge in an EG stratum. In particular, for every $k \in \mathbb{N}^{*}$, the complete splitting of $\left[f^{k}(e)\right]$ does not contain a splitting unit which is an edge in $H_{r_{+}}$. Hence $e \subseteq Z_{r_{+}}$and $G_{P G}$ is a subgraph of $Z_{r_{+}}$. Let $\rho$ be an EG INP and let $r$ be the height of $\rho$. By definition of $r_{+}$, we have $r \leqslant r_{+}$. If $r=r_{+}$, by Proposition 2.5 (9), we have $\rho \in\left\{\rho_{r_{+}}, \rho_{r_{+}}^{-1}\right\}$, hence we have $\rho \in\left\langle Z_{r_{+}}, \rho_{r_{+}}\right\rangle$. If $r<r_{+}$, then $\rho$ is contained in $G_{r_{+}-1}$. Hence $\rho$ is contained in $\left\langle Z_{r_{+}}, \rho_{r_{+}}\right\rangle$by the above remark.

We now define a graph which will be used in the proof of Lemma 3.12. Let $G^{*}$ be the finite, not necessarily connected, graph defined as follows:
(a) vertices of $G^{*}$ are the vertices in $G_{P G}$ and the endpoints of EG INPs in $G$ which are not in $G_{P G}$;
(b) we add one edge between two vertices corresponding to vertices in $G_{P G}$ if there exists an edge in $G_{P G}$ between the corresponding vertices of $G_{P G}$;
(c) we add one edge between two vertices corresponding to the endpoints of an EG INP.

Note that we have a natural continuous application $p_{G^{*}}: G^{*} \rightarrow G$ which sends an edge as defined in (b) to the corresponding edge in $G_{P G}$ and which sends an edge as defined in $(c)$ to the corresponding EG INP in $G$. Let $x \in V G^{*}$.

Lemma 3.11. (1) If $\gamma$ is a nontrivial reduced path in $G^{*}$, so is $p_{G^{*}}(\gamma)$.
(2) The homomorphism

$$
p_{G^{*}}^{\prime}: \pi_{1}\left(G^{*}, x\right) \rightarrow \pi_{1}\left(G, p_{G^{*}}(x)\right)
$$

induced by $p_{G^{*}}$ is injective.
Proof. (1) Let $\gamma$ be a reduced path in $G^{*}$. Suppose towards a contradiction that $p_{G^{*}}(\gamma)$ is not a reduced path in $G$. Thus, there exist an edge $e \in \vec{E} G$ and two paths $a$ and $b$ such that $p_{G^{*}}(\gamma)=a e e^{-1} b$. Let $e^{*}$ be an arc in $\gamma$ such that $p_{G^{*}}\left(e^{*}\right)=e e^{-1}$. Note that, by definition of $p_{G^{*}}$, the application $p_{G^{*}}$ sends edges of $G^{*}$ to reduced edge paths in $G$. In particular, the path $e^{*}$ is not contained in a single edge of $G^{*}$. As the image of an edge in $G^{*}$ by $p_{G^{*}}$ is either an edge in $G$ or an edge path, we see that the path $e^{*}$ is contained in at most two edges of $G^{*}$. Let $e_{1}, e_{2} \in G^{*}$ be such that $e^{*} \subseteq e_{1} e_{2}$. Suppose first that $p_{G^{*}}\left(e_{1}\right)$ and $p_{G^{*}}\left(e_{2}\right)$ are edges in $G_{P G}$. Then $p_{G^{*}}\left(e_{1}\right)=e$ and $p_{G^{*}}\left(e_{2}\right)=e^{-1}$. But, as $\gamma$ is reduced, we have $e_{1} \neq e_{2}^{-1}$. Thus we have $p_{G^{*}}\left(e_{1}\right) \neq p_{G^{*}}\left(e_{2}\right)^{-1}$. Suppose now that $p_{G^{*}}\left(e_{1}\right)$ is an edge in $G_{P G}$ and $p_{G^{*}}\left(e_{2}\right)$ is an EG INP. By Proposition 2.5 (9), the first edge of $p_{G^{*}}\left(e_{2}\right)$ is an edge in an EG stratum. By definition, every edge in $G_{P G}$ is an edge
in an NEG stratum. Hence the turn $\left\{p_{G^{*}}\left(e_{1}\right)^{-1}, p_{G^{*}}\left(e_{2}\right)\right\}$ is nondegenerate. Therefore, we see that $p_{G^{*}}\left(e^{*}\right) \neq e e^{-1}$. Finally, suppose that $p_{G^{*}}\left(e_{1}\right)$ and $p_{G^{*}}\left(e_{2}\right)$ are EG INPs. for every $i \in\{1,2\}$, let $r_{i}$ be the height of $p_{G^{*}}\left(e_{i}\right)$. By Proposition [2.5 (9), the last edge of $p_{G^{*}}\left(e_{1}\right)$ is in $H_{r_{1}}$ whereas the first edge of $p_{G^{*}}\left(e_{2}\right)$ is in $H_{r_{2}}$. Hence if $r_{1} \neq r_{2}$, there is no identification between $p_{G^{*}}\left(e_{1}\right)$ and $p_{G^{*}}\left(e_{2}\right)$. Hence $p_{G^{*}}\left(e^{*}\right) \neq e e^{-1}$. If $r_{1}=r_{2}$, then by the uniqueness statement in Proposition 2.5(9), we have $p_{G^{*}}\left(e_{2}\right) \in\left\{p_{G^{*}}\left(e_{1}\right), p_{G^{*}}\left(e_{1}\right)^{-1}\right\}$. Hence $e_{2} \in\left\{e_{1}, e_{1}^{-1}\right\}$. As $\gamma$ is a reduced path, we see that $e_{2}=e_{1}$. Hence $e_{1}$ is a loop and $p_{G^{*}}\left(e_{1}\right)$ is a closed EG INP. By Proposition 2.5 (9), the initial and terminal edges of $p_{G^{*}}\left(e_{1}\right)$ are distinct unoriented edges. Hence the path $p_{G^{*}}\left(e_{1}\right) p_{G^{*}}\left(e_{2}\right)$ is a reduced path and $p_{G^{*}}\left(e^{*}\right) \neq e e^{-1}$. As we have ruled out every case, we see that such a path $e^{*}$ does not exist. This concludes the proof of Assertion (1).
(2) Let $\gamma$ be a nontrivial reduced closed path in $G^{*}$ based at $x$. By Assertion (1), the path $p_{G^{*}}(\gamma)$ is a nontrivial reduced closed path in $G$. Hence the kernel of $p_{G^{*}}^{\prime}$ is trivial.

Lemma 3.12. The application [f] which sends a circuit $\alpha$ in $G$ to $[f(\alpha)]$ preserves the set of circuits which are concatenations of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$. Moreover, $[f]$ restricts to a bijection on the set of circuits which are concatenations of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$.

Proof. The first part follows from Lemma 3.9 (3). By [HM, Lemma III.1.6 (2), (5)], the application $[f]$ preserves $\left\langle Z_{r_{+}}, \rho_{r_{+}}\right\rangle$and restricts to a bijection on the set of circuits of $\left\langle Z_{r_{+}}, \rho_{r_{+}}\right\rangle$. By Lemma 3.10 concatenations of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$ are contained in $\left\langle Z_{r_{+}}, \rho_{r_{+}}\right\rangle$. By Lemma 3.9, the application [ $f$ ] preserves concatenations of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$. In particular, this shows that $[f]$ is injective when restricted to the set of paths which are concatenations of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$.

For surjectivity, let $\alpha$ be a circuit in $G$ which is a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$ and let $x$ be a vertex in $\alpha$ which is either an endpoint of an edge in $G_{P G}$ or an endpoint of an EG INP contained in $\alpha$. Note that by Proposition 2.5 (2), the endpoint of every edge in $G_{P G}$ is fixed by $f$. Moreover, the endpoint of every EG INP is fixed by $f$. Therefore, $f$ fixes $x$. The circuit $\alpha$ naturally corresponds to a circuit $\alpha^{\prime}$ in $G^{*}$. Let $x^{\prime}$ be the vertex of $\alpha^{\prime}$ corresponding to $x$ (which exists by the choices made on $x$ ). Since [ $f$ ] preserves concatenations of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$ by Lemma 3.9, the application $[f]$ induces an application

$$
[f]_{G^{*}}: \pi_{1}\left(G^{*}, x^{\prime}\right) \rightarrow \pi_{1}\left(G^{*}, x^{\prime}\right) .
$$

Note that, by Lemma 3.11, the group $\pi_{1}\left(G^{*}, x^{\prime}\right)$ is naturally identified with a subgroup of $\pi_{1}(G, x)$. By [BFH1, Lemma 6.0.6], the application $[f]_{G^{*}}$ is a bijection. Hence there exists a closed path $\beta^{\prime}$ in $G^{*}$ such that $[f]_{G^{*}}\left(\left[\beta^{\prime}\right]\right)=\alpha^{\prime}$. Let $\beta$ be the circuit corresponding to $\beta^{\prime}$ in $G$. Then $\beta$ is a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$ and $[f(\beta)]=\alpha$. This concludes the proof.

Proposition 3.13. Let $\mathrm{n} \geqslant 3$. Let $\phi \in \operatorname{Out}\left(F_{\mathrm{n}}, \mathcal{F}\right)$ be an exponentially growing outer automorphism, let $f: G \rightarrow G$ be a CT map representing a power of $\phi$. Let $w \in F_{\mathrm{n}}$.

There exists a subgroup $A$ of $F_{\mathrm{n}}$ such that $[A] \in \mathcal{A}(\phi)$ and $w \in A$ if and only if the circuit $\gamma_{w}$ of $G$ associated with $w$ is a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$.
Proof. Suppose first that $\gamma_{w}$ is a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$. We claim that $\gamma_{w}$ has polynomial growth under iteration of $f$. By Proposition 2.5) (8), there exists $m \in \mathbb{N}^{*}$ such that $\left[f^{m}\left(\gamma_{w}\right)\right]$ is completely split. By Lemma $3.9(3)$, the path $\left[f^{m}\left(\gamma_{w}\right)\right]$ is a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$. Hence every splitting unit of $\left[f^{m}\left(\gamma_{w}\right)\right]$ is either an edge of $G_{P G}$ or an INP. Let $\left[f^{m}\left(\gamma_{w}\right)\right]=\gamma_{1} \ldots \gamma_{k}$ be the complete splitting of [ $\left.f^{m}\left(\gamma_{w}\right)\right]$. For every $i \geqslant m$, we have

$$
\left.\ell\left[f^{i}\left(\gamma_{w}\right)\right]\right)=\sum_{j=1}^{k} \ell\left(\left[f^{i}\left(\gamma_{j}\right)\right]\right)
$$

Therefore, it suffices to prove that, for every $j \in\{1, \ldots, k\}$, there exists a polynomial $P_{j} \in \mathbb{Z}[X]$ such that for every $i \in \mathbb{N}^{*}$, we have

$$
\ell\left(\left[f^{i}\left(\gamma_{j}\right)\right]\right)=\mathrm{O}(P(i)) .
$$

Claim. There exists a polynomial $P \in \mathbb{Z}[X]$ such that for every edge $e \in \vec{E} G_{P G}$ and every $i \in \mathbb{N}^{*}$, we have

$$
\ell\left(\left[f^{i}(e)\right]\right)=\mathrm{O}(P(i)) .
$$

Proof. Since there are finitely many edges in $G_{P G}$, it suffices to prove the claim for a single edge $e \in \vec{E} G_{P G}$. Let $e \in \vec{E} G_{P G}$. By Proposition [2.5 (2), there exists a cyclically reduced, completely split circuit $w$ of height less than the one of $e$ and such that $f(e)=$ $e w$. By Lemma 3.9 (1), the path $w$ is a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$. We prove the claim by induction on the height of $e$. Suppose first that $e$ has minimal height in $G_{P G}$. By minimality of $e$, the path $w$ does not contain a splitting unit which is an edge in $G_{P G}$. Hence $w$ is either trivial or a path in $\mathcal{N}_{P G}$, that it, a closed Nielsen path. If $w$ is trivial then $e$ is a fixed edge and $P=1$ satisfies the claim. Suppose that $w$ is a closed Nielsen path. For every $i \in \mathbb{N}^{*}$, we have $\left[f^{i}(e)\right]=e w^{i}$. Hence $\ell\left(\left[f^{i}(e)\right]\right) \leqslant i \ell(w)+1$. Then the polynomial $P(i)=i \ell(w)+1$ satisfies the assertion of the claim. This proves the base case. Suppose now that $e$ has height $r$. Let $w=w_{1} \ldots w_{k}$ be the complete splitting of $w$. Recall that, for every reduced path $x$ in $G$, we have $[f([f(x)])]=\left[f^{2}(x)\right]$. Thus, for every $i \in \mathbb{N}^{*}$. we have

$$
\left[f^{i}(e)\right]=e w_{1} \ldots w_{k}\left[f\left(w_{1}\right)\right] \ldots\left[f\left(w_{k}\right)\right] \ldots\left[f^{i-1}\left(w_{1}\right)\right] \ldots\left[f^{i-1}\left(w_{k}\right)\right]
$$

Hence, for every $i \in \mathbb{N}^{*}$, we have

$$
\ell\left(\left[f^{i}(e)\right]\right)=1+\sum_{\ell=1}^{k} \sum_{j=0}^{i-1} \ell\left(\left[f^{j}\left(w_{\ell}\right)\right]\right)
$$

Hence it suffices, for every $\ell \in\{1, \ldots, k\}$, to find a polynomial $P_{\ell} \in \mathbb{Z}[X]$ such that, for every $i \in \mathbb{N}^{*}$, we have

$$
\ell\left(\left[f^{i}\left(w_{\ell}\right)\right]\right)=\mathrm{O}\left(P_{\ell}(i)\right)
$$

Let $\ell \in\{1, \ldots, k\}$. As $w$ is a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$, every splitting unit of $w$ is either an edge in $G_{P G}$ or an INP. If $w_{\ell}$ is an edge in $G_{P G}$, the polynomial $P_{\ell}$ exists using the induction hypothesis. If $w_{\ell}$ is an INP, then the polynomial $P_{\ell}(i)=\ell\left(w_{\ell}\right)$ satisfies the conclusion of the claim. This proves the existence of the polynomial $P$.

Let $j \in\{1, \ldots, k\}$. If $\gamma_{k}$ is an edge in $G_{P G}$ which is a splitting unit of $\left[f^{m}\left(\gamma_{w}\right)\right]$, by the above claim, the polynomial $P_{j}$ exists. If $\gamma_{j}$ is an INP, then the polynomial $P_{\ell}(x)=\ell\left(\gamma_{j}\right)$ satisfies the conclusion. Thus, the path $\gamma_{w}$ has polynomial growth under iteration of $[f]$. Therefore, $[w]$ has polynomial growth under iterates of $\phi$. By the definition of $\mathcal{A}(\phi)$, there exists a subgroup $A$ of $F_{\mathrm{n}}$ such that $[A] \in \mathcal{A}(\phi)$ and $w \in A$.

Conversely, suppose that there exists a subgroup $A$ of $F_{\mathrm{n}}$ such that $[A] \in \mathcal{A}(\phi)$ and $w \in A$. Let $m \in \mathbb{N}^{*}$ be such that $\left[f^{m}\left(\gamma_{w}\right)\right]$ is completely split, which exists by Proposition 2.5 (7). Since [ $w$ ] has polynomial growth under iteration of $\phi$, there does not exist a splitting unit of $\left[f^{m}\left(\gamma_{w}\right)\right]$ which is an edge in an EG stratum or a superlinear edge with exponential growth. Suppose towards a contradiction that a splitting unit $\sigma$ of $\left[f^{m}\left(\gamma_{w}\right)\right]$ is contained in a zero stratum. By Proposition [2.5 (3), every zero stratum of $G$ is contractible. As $\left[f^{m}\left(\gamma_{w}\right)\right]$ is a cycle, it is not contained in a zero stratum. By Proposition 2.5 (4), every edge adjacent to $\sigma$ and not contained in the same stratum as $\sigma$ is in an EG stratum. Hence there exists a splitting unit $\sigma^{\prime}$ of $\left[f^{m}\left(\gamma_{w}\right)\right]$ such that $\sigma \sigma^{\prime} \subseteq\left[f^{m}\left(\gamma_{w}\right)\right]$ and $\sigma^{\prime}$ the first edge of $\sigma$ is in an EG stratum. Hence $\sigma^{\prime}$ is either an edge in an EG stratum or an INP. But, by Lemma 2.9, the path $\sigma^{\prime}$ is not an INP. Hence $\sigma^{\prime}$ is an edge in an EG stratum. This contradicts the fact that [ $w$ ] has polynomial growth under iteration of $\phi$. Hence every splitting unit of $\left[f^{m}\left(\gamma_{w}\right)\right]$ is either an INP, an exceptional path or an edge in an NEG stratum whose iterates by $f$ do not contain splitting units which are edges in EG strata. Edges in the last category are precisely the edges in $G_{P G}$. By Lemma 3.7 and Lemma 3.8 every INP and every exceptional path is a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$. Thus, the path [ $f^{m}\left(\gamma_{w}\right)$ ] is a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$. By Lemma 3.12, the circuit $\gamma_{w}$ is a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$.

Let $\mathcal{F}$ be a nonsporadic free factor system of $F_{\mathrm{n}}$ and let $\phi \in \operatorname{Out}\left(F_{\mathrm{n}}, \mathcal{F}\right)$. We say that $\phi$ is fully irreducible relative to $\mathcal{F}$ if no power of $\phi$ preserves a proper free factor system $\mathcal{F}^{\prime}$ of $F_{\mathrm{n}}$ such that $\mathcal{F}<\mathcal{F}^{\prime}$. The following corollary will be used in Gue2. It is a well-known result but we did not find a precise statement in the literature.

Corollary 3.14. Let $\mathrm{n} \geqslant 3$ and let $\mathcal{F}$ be a nonsporadic free factor system of $F_{\mathrm{n}}$. Let $\phi \in \operatorname{Out}\left(F_{\mathrm{n}}, \mathcal{F}\right)$ be a fully irreducible outer automorphism relative to $\mathcal{F}$. There exists at most one (up to taking inverse) conjugacy class $[g]$ of root-free $\mathcal{F}$-nonperipheral element of $F_{\mathrm{n}}$ which has polynomial growth under iteration of $\phi$. Moreover, the conjugacy class $[g]$ is $\phi$-periodic.

Proof. Let $f: G \rightarrow G$ be a CT map representing a power of $\phi$ and let $G^{\prime}$ be a subgraph of $G$ such that $\mathcal{F}\left(G^{\prime}\right)=\mathcal{F}$. Since $\phi$ is irreducible relative to $\mathcal{F}$ and since $\mathcal{F}$ is nonsporadic, we see that $\overline{G-G^{\prime}}$ is an EG stratum $H_{r}$. Let $[g]$ be the conjugacy class of a root-free $\mathcal{F}$-nonperipheral element $g$ of $F_{\mathrm{n}}$. Then $\gamma_{g}$ has height $r$. Suppose that $[g]$ has polynomial
growth with respect to $\phi$. By Proposition 3.13, the circuit $\gamma_{g}$ is a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$. Since $\gamma_{g}$ has height $r$ and since $H_{r}$ is an $E G$ stratum, every subpath $\alpha$ of $\gamma_{g}$ contained in $H_{r}$ is contained in a concatenation of INPs of height $r$. By Proposition 2.5 (9), there exists at most one INP $\sigma$ of height $r$. Moreover, one of its endpoints is not contained in $G^{\prime}=G_{r-1}$ (see [HM, I.Fact 1.42]). Hence $\sigma$ is necessarily a closed EG INP. Since the endpoint of $\sigma$ is not in $G_{r-1}$ and since $\gamma_{g}$ is a concatenation of paths in $G_{P G}$ and $\mathcal{N}_{P G}$, we see that $\gamma_{g}$ is an iteration of the closed path $\sigma$. Since $g$ is root-free, we have $\gamma_{g}=\sigma^{ \pm 1}$. This concludes the proof.

### 3.2 The exponential length of a CT map

In this section, we define the exponential length function $\ell_{\text {exp }}$, and its relative version $\ell_{\mathcal{F}}$, of paths in CT maps. We compute its value for some paths in $G$. Let $G_{P G}^{\prime}=G_{P G} \cup \mathcal{Z}$ (see Definition 3.1) and let $G_{P G, \mathcal{F}}^{\prime}=G_{P G, \mathcal{F}} \cup \mathcal{Z}_{\mathcal{F}}$.

Let $\gamma$ be a reduced edge path in $G$. By Lemma 3.4 (2), every path of $\mathcal{N}_{P G}$ which is contained in $\gamma$ is contained in a unique maximal subpath of $\gamma$ contained in $\mathcal{N}_{P G}$. Thus, the path $\gamma$ has a unique decomposition into edge paths $\gamma=\gamma_{0} \gamma_{1}^{\prime} \gamma_{1} \ldots \gamma_{k} \gamma_{k}^{\prime}$ where:
(1) for every $i \in\{0, \ldots, k\}$, the path $\gamma_{i}$ is a maximal path in $\mathcal{N}_{P G}$ contained in $\gamma$ (where $\gamma_{0}$ and $\gamma_{k}^{\prime}$ might be trivial);
(2) for every $\gamma^{\prime} \in \mathcal{N}_{P G}$ contained in $\gamma$, there exists $i \in\{1, \ldots, k\}$ such that $\gamma^{\prime} \subseteq \gamma_{i}$.

Such a decomposition of $\gamma$ is called the exponential decomposition of $\gamma$. Note that the exponential decomposition of $\gamma$ is not necessarily a splitting of $\gamma$. We denote by $\mathcal{N}_{P G}^{\max }(\gamma)$ the set consisting in all paths $\gamma_{i}$, with $i \in\{0, \ldots, k\}$. Similarly, $\gamma$ has a decomposition $\gamma=\alpha_{0} \alpha_{1}^{\prime} \alpha_{1} \ldots \alpha_{m} \alpha_{m}^{\prime}$, where for every $i \in\{0, \ldots, m\}$, the path $\alpha_{i}$ is a maximal path in $\mathcal{N}_{P G, \mathcal{F}}$ and for every $\gamma^{\prime} \in \mathcal{N}_{P G, \mathcal{F}}$ contained in $\gamma$, there exists $i \in\{1, \ldots, k\}$ such that $\gamma^{\prime} \subseteq \alpha_{i}$. Such a decomposition is called the $\mathcal{F}$-exponential decomposition of $\gamma$. We denote by $\mathcal{N}_{P G, \mathcal{F}}^{\max }(\gamma)$ the set consisting in all paths $\alpha_{i}$, with $i \in\{0, \ldots, m\}$.
Definition 3.15. (1) Let $\gamma$ be a reduced edge path in $G$. The exponential length of $\gamma$, denoted by $\ell_{\text {exp }}(\gamma)$ is:

$$
\ell_{\exp }(\gamma)=\ell\left(\gamma \cap \overline{G-G_{P G}^{\prime}}\right)-\sum_{\alpha \in \mathcal{N}_{P G}^{\max }(\gamma)} \ell\left(\alpha \cap \overline{G-G_{P G}^{\prime}}\right) .
$$

(2) Let $\gamma$ be a reduced edge path in $G$. The $\mathcal{F}$-exponential length of $\gamma$, denoted by $\ell_{\mathcal{F}}(\gamma)$ is:

$$
\ell_{\mathcal{F}}(\gamma)=\ell\left(\gamma \cap \overline{G-G_{P G, \mathcal{F}}^{\prime}}\right)-\sum_{\alpha \in \mathcal{\mathcal { N } _ { P G , \mathcal { F } } ( \gamma )}} \ell\left(\alpha \cap \overline{G-G_{P G, \mathcal{F}}^{\prime}}\right) .
$$

(3) Let $\gamma$ be a reduced edge path in $G$ and let $\gamma=\gamma_{0} \gamma_{1}^{\prime} \gamma_{1} \ldots \gamma_{k}^{\prime} \gamma_{k}$ be the exponential decomposition of $\gamma$. A $P G$-relative complete splitting of the path $\gamma$ is a splitting $\gamma=$ $\delta_{1} \ldots \delta_{m}$ such that for every $i \in\{1, \ldots, m\}$, the path $\delta_{i}$ is one of the following paths:

- a splitting unit of positive exponential length not contained in some $\gamma_{i}$ for $i \in\{0, \ldots, k\}$;
- a maximal taken connecting path in a zero stratum;
- a subpath of $\gamma$ which is a concatenation of subpaths contained in $G_{P G}$ and Nielsen paths in $\mathcal{N}_{P G}$.

We call the above paths $P G$-relative splitting units. If $\gamma$ is a circuit, a $P G$-relative circuital complete splitting of $\gamma$ is a circuital splitting of $\gamma$ which is a $P G$-relative complete splitting of $\gamma$.
(4) A factor of a $P G$-relative completely split edge path $\gamma$ is a concatenation of $P G$ relative splitting units of some given $P G$-relative complete splitting of $\gamma$.

Note that if $\gamma$ is an edge path of $G$, then $\ell_{\exp }(\gamma) \geqslant 0$. Indeed, two paths $\gamma_{1}$ and $\gamma_{2}$ contained in $\mathcal{N}_{P G}^{\max }(\gamma)$ are either equal or disjoint. Let $\gamma=\gamma_{0} \gamma_{1}^{\prime} \gamma_{1} \ldots \gamma_{k}^{\prime} \gamma_{k}$ be the exponential decomposition of $\gamma$. For every $i \in\{1, \ldots, k\}$, we have $\ell_{\text {exp }}\left(\gamma_{i}^{\prime}\right)=\ell\left(\gamma_{i}^{\prime} \cap \overline{G-G_{P G}^{\prime}}\right)$ and

$$
\ell_{\exp }(\gamma)=\sum_{i=1}^{k} \ell_{\exp }\left(\gamma_{i}^{\prime}\right)
$$

We prove the existence of $P G$-relative complete splittings in Lemma 3.19, Note that a $P G$-relative complete splitting of a reduced edge path $\gamma$ is not necessarily unique. Indeed, it might be possible that one can split a $P G$-relative splitting unit of $\gamma$ which is a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$ into two $P G$-relative splitting units which are concatenations of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$.

In the rest of the section, we describe some properties of the exponential length.
Lemma 3.16. Let $\gamma$ be a reduced edge path in $G$ and let $\gamma=\gamma_{1} \gamma_{2}$ be a decomposition of $\gamma$ into two edge paths. We have:

$$
\ell_{\exp }(\gamma) \leqslant \ell_{\exp }\left(\gamma_{1}\right)+\ell_{\exp }\left(\gamma_{2}\right)
$$

Proof. It is immediate that

$$
\ell\left(\gamma \cap \overline{G-G_{P G}^{\prime}}\right)=\ell\left(\gamma_{1} \cap \overline{G-G_{P G}^{\prime}}\right)+\ell\left(\gamma_{2} \cap \overline{G-G_{P G}^{\prime}}\right)
$$

Let $i \in\{1,2\}$. Let $\gamma^{\prime} \in \mathcal{N}_{P G}^{\max }\left(\gamma_{i}\right)$. Then there exists $\gamma^{\prime \prime} \in \mathcal{N}_{P G}^{\max }(\gamma)$ such that $\gamma^{\prime} \subseteq \gamma^{\prime \prime}$. In particular, we have
$\sum_{\gamma^{\prime \prime} \in \mathcal{\mathcal { N } _ { P G } ^ { \operatorname { m a x } }}(\gamma)} \ell\left(\gamma^{\prime \prime} \cap \overline{G-G_{P G}^{\prime}}\right) \geqslant \sum_{\gamma^{\prime} \in \mathcal{N}_{P G}^{\max }\left(\gamma_{1}\right)} \ell\left(\gamma^{\prime} \cap \overline{G-G_{P G}^{\prime}}\right)+\sum_{\gamma^{\prime} \in \mathcal{N}_{P G}^{\max }\left(\gamma_{2}\right)} \ell\left(\gamma^{\prime} \cap \overline{G-G_{P G}^{\prime}}\right)$.
By definition of the exponential length, this concludes the proof.
Note that we do not necessarily have equality in Lemma 3.16. Indeed, let $\gamma=\gamma_{1} \gamma_{2}$ be as in Lemma 3.16. Suppose that the endpoint of $\gamma_{1}$ is contained in a path $\gamma^{\prime}$ of $\mathcal{N}_{P G}^{\max }(\gamma)$. Then $\gamma^{\prime}$ is not necessarily a concatenation of paths in $\mathcal{N}_{P G}^{\max }\left(\gamma_{1}\right)$ and $\mathcal{N}_{P G}^{\max }\left(\gamma_{2}\right)$. Therefore, we might have:
$\sum_{\gamma^{\prime} \in \mathcal{N}_{P G}^{\max }(\gamma)} \ell\left(\gamma^{\prime} \cap \overline{G-G_{P G}^{\prime}}\right)>\sum_{\gamma^{\prime} \in \mathcal{\mathcal { N } _ { P G } ^ { \operatorname { m a x } } ( \gamma _ { 1 } )}} \ell\left(\gamma^{\prime} \cap \overline{G-G_{P G}^{\prime}}\right)+\sum_{\gamma^{\prime} \in \mathcal{N}_{P G}^{\max }\left(\gamma_{2}\right)} \ell\left(\gamma^{\prime} \cap \overline{G-G_{P G}^{\prime}}\right)$,
and a strict inequality in Lemma 3.16. In particular, a proper subpath of $\gamma$ might have greater exponential length than $\gamma$ itself. For instance, if $\gamma$ is a reduced path in $G$ such that $\ell_{\text {exp }}(\gamma)=0$, it is possible that there exists a proper subpath $\gamma^{\prime}$ of $\gamma$ such that $\ell_{\exp }\left(\gamma^{\prime}\right)>0$. However, there exists a bound, depending only on $G$, on the difference of the exponential length of a subpath of $\gamma$ and the exponential length of $\gamma$ (see Lemma 5.6).

If $\gamma$ is a path in $G$ such that $\ell_{\text {exp }}(\gamma)=0$, we do not necessarily have $\ell_{\text {exp }}([f(\gamma)])=0$. Indeed, if $\gamma$ is an edge in a zero stratum such that $[f(\gamma)]$ contains a splitting unit which is an edge in an EG stratum, we have $\ell_{\text {exp }}([f(\gamma)])>0$. However, the following lemma describes an important situation where the map $f$ preserves the property of having zero exponential length.

Lemma 3.17. Let $\gamma$ be a reduced edge path which is a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$. For every $n \in \mathbb{N}$, we have $\ell_{\text {exp }}\left(\left[f^{n}(\gamma)\right]\right)=0$.

Proof. Since the [f]-image of a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$ is a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$ by Lemma 3.9, it suffices to prove the result for $n=0$. Let $\gamma$ be a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$. Let $\gamma=\gamma_{0} \gamma_{1}^{\prime} \gamma_{1} \ldots \gamma_{k} \gamma_{k}^{\prime}$ be the exponential decomposition of $\gamma$ : for every $i \in\{1, \ldots, k\}$, the path $\gamma_{i}$ is a maximal subpath of $\gamma$ in $\mathcal{N}_{P G}$ and for every $i \in\{0, \ldots, k\}$, the path $\gamma_{i}^{\prime}$ is a path in $G_{P G}$. Note that for every $i \in\{1, \ldots, k\}$, we have $\gamma_{i} \in \mathcal{N}_{P G}^{\max }(\gamma)$. By definition of the exponential length, we have $\ell_{\exp }(\gamma)=\sum_{i=0}^{k} \ell_{\exp }\left(\gamma_{i}^{\prime}\right)=0$.

Corollary 3.18. Let $\gamma$ be a path of $\mathcal{N}_{P G}^{\prime}$. Then $\ell_{\exp }(\gamma)=0$. In particular, if $\gamma$ is either a closed Nielsen path, an NEG INP or an exceptional path, we have $\ell_{\text {exp }}(\gamma)=0$.

Proof. By Lemma 3.8, the path $\gamma$ is a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$. By Lemma 3.17, we have $\ell_{\exp }(\gamma)=0$. The second assertion follows from Lemmas 3.6 and 3.7.

Lemma 3.19. Let $\gamma$ be a completely split edge path and let $\gamma=\gamma_{1} \ldots \gamma_{m}$ be its complete splitting. Let $\gamma^{\prime} \in \mathcal{N}_{P G}^{\max }(\gamma)$. Then either $\gamma^{\prime}$ is a concatenation of splitting units of $\gamma$ or there exists $i \in\{1, \ldots, m\}$ such that $\gamma^{\prime} \subsetneq \gamma_{i}$. Moreover, the complete splitting of $\gamma$ is a $P G$-relative complete splitting of $\gamma$.

Proof. Let $e$ be the first edge of $\gamma^{\prime}$ and let $i \in\{1, \ldots, m\}$ be such that $e$ is contained in $\gamma_{i}$. Let $\sigma$ be the splitting unit of $\gamma^{\prime}$ containing $e$. By Proposition 2.5 (9), the edge $e$ is in an EG stratum. Hence $\gamma_{i}$ is either an edge in an EG stratum, an exceptional path or an INP. Since $\gamma^{\prime}$ is a Nielsen path, and since $\gamma_{i}$ is a splitting unit of $\gamma$, we see that $\gamma_{i}$ is not an edge in an EG stratum. If $\gamma_{i}$ is either an NEG INP or an exceptional path, then Proposition [2.5 (11) implies that $\gamma_{i}$ starts and ends with edges in NEG strata whose height are strictly higher than the one of $e$. Since the height of $e$ is equal to the height of $\sigma$, we see that $\gamma_{i}$ contains $\sigma$. An inductive argument shows that $\gamma^{\prime}$ is contained in $\gamma_{i}$.

Suppose now that $\gamma_{i}$ is an EG INP. By Lemma 3.4 (2) applied to $\gamma_{i}$ and $\gamma^{\prime}$, either $\gamma^{\prime}$ is contained in $\gamma_{i}$ or $\gamma_{i}$ is the initial segment of $\gamma^{\prime}$. If $\gamma^{\prime}$ is contained in $\gamma_{i}$, by maximality
of $\gamma^{\prime}$, we see that $\gamma^{\prime}=\gamma_{i}$. Suppose that $\gamma^{\prime}$ is the initial segment of the completely split edge path $\gamma_{i} \ldots \gamma_{k}$. Then [FH, Corollary 4.12] implies that $\gamma^{\prime}$ is a factor of $\gamma$.

The last assertion of the lemma follows from the following observations. Every splitting unit of $\gamma$ which is either an INP or an exceptional path is a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$ by Lemma 3.7. Moreover, by the first assertion of the lemma, every splitting unit of $\gamma$ which is an edge in an irreducible stratum not contained in $G_{P G}$ does not intersect a path in $\mathcal{N}_{P G}^{\max }(\gamma)$. Hence the complete splitting of $\gamma$ is a $P G$-relative complete splitting.
$P G$-relative completely split edge paths are well-adapted to the computation of the exponential length as explained by the following lemma.

Lemma 3.20. Let $\gamma$ be a $P G$-relative completely split edge path and let $\gamma=\alpha_{1} \ldots \alpha_{\ell}$ be a $P G$-relative complete splitting.
(1) For every path $\gamma^{\prime} \in \mathcal{N}_{P G}^{\max }(\gamma)$, there exists a minimal concatenation of $P G$-relative splitting units $\delta$ of $\gamma$ such that $\gamma^{\prime} \subseteq \delta$; every $P G$-relative splitting unit of $\delta$ is a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$; for every PG-relative splitting unit $\delta^{\prime}$ of $\delta$, the intersection $\delta^{\prime} \cap \gamma^{\prime}$ is an element of $\mathcal{N}_{P G}^{\max }\left(\delta^{\prime}\right)$.
(2) We have $\ell_{\exp }(\gamma)=\sum_{i=1}^{\ell} \ell_{\exp }\left(\alpha_{i}\right)$ and $\ell_{\mathcal{F}}(\gamma)=\sum_{i=1}^{\ell} \ell_{\mathcal{F}}\left(\alpha_{i}\right)$.

Proof. (1) Let $\gamma=\gamma_{0} \gamma_{1}^{\prime} \gamma_{1} \ldots \gamma_{k}^{\prime} \gamma_{k}$ be the exponential decomposition of $\gamma$ where, for every $i \in\{0, \ldots, k\}$, we have $\gamma_{i} \in \mathcal{N}_{P G}^{\max }(\gamma)$. Let $i \in\{0, \ldots, k\}$. Let $j \in\{1, \ldots, \ell\}$ be such that $\alpha_{j}$ contains an initial segment of $\gamma_{i}$. By Proposition [2.5)(10), the splitting unit $\alpha_{j}$ is not contained in a zero stratum. Moreover, by definition of the $P G$-relative splitting units, if $\alpha_{j}$ is an edge in an irreducible stratum of positive exponential length, it is not contained in $\gamma_{i}$. Hence, by the description of $P G$-relative splitting units, the path $\alpha_{j}$ is a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$. By Proposition 2.5 (9), the path $\gamma_{i}$ starts with an edge in an EG stratum. Hence there exists a path $\beta_{j}$ in $\mathcal{N}_{P G}^{\max }\left(\alpha_{j}\right)$ which contains an initial segment of $\gamma_{i}$. By maximality of $\gamma_{i}$, we see that $\beta_{j} \subseteq \gamma_{i}$. Suppose first that $\beta_{j}=\gamma_{i}$. Then setting $\delta=\alpha_{j}$ proves the first assertion. Suppose now that $\beta_{j} \subsetneq \gamma_{i}$. By Lemma 3.4 (2) applied to $\gamma=\gamma_{i}^{-1}$ and $\gamma^{\prime}=\beta_{j}^{-1}$, the path $\left[\beta_{j}^{-1} \gamma_{i}\right]$ is a path in $\mathcal{N}_{P G}$. Therefore, by Proposition [2.5 (9), the path $\left[\beta_{j}^{-1} \gamma_{i}\right]$ starts with an edge in an EG stratum. Note that, as $\alpha_{j}$ is a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$, if $\alpha_{j}$ contains the first edge $e$ of $\left[\beta_{j}^{-1} \gamma_{i}\right]$, then $e$ would be contained in an EG INP contained in $\alpha_{j}$. Since $\beta_{j}$ is a maximal subpath of $\alpha_{j}$ in $\mathcal{N}_{P G}$, we see that $\left[\beta_{j}^{-1} \gamma_{i}\right]$ is contained in $\gamma^{\prime \prime}=\alpha_{j+1} \ldots \alpha_{\ell}$ and is in $\mathcal{N}_{P G}^{\max }\left(\gamma^{\prime \prime}\right)$. We can thus apply the same arguments to the paths $\left[\beta_{j}^{-1} \gamma_{i}\right]$ and $\gamma^{\prime \prime}$. This concludes the proof of (1).

The proof of (2) follows as the exponential length and the $\mathcal{F}$-length are computed by removing paths in $G_{P G}$ and in $\mathcal{N}_{P G}$. As all subpaths in $G_{P G}$ are contained in a splitting unit of $\gamma$ and as subpaths in $\mathcal{N}_{P G}$ are obtained by concatenating paths in $\amalg_{j=1}^{\ell} \mathcal{N}_{P G}^{\max }\left(\alpha_{j}\right)$, we see that $\ell_{\text {exp }}(\gamma)=\sum_{i=1}^{\ell} \ell_{\text {exp }}\left(\alpha_{i}\right)$ and $\ell_{\mathcal{F}}(\gamma)=\sum_{i=1}^{\ell} \ell_{\mathcal{F}}\left(\alpha_{i}\right)$.

The following property of the exponential length allows us to pass, if needed, to a further iterate of the CT map $f$.

Lemma 3.21. For every edge e of $\overline{G-G_{P G}^{\prime}}$, we have

$$
\lim _{n \rightarrow \infty} \ell_{\exp }\left(\left[f^{n}(e)\right]\right)=\infty \text { and } \lim _{n \rightarrow \infty} \ell_{\mathcal{F}}\left(\left[f^{n}(e)\right]\right)=\infty
$$

Moreover, the sequences $\left(\ell_{\exp }\left(\left[f^{n}(e)\right]\right)\right)_{n \in \mathbb{N}}$ and $\left(\ell_{\mathcal{F}}\left(\left[f^{n}(e)\right]\right)\right)_{n \in \mathbb{N}}$ grows exponentially fast.
Proof. We prove the result concerning $\ell_{\text {exp }}$, the proof of the result concerning $\ell_{\mathcal{F}}$ follows from the fact that for every reduced edge path $\gamma$ in $G$, we have $\ell_{\exp }(\gamma) \leqslant \ell_{\mathcal{F}}(\gamma)$. Let $e$ be an edge of $\overline{G-G_{P G}^{\prime}}$. Since every iterate of $e$ is completely split by Proposition 2.5 (6) and since there exists an iterate of $e$ which contains a splitting unit which is an edge in an EG stratum, we may suppose that $e$ is an edge in an EG stratum $H_{r}$. Since $H_{r}$ is an EG stratum, the number of edges in $\left[f^{n}(e)\right] \cap H_{r}$ grows exponentially fast as $n$ goes to infinity. Therefore the number of splitting units of $\left[f^{n}(e)\right]$ which are edges of $H_{r}$ grows exponentially fast and $\lim _{n \rightarrow \infty} \ell_{\exp }\left(\left[f^{n}(e)\right]\right)=\infty$.

Lemma 3.22. Let $\gamma$ be a $P G$-relative completely split edge path. There exists $n_{0} \in \mathbb{N}^{*}$ such that for every $k \geqslant n_{0}$, we have $\ell_{\exp }\left(\left[f^{k}(\gamma)\right]\right) \geqslant \ell_{\exp }(\gamma)$.

Proof. Let $\gamma=\gamma_{1} \ldots \gamma_{k}$ be a $P G$-relative complete splitting of $\gamma$. By Lemma 3.20, it suffices to prove the assertion for every subpath $\gamma_{i}$, with $i \in\{1, \ldots, k\}$. Let $i \in\{1, \ldots, k\}$. If $\gamma_{i}$ is a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$, then $\ell_{\exp }\left(\left[f\left(\gamma_{i}\right)\right]\right)=\ell_{\exp }\left(\gamma_{i}\right)=$ 0 by Lemma 3.17. If $\gamma_{i}$ is a maximal taken connecting path in a zero stratum, we have $\ell_{\exp }\left(\gamma_{i}\right)=0$. Hence $\ell_{\exp }\left(\left[f\left(\gamma_{i}\right)\right]\right) \geqslant \ell_{\exp }\left(\gamma_{i}\right)$. In the other cases, $\gamma_{i}$ is an edge in an irreducible stratum which is not contained in $G_{P G}$. By Lemma 3.21, we have $\lim _{n \rightarrow \infty} \ell_{\exp }\left(\left[f^{n}\left(\gamma_{i}\right)\right]\right)=\infty$. Hence there exists $n_{0} \in \mathbb{N}^{*}$ such that, for every $k \geqslant n_{0}$, we have $\ell_{\exp }\left(\left[f^{k}\left(\gamma_{i}\right)\right]\right) \geqslant \ell_{\exp }\left(\gamma_{i}\right)$, and $n_{0}$ may be chosen to be independent of $\gamma_{i}$ with $i \in\{1, \ldots, k\}$.

The last lemma in this section shows that the exponential length of a $P G$-relative completely split edge path encaptures the splitting units which are edges with exponential growth under iterates of $f$.

Lemma 3.23. Let $\gamma$ be a PG-relative completely split edge path, let $\gamma=\gamma_{1} \ldots \gamma_{k}$ be a $P G$-relative complete splitting and let $i \in\{1, \ldots, k\}$. Then $\ell_{\exp }\left(\gamma_{i}\right)>0$ if and only if $\gamma_{i}$ is an edge in an irreducible stratum not contained in $G_{P G}$. In particular, the value $\ell_{\exp }(\gamma)$ is the number of splitting units which are edges in $\overline{G-G_{P G}^{\prime}}$.

Proof. Suppose first that $\gamma_{i}$ is either a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$ or a maximal taken connecting path in a zero stratum. By Lemma 3.17, we have $\ell_{\exp }\left(\gamma_{i}\right)=0$. Suppose that $\gamma_{i}$ is an edge in an irreducible stratum which is not contained in $G_{P G}$. Since there does not exist an EG INP of length 1, by definition of the exponential length, we have $\ell_{\exp }\left(\gamma_{i}\right)=1>0$. This concludes the proof of the first part of the lemma. The computation of $\ell_{\exp }(\gamma)$ follows from Lemma 3.20 (2).

### 3.3 The space of polynomially growing currents

In this section, let $\mathcal{F}$ be a free factor system and let $\phi \in \operatorname{Out}\left(F_{\mathrm{n}}, \mathcal{F}\right)$ be an exponentially growing outer automorphism. Recall the definition of $\mathcal{A}(\phi)$ and $\mathcal{F} \wedge \mathcal{A}(\phi)$ from Section [2.1. We define a subspace of $\mathbb{P} \operatorname{Curr}\left(F_{\mathrm{n}}, \mathcal{F} \wedge \mathcal{A}(\phi)\right)$, called the space of polynomially growing currents. It consists in the currents whose support is contained in $\partial^{2} \mathcal{A}(\phi)$ (see Lemma 3.27). In order to define it, we first need to show that the exponential length extends to a continuous function $\Psi: \mathbb{P} \operatorname{Curr}\left(F_{\mathrm{n}}, \mathcal{F} \wedge \mathcal{A}(\phi)\right) \rightarrow \mathbb{R}$. The space of polynomially growing currents will then be defined as a level set of $\Psi$.

We first need some preliminary results concerning paths in $\mathcal{N}_{P G}$. For a path $\gamma \in \mathcal{N}_{P G}$, let $\mathcal{N}_{P G}^{++}(\gamma)$ be the subset of $\mathcal{N}_{P G}$ which consists in all paths $\gamma^{\prime} \in \mathcal{N}_{P G}$ such that $\gamma \subsetneq \gamma^{\prime}$ and $\gamma^{\prime}$ is minimal for this property. Let $\gamma^{\prime} \in \mathcal{N}_{P G}^{++}(\gamma)$. By Lemma 3.4 (3), either $\gamma$ is properly contained in an INP $\sigma$ of the complete splitting of $\gamma^{\prime}$, or there exist (possibly trivial) paths $\gamma_{1}, \gamma_{2} \in \mathcal{N}_{P G}$ such that $\gamma^{\prime}=\gamma_{1} \gamma \gamma_{2}$. By minimality, either $\gamma_{1}$ or $\gamma_{2}$ is trivial. Moreover, a result of Feighn and Handel ([FH] Corollary 4.12]) shows that, in this case, splitting units of the complete splittings of $\gamma_{1}, \gamma_{2}$ and $\gamma$ are splitting units of $\gamma^{\prime}$. Thus the set $\mathcal{N}_{P G}^{++}(\gamma)$ can be partitioned into three disjoint subsets:

$$
\mathcal{N}_{P G}^{++}(\gamma)=\mathcal{N}_{P G, I N P}^{++}(\gamma) \amalg \mathcal{N}_{P G, l e f t}^{++}(\gamma) \amalg \mathcal{N}_{P G, \text { right }}^{++}(\gamma),
$$

where $\mathcal{N}_{P G, I N P}^{++}(\gamma)$ is the set of paths in $\mathcal{N}_{P G}^{++}(\gamma)$ such that one of their splitting units properly contains $\gamma, \mathcal{N}_{\text {PG,left }}^{++}(\gamma)$ is the set of paths $\gamma^{\prime} \in \mathcal{N}_{P G}^{++}(\gamma)$ such that $\gamma^{\prime}=\gamma_{1} \gamma$ and $\mathcal{N}_{\text {PG, right }}^{++}(\gamma)$ is the set of paths $\gamma^{\prime} \in \mathcal{N}_{P G}^{++}(\gamma)$ such that $\gamma^{\prime}=\gamma \gamma_{2}$. One can also define similarly the three sets $\mathcal{N}_{P G, I N P, \mathcal{F}}^{++}(\gamma), \mathcal{N}_{P G, l e f t, \mathcal{F}}^{++}(\gamma)$ and $\mathcal{N}_{P G, r i g h t, \mathcal{F}}^{++}(\gamma)$ as the restriction to the paths in $\mathcal{N}_{P G, I N P}^{++}(\gamma), \mathcal{N}_{P G, l e f t}^{++}(\gamma)$ and $\mathcal{N}_{\text {PG,right }}^{++}(\gamma)$ contained in $G_{p}$. We emphasize on the fact that a path in $\mathcal{N}_{P G, I N P}^{++}(\gamma)$ might contain several occurrences of the path $\gamma$. However, a path in $\mathcal{N}_{P G, l e f t}^{++}(\gamma)$ or in $\mathcal{N}_{P G, \text { right }}^{++}(\gamma)$ contains a unique occurrence of $\gamma$. Indeed, let $\gamma^{\prime} \in \mathcal{N}_{\text {PG,left }}^{++}(\gamma)$ (the proof for $\mathcal{N}_{\text {PG, right }}^{++}(\gamma)$ being similar). Then $\gamma^{\prime}=\gamma_{1} \gamma_{2}$ with $\gamma_{1} \in \mathcal{N}_{P G}$ and $\gamma_{2}=\gamma$. Let $\gamma_{3}$ be an occurrence of $\gamma$ which contains an edge of $\gamma_{1}$. By Lemma 3.3 (2), the path $\gamma_{3}$ cannot intersect $\gamma_{2}$ nontrivially. Hence $\gamma_{3} \subseteq \gamma_{1}$. Hence $\gamma_{1} \in \mathcal{N}_{P G}$ and $\gamma_{1}$ contains an occurrence of $\gamma$. This contradicts the minimality of $\gamma^{\prime}$.

Lemma 3.24. Let $\gamma$ be a path in $\mathcal{N}_{P G}$. Let $\gamma_{1}, \gamma_{2}$ be two distinct paths in $\mathcal{N}_{P G}^{++}(\gamma)$. Suppose that there exist three paths $\mu_{1}, \mu_{2}, \mu_{3}$ such that $\gamma_{1}=\mu_{1} \mu_{2}, \gamma_{2}=\mu_{2} \mu_{3}$ and $\gamma$ is contained in $\mu_{2}$. Then $\gamma_{1} \in \mathcal{N}_{\text {PG,left }}^{++}(\gamma), \gamma_{2} \in \mathcal{N}_{\text {PG, right }}^{++}(\gamma)$ and $\mu_{2}=\gamma$.
Proof. By Lemma 3.4 (2), the path $\mu_{2}$ belongs to $\mathcal{N}_{P G}$ and contains $\gamma$. Since $\gamma_{1}$ and $\gamma_{2}$ are minimal paths of $\mathcal{N}_{P G}$ for the property of properly containing $\gamma$, we have $\mu_{2}=\gamma$. Therefore, we see that $\gamma_{1}=\mu_{1} \gamma$ and $\gamma_{2}=\gamma \mu_{3}$. This shows that $\gamma_{1} \in \mathcal{N}_{P G, l e f t}^{++}(\gamma)$ and that $\gamma_{2} \in \mathcal{N}_{P G, \text { right }}^{++}(\gamma)$.

Lemma 3.24 implies that an occurrence of $\gamma$ in the intersection of paths in $\mathcal{N}_{P G}^{++}(\gamma)$ is well-controlled. Following Lemma 3.24, we then define $\mathcal{N}_{P G, l r}^{++}(\gamma)$ to be the set of
paths of the form $\gamma_{1} \gamma \gamma_{2}$, where $\gamma_{1} \gamma \in \mathcal{N}_{\text {PG,left }}^{++}(\gamma)$ and $\gamma \gamma_{2} \in \mathcal{N}_{P G, r i g h t}^{++}(\gamma)$. We define similarly the set $\mathcal{N}_{P G, l r, \mathcal{F}}^{++}(\gamma)$ to be the set of all paths in $\mathcal{N}_{P G, l r}^{++}(\gamma)$ contained in $G_{p}$. As for $\mathcal{N}_{P G, l e f t}^{++}(\gamma)$ and $\mathcal{N}_{P G, r i g h t}^{++}(\gamma)$, a path in $\mathcal{N}_{P G, l r}^{++}(\gamma)$ contains a unique occurrence of $\gamma$.

Given two paths $\gamma$ and $\gamma^{\prime}$ of $G$ let $N\left(\gamma^{\prime}, \gamma\right)$ be the number of occurrences of $\gamma$ and $\gamma^{-1}$ in $\gamma^{\prime}$. Using the finiteness of $\mathcal{N}_{P G}$ (see Lemma 3.4 (1)), we denote by

$$
\Psi_{0}^{\prime}: \operatorname{Curr}\left(F_{\mathrm{n}}, \mathcal{F} \wedge \mathcal{A}(\phi)\right) \rightarrow \mathbb{R}
$$

the continuous function
$\left.\Psi_{0}^{\prime}(\nu)=\sum_{\gamma \in \mathcal{N}_{P G}}\left(\langle\gamma, \nu\rangle-\sum_{\gamma^{\prime} \in \mathcal{N}_{P G}^{+}(\gamma)}\left\langle\gamma^{\prime}, \nu\right\rangle N\left(\gamma^{\prime}, \gamma\right)+\sum_{\gamma^{\prime} \in \mathcal{N}_{P G}^{+}+l r}(\gamma)<\gamma^{\prime}, \nu\right\rangle\right) \ell\left(\gamma \cap \overline{G-G_{P G}^{\prime}}\right)$, and by $\Psi_{0}: \operatorname{Curr}\left(F_{\mathrm{n}}, \mathcal{F} \wedge \mathcal{A}(\phi)\right) \rightarrow \mathbb{R}$ the continuous linear function

$$
\begin{aligned}
& \Psi_{0}(\nu)= \frac{1}{2}\left(\sum_{e \in \vec{E}\left(\overline{G-G_{P G}^{\prime}}\right)}\langle e, \nu\rangle-\Psi_{0}^{\prime}(\nu)\right) \\
&= \frac{1}{2}\left(\sum_{e \in \vec{E} \overline{(\overline{G-G}} \bar{\prime})}(\langle e, \nu\rangle-\right. \\
& \sum_{\gamma \in \mathcal{N}_{P G}^{\prime}, e \subseteq \gamma}\left(\langle\gamma, \nu\rangle-\sum_{\gamma^{\prime} \in \mathcal{N}_{P G}^{++}(\gamma)}\left\langle\gamma^{\prime}, \nu\right\rangle N\left(\gamma^{\prime}, \gamma\right)+\sum_{\gamma^{\prime} \in \mathcal{N}_{P G}^{+}+l r}(\gamma)\right. \\
&\left.\left.\left.\left\langle\gamma^{\prime}, \nu\right\rangle\right) N(\gamma, e)\right)\right) .
\end{aligned}
$$

Definition 3.25. The space of polynomially growing currents, denoted by $K_{P G}(f)$, is the compact subset of $\mathbb{P C u r r}\left(F_{\mathrm{n}}, \mathcal{F} \wedge \mathcal{A}(\phi)\right)$ consisting in all projective classes of currents $[\nu] \in \mathbb{P C u r r}\left(F_{\mathrm{n}}, \mathcal{F} \wedge \mathcal{A}(\phi)\right)$ such that:

$$
\Psi_{0}(\nu)=0 .
$$

Finally, we define the $\mathcal{F}$-simplicial length function $\|\cdot\|_{\mathcal{F}}: \operatorname{Curr}\left(F_{\mathrm{n}}, \mathcal{F} \wedge \mathcal{A}(\phi)\right) \rightarrow \mathbb{R}$ as

$$
\begin{aligned}
\|\nu\|_{\mathcal{F}}= & \frac{1}{2}\left(\sum_{e \in \vec{E}\left(\overline{\left.G-G_{P G, \mathcal{F}}^{\prime}\right)}\right.}\langle e, \nu\rangle-\right. \\
& \left.\sum_{\gamma \in \overrightarrow{\mathcal{N}_{P G, \mathcal{F}}}}\left(\langle\gamma, \nu\rangle-\sum_{\gamma^{\prime} \in \mathcal{N}_{P G, \mathcal{F}}^{++}(\gamma)}\left\langle\gamma^{\prime}, \nu\right\rangle N\left(\gamma^{\prime}, \gamma\right)+\sum_{\gamma^{\prime} \in \mathcal{N}_{P G, l r, \mathcal{F}}^{+}(\gamma)}\left\langle\gamma^{\prime}, \nu\right\rangle\right) \ell\left(\gamma \cap \overline{G-G_{P G}^{\prime}}\right)\right) .
\end{aligned}
$$

Lemma 3.26. Let $w \in F_{\mathrm{n}}$ be a nonperipheral element with conjugacy class $[w]$, associated rational current $\eta_{[w]}$ and associated reduced edge path $\gamma_{w}$ in $G$. Then

$$
\begin{aligned}
\Psi_{0}\left(\eta_{[w]}\right) & =\ell_{\text {exp }}\left(\gamma_{w}\right) ; \\
\left\|\eta_{[w]}\right\|_{\mathcal{F}} & =\ell_{\mathcal{F}}\left(\gamma_{w}\right)
\end{aligned}
$$

Therefore $\eta_{[w]} \in K_{P G}(f)$ if and only if

$$
\ell_{\exp }\left(\gamma_{w}\right)=0 .
$$

In particular, there exist a basis $\mathfrak{B}$ of $F_{\mathrm{n}}$ and a constant $C>0$ such that, for every $\mathcal{F} \wedge \mathcal{A}(\phi)$-nonperipheral element $g \in F_{\mathrm{n}}$, we have $\left\|\eta_{[g]}\right\|_{\mathcal{F}} \in \mathbb{N}^{*}$ and

$$
\ell_{\mathfrak{B}}([g]) \geqslant C\left\|\eta_{[g]}\right\|_{\mathcal{F}} .
$$

Proof. We prove the result for $\Psi_{0}$, the proof for $\left\|\eta_{[w]}\right\|_{\mathcal{F}}$ being similar. First note that

$$
\sum_{\left.e \in \vec{E} \overline{\left(G-G_{P G}^{\prime}\right.}\right)}\left\langle e, \eta_{[w]}\right\rangle=2 \ell\left(\gamma_{w} \cap \overline{G-G_{P G}^{\prime}}\right),
$$

where the factor 2 follows from the fact that the sum on the left hand side is over oriented edges. Therefore, it remains to prove that

$$
\begin{equation*}
\Psi_{0}^{\prime}\left(\eta_{[w]}\right)=\sum_{\gamma \in \mathcal{N}_{P G}^{\max }\left(\gamma_{w}\right)} \ell\left(\gamma \cap \overline{G-G_{P G}^{\prime}}\right) . \tag{3}
\end{equation*}
$$

Let $\gamma \in \mathcal{N}_{P G}$. Then the value

$$
\left\langle\gamma, \eta_{[w]}\right\rangle-\sum_{\gamma^{\prime} \in \mathcal{N}_{P G}^{++}(\gamma)}\left\langle\gamma^{\prime}, \eta_{[w]}\right\rangle N\left(\gamma^{\prime}, \gamma\right)+\sum_{\gamma^{\prime} \in \mathcal{N}_{P G}^{++}, r(\gamma)}\left\langle\gamma^{\prime}, \eta_{[w]}\right\rangle
$$

measures the number of occurrences of $\gamma$ or $\gamma^{-1}$ in $\gamma_{w}$ which are not induced by an occurrence of a path $\gamma^{\prime} \in \mathcal{N}_{P G}$ containing properly $\gamma$ or $\gamma^{-1}$ and contained in $\gamma_{w}$. Indeed, an occurrence of $\gamma$ in a path $\gamma^{\prime} \in \mathcal{N}_{P G}$ containing properly $\gamma$ will be counted in $\sum_{\gamma^{\prime} \in \mathcal{N}_{P G}^{++}(\gamma)}\left\langle\gamma^{\prime}, \eta_{[w]}\right\rangle N\left(\gamma^{\prime}, \gamma\right)$. Moreover, if an occurrence of $\gamma$ is contained in two distinct paths $\gamma_{1}, \gamma_{2} \in \mathcal{N}_{P G}^{++}(\gamma)$, Lemma 3.24 ensures that this occurrence is contained in a path $\gamma_{3} \in \mathcal{N}_{P G, l r}^{\max }(\gamma)$. Therefore, the value

$$
-\sum_{\gamma^{\prime} \in \mathcal{N}_{P G}^{++}(\gamma)}\left\langle\gamma^{\prime}, \eta_{[w]}\right\rangle N\left(\gamma^{\prime}, \gamma\right)+\sum_{\gamma^{\prime} \in \mathcal{N}_{P G, l r}^{++}(\gamma)}\left\langle\gamma^{\prime}, \eta_{[w]}\right\rangle
$$

measures an occurrence of $\gamma$ or $\gamma^{-1}$ in a larger path, and each such occurrence will be counted exactly once. Therefore, the equation below Equation (3) measures the number of occurrences of $\gamma$ and $\gamma^{-1}$ in $\mathcal{N}_{P G}^{\max }\left(\gamma_{w}\right)$. Thus, the equality (3) holds. The last assertions of Lemma 3.26 then follows by definition of $K_{P G}(f)$ and of $\ell_{\mathcal{F}}$.

Note that in the proof of Lemma 3.26, we show that, for every edge $e \in \vec{E}\left(\overline{G-G_{P G}^{\prime}}\right)$ and every nonperipheral element $w \in F_{\mathrm{n}}$, the value:

$$
\left\langle e, \eta_{[w]}\right\rangle-\sum_{\gamma \in \mathcal{N}_{P G}, e \subseteq \gamma}\left(\left\langle\gamma, \eta_{[w]}\right\rangle-\sum_{\gamma^{\prime} \in \mathcal{N}_{P G}^{++}(\gamma)}\left\langle\gamma^{\prime}, \eta_{[w]}\right\rangle N\left(\gamma^{\prime}, \gamma\right)+\sum_{\gamma^{\prime} \in \mathcal{N}_{P G}^{++l r}(\gamma)}\left\langle\gamma^{\prime}, \eta_{[w]}\right\rangle\right) N(\gamma, e)
$$

measures the number of occurrences of $e$ in $\gamma_{w}$ which are not contained in a path of $\mathcal{N}_{P G}^{\max }\left(\gamma_{w}\right)$. Thus, for every nonperipheral element and every edge $e \in \vec{E}\left(\overline{G-G_{P G}^{\prime}}\right)$, we have:

$$
\left.\left\langle e, \eta_{[w]}\right\rangle-\sum_{\gamma \in \mathcal{N}_{P G}, e \subseteq \gamma}\left(\left\langle\gamma, \eta_{[w]}\right\rangle-\sum_{\gamma^{\prime} \in \mathcal{N}_{P G}^{++}(\gamma)}\left\langle\gamma^{\prime}, \eta_{[w]}\right\rangle N\left(\gamma^{\prime}, \gamma\right)+\sum_{\gamma^{\prime} \in \mathcal{N}_{P G}^{++}, l r}(\gamma) \mathrm{\gamma}, \eta_{[w]}\right\rangle\right) N(\gamma, e) \geqslant 0 .
$$

The density of rational currents given by Proposition 2.15 and the continuity of $\langle.,$.$\rangle then$ shows that for every current $\nu \in \operatorname{Curr}\left(F_{\mathrm{n}}, \mathcal{F} \wedge \mathcal{A}(\phi)\right)$ and every edge $e \in \vec{E}\left(\overline{G-G_{P G}^{\prime}}\right)$, we have:

$$
\left.\langle e, \nu\rangle-\sum_{\gamma \in \mathcal{N}_{P G}, e \subseteq \gamma}\left(\langle\gamma, \nu\rangle-\sum_{\gamma^{\prime} \in \mathcal{N}_{P G}^{++}(\gamma)}\left\langle\gamma^{\prime}, \nu\right\rangle N\left(\gamma^{\prime}, \gamma\right)+\sum_{\gamma^{\prime} \in \mathcal{N}_{P G}^{++}, l r}(\gamma) \mathrm{\gamma}, \nu\right\rangle\right) N(\gamma, e) \geqslant 0 .
$$

Lemma 3.27. Let $\mathrm{n} \geqslant 3$ and let $\mathcal{F}$ be a free factor system. Let $\phi \in \operatorname{Out}\left(F_{\mathrm{n}}, \mathcal{F}\right)$ be an exponentially growing outer automorphism. Let $f: G \rightarrow G$ be a CT map representing a power of $\phi$.
(1) If $[\nu] \in K_{P G}(f)$, then $\operatorname{Supp}(\nu) \subseteq \partial^{2}\left(F_{\mathbf{n}}, \mathcal{F} \wedge \mathcal{A}(\phi)\right) \cap \partial^{2} \mathcal{A}(\phi)$. In particular, if $\phi$ is expanding relative to $\mathcal{F}$, then $K_{P G}(f)=\varnothing$.
(2) Conversely, if $\nu \in \operatorname{Curr}\left(F_{\mathrm{n}}, \mathcal{F} \wedge \mathcal{A}(\phi)\right)$ is such that the support $\operatorname{Supp}(\nu)$ of $\nu$ is contained in $\partial^{2}\left(F_{\mathrm{n}}, \mathcal{F} \wedge \mathcal{A}(\phi)\right) \cap \partial^{2} \mathcal{A}(\phi)$, then $[\nu] \in K_{P G}(f)$. Thus we have

$$
K_{P G}(f)=\left\{[\mu] \in \mathbb{P} \operatorname{Curr}\left(F_{\mathbf{n}}, \mathcal{F} \wedge \mathcal{A}\right) \mid \operatorname{Supp}(\mu) \subseteq \partial^{2}\left(F_{\mathbf{n}}, \mathcal{F} \wedge \mathcal{A}(\phi)\right) \cap \partial^{2} \mathcal{A}(\phi)\right\} .
$$

(3) If $\nu \in \operatorname{Curr}\left(F_{\mathrm{n}}, \mathcal{F} \wedge \mathcal{A}(\phi)\right)$, we have $\|\nu\|_{\mathcal{F}}=0$ if and only if $\nu=0$.

Proof. The proof of (3) being identical to the proof of (1) and (2) replacing $G_{P G}^{\prime}$ and $\mathcal{N}_{P G}$ by $G_{P G, \mathcal{F}}^{\prime}$ and $\mathcal{N}_{P G, \mathcal{F}}$, we only prove (1) and (2). For the proof of both (1) and (2), let $\mathcal{B}$ be a free basis of $F_{\mathrm{n}}$ and let $T$ be the Cayley graph of $F_{\mathrm{n}}$ associated with $\mathcal{B}$. Let $\mathscr{C}(\mathcal{A}(\phi))$ be the set of elements of $F_{\mathrm{n}}$ associated with $\mathcal{A}(\phi)$ given by Lemma 2.11, Recall that $\operatorname{Cyl}(\mathscr{C}(\mathcal{A}(\phi)))$ is the set of cylinder subsets of the form $C(\gamma)$, where $\gamma$ is a geodesic edge path in $T$ starting at the base point whose associated element $w \in F_{\mathrm{n}}$ contains a word of $\mathscr{C}(\mathcal{A}(\phi))$ as a subword.
(1) Let $\nu \in \operatorname{Curr}\left(F_{\mathrm{n}}, \mathcal{F} \wedge \mathcal{A}(\phi)\right)$ nonzero be such that $\operatorname{Supp}(\nu)$ is not contained in $\partial^{2}\left(F_{\mathrm{n}}, \mathcal{F} \wedge \mathcal{A}(\phi)\right) \cap \partial^{2} \mathcal{A}(\phi)$. Then $\operatorname{Supp}(\nu) \cap \partial^{2}\left(F_{\mathrm{n}}, \mathcal{A}(\phi)\right) \neq \varnothing$. Hence the restriction of $\nu$ to $\partial^{2}\left(F_{\mathrm{n}}, \mathcal{A}(\phi)\right)$ induces a nonzero current $\nu^{\prime} \in \operatorname{Curr}\left(F_{\mathrm{n}}, \mathcal{A}(\phi)\right)$. By Lemma 2.12 applied to $\mathcal{A}=\mathcal{A}(\phi)$ and $\nu^{\prime}$, there exists $C(\gamma) \in \mathscr{C}(\mathcal{A}(\phi))$ such that $\nu(C(\gamma))>0$. Let $w$ be the element of $F_{\mathrm{n}}$ associated with $\gamma$, and let $\gamma_{w}^{\prime}$ be the reduced circuit in $G$ associated with the conjugacy class of $w$. Up to taking a larger geodesic edge path $\gamma^{\prime \prime} \supseteq \gamma$ in $T$ such that $\nu\left(C\left(\gamma^{\prime \prime}\right)\right)>0$ (which exists by additivity of $\nu$ ), we may suppose that $w$ is cyclically reduced. By Lemma 2.11 (3), the path $\gamma$ is not contained in any tree $T_{A}$ such that $[A] \in \mathcal{A}(\phi)$. As $w$ is cyclically reduced, the translation axis in $T$ of $w$ contains $\gamma$. Hence $\left\{w^{+\infty}, w^{-\infty}\right\} \notin \partial^{2} \mathcal{A}(\phi)$ and $w$ is not contained in any subgroup $A$ such that $[A] \in \mathcal{A}(\phi)$. By Proposition 3.13, the circuit $\gamma_{w}^{\prime}$ is not a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$. Therefore, there exists an edge $e$ of $G$ such that
$\langle e, \nu\rangle-\sum_{\gamma \in \mathcal{N}_{P G}, e \subseteq \gamma}\left(\langle\gamma, \nu\rangle-\sum_{\gamma^{\prime} \in \mathcal{N}_{P G}^{++}(\gamma)}\left\langle\gamma^{\prime}, \nu\right\rangle N\left(\gamma^{\prime}, \gamma\right)+\sum_{\gamma^{\prime} \in \mathcal{N}_{P G}^{+}+l r} \sum_{l)}\left\langle\gamma^{\prime}, \nu\right\rangle\right) N(\gamma, e)>0$.
Thus, we see that $\Psi_{0}(\nu)>0$ and that $[\nu] \notin K_{P G}(f)$. The second part of (1) follows from the fact that, if $\phi$ is expanding relative to $\mathcal{F}$, then $\partial^{2} \mathcal{A}(\phi) \subseteq \partial^{2} \mathcal{F}$. This proves (1).
(2) Let $\nu \in \operatorname{Curr}\left(F_{\mathrm{n}}, \mathcal{F} \wedge \mathcal{A}(\phi)\right)$ be such that $\operatorname{Supp}(\nu) \subseteq \partial^{2}\left(F_{\mathrm{n}}, \mathcal{F} \wedge \mathcal{A}(\phi)\right) \cap \partial^{2} \mathcal{A}(\phi)$. Let $e$ be an edge such that $\langle e, \nu\rangle>0$. By Lemma 3.4 (1), there exists a constant $C_{1}>0$ such that, for every path $\gamma^{\prime} \in \mathcal{N}_{P G}$, we have $\ell\left(\gamma^{\prime}\right) \leqslant C_{1}$. Recall the definition of the graph $G^{*}$ and the application $p_{G^{*}}: G^{*} \rightarrow G$. from Lemma 3.11. Let $C_{2}$ be the length of a maximal path in a maximal forest of $p_{G^{*}}\left(G^{*}\right)$. Let $C=\max \left\{2 C_{1}, C_{2}\right\}$.

Claim. Let $\gamma, \delta_{1}$ and $\delta_{2}$ be reduced paths such that $\gamma=\delta_{1} e \delta_{2}, \ell\left(\delta_{1}\right), \ell\left(\delta_{2}\right) \geqslant 2 C$ and $\langle\gamma, \nu\rangle>0$. Let $\gamma=\gamma_{0} \gamma_{1}^{\prime} \gamma_{1} \ldots \gamma_{k} \gamma_{k}^{\prime}$ be the exponential decomposition of $\gamma$ (where, for every $i \in\{0, \ldots, k\}$, the path $\gamma_{i}$ is contained in $\left.\mathcal{N}_{P G}\right)$. Either $e \in \vec{E} G_{P G}^{\prime}$ or $e$ is contained in an EG stratum and there exists $i \in\{0, \ldots, k\}$ such that $e \subseteq \gamma_{i}$.

Proof. Since $\operatorname{Supp}(\nu) \subseteq \partial^{2}\left(F_{\mathrm{n}}, \mathcal{F} \wedge \mathcal{A}(\phi)\right) \cap \partial^{2} \mathcal{A}(\phi)$, there exists a subgroup $A$ of $F_{\mathrm{n}}$ such that $[A] \in \mathcal{A}(\phi)$, and two elements $a$ and $b$ of $A$ such that the geodesic path in $\widetilde{G}$ representing $\left\{a^{+\infty}, b^{+\infty}\right\} \in \partial^{2} A$ contains a lift of $\gamma$. If $b=a^{-1}$, then $\gamma$ is contained in an iterate of $a$ and, by Proposition 3.13, $\gamma$ is contained in a concatenation of paths in $G_{P G}$ and $\mathcal{N}_{P G}$. The claim follows in this case. So we may assume that $b \neq a^{-1}$. Suppose first that the axes $\operatorname{Ax}(a)$ and $\operatorname{Ax}(b)$ of $a$ and $b$ are disjoint. Then $\gamma$ is contained in the axis of $a^{-1} b$. Thus, by Proposition 3.13, $\gamma$ is contained in a concatenation of paths in $G_{P G}$ and $\mathcal{N}_{P G}$ and the claim follows in this case.

Suppose now that $\operatorname{Ax}(a) \cap \operatorname{Ax}(b) \neq \varnothing$. Let $\gamma_{a}^{\prime}$ and $\gamma_{b}^{\prime}$ be the reduced circuit in $G$ associated with $a$ and $b$. Then $\gamma$ is contained in the union of $\gamma_{a}^{\prime} \cup \gamma_{b}^{\prime}$. Recall that, by Proposition 3.13, the paths $\gamma_{a}^{\prime}$ and $\gamma_{b}^{\prime}$ are concatenation of paths in $G_{P G}$ and $\mathcal{N}_{P G}$. Hence there exist reduced circuits $\alpha$ and $\beta$ in $G^{*}$ and reduced $\operatorname{arcs} \tau, \tau_{e}$ in $G^{*}$ such that $p_{G^{*}}(\alpha)=\gamma_{a}^{\prime}$ and $p^{*}(\beta)=\gamma_{b}^{\prime}$ and such that $p_{G^{*}}(\tau)=\gamma$ and $p_{G^{*}}\left(\tau_{e}\right)=e$. By the choice of $C$, and as $\ell\left(\delta_{1}\right), \ell\left(\delta_{2}\right) \geqslant 2 C$, one can remove an initial and a terminal segment of $\tau$ so that the resulting path $\tau^{\prime}$ is nontrivial, is contained in a subgraph of $G^{*}$ with no leaf and is such that $\ell\left(p_{G^{*}}\left(\tau^{\prime}\right)\right) \geqslant 2 C+1$. Thus, there exist subpaths $\tau_{1}^{\prime}, \tau_{1}^{\prime \prime}, \tau_{2}^{\prime}, \tau_{2}^{\prime \prime}$ of $\tau$ and a reduced circuit $\delta$ of $G^{*}$ such that:
(i) $\ell\left(p_{G^{*}}\left(\tau_{1}^{\prime}\right)\right), \ell\left(p_{G^{*}}\left(\tau_{2}^{\prime}\right)\right) \geqslant C$,
(ii) $\tau=\tau_{1}^{\prime \prime} \tau_{1}^{\prime} e \tau_{2}^{\prime} \tau_{2}^{\prime \prime}$,
(iii) $\tau^{\prime}=\tau_{1}^{\prime} e \tau_{2}^{\prime} \subseteq \delta$.

By Lemma 3.11 (1), the path $p_{G^{*}}(\delta)$ is a reduced ciruit which contains $e$. Since $\ell\left(p_{G^{*}}\left(\tau_{1}^{\prime}\right)\right), \ell\left(p_{G^{*}}\left(\tau_{2}^{\prime}\right)\right) \geqslant C \geqslant 2 C_{1}$, if $\gamma^{\prime} \in \mathcal{N}_{P G}^{\max }\left(p_{G^{*}}(\delta)\right)$ is such that $e \subseteq \gamma^{\prime}$, then $\gamma^{\prime} \subseteq \tau_{1}^{\prime} e \tau_{2}^{\prime}$. Hence it suffices to prove the claim for $\gamma=p_{G^{*}}(\delta)$. As $\delta$ is a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$, the claim follows.

Suppose towards a contradiction that there exists an edge $e \in \overline{G-G_{P G}^{\prime}}$ such that:

$$
\begin{equation*}
\left.\langle e, \nu\rangle-\sum_{\gamma \in \mathcal{N}_{P G}, e \subseteq \gamma}\left(\langle\gamma, \nu\rangle-\sum_{\gamma^{\prime} \in \mathcal{N}_{P G}^{++}(\gamma)}\left\langle\gamma^{\prime}, \nu\right\rangle N\left(\gamma^{\prime}, \gamma\right)+\sum_{\gamma^{\prime} \in \mathcal{N}_{P G}^{++}, l r}(\gamma)<\gamma^{\prime}, \nu\right\rangle\right) N(\gamma, e)>0 \tag{4}
\end{equation*}
$$

By additivity of $\nu$, there exists a reduced path $\gamma$ of length $4 C+1$ such that the path $\gamma$ has a decomposition $\gamma=\gamma_{1} e \gamma_{2}$, where for every $i \in\{1,2\}$, the path $\gamma_{i}$ has length equal to $2 C$ and we have $\nu(C(\gamma))>0$. By Equation 4, we can choose $\gamma$ such that if
$\gamma^{\prime} \in \mathcal{N}_{P G}^{\max }(\gamma)$, then $\gamma^{\prime}$ does not contain $e$. Hence $e \notin G_{P G}^{\prime}$ and $e$ is not contained in a subpath of $\mathcal{N}_{P G}^{\max }(\gamma)$. This contradicts the above claim and this concludes the proof.

Let $\mathcal{F}$ be a free factor system and let $\phi \in \operatorname{Out}\left(F_{\mathrm{n}}, \mathcal{F}\right)$ be an exponentially growing outer automorphism. Note that, by Lemma 3.27 and since for every $k \in \mathbb{N}^{*}$, we have $\mathcal{A}(\phi)=\mathcal{A}\left(\phi^{k}\right)$, the space $K_{P G}(f)$ does not depend on the CT map $f$ and does not depend on the chosen power of $\phi$. Therefore, we will simply write $K_{P G}(\phi)$ instead. Moreover, since $\mathcal{A}(\phi)=\mathcal{A}\left(\phi^{-1}\right)$, we see that $K_{P G}(\phi)=K_{P G}\left(\phi^{-1}\right)$.

For the next proposition, let $C_{1}>0$ be a constant such that for every path $\gamma \in$ $\mathcal{N}_{P G}$, we have $\ell(\gamma) \leqslant C_{1}$. It exists since $\mathcal{N}_{P G}$ is finite by Lemma 3.4 (1). Let $L$ be the malnormality constant associated with $\mathcal{A}(\phi)$ as defined above Lemma 2.11 and let $C_{0}=\max \left\{C_{1}, L\right\}$. Let $\mathscr{C}$ be the set of elements of $F_{\mathrm{n}}$ associated with $\mathcal{F} \wedge \mathcal{A}(\phi)$ given above Lemma 2.11. Let $\mathcal{P}(\mathcal{F} \wedge \mathcal{A}(\phi))$ be the set of reduced paths $\gamma$ in $G$ such that $C(\gamma) \in \operatorname{Cyl}(\mathscr{C}), \ell(\gamma)>C_{0}$ and $\gamma$ is not contained in a concatenation of paths in $G_{P G, \mathcal{F}}$ and $\mathcal{N}_{P G, \mathcal{F}}$.

Lemma 3.28. Let $\mathrm{n} \geqslant 3$, let $\mathcal{F}$ be a free factor system of $F_{\mathrm{n}}$ and let $\phi \in \operatorname{Out}\left(F_{\mathrm{n}}, \mathcal{F}\right)$ be an exponentially growing outer automorphism. We have

$$
\partial^{2}\left(F_{\mathrm{n}}, \mathcal{F} \wedge \mathcal{A}(\phi)\right)=\bigcup_{\gamma \in \mathcal{P}(\mathcal{F} \wedge \mathcal{A}(\phi))} C(\gamma)
$$

Proof. Let $A_{1}, \ldots, A_{r}$ be subgroups of $F_{\mathrm{n}}$ such that $\mathcal{F} \wedge \mathcal{A}(\phi)=\left\{\left[A_{1}\right], \ldots,\left[A_{r}\right]\right\}$ and $\mathscr{C}=\mathscr{C}\left(A_{1}, \ldots, A_{r}\right)$. By Lemma 2.12, we have

$$
\partial^{2}\left(F_{\mathrm{n}}, \mathcal{F} \wedge \mathcal{A}(\phi)\right)=\bigcup_{C(\gamma) \in \operatorname{Cyl}(\mathscr{C})} C(\gamma)
$$

Note that, for every path $\gamma \subseteq G$, we have

$$
C(\gamma)=\bigcup_{e \in \vec{E} G, \ell(\gamma e)>\ell(\gamma)} C(\gamma e)
$$

Hence we have

$$
\partial^{2}\left(F_{\mathrm{n}}, \mathcal{F} \wedge \mathcal{A}(\phi)\right)=\bigcup_{C(\gamma) \in \operatorname{Cyl}(\mathscr{C}), \ell(\gamma)>C_{0}} C(\gamma)
$$

So it suffices to prove that we can restrict our considerations to paths $\gamma$ which are not contained in a concatenation of paths in $G_{P G, \mathcal{F}}$ and $\mathcal{N}_{P G, \mathcal{F}}$. Let $\gamma$ be a path such that $C(\gamma) \in \operatorname{Cyl}(\mathscr{C})$ and $\ell(\gamma)>C_{0}$. By Lemma 2.11 (3), the path $\gamma$ is not contained in any tree $T_{g A_{i} g^{-1}}$ with $g \in F_{\mathrm{n}}$ and $i \in\{1, \ldots, r\}$. Moreover, it is not contained in any path of $\mathcal{N}_{P G}$ since $\ell(\gamma)>C_{1}$. Suppose that $\gamma$ is contained in a concatenation of paths in $G_{P G, \mathcal{F}}$ and $\mathcal{N}_{P G, \mathcal{F}}$. Suppose first that there does not exist a circuit which contains $\gamma$ and which is a concatenation of paths in $G_{P G, \mathcal{F}}$ and $\mathcal{N}_{P G, \mathcal{F}}$. Recall the definition of $G^{*}$ and $p_{G^{*}}$ from Lemma 3.11 and let $G_{\mathcal{F}}^{*}=p_{G^{*}}^{-1}\left(G_{p}\right)$. By assumption, either there does not exist an
immersed path (not necessarily an edge path) $\gamma^{*}$ in $G_{\mathcal{F}}^{*}$ such that $p_{G^{*}}\left(\gamma^{*}\right)=\gamma$ or there exists an immersed path $\gamma^{*}$ in $G_{\mathcal{F}}^{*}$ such that $p_{G^{*}}\left(\gamma^{*}\right)=\gamma$ and $\gamma^{*}$ is not contained in a circuit of $G_{\mathcal{F}}^{*}$ (recall that $G^{*}$ might contain univalent vertices). In the first case, we have $\ell_{\mathcal{F}}(\gamma)>0$. In the second case, since $G^{*}$ is finite, by Lemma 3.11, up to considering $\gamma^{-1}$, there exists $d \in \mathbb{N}^{*}$ such that for every path of $\gamma^{\prime}$ such that $\gamma \gamma^{\prime}$ is a reduced path in $G$ and $\ell\left(\gamma \gamma^{\prime}\right)=\ell(\gamma)+d$, the path $\gamma \gamma^{\prime}$ is not the image by $p_{G^{*}}$ of an immersed path in $G_{\mathcal{F}}^{*}$. Thus we have $\ell_{\mathcal{F}}\left(\gamma \gamma^{\prime}\right)>0$. Using the fact that

$$
C(\gamma)=\bigcup_{e \in \vec{E} G, \ell(\gamma e)>\ell(\gamma)} C(\gamma e)
$$

we can replace $\gamma$ by paths $\gamma^{\prime \prime}$ such that $\gamma \subseteq \gamma^{\prime \prime}$ and $\gamma^{\prime \prime}$ is not contained in a concatenation of paths in $G_{P G, \mathcal{F}}$ and $\mathcal{N}_{P G, \mathcal{F}}$. This concludes the proof.

Let $\nu$ be a nonzero current in $\operatorname{Curr}\left(F_{\mathrm{n}}, \mathcal{F} \wedge \mathcal{A}(\phi)\right)$. By Lemma 3.27 (3), we have $\|\nu\|_{\mathcal{F}} \neq 0$. The following result characterizes limits in $\operatorname{PCurr}\left(F_{\mathrm{n}}, \mathcal{F} \wedge \mathcal{A}(\phi)\right)$. The result is due to Kapovich Kap, Lemma 3.5] for a nonrelative context.

Lemma 3.29. Let $\mathrm{n} \geqslant 3$ and let $\mathcal{F}$ be a free factor system of $F_{\mathrm{n}}$. Let $\phi \in \operatorname{Out}\left(F_{\mathrm{n}}, \mathcal{F}\right)$ be an exponentially growing outer automorphism. Let $\left(\left[\mu_{n}\right]\right)_{n \in \mathbb{N}}$ be a sequence in $\mathbb{P} \operatorname{Curr}\left(F_{\mathrm{n}}, \mathcal{F} \wedge\right.$ $\mathcal{A}(\phi))$ and let $[\mu] \in \mathbb{P} \operatorname{Curr}\left(F_{\mathrm{n}}, \mathcal{F} \wedge \mathcal{A}(\phi)\right)$. Let $G$ be a graph whose fundamental group is isomorphic to $F_{\mathrm{n}}$ and such that there exists a subgraph $G_{p}$ of $G$ such that $\mathcal{F}\left(G_{p}\right)=\mathcal{F}$. Then $\lim _{n \rightarrow \infty}\left[\mu_{n}\right]=[\mu]$ if and only if, for every reduced edge path $\gamma \in \mathcal{P}(\mathcal{F} \wedge \mathcal{A}(\phi))$, we have

$$
\begin{equation*}
\lim _{n \rightarrow \infty} \frac{\left\langle\gamma, \mu_{n}\right\rangle}{\left\|\mu_{n}\right\|_{\mathcal{F}}}=\frac{\langle\gamma, \mu\rangle}{\|\mu\|_{\mathcal{F}}} \tag{5}
\end{equation*}
$$

Proof. Suppose first that $\lim _{n \rightarrow \infty}\left[\mu_{n}\right]=[\mu]$. Thus there exists a sequence $\left(\lambda_{n}\right)_{n \in \mathbb{N}^{*}}$ of positive real numbers such that $\lim _{n \rightarrow \infty} \lambda_{n} \mu_{n}=\mu$. By continuity of $\|.\|_{\mathcal{F}}$, we have $\lim _{n \rightarrow \infty}\left\|\lambda_{n} \mu_{n}\right\|_{\mathcal{F}}=\|\mu\|_{\mathcal{F}}$. By linearity of $\left\|_{\cdot}\right\|_{\mathcal{F}}$ and $\langle.,$.$\rangle in the second variable, for every$ reduced edge path $\gamma \in \mathcal{P}(\mathcal{F} \wedge \mathcal{A}(\phi))$, we have

$$
\lim _{n \rightarrow \infty} \frac{\left\langle\gamma, \lambda_{n} \mu_{n}\right\rangle}{\left\|\lambda_{n} \mu_{n}\right\|_{\mathcal{F}}}=\lim _{n \rightarrow \infty} \frac{\left\langle\gamma, \mu_{n}\right\rangle}{\left\|\mu_{n}\right\|_{\mathcal{F}}}=\frac{\langle\gamma, \mu\rangle}{\|\mu\|_{\mathcal{F}}}
$$

Suppose now that for every reduced edge path $\gamma \in \mathcal{P}(\mathcal{F} \wedge \mathcal{A}(\phi))$, Equation (15) holds. By Lemma 3.28, for every Borel subset $B$ of $\partial^{2}\left(F_{\mathrm{n}}, \mathcal{F} \wedge \mathcal{A}(\phi)\right)$ such that $\mu(\partial B)=0$, we have

$$
\lim _{n \rightarrow \infty} \frac{\mu_{n}(B)}{\left\|\mu_{n}\right\|_{\mathcal{F}}}=\frac{\mu(B)}{\|\mu\|_{\mathcal{F}}}
$$

Hence we have $\lim _{n \rightarrow \infty}\left[\mu_{n}\right]=[\mu]$.

## 4 Stable and unstable currents for relative atoroidal outer automorphisms

Let $\mathrm{n} \geqslant 3$ and let $\mathcal{F}$ be a free factor system of $F_{\mathrm{n}}$. Let $\phi \in \operatorname{Out}\left(F_{\mathrm{n}}, \mathcal{F}\right)$ be an atoroidal outer automorphism relative to $\mathcal{F}$. In this section, under additional hypotheses on $\phi$, we construct two $\phi$-invariant convex subsets of $\mathbb{P} \operatorname{Curr}\left(F_{\mathrm{n}}, \mathcal{F}\right)$. We will then show in the following section that, with respect to these convex subsets, the outer automorphism $\phi$ acts with generalized north-south dynamics.

In order to define the extremal points of these simplices, we need some results regarding substitution dynamics.

### 4.1 Substitution dynamics

Let $A$ be a finite set with cardinality at least equal to 2 . Let $\zeta$ be a substitution on $A$, that is, a map from $A$ to the set of nonempty finite words on $A$. The substitution $\zeta$ induces a map on the set of all finite words on $A$ by concatenation, which we still denote by $\zeta$. We can therefore iterate the substitution $\zeta$. For a word $w$ on $A$, we will denote by $|w|$ the length of $w$ on the alphabet $A$.

To the substitution $\zeta$ one can associate its transition matrix $M$, which is a square matrix whose rows and columns are indexed by letters in $A$ and, for all $a, b \in A, M(a, b)$ is the number of occurrences of $a$ in $\zeta(b)$. Likewise, for $n \geqslant 1$, the matrix $M^{n}$ is the transition matrix for $\zeta^{n}$. We say that a substitution $\zeta$ is irreducible if its transition matrix is irreducible, and that the substitution is primitive if its transition matrix is.

Let $\ell \in \mathbb{N}^{*}$ and let $A_{\ell}$ be the set of words on $A$ of length $\ell$. As defined in Que, Section 5.4.1], the substitution $\zeta$ induces a substitution $\zeta_{\ell}$ on $A_{\ell}$ as follows. Let $w=$ $x_{1} \ldots x_{\ell} \in A_{\ell}$. Then $\zeta_{\ell}(w)=w_{1} w_{2} \ldots w_{\left|\zeta\left(x_{1}\right)\right|}$, where, for every $i \in\left\{1, \ldots,\left|\zeta\left(x_{1}\right)\right|\right\}$, the word $w_{i}$ is the subword of $\zeta(w)$ of length $\ell$ starting at the $i^{\text {th }}$ position of $\zeta\left(x_{1}\right)$. Therefore, $\zeta_{\ell}$ is the concatenation of the $\left|\zeta\left(x_{1}\right)\right|$ first subwords of $\zeta(w)$ of length $\ell$. Note that the number of $i \in\left\{1, \ldots,\left|\zeta\left(x_{1}\right)\right|\right\}$ such that $w_{i}$ that is not contained in $\zeta\left(x_{1}\right)$ is bounded by $\ell-1$. Let $|\cdot|_{\ell}$ be the length of words on $A_{\ell}$. Then $\left|\zeta_{\ell}(w)\right|_{\ell}=\left|\zeta\left(x_{1}\right)\right|$. Denote by $M_{\ell}$ the transition matrix of $\zeta_{\ell}$. Note that, for every $n, \ell \geqslant 1$, we have $\left(\zeta^{n}\right)_{\ell}=\left(\zeta_{\ell}\right)^{n}$ as applications on the set of words on $A_{\ell}$ and thus $\left(M^{n}\right)_{\ell}=\left(M_{\ell}\right)^{n}$.

Consider now a partition of the alphabet $A=\coprod_{i=0}^{k} B_{i}$. Suppose that the transition matrix associated with the substitution $\zeta$ is lower block triangular with respect to this partition. Therefore, for every $i \in\{0, \ldots, k\}$, for every $x \in B_{i}$ and for every $j<i$, the word $\zeta(x)$ does not contain letters in $B_{j}$. In the remainder of the article, for every $i \in\{0, \ldots, k\}$ the diagonal block in $M$ corresponding to the block $B_{i}$ will be denoted by $M_{B_{i}}$.

The partition of $A$ induces a partition of $A_{\ell}$ as follows. For every $i \in\{0, \ldots, k\}$, let $\widetilde{B}_{i} \subseteq A_{\ell}$ be the set of all words on $A$ of length $\ell$ which start with a letter in $B_{i}$ and which, for every $j<i$ do not contain a letter in $B_{j}$. Let $\bar{B}_{i}$ be the set of all words $w$ on $A$ of length $\ell$ which start with a letter in $B_{i}$ and such that there exists $j<i$ such that $w$ contains a letter in $B_{j}$ (note that $\bar{B}_{0}$ is empty). Then $\widetilde{B}_{i} \cup \bar{B}_{i}$ is the set of all words on $A$
of length $\ell$ which starts with a letter in $B_{i}$. The hypothesis on the substitution $\zeta$ implies that the transition matrix $M_{\ell}$ is lower block triangular with respect to the partition

$$
\widetilde{B}_{0} \amalg \bar{B}_{1} \amalg \widetilde{B}_{1} \amalg \ldots \amalg \bar{B}_{k} \amalg \widetilde{B}_{k}
$$

of $A_{\ell}$. As before, for every $i \in\{0, \ldots, k\}$, we will denote by $M_{\ell, \bar{B}_{i}}$ the diagonal block in $M_{\ell}$ corresponding to $\bar{B}_{i}$ and by $M_{\ell, \widetilde{B}_{i}}$ the diagonal block in $M_{\ell}$ corresponding to $\widetilde{B}_{i}$.

Lemma 4.1. Gup1, Lemma 8.8] Let $A$ be a finite alphabet equipped with a partition $A=\amalg_{i=0}^{k} B_{i}$. Let $\zeta$ be a substitution and let $M$ be its transition matrix. Let $\ell \in \mathbb{N}^{*}$.
(1) The eigenvalues of $M_{\ell, \widetilde{B}_{i}}$ are those of $M_{B_{i}}$ with possibly additional eigenvalues of absolute value at most equal to 1.
(2) The eigenvalues of $M_{\ell, \bar{B}_{i}}$ have absolute value at most equal to 1.

Fix an integer $p \in\{0, \ldots, k\}$. For every $i \geqslant p$, let $\bar{B}_{i}^{(p)}$ be the subset of $\bar{B}_{i}$ consisting in all words $w$ of length $\ell$ which start with a letter in $B_{i}$ and such that there exists $j<p$ such that $w$ contains a letter in $B_{j}$. Then, for every $i \geqslant p$, the block $M_{\ell, \bar{B}_{i}}$ decomposes into a lower triangular block matrix where the columns and rows corresponding to $\bar{B}_{i}^{(p)}$ are on the top left. Let $M_{\ell, \bar{B}_{i}^{(p)}}$ be the corresponding block matrix. By Lemma 4.1 (2), the eigenvalues of $M_{\ell, \bar{B}_{i}^{(p)}}$ have absolute value at most 1 . Moreover, for every $i, j \geqslant p$, for every word $w$ contained in $\widetilde{B}_{j} \cup \bar{B}_{j}-\bar{B}_{j}^{(p)}$, the word $\zeta_{\ell}(w)$ considered as a word on $A_{\ell}$ does not contain any word of $\bar{B}_{i}^{(p)}$. Let $M_{\ell}(p)$ be the matrix obtained from $M_{\ell}$ by deleting, for every $i \geqslant p$, every row and column corresponding to elements in $\widetilde{B}_{i}$, and every row and columns corresponding to elements of $\bar{B}_{i}$ which do not belong to $\bar{B}_{i}^{(p)}$. Note that, by Lemma 4.1 (1), the eigenvalues of $M_{\ell}(p)$ are those of every block $M_{B_{j}}$ with $j<p$ with possibly additional eigenvalues of absolute value at most 1.

We can now prove a result concerning the number of occurrences of words in iterates of a letter. For words $w, v$ on $A$, we denote by $(w, v)$ the number of occurrences of $w$ in $v$, so that $M=\left((a, \zeta(b))_{a, b \in A}\right.$. For a word $w$ on $A$, we denote by $\|w\|_{(p)}$ the number of letters in $w$ which are contained in some $B_{j}$ for $j<p$.

Proposition 4.2. Let $A$ be an alphabet equipped with a partition $A=\amalg_{i=0}^{k} B_{i}$. Let $\zeta$ be a substitution on $A$ and let $M$ be its transition matrix. Suppose that $M$ is lower triangular by block with respect to the partition of $A$. Let $p \in \mathbb{N}^{*}$. Let $a \in \bigcup_{j<p} B_{j}$ be such that $\zeta(a)$ starts with $a$. Suppose that there exists $j<p$ such that $M_{B_{j}}$ is a primitive block whose Perron-Frobenius eigenvalue is greater than 1 and such that there exists $n_{j} \geqslant 1$ such that $\zeta^{n_{j}}(a)$ contains a letter of $B_{j}$. Let $w$ be a word such that $w$ contains a letter in $B_{j}$. Then

$$
\lim _{n \rightarrow \infty} \frac{\left(w, \zeta^{n}(a)\right)}{\left\|\zeta^{n}(a)\right\|_{(p)}}
$$

exists and is finite. Furthermore there exists a word $w$ containing a letter in some $B_{j}$ with $j<p$ such that this limit is positive.

Proof. The proof follows [Gup1, Lemma 8.9] (see also LU1 for similar statements). First, up to replacing $A$ by the smallest $\zeta$-invariant subalphabet of $A$ containing $a$ (which still satisfies the hypotheses of Proposition (4.2), we may suppose that, for every letter $x \in A$, there exists $n_{x} \geqslant 1$ such that $\zeta^{n_{x}}(a)$ contains the letter $x$. Let $\alpha$ be a word on $A$ with length $\ell \geqslant 1$ that starts with $a$. Note that, since $a \in \cup_{j<p} B_{j}$, the word $\alpha$ defines a column and a row in $M_{\ell}(p)$. Recall that for every $n$ the number of occurrences of a word $w$ in $\zeta^{n}(a)$ differs from the number of occurrences of the letter $w \in A_{\ell}$ in $\zeta_{\ell}^{n}(\alpha)$ by at most $\ell-1$. Moreover, we have $\left(w, \zeta_{\ell}^{n}(\alpha)\right)=M_{\ell}^{n}(p)(w, \alpha)$.

Let $S$ be the set of all $s<p$ such that $M_{B_{s}}$ is a primitive block with associated Perron-Frobenius eigenvalue greater than 1. By assumption, the set $S$ is a nonempty finite set. Let $S^{\prime}$ be the subset of $S$ consisting in all such $B_{s}$ such that the associated Perron-Frobenius eigenvalue is maximal. Call this eigenvalue $\lambda$. By Lemma 4.1, the eigenvalue $\lambda$ is also the maximal eigenvalue of the matrix $M_{\ell}(p)$. Let $d_{\lambda}$ be the size of the maximal Jordan block of $M_{\ell}(p)$ associated with $\lambda$. Then the growth under iterates of the maximal Jordan block of $\frac{M_{\ell}(p)}{\lambda}$ is polynomial of degree $d_{\lambda}$. Therefore, we have

$$
\lim _{n \rightarrow \infty} \frac{\left(w, \zeta^{n}(a)\right)}{\lambda^{n} n^{d_{\lambda}}}=\lim _{n \rightarrow \infty} \frac{\left(w, \zeta_{\ell}^{n}(\alpha)\right)}{\lambda^{n} n^{d_{\lambda}}}=\lim _{n \rightarrow \infty} \frac{M_{\ell}^{n}(p)(w, \alpha)}{\lambda^{n} n^{d_{\lambda}}}=d_{w, a},
$$

where $d_{w, a}$ is a real number. Moreover, the limit does not depend on the choice of $\alpha$ since, for any $n$, and for any two columns of $M_{\ell}^{n}(p)$ corresponding to words starting with the same letter, the sum of the values of each column differ by at most $\ell-1$ (see Gup1, Lemma 8.6]). Moreover, there exists a word $w$ such that the limit is positive since we quotiented by the growth of the iterates of the Jordan block with maximal eigenvalue.

Let $\|\cdot\|$ be the $L_{1}$-norm on $\mathbb{R}^{\left|A_{\ell}\right|}$. By [LU1, Remark 4.1], since $\lim _{n \rightarrow \infty} \frac{M_{\ell}^{n}(p)(w, \alpha)}{\lambda^{n} n^{d} \lambda}$ exists, so does

$$
\lim _{n \rightarrow \infty} \frac{M_{\ell}^{n}(p)(w, \alpha)}{\left\|M_{\ell}^{n}(p)(\alpha)\right\|},
$$

where $\left\|M_{\ell}^{n}(p)(\alpha)\right\|$ is the norm of the column of $M_{\ell}^{n}(p)$ corresponding to $\alpha$.
Claim. Suppose that there exists $C \geqslant 1$ such that for every $n \in \mathbb{N}$, we have

$$
\left\|\zeta^{n}(a)\right\|_{(p)} \leqslant\left\|M_{\ell}^{n}(p)(\alpha)\right\| \leqslant C\left\|\zeta^{n}(a)\right\|_{(p)} .
$$

Then

$$
\lim _{n \rightarrow \infty} \frac{\left(w, \zeta^{n}(a)\right)}{\left\|\zeta^{n}(a)\right\|_{(p)}}
$$

exists for all words $w$ on $A$ and is positive for some word $w$.
Proof. Recall that two sequences $\left(u_{n}\right)_{n \in \mathbb{N}}$ and $\left(v_{n}\right)_{n \in \mathbb{N}}$ with values in $\mathbb{R}$ are equivalent if there exists a sequence $\left(\epsilon_{n}\right)_{n \in \mathbb{N}}$ tending to zero such that $u_{n}=\left(1+\epsilon_{n}\right) v_{n}$. Recall that there exists $C^{\prime}>0$ such that the sequence $\left(\left\|M_{\ell}^{n}(p)(\alpha)\right\|\right)_{n \in \mathbb{N}}$ is equivalent to $\left(C^{\prime} \lambda^{n} n^{d}\right)_{n \in \mathbb{N}}$. Recall also that for every $n$, the value of $\left\|\zeta^{n}(a)\right\|_{(p)}$ is the norm of $M^{n}(p)\left(v_{a}\right)$, where $v_{a}$ is the vector whose coordinates is 1 on the coordinate associated with $a$ and 0 otherwise. Hence, since the matrix $M^{n}(p)$ is nonnegative and not the zero
matrix, there exist $C_{a}, \lambda_{a} \in \mathbb{R}_{+}^{*}$ and $d_{a} \in \mathbb{N}$ such that the sequence $\left(\left\|\zeta^{n}(a)\right\|_{(p)}\right)_{n \in \mathbb{N}}$ is equivalent to $\left(C_{a} \lambda_{a}^{n} n^{d_{a}}\right)_{n \in \mathbb{N}}$. Thus, by the assumption of the claim, since the limit

$$
\lim _{n \rightarrow \infty} \frac{M_{\ell}^{n}(p)(w, \alpha)}{\left\|M_{\ell}^{n}(p)(\alpha)\right\|}
$$

exists, and is not equal to zero for some $w$, the same is true for

$$
\lim _{n \rightarrow \infty} \frac{\left(w, \zeta^{n}(a)\right)}{\left\|\zeta^{n}(a)\right\|_{(p)}}
$$

This proves the claim.
Therefore, in order to conclude the proof of the proposition, it remains to prove that the hypothesis of the claim is true in our context. Let $\zeta^{n}(a)=x_{1} \ldots x_{\left|\zeta^{n}(a)\right|}$ and let

$$
\zeta_{\ell}^{n}(\alpha)=w_{1} \ldots w_{\left|\zeta^{n}(a)\right|}
$$

Let $X^{n}(a)$ be the list $x_{1}, \ldots, x_{\left|\zeta^{n}(a)\right|}$ and let $X_{<p}^{n}(a)$ be the sublist of $X^{n}(a)$ consisting in all letters in $\cup_{i=1}^{p-1} B_{i}$. Let $X^{(\ell, n)}(\alpha)$ be the list $w_{1}, \ldots, w_{\left|S^{n}(a)\right|}$ and let $X_{<p}^{(\ell, n)}(\alpha)$ be the sublist of $X^{(\ell, n)}(\alpha)$ which consists in all elements of $X^{(\ell, n)}(\alpha)$ that do not belong to $\cup_{i \leqslant p} \widetilde{B}_{i} \cup \bar{B}_{i}-\bar{B}_{i}^{(p)}$. Note that $\left|X_{<p}^{(\ell, n)}(\alpha)\right|=\left\|M_{\ell}^{n}(p)(\alpha)\right\|$ and that $\left|X_{<p}^{n}(a)\right|=\left\|\zeta^{n}(a)\right\| \|_{(p)}$. The fact that $\left\|\zeta^{n}(a)\right\|_{(p)} \leqslant\left\|M_{\ell}^{n}(p)(\alpha)\right\|$ follows from the fact that we have an injection from $X_{<p}^{n}(a)$ to $X_{<p}^{(\ell, n)}(\alpha)$ by sending the letter $x_{i} \in X_{<p}^{n}(a)$ to $w_{i} \in X_{<p}^{(\ell, n)}(\alpha)$. Since every word of length $\ell$ contained in $X_{<p}^{(\ell, n)}(\alpha)$ contains a letter in $X_{<p}^{n}(a)$, we have an application from $X_{<p}^{(\ell, n)}(\alpha)$ to $X_{<p}^{n}(a)$ defined as follows. Let $w \in X_{<p}^{(\ell, n)}(\alpha)$ and let $j_{w} \in\left\{1, \ldots,\left|\zeta^{n}(a)\right|\right\}$ be the minimal integer such that $x_{j_{w}} \in X_{<p}^{n}(a)$ and $x_{j_{w}}$ is a letter in $w$. Then the application sends $w$ to $x_{j_{w}}$. By construction, the cardinal of the preimage of any $x \in X_{<p}^{n}(a)$ is at most equal to $\ell$. Therefore, we have

$$
\left\|\zeta^{n}(a)\right\|_{(p)} \leqslant\left\|M_{\ell}^{n}(p)(\alpha)\right\| \leqslant \ell\left\|\zeta^{n}(a)\right\|_{(p)} .
$$

This concludes the proof.

### 4.2 Construction of the attractive and repulsive currents for relative almost atoroidal automorphisms

Let $\mathrm{n} \geqslant 3$ and let $\mathcal{F}=\left\{\left[A_{1}\right], \ldots,\left[A_{k}\right]\right\}$ be a free factor system of $F_{\mathrm{n}}$. We first define a class of outer automorphisms of $F_{\mathrm{n}}$ which we will study in the rest of the article. If $\phi \in \operatorname{Out}\left(F_{\mathrm{n}}, \mathcal{F}\right)$ and $\phi$ preserves the conjugacy class of every $A_{i}$ with $i \in\{1, \ldots, k\}$, we denote by $\left.\phi\right|_{\mathcal{F}}$ the element $\left(\left[\left.\phi_{1}\right|_{A_{1}}\right], \ldots,\left[\left.\phi_{k}\right|_{A_{k}}\right]\right.$, where, for every $i \in\{1, \ldots, k\}$, the element $\phi_{i}$ is a representative of $\phi$ such that $\phi_{i}\left(A_{i}\right)=A_{i}$ and $\left[\left.\phi_{i}\right|_{\mathcal{A}_{i}}\right]$ is an element of $\operatorname{Out}\left(A_{i}\right)$. Note that the outer class of $\left.\phi_{i}\right|_{A_{i}}$ in $\operatorname{Out}\left(A_{i}\right)$ does not depend on the choice of $\phi_{i}$.

Definition 4.3. Let $\mathrm{n} \geqslant 3$ and let $\mathcal{F}=\left\{\left[A_{1}\right], \ldots,\left[A_{k}\right]\right\}$ be a free factor system of $F_{\mathrm{n}}$. Let $\phi \in \operatorname{Out}\left(F_{\mathrm{n}}, \mathcal{F}\right)$. The outer automorphism $\phi$ is almost atoroidal relative to $\mathcal{F}$ if $\phi$ preserves the conjugacy class of every $A_{i}$ with $i \in\{1, \ldots, k\}$ and $\phi$ is one of the following:
(1) an atoroidal outer automorphism relative to $\mathcal{F}$.
(2) an outer automorphism which preserves a sequence of free factor systems $\mathcal{F} \leqslant \mathcal{F}_{1} \leqslant$ $\left\{F_{\mathrm{n}}\right\}$ with $\mathcal{F}_{1}=\left\{\left[B_{1}\right], \ldots,\left[B_{\ell}\right]\right\}$ and such that:
(a) $\mathcal{F}_{1} \leqslant\left\{F_{\mathrm{n}}\right\}$ is sporadic,
(b) $\phi$ preserves the conjugacy class of every $B_{i}$ with $i \in\{1, \ldots, \ell\}$, the element $\left.\phi\right|_{\mathcal{F}_{1}}$ is an expanding atoroidal outer automorphism relative to $\mathcal{F}$ and $\phi$ is not expanding relative to $\mathcal{F}\left(\mathcal{F}\right.$ might be equal to $\left.\mathcal{F}_{1}\right)$.

The main example of an almost atoroidal automorphism is the following. Suppose that $\mathcal{F}_{1}=[A]$ and let $\phi \in \operatorname{Out}\left(F_{\mathrm{n}}, \mathcal{F}\right)$ be such that $\phi([A])=[A]$. Then $\phi$ is almost atoroidal if $\left.\phi\right|_{[A]}$ is expanding relative to $\mathcal{F}$. Indeed, either $\phi$ is expanding relative to $\mathcal{F}$ and in this case $\phi$ satisfies (1) or $\phi$ is not expanding relative to $\mathcal{F}$ and $\phi$ satisfies (2). Almost atoroidality allows us to deal with sporadic extensions.

Let $\phi \in \operatorname{Out}\left(F_{\mathrm{n}}, \mathcal{F}\right)$ be an almost atoroidal outer automorphism relative to $\mathcal{F}$. In this section, we construct a nontrivial convex compact subset in $\mathbb{P} \operatorname{Curr}\left(F_{\mathrm{n}}, \mathcal{F} \wedge \mathcal{A}(\phi)\right)$ associated with $\phi$. We follow the construction of Uya2 in the context of atoroidal automorphisms. By Theorem 2.10, there exists $M \geqslant 1$ such that $\phi^{M}$ is represented by a CT map $f: G \rightarrow G$ with filtration $\varnothing=G_{0} \subsetneq G_{1} \subsetneq \ldots \subsetneq G_{k}=G$ and such that there exists $p \in\{1, \ldots, k\}$ such that $\mathcal{F}\left(G_{p}\right)=\mathcal{F}$. For a splitting unit $\sigma$ in $G$, we say that $\sigma$ is expanding if $\lim _{m \rightarrow \infty} \ell_{\exp }\left(\left[f^{m}(\sigma)\right]\right)=+\infty$. Note that, by Lemma 3.23, this is equivalent to saying that there exists $N \in \mathbb{N}^{*}$ such that $\left[f^{N}(\sigma)\right]$ contains a splitting unit which is an edge in an EG stratum. Moreover, a splitting unit $\sigma$ which is an expanding splitting unit is either an edge in $\overline{G-G_{P G}^{\prime}}$ or a maximal taken connecting path in zero stratum such that a reduced iterate of $\sigma$ contains an edge in $\overline{G-G_{P G}^{\prime}}$ as a splitting unit. In particular, there are finitely many expanding splitting units by Proposition 2.5 (3).

Let $\gamma$ and $\gamma^{\prime}$ be two finite reduced subpaths of $G$. We denote by $\#\left(\gamma, \gamma^{\prime}\right)$ the number of occurrences of $\gamma$ in $\gamma^{\prime}$ and by $\left\langle\gamma, \gamma^{\prime}\right\rangle$ the sum

$$
\begin{equation*}
\left\langle\gamma, \gamma^{\prime}\right\rangle=\#\left(\gamma, \gamma^{\prime}\right)+\#\left(\gamma^{-1}, \gamma^{\prime}\right) . \tag{6}
\end{equation*}
$$

The next proposition shows the existence of relative currents associated with relative atoroidal outer automorphisms. Once we have constructed these currents for relative atoroidal outer automorphisms, we will also be able to construct attractive and repulsive simplices for every almost atoroidal outer automorphisms relative to $\mathcal{F}$. The proposition and its proof are inspired by the same result in the absolute context due to Uyanik (Uya2, Proposition 3.3]) and by the proof due to Gupta in the relative fully irreducible context (Gup1, Proposition 8.13]). Recall the definition of $\mathcal{P}(\mathcal{F} \wedge \mathcal{A}(\phi))$ before Lemma 3.28 and $\mathscr{C}$ before Lemma 2.11.

Proposition 4.4. Let $\mathrm{n} \geqslant 3$ and let $\mathcal{F}$ be a free factor system of $F_{\mathrm{n}}$. Let $\phi \in \operatorname{Out}\left(F_{\mathrm{n}}, \mathcal{F}\right)$ be an atoroidal outer automorphism relative to $\mathcal{F}$. Let $f: G \rightarrow G$ be a CT map that
represents a power of $\phi$ with filtration $\varnothing=G_{0} \subsetneq G_{1} \subsetneq \ldots \subsetneq G_{k}=G$ and such that there exists $p \in\{1, \ldots, k\}$ such that $\mathcal{F}\left(G_{p}\right)=\mathcal{F}$. Let $\gamma \in \mathcal{P}(\mathcal{F} \wedge \mathcal{A}(\phi))$ and let $\sigma$ be an expanding splitting unit with fixed initial direction.
(1) The limit

$$
\sigma_{\gamma}=\lim _{m \rightarrow \infty} \frac{\left\langle\gamma,\left[f^{m}(\sigma)\right]\right\rangle}{\ell_{\mathcal{F}}\left(\left[f^{m}(\sigma)\right]\right)}
$$

exists and is finite.
(2) There exists a unique current $\eta_{\sigma} \in \operatorname{Curr}\left(F_{\mathrm{n}}, \mathcal{F} \wedge \mathcal{A}(\phi)\right)$ such that, for every finite reduced edge path $\gamma \in \mathcal{P}(\mathcal{F} \wedge \mathcal{A}(\phi))$, we have:

$$
\eta_{\sigma}(C(\gamma))=\sigma_{\gamma} .
$$

Proof. (1) We may suppose that $\gamma$ occurs in a reduced iterate of $\sigma$ as otherwise $\sigma_{\gamma}=0$. We first treat the case where $\sigma$ is an expanding splitting unit which is an edge in an irreducible stratum. Let $r$ be the height of $\sigma$. In order to prove the proposition in this case, we want to apply Proposition 4.2 to the CT map $f$ seen as a substitution on the set of splitting units contained in iterates of $\sigma$. However, the set of splitting units might be infinite since exceptional paths may have arbitrarily large widths and INPs arbitrarily large lengths. Instead, we construct a finite alphabet $A_{\gamma}$ depending on $\gamma$. The alphabet is constructed as follows by associating a letter to every splitting unit occurring in a reduced iterate of $\sigma$. However some letters will correspond to infinitely many splitting units.
(a) We add one letter for each of the finitely many edges in irreducible strata that are contained in a reduced iterate of $\sigma$.
(b) We add one letter for each reduced maximal taken connecting path in a zero stratum contained in a reduced iterate of $\sigma$.
(c) We add one letter for each INP contained in a reduced iterate of $\sigma$ and such that the stratum of maximal height it intersects is an EG stratum.
(d) Let $\delta$ be an INP such that the stratum of maximal height it intersects is an NEG stratum and such that it appears in a reduced iterate of $\sigma$. By Proposition 2.5 (11), there exist an edge $e$, an integer $s \in \mathbb{Z}$ and a closed Nielsen path $w$ such that $\delta=e w^{s} e^{-1}$. Note that $\gamma$ is not contained in $w^{s}$ since $\gamma \in \mathcal{P}(\mathcal{F} \wedge \mathcal{A}(\phi))$ and $w^{s}$ is a concatenation of paths in $G_{P G, \mathcal{F}}$ and $\mathcal{N}_{P G, \mathcal{F}}$ by Lemma 3.7 and the fact that $\phi$ is atoroidal relative to $\mathcal{F}$. Hence if $\gamma$ is contained in $\delta$, it is either an initial or a terminal segment of $\delta$. Let $M_{1}$ be the maximal integer $|d|$ such that $\gamma$ contains an INP of the form $e w^{d} e^{-1}$. Let $M_{2}$ be the minimal integer $|d|$ such that $\gamma \cap\left(e w^{d} e^{-1}\right)$ is either an initial or a terminal segment of $e w^{d} e^{-1}$. Let $M_{3}$ be the maximal integer $|d|$ such that $e w^{d} e^{-1}$ is contained in $\left[f\left(\sigma^{\prime}\right)\right]$ with $\sigma^{\prime}$ a splitting unit which is either an edge in an irreducible stratum or a maximal taken connecting path in a zero stratum. Let $M=\max \left\{M_{1}, M_{2}, M_{3}\right\}$. We add one letter for each $e w^{d} e^{-1}$ with $|d| \leqslant M+1$. We add exactly one letter representing every $e w^{d} e^{-1}$ with $|d|>M+1$.
(e) Let $\delta$ be an exceptional path appearing in a reduced iterate of $\sigma$. There exist edges $e_{1}, e_{2}$, a nonzero integer $s$ and a closed Nielsen path $w$ such that $\delta=e_{1} w^{s} e_{2}^{-1}$. Note that $\gamma$ is not contained in $w^{s}$ since $\gamma \in \mathcal{P}(\mathcal{F} \wedge \mathcal{A}(\phi))$ and $w^{s}$ is a concatenation of paths in $G_{P G, \mathcal{F}}$ and $\mathcal{N}_{P G, \mathcal{F}}$ by Lemma 3.7 and the fact that $\phi$ is atoroidal relative to $\mathcal{F}$. Let $M_{4}$ be the maximal integer $|d|$ such that $\gamma$ contains an exceptional path of the form $e_{1} w^{d} e_{2}^{-1}$. Let $M_{5}$ be the minimal integer $|d|$ such that $\gamma \cap e_{1} w^{d} e_{2}^{-1}$ is either a proper initial or terminal segment of $e_{1} w^{d} e_{2}^{-1}$. Let $M_{6}$ be the maximal integer $|d|$ such that $e_{1} w^{d} e_{2}^{-1}$ is contained in $\left[f\left(\sigma^{\prime}\right)\right]$ with $\sigma^{\prime}$ a splitting unit which is either an edge in an irreducible stratum or a maximal taken connecting path in a zero stratum. Let $M^{\prime}=\max \left\{M_{4}, M_{5}, M_{6}\right\}$. We add one letter for each $e_{1} w^{d} e_{2}^{-1}$ with $|d| \leqslant M^{\prime}+1$. We add one letter representing every $e_{1} w^{d} e_{2}^{-1}$ with $|d|>M^{\prime}+1$.

We claim that the alphabet $A_{\gamma}$ is finite. Indeed, since the graph $G$ is finite, so is the number of letters in the first category. By Proposition 2.5 (3), the zero strata of $G_{r-1}$ are exactly the contractible components of $G_{r-1}$. Hence the number of letters in the second category is finite. The number of letters in the third category is finite by Proposition 2.5 (9). The remaining letters of $A_{\gamma}$ are finite by definition. Let $\zeta$ be the following substitution on $A_{\gamma}$. If $a \in A_{\gamma}$ represents a unique path in $G$, we set $\zeta(a)=[f(a)]$. If $a \in A_{\gamma}$ represents several paths in $G$, we set $\zeta(a)=a$. We claim that $\zeta$ is a well-defined substitution. Indeed, by Proposition 2.5 (6), if $a$ is a letter in $A_{\gamma}$ which represents a unique path in $G$, then $[f(a)]$ is completely split and every splitting unit in $[f(a)]$ is represented by a unique letter by the construction of letters in the fourth and fifth category. Moreover, if $a \in A_{\gamma}$ represents several paths, then the definition of $\zeta$ does not depend on the choice of a representative of $a$. Hence $\zeta$ is a well-defined substitution.

We claim that if $a \in A_{\gamma}$ represents several paths in $G$, then, for every representative $\alpha$ of $a$, the path $[f(\alpha)]$ is represented by $a$. Indeed, the claim is immediate when $a$ represents several INPs, so we focus on the case where $a$ represents several exceptional paths. Let $e_{1}, e_{2}$ be edges in $G$, let $w$ be a closed Nielsen path in $G$ and let $d \in \mathbb{Z}$ be such that $e_{1} w^{d} e_{2}^{-1}$ is represented by the letter $a$. There exist a splitting unit $\sigma^{\prime}$ of a reduced iterate of $\sigma$ by [f], an integer $N \in \mathbb{N}^{*}$ and an integer $d_{1} \in \mathbb{Z}$ such that $e_{1} w^{d_{1}} e_{2}^{-1}$ is a subpath of $\left[f^{N}\left(\sigma^{\prime}\right)\right]$. Thus, using the constants given in $(e)$, we have $\left|d_{1}\right| \leqslant M_{6} \leqslant M$. By the construction of the alphabet $A_{\gamma}$, there exists a letter $a^{\prime}$ in $A_{\gamma}$ corresponding to the path $e_{1} w^{d_{1}} e_{2}^{-1}$ and $a^{\prime}$ represents a unique path. For every $n \in \mathbb{N}$, let $d_{n} \in \mathbb{Z}$ be such that $\left[f^{n}\left(e_{1} w^{d_{1}} e_{2}^{-1}\right)\right]=e_{1} w^{d_{n}} e_{2}^{-1}$. Then the sequence $\left(d_{n}\right)_{n \in \mathbb{N}}$ is monotonic. Let $m_{0}$ be the minimal integer such that the path $e_{1} w^{d_{m_{0}}} e_{2}^{-1}$ is represented by $a$. Note that $m_{0}>1$ as $a^{\prime}$ represents a unique path. By monotonicity, $d_{m_{0}} \neq d_{1}$. Thus, if $d_{m_{0}}>d_{1}$, then for every $m \geqslant m_{0}$, we have $d_{m} \geqslant d_{m_{0}}$ and if $d_{m_{0}}<d_{1}$, then for every $m \geqslant m_{0}$, we have $d_{m} \leqslant d_{m_{0}}$. Hence for every $m \geqslant m_{0}$, the path $e_{1} w^{d_{m+1}} e_{2}^{-1}$ is represented by $a$. This shows that if $\alpha \in a$ then $[f(\alpha)] \in a$. This concludes the proof of the claim. Hence $\zeta$ only depends on the function $[f()$.$] .$

By reordering columns and rows, we may suppose that, if $M$ is the matrix associated with $\zeta$, then columns and rows of $M$ with index greater than $p$ are precisely the letters in $A_{\gamma}$ representing splitting units which are concatenations of paths in $G_{P G, \mathcal{F}}$ and $\mathcal{N}_{P G, \mathcal{F}}$. By Lemma 3.9, iterates by $\zeta$ of letters of $A_{\gamma}$ representing concatenations of paths in
$G_{P G, \mathcal{F}}$ and $\mathcal{N}_{P G, \mathcal{F}}$ are words on $A_{\gamma}$ whose letters represent concatenations of paths in $G_{P G, \mathcal{F}}$ and $\mathcal{N}_{P G, \mathcal{F}}$. Thus, the matrix $M$ is a lower block triangular matrix, where every block of index at most $p$ corresponds to either edges in a common stratum, or the 0 matrix when the associated letter is a maximal taken connecting path in a zero stratum.

Since $\sigma$ is expanding, it has a reduced iterate which contains splitting units which are edges in EG strata. Hence if $a_{\sigma}$ is the letter in $A_{\gamma}$ corresponding to $\sigma$, the iterates $\zeta^{n}\left(a_{\sigma}\right)$ contain letters of $A_{\gamma}$ in a Perron-Frobenius block with eigenvalue greater than 1. Since the initial direction of $\sigma$ is fixed by Proposition 4.2, for every word $w$ in the alphabet $A_{\gamma}$, the limit

$$
\lim _{m \rightarrow \infty} \frac{\left(w,\left[\zeta^{m}(\sigma)\right]\right)}{\left\|\zeta^{m}(\sigma)\right\|_{(p)}}
$$

exists and is finite. Hence the limit

$$
\lim _{m \rightarrow \infty} \frac{\left\langle w,\left[\zeta^{m}(\sigma)\right]\right\rangle}{\left\|\zeta^{m}(\sigma)\right\|_{(p)}}
$$

exists and is finite.
Claim. There exists a matrix $M^{\prime}$ obtained from $M$ by multiplying rows and columns by positive scalars and such that, for every $m \in \mathbb{N}^{*}$, we have $\ell_{\mathcal{F}}\left(\left[f^{m}(\sigma)\right]\right)=\left\|M^{\prime m}(\sigma)\right\|_{(p)}$.
Proof. Remark that if $e_{1} w^{s} e_{2}^{-1}$ is an exceptional path, and if $e_{1} w^{d} e_{2}^{-1}$ is an exceptional path with distinct width, then their $\mathcal{F}$-lengths are equal and at most equal to 2 . Indeed, since $\phi$ is an atoroidal outer automorphism relative to $\mathcal{F}$, every closed Nielsen path of $G$ is contained in $G_{p}$. Since $w$ is a closed Nielsen path, we see that $w$ is a concatenation of paths in $G_{P G, \mathcal{F}}$ and $\mathcal{N}_{P G, \mathcal{F}}$ by Lemma 3.6. Hence we have

$$
\ell_{\mathcal{F}}\left(e_{1} w^{s} e_{2}^{-1}\right)=\ell_{\mathcal{F}}\left(e_{1}\right)+\ell_{\mathcal{F}}\left(e_{2}\right) \leqslant 2 .
$$

Similarly, if $e w^{s} e^{-1}$ and $e w^{d} e^{-1}$ are INP intersecting the same maximal NEG stratum, then their $\mathcal{F}$-length are equal and at most equal to 2 . Let $M^{\prime}$ be the matrix obtained from $M$ by multiplying every row correponding to either an exceptional path not contained in $G_{p}$, an INP not contained in $G_{p}$, a collection of exceptional paths not contained in $G_{p}$, a collection of INPs not contained in $G_{p}$ or a maximal taken connecting path not contained in $G_{p}$, by the corresponding $\mathcal{F}$-length. Note that, by the above remarks, this does not depend on the choice of a representative when the letter corresponds to a collection of paths. Then for every $m \in \mathbb{N}^{*}$, the value $\left\|M^{\prime m}(\sigma)\right\|_{(p)}$ corresponds to the sum of the $\mathcal{F}$-length of every splitting unit in $\left[f^{m}(\sigma)\right]$ not contained in $G_{p}$. By Lemma 3.19, complete splittings are $P G$-relative complete splittings. By Lemma 3.20 (2), we have $\ell_{\mathcal{F}}\left(\left[f^{m}(\sigma)\right]\right)=\left\|M^{\prime m}(\sigma)\right\|_{(p)}$. This proves the claim.

By the claim, we see that for every $m \in \mathbb{N}^{*}$, there exists a constant $K$ such that we have

$$
\frac{1}{K}\left\|\zeta^{m}(\sigma)\right\|_{(p)} \leqslant \ell_{\mathcal{F}}\left(\left[f^{m}(\sigma)\right]\right) \leqslant K\left\|\zeta^{m}(\sigma)\right\|_{(p)}
$$

Using the claim in the proof of Proposition 4.2 (replacing $\left\|M_{\ell}^{n}(p)(\alpha)\right\|$ by $\ell_{\mathcal{F}}\left(\left[f^{n}(\sigma)\right]\right)$ which is possible since $\ell_{\mathcal{F}}\left(\left[f^{n}(\sigma)\right]\right)$ is the norm of a matrix by the claim), the limit

$$
\lim _{m \rightarrow \infty} \frac{\left\langle w,\left[f^{m}(\sigma)\right]\right\rangle}{\ell_{\mathcal{F}}\left(\left[f^{m}(\sigma)\right]\right)}
$$

exists and is finite. We now construct a finite set of words $W(\gamma)$ in the alphabet $A_{\gamma}$ such that for every $m \in \mathbb{N}^{*}$, there exists a bijection between occurrences of $\gamma$ in $\left[f^{m}(\sigma)\right]$ and occurrences of a word $w \in W(\gamma)$ in $\left[\zeta^{m}(\sigma)\right]$. This will conclude the proof of Case 2. Let $W(\gamma)$ be the set of words in $A_{\gamma}$ consisting in every path contained in a reduced iterate of $\sigma$ which contains $\gamma$, which is completely split and which is minimal for these properties. By construction, every occurrence of $\gamma$ in a reduced iterate of $\sigma$ is contained in a word in $W(\gamma)$. We claim that the set $W(\gamma)$ is finite. Indeed, let $w$ be a word in $W(\gamma)$. Then $w$ corresponds to a path in a reduced iterate of $\sigma$ which is a concatenation of splitting units $w=\sigma_{1} \ldots \sigma_{k}$. By minimality of $w$, if $w^{\prime} \in W(\gamma)$ is distinct from $w^{\prime}$, then the number of splitting units in $w^{\prime}$ is at most equal to $k$ and $w^{\prime}$ might differ from $w$ by changing $\sigma_{1}$ and $\sigma_{k}$. Thus, $W(\gamma)$ is finite. For every $w \in W(\gamma)$, let $m_{w}$ be the number of occurrences of $\gamma$ in $w$. Since $\gamma$ is not contained in $G_{p}$, the value $m_{w}$ does not depend on the choice of a representative of $w$ if $w$ represents a collection of paths. Therefore, for every $m \in \mathbb{N}^{*}$, we have

$$
\left\langle\gamma, f^{m}(\sigma)\right\rangle=\sum_{w \in W(\gamma)} m_{w}\left\langle w, f^{m}(\sigma)\right\rangle .
$$

This shows that the limit

$$
\sigma_{\gamma}=\lim _{m \rightarrow \infty} \frac{\left\langle\gamma, f^{m}(\sigma)\right\rangle}{\ell_{\mathcal{F}}\left(f^{m}(\sigma)\right)}
$$

exists and is finite. This proves Assertion (1) of the proposition when $\sigma$ is an edge in an irreducible stratum.

Suppose now that $\sigma$ is a maximal taken connecting path in a zero stratum. We prove the proposition by induction on the height $r$ of the splitting unit $\sigma$. Suppose first that $\sigma$ is an expanding splitting unit which is a maximal taken connecting path in a zero stratum of minimal height $r$. Then $[f(\sigma)]$ has height $r-1$, hence it does not contain splitting units which are maximal taken connecting path in zero strata. In this case, the proof follows from the above case. Suppose now that $\sigma$ is a maximal taken connecting path in a zero stratum. Then its reduced image is completely split and has height at most $r-1$. In this case the claim follows by induction applied to $[f(\sigma)]$. This concludes the proof of Assertion (1).
(2) Let us prove that for every element $\gamma \in \mathcal{P}(\mathcal{F} \wedge \mathcal{A}(\phi))$, we have:
(i) $0 \leqslant \sigma_{\gamma}<\infty$;
(ii) $\sigma_{\gamma}=\sigma_{\gamma^{-1}}$;
(iii) $\sigma_{\gamma}=\sum_{e \in E} \sigma_{\gamma e}$, where $E$ is the subset of $\vec{E} G$ consisting in all edges that are incident to the endpoints of $\gamma$ and distinct from the inverse of the last edge of $\gamma$.

The point ( $i$ ) follows from Assertion (1). The second point follows from the definition of $\left\langle\gamma, f^{m}(\sigma)\right\rangle$. In order to prove the third point, remark that $\left\langle\gamma, f^{m}(\sigma)\right\rangle$ and $\sum_{e \in E}\left\langle\gamma e, f^{n}(\sigma)\right\rangle$ differ only when $\left[f^{m}(\sigma)\right]$ ends with $\gamma$ or $\gamma^{-1}$. Therefore the difference between $\left\langle\gamma, f^{m}(\sigma)\right\rangle$ and $\sum_{e \in E}\left\langle\gamma e, f^{m}(\sigma)\right\rangle$ is at most 2. This implies that

$$
\left|\frac{\left\langle\gamma, f^{m}(\sigma)\right\rangle}{\ell_{\mathcal{F}}\left(f^{m}(\sigma)\right)}-\sum_{e \in E} \frac{\left\langle\gamma e, f^{m}(\sigma)\right\rangle}{\ell_{\mathcal{F}}\left(f^{m}(\sigma)\right)}\right| \rightarrow 0 \text { as } n \rightarrow \infty .
$$

This proves the third point. By Gue1, Lemma 3.2], since the map $\gamma \mapsto \sigma_{\gamma}$ satisfies the conditions $(i)-(i i i)$, it determines a projective relative current $n_{\sigma} \in \mathbb{P} \operatorname{Curr}\left(F_{\mathrm{n}}, \mathcal{F}\right)$. This current is unique since a relative current is entirely determined by its set of values on cylinders of finite paths $\gamma \in \mathcal{P}(\mathcal{F} \wedge \mathcal{A}(\phi))$ by Lemma 3.28. This concludes the proof.

Definition 4.5. Let $\mathrm{n} \geqslant 3$ and let $\mathcal{F}$ be a free factor system of $F_{\mathrm{n}}$. Let $\phi \in \operatorname{Out}\left(F_{\mathrm{n}}, \mathcal{F}\right)$ be an almost atoroidal outer automorphism relative to $\mathcal{F}$ and let $\mathcal{F}_{1}$ be a free factor system such that $\mathcal{F} \leqslant \mathcal{F}_{1}$ and such that the extension $\mathcal{F}_{1} \leqslant\left\{F_{\mathrm{n}}\right\}$ is sporadic and such that $\left.\phi\right|_{\mathcal{F}_{1}}$ is atoroidal relative to $\mathcal{F}$. In the case that $\phi$ is atoroidal relative to $\mathcal{F}$, we assume that $\mathcal{F}_{1}=\left\{\left[F_{\mathrm{n}}\right]\right\}$. Let $f: G \rightarrow G$ be a CT map representing a power of $\phi$ with filtration

$$
\varnothing=G_{0} \subsetneq G_{1} \subsetneq \ldots \subsetneq G_{k}=G
$$

such that there exists $i \in\{1, \ldots, k-1\}$ with $\mathcal{F}\left(G_{i}\right)=\mathcal{F}_{1}$. We define the simplex of attraction of $\phi$, denoted by $\Delta_{+}(\phi)$, as the set of projective classes of nonnegative linear combinations of currents $\mu_{\sigma}$ obtained from Proposition 4.4 applied to $\left.\phi\right|_{\mathcal{F}_{1}}$ and $f$ and which correspond to splitting units $\sigma$ whose exponential length grows exponentially fast under iteration of $f$. The simplex of repulsion of $\phi$, denoted by $\Delta_{-}(\phi)$, is $\Delta_{+}\left(\phi^{-1}\right)$.

Remark 4.6. The definitions of attractive and repulsive currents given in Definition 4.5 rely on the choice of CT maps representing powers of the almost atoroidal outer automorphisms $\phi$ and $\phi^{-1}$. However, it will be a consequence of Proposition 4.12 and Proposition 5.24 that the attractive and repulsive currents depend only on $\phi$.

We now prove properties of the subsets $\Delta_{ \pm}(\phi)$. As explained above Proposition 4.4, there are only finiely many expanding splitting units. Hence the subsets $\Delta_{ \pm}(\phi)$ are closed. Since $\mathbb{P} \operatorname{Curr}\left(F_{\mathrm{n}}, \mathcal{F} \wedge \mathcal{A}(\phi)\right)$ is a Hausdorff, compact space by Lemma 2.14 and since $\Delta_{ \pm}(\phi)$ are closed subsets, we have the following.

Lemma 4.7. Let $\mathrm{n} \geqslant 3$ and let $\mathcal{F}$ be a free factor system of $F_{\mathrm{n}}$. Let $\phi \in \operatorname{Out}\left(F_{\mathrm{n}}, \mathcal{F}\right)$ be an atoroidal outer automorphism relative to $\mathcal{F}$. The subsets $\Delta_{ \pm}(\phi)$ are compact and contain finitely many extremal points.

Note that one compute $\|\mu(\sigma)\|_{\mathcal{F}}$ by counting the number of occurrences of every $P G$-relative splitting unit of positive $\mathcal{F}$-length in a reduced iterate of $\sigma$ and taking the limit. This is precisely the limit of the $\mathcal{F}$-length of reduced iterates of $\sigma$ by Lemma3.20. Hence we have the following result.

Lemma 4.8. Let $\mathrm{n} \geqslant 3$ and let $\mathcal{F}$ be a free factor system of $F_{\mathrm{n}}$. Let $\phi \in \operatorname{Out}\left(F_{\mathrm{n}}, \mathcal{F}\right)$ be an atoroidal outer automorphism relative to $\mathcal{F}$. We have $\|\mu(\sigma)\|_{\mathcal{F}}=1$.

We now prove that the subsets $\Delta_{ \pm}(\phi)$ are $\phi$-invariant. We first recall some lemmas.
Lemma 4.9. Coo, Bounded Cancellation] Let $\mathrm{n} \geqslant 2$ and let $G$ be a marked graph of $F_{\mathrm{n}}$. Let $f: G \rightarrow G$ be a graph map. There exists a constant $C_{f}$ such that for any reduced path $\rho=\rho_{1} \rho_{2}$ in $G$ we have

$$
\ell([f(\rho)]) \geqslant \ell\left(\left[f\left(\rho_{1}\right)\right]\right)+\ell\left(\left[f\left(\rho_{2}\right)\right]\right)-2 C_{f} .
$$

Lemma 4.10. [LU2, Lemma 5.7] For any graph $G$ without valence 1 vertices there exists a constant $K \geqslant 0$ such that for any finite reduced edge path $\gamma$ in $G$ there exists an edge path $\gamma^{\prime}$ of length at most $K$ such that the concatenation $\gamma \gamma^{\prime}$ exists and is a reduced circuit.

Lemma 4.11. Let $f: G \rightarrow G$ be as in Proposition 4.4. Let $K_{1} \geqslant 0$ be any constant, let $\sigma$ be an expanding splitting unit and let $\eta_{\sigma}$ be the current associated with $\sigma$ given by Proposition 4.4 (2). Let $m \in \mathbb{N}$ and let $\gamma_{m}^{\prime}$ be a reduced edge path of length at most $K_{1}$. Let $\gamma_{m}=\left[f^{m}(\sigma)\right]^{*} \gamma_{m}^{\prime}$, where $\left[f^{m}(\sigma)\right]^{*}$ is obtained from $\left[f^{m}(\sigma)\right]$ by erasing an initial and a terminal subpath of length $K_{1}$. For every element $\gamma \in \mathcal{P}(\mathcal{F} \wedge \mathcal{A}(\phi))$, we have

$$
\lim _{m \rightarrow \infty} \frac{\left\langle\gamma, \gamma_{m}\right\rangle}{\ell_{\mathcal{F}}\left(\gamma_{m}\right)}=\left\langle\gamma, \eta_{\sigma}\right\rangle
$$

Proof. The proof follows [LU2, Lemma 5.8]. Since $\ell\left(\gamma_{m}^{\prime}\right) \leqslant K_{1}$, we have

$$
\ell_{\mathcal{F}}\left(\left[f^{m}(\sigma)\right]^{*}\right) \geqslant \ell_{\mathcal{F}}\left(\left[f^{m}(\sigma)\right]\right)-2 K_{1} .
$$

Since $\sigma$ is expanding, we have $\lim _{m \rightarrow \infty} \ell_{\mathcal{F}}\left(\left[f^{m}(\sigma)\right]\right)=+\infty$. Hence we have

$$
\lim _{m \rightarrow \infty} \frac{\left\langle\gamma, \gamma_{m}\right\rangle}{\left\langle\gamma,\left[f^{m}(\sigma)\right]\right\rangle}=1
$$

and

$$
\lim _{m \rightarrow \infty} \frac{\ell_{\mathcal{F}}\left(\gamma_{m}\right)}{\ell_{\mathcal{F}}\left(\left[f^{m}(\sigma)\right]\right)}=1 .
$$

Hence the result follows from Proposition 4.4 (1).
Proposition 4.12. Let $\mathrm{n} \geqslant 3$ and let $\mathcal{F}$ be a free factor system of $F_{\mathrm{n}}$. Let $\phi \in \operatorname{Out}\left(F_{\mathrm{n}}, \mathcal{F}\right)$ be an almost atoroidal outer automorphism relative to $\mathcal{F}$. Let $f: G \rightarrow G$ be as in Proposition 4.4. Let $\sigma$ be an expanding splitting unit and let $\eta_{\sigma}$ be the current associated with $\sigma$ given by Proposition 4.4 (2). There exists $\lambda_{\sigma}>0$ such that

$$
\phi\left(\eta_{\sigma}\right)=\lambda_{\sigma} \eta_{\sigma}
$$

Proof. The proof follows [LU2, Proposition 5.9]. Let $K \geqslant 0$ be the constant associated with $G$ given by Lemma 4.10, Let $m \in \mathbb{N}$, and let $\gamma_{m}^{\prime}$ be the path of length at most $K$ given by Lemma 4.10 such that $\gamma_{m}=\left[f^{m}(\sigma)\right] \gamma_{m}^{\prime}$ is a reduced circuit. Since $\lim _{t \rightarrow \infty} \ell_{\text {exp }}\left(\left[f^{t}(\sigma)\right]\right)=+\infty$, for large values of $m$, we have $\ell_{\text {exp }}\left(\gamma_{m}\right)>0$. Let $w_{m}$ be an element of $F_{\mathrm{n}}$ whose conjugacy class is represented by $\gamma_{m}$. Note that, by Lemma 3.26, we have $\ell_{\mathcal{F}}\left(\gamma_{m}\right)=\left\|\eta_{w_{m}}\right\|_{\mathcal{F}}$. By Proposition 3.13, since $\ell_{\exp }\left(\gamma_{m}\right)>0$, we see that $w_{m}$ is $\mathcal{F} \wedge \mathcal{A}(\phi)$-nonperipheral, hence $w_{m}$ defines a current $\eta_{\left[w_{m}\right]} \in \operatorname{Curr}\left(F_{\mathrm{n}}, \mathcal{F} \wedge \mathcal{A}(\phi)\right)$.

Let $\alpha_{m}=\left[f^{m+1}(\sigma)\right]\left[f\left(\gamma_{m}^{\prime}\right)\right]$. Note that since $\ell\left(\gamma_{m}^{\prime}\right) \leqslant K$, the value $\ell\left(\left[f\left(\gamma_{m}^{\prime}\right)\right]\right)$ is bounded by a constant $K_{0}$ which only depends on $K$. Let $C^{\prime}$ be the constant given by Lemma 4.9 and let $K_{1}=\max \left\{K_{0}, C^{\prime}\right\}$. Then, with the notations of Lemma 4.11, the reduced circuit $\gamma_{m}^{\prime \prime}=\left[\alpha_{m}\right]$ can be written as a product $\gamma_{m}^{\prime \prime}=\left[f^{m}(\sigma)\right]^{*} \beta_{m}$ where $\ell\left(\beta_{m}\right) \leqslant K_{1}$ and $\ell_{\mathcal{F}}\left(\left[f^{m}(\sigma)\right]^{*}\right) \geqslant \ell_{\mathcal{F}}\left(\left[f^{m}(\sigma)\right]\right)-2 K_{1}$. Applying Lemma 4.11 twice, we see that, for every element $\gamma \in \mathcal{P}(\mathcal{F} \wedge \mathcal{A}(\phi))$, we have

$$
\lim _{m \rightarrow \infty} \frac{\left\langle\gamma, \gamma_{m}\right\rangle}{\ell_{\mathcal{F}}\left(\gamma_{m}\right)}=\left\langle\gamma, \eta_{\sigma}\right\rangle
$$

and

$$
\lim _{m \rightarrow \infty} \frac{\left\langle\gamma, \gamma_{m}^{\prime \prime}\right\rangle}{\ell_{\mathcal{F}}\left(\gamma_{m}^{\prime \prime}\right)}=\left\langle\gamma, \eta_{\sigma}\right\rangle
$$

By Lemma 3.29, we have

$$
\lim _{m \rightarrow \infty} \frac{\eta_{\left[w_{m}\right]}}{\left\|\eta_{\left[w_{m}\right]}\right\|_{\mathcal{F}}}=\eta_{\sigma}
$$

From the continuity of the $\operatorname{Out}\left(F_{\mathrm{n}}\right)$-action on $\mathbb{P} \operatorname{Curr}\left(F_{\mathrm{n}}, \mathcal{F} \wedge \mathcal{A}(\phi)\right)$ and from $\phi\left(\eta_{\eta_{\left[w_{m}\right]}}\right)=$ $\eta_{\phi\left(\left[w_{m}\right]\right)}$, we see that

$$
\lim _{m \rightarrow \infty} \frac{\eta_{\phi\left(\left[w_{m}\right]\right)}}{\left\|\eta_{\left[w_{m}\right]}\right\|_{\mathcal{F}}}=\phi\left(\eta_{\sigma}\right)
$$

Since the reduced circuit $\gamma_{m}^{\prime \prime}$ represents the conjugacy class $\phi\left(\left[w_{m}\right]\right)$, the second of the above equalities implies that

$$
\lim _{m \rightarrow \infty} \frac{\eta_{\phi\left(\left[w_{m}\right]\right)}}{\left\|\eta_{\phi\left(\left[w_{m}\right]\right)}\right\|_{\mathcal{F}}}=\eta_{\sigma}
$$

Recall that $\lim _{m \rightarrow \infty} \frac{\ell_{\mathcal{F}}\left(\gamma_{m}\right)}{\ell_{\mathcal{F}}\left(\left[f^{m}(\sigma)\right]\right)}=1$, that $\lim _{m \rightarrow \infty} \frac{\ell_{\mathcal{F}}\left(\gamma_{m}^{\prime \prime}\right)}{\ell_{\mathcal{F}}\left(\left[f^{m+1}(\sigma)\right]\right)}=1$, that $\ell_{\mathcal{F}}\left(\gamma_{m}\right)=$ $\left\|\eta_{\left[w_{m}\right]}\right\|_{\mathcal{F}}$ and that $\ell_{\mathcal{F}}\left(\gamma_{m}^{\prime \prime}\right)=\left\|\eta_{\phi\left(\left[w_{m}\right]\right)}\right\|_{\mathcal{F}}$. Recall from the claim in the proof of Proposition 4.4 that $\ell_{\mathcal{F}}([f(\sigma)])$ is the norm of a matrix. The conclusion of Proposition 4.12 then follows from the fact (see [LU1, Remark 3.3]) that there exists $\lambda_{\sigma}>0$ such that

$$
\lim _{m \rightarrow \infty} \frac{\ell_{\mathcal{F}}\left(\left[f^{m+1}(\sigma)\right]\right)}{\ell_{\mathcal{F}}\left(\left[f^{m}(\sigma)\right]\right)}=\lambda_{\sigma}
$$

We now prove a lemma which will be used in Gue2.

Lemma 4.13. Let $\mathrm{n} \geqslant 3$ and let $\mathcal{F}$ be a free factor system of $F_{\mathrm{n}}$. Let $\phi \in \operatorname{Out}\left(F_{\mathrm{n}}, \mathcal{F}\right)$ be an expanding outer automorphism relative to $\mathcal{F}$. Let $f: G \rightarrow G$ be as in Proposition 4.4. Let $\sigma$ be an expanding splitting unit and let $\eta_{\sigma}$ be the current associated with $\sigma$ given by Proposition 4.4 (2).
(1) There exists a projective current $[\eta] \in \mathbb{P} \operatorname{Curr}\left(F_{\mathrm{n}}, \mathcal{F} \wedge \mathcal{A}(\phi)\right)$ whose support is contained in the support of $\eta_{\sigma}$ and such that $\operatorname{Supp}(\eta)$ is uniquely ergodic. In particular, the support of every extremal current of $\Delta_{ \pm}(\phi)$ contains a closed subset which is uniquely ergodic.
(2) There exists only finitely many projective currents $[\eta] \in \mathbb{P} \operatorname{Curr}\left(F_{\mathrm{n}}, \mathcal{F} \wedge \mathcal{A}(\phi)\right)$ whose support is contained in the support of $\eta_{\sigma}$ and such that $\operatorname{Supp}(\eta)$ is uniquely ergodic.

Proof. (1) Note that, since $\phi$ is expanding relative to $\mathcal{F}$, we have $\mathcal{F} \wedge \mathcal{A}(\phi)=\mathcal{A}(\phi)$. Let $r \in \mathbb{N}$ be the minimal integer such that $H_{r}$ is an EG stratum and a reduced iterate of $\sigma$ contains an edge of $H_{r}$. Such a stratum $H_{r}$ exists since $\sigma$ is expanding. Let $e$ be an edge of $H_{r}$ with fixed initial direction and let $\eta_{e}$ be the current in $\mathbb{P} \operatorname{Curr}\left(F_{\mathrm{n}}, \mathcal{A}(\phi)\right)$ associated with $e$ given by Proposition 4.4 (2).

Claim. The support of $\eta_{e}$ is uniquely ergodic.
Proof. By minimality of $r$, every edge contained in a reduced iterate of $e$ is either in $H_{r}$ or in $G_{P G}^{\prime}$. Let $G^{\prime}$ be the minimal subgraph of $G$ which contains every reduced iterate of $e$ and let $A$ be a subgroup of $F_{\mathrm{n}}$ such that $\pi_{1}\left(G^{\prime}\right)$ is a conjugate of $A$ when $\pi_{1}(G)$ is identified with $F_{\mathrm{n}}$. Then $G^{\prime}$ is $f$-invariant and hence $[A]$ is $\phi$-invariant. Let $G_{1}^{\prime}, \ldots, G_{k}^{\prime}$ be the connected component of $\overline{G^{\prime}-H_{r}}$ and let $\mathcal{F}^{\prime}$ be the free factor system of $F_{\mathrm{n}}$ determined by $G_{1}^{\prime}, \ldots, G_{k}^{\prime}$. Let $\Phi \in \phi$ be such that $\Phi(A)=A$. Note that $\left[\left.\Phi\right|_{A}\right] \in \operatorname{Out}(A)$ is fully irreducible relative to $\mathcal{F}^{\prime}$. For every $i \in\{1, \ldots, k\}$, we have $G_{i}^{\prime} \subseteq G_{P G}^{\prime}$. By Proposition 2.5 (3), for every $i \in\{1, \ldots, k\}$, either $G_{i}^{\prime}$ is contractible or $G_{i}^{\prime} \subseteq G_{P G}$. By Proposition 3.13 for every subgroup $H$ of $F_{\mathrm{n}}$ such that $[H] \in \mathcal{F}^{\prime}$, there exists a subgroup $H^{\prime}$ of $F_{\mathrm{n}}$ such that $\left[H^{\prime}\right] \in \mathcal{A}(\phi)$ and $H \subseteq H^{\prime}$. Hence we have $\mathcal{F}^{\prime} \leqslant \mathcal{A}(\phi)$. Moreover by Proposition 3.13 and Proposition 2.5 (9), if $\gamma$ is a cyclically reduced circuit of $G^{\prime}$ of height $r$ whose growth under iteration of $f$ is polynomial, then $\gamma$ contains (up to taking inverse) the only height $r$ EG INP $\sigma_{r}$. As one of the endpoints of $\sigma_{r}$ is not contained in $G_{r-1}$ by [HM, Fact I.1.42], we see that either $\sigma_{r}$ is not closed and $\gamma$ does not exist or $\sigma_{r}$ is closed and $\gamma$ is an iterate of $\sigma_{r}$ or $\sigma_{r}^{-1}$. Let $b \in F_{\mathrm{n}}$ be the (possibly trivial) element associated with $\sigma_{r}$. Then, we have

$$
\partial^{2} A \cap \partial^{2}\left(F_{\mathrm{n}}, \mathcal{A}(\phi)\right)=\partial^{2}\left(A, \mathcal{F}^{\prime} \cup\{[b]\}\right)
$$

Let $\mathbb{P} \operatorname{Curr}\left(\operatorname{Supp}\left(\eta_{e}\right)\right)$ be the set of projective currents in $\mathbb{P} \operatorname{Curr}\left(F_{\mathrm{n}}, \mathcal{F} \wedge \mathcal{A}(\phi)\right)$ whose support is contained in $\operatorname{Supp}\left(\eta_{e}\right)$. We now construct an injective application

$$
\Theta: \mathbb{P} \operatorname{Curr}\left(\operatorname{Supp}\left(\eta_{e}\right)\right) \rightarrow \mathbb{P} \operatorname{Curr}\left(A, \mathcal{F}^{\prime}\right)
$$

such that for every projective current $\mu \in \mathbb{P} \operatorname{Curr}\left(\operatorname{Supp}\left(\eta_{e}\right)\right)$ we have

$$
\operatorname{Supp}(\Theta([\mu]))=\operatorname{Supp}([\mu]) \cap \partial^{2} A
$$

Let $\mathcal{P}\left(\mathcal{F}^{\prime}\right)$ be the set of paths in a Cayley tree of $F_{\mathrm{n}}$ defined above Lemma 3.28 (replacing $\mathcal{F} \wedge \mathcal{A}(\phi)$ by $\left.\mathcal{F}^{\prime}\right)$. Let $\mathcal{P}_{A}\left(\mathcal{F}^{\prime}\right)$ be the set of paths in $\mathcal{P}\left(\mathcal{F}^{\prime}\right)$ contained in $G^{\prime}$. By Lemma 3.28, the set consisting in elements $C(\gamma)$ with $\gamma \in \mathcal{P}\left(\mathcal{F}^{\prime}\right)$ covers $\partial^{2}\left(A, \mathcal{F}^{\prime}\right)$. Thus, by Gue1, Lemma 3.2], it suffices to prove that for every projective current $\eta \in \mathbb{P} \operatorname{Curr}\left(\operatorname{Supp}\left(\eta_{e}\right)\right)$, we can associate a function $\widetilde{\eta}: \mathcal{P}_{A}\left(\mathcal{F}^{\prime}\right) \rightarrow \mathbb{R}$ such that for every $\gamma \in \mathcal{P}_{A}\left(\mathcal{F}^{\prime}\right)$, we have
(i) $0 \leqslant \widetilde{\eta}(\gamma)<\infty$;
(ii) $\widetilde{\eta}(\gamma)=\sigma_{\gamma^{-1}}$;
(iii) $\widetilde{\eta}(\gamma)=\sum_{e \in E} \sigma_{\gamma e}$, where $E$ is the subset of $\vec{E} G^{\prime}$ consisting in all edges that are incident to the endpoints of $\gamma$ and distinct from the inverse of the last edge of $\gamma$.

Let $\eta \in \mathbb{P} \operatorname{Curr}\left(\operatorname{Supp}\left(\eta_{e}\right)\right)$. If $\gamma \in \mathcal{P}_{A}\left(\mathcal{F}^{\prime}\right)$ is not contained in the axis of a conjugate of $b$, we may set $\widetilde{\eta}(\gamma)=\eta(C(\gamma))$. Since $\sigma_{e}$ is $r$-legal, a reduced iterate of $\sigma_{e}$ cannot contain the only height $r$ EG INP. Thus, we may set, for every path $\gamma \in \mathcal{P}_{A}\left(\mathcal{F}^{\prime}\right)$ contained in the axis of a conjugate of $b: \widetilde{\eta}(\gamma)=0$. The function $\widetilde{\eta}$ satisfies conditions $(i)-(i i i)$ as $\eta$ is a relative currents, hence it defines a unique current in $\operatorname{PCurr}\left(A, \mathcal{F}^{\prime}\right)$, which we still denote by $\widetilde{\eta}$. Note that for every element $\gamma \in \mathcal{P}_{A}\left(\mathcal{F}^{\prime}\right)$, we have

$$
\widetilde{\eta}\left(C(\gamma) \cap \partial^{2} A \cap \partial^{2}\left(F_{\mathrm{n}}, \mathcal{A}(\phi)\right)\right)=\eta\left(C(\gamma) \cap \partial^{2} A \cap \partial^{2}\left(F_{\mathrm{n}}, \mathcal{A}(\phi)\right)\right)
$$

so that the application $\mathbb{P} \operatorname{Curr}\left(\operatorname{Supp}\left(\eta_{e}\right)\right) \rightarrow \mathbb{P} \operatorname{Curr}\left(A, \mathcal{F}^{\prime}\right)$ is injective. Moreover, we have $\operatorname{Supp}(\widetilde{\eta})=\operatorname{Supp}(\eta)) \cap \partial^{2} A$.

Hence $\eta_{e}$ defines a current $\widetilde{\eta_{e}} \in \mathbb{P} \operatorname{Curr}\left(A, \mathcal{F}^{\prime}\right)$. This current coincides with the attractive projective current associated with $\left[\left.\Phi\right|_{A}\right]$ defined by Gupta in Gup1, Proposition 8.12]. By Gup2, Lemma 4.17], the support of $\widetilde{\eta}_{e}$ is uniquely ergodic. Thus the support of $\eta_{e}$ is uniquely ergodic.

By the claim, it remains to prove that $\operatorname{Supp}\left(\eta_{e}\right) \subseteq \operatorname{Supp}\left(\eta_{\sigma}\right)$. But an element $\eta \in$ $\partial^{2}\left(F_{\mathrm{n}}, \mathcal{A}(\phi)\right)$ is contained in the support of $\eta_{\sigma}$ if for every element $\gamma \in \mathcal{P}(\mathcal{F} \wedge \mathcal{A}(\phi))$ such that $\beta \in C(\gamma)$, we have $\eta_{\sigma}(C(\gamma))>0$. Thus, the support of $\eta_{\sigma}$ contains all the cylinder sets of the form $C(\gamma)$ where $\gamma \in \mathcal{P}(\mathcal{F} \wedge \mathcal{A}(\phi))$ and $\gamma$ is contained in a reduced iterate of $\sigma$. In particular, since $e$ is contained in a reduced iterate of $\sigma$, we have $\operatorname{Supp}\left(\eta_{e}\right) \subseteq \operatorname{Supp}\left(\eta_{\sigma}\right)$. This proves Assertion (1).
(2) Suppose towards a contradiction that there exist infinitely many pairwise distinct projective currents $\left(\left[\eta_{m}\right]\right)_{m \in \mathbb{N}} \in \mathbb{P} \operatorname{Curr}\left(F_{\mathrm{n}}, \mathcal{F} \wedge \mathcal{A}(\phi)\right)$ whose support is contained in the support of $\eta_{\sigma}$ and such that for every $m \in \mathbb{N}$, the support $\operatorname{Supp}\left(\eta_{m}\right)$ is uniquely ergodic. By compactness of $\mathbb{P} \operatorname{Curr}\left(F_{\mathrm{n}}, \mathcal{F} \wedge \mathcal{A}(\phi)\right)$ (see Lemma2.14) up to passing to a subsequence, there exists a projective current $[\eta] \in \mathbb{P} \operatorname{Curr}\left(F_{\mathrm{n}}, \mathcal{F} \wedge \mathcal{A}(\phi)\right)$ such that $\lim _{m \rightarrow \infty}\left[\eta_{m}\right]=[\eta]$. Let $K \in \mathbb{N}^{*}$ be such that $\mathcal{P}(\mathcal{F} \wedge \mathcal{A}(\phi))$ contains reduced edge paths of length equal to $K$. By additivity of $\eta$, there exists $\gamma, \ldots, \gamma_{t} \in \mathcal{P}(\mathcal{F} \wedge \mathcal{A}(\phi))$ of length equal to $K$ such that the support $\operatorname{Supp}(\eta)$ is contained in $\bigcup_{j=1}^{t} C\left(\gamma_{j}\right)$ and for every $j \in\{1, \ldots, m\}$, we have $\eta\left(C\left(\gamma_{j}\right)\right)>0$. Then, there exists $N \in \mathbb{N}^{*}$ such that, for every $m \geqslant N$ and every
$j \in\{1, \ldots, t\}$, we have $\eta_{m}\left(C\left(\gamma_{j}\right)\right)>0$. Hence for every $m \geqslant N$, we have

$$
\operatorname{Supp}(\eta) \subseteq \bigcup_{j=1}^{t} C\left(\gamma_{j}\right) \subseteq \operatorname{Supp}\left(\eta_{m}\right)
$$

By unique ergodicity, for every $m \geqslant N$, we have $[\eta]=\left[\eta_{m}\right]$, a contradiction.

## 5 North-South dynamics for almost atoroidal outer automorphisms

Let $X$ be a compact metric space and let $G$ be a group acting on $X$ by homeomorphisms. We say that an element $g \in G$ acts on $X$ with generalized north-south dynamics if the action of $g$ on $X$ has two invariant disjoint closed subsets $\Delta_{-}$and $\Delta_{+}$such that, for every open neighborhood $U_{ \pm}$of $\Delta_{ \pm}$and every compact set $K_{ \pm} \subseteq X-\Delta_{\mp}$, there exists $M>0$ such that, for every $n \geqslant M$, we have

$$
g^{ \pm n} K_{ \pm} \subseteq U_{ \pm} .
$$

In this section we prove the following theorem. Recall that a relative expanding outer automorphism is relative atoroidal, hence relative almost atoroidal.

Theorem 5.1. Let $\mathrm{n} \geqslant 3$ and let $\mathcal{F}$ be a free factor system of $F_{\mathrm{n}}$. Let $\phi \in \operatorname{Out}\left(F_{\mathrm{n}}, \mathcal{F}\right)$ be a relative expanding outer automorphism. Let $\Delta_{+}(\phi)$ and $\Delta_{-}(\phi)$ be the simplexes of attraction and repulsion of $\phi$. Then $\phi$ acts on $\operatorname{PCurr}\left(F_{\mathrm{n}}, \mathcal{F}\right)$ with generalized north-south dynamics with respect to $\Delta_{+}(\phi)$ and $\Delta_{-}(\phi)$.

Theorem 1.2 in the introduction follows from Theorem 5.1 since every exponentially growing element of $\operatorname{Out}\left(F_{\mathrm{n}}\right)$ is expanding relative to its polynomial part.

### 5.1 Relative exponential length and goodness

Let $\mathrm{n} \geqslant 3$ and let $\mathcal{F}$ be a free factor system of $F_{\mathrm{n}}$. Let $\phi \in \operatorname{Out}\left(F_{\mathrm{n}}, \mathcal{F}\right)$ be an almost atoroidal outer automorphism relative to $\mathcal{F}$. In this section we define and prove the properties of the objects needed in order to prove Theorem 5.1, Let $f: G \rightarrow G$ be a CT map representing a power of $\phi$ with filtration $\varnothing=G_{0} \subsetneq G_{1} \subsetneq \ldots \subsetneq G_{k}=G$ and let $p \in\{1, \ldots, k\}$ be such that $\mathcal{F}\left(G_{p}\right)=\mathcal{F}$. The proof of Theorem 5.1 relies on the study of $P G$-relative completely split edge paths. More precisely, given a reduced circuit $\gamma$ of $G$, we study the proportion of subpaths of $\gamma$ which have $P G$-relative complete splittings. This proportion will be measured using the exponential length. However, the lack of equality in Lemma 3.16 shows that the exponential length is not well-adapted to study the exponential length of a path by comparing it with the exponential length of its subpaths. Instead, we define a notion of exponential length of a subpath relative to $\gamma$. We first need some preliminary results regarding splittings of edge paths.

Definition 5.2. Let $\gamma$ be a reduced edge path in $G$ and let $\gamma=\gamma_{0} \gamma_{1}^{\prime} \gamma_{1} \ldots \gamma_{k} \gamma_{k}^{\prime}$ be the exponential decomposition of $\gamma$ (see the beginning of Section 3.2). Let $\alpha$ be a subpath of $\gamma$. The exponential length of $\alpha$ relative to $\gamma$, denoted by $\ell_{\text {exp }}^{\gamma}(\alpha)$ is:

$$
\ell_{e x p}^{\gamma}(\alpha)=\sum_{i=1}^{k} \ell_{\exp }\left(\alpha \cap \gamma_{k}^{\prime}\right)
$$

We define the $\mathcal{F}$-length of $\alpha$ relative to $\gamma$ similarly replacing $\ell_{\exp }$ by $\ell_{\mathcal{F}}$ and the exponential decomposition by the $\mathcal{F}$-exponential decomposition.

Note that, for every reduced edge path $\gamma$ of $G$, we have $\ell_{\text {exp }}^{\gamma}(\gamma)=\ell_{\exp }(\gamma)$. The exponential length relative to a path $\gamma$ is well-adapted to compute the exponential length of $\gamma$ using its subpaths, as shown by the following lemma.

Lemma 5.3. Let $\gamma$ be a reduced edge path and let $\gamma^{\prime}=\alpha \beta \subseteq \gamma$ be a subpath of $\gamma$. Then

$$
\ell_{e x p}^{\gamma}\left(\gamma^{\prime}\right)=\ell_{e x p}^{\gamma}(\alpha)+\ell_{e x p}^{\gamma}(\beta)
$$

In particular, when $\gamma^{\prime}=\gamma$, we have

$$
\ell_{e x p}(\gamma)=\ell_{e x p}^{\gamma}(\alpha)+\ell_{e x p}^{\gamma}(\beta)
$$

The same statement is true replacing $\ell_{\text {exp }}^{\gamma}$ by $\ell_{\mathcal{F}}^{\gamma}$.
Proof. The proof is similar for both $\ell_{\text {exp }}^{\gamma}$ and $\ell_{\mathcal{F}}^{\gamma}$, so we only do the proof for $\ell_{\text {exp }}^{\gamma}$. Let $\gamma=\gamma_{0} \gamma_{1}^{\prime} \gamma_{1} \ldots \gamma_{k} \gamma_{k}^{\prime}$ be the exponential decomposition of $\gamma$. Then, for every $i \in\{1, \ldots, k\}$, the paths $\alpha \cap \gamma_{i}^{\prime}$ and $\beta \cap \gamma_{i}^{\prime}$ do not contain a subpath of a path in $\mathcal{N}_{P G}^{\max }(\gamma)$. In particular, for every $i \in\{1, \ldots, k\}$, one computes $\ell_{\exp }\left(\alpha \cap \gamma_{i}^{\prime}\right)$ and $\ell_{\exp }\left(\beta \cap \gamma_{i}^{\prime}\right)$ by removing edges from $G_{P G}^{\prime}$. Since $\ell_{e x p}^{\gamma}\left(\gamma^{\prime}\right)$ is computed by removing edges in $G_{P G}^{\prime}$ from every $\gamma_{i}^{\prime}$ with $i \in\{1, \ldots, k\}$, the proof follows.

In Lemma 5.6, we will show that if $\gamma$ is a reduced edge path in $G$ and that $\alpha$ is a subpath of $\gamma$, then $\ell_{\text {exp }}(\alpha)$ and $\ell_{\text {exp }}^{\gamma}(\alpha)$ differ by a uniform additive constant. This will allow us to compute directly $\ell_{\exp }(\alpha)$ rather than $\ell_{\text {exp }}^{\gamma}(\alpha)$.

Let $\gamma$ be a reduced edge path in $G$ and let $\gamma=\gamma_{1} \ldots \gamma_{m}$ be a splitting of $\gamma$. Let $J_{C S, P G} \subseteq\left\{\gamma_{1}, \ldots, \gamma_{m}\right\}$ be the subset consisting in all subpaths which have a $P G$-relative complete splitting. If $\ell_{\exp }(\gamma)>0$, let

$$
\mathfrak{g}_{C T, P G}\left(\gamma, \gamma_{1}, \ldots, \gamma_{m}\right)=\frac{\sum_{\gamma_{i} \in J_{C S, P G}} \ell_{\exp }^{\gamma}\left(\gamma_{i}\right)}{\ell_{\exp }(\gamma)}
$$

The goodness of $\gamma$, denoted by $\mathfrak{g}(\gamma)$, is the least upperbound of $\mathfrak{g}_{C T, P G}(\gamma)$ over all splittings of $\gamma$ if $\ell_{\exp }(\gamma)>0$, and is equal to 0 otherwise. When $\gamma$ is a circuit, the value $\mathfrak{g}_{C T, P G}(\gamma)$ is defined using only circuital splittings.

Since there are only finitely many decompositions of a finite edge path into subpaths, the value $\mathfrak{g}(\gamma)$ is realized for some splitting of $\gamma$. A splitting for which $\mathfrak{g}(\gamma)$ is realized is called an optimal splitting of $\gamma$, and an optimal circuital splitting when $\gamma$ is a circuit.

A subpath of $\gamma$ which is the concatenation of consecutive splitting units of an optimal splitting of $\gamma$ is called a factor of $\gamma$. When $\ell_{\exp }(\gamma)=0$, we use the convention that the only factor of $\gamma$ is $\gamma$ itself. The factors of $\gamma$ that admit a $P G$-relative complete splitting are called complete factors. The factors in an optimal splitting which do not admit $P G$-relative complete splittings are said to be incomplete. Remark that, by Proposition [2.5(6), (8) and by Lemma 3.9, the [f]-image of a $P G$-relative complete path is $P G$-relative complete, and the reduced iterates of an incomplete factor are eventually $P G$-relative complete.

Using Lemma 5.3, we have the following result.
Lemma 5.4. Let $\gamma$ be a reduced edge path and let $\gamma=\gamma_{0}^{\prime} \gamma_{1} \gamma_{1}^{\prime} \ldots \gamma_{m} \gamma_{m}^{\prime}$ be an optimal splitting of $\gamma$, where, for every $i \in\{0, \ldots, m\}$, the path $\gamma_{i}^{\prime}$ is an incomplete factor of $\gamma$ and, for every $i \in\{1, \ldots, m\}$, the path $\gamma_{i}$ is complete. Then

$$
\mathfrak{g}(\gamma)=\frac{\sum_{i=1}^{m} \ell_{\text {exp }}^{\gamma}\left(\gamma_{i}\right)}{\sum_{i=1}^{m} \ell_{\text {exp }}^{\gamma}\left(\gamma_{i}\right)+\sum_{j=0}^{m} \ell_{\text {exp }}^{\gamma}\left(\gamma_{i}^{\prime}\right)} .
$$

Definition 5.5. Let $\mathrm{n}, \mathcal{F}, \phi, f, p$ be as in the beginning of Section 5.1. Let $K \geqslant 1$. The CT map $f$ is $3 K$-expanding if for every edge $e$ of $\overline{G-G_{P G}^{\prime}}$, we have

$$
\ell_{\exp }([f(e)]) \geqslant 3 K
$$

Note that, by Lemma 3.21, for every $K \geqslant 1$, the CT map $f$ has a power which is $3 K$-expanding. Note that, since $\phi$ is exponentially growing, we have $G \neq G_{P G}^{\prime}$, so that the definition of 3 K -expanding is not empty.

In the rest of the section, let $K \geqslant 1$ be a constant such that, for every reduced edge path $\sigma$ which is either in $\mathcal{N}_{P G}$ or a path in a zero stratum, we have $\ell(\sigma) \leqslant \frac{K}{2}$. Such a $K$ exists since $\mathcal{N}_{P G}$ is finite by Lemma 3.4 (1) and since every zero stratum is contractible by Proposition 2.5 (3). We fix a constant $C_{f}$ given by Lemma 4.9, Let

$$
\begin{equation*}
C=\max \left\{K, C_{f}\right\} . \tag{7}
\end{equation*}
$$

Recall that, if $\sigma$ is a $P G$-relative splitting unit, $\sigma$ is either an edge in an irreducible stratum, a path in a zero stratum or a path in $\mathcal{N}_{P G}$. Thus, the choice of $K$ implies that for every $P G$-relative splitting unit $\sigma$, we have $\ell_{\text {exp }}(\sigma) \leqslant \frac{K}{2}$.

Lemma 5.6. Let $\gamma$ be a reduced edge path in $G$ and let $\gamma^{\prime}$ be a subpath of $\gamma$. Let $\gamma=$ $\gamma_{0} \gamma_{1}^{\prime} \gamma_{1} \ldots \gamma_{k} \gamma_{k}^{\prime}$ be the exponential decomposition of $\gamma$. There exist three (possibly empty) subpaths $\delta_{1}, \delta_{2}$ and $\tau$ of $\gamma$ such that for every $i \in\{1,2\}$, the path $\delta_{i}$ is a proper subpath of a splitting unit of some $\gamma_{j}$, we have $\ell_{\text {exp }}(\tau)=\ell_{\text {exp }}^{\gamma}(\tau)=\ell_{\text {exp }}^{\gamma}\left(\gamma^{\prime}\right)$ and $\gamma^{\prime}=\delta_{1} \tau \delta_{2}$. In particular, we have

$$
\ell_{\text {exp }}^{\gamma}\left(\gamma^{\prime}\right) \leqslant \ell_{\text {exp }}\left(\gamma^{\prime}\right) \leqslant \ell_{\text {exp }}^{\gamma}\left(\gamma^{\prime}\right)+2 C \leqslant \ell_{\exp }(\gamma)+2 C .
$$

The same statement is true replacing $\ell_{\text {exp }}$ by $\ell_{\mathcal{F}}$ and $\ell_{\text {exp }}^{\gamma}$ by $\ell_{\mathcal{F}}^{\gamma}$.

Proof. The proof is similar for both $\ell_{\text {exp }}$ and $\ell_{\mathcal{F}}$, so we only do the proof for $\ell_{\text {exp }}$. Since $\gamma^{\prime}$ is a subpath of $\gamma$, there exist three (possibly trivial) paths $\delta_{1}^{\prime}, \tau^{\prime}$ and $\delta_{2}^{\prime}$ such that: (a) for every $i \in\{1,2\}$, there exists $k_{i} \in\{0, \ldots, k\}$ such that the path $\delta_{i}^{\prime}$ is a subpath of some $\gamma_{k_{i}}$;
(b) for every $j \in\{0, \ldots, k\}$, either $\gamma_{j}$ is contained in $\tau^{\prime}$ or $\gamma_{j}$ does not contain edges of $\tau^{\prime}$;
(c) we have $\gamma^{\prime}=\delta_{1}^{\prime} \tau^{\prime} \delta_{2}^{\prime}$.

The path $\delta_{1}^{\prime}$ has a decomposition $\delta_{1}^{\prime}=\delta_{1} f_{1}$, where $f_{1}$ is a (possibly trivial) factor of $\gamma_{k_{1}}$ and $\delta_{1}$ is properly contained in a splitting unit of $\gamma_{k_{1}}$ for some fixed choice of optimal splitting of $\gamma_{k_{1}}$. Similarly, the path $\delta_{2}^{\prime}$ has a decomposition $\delta_{2}^{\prime}=f_{2} \delta_{2}$, where $f_{2}$ is a (possibly trivial) factor of $\gamma_{k_{2}}$ and $\delta_{2}$ is properly contained in a splitting unit of $\gamma_{k_{2}}$ for some fixed choice of optimal splitting of $\gamma_{k_{2}}$. Let $\tau=f_{1} \tau^{\prime} f_{2}$. Then $\gamma^{\prime}=\delta_{1} \tau \delta_{2}$. It remains to show that $\ell_{\text {exp }}(\tau)=\ell_{\text {exp }}^{\gamma}(\tau)=\ell_{\text {exp }}^{\gamma}\left(\gamma^{\prime}\right)$. Since for every $i \in\{1,2\}$, the path $f_{i}$ is a path in $\mathcal{N}_{P G}$, we have $\ell_{\exp }(\tau)=\ell_{\exp }\left(\tau^{\prime}\right)$. By $(b)$, one obtains $\ell_{\exp }\left(\gamma^{\prime}\right)$ by deleting edges in $G_{P G}^{\prime}$ and every path of $\mathcal{N}_{P G}^{\max }(\gamma)$ contained in $\tau^{\prime}$. Hence we have

$$
\ell_{e x p}^{\gamma}\left(\tau^{\prime}\right)=\sum_{i=1}^{k} \ell_{e x p}\left(\tau^{\prime} \cap \gamma_{k}^{\prime}\right)=\sum_{i=1}^{k} \ell_{\text {exp }}\left(\tau \cap \gamma_{k}^{\prime}\right)=\ell_{\text {exp }}^{\gamma}(\tau) .
$$

Since $\delta_{1}$ and $\delta_{2}$ are contained in paths of $\mathcal{N}_{P G}^{\max }(\gamma)$, we have $\ell_{\text {exp }}^{\gamma}\left(\gamma^{\prime}\right)=\ell_{\text {exp }}^{\gamma}(\tau)$, that is, the second equality holds.

We now prove the final inequalities in the lemma. The first inequality follows from the fact that every path in $\mathcal{N}_{P G}^{\max }\left(\gamma^{\prime}\right)$ is a subpath of some $\gamma_{i}$ for $i \in\{0, \ldots, k\}$. Thus, we have $\ell_{\text {exp }}^{\gamma}\left(\gamma^{\prime}\right) \leqslant \ell_{\exp }\left(\gamma^{\prime}\right)$. By Lemma 3.16, we have

$$
\ell_{\exp }\left(\gamma^{\prime}\right) \leqslant \ell_{\exp }\left(\delta_{1}\right)+\ell_{\exp }(\tau)+\ell_{\exp }\left(\delta_{2}\right) \leqslant \ell_{\text {exp }}^{\gamma}\left(\gamma^{\prime}\right)+\ell\left(\delta_{1}\right)+\ell\left(\delta_{2}\right) .
$$

By definition of the constant $K$ and the fact that $K \leqslant C$, we have:

$$
\ell_{\text {exp }}^{\gamma}\left(\gamma^{\prime}\right)+\ell\left(\delta_{1}\right)+\ell\left(\delta_{2}\right) \leqslant \ell_{\text {exp }}^{\gamma}\left(\gamma^{\prime}\right)+2 C \leqslant \ell_{\text {exp }}(\gamma)+2 C,
$$

where the last inequality follows from Lemma 5.3,
Lemma 5.7. Let $f: G \rightarrow G$ be a $3 K$-expanding $C T$ map. Let $\gamma$ be a $P G$-relative completely split edge path of positive exponential length. Then

$$
\ell_{\exp }([f(\gamma)]) \geqslant 3 \ell_{\exp }(\gamma) .
$$

Proof. Consider a $P G$-relative complete splitting $\gamma=\gamma_{0}^{\prime} \gamma_{1} \gamma_{1}^{\prime} \ldots \gamma_{m} \gamma_{m}^{\prime}$ of $\gamma$, where, for every $i \in\{0, \ldots, m\}$, the path $\gamma_{i}^{\prime}$ is either a (possibly trivial) concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$ or a (possibly trivial) reduced maximal taken connecting path in a zero stratum and, for every $i \in\{1, \ldots, m\}$, the path $\gamma_{i}$ is an edge in an irreducible stratum of positive exponential length. By Lemma 3.23, we have

$$
\ell_{\exp }(\gamma)=\sum_{i=1}^{m} \ell\left(\gamma_{i}\right) .
$$

[ $\gamma$ ]
Figure 2: Illustration of Lemma 5.8. If a complete factor of $\gamma_{1}$ contained in $[\gamma]$ is not contained in $\gamma_{2}^{+}$, then it is a complete factor of $[\gamma]$.

Since $f$ is $3 K$-expanding, for every $i \in\{1, \ldots, m\}$, we have

$$
\ell_{\exp }\left(\left[f\left(\gamma_{i}\right)\right]\right) \geqslant 3 K \ell_{\exp }\left(\gamma_{i}\right) .
$$

Since the reduced image of a $P G$-relative complete splitting is a $P G$-relative complete splitting by Lemma 3.9, by Lemma 3.20 (2), we see that

$$
\ell_{\exp }([f(\gamma)]) \geqslant \sum_{i=1}^{m} \ell_{\exp }\left(\left[f\left(\gamma_{i}\right)\right]\right) \geqslant \sum_{i=1}^{m} 3 K \ell_{\exp }\left(\gamma_{i}\right) \geqslant 3 \ell_{\exp }(\gamma) .
$$

This concludes the proof.
Lemma 5.8. Let $f: G \rightarrow G$ be a $3 K$-expanding CT map. Let $\gamma=\gamma_{1} \gamma_{2}$ be a (not necessarily reduced) edge path of positive exponential length, where $\gamma_{1}$ and $\gamma_{2}$ are reduced edge paths. Let $\gamma_{1}=a_{1} b_{1} \ldots a_{k} b_{k}$ be an optimal splitting of $\gamma_{1}$ where for every $i \in$ $\{1, \ldots, k\}$, the path $a_{i}$ is an incomplete factor and for every $i \in\{1, \ldots, k\}$ the path $b_{i}$ is complete. For every $i \in\{1,2\}$, let $\gamma_{i}^{\prime}$ be the subpath of $\gamma_{i}$ contained in $[\gamma]$. Let $\gamma_{1}^{\prime}=\gamma_{1}^{-} \gamma_{1}^{+}$ be a decomposition of $\gamma_{1}^{\prime}$ into two subpaths where $\gamma_{1}^{+}$is the maximal terminal segment of $\gamma_{1}^{\prime}$ such that $\sum_{i=1}^{k} \ell_{\text {exp }}\left(\gamma_{1}^{+} \cap b_{i}\right)=2 C$. Then every $P G$-relative complete factor $b^{\prime}$ of $\gamma_{1}$ contained in $\gamma_{1}^{-}$(for the given optimal splitting) is also a $P G$-relative complete factor of [ $\gamma$ ].

Remark 5.9. (1) We emphasize that, in the statement of Lemma 5.8. if the path $\gamma_{1}$ is $P G$-relative completely split, the path $\gamma_{1}^{\prime}$ is not necessarily $P G$-relative completely split. Indeed, there might be some identification with the path $\gamma_{2}$ that might create incomplete factors in $\gamma_{1}^{\prime}$.
(2) Lemma 5.8 also implies that if $\gamma_{1}$ is $P G$-relative completely split, the intersection of an incomplete factor of $[\gamma]$ with $\gamma_{1}^{\prime}$ is contained in a terminal segment of $\gamma_{1}^{\prime}$ of exponential length at most equal to 2C (see Figure (2). Indeed, the claim in the proof of Lemma 5.8 shows that the path $\gamma_{1}^{-}$is a complete factor of $\gamma_{1}$, hence a complete factor of $[\gamma]$ by Lemma 5.8. Moreover, we have $k=1, a_{1}$ is trivial and $\ell_{\exp }\left(\gamma_{1}^{+}\right)=\ell_{\exp }\left(\gamma_{1}^{+} \cap b_{1}\right)$.

Proof. Let $t \in\{1, \ldots, k\}$ be the minimal integer such that $\gamma_{1}^{-}$is contained in $\delta^{\prime}=$ $a_{1} b_{1} \ldots a_{t} b_{t}$. Let $b_{t}=\delta_{1} \ldots \delta_{s^{\prime}}$ be a $P G$-relative complete splitting of $b_{t}$. Let $s \in$
$\left\{1, \ldots, s^{\prime}\right\}$ be the minimal integer such that $\gamma_{1}^{-}$is contained in $\delta=a_{1} b_{1} \ldots a_{t} \delta_{1} \ldots \delta_{s}$. The integer $s$ exists since, by maximality of $\gamma_{1}^{+}$, for every $i \in\{1, \ldots, k\}$, either $\gamma_{1}^{+} \cap a_{i}=a_{i}$ or $\gamma_{1}^{+} \cap a_{i}=\varnothing$.
Claim. We have $\delta=\gamma_{1}^{-}$.
Proof. By minimality of $t$ and $s$, the path $\gamma_{1}^{-}$contains an edge of $\delta_{s}$. We claim that $\delta_{s}$ is contained in $\gamma_{1}^{\prime}$. Indeed, it is clear if $\delta_{s}$ is an edge. Suppose towards a contradiction that $\delta_{s}$ is not contained in $\gamma_{1}^{\prime}$. Then the concatenation point of $\gamma_{1}^{\prime}$ and $\gamma_{2}^{\prime}$ is contained in $\delta_{s}$. If $\delta_{s}$ is a maximal taken connecting path in a zero stratum, then, by the choice of $K$, we have $\ell\left(\delta_{s}\right) \leqslant \frac{K}{2} \leqslant \frac{C}{2}$. Since $\ell\left(\gamma_{1}^{+}\right) \geqslant 2 C$, the path $\delta_{s} \cap \gamma_{1}^{\prime}$ would be contained in $\gamma_{1}^{+}$, contradicting the fact that $\gamma_{1}^{-}$contains the first edge of $\delta_{s}$. Suppose that $\delta_{s}$ is a concatenation of paths in $G_{P G}$ and $\mathcal{N}_{P G}$. Then $\delta_{s}$ has a decomposition $\delta_{s}=\beta_{1}^{(s)} \alpha_{1}^{(s)} \beta_{1}^{(s)} \ldots \alpha_{k_{s}-1}^{(s)} \beta_{k_{s}}^{(s)} \alpha_{k_{s}}^{(s)}$, where for every $i \in\left\{1, \ldots, k_{s}\right\}$, the path $\beta_{i}^{(s)}$ is contained in $G_{P G}$, for every $i \in\left\{1, \ldots, k_{s}-1\right\}$, the path $\alpha_{i}^{(s)}$ is contained in $\mathcal{N}_{P G}^{\max }(\sigma)$ and $\alpha_{k_{s}}^{(s)}$ is a subpath of a path in $\mathcal{N}_{P G}^{\max }\left(\delta_{s}\right)$. By the choice of $K$, we have $\ell_{\text {exp }}\left(\delta_{s}\right) \leqslant \ell\left(\alpha_{k_{s}}\right) \leqslant \frac{K}{2} \leqslant \frac{C}{2}$. Since $\ell_{\text {exp }}\left(\gamma_{1}^{+}\right) \geqslant 2 C$, the path $\delta_{s} \cap \gamma_{1}^{\prime}$ would be contained in $\gamma_{1}^{+}$, contradicting the fact that $\gamma_{1}^{-}$contains the first edge of $\delta_{s}$. Hence, in every case, the path $\delta_{s}$ is contained in $\gamma_{1}^{\prime}$. Note that, since $\gamma_{1}^{+}$is the maximal subpath of $\gamma_{1}^{\prime}$ for the property that $\sum_{i=1}^{k} \ell_{\exp }\left(\gamma_{1}^{+} \cap b_{i}\right)=2 C$, the $P G$-relative splitting unit $\delta_{s}$ is not a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$ or a maximal taken connecting path in a zero stratum. Indeed, otherwise it is properly contained in $\gamma_{1}^{+}$, contradicting the fact that $\gamma_{1}^{-}$intersects $\delta_{s}$. Hence $\delta_{s}$ is an edge and $\delta=\gamma_{1}^{-}$.

By the claim, we see that $\gamma_{1}^{-}=a_{1} b_{1} \ldots a_{t} \delta_{1} \ldots \delta_{s}$ is an optimal splitting of $\gamma_{1}^{-}$. Let $r \in\{1, \ldots, k\}$ be the minimal integer such that $\gamma_{1}^{\prime}$ is contained in $a_{1} b_{1} \ldots a_{r} b_{r}$. The last edge of $\gamma_{1}^{\prime}$ is either contained in $a_{r}$ or in $b_{r}$. In the first case, for every $i \in\{1, \ldots, k\}$, either $b_{i}$ is contained in $\gamma_{1}^{\prime}$ or $b_{i} \cap \gamma_{1}^{\prime}$ is at most a point. In the second case, it is possible that $b_{r} \cap \gamma_{1}^{\prime} \neq b_{r}$ and that $b_{r} \cap \gamma_{1}^{\prime}$ contains an edge. Let $\alpha^{\prime}$ be the (possibly trivial) terminal segment of $\gamma_{1}^{+}$which is properly contained in a splitting unit $\sigma$ of $b_{r}$. If $\sigma$ is a maximal taken connecting path in a zero stratum, then, by the choice of $K$, we have $\ell_{\exp }\left(\alpha^{\prime}\right) \leqslant \ell\left(\alpha^{\prime}\right) \leqslant \ell(\sigma) \leqslant \frac{K}{2} \leqslant \frac{C}{2}$. Suppose that $\sigma$ is a concatenation of paths in $G_{P G}$ and $\mathcal{N}_{P G}$. Then $\alpha^{\prime}$ has a decomposition $\alpha^{\prime}=\beta_{1} \alpha_{1} \beta_{1} \ldots \alpha_{\ell-1} \beta_{\ell} \alpha_{\ell}$, where for every $i \in\{1, \ldots, \ell\}$, the path $\beta_{i}$ is contained in $G_{P G}$, for every $i \in\{1, \ldots, \ell-1\}$, the path $\alpha_{i}$ is contained in $\mathcal{N}_{P G}^{\max }(\sigma)$ and $\alpha_{\ell}$ is a subpath of a path in $\mathcal{N}_{P G}^{\max }(\sigma)$. By the choice of $K$, we have $\ell_{\text {exp }}\left(\alpha^{\prime}\right) \leqslant \ell\left(\alpha_{\ell}\right) \leqslant \frac{K}{2} \leqslant \frac{C}{2}$. Since $\ell_{\exp }\left(\gamma_{1}^{+}\right) \geqslant 2 C$, there exists a $P G$-relative complete factor $\alpha_{0}$ of $b_{r}$ such that $\gamma_{1}^{+}=\delta_{s+1} \ldots \delta_{s^{\prime}} a_{t+1} b_{t+1} \ldots a_{r} \alpha_{0} \alpha^{\prime}=\alpha \alpha^{\prime}$ and

$$
\sum_{i=1}^{k} \ell_{\exp }\left(\alpha \cap b_{i}\right) \geqslant C .
$$

We now prove that every $P G$-relative complete factor of $\gamma_{1}$ contained in $\gamma_{1}^{-}$is a $P G$ relative complete factor of $\gamma$. Note that the decomposition $\gamma_{1}^{-} \alpha$ is a splitting. Thus, it suffices to prove that, for every $k \in \mathbb{N}^{*}$, the path $\left[f^{k}\left(\gamma_{1}^{-}\right)\right]$is contained in $\left[f^{k}(\gamma)\right]$ as any
identification in order to obtain $\left[f^{k}(\gamma)\right]$ which involves a path in $f^{k}\left(\gamma_{1}^{-}\right)$will be induced by an identification in order to obtain $\left[f^{k}\left(\gamma_{1}^{-}\right)\right]$from $f^{k}\left(\gamma_{1}^{-}\right)$. By Lemma 5.7 applied to $\delta_{s+1}, \ldots, \delta_{s^{\prime}}$, to the paths $b_{i}$ with $i \in\{1, \ldots, k\}$ such that $b_{i} \subseteq \alpha$ and to $\alpha_{0}$, we have

$$
\begin{aligned}
\sum_{i=1}^{k} \ell_{\exp }\left([f(\alpha)] \cap\left[f\left(b_{i}\right)\right]\right) & \geqslant \sum_{i=s+1}^{s^{\prime}} \ell_{\exp }\left(\left[f\left(\delta_{i}\right)\right]\right)+\sum_{i=t+1}^{r-1} \ell_{\exp }\left(\left[f\left(b_{i}\right)\right]\right)+\ell_{\exp }\left(\left[f\left(\alpha_{0}\right)\right]\right) \\
& \geqslant 3 \sum_{i=1}^{k} \ell_{\exp }\left(\alpha \cap b_{i}\right) \geqslant 3 C,
\end{aligned}
$$

where the first inequality follows from the fact that the decomposition

$$
\alpha=\delta_{s+1} \ldots \delta_{s^{\prime}} a_{t+1} b_{t+1} \ldots a_{r} \alpha_{0}
$$

is an optimal splitting of $\alpha$. Note that, since the decomposition $\gamma_{1}^{-} \alpha$ is a splitting, for every $k \in \mathbb{N}^{*}$, the path $\left[f^{k}(\alpha)\right]$ is contained in [ $\left.f^{k}\left(\gamma_{1}^{-} \alpha\right)\right]$. Remark that Lemma 4.9 implies that the segment of $\left[f\left(\gamma_{1}^{-} \alpha\right)\right]$ which is $C$ away from the concatenation point between $\left[f\left(\gamma_{1}^{-} \alpha\right)\right]$ and $\left[f\left(\alpha^{\prime} \gamma_{2}^{\prime}\right)\right]$ remains in $[f([\gamma])]$. In particular, the edges of $\left[f\left(\gamma_{1}^{-} \alpha\right)\right]$ which are cancelled with edges of $\left[f\left(\alpha^{\prime} \gamma_{2}^{\prime}\right)\right]$ are contained in $[f(\alpha)]$. Recall that $\sum_{i=1}^{k} \ell_{\text {exp }}([f(\alpha)] \cap$ $\left.\left[f\left(b_{i}\right)\right]\right) \geqslant 3 C$ and that the subpath of $[f(\alpha)]$ which is contained in $[f([\gamma])]$ is obtained by the concatenation of at most $C$ edges of $[f(\alpha)]$. Thus, we see that the sum over $i$ of the exponential length of the subpaths of $[f(\alpha)] \cap\left[f\left(b_{i}\right)\right]$ which are contained in [ $f([\gamma])]$ is at least equal to $2 C$. Hence the path $\left[f\left(\gamma_{1}^{-}\right)\right]$is a subpath of $[f([\gamma])]$ and $\sum_{i=1}^{k} \ell_{\text {exp }}\left(\left[f\left(\gamma_{1}^{+}\right)\right] \cap\left[f\left(b_{i}\right)\right] \cap[f([\gamma])]\right) \geqslant 2 C$. Thus, we can apply the same arguments to show that for every $k \geqslant 1$, the path $\left[f^{k}\left(\gamma_{1}^{-}\right)\right]$is contained in $\left[f^{k}([\gamma])\right]$ and the exponential length of the subpath of $\left[f^{k}(\alpha)\right]$ contained in $\left[f^{k}([\gamma])\right]$ is at least equal to $2 C$. Hence every $P G$-relative complete factor of the path $\gamma_{1}$ contained in $\gamma_{1}^{-}$is a complete factor of an optimal splitting of $[\gamma]$.

Lemma 5.10. (1) Let $\gamma=\alpha \beta$ be a reduced path. Let $N \in \mathbb{N}^{*}$ be such that $\left[f^{N}(\alpha)\right]$ has a $P G$-relative complete splitting and that $\left[f^{N}(\beta)\right]$ is a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$. For every $m \geqslant N$, let $\alpha_{m}, \beta_{m}$ and $\sigma_{m}$ be paths such that $\left[f^{m}(\alpha)\right]=$ $\alpha_{m} \sigma_{m}$ and $\left[f^{m}(\beta)\right]=\sigma_{m}^{-1} \beta_{m}$. For every $m \geqslant N$, we have $\ell_{\text {exp }}\left(\sigma_{m}\right) \leqslant C$, $\ell_{\text {exp }}\left(\alpha_{m}\right) \geqslant$ $\ell_{\text {exp }}\left(\left[f^{m}(\alpha)\right]\right)-C$ and $\ell_{\text {exp }}\left(\beta_{m}\right) \leqslant C$.
(2) Let $\gamma=\beta^{(1)} \alpha \beta^{(2)}$ be a reduced path. Let $N \in \mathbb{N}^{*}$ be such that $\left[f^{N}(\alpha)\right]$ has a $P G$ relative complete splitting and, for every $i \in\{1,2\}$, the path $\left[f^{N}\left(\beta^{(i)}\right)\right]$ is a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$. For every $m \geqslant N$, let $\alpha_{m}, \beta_{m}^{(1)}, \beta_{m}^{(2)}$, and $\sigma_{m}^{(1)}, \sigma_{m}^{(2)}$ be paths such that $\left[f^{m}(\alpha)\right]=\sigma_{m}^{(1)} \alpha_{m} \sigma_{m}^{(2)},\left[f^{m}\left(\beta^{(1)}\right)\right]=\beta_{m}^{(1)} \sigma_{m}^{(1)-1}$ and $\left[f^{m}\left(\beta^{(2)}\right)\right]=$ $\sigma_{m}^{(2)-1} \beta_{m}$. For every $m \geqslant N$, either $\ell_{\exp }\left(\alpha_{m}\right) \leqslant 2 C$ or we have $\ell_{\exp }\left(\sigma_{m}^{(1)}\right), \ell_{\text {exp }}\left(\sigma_{m}^{(2)}\right) \leqslant C$, $\ell_{\text {exp }}\left(\alpha_{m}\right) \geqslant \ell_{\text {exp }}\left(\left[f^{m}(\alpha)\right]\right)-2 C$ and $\ell_{\text {exp }}\left(\beta_{m}^{(1)}\right), \ell_{\text {exp }}\left(\beta_{m}^{(2)}\right) \leqslant C$.

Proof. The proof of Assertion (2) follows from Assertion (1) by applying Assertion (1) twice: one with $\gamma=\alpha \beta^{(2)}$ and one with $\gamma=\alpha^{-1} \beta^{(1)}$. If for some $m \in \mathbb{N}^{*}, \ell_{\text {exp }}\left(\alpha_{m}\right) \geqslant 2 C$, there is no identification between $\left[f^{m}\left(\beta^{(1)}\right)\right]$ and $\left[f^{m}\left(\beta^{(2)}\right)\right]$, so Assertion (2) follows from Assertion (1). Therefore, we focus on the proof of Assertion (1). Let $m \geqslant N$. When $\sigma_{m}$ is reduced to a point, we have $\ell_{\text {exp }}\left(\alpha_{m}\right)=\ell_{\text {exp }}\left(\left[f^{m}(\alpha)\right]\right)$ and $\ell_{\text {exp }}\left(\beta_{m}\right)=\ell_{\text {exp }}\left(\left[f^{m}(\beta)\right]\right)=0$
by Lemma 3.17. This concludes the proof in this case. So we may suppose that $\sigma_{m}$ is nontrivial. Let $\left[f^{m}(\alpha)\right]=a_{1} \ldots a_{k}$ be a $P G$-relative complete splitting of $\left[f^{m}(\alpha)\right]$. Suppose that, for every $i \in\{1, \ldots, k\}$ such that $a_{i}$ is a concatenation of paths in $G_{P G}$ and $\mathcal{N}_{P G}$, the path $a_{i}$ is a maximal subpath of $\left[f^{m}(\alpha)\right]$ for the property of being a factor which is a concatenation of paths in $G_{P G}$ and $\mathcal{N}_{P G}$. For every $j \in\{1, \ldots, k\}$, let $r_{j}$ be the height of $a_{j}$. Let $i \in\{1, \ldots, k\}$ be such that $a_{i}$ contains the first edge of $\sigma_{m}$. Let $\sigma^{\prime} \in \mathcal{N}_{P G}^{\max }\left(\sigma_{m}\right)$. Note that there exists $\sigma^{\prime \prime} \in \mathcal{N}_{P G}^{\max }\left(\left[f^{m}(\alpha)\right]\right)$ such that $\sigma^{\prime} \subseteq \sigma^{\prime \prime}$. By Lemma 3.20 (1) applied to $\sigma^{\prime \prime}$ and $\left[f^{m}(\alpha)\right]$, the path $\sigma^{\prime \prime}$ is contained in a factor which is a concatenation of paths in $G_{P G}$ and $\mathcal{N}_{P G}$. By the maximality assumption, there exists $j \in\{1, \ldots, k\}$ such that $\sigma^{\prime} \subseteq \sigma^{\prime \prime} \subseteq a_{j}$. Hence we can compute $\ell_{\exp }\left(\sigma_{m}\right)$ by removing, for every $j \in\{1, \ldots, k\}$, paths in the intersection $\sigma_{m} \cap a_{j}$. Thus, we have,

$$
\ell_{\exp }\left(\sigma_{m}\right)=\sum_{j>i} \ell_{\exp }\left(a_{j}\right)+\ell_{\exp }\left(a_{i} \cap \sigma_{m}\right) .
$$

Note that, by Lemma 3.9, the path $\left[f^{m}(\beta)\right]=\sigma_{m}^{-1} \beta_{m}$ is a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$. Let $j \in\{i, \ldots, k\}$.
Claim. If $j>i$, then either $a_{j}$ is not an edge in an EG stratum and $\ell_{\text {exp }}\left(a_{j} \cap \sigma_{m}\right)=0$, or $\ell_{\text {exp }}\left(\left(a_{i} \ldots a_{j}\right) \cap \sigma_{m}\right) \leqslant C$. If $j=i$, then $\ell_{\text {exp }}\left(a_{j} \cap \sigma_{m}\right) \leqslant C$.
Proof. We distinguish several cases, according to the nature of $a_{j}$.
(i) Suppose that $a_{j}$ is maximal taken connecting path in a zero stratum. By definition we have $\ell_{\text {exp }}\left(a_{j} \cap \sigma_{m}\right)=0$.
(ii) Suppose that $a_{j}$ is a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$. If $j>i$, we have $a_{j} \cap \sigma_{m}=a_{j}$. By Lemma 3.17 applied to $a_{j}$, we have $\ell_{\text {exp }}\left(a_{j} \cap \sigma_{m}\right)=0$. Suppose that $i=j$. Suppose that the first edge of $\sigma_{m}$ is not contained in a path in $\mathcal{N}_{P G}^{\max }\left(a_{i}\right)$. Then $a_{i}$ has a decomposition $a_{i}=a_{i}^{0} a_{i}^{1} a_{i}^{2}$ where $a_{i}^{1}$ is a path contained in $G_{P G}$ such that the first edge of $\sigma_{m}$ is contained in $a_{i}^{1}$ and such that, for every path $\delta \in \mathcal{N}_{P G}^{\max }\left(a_{i}\right)$, either $\delta \subseteq a_{i}^{0}$ or $\delta \subseteq a_{i}^{2}$. Note that a terminal segment of $a_{i}$ whose first edge is contained in $a_{i}^{1}$ is a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$. In particular, the path $a_{i} \cap \sigma_{m}$ is a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$. By Lemma 3.17 applied to $a_{i} \cap \sigma_{m}$, we have $\ell_{\text {exp }}\left(a_{i} \cap \sigma_{m}\right)=0$. Suppose now that the first edge of $\sigma_{m}$ is contained in a path $\delta \in \mathcal{N}_{P G}^{\max }\left(a_{i}\right)$. Then $a_{i}$ has a decomposition $a_{i}^{1} \delta a_{i}^{2}$, where the first edge of $\sigma_{m}$ is contained in $\delta$. Note that $a_{i}^{2}$ is a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$ which is contained in $\sigma_{m}$. By Lemma 3.16 applied to $a_{i} \cap \sigma_{m}=\left(\delta \cap \sigma_{m}\right) a_{i}^{2}$, by Lemma 3.17 applied to $a_{i}^{2}$ and by definition of the constant $K$, we have

$$
\ell_{\text {exp }}\left(\sigma_{m} \cap a_{i}\right) \leqslant \ell_{\exp }\left(\sigma_{m} \cap \delta\right)+\ell_{\exp }\left(a_{i}^{2}\right)=\ell_{\exp }\left(\delta \cap \sigma_{m}\right) \leqslant \ell(\delta) \leqslant K \leqslant C .
$$

(iii) Suppose that $a_{j}$ is an edge in an irreducible stratum with positive exponential length. Since $\left[f^{m}(\beta)\right]$ is a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$, there exists a path $\gamma^{\prime} \in \mathcal{N}_{P G}^{\max }\left(\left[f^{m}(\beta)\right]\right)$ such that $a_{j}$ is contained in $\gamma^{\prime}$. By Lemma 3.20 (1), every path in $\mathcal{N}_{P G}^{\max }\left(\left[f^{m}(\alpha)\right]\right)$ is contained in a minimal factor of $\left[f^{m}(\alpha)\right]$ consisting in $P G$ relative splitting units which are concatenation of paths in $G_{P G}$ and $\mathcal{N}_{P G}$. Since $a_{j}$ is a $P G$-relative splitting unit of $\left[f^{m}(\alpha)\right]$ which is not a concatenation of paths in $G_{P G}$ and
in $\mathcal{N}_{P G}$, the path $a_{j}$ is not contained in a path of $\mathcal{N}_{P G}^{\max }\left(\left[f^{m}(\alpha)\right]\right)$. Hence the path $\gamma^{\prime}$ is not contained in $\sigma_{m}$ as otherwise it would be contained in a path of $\mathcal{N}_{P G}^{\max }\left(\left[f^{m}(\alpha)\right]\right)$. Therefore, we see that $\left(a_{i} \ldots a_{j}\right) \cap \sigma_{m} \subseteq \gamma^{\prime}$. Hence, by the choice of $K$, we have

$$
\ell_{\exp }\left(\left(a_{i} \ldots a_{j}\right) \cap \sigma_{m}\right) \leqslant \ell\left(\left(a_{i} \ldots a_{j}\right) \cap \sigma_{m}\right) \leqslant \ell\left(\gamma^{\prime}\right) \leqslant C
$$

This proves the claim as we considered all possible $P G$-relative splitting units.
Let $m \in \mathbb{N}^{*}$. By the claim, either $\ell_{\exp }\left(\left(a_{i} \ldots a_{j}\right) \cap \sigma_{m}\right) \leqslant C$ or, for every $j>i$, we have $\ell_{\text {exp }}\left(a_{j} \cap \sigma_{m}\right)=0$. In the second case, we have

$$
\ell_{\exp }\left(\sigma_{m}\right)=\sum_{j>i} \ell_{\exp }\left(a_{j}\right)+\ell_{\exp }\left(a_{i} \cap \sigma_{m}\right)=\ell_{\exp }\left(a_{i} \cap \sigma_{m}\right) \leqslant C
$$

where the las inequality follows from the case $j=i$ of the claim. Hence, for every $m \in \mathbb{N}^{*}$, we have $\ell_{\text {exp }}\left(\sigma_{m}\right) \leqslant C$. Note that, by Lemma 3.16 applied to $\left[f^{m}(\alpha)\right]=\alpha_{m} \sigma_{m}$, we have

$$
\ell_{\exp }\left(\alpha_{m}\right) \geqslant \ell_{\exp }\left(\left[f^{m}(\alpha)\right]\right)-\ell_{\exp }\left(\sigma_{m}\right) \geqslant \ell_{\exp }\left(\left[f^{m}(\alpha)\right]\right)-C .
$$

It remains to prove that $\ell_{\text {exp }}\left(\beta_{m}\right) \leqslant C$. But $\beta_{m}$ can be written as $\beta_{m}=\delta_{1} \delta_{2}$ where $\delta_{2}$ is a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$ and $\delta_{1}$ is a (possibly trivial) path contained in a path of $\mathcal{N}_{P G}^{\max }\left(\left[f^{m}(\beta)\right]\right)$. By Lemma 3.17 applied to $\delta_{2}$ and by the choice of $K$ (since $\delta_{1}$ is a subpath of a path in $\mathcal{N}_{P G}$ ), we have

$$
\ell_{\exp }\left(\beta_{m}\right) \leqslant \ell_{e x p}\left(\delta_{1}\right)+\ell_{\exp }\left(\delta_{2}\right)=\ell_{\exp }\left(\delta_{1}\right) \leqslant \ell\left(\delta_{1}\right) \leqslant C
$$

This concludes the proof.
Lemma 5.11. Let $L \geqslant 1$. There exists $n_{0}=n_{0}(L) \in \mathbb{N}^{*}$ which satisfies the following properties. Let $\gamma$ be a reduced edge path of $G$ such that $\ell_{\exp }(\gamma) \leqslant L$. For every $n \geqslant n_{0}$ and every optimal splitting of $\left[f^{n}(\gamma)\right]$, either $\left[f^{n}(\gamma)\right]$ is a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$ or the following two assertions hold:
(a) the path $\left[f^{n}(\gamma)\right]$ contains a complete factor of exponential length at least equal to $10 C$;
(b) the exponential length of an incomplete factor of $\left[f^{n}(\gamma)\right]$ is at most equal to $8 C$.

Proof. By Lemma 3.21, there exists an integer $m^{\prime} \in \mathbb{N}^{*}$ depending only on $f$ such that for every edge $e$ of $\overline{G-G_{P G}^{\prime}}$ and every $n \geqslant m^{\prime}$, we have $\ell_{\exp }\left[f^{n}(e)\right] \geqslant 16 C+1$. Let $\gamma=\gamma_{0} \gamma_{1}^{\prime} \gamma_{1} \ldots \gamma_{\ell} \gamma_{\ell}^{\prime}$ be the exponential decomposition of $\gamma$. Let

$$
\gamma=\beta_{0} \alpha_{1} \beta_{1} \ldots \alpha_{k} \beta_{k}
$$

be a nontrivial decomposition of $\gamma$ such that, for every $i \in\{0, \ldots, k\}$, the path $\beta_{i}$ is a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$ and for every $i \in\{1, \ldots, k\}$, the path $\alpha_{i}$ is a concatenation of edges in irreducible strata not contained in some $\gamma_{j}$ with $j \in\{0, \ldots, \ell\}$ and paths in zero strata. The main point of the proof is to show that, up to applying
an iterate of $[f]$, there is no cancellation between the subpaths $\alpha_{i}$. By definition of the exponential length, for every $i \in\{1, \ldots, k\}$, we have $\ell_{\text {exp }}(\gamma)=\sum_{i=1}^{k} \ell_{\text {exp }}\left(\alpha_{i}\right)$. Therefore, since $\ell_{\text {exp }}(\gamma) \leqslant L$, for every $i \in\{1, \ldots, k\}$, we have $\ell_{\text {exp }}\left(\alpha_{i}\right) \leqslant L$. Note that, for every $i \in\{1, \ldots, k\}$, we have $\ell_{\exp }\left(\alpha_{i}\right)=\ell\left(\alpha_{i}\right)-\ell\left(\alpha_{i} \cap \mathcal{Z}\right)$ where $\mathcal{Z}$ is the subgraph of $G$ consisting in all zero strata. By the choice of $C$ the length of every path contained in a zero stratum is at most equal to $C$. Hence for every $i \in\{1, \ldots, k\}$, we have $\ell\left(\alpha_{i}\right) \leqslant C L$. By Proposition [2.5 (8) there exists $m^{\prime \prime} \in \mathbb{N}^{*}$ depending only on $L$ such that, for all $i \in\{1, \ldots, k\}$ and $m \geqslant m^{\prime \prime}$, the path $\left[f^{m}\left(\alpha_{i}\right)\right]$ is completely split. Let $m=m^{\prime}+m^{\prime \prime}$. By Lemma 3.20 (2), for every $n \geqslant m$ and every $i \in\{1, \ldots, k\}$, since $\left[f^{n-m^{\prime}}\left(\alpha_{i}\right)\right]$ is completely split, one compute its exponential length by adding the exponential length of all its splitting units. Thus, if $\left[f^{n-m^{\prime}}\left(\alpha_{i}\right)\right.$ ] contains a splitting unit which is an edge $e$ in $\overline{G-G_{P G}^{\prime}}$, we have

$$
\begin{equation*}
\ell_{\exp }\left(\left[f^{n}\left(\alpha_{i}\right)\right]\right) \geqslant \ell_{\exp }\left(\left[f^{m^{\prime}}(e)\right]\right) \geqslant 16 C+1 \tag{8}
\end{equation*}
$$

Let $C_{m}$ be a bounded cancellation constant for $f^{m}$ given by Lemma 4.9, Note that, if there exists $i \in\{1, \ldots, k-1\}$ such that $\ell\left(\beta_{i}\right)<C_{m}$, then there might exist some identifications between $\left[f^{m}\left(\alpha_{i-1}\right)\right]$ and $\left[f^{m}\left(\alpha_{i}\right)\right]$ when reducing the paths in order to obtain $\left[f^{m}(\gamma)\right]$. This is why we replace the decomposition $\gamma=\beta_{0} \alpha_{1} \beta_{1} \ldots \alpha_{k} \beta_{k}$ of $\gamma$ by a new one. This new decompostion is defined as follows. Since every lift of $f^{m}$ to the universal cover of $G$ is a quasi-isometry, there exists $M_{m}>0$ depending only on $m$ such that, for every reduced edge path of length $\ell(\beta)>M_{m}$, we have $\ell\left(\left[f^{m}(\beta)\right]\right) \geqslant 2 C_{m}+1$. Let $\Gamma_{m}=\left\{\beta_{i} \mid \ell\left(\beta_{i}\right) \leqslant M_{m}\right\}$. Note that $\left|\Gamma_{m}\right| \leqslant k+1$. Note that, by Lemma 2.9 and Proposition 2.5 (4) and Lemma [2.9, for every $i \in\{1, \ldots, k\}$, if $\beta_{i-1}$ or $\beta_{i}$ is not trivial, then $\alpha_{i}$ is not contained in a zero stratum. In particuliar, we may suppose that, for every $i \in\{1, \ldots, k\}$, we have $\ell_{\text {exp }}\left(\alpha_{i}\right)>0$. Thus, since $\ell_{\exp }(\gamma)=\sum_{i=1}^{k} \ell_{\text {exp }}\left(\alpha_{i}\right) \leqslant L$, and, for every $i \in\{1, \ldots, k\}$, we have $\ell_{\exp }\left(\alpha_{i}\right)>0$, we see that $k \leqslant L$. Hence we have $\left|\Gamma_{m}\right| \leqslant k+1 \leqslant L+1$.
Claim. There exist $m_{1} \geqslant m$ depending only on $\left|\Gamma_{m}\right|$ (and hence on $L$ ) and a decomposition $\gamma=\beta_{0}^{(1)} \alpha_{1}^{(1)} \beta_{1}^{(1)} \ldots \alpha_{k_{1}}^{(1)} \beta_{k_{1}}^{(1)}$ such that:
( $a^{\prime}$ ) for every $i \in\left\{1, \ldots, k_{1}\right\}$, the path $\left[f^{m_{1}}\left(\alpha_{i}^{(1)}\right)\right]$ is completely split;
( $b^{\prime}$ ) for every $i \in\left\{0, \ldots, k_{1}\right\}$, the path $\beta_{i}^{(1)}$ is a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$;
( $c^{\prime}$ ) for every $i \in\left\{0, \ldots, k_{1}\right\}$, the subpath of $\left[f^{m_{1}}\left(\beta_{i}^{(1)}\right)\right]$ contained in $\left[f^{m_{1}}(\gamma)\right]$ is not reduced to a point;
( $d^{\prime}$ ) for every $i \in\left\{1, \ldots, k_{1}\right\}$, for every $n \geqslant m^{\prime}$, if $\left[f^{n-m^{\prime}}\left(\alpha_{i}^{(1)}\right)\right]$ contains a splitting unit which is an edge in $\overline{G-G_{P G}^{\prime}}$ then $\ell_{\exp }\left(\left[f^{n}\left(\alpha_{i}^{(1)}\right)\right]\right) \geqslant 16 C+1$.
Proof. The proof is by induction on $\left|\Gamma_{m}\right|$. Suppose first that $\Gamma_{m}=\varnothing$. By the definition of $\left|\Gamma_{m}\right|$ and $M_{m}$, for every $i \in\{0, \ldots, k\}$, the path $\left[f^{m}\left(\beta_{i}\right)\right]$ has length at least equal to $2 C_{m}+1$. By Lemma 4.9, for every $i \in\{0, \ldots, k\}$, the subpath of $\left[f^{m}\left(\beta_{i}\right)\right]$ contained in $\left[f^{m}(\gamma)\right]$ is not reduced to a point. So the integer $m_{1}=m$ and the decomposition $\gamma=\beta_{0} \alpha_{1} \beta_{1} \ldots \alpha_{k} \beta_{k}$ satisfy the assertions of the claim (Assertion ( $d^{\prime}$ ) follows from Equation (8)).

Suppose now that $\Gamma_{m} \neq \varnothing$. Then

$$
\sum_{i=1}^{k} \ell\left(\alpha_{i}\right)+\sum_{\beta_{i} \in \Gamma_{m}} \ell\left(\beta_{i}\right) \leqslant k C L+M_{m} L \leqslant C L^{2}+M_{m} L
$$

Let $m_{2}^{\prime} \geqslant m$ be such that for every path $\beta$ of length at most equal to $C L^{2}+M_{m} L$ and every $n \geqslant m_{2}^{\prime}$, the path $\left[f^{n}(\beta)\right]$ is completely split. Then $\gamma$ has a decomposition $\gamma=\beta_{0}^{(2)} \alpha_{1}^{(2)} \beta_{2}^{(2)} \ldots \alpha_{k_{2}}^{(2)} \beta_{k_{2}}^{(2)}$ such that, for every $i \in\left\{1, \ldots, k_{2}\right\}$, the path $\left[f^{m_{2}^{\prime}}\left(\alpha_{i}^{(2)}\right)\right]$ is completely split and for every $i \in\left\{0, \ldots, k_{2}\right\}$, the path $\beta_{i}^{(2)}$ is a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$ of length greater than $M_{m}$. Let $m_{2}=m_{2}^{\prime}+m^{\prime}$. Then for every $i \in\left\{1, \ldots, k_{2}\right\}$, the paths $\left[f^{m_{2}}\left(\alpha_{i}^{(2)}\right)\right]$ and $\left[f^{m_{2}-m^{\prime}}\left(\alpha_{i}^{(2)}\right)\right]$ are completely split. Moreover, if $\left[f^{m_{2}-m^{\prime}}\left(\alpha_{i}^{(2)}\right)\right]$ contains a splitting unit which is an edge in $\overline{G-G_{P G}^{\prime}}$, then $\ell_{\exp }\left(\left[f^{m}\left(\alpha_{i}^{(2)}\right)\right]\right) \geqslant 16 C+1$ as in Equation (8). Let $C_{m_{2}}$ be a bounded cancellation constant associated with $f^{m_{2}}$ and let $M_{m_{2}} \geqslant M_{m}$ be such that, for every reduced edge path of length $\ell(\beta)>M_{m_{2}}$, we have $\ell\left(\left[f^{m_{1}}(\beta)\right]\right) \geqslant 2 C_{m_{2}}+1$. Let $\Gamma_{m_{2}}=\left\{\beta_{i}^{(2)} \mid \ell\left(\beta_{i}\right) \leqslant\right.$ $\left.M_{m_{2}}\right\}$. Note that $\left|\Gamma_{m_{2}}\right|<\left|\Gamma_{m}\right|$. Hence we can apply the induction hypothesis to the decomposition $\gamma=\beta_{0}^{(2)} \alpha_{1}^{(2)} \beta_{2}^{(2)} \ldots \alpha_{k_{2}}^{(2)} \beta_{k_{2}}^{(2)}$ to obtain the desired decomposition of $\gamma$. This concludes the proof of the claim.

Let $m_{1}$ and $\gamma=\beta_{0}^{(1)} \alpha_{1}^{(1)} \beta_{1}^{(1)} \ldots \alpha_{k_{1}}^{(1)} \beta_{k_{1}}^{(1)}$ be as in the assertion of the claim. By Assertion $\left(c^{\prime}\right)$ of the claim, for every $i \in\left\{1, \ldots, k_{1}\right\}$, there is no identification between edges of $\left[f^{m_{1}}\left(\alpha_{i}^{(1)}\right)\right]$, $\left[f^{m_{1}}\left(\alpha_{i-1}^{(1)}\right)\right]$ and $\left[f^{m_{1}}\left(\alpha_{i+1}^{(1)}\right)\right]$ when reducing in order to obtain $\left[f^{m_{1}}(\gamma)\right]$.

For every $i \in\left\{1, \ldots, k_{1}\right\}$, since $\left[f^{m_{1}}\left(\alpha_{i}^{(1)}\right)\right]$ is $P G$-relative completely split, we can distinguish three possible cases for $\left[f^{m_{1}}\left(\alpha_{i}^{(1)}\right)\right]$ :
(i) the path $\left[f^{m_{1}}\left(\alpha_{i}^{(1)}\right)\right]$ contains a $P G$-relative splitting unit which is an edge in $\overline{G-G_{P G}^{\prime}}$ (by Lemma 3.23 this case happens exactly when $\left.\ell_{\exp }\left(\left[f^{m_{1}}\left(\alpha_{i}^{(1)}\right)\right]\right)>0\right)$;
(ii) $\ell_{\exp }\left(\left[f^{m_{1}}\left(\alpha_{i}^{(1)}\right)\right]\right)=0$ and the path $\left[f^{m_{1}}\left(\alpha_{i}^{(1)}\right)\right]$ is a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$;
(iii) $\ell_{\exp }\left(\left[f^{m_{1}}\left(\alpha_{i}^{(1)}\right)\right]\right)=0$ and $\left[f^{m_{1}}\left(\alpha_{i}^{(1)}\right)\right]$ contains a maximal taken connecting path in a zero stratum.

We claim that if there exists $i \in\left\{1, \ldots, k_{1}\right\}$ such that $\left[f^{m_{1}}\left(\alpha_{i}^{(1)}\right)\right]$ satisfies $(i i i)$, then $\left[f^{m_{1}}(\gamma)\right]$ is contained in a zero stratum. Indeed, suppose that $\left[f^{m_{1}}\left(\alpha_{i}^{(1)}\right)\right]$ satisfies (iii). By Lemma 3.23 applied to the $P G$-relative completely split edge path [ $f^{m_{1}}\left(\alpha_{i}^{(1)}\right)$ ], since $\ell_{\exp }\left(\left[f^{m_{1}}\left(\alpha_{i}^{(1)}\right)\right]\right)=0$ the path $\left[f^{m_{1}}\left(\alpha_{i}^{(1)}\right)\right]$ does not contain an edge in $\overline{G-G_{P G}^{\prime}}$. Therefore, the path $\left[f^{m_{1}}\left(\alpha_{i}^{(1)}\right)\right]$ is a concatenation of paths in $G_{P G}^{\prime}$ and in $\mathcal{N}_{P G}$. By Proposition 2.5 (4) and Lemma 2.9, there is no path in a zero stratum which is adjacent to a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$. Hence $\left[f^{m_{1}}\left(\alpha_{i}^{(1)}\right)\right]=\sigma$, where $\sigma$ is a maximal taken connecting path in a zero stratum not contained in $G_{P G}$. But the
endpoints of $\sigma$ are the endpoints of $\left[f^{m_{1}}\left(\beta_{i-1}^{(1)}\right)\right]$ and $\left[f^{m_{1}}\left(\beta_{i}^{(1)}\right)\right]$, which are concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$. As above, this implies that $\left[f^{m_{1}}(\gamma)\right]=\sigma$. Since zero strata are contractible, there exists $m_{3} \in \mathbb{N}^{*}$ such that $\left[f^{m_{3}}(\gamma)\right]$ is $P G$-relative completely split. Hence Assertion (b) of Lemma 5.11 follows. Applying a further power of [f] (which can be chosen uniformly as there are finitely many reduced edge paths contained in a zero stratum), there exists $m_{4} \in \mathbb{N}^{*}$ such that $\left[f^{m_{4}}(\gamma)\right]$ is a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$ or it satisfies Assertion (a) of Lemma 5.11. This concludes the proof of Lemma 5.11 in case (iii).

Hence we may suppose that for every $i \in\left\{1, \ldots, k_{1}\right\}$, the path $\left[f^{m_{1}}\left(\alpha_{i}^{(1)}\right)\right]$ satisfies either $(i)$ or $(i i)$. Note that, if $i \in\left\{1, \ldots, k_{1}\right\}$ is such that the path $\left[f^{m_{1}}\left(\alpha_{i}^{(1)}\right)\right]$ satisfies $(i)$, then $\left[f^{m_{1}}\left(\alpha_{i}^{(1)}\right)\right.$ ] also satisfies the hypothesis of Assertion $\left(d^{\prime}\right)$ of the claim. Thus

$$
\ell_{\exp }\left(\left[f^{m_{1}+m^{\prime}}\left(\alpha_{i}^{(1)}\right)\right]\right) \geqslant 16 C+1
$$

Let $m_{1}^{\prime}=m_{1}+m^{\prime}$ and let $n^{\prime} \geqslant m_{1}^{\prime}$. Let $\Lambda_{\text {exp }}=\left\{\alpha_{i}^{(1)} \mid \ell_{\exp }\left(\left[f^{n^{\prime}}\left(\alpha_{i}^{(1)}\right)\right]\right) \geqslant 16 C+\right.$ $1\}$. For every $j \in\left\{1, \ldots, k_{1}\right\}$ and every $n \in \mathbb{N}^{*}$, let $\alpha_{j}^{(n)}$ be the subpath of $\left[f^{n}\left(\alpha_{j}^{(1)}\right)\right]$ contained in $\left[f^{n}(\gamma)\right]$. For every $j \in\left\{0, \ldots, k_{1}\right\}$ and every $n \in \mathbb{N}^{*}$, let $\beta_{j}^{(n)}$ be the subpath of $\left[f^{n}\left(\beta_{j}^{(1)}\right)\right]$ contained in $\left[f^{n}(\gamma)\right]$. Suppose first that $\Lambda_{\text {exp }}$ is not empty and let $\alpha_{i}^{(1)} \in \Lambda_{\text {exp }}$. By Lemma 5.10 (2) applied to $\beta^{(1)}=\left[f^{n^{\prime}}\left(\beta_{i-1}^{(1)}\right)\right], \alpha=\left[f^{n^{\prime}}\left(\alpha_{i}^{(1)}\right)\right]$ and $\beta^{(2)}=\left[f^{n^{\prime}}\left(\beta_{i}^{(1)}\right)\right]$, we have $\ell_{\exp }\left(\alpha_{i}^{\left(n^{\prime}\right)}\right) \geqslant 14 C+1$. By Remark $5.9(2)$ applied twice (once with $\gamma_{1}=\left[f^{n^{\prime}}\left(\alpha_{i}^{(1)}\right)\right]$ and $\gamma_{2}=\left[f^{n^{\prime}}\left(\beta_{i}^{(1)} \ldots \alpha_{k_{1}}^{(1)} \beta_{k_{1}}^{(1)}\right)\right]$, and once with $\gamma_{1}=\left[f^{n^{\prime}}\left(\alpha_{i}^{(1)}\right)\right]^{-1}$ and $\left.\gamma_{2}=\left[f^{n^{\prime}}\left(\beta_{0}^{(1)} \ldots \alpha_{i-1}^{(1)} \beta_{i-1}^{(1)}\right)\right]^{-1}\right)$, the path $\alpha_{i}^{\left(n^{\prime}\right)}$ contains a complete factor of $\left[f^{n^{\prime}}(\gamma)\right]$ of exponential length at least equal to $14 C+1-4 C=10 C+1$. This proves Assertion $(a)$ of Lemma 5.11. Moreover, Remark 5.9 (2) implies that the intersection of an incomplete factor of $\left[f^{n^{\prime}}(\gamma)\right]$ with $\alpha_{i}^{\left(n^{\prime}\right)}$ is contained in the union of an initial and a terminal segment of $\alpha_{i}^{\left(n^{\prime}\right)}$ of exponential lengths at most $2 C$. For every $i \in\left\{1, \ldots, k_{1}\right\}$ such that $\alpha_{i}^{(1)} \in \Lambda_{\text {exp }}$, let $\tau_{i}^{1}$ be the maximal initial segment of $\alpha_{i}^{\left(n^{\prime}\right)}$ of exponential length equal to $2 C$ and let $\tau_{i}^{2}$ be the maximal terminal segment of $\alpha_{i}^{\left(n^{\prime}\right)}$ of exponential length equal to $2 C$.

We now prove Assertion (b) of Lemma 5.11. Suppose that there exists $i \in\left\{1, \ldots, k_{1}\right\}$ such that $\alpha_{i}^{(1)} \notin \Lambda_{e x p}$, so that in particular $\left[f^{m_{1}}\left(\alpha_{i}^{(1)}\right)\right]$ does not satisfy $(i)$. Then $\left[f^{m_{1}}\left(\alpha_{i}^{(1)}\right)\right]$ satisfies $(i i)$ and is a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$. By Lemma 3.9 (3), the path $\left[f^{n^{\prime}}\left(\alpha_{i}^{(1)}\right)\right]$ is a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$. By Lemma 3.5, the path $\left[\left[f^{n^{\prime}}\left(\beta_{i-1}^{(1)}\right)\right]\left[f^{n^{\prime}}\left(\alpha_{i}^{(1)}\right)\right]\left[f^{n^{\prime}}\left(\beta_{i}^{(1)}\right)\right]\right]$ is a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$. Thus, the path $\beta_{i-1}^{\left(n^{\prime}\right)} \alpha_{i}^{\left(n^{\prime}\right)} \beta_{i}^{\left(n^{\prime}\right)}$ is a subpath of a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$. Hence $\left[f^{n^{\prime}}(\gamma)\right]$ has a decomposition

$$
\left[f^{n^{\prime}}(\gamma)\right]=\epsilon_{1} \alpha_{1}^{\left(n^{\prime},+\right)} \epsilon_{2} \ldots \alpha_{k_{2}}^{\left(n^{\prime},+\right)} \epsilon_{k_{2}}
$$

where for every $j \in\left\{1, \ldots, k_{2}\right\}$, the path $\alpha_{j}^{\left(n^{\prime},+\right)}$ is in $\Lambda_{\text {exp }}$ and for every $j \in\left\{0, \ldots, k_{2}\right\}$, the path $\epsilon_{j}$ is contained in a path $\iota_{j}$ which is a concatenation of paths in $G_{P G}$ and in
$\mathcal{N}_{P G}$. Hence, for every $j \in\left\{0, \ldots, k_{2}\right\}$, we have $\ell_{\exp }\left(\iota_{j}\right)=0$ by Lemma 3.17 and, by Lemma 5.6, we have $\ell_{\exp }\left(\epsilon_{j}\right) \leqslant 2 C$.

If $\gamma^{\prime}$ is an incomplete factor of $\left[f^{n^{\prime}}(\gamma)\right]$, as explained above, there exists $i \in\left\{1, \ldots, k_{2}\right\}$ such that $\gamma^{\prime}$ is contained in $\tau_{i-1}^{2} \epsilon_{i-1} \tau_{i}^{1}$. By Lemma 5.6, we have

$$
\ell_{\exp }\left(\gamma^{\prime}\right) \leqslant \ell_{\exp }\left(\tau_{i-1}^{2} \epsilon_{i-1} \tau_{i}^{1}\right)+2 C .
$$

By Lemma 3.16, the exponential length of $\gamma^{\prime}$ is at most equal to

$$
\ell_{\exp }\left(\tau_{i-1}^{2}\right)+\ell_{\exp }\left(\epsilon_{i-1}\right)+\ell_{\exp }\left(\tau_{i}^{1}\right)+2 C \leqslant 6 C+\ell_{\exp }\left(\epsilon_{i-1}\right) \leqslant 8 C
$$

This proves (b).
Finally, suppose that $\Lambda_{\text {exp }}$ is empty. For every $j \in\left\{1, \ldots, k_{1}\right\}$, the path $\left[f^{m_{1}}\left(\alpha_{j}^{(1)}\right)\right]$ is a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$. By Lemma 3.5, the path [ $\left.f^{m_{1}}(\gamma)\right]$ is a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$. By Lemma 3.9, for every $n^{\prime} \geqslant m_{1}$, the path [ $f^{n^{\prime}}(\gamma)$ ] is a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$. This concludes the proof.

Lemma 5.12. Let $f: G \rightarrow G$ be a $3 K$-expanding $C T$ map. There exists $N \in \mathbb{N}^{*}$ such that for every reduced edge path $\gamma$ and every $m \geqslant N$, the total exponential length of incomplete factors in any optimal splitting of $\left[f^{m}(\gamma)\right]$ is uniformly bounded by $8 C \ell_{\text {exp }}(\gamma)$.

Proof. By Proposition $2.5(8)$, there exists $N \in \mathbb{N}^{*}$ such that, for every reduced edge path $\alpha$ of length at most equal to $C+1$, the path $\left[f^{N}(\alpha)\right]$ is completely split. Suppose first that $\ell_{\text {exp }}(\gamma)=0$. Then, by definition of the exponential length, the path $\gamma$ is a concatenation of paths in $G_{P G}^{\prime}$ and in $\mathcal{N}_{P G}$. By Proposition 2.5 (4), every edge in a zero stratum is adjacent to either an edge in a zero stratum or an edge in an EG stratum. Moreover, by Lemma 2.9, there does not exist a subpath of $\gamma$ contained in a zero stratum which is adjacent to a Nielsen path. Hence $\gamma$ is either a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$ or a path in a zero stratum. In the first case, the path $\gamma$ is $P G$-relative completely split. In the second case, by the definition of the constant $K$ and Equation (7), we have $\ell(\gamma) \leqslant K \leqslant C$. By the choice of $N$, for every $m \geqslant N$, the path [ $f^{m}(\gamma)$ ] is completely split. By Lemma 3.19, for every $m \geqslant N$, the path $\left[f^{m}(\gamma)\right]$ is $P G$-relative completely split. By Lemma 3.17, for every $m \geqslant N$, we have $\ell_{\exp }\left(\left[f^{m}(\gamma)\right]\right)=0$.

So we may suppose that $\ell_{\exp }(\gamma)>0$. Let $\gamma=\gamma_{0} \gamma_{1}^{\prime} \gamma_{1} \ldots \gamma_{\ell} \gamma_{\ell}^{\prime}$ be the exponential decomposition of $\gamma$ (see the beginning of Section (3.2). By Lemma 2.9, there does not exist a subpath of $\gamma$ contained in a zero stratum which is adjacent to a Nielsen path. Therefore, the path $\gamma$ has a decomposition $\alpha_{0} \beta_{1} \alpha_{1} \ldots \beta_{k} \alpha_{k}$ where, for every $i \in\{0, \ldots, k\}$, the path $\alpha_{i}$ is a (possibly trivial) concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$ and, for every $i \in\{1, \ldots, k\}$, the path $\beta_{i}$ is a concatenation of a (possibly trivial) maximal reduced path in a zero stratum and an edge in an irreducible stratum not contained in $G_{P G}$ or in some $\gamma_{i}$. By construction of $K$, for every $i \in\{1, \ldots, k\}$, we have $\ell\left(\beta_{i}\right) \leqslant C+1$. By the choice of $N$, for every $m \geqslant N$, the path $\left[f^{m}\left(\beta_{i}\right)\right]$ is completely split. Note that, for every $i \in\{1, \ldots, k\}$, we have $\ell_{\exp }\left(\beta_{i}\right)=1$ and that

$$
\ell_{\exp }(\gamma)=\sum_{i=1}^{k} \ell_{\exp }\left(\beta_{i}\right)=k
$$

By Lemma 3.9, for every $i \in\{0, \ldots, k\}$ and every $m \geqslant M$, the path $\left[f^{m}\left(\alpha_{i}\right)\right]$ is a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$. By Lemma 3.17, for every $m \geqslant M$, we have $\ell_{\text {exp }}\left(\left[f^{m}\left(\alpha_{i}\right)\right]\right)=0$. By Lemma [5.6, the exponential length of the subpath of $\left[f^{m}\left(\alpha_{i}\right)\right]$ contained in $\left[f^{m}(\gamma)\right]$ is at most equal to $2 C$. For every $i \in\{0, \ldots, k\}$ (resp. $i \in\{1, \ldots, k\}$ ) and every $m \geqslant N$, let $\alpha_{i, m}$ (resp. $\beta_{i, m}$ ) be the subpath of $\left[f^{m}\left(\alpha_{i}\right)\right]$ (resp. $\left[f^{m}\left(\beta_{i}\right)\right]$ ) contained in $\left[f^{m}(\gamma)\right]$. By Remark 5.9 (2), for every $i \in\{1, \ldots, k\}$ and every $m \geqslant N$, the exponential length of any incomplete factor in $\beta_{i, m}$ is at most equal to $4 C$. By Lemma 3.16, for every $m \geqslant N$, the sum of the exponential lengths of the incomplete factors in $\left[f^{m}(\gamma)\right]$ is at most equal to

$$
\sum_{i=0}^{k} \ell_{\exp }\left(\alpha_{i, m}\right)+4 C k \leqslant 2 C(k+1)+4 k C \leqslant 4 C k+4 C k=8 C k=8 C \ell_{\exp }(\gamma)
$$

The conclusion of the lemma follows.
Lemma 5.13. Let $f: G \rightarrow G$ be a $3 K$-expanding $C T$ map. Let $\gamma$ be a reduced edge path in $G$. Suppose that $\gamma$ has a splitting $\gamma=b_{1} a b_{2}$ where, for every $i \in\{1,2\}$, the path $b_{i}$ is a possibly trivial $P G$-relative completely split. If $\ell_{\text {exp }}^{\gamma}(a)=0$ then $\ell_{\text {exp }}(a)=0$.

Proof. Let $\gamma=\gamma_{0} \gamma_{1}^{\prime} \gamma_{1} \ldots \gamma_{k} \gamma_{k}^{\prime}$ be the exponential decomposition of $\gamma$. By Lemma 5.6, there exist three (possibly trivial) paths $\delta_{1}, \delta_{2}$ and $\tau$ such that for every $i \in\{1,2\}$, the path $\delta_{i}$ is a proper initial or terminal subpath of a splitting unit of some $\gamma_{j}$, we have $\ell_{\text {exp }}(\tau)=\ell_{\text {exp }}^{\gamma}(\tau)=\ell_{\text {exp }}^{\gamma}(a)$ and $a=\delta_{1} \tau \delta_{2}$. Since $\ell_{\text {exp }}^{\gamma}(a)=0$, we have $\ell_{\text {exp }}(\tau)=0$. Hence $\tau$ is a concatenation of paths in $G_{P G}^{\prime}$ and in $\mathcal{N}_{P G}$. By Proposition 2.5 (4), every edge in a zero stratum is adjacent to either an edge in a zero stratum or an edge in an EG stratum. Moreover, by Lemma 2.9, there does not exist a subpath of $\gamma$ contained in a zero stratum which is adjacent to a Nielsen path. Hence $\tau$ is either a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$ or a path in a zero stratum. If $\tau$ is contained in a zero stratum, by Lemma [2.9, we see that $\delta_{1}$ and $\delta_{2}$ are trivial, that is, $a=\tau$. Thus, we have $\ell_{\text {exp }}(a)=\ell_{\text {exp }}(\tau)=0$.

So we may suppose that $\tau$ is a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$. Suppose towards a contradiction that there exists $i \in\{1,2\}$ such that $\delta_{i}$ is not trivial. For every $i \in\{1,2\}$ such that $\delta_{i} \neq \varnothing$, let $\sigma_{i}$ be the splitting unit of some $\gamma_{j}$ containing $\delta_{i}$ and let $r_{i}$ be the height of $\sigma_{i}$. By [BH, Lemma 5.11], for every $i \in\{1,2\}$ such that $\delta_{i}$ is not trivial, there exist two distinct $r_{i}$-legal paths $\alpha_{i}$ and $\beta_{i}$ such that $\sigma_{i}=\alpha_{i} \beta_{i}$ and such that the turn $\left\{D f\left(\alpha_{i}^{-1}\right), D f\left(\beta_{i}\right)\right\}$ is the only height $r_{i}$ illegal turn. Moreover, there exists a path $\tau_{i}^{\prime}$ such that $\left[f\left(\alpha_{i}\right)\right]=\alpha_{i} \tau_{i}^{\prime}$ and $\left[f\left(\beta_{i}\right)\right]=\tau_{i}^{\prime-1} \beta_{i}$. Let $\epsilon_{1}^{(1)}, \epsilon_{1}^{(2)}$ be two paths such that $\sigma_{1}=\epsilon_{1}^{(1)} \epsilon_{1}^{(2)}$, the path $\epsilon_{1}^{(1)}$ is contained in $b_{1}$ and the path $\epsilon_{1}^{(2)}$ is contained in $a$. Similarly, let $\epsilon_{2}^{(1)}, \epsilon_{2}^{(2)}$ be two paths such that $\sigma_{2}=\epsilon_{2}^{(1)} \epsilon_{2}^{(2)}$, the path $\epsilon_{2}^{(2)}$ is contained in $b_{2}$ and the path $\epsilon_{2}^{(1)}$ is contained in $a$.
Claim. (1) For every path $b \in \mathcal{N}_{P G}^{\max }\left(b_{1}\right)$ (resp. $b \in \mathcal{N}_{P G}^{\max }\left(b_{2}\right)$ ), the path $b$ does not contain edges of $\epsilon_{1}^{(1)}$ (resp. $\epsilon_{2}^{(2)}$ ).
(2) The path $\epsilon_{1}^{(1)}$ is $r_{1}$-legal and the path $\epsilon_{2}^{(2)}$ is $r_{2}$-legal.

Proof. We prove the claim for $b_{1}$, the proof for $b_{2}$ being similar.
(1) Let $b \in \mathcal{N}_{P G}^{\max }\left(b_{1}\right)$. There exists $c \in \mathcal{N}_{P G}^{\max }(\gamma)$ such that $b \subseteq c$. Moreover, by Lemma 3.4 (3) applied to $\gamma^{\prime}=b$ and $\gamma=c$, either $b$ is a concatenation of splitting units of $c$, or $b$ is properly contained in a splitting unit of $c$ and is not an initial or a terminal segment of $c$. Since $b_{1}$ is an initial segment of $\gamma$, the second case cannot occur. Hence $b$ is a concatenation of splitting units of $c$. Since $\sigma_{1}$ is not contained in $b_{1}$, the path $b$ cannot contain edges of $\sigma_{1}$. Since $\epsilon_{1}^{(1)} \subseteq \sigma_{1}$, the path $b$ cannot contain edges of $\epsilon_{1}^{(1)}$.
(2) Suppose towards a contradiction that $\epsilon_{1}^{(1)}$ is not $r_{1}$-legal. Then it contains the illegal turn $\left\{D f\left(\alpha_{1}^{-1}\right), D f\left(\beta_{2}\right)\right\}$. Recall that the path $b_{1}$ is $P G$-relative completely split. By the description of $P G$-relative splitting units, the illegal turn must be contained in a $P G$-relative splitting unit of $b_{1}$ which is a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$. Since the last edge of $\alpha_{1}$ is an edge in an EG stratum, the last edge of $\alpha_{1}$ must be contained in a path contained in $\mathcal{N}_{P G}$. Hence $\epsilon_{1}$ intersects a path in $\mathcal{N}_{P G}^{\max }\left(b_{1}\right)$. This contradicts Assertion (1).

By Assertion (2) of the claim, for every $i \in\{1,2\}$ such that $\sigma_{i}$ is not trivial, the path $\epsilon_{i}^{(i)}$ is $r_{i}$-legal. Moreover, by Assertion (1) of the claim an INP contained in $b_{i}$ cannot intersect the path $\epsilon_{i}^{(i)}$. Since the paths $b_{1}$ and $b_{2}$ are $P G$-relative completely split, the paths $b_{1}$ and $b_{2}$ split respectively at the origin of $\epsilon_{1}^{(1)}$ and at the end of $\epsilon_{2}^{(2)}$. So we may suppose that $b_{1}=\epsilon_{1}^{(1)}$ and $b_{2}=\epsilon_{2}^{(2)}$. Therefore, there exists a (possibly trivial) path $\tau_{1}$ such that, up to taking a power of $f$ so that the length of $\left[f\left(b_{1}\right)\right]$ is greater than $\alpha_{1}$, we have $\left[f\left(b_{1}\right)\right]=\alpha_{1} \tau_{1}$ and $\left[f\left(\epsilon_{1}^{(2)}\right)\right]=\tau_{1}^{-1} \beta_{1}$. Similarly, there exists a path $\tau_{2}$ such that $\left[f\left(\epsilon_{2}^{(1)}\right)\right]=\alpha_{2} \tau_{2}$ and $\left[f\left(b_{2}\right)\right]=\tau_{2}^{-1} \beta_{2}$.

Since $\gamma$ splits at the concatenation points of $b_{1}, a$ and $b_{2}$, the paths $\tau_{1}^{-1}$ and $\tau_{2}$ contained in $\left[f\left(\epsilon_{1}^{(2)}\right)\right][f(\tau)]\left[f\left(\epsilon_{2}^{(1)}\right)\right]$ must be identified when passing to $[f(a)]$. Suppose first that $[f(\tau)]$ is a point. Then since the EG INPs $\sigma_{1}$ and $\sigma_{2}$ are uniquely determined by their initial and terminal edges by Proposition 2.5 (9), we see that $\sigma_{1}=\sigma_{2}^{-1}$. But then there are some identifications between $b_{1}$ and $b_{2}$, which contradicts the fact that $b_{1} a b_{2}$ is a splitting.

Thus, we may suppose that $[f(\tau)]$ is nontrivial. By Lemma 3.9, since $\tau$ is a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$ so is $[f(\tau)]$. Note that, since an EG INP is completely determined by its initial and terminal edges by Proposition 2.5 (9), if $[f(\tau)]$ contains the initial or the terminal edge of an EG INP $\sigma$, then $\sigma$ is contained in $[f(\tau)]$. Note that there are identifications between edges of $\left[f\left(\epsilon_{1}^{(2)}\right)\right]$ and $[f(\tau)]$ or between edges of $[f(\tau)]$ and $\left[f\left(\epsilon_{2}^{(1)}\right)\right]$. Therefore, $[f(\tau)]$ starts with $\sigma_{1}^{-1}$ or $[f(\tau)]$ ends with $\sigma_{2}^{-1}$. Thus, one of the following holds:
(a) $[f(\tau)]=\sigma_{1}^{-1} \tau^{\prime}$ with $\tau^{\prime}$ a (possibly trivial) path which is a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$ which does not end by $\sigma_{2}^{-1}$;
(b) $[f(\tau)]=\tau^{\prime} \sigma_{2}^{-1}$ with $\tau^{\prime}$ a (possibly trivial) path which is a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$ which does not start by $\sigma_{1}^{-1}$;
(c) $[f(\tau)]=\sigma_{1}^{-1} \tau^{\prime} \sigma_{2}^{-1}$ with $\tau^{\prime}$ a (possibly trivial) path.

Note that $\sigma_{1}^{-1} \tau^{\prime} \sigma_{2}^{-1}$ is reduced, so that there is no identification between $\alpha_{1}^{-1}$ and $\tau^{\prime}$ and between $\tau^{\prime}$ and $\beta_{2}^{-1}$. Let $e_{\sigma_{1}}$ be the terminal edge of $\sigma_{1}$ and let $e_{\sigma_{2}}$ be the initial edge of $\sigma_{2}$. By Proposition 2.5 (9), both $e_{\sigma_{1}}$ and $e_{\sigma_{2}}$ are edges in EG strata. Since $f$ is $3 K$-expanding, for every $i \in\{1,2\}$, the path $\left[f\left(e_{\sigma_{i}}\right)\right]$ has length at least equal to $3 K$. Recall that, for every $i \in\{1,2\}$, by definition of $K$, we have $\ell\left(\sigma_{i}\right) \leqslant K$, so that $\ell\left(\alpha_{i}\right), \ell\left(\beta_{i}\right) \leqslant K$. Since $\left[f\left(\epsilon_{1}^{(2)}\right)\right]=\alpha_{1} \tau_{1}$ and $\left[f\left(\epsilon_{2}^{(1)}\right)\right]=\alpha_{2} \tau_{2}$, the path $\left[f\left(e_{\sigma_{1}}\right)\right]$ contains a nondegenerate terminal segment of $\tau_{1}^{-1}$ and the path $\left[f\left(e_{\sigma_{2}}\right)\right]$ contains a nondegenerate initial segment of length $2 K$ of $\tau_{2}$. As $e_{\sigma_{1}}$ is $r_{1}$-legal and as $f$ is a relative train track by Proposition [2.5 (1), we see that the last edge of $\tau_{1}^{-1}$ is not the last edge of $\alpha_{1}$. Similarly, the first edge of $\tau_{2}$ is not the first edge of $\beta_{2}$. Therefore, we have $\left[\tau_{1}^{-1} \beta_{1} \sigma_{1}^{-1}\right]=\tau_{1}^{-1} \alpha_{1}^{-1}$ and $\left[\sigma_{2}^{-1} \alpha_{2} \tau_{2}\right]=\beta_{2}^{-1} \tau_{2}$. Thus we have

$$
\left[\left[f\left(\epsilon_{1}^{(2)}\right)\right][f(\tau)]\left[f\left(\epsilon_{2}^{(1)}\right)\right]\right]=\left[\tau_{1}^{-1} \beta_{1} \sigma_{1}^{-1} \tau^{\prime} \sigma_{2}^{-1} \alpha_{2} \tau_{2}\right]=\left[\tau_{1}^{-1} \alpha_{1}^{-1} \tau^{\prime} \beta_{2}^{-1} \tau_{2}\right]
$$

and there is no identification between $\tau_{1}^{-1}$ and $\alpha_{1}^{-1}, \alpha_{1}^{-1}$ and $\tau^{\prime}, \tau^{\prime}$ and $\beta_{2}^{-1}$ and $\beta_{2}^{-1}$ and $\tau_{2}$. Therefore, if $\tau^{\prime}$ is not trivial, then we have a contradiction as $\tau_{1}^{-1}$ and $\tau_{2}$ are not identified in $[f(a)]$. Suppose that $\tau^{\prime}$ is trivial. Then the paths $\tau_{1}^{-1}$ and $\tau_{2}$ are identified in $[f(a)]$ only if a terminal segment of $\alpha_{1}^{-1}$ is identified with an initial segment of $\beta_{2}^{-1}$. Since EG INP are uniquely determined by their initial and terminal edges by Proposition 2.5 (9), we see that $\sigma_{1}=\sigma_{2}^{-1}$. Hence $\alpha_{1}^{-1}=\beta_{2}$ and either $\tau_{1}^{-1}$ is an initial segment of $\tau_{2}^{-1}$ or $\tau_{2}$ is an initial segment of $\tau_{1}$. Up to changing the orientation of $\gamma$, we may suppose that $\tau_{1}^{-1}$ is an initial segment of $\tau_{2}^{-1}$. If $\tau_{1}^{-1}=\tau_{2}^{-1}$, then $[f(a)]$ is a vertex. Moreover, as $\sigma_{1}=\sigma_{2}^{-1}$, the segment $b_{1}=\epsilon_{1}^{(1)}$ is equal to $b_{2}^{-1}$. Therefore, a terminal segment of $b_{1}$ is identified with an initial segment of $b_{2}$, a contradiction. If $\tau_{1}^{-1}$ is a proper initial segment of $\tau_{2}^{-1}$, then $\tau_{2}$ is identified with edges in $b_{1}$, a contradiction. As we have considered every case, we see that $\delta_{1}$ and $\delta_{2}$ are trivial and $\ell_{\exp }(a)=\ell_{\exp }(\tau)=0$.

Lemma 5.14. Let $f: G \rightarrow G$ be a $3 K$-expanding $C T$ map. There exists $n_{0} \in \mathbb{N}^{*}$ such that for every $n \geqslant n_{0}$, and every closed reduced edge path $\gamma$ of $G$, we have the following relation between the goodness of $\gamma$ and the one of $\left[f^{n}(\gamma)\right]$ :

$$
\mathfrak{g}\left(\left[f^{n}(\gamma)\right]\right) \geqslant \mathfrak{g}(\gamma)
$$

Proof. By Lemma 3.22, there exists $N_{0} \in \mathbb{N}^{*}$ such that, for every $n \geqslant N_{0}$ and every $P G$ relative splitting unit $\sigma$, the exponential length of the path $\left[f^{n}(\sigma)\right]$ is at least equal to the one of $\sigma$. By Lemma 5.12, there exists $N_{1}$ such that for every $n \geqslant N_{1}$ and every closed reduced edge path $\gamma$ of $G$, the total exponential length of incomplete segments in any optimal splitting of $\left[f^{n}(\gamma)\right]$ is bounded by $8 C \ell_{\exp }(\gamma)$. Let $N_{2}=\left\lceil\log _{3}\left(10 C+16 C^{2}\right)\right\rceil \in \mathbb{N}^{*}$ be such that for every $x, y \geqslant 0$ such that $(x, y) \neq(0,0)$, we have

$$
\frac{\left(3^{N_{2}}-2 C\right) x}{\left(3^{N_{2}}-2 C\right) x+8 C(1+2 C) y} \geqslant \frac{x}{x+y}
$$

Let $n_{0}=\max \left\{N_{0}, N_{1}, N_{2}\right\}$.
Let $\gamma$ be a closed reduced edge path in $G$. All splittings of $\gamma$ are circuital splittings in what follows. Let $\gamma=\alpha_{0} \beta_{1} \alpha_{1} \ldots \beta_{k} \alpha_{k}$ be an optimal splitting of $\gamma$, where for every $i \in\{0, \ldots, k\}$, the path $\alpha_{i}$ is an incomplete factor of $\gamma$ and for every $i \in\{1, \ldots, k\}$, the path $\beta_{i}$ is a $P G$-relative complete factor of $\gamma$. First note that, for every $i \in\{1, \ldots, k\}$, and for every $n \geqslant 1$, the path $\left[f^{n}\left(\beta_{i}\right)\right]$ is $P G$-relative completely split by Proposition [2.5 (6) and Lemma 3.9. Therefore, if $n \geqslant n_{0} \geqslant N_{0}$, the total exponential length of such $P G$ relative complete segments is nondecreasing under $\left[f^{n}\right]$. We now distinguish two cases, according to the growth of the paths $\beta_{i}$.

Suppose first that for every $i \in\{1, \ldots, k\}$, the exponential length of $\beta_{i}$ relative to $\gamma$ is equal to zero. Since the splitting $\gamma=\alpha_{0} \beta_{1} \alpha_{1} \ldots \beta_{k} \alpha_{k}$ is optimal and since for every $i \in\{1, \ldots, k\}$, we have $\ell_{\text {exp }}^{\gamma}\left(\beta_{i}\right)=0$, we have $\mathfrak{g}(\gamma)=0$. Therefore, for every $n \in \mathbb{N}^{*}$, we have $\mathfrak{g}\left(\left[f^{n}(\gamma)\right]\right) \geqslant \mathfrak{g}(\gamma)$.

Suppose now that there exists $i \in\{1, \ldots, k\}$ such that the exponential length of $\beta_{i}$ relative to $\gamma$ is positive. By Lemma 3.21, the sequence $\left(\ell_{\exp }\left(\left[f^{n}\left(\beta_{i}\right)\right]\right)\right)_{n \in \mathbb{N}^{*}}$ grows exponentially with $n$. We can now modify the splitting of $\gamma$ into the following splitting: $\gamma=\alpha_{0}^{\prime} \beta_{1}^{\prime} \alpha_{1}^{\prime} \ldots \beta_{m}^{\prime} \alpha_{m}^{\prime}$ where:
(a) for every $j \in\{0, \ldots, m\}$, the path $\alpha_{i}^{\prime}$ is a concatenation of incomplete factors and complete factors of zero exponential length relative to $\gamma$ of the previous splitting;
(b) for every $j \in\{1, \ldots, m\}$, the path $\beta_{i}^{\prime}$ is a complete factor of positive exponential length relative to $\gamma$ of the previous splitting.

Note that, by definition of the exponential length relative to $\gamma$, for every $i \in\{1, \ldots, m\}$ and every path $\gamma^{\prime} \in \mathcal{N}_{P G}^{\max }(\gamma)$, the path $\beta_{i}^{\prime}$ is not contained in $\gamma^{\prime}$. Therefore, if there exists $j \in\{0, \ldots, m\}$ and $\gamma^{\prime} \in \mathcal{N}_{P G}^{\max }(\gamma)$ such that $\alpha_{j}^{\prime}$ intersects $\gamma^{\prime}$ nontrivially, then $\gamma^{\prime}$ is contained in $\beta_{j-1}^{\prime} \alpha_{j}^{\prime} \beta_{j}^{\prime}$. In particular, Lemma 5.13 applies and for every $j \in\{0, \ldots, m\}$, if $\ell_{\text {exp }}^{\gamma}\left(\alpha_{j}^{\prime}\right)=0$, then $\ell_{\text {exp }}\left(\alpha_{j}^{\prime}\right)=0$. Let $\Lambda$ be the subset of $\{0, \ldots, m\}$ such that for every $j \in \Lambda$, we have $\ell_{e x p}^{\gamma}\left(\alpha_{j}^{\prime}\right)>0$.

By Lemma 5.6 and Lemma 5.7, for every $j \in\{1, \ldots, m\}$ and every $M \in \mathbb{N}^{*}$, we have

$$
\ell_{e x p}^{\left[f^{M}(\gamma)\right]}\left(\left[f^{M}\left(\beta_{i}^{\prime}\right)\right]\right) \geqslant \ell_{\exp }\left(\left[f^{M}\left(\beta_{i}^{\prime}\right)\right]\right)-2 C \geqslant 3^{M} \ell_{\exp }\left(\beta_{i}^{\prime}\right)-2 C^{\prime} \geqslant\left(3^{M}-2 C\right) \ell_{e x p}^{\gamma}\left(\beta_{i}^{\prime}\right)
$$

By Lemma 5.6, for every $j \in\{0, \ldots, m\}$, we have $\ell_{\text {exp }}^{\gamma}\left(\alpha_{j}^{\prime}\right) \leqslant \ell_{\text {exp }}\left(\alpha_{j}^{\prime}\right)$. Note that, for every $i \in\{1, \ldots, m\}$, and every $n \in \mathbb{N}^{*}$, the path $\left[f^{n}\left(\beta_{i}^{\prime}\right)\right]$ is $P G$-relative completely split. In particular, for every $n \in \mathbb{N}^{*}$, any incomplete factor of [ $f^{n}(\gamma)$ ] is contained in a reduced iterate of some $\alpha_{i}^{\prime}$. Thus, by Lemma 5.12, for every $n \geqslant n_{0} \geqslant N_{1}$, the total exponential length of incomplete segments in $\left[f^{n}(\gamma)\right]$ is bounded by $8 C \sum_{j=1}^{k} \ell_{\text {exp }}\left(\alpha_{j}^{\prime}\right)=$ $8 C \sum_{j \in \Lambda} \ell_{\exp }\left(\alpha_{j}^{\prime}\right)$. Note that the function

$$
x \mapsto \frac{x}{x+8 C \sum_{j \in \Lambda} \ell_{e x p}\left(\alpha_{j}^{\prime}\right)}
$$

is nondecreasing. Recall that, for every $n \in \mathbb{N}^{*}$, the goodness function is a supremum over splittings of $\left[f^{n}(\gamma)\right]$. Thus, by Lemma 5.4 , for every $n \geqslant n_{0}$, we have:

$$
\mathfrak{g}\left(\left[f^{n}(\gamma)\right]\right) \geqslant \frac{\left(3^{n}-2 C\right) \sum_{i=1}^{m} \ell_{e x p}^{\gamma}\left(\beta_{i}^{\prime}\right)}{\left(3^{n}-2 C\right) \sum_{i=1}^{m} \ell_{e x p}^{\gamma}\left(\beta_{i}^{\prime}\right)+8 C \sum_{j \in \Lambda} \ell_{\exp }\left(\alpha_{j}^{\prime}\right)} .
$$

By Lemma 5.6, we have

$$
8 C \sum_{j \in \Lambda} \ell_{e x p}\left(\alpha_{j}^{\prime}\right) \leqslant 8 C \sum_{j \in \Lambda}\left(\ell_{e x p}^{\gamma}\left(\alpha_{j}^{\prime}\right)+2 C\right) \leqslant 8 C(1+2 C) \sum_{j \in \Lambda} \ell_{e x p}^{\gamma}\left(\alpha_{j}^{\prime}\right)
$$

where the last inequality follows from the fact that, for every $j \in \Lambda$, we have $\ell_{e x p}^{\gamma}\left(\alpha_{j}^{\prime}\right) \geqslant 1$. Therefore, since $n_{0} \geqslant N_{2}$, for every $n \geqslant n_{0}$, we have:

$$
\frac{\left(3^{n}-2 C\right) \sum_{j=1}^{m} \ell_{e x p}^{\gamma}\left(\beta_{j}^{\prime}\right)}{\left(3^{n}-2 C\right) \sum_{j=1}^{m} \ell_{e x p}^{\gamma}\left(\beta_{j}^{\prime}\right)+8 C(1+2 C) \sum_{j \in \Lambda} \ell_{\exp }^{\gamma}\left(\alpha_{j}^{\prime}\right)} \geqslant \frac{\sum_{j=1}^{m} \ell_{e x p}^{\gamma}\left(\beta_{j}^{\prime}\right)}{\sum_{j=1}^{m} \ell_{e x p}^{\gamma}\left(\beta_{j}^{\prime}\right)+\sum_{j \in \Lambda} \ell_{e x p}^{\gamma}\left(\alpha_{j}^{\prime}\right)}
$$

By Lemma 5.3, we have

$$
\ell_{e x p}(\gamma)=\sum_{j=1}^{m} \ell_{e x p}^{\gamma}\left(\beta_{j}^{\prime}\right)+\sum_{j=0}^{m} \ell_{e x p}^{\gamma}\left(\alpha_{j}^{\prime}\right)=\sum_{j=1}^{m} \ell_{e x p}^{\gamma}\left(\beta_{j}^{\prime}\right)+\sum_{j \in \Lambda} \ell_{e x p}^{\gamma}\left(\alpha_{j}^{\prime}\right)
$$

Thus, we see that

$$
\frac{\sum_{j=1}^{m} \ell_{e x p}^{\gamma}\left(\beta_{j}^{\prime}\right)}{\sum_{j=1}^{m} \ell_{\exp }^{\gamma}\left(\beta_{j}^{\prime}\right)+\sum_{j \in \Lambda} \ell_{e x p}^{\gamma}\left(\alpha_{j}^{\prime}\right)}=\mathfrak{g}(\gamma),
$$

which gives the result.
Remark 5.15. In the next lemmas, we will adopt the following conventions.
Let $\phi \in \operatorname{Out}\left(F_{\mathrm{n}}, \mathcal{F}\right)$ be an almost atoroidal outer automorphism relative to $\mathcal{F}$. Let $f: G \rightarrow G$ be a CT map representing a power of $\phi$ with filtration

$$
\varnothing=G_{0} \subsetneq \ldots \subsetneq G_{k}=G
$$

Let $p \in\{1, \ldots, k-1\}$ be such that $\mathcal{F}\left(G_{p}\right)=\mathcal{F}$. By Lemma 3.21, up to taking a power of $f$, we may suppose that $f$ is $3 K$-expanding. By Lemma 5.14, up to passing to a power of $f$, we may suppose that for every closed reduced edge path $\gamma$ of $G$, we have $\mathfrak{g}([f(\gamma)]) \geqslant \mathfrak{g}(\gamma)$.

Lemma 5.16. Let $f: G \rightarrow G$ be as in Remark 5.15.
(1) For every $\delta>0$, there exists $m \in \mathbb{N}^{*}$ such that for every reduced edge path $\gamma$ such that $\mathfrak{g}(\gamma) \geqslant \delta$ and every $n \geqslant m$, the total exponential length relative to $\left[f^{n}(\gamma)\right]$ of complete factors in $\left[f^{n}(\gamma)\right]$ denoted by $T E L(n, \gamma)$ is at least

$$
T E L(n, \gamma) \geqslant \mathfrak{g}(\gamma) \ell_{\exp }(\gamma)\left(3^{n}-2 C\right)
$$

(2) For every $\delta>0$ and every $\epsilon>0$, there exists $m \in \mathbb{N}^{*}$ such that for every cyclically reduced circuit $\gamma$ such that $\ell_{\exp }(\gamma)>0, \mathfrak{g}(\gamma) \geqslant \delta$ and every $n \geqslant m$, we have $\mathfrak{g}\left(\left[f^{n}(\gamma)\right]\right) \geqslant$ $1-\epsilon$.

Proof. Let $\gamma=\alpha_{0} \beta_{1} \alpha_{1} \ldots \alpha_{k} \beta_{k}$ be an optimal splitting, where for every $i \in\{0, \ldots, k\}$, the path $\alpha_{i}$ is an incomplete factor of $\gamma$ and for every $i \in\{1, \ldots, k\}$, the path $\beta_{i}$ is a $P G$-relative complete factor of $\gamma$. We may assume that $\ell_{\exp }(\gamma)>0$, otherwise $\mathfrak{g}(\gamma)=0$ and the result is immediate. Note that, since $\mathfrak{g}(\gamma) \geqslant \delta>0$, there exists $i \in\{1, \ldots, k\}$ such that $\ell_{\text {exp }}^{\gamma}\left(\beta_{i}\right)>0$. Let $\Lambda_{\gamma}$ be the set consisting in all complete factors $\beta_{i}$ of $\gamma$ whose exponential length relative to $\gamma$ is positive. Let $\ell_{\text {exp }}^{\gamma}\left(\Lambda_{\gamma}\right)$ be the sum of the exponential lengths relative to $\gamma$ of all factors that belongs to $\Lambda_{\gamma}$. Note that

$$
\ell_{\text {exp }}^{\gamma}\left(\Lambda_{\gamma}\right)=\sum_{\beta_{i} \in \Lambda_{\gamma}} \ell_{\text {exp }}^{\gamma}\left(\beta_{i}\right)=\mathfrak{g}(\gamma) \ell_{\text {exp }}(\gamma) .
$$

Note that, for every $n \in \mathbb{N}^{*}$, the value $T E L(n, \gamma)$ is a supremum over all splittings of $\left[f^{n}(\gamma)\right]$. Thus, by Lemma 5.6 and Lemma 5.7, for every $n \in \mathbb{N}^{*}$, we have:

$$
T E L(n, \gamma) \geqslant \sum_{\beta_{i} \in \Lambda_{\gamma}} \ell_{\text {exp }}^{\left[f^{n}(\gamma)\right]}\left(\left[f^{n}\left(\beta_{i}\right)\right]\right) \geqslant\left(3^{n}-2 C\right) \ell_{\text {exp }}^{\gamma}\left(\Lambda_{\gamma}\right) \geqslant\left(3^{n}-2 C\right) \mathfrak{g}(\gamma) \ell_{\text {exp }}(\gamma) .
$$

This proves (1). We now prove (2). By Lemma 5.12, there exists $n_{0} \in \mathbb{N}^{*}$ such that for every $n \geqslant n_{0}$, the total exponential length of incomplete segments in $\left[f^{n}(\gamma)\right]$ is bounded by $8 C \ell_{\text {exp }}(\gamma)$. By Lemma [5.6, the total exponential length relative to $\gamma$ of incomplete segments in $\left[f^{n}(\gamma)\right]$ is hence bounded by $10 C \ell_{\exp }(\gamma)$. Note that, for every $n \in \mathbb{N}^{*}$, the value $\mathfrak{g}\left(\left[f^{n}(\gamma)\right]\right)$ is a supremum over all splittings of $\left[f^{n}(\gamma)\right]$. Thus, by Lemma 5.4, for every $n \geqslant n_{0}$, we have:

$$
\begin{aligned}
\mathfrak{g}\left(\left[f^{n}(\gamma)\right]\right) & \geqslant \frac{\mathfrak{g}(\gamma) \ell_{\exp }(\gamma)\left(3^{n}-2 C\right)}{10 C \ell_{\exp }(\gamma)+\mathfrak{g}(\gamma) \ell_{\exp }(\gamma)\left(3^{n}-2 C\right)} \\
& =\frac{\mathfrak{g}(\gamma)\left(3^{n}-2 C\right)}{10 C+\mathfrak{g}(\gamma)\left(3^{n}-2 C\right)} \geqslant \frac{\delta\left(3^{n}-2 C\right)}{10 C+\delta\left(3^{n}-2 C\right)} .
\end{aligned}
$$

The last term is independent of $\gamma$ and converges to 1 as $n$ goes to infinity. Therefore the conclusion of Lemma 5.16 holds for some $n$ large enough which does not depend on $\gamma$. This proves (2) and this concludes the proof.

### 5.2 North-South dynamics for a relative atoroidal outer automorphisms

Let $\mathrm{n} \geqslant 3$ and let $\mathcal{F}$ be a free factor system of $F_{\mathrm{n}}$. Let $\phi \in \operatorname{Out}\left(F_{\mathrm{n}}, \mathcal{F}\right)$ be an almost atoroidal automorphism relative to $\mathcal{F}$. In this subsection we prove Theorem 5.1. The proof of Theorem 5.1] is inspired by the proof of the same result due to Uyanik (Uya2) in the context of an atoroidal outer automorphism for $\operatorname{Out}\left(F_{\mathrm{n}}\right)$, that is, in the special case when $\mathcal{F}=\varnothing$. The proof relies on the study of splittings of reduced edge paths in the graph associated with a CT map representing a power of $\phi$. Indeed, we show that, when a cyclically reduced edge path representing $w \in F_{\mathrm{n}}$ has a splitting which is close to a complete splitting, then some iterate of $\phi$ sends $[w]$ into an open neighborhood of $\Delta_{+}(\phi)$ (see Definition 4.5), and this iterate can be chosen uniformly (see Lemma 5.20).

Let $\phi \in \operatorname{Out}\left(F_{\mathrm{n}}, \mathcal{F}\right)$ be an almost atoroidal outer automorphism which satisfies Definition $4.3(2)$. Let $\mathcal{F} \leqslant \mathcal{F}_{1} \leqslant \mathcal{F}_{2}=\left\{\left[F_{\mathrm{n}}\right]\right\}$ be a sequence of free factor system given in this definition. Let $f: G \rightarrow G$ be a CT map representing a power of $\phi$ with filtration $\varnothing=G_{0} \subsetneq G_{1} \subsetneq \ldots \subsetneq G_{k}=G$ and such that there exist $p$ and $i$ in $\{1, \ldots, k\}$ such that $\mathcal{F}\left(G_{p}\right)=\mathcal{F}$ and $\mathcal{F}\left(G_{i}\right)=\mathcal{F}_{1}$. We denote by $\operatorname{Curr}\left(\mathcal{F}_{1}, \mathcal{F}_{1} \wedge \mathcal{A}(\phi)\right)$ the set of currents of $\operatorname{Curr}\left(F_{\mathrm{n}}, \mathcal{F}_{1} \wedge \mathcal{A}(\phi)\right)$ whose support is contained in $\partial^{2} \mathcal{F}_{1}$. Note that, since the extension $\mathcal{F}_{1} \leqslant\left\{\left[F_{\mathrm{n}}\right]\right\}$ is sporadic, either $\mathcal{F}_{1}=\left\{\left[H_{1}\right],\left[H_{2}\right]\right\}$ or $\mathcal{F}_{1}=\{[H]\}$ for some subgroups $H_{1}, H_{2}$ of $F_{\mathrm{n}}$. Up to assuming that $H_{2}$ is the trivial group, we may assume that $\mathcal{F}_{1}=\left\{\left[H_{1}\right],\left[H_{2}\right]\right\}$. Moreover, we have $\mathcal{F}_{1} \wedge \mathcal{A}(\phi)=\left\{\left[A_{1}\right], \ldots,\left[A_{s}\right],\left[B_{1}\right], \ldots,\left[B_{t}\right]\right\}$ where, for every $j \in\{1, \ldots, s\}$, the group $A_{j}$ is contained in $H_{1}$ and for every $j \in\{1, \ldots, t\}$, the group $B_{j}$ is contained in $H_{2}$. Since $\mathcal{F}_{1} \wedge \mathcal{A}(\phi)$ is a malnormal subgroup system, the set $\left\{\left[A_{1}\right], \ldots,\left[A_{s}\right]\right\}$ is a malnormal subgroup system of $H_{1}$ and the set $\left\{\left[B_{1}\right], \ldots,\left[B_{t}\right]\right\}$ is a malnormal subgroup system of $H_{2}$.

Let

$$
X\left(\mathcal{F}_{1}\right)=\operatorname{Curr}\left(H_{1},\left\{\left[A_{1}\right], \ldots,\left[A_{s}\right]\right\}\right) \times \operatorname{Curr}\left(H_{2},\left\{\left[B_{1}\right], \ldots,\left[B_{t}\right]\right\}\right)
$$

Let $\mu \in \operatorname{Curr}\left(\mathcal{F}_{1}, \mathcal{F}_{1} \wedge \mathcal{A}(\phi)\right)$. We set $\psi_{1}(\mu)=\left(\left.\mu\right|_{\partial^{2} H_{1}},\left.\mu\right|_{\partial^{2} H_{2}}\right) \in X\left(\mathcal{F}_{1}\right)$. Since $\mu$ is $F_{\mathrm{n}^{-}}$ invariant, $\psi_{1}(\mu)$ does not depend on the choice of the representatives of the conjugacy classes of $H_{1}$ and $H_{2}$. Let $\left(\mu_{1}, \mu_{2}\right) \in X\left(\mathcal{F}_{1}\right)$. Since the subgroup system $\mathcal{F}_{1} \wedge \mathcal{A}(\phi)$ is malnormal, for every $j \in\{1,2\}$, the current $\mu_{j}$ can be extended in a canonical way to a current $\mu_{j}^{*} \in \operatorname{Curr}\left(F_{\mathrm{n}}, \mathcal{F}_{1} \wedge \mathcal{A}(\phi)\right)$. The current $\mu_{j}^{*}$ is such that, for every Borel subset $B$ of $\partial^{2}\left(F_{\mathrm{n}}, \mathcal{F}_{1} \wedge \mathcal{A}(\phi)\right)$, we have

$$
\mu_{j}^{*}(B)=\mu_{j}^{*}\left(B \cap \partial^{2} H_{j}\right)=\mu_{j}\left(B \cap \partial^{2} H_{j}\right)
$$

We set $\psi_{2}\left(\left(\mu_{1}, \mu_{2}\right)\right)=\mu_{1}^{*}+\mu_{2}^{*}$. By the property of $\mu_{j}^{*}$ described above, we see that $\psi_{2}\left(\left(\mu_{1}, \mu_{2}\right)\right) \in \operatorname{Curr}\left(\mathcal{F}_{1}, \mathcal{F}_{1} \wedge \mathcal{A}(\phi)\right)$. The maps $\psi_{1}$ and $\psi_{2}$ are clearly continuous.

Lemma 5.17. The space $\operatorname{Curr}\left(\mathcal{F}_{1}, \mathcal{F}_{1} \wedge \mathcal{A}(\phi)\right)$ is homeomorphic to $X\left(\mathcal{F}_{1}\right)$.
Proof. We prove that $\psi_{1}$ and $\psi_{2}$ are inverse from each other. Let $\mu \in \operatorname{Curr}\left(F_{\mathrm{n}}, \mathcal{F}_{1} \wedge \mathcal{A}(\phi)\right)$. Then $\psi_{2} \circ \psi_{1}(\mu)=\left(\left.\mu\right|_{\partial^{2} H_{1}}\right)^{*}+\left(\left.\mu\right|_{\partial^{2} H_{2}}\right)^{*}$. Note that $\mu$ and $\psi_{2} \circ \psi_{1}(\mu)$ coincide on Borel subsets contained in $\partial^{2} \mathcal{F}_{1}$. Since both have supports contained in $\partial^{2} \mathcal{F}_{1}$, they are equal. Conversely, let $\left(\mu_{1}, \mu_{2}\right) \in X\left(\mathcal{F}_{1}\right)$. Then

$$
\psi_{1} \circ \psi_{2}\left(\left(\mu_{1}, \mu_{2}\right)\right)=\left(\left.\left(\mu_{1}^{*}+\mu_{2}^{*}\right)\right|_{\partial^{2} H_{1}},\left.\left(\mu_{1}^{*}+\mu_{2}^{*}\right)\right|_{\partial^{2} H_{2}}\right)
$$

But $\left.\mu_{2}^{*}\right|_{\partial^{2} H_{1}}=0$ and $\left.\mu_{1}^{*}\right|_{\partial^{2} H_{2}}=0$. Hence we have

$$
\left(\left.\left(\mu_{1}^{*}+\mu_{2}^{*}\right)\right|_{\partial^{2} H_{1}},\left.\left(\mu_{1}^{*}+\mu_{2}^{*}\right)\right|_{\partial^{2} H_{2}}\right)=\left(\left.\mu_{1}^{*}\right|_{\partial^{2} H_{1}},\left.\mu_{2}^{*}\right|_{\partial^{2} H_{2}}\right)=\left(\mu_{1}, \mu_{2}\right) .
$$

This concludes the proof.
For every $\phi \in \operatorname{Out}\left(F_{\mathrm{n}}, \mathcal{F}\right)$, we refer to the definition of $\mathcal{P}(\mathcal{F} \wedge \mathcal{A}(\phi))$ given above Lemma 3.28 .

Lemma 5.18. Let $\mathrm{n} \geqslant 3$ and let $\mathcal{F}$ be a free factor system of $F_{\mathrm{n}}$. Let $\phi \in \operatorname{Out}\left(F_{\mathrm{n}}, \mathcal{F}\right)$ be an almost atoroidal outer automorphism which satisfies Definition 4.3 (2). Let $\mathcal{F} \leqslant \mathcal{F}_{1} \leqslant$ $\mathcal{F}_{2}=\left\{F_{\mathrm{n}}\right\}$ be a sequence of free factor systems given in this definition. Let $f: G \rightarrow G$ be a CT map representing a power of $\phi$ with filtration $\varnothing=G_{0} \subsetneq G_{1} \subsetneq \ldots \subsetneq G_{k}=G$ and such that there exist $p$ and $i$ in $\{0, \ldots, k-1\}$ such that $\mathcal{F}\left(G_{p}\right)=\mathcal{F}$ and $\mathcal{F}\left(G_{i}\right)=\mathcal{F}_{1}$.
(1) The graph $\overline{G-G_{i}}$ either is a topological arc whose endpoints are in $G_{i}$ or it retracts onto a circuit $C$ and there exists exactly one topological arc that connects $C$ and $G_{i}$.
(2) There do not exist an EG stratum or a zero stratum of height greater than i. If $\overline{G-G_{i}}$ is a topological arc, every edge in $\overline{G-G_{i}}$ is contained in $G_{P G}$. Otherwise every edge of the circuit $C$ in $\overline{G-G_{i}}$ is contained in $G_{P G}$.
(3) Let $\gamma$ be a path of $G_{i}$ which is not contained in a concatenation of paths of $G_{P G, \mathcal{F}_{1}}$ and $\mathcal{N}_{P G, \mathcal{F}_{1}}$. Then $\gamma$ is not contained in a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$.
(4) We have

$$
\partial^{2}\left(F_{\mathrm{n}}, \mathcal{F} \wedge \mathcal{A}(\phi)\right)=\bigcup_{\gamma \in \mathcal{P}\left(\mathcal{F}_{1} \wedge \mathcal{A}(\phi)\right)} C(\gamma)
$$

In particular, we have

$$
\mathbb{P} \operatorname{Curr}\left(F_{\mathrm{n}}, \mathcal{F} \wedge \mathcal{A}(\phi)\right)=\mathbb{P} \operatorname{Curr}\left(F_{\mathrm{n}}, \mathcal{F}_{1} \wedge \mathcal{A}(\phi)\right)
$$

(5) For every edge path $\gamma$ in $G$, the value $\ell_{\mathcal{F}_{1}}(\gamma)-\ell_{\exp }(\gamma)$ is the number of edges of $\overline{G-G_{i}}$ contained in $\gamma$. In particular, for every path $\gamma$ contained in $G_{i}$, we have

$$
\ell_{\mathcal{F}_{1}}(\gamma)=\ell_{\exp }(\gamma)
$$

and for every current $\mu \in \operatorname{Curr}\left(F_{\mathrm{n}}, \mathcal{F} \wedge \mathcal{A}(\phi)\right)$ whose support is contained in $\partial^{2} \mathcal{F}_{1}$, we have

$$
\Psi_{0}(\mu)=\|\mu\|_{\mathcal{F}_{1}}
$$

(6) Let $\gamma$ be a circuit in $G$. For every $m \in \mathbb{N}^{*}$, we have

$$
\ell_{\mathcal{F}_{1}}\left(\left[f^{m}(\gamma)\right]\right)-\ell_{\exp }\left(\left[f^{m}(\gamma)\right]\right)=\ell_{\mathcal{F}_{1}}(\gamma)-\ell_{\exp }(\gamma)
$$

(7) Suppose that $\mathcal{F} \wedge \mathcal{A}(\phi)=\left\{\left[A_{1}\right], \ldots,\left[A_{r}\right]\right\}$. One of the following holds.

- There exist distinct $i, j \in\{1, \ldots, r\}$ such that

$$
\left.\mathcal{A}(\phi)=(\mathcal{F} \wedge \mathcal{A}(\phi))-\left\{\left[A_{i}\right],\left[A_{j}\right]\right\}\right) \cup\left\{\left[A_{i} * A_{j}\right]\right\}
$$

- There exists $i \in\{1, \ldots, r\}$ and an element $g \in F_{\mathrm{n}}$ such that

$$
\left.\mathcal{A}(\phi)=(\mathcal{F} \wedge \mathcal{A}(\phi))-\left\{\left[A_{i}\right]\right\}\right) \cup\left\{\left[A_{i} *\langle g\rangle\right]\right\}
$$

In that case, there exists a subgroup $A$ of $F_{\mathrm{n}}$ such that $\mathcal{F}=\{[A]\}$ and $F_{\mathrm{n}}=A *\langle g\rangle$.

- There exists $g \in F_{\mathrm{n}}$ such that $\mathcal{A}(\phi)=\mathcal{F} \wedge \mathcal{A}(\phi) \cup\{[\langle g\rangle]\}$. In that case, there exists a subgroup $A$ of $F_{\mathrm{n}}$ such that $\mathcal{F}=\{[A]\}$ and $F_{\mathrm{n}}=A *\langle g\rangle$.

Proof. (1) It is a consequence of HM, Lemma II.2.5]. Note that, in the terminology of [HM, Lemma 2.2.5], the first case is called a one-edge extension and the second case is called a lollipop extension.
(2) By Proposition 2.5 (4), it suffices to show that there does not exist an EG stratum of height greater than $i$. This follows from [BFH1, Corollary 3.2.2] (where the stratum described in it is the whole graph $\left.\overline{G-G_{i}}\right)$ We now prove the second part of Assertion (2). Let $w$ be an element of $F_{\mathrm{n}}$ represented by $\gamma$. Then there exists a subgroup $A$ of $F_{\mathrm{n}}$ such that $[A] \in \mathcal{A}(\phi)$ and $w \in A$. Since $\left.\phi\right|_{\mathcal{F}_{1}}$ is expanding relative to $\mathcal{F}$ but $\phi$ is not expanding relative to $\mathcal{F}$ by Definition 4.3 (2), there exists a reduced circuit $\gamma$ in $G$ which is not contained in $G_{i}$ which has polynomial growth under iterates of $f$. By Proposition 3.13, the circuit $\gamma$ is a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$. By the first part of Assertion (2), the intersection $\gamma \cap \overline{G-G_{i}}$ does not contain EG INPs, hence consists in edges in $G_{P G}$. Hence if $\overline{G-G_{i}}$ is a lollipop, then the circuit $C$ in $\overline{G-G_{i}}$ is contained in $\gamma$, hence is contained in $G_{P G}$. If $\overline{G-G_{i}}$ is a topological arc, the graph $\overline{G-G_{i}}$ is contained in $\gamma$, hence consists in edges in $G_{P G}$. This proves (2).
(3) Let $\gamma$ be as in Assertion (3). By Assertion (2), every edge of $\overline{G-G_{i}}$ is contained in an NEG stratum. In particular, there does not exist an EG INP of height greater than $i$. Hence $\mathcal{N}_{P G}=\mathcal{N}_{P G, \mathcal{F}_{1}}$. Since $\gamma$ is contained in $G_{i}$ and since $G_{P G} \cap G_{i}=G_{P G, \mathcal{F}_{1}}$, the path $\gamma$ is not contained in a concatenation of paths in $G_{P G}$ and $\mathcal{N}_{P G}$.
(4) Since $\left.\phi\right|_{\mathcal{F}_{1}}$ is expanding relative to $\mathcal{F}$, we see that $\mathcal{F}_{1} \wedge \mathcal{A}(\phi)=\mathcal{F} \wedge \mathcal{A}(\phi)$. Thus, we have $\partial^{2}\left(F_{\mathrm{n}}, \mathcal{F} \wedge \mathcal{A}(\phi)\right)=\partial^{2}\left(F_{\mathrm{n}}, \mathcal{F}_{1} \wedge \mathcal{A}(\phi)\right)$. Assertion (4) then follows from Lemma 3.28 applied to $\mathcal{F}_{1} \wedge \mathcal{A}(\phi)$.
(5) By Assertion (2), there does not exist an EG INP of height at least $i+1$. Hence $\ell_{\mathcal{F}_{1}}(\gamma)$ differs from $\ell_{\exp }(\gamma)$ by the number of edges in $G_{P G}$ of height at least $i+1$. Since every edge in $\overline{G-G_{i}}$ is in $G_{P G}$ by Assertion (2), the conclusion of the first claim of Assertion (5) follows. The claim about paths contained in $G_{i}$ is then a direct consequence. Let $\mu$ be a current in $\operatorname{Curr}\left(\mathcal{F}_{1}, \mathcal{F}_{1} \wedge \mathcal{A}(\phi)\right)$. By Lemma 5.17, there exists $\left(\mu_{1}, \mu_{2}\right) \in X\left(\mathcal{F}_{1}\right)$ such that $\mu=\mu_{1}^{*}+\mu_{2}^{*}$. Since rational currents are dense in $\operatorname{Curr}\left(H_{1},\left\{\left[A_{1}\right], \ldots,\left[A_{s}\right]\right\}\right)$ and $\operatorname{Curr}\left(H_{2},\left\{\left[B_{1}\right], \ldots,\left[B_{t}\right]\right\}\right)$ by Proposition 2.15, linear combination of rational currents are dense in $\operatorname{Curr}\left(\mathcal{F}_{1}, \mathcal{F}_{1} \wedge \mathcal{A}(\phi)\right)$. The last claim of Assertion (5) then follows from the linearity and continuity of $\Psi_{0}$ and $\|\cdot\|_{\mathcal{F}_{1}}$.
(6) Let $m \in \mathbb{N}^{*}$. By Assertion (5), it suffices to prove that the number of edges in $\overline{G-G_{i}}$ contained in $\left[f^{m}(\gamma)\right]$ is equal to the number of edges in $\overline{G-G_{i}}$ contained in $\gamma$. In the case that $\overline{G-G_{i}}$ is a lollipop extension and that $\gamma$ is the circuit $C$ in $\overline{G-G_{i}}$, then $\gamma$ is fixed by $f$ by [HM, Definition I.1.29 (3)] (that is the filtration associated with $f$ is reduced). Hence $\left[f^{m}(\gamma)\right]=\gamma$ and the claim follows. Otherwise, if $\overline{G-G_{i}}$ is either a one-edge extension or a lollipop extension, the circuit $\gamma$ is not contained in $\overline{G-G_{i}}$. Moreover, if $\gamma$ or $\left[f^{m}(\gamma)\right]$ contains an edge in $\overline{G-G_{i}}$, then it contains $\overline{G-G_{i}}$. Hence it suffices to count the number of occurrences of $\overline{G-G_{i}}$ in $\gamma$ and $\left[f^{m}(\gamma)\right]$. Since $f$
preserves $G_{i}$, the result follows from Assertion (1) and BFH1, Corollary 3.2.2] (where the stratum in it is the graph $\left.\overline{G-G_{i}}\right)$.
(7) Note that since $\left.\phi\right|_{\mathcal{F}_{1}}$ is expanding relative to $\mathcal{F}$, we have $\mathcal{F}_{1} \wedge \mathcal{A}(\phi)=\mathcal{F} \wedge \mathcal{A}(\phi)$. Recall the definition of the graph $G^{*}$ and the map $p_{G^{*}}: G^{*} \rightarrow G$ from above Lemma 3.11. By Proposition 3.13 and Lemma 3.11 (2), the malnormal subgroup system $\mathcal{A}(\phi)$ is precisely the subgroup system associated with the fundamental groups of the connected components of $G^{*}$. Moreover, the malnormal subgroup system associated with $\mathcal{F}_{1} \wedge \mathcal{A}(\phi)=\mathcal{F} \wedge \mathcal{A}(\phi)$ is the subgroup system associated with the connected components of $p_{G^{*}}^{-1}\left(G_{i}\right)$. By Assertion (1), the graph $\overline{G-G_{i}}$ is either a topological arc or a lollipop. Suppose first that $\overline{G-G_{i}}$ is a topological arc. By Assertion (2), the graph $\overline{G-G_{i}}$ consists in edges in $G_{P G}$. Thus, the graph $G^{*}$ is obtained from $p_{G^{*}}^{-1}\left(G_{i}\right)$ by adding a topological arc $\tau$. If the endpoints of $\tau$ are in two distinct connected components of $G^{*}$, then the first case of Assertion (7) occurs and otherwise the second case of Assertion (7) occurs. Moreover, if the second case occurs, the extension $\mathcal{F} \leqslant\left\{\left[F_{n}\right]\right\}$ is an HNN extension. Thus there exists a subgroup $A$ of $F_{\mathrm{n}}$ such that $\mathcal{F}=\{[A]\}$. By BFH1, Corollary 3.2.2], one can obtain an element $g$ of $F_{\mathrm{n}}$ such that $F_{\mathrm{n}}=A * g$ by taking a circuit in the image of $p_{G^{*}}$ which contains $\overline{G-G_{i}}$ exactly once. Suppose now that $\overline{G-G_{i}}$ is a lollipop extension. By Assertion (2), the circuit $C$ in $\overline{G-G_{i}}$ consists in edges in $G_{P G}$. Thus, either $G^{*}$ is obtained from $p_{G^{*}}^{-1}\left(G_{i}\right)$ by adding a lollipop extension, or $G^{*}$ is obtained from $p_{G^{*}}^{-1}\left(G_{i}\right)$ by adding a connected component which is homotopy equivalent to a circle. If $G^{*}$ is obtained from $p_{G^{*}}^{-1}\left(G_{i}\right)$ by adding a lollipop extension, the second case of Assertion (7) occurs. If $G^{*}$ is obtained from $p_{G^{*}}^{-1}\left(G_{i}\right)$ by adding a connected component which is homotopy equivalent to a circle, the third case of Assertion (7) occurs. The proof of the fact about HNN extension is similar to the proof for the one-edge extension case. This concludes the proof.

Remark 5.19. By Lemma 5.18 (1), $\overline{G-G_{i}}$ is either a topological arc or it retracts onto $a$ circuit $C$ and there exists exactly one topological arc that connects $C$ and $G_{i}$. In the second case, we will adopt the convention that $\overline{G-G_{i}}=C$, so that, by Lemma 5.18 (2), in both cases of Lemma 5.18 (1), every edge in $\overline{G-G_{i}}$ is in $G_{P G}$.

Lemma 5.20. Let $\phi \in \operatorname{Out}\left(F_{\mathrm{n}}, \mathcal{F}\right)$ and let $f: G \rightarrow G$ be as in Remark 5.15.
(1) Let $U$ be an open neighborhood of $\Delta_{+}(\phi)$, let $V$ be a neighborhood of $K_{P G}(\phi)$ (see Definition 3.25). There exist $N \in \mathbb{N}^{*}$ and $\delta \in(0,1)$ such that for every $m \geqslant 1$ and every $w \in F_{\mathrm{n}}$ with $\mathfrak{g}\left(\gamma_{w}\right)>\delta$ and $\eta_{[w]} \notin V$, we have

$$
\left(\phi^{N}\right)^{m}\left(\eta_{[w]}\right) \in U .
$$

(2) Suppose that $\phi$ is an almost atoroidal outer automorphism relative to $\mathcal{F}$ as in Definition 4.3 (2). Let $\mathcal{F} \leqslant \mathcal{F}_{1} \leqslant \mathcal{F}_{2}$ be an associated sequence of free factor systems.

For every $\epsilon>0$ and $L>0$, there exists $\delta \in(0,1)$ and $M>0$ such that, for every $n \geqslant M$, for every reduced edge path $\gamma \in \mathcal{P}(\mathcal{F} \wedge \mathcal{A}(\phi))$ of length at most $L$ contained in
$G_{i}$, for every nonperipheral element $w \in F_{\mathrm{n}}$ with $\mathfrak{g}\left(\gamma_{w}\right)>\delta$, there exists $\left[\mu_{w}\right] \in \Delta_{+}(\phi)$ such that:

$$
\left|\frac{\left\langle\gamma,\left[f^{n}\left(\gamma_{w}\right)\right]\right\rangle}{\ell_{\exp }\left(\left[f^{n}\left(\gamma_{w}\right)\right]\right)}-\frac{\left.\left\langle\gamma,\left[\mu_{w}\right]\right)\right\rangle}{\left\|\left[\mu_{w}\right]\right\|_{\mathcal{F}_{1}}}\right|<\epsilon
$$

Proof. The proof is similar to the one of [LU2, Lemma 6.1]. By Lemma 5.3 and Lemma 5.16 (1), up to passing to a power of $f$, we may assume that for every $w \in F_{\mathrm{n}}$ such that $\mathfrak{g}\left(\gamma_{w}\right) \geqslant \frac{1}{2}$, and every $n \in \mathbb{N}^{*}$, we have $\mathfrak{g}\left(\left[f^{n}\left(\gamma_{w}\right)\right]\right) \geqslant \mathfrak{g}\left(\gamma_{w}\right)$ and

$$
\begin{equation*}
\ell_{\exp }\left(\left[f^{n}\left(\gamma_{w}\right)\right]\right) \geqslant T E L(n, \gamma) \geqslant\left(3^{n}-2 C\right) \mathfrak{g}\left(\gamma_{w}\right) \ell_{\exp }\left(\gamma_{w}\right) \tag{9}
\end{equation*}
$$

Let $N \in \mathbb{N}^{*}$ be such that $3^{N}>2 C$. Let $\lambda>0$ be such that, for every edge $e \in \vec{E} G$ and every $n \in \mathbb{N}^{*}$, we have

$$
\begin{equation*}
\ell\left(\left[f^{n}(e)\right]\right) \leqslant \lambda^{n} \tag{10}
\end{equation*}
$$

By Lemma 3.29, a sequence $\left(\left[\nu_{m}\right]\right)_{m \in \mathbb{N}}$ of projective relative currents tends to a projective current $[\nu] \in \mathbb{P} \operatorname{Curr}\left(F_{\mathrm{n}}, \mathcal{F} \wedge \mathcal{A}(\phi)\right)$ if for every $\epsilon>0$ and $R>0$ there exists $M \in \mathbb{N}^{*}$ such that, for every $m \geqslant M$ and every reduced edge path $\gamma \in \mathcal{P}(\mathcal{F} \wedge \mathcal{A}(\phi))$ with $\ell(\gamma) \leqslant R$, we have

$$
\begin{equation*}
\left|\frac{\langle\gamma, \nu\rangle}{\|\nu\|_{\mathcal{F}}}-\frac{\left\langle\gamma, \nu_{m}\right\rangle}{\left\|\nu_{m}\right\|_{\mathcal{F}}}\right|<\epsilon \tag{11}
\end{equation*}
$$

For every $\mathcal{F}$-expanding splitting unit $\sigma$, we denote by $\mu(\sigma)$ the corresponding current given by Proposition 4.4. By Lemma 4.8, we have $\|\mu(\sigma)\|_{\mathcal{F}}=1$. Since $\Delta_{+}(\phi)$ is compact by Lemma4.7, there exist $\epsilon, R>0$ such that for every $m \geqslant M$, if there exists $\nu \in \Delta_{+}(\phi)$ such that $\nu_{m}, \nu, R, \epsilon$ satisfy Equation (11), then $\nu_{m} \in U$. Since there are only finitely many expanding splitting units of positive exponential length and finitely many edge paths $\gamma \in \mathcal{P}(\mathcal{F} \wedge \mathcal{A}(\phi))$ such that $\ell(\gamma) \leqslant R$, there exists $M_{0} \in \mathbb{N}^{*}$ such that for every $m \geqslant M_{0}$, for every expanding splitting unit $\sigma$ and for every reduced edge path $\gamma \in$ $\mathcal{P}(\mathcal{F} \wedge \mathcal{A}(\phi))$ with $\ell(\gamma) \leqslant R$, we have:

$$
\left|\frac{\left\langle\gamma,\left[f^{m}(\sigma)\right]\right\rangle}{\ell_{\mathcal{F}}\left(\left[f^{m}(\sigma)\right]\right)}-\langle\gamma, \mu(\sigma)\rangle\right|<\frac{\epsilon}{6}
$$

Recall that $\langle\gamma, \mu(\sigma)\rangle$ is equal to $\mu(\sigma)(C(\gamma))$ by definition of the number of occurrences of $\gamma$ in $\mu(\sigma)$. Let $\gamma^{\prime}$ be a reduced edge path in $G$. By Lemma 5.6. for every reduced edge path $\sigma$ of $G$ contained in $\gamma^{\prime}$, we have $\ell_{\mathcal{F}}(\sigma) \geqslant \ell_{\mathcal{F}}^{\gamma^{\prime}}(\sigma) \geqslant \ell_{\mathcal{F}}(\sigma)-2 C$. Hence there exists $M_{1} \in \mathbb{N}^{*}$ such that for every $m \geqslant M_{1}$, for every expanding splitting unit $\sigma$, for every edge path $\gamma^{\prime}$ containing $\sigma$ as a splitting unit and for every reduced edge path $\gamma \in \mathcal{P}(\mathcal{F} \wedge \mathcal{A}(\phi))$ with $\ell(\gamma) \leqslant R$, we have:

$$
\begin{equation*}
\left|\frac{\left\langle\gamma,\left[f^{m}(\sigma)\right]\right\rangle}{\ell_{\mathcal{F}}^{\left[f^{m}\left(\gamma^{\prime}\right)\right]}\left(\left[f^{m}(\sigma)\right]\right)}-\langle\gamma, \mu(\sigma)\rangle\right|<\frac{\epsilon}{6} . \tag{12}
\end{equation*}
$$

Recall the definition of the continuous function $\Psi_{0}: \operatorname{Curr}\left(F_{\mathrm{n}}, \mathcal{F} \wedge \mathcal{A}(\phi)\right) \rightarrow \mathbb{R}$ given above Definition 3.25. Recall that, by Lemma3.27(3), for every current $\mu \in \operatorname{Curr}\left(F_{\mathrm{n}}, \mathcal{F} \wedge\right.$ $\mathcal{A}(\phi))$, we have $\|\mu\|_{\mathcal{F}}>0$. Let

$$
\begin{array}{rll}
\Psi: \operatorname{Curr}\left(F_{\mathrm{n}}, \mathcal{F} \wedge \mathcal{A}(\phi)\right) & \rightarrow & \mathbb{R} \\
{[\nu]} & \mapsto & \frac{\Psi_{0}(\nu)}{\|\nu\|_{\mathcal{F}}} .
\end{array}
$$

Since $\Psi$ is continuous and since $\mathbb{P} \operatorname{Curr}\left(F_{\mathrm{n}}, \mathcal{F} \wedge \mathcal{A}(\phi)\right)-V$ is compact, there exists $s>0$ such that for every $\nu \in \mathbb{P} \operatorname{Curr}\left(F_{\mathrm{n}}, \mathcal{F} \wedge \mathcal{A}(\phi)\right)-V$, we have:

$$
\Psi([\nu]) \geqslant s
$$

In particular, by Lemma 3.26, for every nonperipheral element $w \in F_{\mathrm{n}}$ such that $\eta_{[w]} \notin V$, we have

$$
\begin{equation*}
\frac{\ell_{\exp }\left(\gamma_{w}\right)}{\ell_{\mathcal{F}}\left(\gamma_{w}\right)}=\frac{\Psi_{0}\left(\eta_{[w]}\right)}{\left\|\eta_{[w]}\right\|_{\mathcal{F}}}=\Psi\left(\left[\eta_{[w]}\right]\right) \geqslant s \tag{13}
\end{equation*}
$$

Now let $w \in F_{\mathrm{n}}$ be a nonperipheral element such that $\mathfrak{g}\left(\gamma_{w}\right) \geqslant \frac{1}{2}$ and $\eta_{[w]} \notin V$. Let $\gamma_{w}=\alpha_{0} \beta_{1} \alpha_{1} \ldots \alpha_{k} \beta_{k}$ be an optimal splitting of $\gamma_{w}$, where for every $i \in\{0, \ldots, k\}$, the path $\alpha_{i}$ is an incomplete factor of $\gamma_{w}$ and for every $i \in\{1, \ldots, k\}$, the path $\beta_{i}$ is a complete factor of $\gamma$. Using this optimal splitting, we construct another decomposition of $\gamma_{w}$ (which is not necessarily a splitting of $\gamma_{w}$ ). Since concatenations of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$ have zero exponential length by Lemma 3.18, we change the decomposition in such a way that every subpath of $\gamma_{w}$ which is a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$ is in some $\alpha_{i}$ for $i \in\{1, \ldots, k\}$. In particular, for every $i \in\{1, \ldots, k\}$, the exponential lengths of $\beta_{i}$ and $\alpha_{i}$ are equal to their exponential lengths relative to $\gamma_{w}$. Let $i \in\{0, \ldots, k\}$. The path $\alpha_{i}$ has a decomposition $\alpha_{i}=\alpha_{i}^{(1)} \alpha_{i}^{\left(1^{\prime}\right)} \ldots \alpha_{i}^{\left(k_{i}\right)} \alpha_{i}^{\left(k_{i}^{\prime}\right)}$ where, for every $j \in\left\{1, \ldots, k_{i}\right\}$, the path $\alpha_{i}^{(j)}$ is a concatenation of paths in $G_{P G}$ and $\mathcal{N}_{P G}$ and, for every $j \in\left\{1, \ldots, k_{i}\right\}$, the path $\alpha_{i}^{\left(j^{\prime}\right)}$ is a path in $\overline{G-G_{P G}}$ such that every edge of $\alpha_{i}^{\left(j^{\prime}\right)}$ either has positive exponential length relative to $\gamma_{w}$ or is in a zero stratum. Note that, by Proposition 2.5 (4), for every $j \in\left\{1, \ldots, k_{i}\right\}$ and every maximal subpath $\tau$ of $\alpha_{i}^{\left(j^{\prime}\right)}$ contained in some zero stratum, the path $\tau$ is adjacent to a path in $\gamma_{w}$ of positive exponential length. Suppose that $\tau$ is nontrivial. Since no zero path is adjacent to a path which is a concatenation of paths in $G_{P G}$ and $\mathcal{N}_{P G}$ by Lemma 2.9 and Proposition 2.5 (4), either $\alpha_{i}=\tau$ or $\ell_{\exp }\left(\alpha_{i}^{\left(j^{\prime}\right)}\right)>0$. In the first case, we have $\ell(\tau) \leqslant C$ by definition of $C$. Thus, there exists $n \in \mathbb{N}^{*}$ such that $\left[f^{n}(\tau)\right]$ is completely split. Thus, if the first case occurs, we may suppose, up to taking a power of $f$, that $\alpha_{i}$ is a completely split and is a splitting unit of some $\beta_{j}$. Let $i \in\{1, \ldots, k\}$. Since $\beta_{i}$ does not contain splitting units which are concatenation of paths in $G_{P G}$ and $\mathcal{N}_{P G}$, every splitting unit of $\beta_{i}$ is an edge in $\overline{G-G_{P G}^{\prime}}$ or a maximal taken connecting path in a zero stratum. By Lemma 3.21, every splitting unit of $\beta_{i}$ which is an edge in $\overline{G-G_{P G}^{\prime}}$ is expanding. Let $\sigma^{\prime}$ be a splitting unit of $\beta_{i}$ which is a maximal taken connecting path in a zero stratum and which is not expanding. Let $n \in \mathbb{N}^{*}$ be such that $\left[f^{n}\left(\sigma^{\prime}\right)\right]$ is completely split. By Lemma 3.21 and Lemma 3.20, the path $\left[f^{n}\left(\sigma^{\prime}\right)\right]$ does not contain splitting units which are edges in
$\overline{G-G_{P G}}$. If $\left[f^{n}\left(\sigma^{\prime}\right)\right]$ contains a splitting unit which is contained in a zero stratum, then an inductive argument shows that, up to taking a larger $n$, the path $\left[f^{n}\left(\sigma^{\prime}\right)\right]$ is a concatenation of paths in $G_{P G}$ and $\mathcal{N}_{P G}$. Thus, the $\mathcal{F}$-length of $\sigma^{\prime}$ grows at most polynomially fast under iterates of $f$. Thus, we see that $\gamma_{w}$ has a decomposition

$$
\gamma_{w}=a_{0} b_{0} a_{1} c_{1}^{(1)} c_{2}^{(1)} \ldots c_{k_{1}}^{(1)} a_{2} b_{2} \ldots a_{t} c_{1}^{(t)} c_{2}^{(t)} \ldots c_{k_{t}}^{(t)} a_{t+1} b_{t+1} a_{t+2}
$$

where:
(a) for every $i \in\{0, \ldots, t+2\}$, the path $a_{i}$ is either possibly trivial, a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$ or a maximal taken connecting path whose $\mathcal{F}$-length grows at most polynomially fast;
(b) for every $i \in\{0, \ldots, t+1\}$, the path $b_{i}$ is a subpath of positive exponential length relative to $\gamma_{w}$ of an incomplete path of $\gamma_{w}$ such that every edge of $b_{i}$ either has positive exponential length relative to $\gamma_{w}$ or is in a zero stratum;
(c) for every $i \in\{1, \ldots, t\}$ and every $j \in\left\{1, \ldots, k_{i}\right\}$, the path $c_{j}^{(i)}$ is a (possibly trivial) expanding splitting unit of a complete factor of $\gamma_{w}$.

Recall that the length of every path in a zero stratum is bounded by $C$. Thus, for every $i \in\{0, \ldots, t+1\}$, we have

$$
\ell\left(b_{i}\right) \leqslant C \ell_{e x p}\left(b_{i}\right)
$$

We claim that the exponential length relative to $\gamma_{w}$ of one of the edges at the concatenation point of two consecutive nontrivial paths of the form $a_{i} b_{i}, b_{i} a_{i+1}, a_{i} c_{1}^{(i)}, c_{j}^{(i)} c_{j+1}^{(i)}$ or $c_{k_{i}}^{(i)} a_{i+1}$ is positive. Indeed, for every $i \in\{1, \ldots, t\}$ (resp. $i \in\{0, \ldots, t+1\}$ ) and every $j \in\left\{1, \ldots, k_{i}\right\}$, the path $c_{j}^{(i)}$ (resp. $b_{i}$ ) either has positive exponential length relative to $\gamma_{w}$ or is contained in a zero stratum. Note that by hypothesis, for every $i \in\{0, \ldots, t+1\}$, the path $b_{i}$ is not contained in a zero stratum. Moreover, if $b_{i}$ is adjacent to a path $a_{i}$, then the first edge of $b_{i}$ is not in a zero stratum by Proposition 2.5 (4), Lemma 2.9 and the fact that the paths in zero strata that we consider in our subdivision are maximal. Hence one of the edges at the concatenation point of every path of the form $a_{i} b_{i}, b_{i} a_{i+1}$ has positive exponential length relative to $\gamma_{w}$. By maximality of the splitting units contained in zero strata, one of the splitting unit in a path $c_{j}^{(i)} c_{j+1}^{(i)}$ is an edge in $\overline{G-G_{P G}^{\prime}}$, hence has positive exponential length relative to $\gamma_{w}$. Since paths in zero strata and concatenations of paths in $G_{P G}$ and $\mathcal{N}_{P G}$ cannot be adjacent by Proposition 2.5 (4) and Lemma 2.9, paths of the form $a_{i} c_{1}^{(i)}$ and $c_{k_{i}}^{(i)} a_{i+1}$ have positive exponential length since in this case $c_{1}^{(i)}$ or $c_{k_{i}}^{(i)}$ is an edge in $\overline{G-G_{P G}^{\prime}}$. This proves the claim.

Remark that, by construction and the definition of goodness of a reduced path, we have

$$
\sum_{i=1}^{t} \sum_{j=1}^{k_{i}} \ell_{\exp }\left(c_{j}^{(i)}\right)=\ell_{\exp }\left(\gamma_{w}\right) \mathfrak{g}\left(\gamma_{w}\right)
$$

Note that the length of reduced iterates of edges in $G_{P G}$ grows at most polynomially fast, hence the $\mathcal{F}$-length of reduced iterates of edges in $G_{P G}$ grows at most polynomially fast. Let $C^{\prime}>0$ and $k \in \mathbb{N}^{*}$ be such that, for every splitting unit $\sigma^{\prime}$ which is either an edge in $G_{P G}$ or a maximal taken connecting path in a zero stratum whose $\mathcal{F}$-length grows at most polynomially fast, and every $m \in \mathbb{N}^{*}$, we have:

$$
\ell_{\mathcal{F}}\left(\left[f^{m}\left(\sigma^{\prime}\right)\right]\right) \leqslant C^{\prime} m^{k} \ell_{\mathcal{F}}\left(\sigma^{\prime}\right) .
$$

The constants $C^{\prime}$ and $k$ exist by the claim in Proposition 3.13. Let $i \in\{0, \ldots, t+2\}$ and let $a_{i}=\alpha_{0} \ldots \alpha_{\ell_{i}}$ be a decomposition of $a_{i}$ such that, for every $j \in\left\{0, \ldots, \ell_{i}\right\}, \alpha_{\ell_{i}}$ is either an edge in $G_{P G}$, a path in $\mathcal{N}_{P G}^{\max }\left(a_{i}\right)$ or a maximal taken connecting path in a zero stratum whose $\mathcal{F}$-length grows at most polynomially fast. By Lemma 3.16, for every $m \in \mathbb{N}^{*}$, we have

$$
\ell_{\mathcal{F}}\left(\left[f^{m}\left(a_{i}\right)\right]\right) \leqslant \sum_{j=0}^{\ell_{i}} \ell_{\mathcal{F}}\left(\left[f^{m}\left(\alpha_{j}\right)\right]\right) \leqslant C^{\prime} m^{k} \sum_{j=1}^{\ell_{i}} \ell_{\mathcal{F}}\left(\alpha_{j}\right)=C^{\prime} m^{k} \ell_{\mathcal{F}}\left(a_{i}\right),
$$

where the last equality follows from the fact that a path in $\mathcal{N}_{P G}$ is contained in some subpath $\alpha_{j}$ by hypothesis. In particular,

$$
\begin{equation*}
\sum_{i=0}^{t+2} \ell_{\mathcal{F}}\left(\left[f^{n}\left(a_{i}\right)\right]\right) \leqslant C^{\prime} m^{k} \sum_{i=0}^{t+2} \ell_{\mathcal{F}}\left(a_{i}\right) \leqslant C^{\prime} \ell_{\mathcal{F}}\left(\gamma_{w}\right) n^{k} \tag{14}
\end{equation*}
$$

where the last inequality follows from the fact that, by hypothesis, every path in $\mathcal{N}_{P G}^{\max }(\gamma)$ is contained in some $a_{i}$. Thus, if $\mathfrak{g}\left(\gamma_{w}\right) \geqslant \frac{1}{2}$, there exists $C^{\prime \prime}>0$ such that, for every $n \geqslant N$, by Equations (9), (14) and (13), we have:
$\frac{\sum_{i=0}^{t+2} \ell_{\mathcal{F}}\left(\left[f^{n}\left(a_{i}\right)\right]\right)}{\ell_{\exp }\left(\left[f^{n}\left(\gamma_{w}\right)\right]\right)} \leqslant \frac{C^{\prime} \ell_{\mathcal{F}}\left(\gamma_{w}\right) n^{k}}{\left(3^{n}-2 C\right) \mathfrak{g}\left(\gamma_{w}\right) \ell_{\exp }\left(\gamma_{w}\right)} \leqslant \frac{C^{\prime} \frac{1}{s} \ell_{\exp }\left(\gamma_{w}\right) n^{k}}{\left(3^{n}-2 C\right) \mathfrak{g}\left(\gamma_{w}\right) \ell_{\exp }\left(\gamma_{w}\right)} \leqslant C^{\prime \prime} \frac{n^{k}}{\left(3^{n}-2 C\right) \mathfrak{g}\left(\gamma_{w}\right)}$.
Recall that, for every reduced edge path $\gamma$ of $G$, we have

$$
\ell_{\exp }(\gamma) \leqslant \ell_{\mathcal{F}}(\gamma) .
$$

Up to taking a larger $N \in \mathbb{N}^{*}$, we may suppose that, for every $n \geqslant N$, we have

$$
\begin{equation*}
C^{\prime \prime} \frac{n^{k}}{\left(3^{n}-2 C\right) \mathfrak{g}\left(\gamma_{w}\right)} \leqslant \frac{\epsilon}{48 \mathfrak{g}\left(\gamma_{w}\right) R} . \tag{15}
\end{equation*}
$$

For every $n \geqslant N$ and every nonperipheral element $w \in F_{\mathrm{n}}$ such that $\mathfrak{g}\left(\gamma_{w}\right) \geqslant \frac{1}{2}$, by Equation (9), we have

$$
\frac{2 R \ell_{\exp }\left(\gamma_{w}\right)}{\ell_{\mathcal{F}}\left(\left[f^{n}\left(\gamma_{w}\right)\right]\right)} \leqslant \frac{2 R \ell_{\exp }\left(\gamma_{w}\right)}{\left(3^{n}-2 C\right) \mathfrak{g}\left(\gamma_{w}\right) \ell_{\exp }\left(\gamma_{w}\right)}=\frac{2 R}{\left(3^{n}-2 C\right) \mathfrak{g}\left(\gamma_{w}\right)} .
$$

Up to taking a larger $N$, we may assume that for every $n \geqslant N$ and every $w \in F_{\mathrm{n}}$ such that $\mathfrak{g}\left(\gamma_{w}\right) \geqslant \frac{1}{2}$, we have:

$$
\begin{equation*}
\frac{2 R \ell_{\exp }\left(\gamma_{w}\right)}{\ell_{\mathcal{F}}\left(\left[f^{n}\left(\gamma_{w}\right)\right]\right)} \leqslant \frac{2 R}{\left(3^{n}-2 C\right) \mathfrak{g}\left(\gamma_{w}\right)} \leqslant \frac{\epsilon}{12 \mathfrak{g}\left(\gamma_{w}\right)} . \tag{16}
\end{equation*}
$$

Let

$$
\delta=\max \left\{\frac{1}{1+\frac{\epsilon}{6}}, \frac{1}{1+\frac{2 R C \epsilon \lambda^{N}}{\left(3^{N}-2 C\right) 6}}, \frac{1}{2}\right\} .
$$

Thus, in order to prove the first assertion of Lemma 5.20, it suffices to show that for every $m \geqslant N$ and every $w \in F_{\mathrm{n}}$ such that $\mathfrak{g}\left(\gamma_{w}\right)>\delta$ and $\eta_{[w]} \notin V$, the projective current [ $\left.\nu_{m}\right]=\phi^{m}\left(\left[\eta_{w}\right]\right)$ is close to an element $[\nu]$ in $\Delta_{+}(\phi)$ in the sense of Equation (11). Since the goodness function is monotone by Remark 5.15, it suffices to prove it for $m=N$. Let $w \in F_{\mathrm{n}}$ such that $\mathfrak{g}\left(\gamma_{w}\right)>\delta$ and $\eta_{[w]} \notin V$.

By Equation (15) and the fact that $\mathfrak{g}\left(\gamma_{w}\right) \geqslant \delta \geqslant \frac{1}{2}$, we have

$$
\begin{align*}
\frac{\sum_{i=0}^{t+2} \ell_{\mathcal{F}}\left(\left[f^{N}\left(a_{i}\right)\right]\right)}{\ell_{\mathcal{F}}\left(\left[f^{N}\left(\gamma_{w}\right)\right]\right)} & \leqslant \frac{\sum_{i=0}^{t+2} \ell_{\mathcal{F}}\left(\left[f^{N}\left(a_{i}\right)\right]\right)}{\ell_{\exp }\left(\left[f^{n}\left(\gamma_{w}\right)\right]\right)} \\
& \leqslant C^{\prime \prime} \frac{n^{k}}{\left(3^{N}-2 C\right) \mathfrak{g}\left(\gamma_{w}\right)} \leqslant C^{\prime \prime} \frac{n^{k}}{\left(3^{N}-2 C\right) \delta} \leqslant \frac{\epsilon}{24 R} . \tag{17}
\end{align*}
$$

Moreover, by Equation (16) and the fact that $\mathfrak{g}\left(\gamma_{w}\right) \geqslant \delta \geqslant \frac{1}{2}$, we have

$$
\begin{equation*}
\frac{2 R \ell_{\exp }\left(\gamma_{w}\right)}{\ell_{\mathcal{F}}\left(\left[f^{N}\left(\gamma_{w}\right)\right]\right)} \leqslant \frac{\epsilon}{6} . \tag{18}
\end{equation*}
$$

Note that, for every $w \in F_{\mathrm{n}}$ such that $\mathfrak{g}\left(\gamma_{w}\right)>\delta$ and $\eta_{[w]} \notin V$, we have:

$$
\begin{align*}
\frac{2 R C \lambda^{N}\left(1-\mathfrak{g}\left(\gamma_{w}\right)\right) \ell_{\exp }\left(\gamma_{w}\right)}{\left(3^{N}-2 C\right) \mathfrak{g}\left(\gamma_{w}\right) \ell_{\exp }\left(\gamma_{w}\right)} & =2 R C \frac{\lambda^{N}}{3^{N}-2 C}\left(\frac{1}{\mathfrak{g}\left(\gamma_{w}\right)}-1\right) \\
& \leqslant 2 R C \frac{\lambda^{N}}{3^{N}-2 C}\left(\frac{1}{\delta}-1\right) \leqslant \frac{\epsilon}{6}, \tag{19}
\end{align*}
$$

where the last inequality follows from the definition of $\delta$.
Let $\gamma \in \mathcal{P}(\mathcal{F} \wedge \mathcal{A}(\phi))$ be of length at most $R$. By the triangle inequality, we have

$$
\begin{align*}
& \left|\frac{\left\langle\gamma,\left[f^{N}\left(\gamma_{w}\right)\right]\right\rangle}{\ell_{\mathcal{F}}\left(\left[f^{N}\left(\gamma_{w}\right)\right]\right)}-\frac{\left\langle\gamma, \sum_{i=1}^{t} \sum_{j=1}^{k_{i}} \ell_{\mathcal{F}}^{\left[f^{N}(\gamma w)\right]}\left(\left[f^{N}\left(c_{j}^{(i)}\right)\right]\right) \mu\left(c_{i}^{(j)}\right)\right\rangle}{\sum_{i=1}^{t} \sum_{j=1}^{k_{i}} \ell_{\mathcal{F}}^{\left[f^{N}\left(\gamma_{w}\right)\right]}\left(\left[f^{N}\left(c_{j}^{(i)}\right)\right]\right)}\right| \\
& \leqslant\left|\frac{\left\langle\gamma,\left[f^{N}\left(\gamma_{w}\right)\right]\right\rangle}{\ell_{\mathcal{F}}\left(\left[f^{N}\left(\gamma_{w}\right)\right]\right)}-\sum_{i=1}^{t} \sum_{j=1}^{k_{i}} \frac{\left\langle\gamma,\left[f^{N}\left(c_{j}^{(i)}\right)\right]\right\rangle}{\ell_{\mathcal{F}}\left(\left[f^{N}\left(\gamma_{w}\right)\right]\right)}\right| \\
& +\left|\sum_{i=1}^{t} \sum_{j=1}^{k_{i}} \frac{\left\langle\gamma,\left[f^{N}\left(c_{j}^{(i)}\right)\right]\right\rangle}{\ell_{\mathcal{F}}\left(\left[f^{N}\left(\gamma_{w}\right)\right]\right)}-\frac{\sum_{i=1}^{t} \sum_{j=1}^{k_{i}}\left\langle\gamma,\left[f^{N}\left(c_{j}^{(i)}\right)\right]\right\rangle}{\sum_{i=1}^{t} \sum_{j=1}^{k_{i}} \ell_{\mathcal{F}}^{\left[f^{N}(\gamma w]\right]}\left(\left[f^{N}\left(c_{j}^{(i)}\right)\right]\right)}\right| \\
& +\left|\frac{\sum_{i=1}^{t} \sum_{j=1}^{k_{i}}\left\langle\gamma,\left[f^{N}\left(c_{j}^{(i)}\right)\right]\right\rangle}{\sum_{i=1}^{t} \sum_{j=1}^{k_{i}} \ell_{\mathcal{F}}^{\left[f^{N}(\gamma w)\right]}\left(\left[f^{N}\left(c_{j}^{(i)}\right)\right]\right)}-\frac{\left\langle\gamma, \sum_{i=1}^{t} \sum_{j=1}^{k_{i}} \ell_{\mathcal{F}}^{\left[f^{N}(\gamma w)\right]}\left(\left[f^{N}\left(c_{j}^{(i)}\right)\right]\right) \mu\left(c_{i}^{(j)}\right)\right\rangle}{\sum_{i=1}^{t} \sum_{j=1}^{k_{i}} \ell_{\mathcal{F}}^{\left[f N^{N}(\gamma w)\right]}\left(\left[f^{N}\left(c_{j}^{(i)}\right)\right]\right)}\right| . \tag{20}
\end{align*}
$$

Note that an occurrence of $\gamma$ or $\gamma^{-1}$ in $\left[f^{N}\left(\gamma_{w}\right)\right]$ might happen either in some $\left[f^{N}\left(c_{j}^{(i)}\right)\right]$ or in some $\left[f^{N}\left(a_{i}\right)\right]$ or in some $\left[f^{N}\left(b_{i}\right)\right]$ or it might cross over the concatenation points. Recall that one of the edges at the concatenation point of paths of the form $a_{i} b_{i}, b_{i} a_{i+1}, a_{i} c_{1}^{(i)}, c_{j}^{(i)} c_{j+1}^{(i)}$ or $c_{k_{i}}^{(i)} a_{i+1}$ has positive exponential length relative to $\gamma_{w}$. Recall also that the length of $\gamma$ is at most equal to $R$. Thus the number of such crossings is at most $2 R \ell_{\text {exp }}\left(\gamma_{w}\right)$. Thus:

$$
\left|\frac{\left\langle\gamma,\left[f^{N}\left(\gamma_{w}\right)\right]\right\rangle}{\ell_{\mathcal{F}}\left(\left[f^{N}\left(\gamma_{w}\right)\right]\right)}-\sum_{i=1}^{t} \sum_{j=1}^{k_{i}} \frac{\left\langle\gamma,\left[f^{N}\left(c_{j}^{(i)}\right)\right]\right\rangle}{\ell_{\mathcal{F}}\left(\left[f^{N}\left(\gamma_{w}\right)\right]\right)}\right| \leqslant \frac{2 R \ell_{e x p}\left(\gamma_{w}\right)}{\ell_{\mathcal{F}}\left(\left[f^{N}\left(\gamma_{w}\right)\right]\right)}+\sum_{i=0}^{t+2} \frac{\left\langle\gamma,\left[f^{N}\left(a_{i}\right)\right]\right\rangle}{\ell_{\mathcal{F}}\left(\left[f^{N}\left(\gamma_{w}\right)\right]\right)}+\sum_{i=0}^{t+1} \frac{\left\langle\gamma,\left[f^{N}\left(b_{i}\right)\right]\right\rangle}{\ell_{\mathcal{F}}\left(\left[f^{N}\left(\gamma_{w}\right)\right]\right)} .
$$

Since $\gamma$ is not contained in a concatenation of paths in $G_{P G, \mathcal{F}}$ and $\mathcal{N}_{P G, \mathcal{F}}$, if $\gamma$ is contained in $\left[f^{N}\left(a_{i}\right)\right]$ for $i \in\{1, \ldots, t+1\}$, then $\gamma$ contains an edge of $\left[f^{N}\left(a_{i}\right)\right]$ of positive $\mathcal{F}$-length relative to $\left[f^{N}\left(a_{i}\right)\right]$. Hence we have $\left\langle\gamma,\left[f^{N}\left(a_{i}\right)\right]\right\rangle \leqslant \ell_{\mathcal{F}}\left(\left[f^{N}\left(a_{i}\right)\right]\right)$. By Equations (18) and (17) with $n=N$, we have

$$
\frac{2 R \ell_{\exp }\left(\gamma_{w}\right)}{\ell_{\mathcal{F}}\left(\left[f^{N}\left(\gamma_{w}\right)\right]\right)}+\sum_{i=0}^{t+2} \frac{\left\langle\gamma,\left[f^{N}\left(a_{i}\right)\right]\right\rangle}{\ell_{\mathcal{F}}\left(\left[f^{N}\left(\gamma_{w}\right)\right]\right)} \leqslant \frac{2 R \ell_{\exp }\left(\gamma_{w}\right)}{\ell_{\mathcal{F}}\left(\left[f^{N}\left(\gamma_{w}\right)\right]\right)}+\frac{\sum_{i=0}^{t+1} \ell_{\mathcal{F}}\left(\left[f^{N}\left(a_{i}\right)\right]\right)}{\ell_{\mathcal{F}}\left(\left[f^{N}\left(\gamma_{w}\right)\right]\right)} \leqslant \frac{\epsilon}{4} .
$$

Moreover, since for every $i \in\{0, \ldots, t+1\}$, we have $\ell\left(b_{i}\right) \leqslant C \ell_{\exp }\left(b_{i}\right)$ and by Equations (9), (13) and (19), we see that:

$$
\begin{aligned}
\sum_{i=0}^{t+1} \frac{\left\langle\gamma,\left[f^{N}\left(b_{i}\right)\right]\right\rangle}{\ell_{\mathcal{F}}\left(\left[f^{N}\left(\gamma_{w}\right)\right]\right)} & \leqslant \sum_{i=0}^{t+1} \frac{\ell\left(\left[f^{N}\left(b_{i}\right)\right]\right)}{\ell_{\mathcal{F}}\left(\left[f^{N}\left(\gamma_{w}\right)\right]\right)} \leqslant \sum_{i=0}^{t+1} \frac{C \lambda^{N} \ell_{e x p}\left(b_{i}\right)}{\left(3^{N}-2 C\right) \mathfrak{g}\left(\gamma_{w}\right) \ell_{e x p}\left(\gamma_{w}\right)} \\
& \leqslant \frac{C \lambda^{N}\left(1-\mathfrak{g}\left(\gamma_{w}\right)\right) \ell_{\exp }\left(\gamma_{w}\right)}{\left(3^{N}-2 C\right) \mathfrak{g}\left(\gamma_{w}\right) \ell_{\text {exp }}\left(\gamma_{w}\right)} \leqslant \frac{\epsilon}{6}
\end{aligned}
$$

For the third term of Inequality (20), note that, since $\gamma \in \mathcal{P}(\mathcal{F} \wedge \mathcal{A}(\phi))$, it is not contained in a concatenation of paths in $G_{P G, \mathcal{F}}$ and in $\mathcal{N}_{P G, \mathcal{F}}$. Hence an occurrence of $\gamma$ always appear with an edge $e$ of $c$ such that $\ell_{\mathcal{F}}^{c}(e)=1$. Since $\ell(\gamma) \leqslant R$, such an edge $e$ can be crossed by at most $R$ occurrences of $\gamma$ in $c$. Thus, for every reduced edge path $c$ in $G$, we have $\langle\gamma, c\rangle \leqslant 2 R \ell_{\mathcal{F}}(c)$. Hence we have

$$
\left|\frac{\sum_{i=1}^{t} \sum_{j=1}^{k_{i}}\left\langle\gamma,\left[f^{N}\left(c_{j}^{(i)}\right)\right]\right\rangle}{\sum_{i=1}^{t} \sum_{j=1}^{k_{i}} \ell_{\mathcal{F}}^{\left[f^{N}\left(\gamma_{w}\right)\right]}\left(\left[f\left(c_{j}^{(i)}\right)\right]\right)}\right| \leqslant 2 R .
$$

Since

$$
\ell_{\mathcal{F}}\left(\left[f^{N}\left(\gamma_{w}\right)\right]\right)=\sum_{i=1}^{t} \sum_{j=1}^{k_{i}} \ell_{\mathcal{F}}^{\left[f^{N}\left(\gamma_{w}\right)\right]}\left(\left[f^{N}\left(c_{j}^{(i)}\right)\right]\right)+\sum_{i=0}^{t+1} \ell_{\mathcal{F}}^{\left[f^{N}\left(\gamma_{w}\right)\right]}\left(\left[f^{N}\left(a_{i} b_{i} a_{i+1}\right)\right]\right)
$$

using Lemma 5.3 and Lemma 5.6 for the last inequality we have:

$$
\begin{aligned}
& \left|\sum_{i=1}^{t} \sum_{j=1}^{k_{i}} \frac{\left\langle\gamma,\left[f^{N}\left(c_{j}^{(i)}\right)\right]\right\rangle}{\ell_{\mathcal{F}}\left(\left[f^{N}\left(\gamma_{w}\right)\right]\right)}-\frac{\sum_{i=1}^{t} \sum_{j=1}^{k_{i}}\left\langle\gamma,\left[f^{N}\left(c_{j}^{(i)}\right)\right]\right\rangle}{\sum_{i=1}^{t} \sum_{j=1}^{k_{i}} \ell_{\mathcal{F}}^{\left[f f^{N}(\gamma w)\right]}\left(\left[f^{N}\left(c_{j}^{(i)}\right)\right]\right)}\right| \\
& =\left|\frac{\left.\left(\sum_{i=1}^{t} \sum_{j=1}^{k_{i}}\left\langle\gamma,\left[f^{N}\left(c_{j}^{(i)}\right)\right]\right\rangle\right)\left(\sum_{i=0}^{t+1} \ell_{\mathcal{F}}^{\left[f^{N}\right.}(\gamma w)\right]\left(\left[f\left(a_{i} b_{i} a_{i+1}\right)\right]\right)\right)}{\left(\sum_{i=1}^{t} \sum_{j=1}^{k_{i}} \ell_{\mathcal{F}}^{\left[f^{N}(\gamma w)\right]}\left(\left[f\left(c_{j}^{(i)}\right)\right]\right)\right)\left(\sum_{i=1}^{t} \sum_{j=1}^{k_{i}} \ell_{\mathcal{F}}^{\left[f^{N}(\gamma w)\right]}\left(\left[f^{N}\left(c_{j}^{(i)}\right)\right]\right)+\sum_{i=0}^{t+1} \ell_{\mathcal{F}}^{\left[f^{N}(\gamma w)\right]}\left(\left[f^{N}\left(a_{i} b_{i} a_{i+1}\right)\right]\right)\right)}\right| \\
& \leqslant\left|\frac{\left(\sum_{i=1}^{t} \sum_{j=1}^{k_{i}}\left\langle\gamma,\left[f^{N}\left(c_{j}^{(i)}\right)\right]\right\rangle\right)\left(\sum_{i=0}^{t+1} \ell_{\mathcal{F}}^{\left[f^{N}\left(\gamma_{w}\right)\right]}\left(\left[f\left(a_{i} b_{i} a_{i+1}\right)\right]\right)\right)}{\left(\sum_{i=1}^{t} \sum_{j=1}^{k_{i}} \ell_{\mathcal{F}}^{\left[f^{N}\left(\gamma_{w}\right)\right]}\left(\left[f\left(c_{j}^{(i)}\right)\right]\right)\right)\left(\sum_{i=1}^{t} \sum_{j=1}^{k_{i}} \ell_{\mathcal{F}}^{\left[f^{N}\left(\gamma_{w}\right)\right]}\left(\left[f^{N}\left(c_{j}^{(i)}\right)\right]\right)\right)}\right| \\
& \leqslant\left|\frac{\left(\sum_{i=1}^{t} \sum_{j=1}^{k_{i}}\left\langle\gamma,\left[f^{N}\left(c_{j}^{(i)}\right)\right]\right\rangle\right)\left(\sum_{i=0}^{t+1} \ell_{\mathcal{F}}\left(\left[f^{N}\left(b_{i}\right)\right]\right)+2 \sum_{i=0}^{t+2} \ell_{\mathcal{F}}\left(\left[f^{N}\left(a_{i}\right)\right]\right)\right)}{\left(\sum_{i=1}^{t} \sum_{j=1}^{k_{i}} \ell_{\mathcal{F}}^{\left[f^{N}(\gamma w)\right]}\left(\left[f\left(c_{j}^{(i)}\right)\right]\right)\right)\left(\sum_{i=1}^{t} \sum_{j=1}^{k_{i}} \ell_{\mathcal{F}}^{\left[f^{N}(\gamma w)\right]}\left(\left[f^{N}\left(c_{j}^{(i)}\right)\right]\right)\right)}\right| \\
& \leqslant 2 R\left|\frac{\sum_{i=0}^{t+1} \ell_{\mathcal{F}}\left(\left[f^{N}\left(b_{i}\right)\right]\right)+2 \sum_{i=0}^{t+2} \ell_{\mathcal{F}}\left(\left[f^{N}\left(a_{i}\right)\right]\right)}{\sum_{i=1}^{t} \sum_{j=1}^{k_{i}} \ell_{\mathcal{F}}^{\left[f^{N}(\gamma w)\right]}\left(\left[f^{N}\left(c_{j}^{(i)}\right)\right]\right)}\right| \text {. }
\end{aligned}
$$

Recall that we have

$$
\sum_{i=1}^{t} \sum_{j=1}^{k_{i}} \ell_{\exp }\left(c_{j}^{(i)}\right)=\ell_{\exp }\left(\gamma_{w}\right) \mathfrak{g}\left(\gamma_{w}\right)
$$

and, for every $i \in\{1, \ldots, t\}$ and every $j \in\left\{1, \ldots, k_{i}\right\}$, we have either $\ell_{\text {exp }}\left(c_{j}^{(i)}\right)=1$ or $\ell_{\exp }\left(c_{j}^{(i)}\right)=0$. Hence, we have:

$$
\begin{aligned}
\sum_{i=1}^{t} \sum_{j=1}^{k_{i}} \ell_{\mathcal{F}}^{\left[f^{N}\left(\gamma_{w}\right)\right]}\left(\left[f^{N}\left(c_{j}^{(i)}\right)\right]\right) & \geqslant \sum_{i=1}^{t} \sum_{j=1}^{k_{i}}\left(\ell_{\mathcal{F}}\left(\left[f^{N}\left(c_{j}^{(i)}\right)\right]\right)-2 C\right) \geqslant \sum_{i=1}^{t} \sum_{j=1}^{k_{i}}\left(3^{N}-2 C\right) \\
& \geqslant\left(3^{N}-2 C\right) \mathfrak{g}\left(\gamma_{w}\right) \ell_{\exp }\left(\gamma_{w}\right)
\end{aligned}
$$

where the first inequality follows from Lemma5.6 and the second inequality follows from the fact that $f$ is $3 K$-expanding and $K \geqslant 1$. Thus, we have

$$
\begin{aligned}
& 2 R\left|\frac{\sum_{i=0}^{t+1} \ell_{\mathcal{F}}\left(\left[f^{N}\left(b_{i}\right)\right]\right)+\sum_{i=0}^{t+2} \ell_{\mathcal{F}}\left(\left[f^{N}\left(a_{i}\right)\right]\right)}{\sum_{i=1}^{t} \sum_{j=1}^{k_{i}} \ell_{\mathcal{F}}^{\left.f f^{N}\left(\gamma_{w}\right)\right]}\left(\left[f^{N}\left(c_{j}^{(i)}\right)\right]\right)}\right| \\
& \leqslant 2 R\left|\frac{\sum_{i=0}^{t+1} \ell_{\mathcal{F}}\left(\left[f^{N}\left(b_{i}\right)\right]\right)+2 \sum_{i=0}^{t+2} \ell_{\mathcal{F}}\left(\left[f^{N}\left(a_{i}\right)\right]\right)}{\sum_{i=1}^{t} \sum_{j=1}^{k_{i}} \ell_{F}^{\left.\left.f f_{F}^{N}(\gamma w)\right]\right]}\left(\left[f^{N}\left(c_{j}^{(i)}\right)\right]\right)}\right| \\
& \leqslant 2 R\left|\frac{\sum_{i=0}^{t+1} \ell_{\mathcal{F}}\left(\left[f^{N}\left(b_{i}\right)\right]\right)}{\left(3^{N}-2 C\right) \mathfrak{g}\left(\gamma_{w}\right) \ell_{\text {exp }}\left(\gamma_{w}\right)}\right|+2 R\left|\frac{2 \sum_{i=0}^{t+2} \ell_{\mathcal{F}}\left(\left[f^{N}\left(a_{i}\right)\right]\right)}{\left(3^{N}-2 C\right) \delta e_{\text {exp }}\left(\gamma_{w}\right)}\right| .
\end{aligned}
$$

By Equation (10), we have

$$
\sum_{i=0}^{t+1} \ell_{\mathcal{F}}\left(\left[f^{N}\left(b_{i}\right)\right]\right) \leqslant \sum_{i=0}^{t+1} \ell\left(\left[f^{N}\left(b_{i}\right)\right]\right) \leqslant \lambda^{N} \sum_{i=0}^{t+1} \ell\left(b_{i}\right) \leqslant C \lambda^{N} \sum_{i=0}^{t+1} \ell_{\text {exp }}\left(b_{i}\right) \leqslant C \lambda^{N} \ell_{\text {exp }}\left(\gamma_{w}\right)\left(1-\mathfrak{g}\left(\gamma_{w}\right)\right) .
$$

Hence we have:

$$
\begin{aligned}
& 2 R\left|\frac{\sum_{i=0}^{t+1} \ell_{\mathcal{F}}\left[\left[f^{N}\left(b_{i}\right)\right]\right)}{\left(3^{N}-2 C\right) \mathfrak{g}\left(\gamma_{w}\right) \ell_{\text {exp }}\left(\gamma_{w}\right)}\right|+2 R\left|\frac{2 \sum_{i=0}^{t+0} \ell_{\mathcal{F}}\left(\left[f^{N}\left(a_{i}\right)\right]\right)}{\left(3^{n}-2 C\right) \delta \ell_{\text {exp }}\left(\gamma_{w}\right)}\right|
\end{aligned}
$$

$$
\begin{aligned}
& \leqslant 2 R\left|\frac{C \lambda^{N}\left(1-\mathfrak{g}\left(\gamma_{w}\right)\right) e_{\text {exp }}\left(\gamma_{w}\right)}{\left(3^{N}-2 C\right) \mathfrak{g}\left(\gamma_{w}\right) \ell_{\text {exp }}\left(\gamma_{w}\right)}\right|+2 R\left|\frac{2 C^{\prime \prime} n^{k}}{\left(3^{N}-2 C\right) \delta}\right| \\
& \leqslant \frac{2 \epsilon}{6} \text { by Equation (17) and (19). }
\end{aligned}
$$

Finally, using Equation (12) and the fact that for every $i \in\{1, \ldots, t\}$ and every $j \in\left\{1, \ldots, k_{i}\right\}$, the splitting unit $c_{j}^{(i)}$ is expanding, we have:

$$
\begin{aligned}
& \left|\frac{\sum_{i=1}^{t} \sum_{j=1}^{k_{i}}\left\langle\left\langle,\left[f^{N}\left(c_{c}^{(i)}\right)\right]\right\rangle\right.}{\sum_{i=1}^{t} \sum_{j=1}^{k_{i}} \ell_{\mathcal{F}}^{\left[f^{N}(\gamma w)\right]}\left(\left[f^{N}\left(c_{j}^{(i)}\right)\right]\right)}-\frac{\left\langle\gamma, \sum_{i=1}^{t} \sum_{j=1}^{k_{i}} \ell_{\mathcal{F}}^{\left[f^{N}(\gamma w)\right]}\left(\left[f^{N}\left(c_{j}^{(i)}\right)\right]\right) \mu\left(c_{i}^{(j)}\right)\right\rangle}{\sum_{i=1}^{t} \sum_{j=1}^{k_{i}} \ell_{\mathcal{F}}^{\left[f^{N}(\gamma w)\right]}\left(\left[f^{N}\left(c_{j}^{(i)}\right)\right]\right)}\right| \\
& =\left|\frac{\sum_{i=1}^{t} \sum_{j=1}^{k_{i}} \ell_{\mathcal{F}}^{\left[f^{N}(\gamma w)\right]}\left(\left[f^{N}\left(c_{j}^{(i)}\right)\right]\right)\left(\frac{\left\langle\gamma,\left[f^{N}\left(c_{j}^{(i)}\right)\right]\right\rangle}{\left.\ell_{F}^{\left.l f^{N}(\gamma w)\right]}\left[f^{N}\left(c_{j}^{(i)}\right)\right]\right)}-\left\langle\gamma, \mu\left(c_{i}^{(j)}\right)\right\rangle\right)}{\left.\sum_{i=1}^{t} \sum_{j=1}^{k_{i}} \ell_{F}^{\left[f_{F}^{N}(\gamma w)\right]}\left[f^{N}\left(c_{j}^{(i)}\right]\right]\right)}\right| \\
& \leqslant \frac{\frac{\epsilon}{6} \sum_{i=1}^{t} \sum_{j=1}^{k_{i}} 1_{f}^{\left[f^{N}(\gamma w)\right]}\left(\left[f^{N}\left(c_{j}^{(i)}\right)\right]\right)}{\sum_{i=1}^{t} \sum_{j=1}^{k_{i}} \ell_{\mathcal{F}}^{\left[f f^{N}(\gamma w)\right]}\left(\left[f^{N}\left(c_{j}^{(i)}\right)\right]\right)}=\frac{\epsilon}{6} .
\end{aligned}
$$

Combining all inequalities, we have

$$
\left|\frac{\left\langle\gamma,\left[f^{N}\left(\gamma_{w}\right)\right]\right\rangle}{\ell_{\mathcal{F}}\left(\left[f^{N}\left(\gamma_{w}\right)\right]\right)}-\frac{\left\langle\gamma, \sum_{i=1}^{t} \sum_{j=1}^{k_{i}} \ell_{\mathcal{F}}^{\left[f^{N}\left(\gamma_{w}\right)\right]}\left(\left[f^{N}\left(c_{j}^{(i)}\right)\right]\right) \mu\left(c_{i}^{(j)}\right)\right\rangle}{\sum_{i=1}^{t} \sum_{j=1}^{k_{i}} \ell_{\mathcal{F}}^{\left[f^{N}\left(\gamma_{w}\right)\right]}\left(\left[f^{N}\left(c_{j}^{(i)}\right)\right]\right)}\right| \leqslant \frac{\epsilon}{4}+\frac{\epsilon}{6}+\frac{2 \epsilon}{6}+\frac{\epsilon}{6} \leqslant \epsilon .
$$

This concludes the proof of Assertion (1) of Lemma 5.20 since for every $i \in\{1, \ldots, t\}$ and every $j \in\left\{1, \ldots, k_{i}\right\}$, we have $\mu\left(c_{j}^{(i)}\right) \in \Delta_{+}(\phi)$.

The proof of Assertion (2) is the same one as the proof of Assertion (1), replacing $\ell_{\mathcal{F}}$ and $\ell_{\mathcal{F}}^{\gamma}$ by $\ell_{\text {exp }}$ and $\ell_{\text {exp }}^{\gamma}$, adding the following arguments. Let $\gamma$ and $w \in F_{\mathrm{n}}$ be as in

Assertion (2). Then $\gamma$ is not contained in a contenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$ by Lemma 5.18 (3). If

$$
\gamma_{w}=a_{0} b_{0} a_{1} c_{1}^{(1)} c_{2}^{(1)} \ldots c_{k_{1}}^{(1)} a_{2} b_{2} \ldots a_{t} c_{1}^{(t)} c_{2}^{(t)} \ldots c_{k_{t}}^{(t)} a_{t+1} b_{t+1} a_{t+2},
$$

is the same decomposition of $\gamma_{w}$ as in the proof of Assertion (1), then for every $m \in \mathbb{N}$ and every $i \in\{1, \ldots, t+2\}$, the path $\gamma$ is not contained in $\left[f^{m}\left(a_{i}\right)\right]$ by Lemma 3.9, Similarly, for every $m \in \mathbb{N}^{*}$ and every $i \in\{1, \ldots, t+2\}$, we have $\ell_{\exp }\left(\left[f^{m}\left(a_{i}\right)\right]\right)=0$. Hence we do not need Equation (17). By Lemma 5.18 (5), we have

$$
\ell_{\exp }(\gamma)=\ell_{\mathcal{F}_{1}}(\gamma) .
$$

Moreover, by Lemma 5.18 (5), for every current $[\mu] \in \Delta_{+}(\phi)$, we have $\Psi_{0}(\mu)=\|\mu\|_{\mathcal{F}_{1}}$. Replacing $\ell_{\mathcal{F}}$ and $\ell_{\mathcal{F}}^{\gamma}$ by $\ell_{\exp }$ and $\ell_{\text {exp }}^{\gamma}$ in the equations in the proof of Assertion (1) concludes the proof.

For the next lemma, we need to compute the exponential length of incomplete segments in a circuit $\gamma$ in $G$. Let $\ell_{\exp }(\operatorname{Inc}(\gamma))$ be the sum of the exponential lengths of the incomplete segments of an optimal splitting of $\gamma$. Let $\ell_{\text {exp }}^{\gamma}(\operatorname{Inc}(\gamma))$ be the sum of the exponential lengths relative to $\gamma$ of the incomplete segments of an optimal splitting of $\gamma$. Note that $\ell_{\text {exp }}^{\gamma}(\operatorname{Inc}(\gamma))$ do not depend on the choice of an optimal splitting. Note that

$$
\ell_{\text {exp }}^{\gamma}(\operatorname{Inc}(\gamma))=(1-\mathfrak{g}(\gamma)) \ell_{\exp }(\gamma) \leqslant \ell_{\exp }(\gamma) .
$$

Lemma 5.21. Let $\phi \in \operatorname{Out}\left(F_{\mathrm{n}}, \mathcal{F}\right)$ and let $f: G \rightarrow G$ be as in Remark 5.15. Let $\delta \in(0,1)$, and let $R>1$. There exists $n_{0} \in \mathbb{N}^{*}$ such that for every $n \geqslant n_{0}$ and every nonperipheral element $w \in F_{\mathrm{n}}$ such that $\eta_{[w]} \notin K_{P G}(\phi)$, we either have

$$
\mathfrak{g}\left(\left[f^{n}\left(\gamma_{w}\right)\right]\right) \geqslant \delta
$$

or

$$
\ell_{e x p}^{\left[f^{n}\left(\gamma_{w}\right)\right]}\left(\operatorname{Inc}\left(\left[f^{n}\left(\gamma_{w}\right)\right]\right)\right) \leqslant \frac{10 C}{R} \ell_{e x p}^{\gamma_{w}}\left(\operatorname{Inc}\left(\gamma_{w}\right)\right) \text { and } \ell_{e x p}\left(\left[f^{n}\left(\gamma_{w}\right)\right]\right) \leqslant \frac{10 C}{(1-\delta) R} \ell_{\exp }\left(\gamma_{w}\right) .
$$

Proof. Let $w \in F_{\mathrm{n}}$ be a nonperipheral element such that $\eta_{[w]} \notin K_{P G}(\phi)$. Suppose that $n \in \mathbb{N}^{*}$ is such that $\mathfrak{g}\left(\left[f^{n}\left(\gamma_{w}\right)\right]\right)<\delta$. Assuming for now that we have proved that

$$
\ell_{e x p}^{\left[f^{n}\left(\gamma_{w}\right)\right]}\left(\operatorname{Inc}\left(\left[f^{n}\left(\gamma_{w}\right)\right]\right)\right) \leqslant \frac{10 C}{R} \ell_{e x p}^{\gamma_{w}}\left(\operatorname{Inc}\left(\gamma_{w}\right)\right),
$$

we deduce that $\ell_{\exp }\left(\left[f^{n}\left(\gamma_{w}\right)\right]\right) \leqslant \frac{10 C}{(1-\delta) R} \ell_{\exp }\left(\gamma_{w}\right)$. Indeed, we have

$$
\ell_{e x p}^{\left[f^{n}(\gamma)\right]}\left(\operatorname{Inc}\left(\left[f^{n}(\gamma)\right]\right)\right)=\left(1-\mathfrak{g}\left(\left[f^{n}(\gamma)\right]\right)\right) \ell_{\exp }\left(\left[f^{n}(\gamma)\right]\right) \geqslant(1-\delta) \ell_{\exp }\left(\left[f^{n}(\gamma)\right]\right) .
$$

Thus we have

$$
\begin{aligned}
\ell_{\text {exp }}\left(\left[f^{n}\left(\gamma_{w}\right)\right]\right) & \leqslant \frac{1}{1-\delta} \ell_{e x p}^{\left[f^{n}\left(\gamma_{w}\right)\right]}\left(\operatorname{Inc}\left(\left[f^{n}\left(\gamma_{w}\right)\right]\right)\right) \leqslant \frac{10 C}{(1-\delta) R} \ell_{e x p}^{\gamma_{w}}\left(\operatorname{Inc}\left(\gamma_{w}\right)\right) \\
& \leqslant \frac{10 C}{(1-\delta) R} \ell_{e x p}\left(\gamma_{w}\right) .
\end{aligned}
$$

Therefore, it suffices to prove that there exists $n_{0} \in \mathbb{N}^{*}$ such that for every $n \geqslant n_{0}$, if $\mathfrak{g}\left(\left[f^{n}\left(\gamma_{w}\right)\right]\right)<\delta$, then

$$
\ell_{e x p}^{\left[f^{n}\left(\gamma_{w}\right)\right]}\left(\operatorname{Inc}\left(\left[f^{n}\left(\gamma_{w}\right)\right]\right)\right) \leqslant \frac{10 C}{R} \ell_{e x p}^{\gamma_{w}}\left(\operatorname{Inc}\left(\gamma_{w}\right)\right) .
$$

Consider an optimal splitting $\gamma_{w}=\alpha_{0}^{\prime} \beta_{1}^{\prime} \alpha_{1}^{\prime} \ldots \alpha_{m}^{\prime} \beta_{m}^{\prime}$, where for every $i \in\{0, \ldots, m\}$, the path $\alpha_{i}^{\prime}$ is an incomplete factor of $\gamma_{w}$ and for every $i \in\{0, \ldots, m\}$, the path $\beta_{i}^{\prime}$ is a $P G$-relative complete factor of $\gamma_{w}$. We can modify the splitting of $\gamma_{w}$ in a new splitting $\gamma_{w}=\alpha_{0} \beta_{1} \alpha_{1} \ldots \beta_{k} \alpha_{k}$ where:
(i) for every $i \in\{0, \ldots, k\}$, the path $\alpha_{i}$ is a concatenation of incomplete factors and complete factors of zero exponential length relative to $\gamma_{w}$ of the old splitting;
(ii) for every $i \in\{1, \ldots, k\}$, the path $\beta_{i}$ is a complete factor of positive exponential length relative to $\gamma_{w}$ of the old splitting.

In the remainder of the proof, we still refer to the paths $\alpha_{i}$ as incomplete factors. By the last claim of Remark 5.15, we may suppose that $\mathfrak{g}\left(\gamma_{w}\right)<\delta$, that is:

$$
\begin{equation*}
\ell_{e x p}^{\gamma_{w}}\left(\operatorname{Inc}\left(\gamma_{w}\right)\right)=\sum_{i=0}^{k} \ell_{e x p}^{\gamma_{w}}\left(\alpha_{i}\right) \geqslant(1-\delta) \ell_{e x p}\left(\gamma_{w}\right) . \tag{21}
\end{equation*}
$$

Claim. For every $i \in\{0, \ldots, k\}$ and every $m \in \mathbb{N}^{*}$, we have

$$
\ell_{e x p}^{\left[f^{m}\left(\gamma_{w}\right)\right]}\left(\operatorname{Inc}\left(\left[f^{m}\left(\alpha_{i}\right)\right]\right)\right) \leqslant 24 C^{2} \ell_{e x p}^{\gamma_{w}}\left(\alpha_{i}\right) .
$$

Similarly, for every $m \in \mathbb{N}^{*}$, we have

$$
\ell_{e x p}^{\left[\left[^{m}\left(\gamma_{w}\right)\right]\right.}\left(\operatorname{Inc}\left(\left[f^{m}\left(\gamma_{w}\right)\right]\right)\right) \leqslant 24 C^{2} \ell_{\text {exp }}\left(\gamma_{w}\right) .
$$

Proof. Since a reduced iterate of a complete factor is complete, every incomplete factor of $\left[f^{m}\left(\gamma_{w}\right)\right]$ is contained in a reduced iterate of some $\alpha_{i}$. Thus, we have

$$
\ell_{e x p}^{\left[f^{m}\left(\gamma_{w}\right)\right]}\left(\operatorname{Inc}\left(\left[f^{m}\left(\gamma_{w}\right)\right]\right)\right) \leqslant \sum_{i=0}^{k} \ell_{e x p}^{\left[f^{m}\left(\gamma_{w}\right)\right]}\left(\operatorname{Inc}\left(\left[f^{m}\left(\alpha_{i}\right)\right]\right)\right) .
$$

Hence it suffices to prove the result for the paths $\alpha_{i}$ with $i \in\{0, \ldots, k\}$. By Property (ii) for every $i \in\{1, \ldots, k\}$, the path $\beta_{i}$ has positive exponential length relative to $\gamma_{w}$. Therefore, if there exists $\gamma^{\prime} \in \mathcal{N}_{P G}^{\max }\left(\gamma_{w}\right)$ such that $\alpha_{i}$ intersects $\gamma^{\prime}$ nontrivially, then $\gamma^{\prime}$ is contained in $\beta_{i} \alpha_{i} \beta_{i+1}$. In particular, Lemma 5.13 applies and for every $i \in\{0, \ldots, k\}$, if $\ell_{\text {exp }}^{\gamma_{w}}\left(\alpha_{i}\right)=0$, then $\ell_{\text {exp }}\left(\alpha_{i}\right)=0$.

Let $i \in\{0, \ldots, k\}$. Suppose first that $\ell_{\text {exp }}^{\gamma_{w}}\left(\alpha_{i}\right)=0$. By the above, we have $\ell_{\text {exp }}\left(\alpha_{i}\right)=$ 0 . By Lemma 5.12, there exists $N \in \mathbb{N}^{*}$ such that for every $m \geqslant N$, such that the total exponential length of incomplete factors in any optimal splitting of $\left[f^{m}\left(\alpha_{i}\right)\right]$ is equal to 0 . Hence for every $m \geqslant N$, the path [ $\left.f^{m}\left(\alpha_{i}\right)\right]$ is $P G$-relative completely split. Up to
taking a power of $f$, we may assume that $N=1$. So this concludes the proof of the claim in the case when $\ell_{e x p}^{\gamma_{w}}\left(\alpha_{i}\right)=0$.

So we may assume that $\ell_{e x p}^{\gamma_{w}}\left(\alpha_{i}\right)>0$. By Lemma 5.12, for every $m \in \mathbb{N}^{*}$, the total exponential length of incomplete factors in $\left[f^{m}\left(\alpha_{i}\right)\right]$ is at most equal to $8 C \ell_{\text {exp }}\left(\alpha_{i}\right)$. By Lemma 5.6, for every $i \in\{1, \ldots, k\}$, we have

$$
\ell_{e x p}\left(\alpha_{i}\right) \leqslant \ell_{e x p}^{\gamma_{w}^{w}}\left(\alpha_{i}\right)+2 C \leqslant 3 C \ell_{e x p}^{\gamma_{w}^{w}}\left(\alpha_{i}\right) .
$$

Hence again by Lemma 5.6, we have

$$
\ell_{e x p}^{\left[f^{m}\left(\gamma_{w}\right)\right]}\left(\operatorname{Inc}\left(\left[f^{m}\left(\alpha_{i}\right)\right]\right)\right) \leqslant \ell_{e x p}\left(\operatorname{Inc}\left(\left[f^{m}\left(\alpha_{i}\right)\right]\right)\right) \leqslant 24 C^{2} \ell_{e x p}^{\gamma_{e x}^{w}}\left(\alpha_{i}\right) .
$$

This proves the claim.
Let $\Lambda_{\gamma_{w}}$ be the set consisting in all incomplete factors $\alpha_{i}$ of $\gamma_{w}$ whose exponential length relative to $\gamma_{w}$ is at least equal to $\left(3.10^{8}\right) R^{6} C^{12}+1$. Let $\Lambda_{\gamma_{w}}^{\prime}$ be the set consisting in all incomplete factors $\alpha_{i}$ of $\gamma_{w}$ which are not in $\Lambda_{\gamma_{w}}$. Let $\ell_{e x p}^{\gamma_{w}}\left(\Lambda_{\gamma_{w}}\right)$ (resp. $\left.\ell_{e x p}^{\gamma_{w}}\left(\Lambda_{\gamma_{w}}^{\prime}\right)\right)$ be the sum of the exponential lengths relative to $\gamma_{w}$ of all incomplete factors of $\gamma$ that belongs to $\Lambda_{\gamma_{w}}\left(\right.$ resp. $\left.\Lambda_{\gamma_{w}}^{\prime}\right)$. We distinguish between two cases, according to the proportion of $\ell_{e x p}^{\gamma_{e}^{w}}\left(\Lambda_{\gamma_{w}}\right)$ in the exponential length relative to $\gamma_{w}$ of incomplete factors in $\gamma_{w}$.
Case 1 Suppose that

$$
\frac{\ell_{e x p}^{\gamma_{w}^{w}}\left(\Lambda_{\gamma_{w}}\right)}{\ell_{e x p}^{\gamma_{x}}\left(\operatorname{Inc}\left(\gamma_{w}\right)\right)}<\frac{1}{\left(24 C^{2} R\right)^{2}}
$$

This implies that

$$
\begin{equation*}
\frac{\ell_{e x p}^{\gamma_{w}^{w}}\left(\Lambda_{\gamma_{w}}^{\prime}\right)}{\ell_{e x p}^{\gamma w}\left(\operatorname{Inc}\left(\gamma_{w}\right)\right)} \geqslant \frac{\left(24 C^{2} R\right)^{2}-1}{\left(24 C^{2} R\right)^{2}} \tag{22}
\end{equation*}
$$

Note that, by Lemma 5.6, every path in $\Lambda_{\gamma_{w}}^{\prime}$ has exponential length at most equal to $\left(3.10^{8}\right) C^{12} R^{6}+1+2 C$. By Lemma 5.11, there exists $n_{0} \in \mathbb{N}^{*}$ such that, for every edge path $\beta$ of exponential length at most equal to $\left(3.10^{8}\right) R^{6} C^{12}+1+2 C$ and every $n \geqslant n_{0}$ either $\left[f^{n}(\beta)\right]$ is a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$ or $\left[f^{n_{0}}(\beta)\right]$ contains a complete factor of exponential length at least equal to $10 C$. By Lemma 5.6. in the second case, the path $\left[f^{n_{0}}(\beta)\right]$ has a complete factor of positive exponential length relative to $\left[f^{n_{0}}(\beta)\right]$. Let $\Gamma_{\gamma_{w}}$ be the set consisting in all incomplete paths $\alpha_{i}$ of $\gamma_{w}$ such that $\alpha_{i} \in \Lambda_{\gamma_{w}}^{\prime}$ and $\left[f^{n_{0}}\left(\alpha_{i}\right)\right]$ is a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$. Let $\Gamma_{\gamma_{w}}^{\prime}$ be the set consisting in all incomplete paths $\alpha_{i}$ of $\gamma_{w}$ such that $\alpha_{i} \in \Lambda_{\gamma_{w}}^{\prime}$ and $\left[f^{n_{0}}\left(\alpha_{i}\right)\right]$ has at least one complete factor of positive exponential length relative to $\left[f^{n_{0}}\left(\alpha_{i}\right)\right]$. Note that $\Lambda_{\gamma_{w}}^{\prime}=\Gamma_{\gamma_{w}} \cup \Gamma_{\gamma_{w}}^{\prime}$. Let $\ell_{e x p}^{\gamma_{w}^{w}}\left(\Gamma_{\gamma_{w}}\right)\left(\right.$ resp. $\left.\ell_{e x p}^{\gamma_{w}}\left(\Gamma_{\gamma_{w}}^{\prime}\right)\right)$ be the sum of the exponential lengths relative to $\gamma_{w}$ of paths in $\Gamma_{\gamma_{w}}$ (resp. $\Gamma_{\gamma_{w}}^{\prime}$ ).
Subcase 1 Suppose that

$$
\frac{\ell_{\ell x p}^{\gamma_{w}^{w}}\left(\Gamma_{\gamma_{w}}\right)}{\ell_{e x p}^{\gamma w}\left(\Lambda_{\gamma_{w}}^{\prime}\right)} \geqslant \frac{24 C^{2} R}{24 C^{2} R+1} .
$$

Then

$$
\ell_{e x p}^{\gamma_{w}^{w}}\left(\Gamma_{\gamma_{w}}\right) \geqslant \frac{24 C^{2} R}{24 C^{2} R+1} \ell_{e x p}^{\gamma_{w}^{w}}\left(\Lambda_{\gamma_{w}}^{\prime}\right) \geqslant \frac{24 C^{2} R-1}{24 C^{2} R} \ell_{e x p}^{\gamma_{w}}\left(\operatorname{Inc}\left(\gamma_{w}\right)\right)
$$

Note that, for every $n \geqslant n_{0}$ and every path $\alpha_{i} \in \Gamma_{\gamma_{w}}$, we have $\ell_{\exp }\left(\left[f^{n}\left(\alpha_{i}\right)\right]\right)=0$ by Lemma 3.17. By the claim, for every path $\alpha_{i}$ such that $\alpha_{i} \in \Lambda_{\gamma_{w}}^{\prime}$ and $\alpha_{i} \notin \Gamma_{\gamma_{w}}$, and for every $n \in \mathbb{N}^{*}$, the total exponential length of incomplete factors in [ $f^{n}\left(\alpha_{i}\right)$ ] relative to [ $\left.f^{n}\left(\alpha_{i}\right)\right]$ is at most equal to $24 C^{2} \ell_{e x p}^{\gamma_{w}}\left(\alpha_{i}\right)$. Thus, for every $n \geqslant n_{0}$, we have:

$$
\begin{aligned}
\ell_{e x p}^{\left[f^{n}\left(\gamma_{w}\right)\right]}\left(\operatorname{Inc}\left(\left[f^{n}\left(\gamma_{w}\right)\right]\right)\right) & \leqslant \sum_{\alpha_{i} \in \Lambda_{\gamma_{w}} \cup \Lambda_{\gamma_{w}}^{\prime}} \ell_{e x p}^{\left[f^{n}\left(\gamma_{w}\right)\right]}\left(\operatorname{Inc}\left(\left[f^{n}\left(\alpha_{i}\right)\right]\right)\right) \\
& \leqslant \sum_{\alpha_{i} \in \Lambda_{\gamma_{w}} \cup\left(\Lambda_{\gamma_{w}}^{\prime}-\Gamma_{\gamma_{w}}\right)} 24 C^{2} \ell_{e x p}^{\gamma_{w}}\left(\alpha_{i}\right) \\
& \leqslant 24 C^{2} \ell_{e x p}^{\gamma_{w}}\left(\operatorname{Inc}\left(\gamma_{w}\right)\right)-24 C^{2} \frac{24 C^{2} R-1}{24 C^{2} R} \ell_{e x p}^{\gamma_{w}}\left(\operatorname{Inc}\left(\gamma_{w}\right)\right) \\
& \leqslant \frac{1}{R} \ell_{e x p}^{w_{w}}\left(\operatorname{Inc}\left(\gamma_{w}\right)\right) .
\end{aligned}
$$

This concludes the proof of Lemma 5.21 when Subcase 1 occurs.
Subcase 2 Suppose that

$$
\frac{\ell_{\exp }\left(\Gamma_{\gamma_{w}}\right)}{\ell_{\exp }\left(\Lambda_{\gamma_{w}}^{\prime}\right)}<\frac{24 C^{2} R}{24 C^{2} R+1}
$$

Note that the assumption of Subcase 2 and Equation (22) imply that

$$
\ell_{e x p}^{\gamma_{w}^{w}}\left(\Gamma_{\gamma_{w}}^{\prime}\right) \geqslant \frac{1}{24 C^{2} R+1} \ell_{e x p}^{\gamma_{w}}\left(\Lambda_{\gamma_{w}}^{\prime}\right) \geqslant \frac{\left(24 C^{2} R\right)^{2}-1}{\left(24 C^{2} R\right)^{2}} \frac{1}{24 C^{2} R+1} \ell_{e x p}^{\gamma_{w}}\left(\operatorname{Inc}\left(\gamma_{w}\right)\right)
$$

Since every path in $\Gamma_{\gamma_{w}}^{\prime}$ has exponential length at most equal to $\left(3.10^{8}\right) R^{6} C^{12}+1+2 C$, by Lemma 5.7, up to taking a larger $n_{0}$, for every path $\alpha_{i} \in \Gamma_{\gamma_{w}}^{\prime}$ such that $\ell_{\text {exp }}\left(\alpha_{i}\right)>0$ and every $n \geqslant n_{0}$, the exponential length of a complete factor in $\left[f^{n}\left(\alpha_{i}\right)\right.$ ] is at least equal to $3^{n-n_{0}} \ell_{\exp }\left(\alpha_{i}\right)$. Moreover, for every path $\alpha_{i} \in \Gamma_{\gamma_{w}}^{\prime}$ such that $\ell_{\text {exp }}\left(\alpha_{i}\right)=0$ and every $n \geqslant n_{0}$, the exponential length of a complete factor in $\left[f^{n}\left(\alpha_{i}\right)\right]$ is at least equal to $3^{n-n_{0}}$. By Lemma 5.6, for every $n \geqslant n_{0}$ and every path $\alpha_{i} \in \Gamma_{\gamma_{w}}^{\prime}$ such that $\ell_{\exp }\left(\alpha_{i}\right)>0$, the exponential length relative to $\left[f^{n}\left(\alpha_{i}\right)\right]$ of a complete factor in $\left[f^{n}\left(\alpha_{i}\right)\right]$ is at least equal to

$$
3^{n-n_{0}} \ell_{\exp }\left(\alpha_{i}\right)-2 C \geqslant\left(3^{n-n_{0}}-2 C\right) \ell_{\exp }\left(\alpha_{i}\right)
$$

Thus, for every $n \geqslant n_{0}$ and every path $\alpha_{i} \in \Gamma_{\gamma_{w}}^{\prime}$, the exponential length relative to [ $\left.f^{n}\left(\alpha_{i}\right)\right]$ of a complete factor in $\left[f^{n}\left(\alpha_{i}\right)\right]$ is at least equal to

$$
\left(3^{n-n_{0}}-2 C\right) \ell_{\exp }\left(\alpha_{i}\right)
$$

Therefore, for every $n \geqslant n_{0}$, the sum of the exponential lengths of complete factors in [ $f^{n}\left(\gamma_{w}\right)$ ] is at least equal to

$$
\begin{equation*}
\left(3^{n-n_{0}}-2 C\right) \ell_{e x p}^{\gamma_{w}}\left(\Gamma_{\gamma_{w}}^{\prime}\right) \geqslant\left(3^{n-n_{0}}-2 C\right) \frac{\left(24 C^{2} R\right)^{2}-1}{\left(24 C^{2} R\right)^{2}} \frac{1}{24 C^{2} R+1} \ell_{e x p}^{\gamma_{w}}\left(\operatorname{Inc}\left(\gamma_{w}\right)\right) \tag{23}
\end{equation*}
$$

By the claim, for every $n \in \mathbb{N}^{*}$, we have $\ell_{\text {exp }}^{\left[f^{n}\left(\gamma_{w}\right)\right]}\left(\operatorname{Inc}\left(\left[f^{n}\left(\gamma_{w}\right)\right]\right)\right) \leqslant 24 C^{2} \ell_{e x p}^{\gamma_{w}}\left(\operatorname{Inc}\left(\gamma_{w}\right)\right)$. Recall that the goodness function is a supremum over splittings of the considered path. Thus, by Equation (23) for every $n \geqslant n_{0}$, since the maps $t \mapsto \frac{t}{t+a}$ are nonincreasing for every $a>0$, we have

$$
\begin{aligned}
\mathfrak{g}\left(\left[f^{n}\left(\gamma_{w}\right)\right]\right) & \geqslant \frac{\left(3^{\left.n-n_{0}-2 C\right) \frac{\left(24 C^{2} R\right)^{2}-1}{\left(24 C^{2} R\right)^{2}} \frac{1}{24 C^{2} R+1} \ell_{e x p}^{\gamma w}\left(\operatorname{Inc}\left(\gamma_{w}\right)\right)}\right.}{\left(3^{n-n_{0}}-2 C\right) \frac{\left(24 C^{2} R\right)^{2}-1}{\left(24 C^{2} R\right)^{2}} \frac{1}{24 C^{2} R+1} \ell_{e x p}^{\gamma w}\left(\operatorname{Inc}\left(\gamma_{w}\right)\right)+\ell_{e x p}^{\left[f^{n}\left(\gamma_{w}\right)\right]}\left(\operatorname{Inc}\left(\left[f^{n}\left(\gamma_{w}\right)\right]\right)\right.} \\
& \geqslant \frac{\left(3^{\left.n-n_{0}-2 C\right) \frac{\left(24 C^{2} R\right)^{2}-1}{\left(24 C^{2} R\right)^{2}} \frac{1}{24 C^{2} R+1} \ell_{e x p}^{\gamma w}\left(\operatorname{Inc}\left(\gamma_{w}\right)\right)}\right.}{\left(3^{\left.n-n_{0}-2 C\right) \frac{\left(24 C^{2} R\right)^{2}-1}{\left(24 C^{2} R\right)^{2}} \frac{1}{24 C^{2} R+1} \ell_{e x p}^{\gamma w}\left(\operatorname{Inc}\left(\gamma_{w}\right)\right)+24 C^{2} \ell_{e x p}^{\gamma_{w}}\left(\operatorname{Inc}\left(\gamma_{w}\right)\right)}\right.} \\
& \geqslant \frac{\left(3^{\left.n-n_{0}-2 C\right) \frac{\left(24 C^{2} R\right)^{2}-1}{\left(24 C^{2} R\right)^{2}} \frac{1}{24 C^{2} R+1}}\right.}{\left(3^{\left.n-n_{0}-2 C\right) \frac{\left(24 C^{2} R\right)^{2}-1}{\left(24 C^{2} R\right)^{2}} \frac{1}{24 C^{2} R+1}+24 C^{2}},\right.}
\end{aligned}
$$

which goes to 1 as $n$ goes to infinity. Hence there exists $n_{1} \in \mathbb{N}$ which is independent of $\gamma_{w}$, such that, for every path $\gamma_{w}$ as in Subcase 2 and every $n \geqslant n_{1}$, we have: $\mathfrak{g}\left(\left[f^{n}\left(\gamma_{w}\right)\right]\right) \geqslant \delta$. This concludes the proof of Lemma 5.21 when Case 1 occurs.
Case 2 Suppose that, contrarily to Case 1, we have

$$
\frac{\ell_{e x p}^{\gamma_{w}}\left(\Lambda_{\gamma_{w}}\right)}{\ell_{e x p}^{\gamma_{w}}\left(\operatorname{Inc}\left(\gamma_{w}\right)\right)} \geqslant \frac{1}{\left(24 C^{2} R\right)^{2}}
$$

Let $\alpha \in \Lambda_{\gamma_{w}}$ and consider the decomposition of the reduced path $\alpha$ into maximal subsegments $\alpha^{(1)} \ldots \alpha^{\left(k_{\alpha}\right)}$ of exponential length relative to $\gamma_{w}$ equal to $2000 R^{3} C^{6}$, except possibly the last one of exponential length relative to $\gamma_{w}$ less than or equal to $2000 R^{3} C^{6}$. Let

$$
\begin{aligned}
\Lambda_{\gamma_{w}}^{(1)} & =\left\{\alpha^{(j)} \mid \alpha \in \Lambda_{\gamma_{w}}, j \in\left\{1, \ldots, k_{\alpha}\right\}, \ell_{e x p}^{\gamma_{w}}\left(\alpha^{(j)}\right)=2000 R^{3} C^{6}\right\} \\
\Lambda_{\gamma_{w}}^{(2)} & =\left\{\alpha^{(j)} \mid \alpha \in \Lambda_{\gamma_{w}}, j \in\left\{1, \ldots, k_{\alpha}\right\}, \ell_{e x p}^{\gamma_{w}}(\alpha)<2000 R^{3} C^{6}\right\}
\end{aligned}
$$

Note that, since for every $\alpha \in \Lambda_{\gamma_{w}}$, we have $\ell_{e x p}^{\gamma_{w}}(\alpha) \geqslant\left(3.10^{8}\right) R^{6} C^{12}+1$, we see that

$$
\begin{equation*}
\left|\Lambda_{\gamma_{w}}^{(1)}\right| \geqslant 120000 R^{3} C^{6}\left|\Lambda_{\gamma_{w}}^{(2)}\right| \tag{24}
\end{equation*}
$$

Note that every element in $\Lambda_{\gamma_{w}}^{(1)} \cup \Lambda_{\gamma_{w}}^{(2)}$ has exponential length at most equal to $2000 R^{3} C^{6}+1+2 C$ by Lemma 5.6. By Lemma 5.11, there exists $M \in \mathbb{N}^{*}$ depending only on $f$ such that for every $n \geqslant M$ and every reduced edge path $\alpha$ of exponential length at most equal to $\left(3.10^{8}\right) R^{6} C^{12}+1+2 C$, either $\left[f^{n}(\alpha)\right]$ is a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$ or the following holds:
(a) there exists a complete factor of $\left[f^{n}(\alpha)\right]$ whose exponential length is at least equal to $10 C$;
(b) the exponential length of an incomplete factor of $\left[f^{n}(\alpha)\right]$ is at most equal to $8 C$.

This applies in particular to every element $\alpha \in \Lambda_{\gamma_{w}}^{(1)} \cup \Lambda_{\gamma_{w}}^{(2)}$ and to every element $\alpha \in \Lambda_{\gamma_{w}}^{\prime}$. For every $\alpha^{(j)} \in \Lambda_{\gamma_{w}}^{(1)}$ and every $n \geqslant M$, let $\alpha^{(j, n)}$ be the (possibly degenerate) subpath of $\left[f^{n}\left(\alpha^{(j)}\right)\right]$ contained in $\left[f^{n}(\alpha)\right]$. Let $\Lambda_{\gamma_{w}}^{(3)}$ be the subset of $\Lambda_{\gamma_{w}}^{(1)}$ consisting in all $\alpha^{(j)} \in \Lambda_{\gamma_{w}}^{(1)}$ such that $\ell_{\exp }\left(\alpha^{(j, M)}\right) \leqslant 80 C^{2}$, and let $\Lambda_{\gamma_{w}}^{(4)}=\Lambda_{\gamma_{w}}^{(1)}-\Lambda_{\gamma_{w}}^{(3)}$.

Suppose first that

$$
\begin{equation*}
\left|\Lambda_{\gamma_{w}}^{(4)}\right|>\frac{1}{30000 R^{3} C^{6}}\left|\Lambda_{\gamma_{w}}^{(3)}\right| . \tag{25}
\end{equation*}
$$

Therefore, as $\left|\Lambda_{\gamma_{w}}^{(1)}\right|=\left|\Lambda_{\gamma_{w}}^{(3)}\right|+\left|\Lambda_{\gamma_{w}}^{(4)}\right|$, by Equation (24), we have

$$
\left|\Lambda_{\gamma_{w}}^{(2)}\right| \leqslant \frac{30001 R^{3} C^{6}}{120000 R^{3} C^{6}}\left|\Lambda_{\gamma_{w}}^{(4)}\right|=K_{0}\left|\Lambda_{\gamma_{w}}^{(4)}\right|
$$

where $K_{0}$ is a constant depending only on $C$ and $R$. Note that $\Lambda_{\gamma_{w}}=\Lambda_{\gamma_{w}}^{(2)} \cup \Lambda_{\gamma_{w}}^{(3)} \cup \Lambda_{\gamma_{w}}^{(4)}$ and for every $j \in\{2,3,4\}$, every path in $\Lambda_{\gamma_{w}}^{(j)}$ has exponential length at most equal to $2000 R^{3} C^{6}$. Thus, we see that

$$
\ell_{e x p}^{\gamma_{w}}\left(\Lambda_{\gamma_{w}}\right) \leqslant 2000 R^{3} C^{6}\left(\left|\Lambda_{\gamma_{w}}^{(2)}\right|+\left|\Lambda_{\gamma_{w}}^{(3)}\right|+\left|\Lambda_{\gamma_{w}}^{(4)}\right|\right) \leqslant K_{0}^{\prime}\left|\Lambda_{\gamma_{w}}^{(4)}\right|
$$

for some constant $K_{0}^{\prime}$ depending only on $C$ and $R$.
Recall that if $\alpha^{(j)} \in \Lambda_{\gamma_{w}}^{(4)}$, then $\ell_{\exp }\left(\alpha^{(j, M)}\right)>80 C^{2}$. Suppose towards a contradiction that $\left[f^{M}\left(\alpha^{(j)}\right)\right]$ is a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$. Since $\alpha^{(j, M)}$ is a subpath of $\left[f^{M}\left(\alpha^{(j)}\right)\right]$, we have $\ell_{\text {exp }}^{\left[f^{M}\left(\alpha^{(j)}\right)\right]}\left(\alpha^{(j, M)}\right)=0$. By Lemma 5.6, we see that $\ell_{\exp }\left(\alpha^{(j, M)}\right) \leqslant \ell_{\text {exp }}^{\left[f^{M}\left(\alpha^{(j)}\right)\right]}\left(\alpha^{(j, M)}\right)+2 C=2 C$, which leads to a contradiction. Hence $\left[f^{M}\left(\alpha^{(j)}\right)\right]$ satisfies $(a)$ and $(b)$. Note that $\alpha^{(j, M)}$ is a subpath of $\left[f^{M}\left(\alpha^{(j)}\right)\right]$. Since $\ell_{\exp }\left(\alpha^{(j, M)}\right)>80 C^{2}$, since every incomplete factor of $\left[f^{M}\left(\alpha^{(j)}\right)\right]$ has exponential length at most equal to $8 C$ by $(b)$ and since an incomplete factor of $\left[f^{M}\left(\alpha^{(j)}\right)\right]$ is followed by a complete factor of $\left[f^{M}\left(\alpha^{(j)}\right)\right]$, we see that $\alpha^{(j, M)}$ contains a subpath of a complete factor of $\left[f^{M}\left(\alpha^{(j)}\right)\right]$. Since $\ell_{\exp }\left(\alpha^{(j, M)}\right)>80 C^{2}$ and since every incomplete subpath of $\left[f^{M}\left(\alpha^{(j)}\right]\right.$ has exponential length at most equal to $8 C$, the path $\alpha^{(j, M)}$ must contain a subpath $\alpha^{(j, M)^{\prime}}$ such that the total exponential length of complete factors of $\alpha^{(j, M)^{\prime}}$ is at least equal to $10 C$. Let $\alpha_{0}^{(j, M)}$ be the minimal concatenation of splittings of a fixed optimal splittings of $\left[f^{m}\left(\alpha^{(j)}\right)\right]$ which contains $\alpha^{(j, M)^{\prime}}$. Let $\tau_{1}^{(j, M)}$ and $\tau_{2}^{(j, M)}$ be paths such that $\left[f^{M}\left(\alpha^{(j)}\right)\right]=\tau_{1}^{(j, M)} \alpha_{0}^{(j, M)} \tau_{2}^{(j, M)}$. By Lemma 5.8 applied twice (once with $\gamma=\alpha_{0}^{(j, M)} \tau_{2}^{(j, M)}\left[f^{M}\left(\alpha^{(j+1)} \ldots \alpha_{k}^{\left(k_{\alpha_{k}}\right)}\right)\right]$ and $\gamma_{1}=\alpha_{0}^{(j, M)}$ and once with $\gamma^{-1}=\left[f^{M}\left(\alpha_{1}^{(1)} \ldots \alpha^{(j-1)}\right)\right] \tau_{1}^{(j, M)} \alpha_{0}^{(j, M)}$ and $\left.\gamma_{1}^{-1}=\alpha_{0}^{(j, M)}\right)$, we see that $\alpha^{(j, M)}$ contains a complete factor of $\left[f^{M}\left(\gamma_{w}\right)\right]$ of exponential length at least equal to $10 C-4 C=6 C$. By Lemma [5.6, the path $\alpha^{(j, M)}$ contains a complete factor of $\left[f^{M}\left(\gamma_{w}\right)\right]$ of exponential length relative to $\left[f^{M}\left(\gamma_{w}\right)\right]$ at least equal to $C$. By Lemma 5.7 (with $\gamma$ a complete factor contained in $\alpha^{(j, M)}$, for every $n \geqslant M$ and every $\alpha^{(j)} \in \Lambda_{\gamma_{w}}^{(4)}$, the path $\alpha^{(j, n)}$ contains a complete subpath of $\left[f^{n}\left(\gamma_{w}\right)\right.$ ] of exponential length at least equal to $3^{n-M} C$. By Lemma 5.6, for every $n \geqslant M$ and every $\alpha^{(j)} \in \Lambda_{\gamma_{w}}^{(4)}$, the path $\alpha^{(j, n)}$ contains a complete subpath of [ $f^{n}\left(\gamma_{w}\right)$ ] of exponential length relative to $\left[f^{n}\left(\gamma_{w}\right)\right]$ at least equal to $3^{n-M} C-2 C$. Hence
for every $n \geqslant M$, the sum of the exponential length relative to [ $f^{n}\left(\gamma_{w}\right)$ ] of complete factors contained in $\left[f^{n}\left(\gamma_{w}\right)\right]$ is at least equal to $\left(3^{n-M} C-2 C\right)\left|\Lambda_{\gamma_{w}}^{(4)}\right|$.

By the claim, for every $n \geqslant M$, we have

$$
\ell_{e x p}^{\left[f^{n}\left(\gamma_{w}\right)\right]}\left(\operatorname{Inc}\left(\left[f^{n}\left(\gamma_{w}\right)\right]\right)\right) \leqslant 24 C^{2} \ell_{e x p}^{\gamma_{w}}\left(\gamma_{w}\right) \leqslant 24 C^{2} \frac{1}{1-\delta} \ell_{e x p}^{\gamma_{w}}\left(\operatorname{Inc}\left(\gamma_{w}\right)\right),
$$

where the last inequality holds by Equation (21). Using the above equations and the assumptions of Case 2, we see that

$$
\begin{aligned}
\ell_{e x p}^{\left[f^{n}\left(\gamma_{w}\right)\right]}\left(\operatorname{Inc}\left(\left[f^{n}\left(\gamma_{w}\right)\right]\right)\right) & \leqslant 24 C^{2} \frac{1}{1-\delta} \ell_{e x p}^{\gamma_{w}}\left(\operatorname{Inc}\left(\gamma_{w}\right)\right) \\
& \leqslant 24 C^{2} \frac{1}{1-\delta}\left(24 C^{2} R\right)^{2} \ell_{e x p}^{x_{x}}\left(\Lambda_{\gamma_{w}}\right) \\
& \leqslant 24 C^{2} \frac{1}{1-\delta}\left(24 C^{2} R\right)^{2} K_{0}^{\prime}\left|\Lambda_{\gamma_{w}}^{4}\right|=K_{1}\left|\Lambda_{\gamma_{w}}^{(4)}\right|,
\end{aligned}
$$

where $K_{1}$ is a constant depending only on $C, R$ and $\delta$. Thus, since the goodness function is a supremum over all splittings of the considered path, for every $n \geqslant M$, we have:

$$
\begin{aligned}
& \mathfrak{g}\left(\left[f^{n}\left(\gamma_{w}\right)\right]\right) \geqslant \frac{\left(3^{n-M} C-2 C\right)\left|\Lambda_{\gamma}^{(4)}\right|}{\left(3^{n-M} C-2 C\right)\left|\Lambda_{\gamma_{w}}^{4}\right|+\ell_{f_{x}}^{n(\gamma)]}\left(\operatorname{Inc}\left(\left[f^{n}(\alpha)\right]\right)\right)} \\
& \geqslant \frac{\left(3^{n-M} C-2 C\right)\left|\Lambda_{\gamma v}^{(4)}\right|}{\left(3^{n-M} C-2 C\right)\left|\Lambda_{\gamma w}^{(4)}\right|+K_{1}\left|\Lambda_{\gamma w}^{(4)}\right|} \\
& =\frac{3^{n-M} C-2 C}{3^{n-M} C-2 C+K_{1}} \text {, }
\end{aligned}
$$

which converges to 1 as $n$ goes to infinity. Hence there exists $M^{\prime} \in \mathbb{N}^{*}$ depending only on $f$ such that for every $n \geqslant M$, we have $\mathfrak{g}\left(\left[f^{n}\left(\gamma_{w}\right)\right]\right) \geqslant \delta$. This proves Lemma 5.21 in this case.

Suppose now that contrarily to Equation (25), we have

$$
\begin{equation*}
\left|\Lambda_{\gamma_{w}}^{(4)}\right| \leqslant \frac{1}{30000 R^{3} C^{6}}\left|\Lambda_{\gamma_{w}}^{(3)}\right| . \tag{26}
\end{equation*}
$$

Then

$$
\left|\Lambda_{\gamma_{w}}^{(1)}\right|=\left|\Lambda_{\gamma_{w}}^{(3)}\right|+\left|\Lambda_{\gamma_{w}}^{(4)}\right| \leqslant\left(1+\frac{1}{30000 R^{3} C^{6}}\right)\left|\Lambda_{\gamma_{w}}^{(3)}\right| .
$$

Claim 2 Let $n \geqslant M$, let $\alpha^{(j)} \in \Lambda_{\gamma_{w}}^{(2)} \cup \Lambda_{\gamma_{w}}^{(4)}$. The total exponential length of incomplete factors of $\left[f^{n}\left(\gamma_{w}\right)\right]$ contained in $\alpha^{(j, n)}$ is at most equal to $12 C \ell_{\text {exp }}\left(\alpha^{(j)}\right)$.
Proof. Let $\sigma$ be an incomplete factor of $\left[f^{n}\left(\gamma_{w}\right)\right]$ which is contained in $\alpha^{(j, M)}$. Then one of the following holds:
(i) the path $\sigma$ is an incomplete factor of $\left[f^{n}\left(\alpha^{(j)}\right)\right]$;
(ii) the path $\sigma$ contains a subpath which is complete in $\left[f^{n}\left(\alpha^{(j)}\right)\right]$.

Note that the total exponential length of incomplete factors of $\left[f^{n}\left(\gamma_{w}\right)\right]$ which satisfy $(i)$ is bounded by the total exponential length of incomplete factors of $\left[f^{n}\left(\alpha^{(j)}\right)\right]$. Thus, by Lemma 5.12, the total exponential length of incomplete factors of $\left[f^{n}\left(\gamma_{w}\right)\right]$
which satisfy $(i)$ is bounded by $8 C \ell_{\exp }\left(\alpha^{(j)}\right)$. Suppose that $\sigma$ satisfies $(i i)$. Let $\alpha^{(j, n)}=$ $a_{1} c a_{2}$ be a decomposition of $\alpha^{(j, n)}$ where for every $i \in\{1,2\}$, the total exponential length of complete factors of $\left[f^{n}\left(\alpha^{(j)}\right)\right.$ ] contained in $a_{i}$ is equal to $2 C$. By Lemma 5.8 applied to $\gamma=\left[f^{n}\left(\alpha^{(j)}\right)\right]\left[f^{n}\left(\alpha^{(j+1)} \ldots \alpha_{k}^{\left(k_{\alpha_{k}}\right)}\right)\right]$ and $\gamma_{1}=\left[f^{n}\left(\alpha^{(j)}\right)\right]$ and to $\gamma^{-1}=$ $\left[f^{n}\left(\alpha_{1}^{(1)} \ldots \alpha^{(j-1)}\right)\right]\left[f^{n}\left(\alpha^{(j)}\right)\right]$ and $\gamma_{1}^{-1}=\left[f^{n}\left(\alpha^{(j)}\right)\right]$, the path $\sigma$ is contained in either $a_{1}$ or $a_{2}$. For every $t \in\{1,2\}$, let $a_{t}=b_{1}^{(t)} b_{1}^{(t)^{\prime}} \ldots b_{s}^{(t)} b_{s_{t}}^{(t)^{\prime}}$ be a decomposition of $a_{t}$ where, for every $i \in\left\{1, \ldots, s_{t}\right\}$, the path $b_{i}^{(t)}$ is an incomplete factor of $\left[f^{n}\left(\alpha^{(j)}\right)\right]$ and for every $i \in\left\{1, \ldots, s_{t}\right\}$, the path $b_{i}^{(t)^{\prime}}$ is a complete factor of $\left[f^{n}\left(\alpha^{(j)}\right)\right]$ contained in $a_{t}$.

Suppose that there exists $i \in\left\{1, \ldots, s_{1}\right\}$ such that $b_{i}^{(1)^{\prime}}$ is a complete factor of [ $\left.f^{n}\left(\gamma_{w}\right)\right]$. We claim that for every $j \geqslant i+1$, the path $b_{j}^{(1)^{\prime}}$ is a complete factor of [ $f^{n}\left(\gamma_{w}\right)$ ]. Indeed, let $n^{\prime} \geqslant n$ and let $j \geqslant i+1$. Then there is no identification between an initial segment of $\left[f^{n^{\prime}}\left(b_{i}^{(1)^{\prime}}\right)\right]$ and an initial segment of $\left[f^{n}\left(\gamma_{w}\right)\right]$ not intersecting $\alpha^{\left(j, n^{\prime}\right)}$ as otherwise there would exist identifications with $\left[f^{n^{\prime}}\left(b_{i}^{(1)^{\prime}}\right)\right]$, contradicting the fact that $b_{i}^{(1)^{\prime}}$ is complete. Similarly, there is no identification between a terminal segment of [ $\left.f^{n^{\prime}}\left(b_{i}^{(1)^{\prime}}\right)\right]$ and a terminal segment of $\left[f^{n}\left(\gamma_{w}\right)\right]$ not intersecting $\alpha^{\left(j, n^{\prime}\right)}$ as otherwise there would exist identifications with $\left[f^{n^{\prime}}(c)\right]$. The claim follows. Similarly, if there exists $i \in\left\{1, \ldots, s_{2}\right\}$ such that $b_{i}^{(2)^{\prime}}$ is a complete factor of $\left[f^{n}\left(\gamma_{w}\right)\right]$, then for every $j<i$, the path $b_{j}^{(2)^{\prime}}$ is a complete factor of $\left[f^{n}\left(\gamma_{w}\right)\right]$. Hence we may assume that for every $t \in\{1,2\}$ and every $s \in\left\{1, \ldots, s_{t}\right\}$, the path $b_{s}^{(t)^{\prime}}$ is incomplete in $\left[f^{n}\left(\gamma_{w}\right)\right]$. Therefore, for every $t \in\{1,2\}$, the whole path $a_{t}$ is incomplete in $\left[f^{n}\left(\gamma_{w}\right)\right]$. Therefore, in order to prove the claim, it suffices to bound the exponential lengths of $a_{1}$ and $a_{2}$. Let $t \in\{1,2\}$. By Lemma 3.16, we have

$$
\ell_{\exp }\left(a_{t}\right) \leqslant \sum_{i=1}^{s_{t}} \ell_{\exp }\left(b_{i}^{(t)}\right)+\ell_{\exp }\left(b_{i}^{(t)^{\prime}}\right)
$$

For every $i \in\left\{1 \ldots, s_{t}\right\}$, the path $b_{i}^{(t)}$ satisfies $(i)$ and we already have a bound on the total exponential length of such paths. Moreover, since the total exponential length of complete factors of $\alpha^{(j, n)}$ contained in $a_{t}$ is at most equal to $2 C$, we have

$$
\sum_{i=1}^{s_{t}} \ell_{\exp }\left(b_{i}^{(t)^{\prime}}\right) \leqslant 2 C
$$

Thus, the total exponential length of incomplete factors of $\left[f^{n}\left(\gamma_{w}\right)\right]$ contained in $\alpha^{(j, M)}$ is at most equal to

$$
8 C \ell_{\exp }\left(\alpha^{(j)}\right)+\sum_{t=1}^{2} \sum_{i=1}^{s_{t}} \ell_{\exp }\left(b_{i}^{(t)^{\prime}}\right) \leqslant 8 C \ell_{\exp }\left(\alpha^{(j)}\right)+4 C \leqslant 12 C \ell_{\exp }\left(\alpha^{(j)}\right)
$$

where the last inequality follows from the fact that every element of $\Lambda_{\gamma_{w}}^{(2)} \cup \Lambda_{\gamma_{w}}^{(4)}$ has positive exponential length.

By Claim 2 and Lemma 5.6, for every $n \geqslant M$ and every $\alpha^{(j)} \in \Lambda_{\gamma_{w}}^{(2)} \cup \Lambda_{\gamma_{w}}^{(4)}$, the total exponential length relative to [ $f^{n}\left(\gamma_{w}\right)$ ] of incomplete factors in the subpath of [ $f^{n}\left(\gamma_{w}\right)$ ] contained in $\left[f^{n}\left(\alpha^{(j)}\right)\right]$ is at most equal to $12 C \ell_{e x p}^{\gamma_{w}}\left(\alpha^{(j)}\right)+2 C \leqslant 14 C \ell_{e x p}^{\gamma_{w}}\left(\alpha^{(j)}\right)$. Hence by definition, for every $n \geqslant M$ and every path $\alpha^{(j)} \in \Lambda_{\gamma_{w}}^{(2)} \cup \Lambda_{\gamma_{w}}^{(4)}$, we have

$$
\ell_{e x p}^{\left[f^{n}\left(\gamma_{w}\right)\right]}\left(\operatorname{Inc}\left(\left[f^{n}\left(\gamma_{w}\right)\right]\right) \cap \alpha^{(j, n)}\right) \leqslant 14 C \ell_{e x p}\left(\alpha^{(j)}\right)
$$

We claim that, for every $n \geqslant M$, every element in $\Lambda_{\left[f^{n}\left(\gamma_{w}\right)\right]}$ is contained in an iterate of an element in $\Lambda_{\gamma_{w}}$. Indeed, note that, by the choice of $M$ (in the above application of Lemma 5.11), for every element $\alpha \in \Lambda_{\gamma_{w}}^{\prime}$, the exponential length of an incomplete factor in $\left[f^{n}(\alpha)\right]$ is at most equal to $8 C$. Hence an incomplete factor of [ $f^{n}(\alpha)$ ] whose exponential length is at least equal to $\left(3.10^{8}\right) R^{6} C^{12}+1$ cannot be contained in an iterate of an element of $\Lambda_{\gamma_{w}}$. The claim follows. Therefore, using Equation (26) for the third inequality, the value of $\ell_{\exp }\left(\Lambda_{\left[f^{M}\left(\gamma_{w}\right)\right]}\right)$ is at most equal to

$$
\begin{aligned}
& \quad \sum_{\alpha^{(j)} \in \Lambda_{\gamma w}^{(3)}} \ell_{\exp }\left(\alpha^{(j, M)}\right)+\sum_{\alpha^{(j)} \in \Lambda_{\gamma w}^{(4)}} \ell_{e x p}^{\left[f^{M}\left(\gamma_{w}\right)\right]}\left(\operatorname{Inc}\left(\left[f^{M}\left(\gamma_{w}\right)\right]\right) \cap \alpha^{(j, M)}\right) \\
& +\sum_{\alpha^{(j) \in \Lambda_{\gamma w}^{(2)}} \ell_{e x p}^{\left[f^{M}\left(\gamma_{w}\right)\right]}\left(\operatorname{Inc}\left(\left[f^{M}\left(\gamma_{w}\right)\right]\right) \cap \alpha^{(j, M)}\right)}^{\leqslant} \leqslant 80 C^{2}\left|\Lambda_{\gamma_{w}}^{(3)}\right|+14 C \sum_{\beta \in \Lambda_{\gamma w}^{(4)}} \ell_{\exp }(\beta)+14 C \sum_{\alpha \in \Lambda_{\gamma w}^{(2)}} \ell_{\exp }(\alpha) \\
& \leqslant 80 C^{2}\left|\Lambda_{\gamma_{w}}^{(3)}\right|+14 C\left(2000 R^{3} C^{6}\right)\left|\Lambda_{\gamma_{w}}^{(4)}\right|+14 C \sum_{\alpha \in \Lambda_{\gamma w}^{(2)}} \ell_{\exp }(\alpha) \\
& \leqslant 80 C^{2}\left|\Lambda_{\gamma_{w}}^{(3)}\right|+C\left|\Lambda_{\gamma_{w}}^{(3)}\right|+14 C \sum_{\alpha \in \Lambda_{\gamma w}^{(2)}} \ell_{\exp }(\alpha) \\
& \leqslant 81 C^{2}\left|\Lambda_{\gamma_{w}}^{(3)}\right|+14 C \sum_{\alpha \in \Lambda_{\gamma w}^{(2)}} \ell_{\exp }(\alpha)
\end{aligned}
$$

Since by Equation (24)

$$
\left(1+\frac{1}{30000 R^{3} C^{6}}\right)\left|\Lambda_{\gamma_{w}}^{(3)}\right| \geqslant\left|\Lambda_{\gamma_{w}}^{(1)}\right| \geqslant 120000 R^{3} C^{6}\left|\Lambda_{\gamma_{w}}^{(2)}\right|,
$$

we have $\left|\Lambda_{\gamma_{w}}^{(3)}\right| \geqslant 60000 R^{3} C^{6}\left|\Lambda_{\gamma_{w}}^{(2)}\right|$. Hence we have

$$
\begin{aligned}
\ell_{e x p}^{\left[f^{M}\left(\gamma_{w}\right)\right]}\left(\Lambda_{\left[f^{M}\left(\gamma_{w}\right)\right]}\right) & \leqslant 81 C^{2}\left|\Lambda_{\gamma_{w}}^{(3)}\right|+14 C \sum_{\alpha \in \Lambda_{\gamma w}^{(2)}} \ell_{\exp }(\alpha) \\
& \leqslant 81 C^{2}\left|\Lambda_{\gamma_{w}}^{(3)}\right|+(14 C)\left(2000 R^{3} C^{6}\right)\left|\Lambda_{\gamma_{w}}^{(2)}\right| \\
& \leqslant 81 C^{2}\left|\Lambda_{\gamma_{w}}^{(3)}\right|+2 C\left|\Lambda_{\gamma_{w}}^{(3)}\right|=83 C^{2}\left|\Lambda_{\gamma_{w}}^{(3)}\right| .
\end{aligned}
$$

Let $n \geqslant M$. Suppose first that

$$
\frac{\ell_{e x p}^{\left[f^{n}\left(\gamma_{w}\right)\right]}\left(\Lambda_{\left[f^{n}\left(\gamma_{w}\right)\right]}\right)}{\ell_{e x p}^{\left[f^{n}\left(\gamma_{w}\right)\right]}\left(\operatorname{Inc}\left(\left[f^{n}\left(\gamma_{w}\right)\right]\right)\right)}<\frac{1}{\left(24 C^{2} R\right)^{2}}
$$

Then we can apply Case 1 to conclude the proof of Lemma 5.21. Otherwise, we have

$$
\left(24 C^{2} R\right)^{2} \ell_{e x p}^{\left[f^{n}\left(\gamma_{w}\right)\right]}\left(\Lambda_{\left[f^{n}\left(\gamma_{w}\right)\right]}\right) \geqslant \ell_{e x p}^{\left[f^{n}\left(\gamma_{w}\right)\right]}\left(\operatorname{Inc}\left(\left[f^{n}\left(\gamma_{w}\right)\right]\right)\right) .
$$

By Lemma 5.12 and Lemma 5.6, we have

$$
\begin{aligned}
\ell_{e x p}^{\left[f^{n}\left(\gamma_{w}\right)\right]}\left(\operatorname{Inc}\left(\left[f^{n}\left(\gamma_{w}\right)\right]\right)\right. & \leqslant \ell_{\exp }\left(\operatorname{Inc}\left(\left[f^{n}\left(\gamma_{w}\right)\right]\right) \leqslant 8 C \ell_{e x p}\left(\operatorname{Inc}\left(\left[f^{M}\left(\gamma_{w}\right)\right]\right)\right.\right. \\
& \leqslant 10 C \ell_{\text {exp }}^{\left[f^{M}\left(\gamma_{w}\right)\right]}\left(\operatorname{Inc}\left(\left[f^{M}\left(\gamma_{w}\right)\right]\right) .\right.
\end{aligned}
$$

Hence we have

$$
\begin{aligned}
& \leqslant \frac{10 C\left(24 C^{2} R\right)^{2} \ell_{e x p}^{\left[f^{n}\left(\gamma_{w}\right)\right]}\left(\Lambda_{\left[f^{n}\left(\gamma_{w}\right)\right]}\right)}{\ell_{e x p}^{\left[f^{n}\left(\gamma_{w}\right)\right]}\left(\Lambda_{\gamma_{w}}\right)} \\
& \leqslant \frac{10 C\left(24 C^{2} R\right)^{2}\left(83 C^{2}\left|\Lambda_{\gamma w}^{(3)}\right|\right)}{2000 R^{3} C^{6}\left|\Lambda_{\gamma w}^{(3)}\right|} \\
& \leqslant \frac{10 C}{R} \text {. }
\end{aligned}
$$

This concludes the proof of Lemma 5.21
In the next proposition, we need to work with CT maps that represent both an almost atoroidal outer automorphism and its inverse. We therefore introduce the following conventions:

Let $f^{\prime}: G^{\prime} \rightarrow G^{\prime}$ be a CT map representing $\phi^{-M}$, which exists by Theorem 2.10. We denote by $K^{\prime}$ the constant similar to the constant $K$ given above Lemma 5.6 and by $C_{f^{\prime}}$ the bounded cancellation constant given by Lemma 4.9. We set $C^{\prime}=\max \left\{K^{\prime}, C_{f^{\prime}}\right\}$ as in Equation (77). We denote by $G_{p^{\prime}}$ the invariant subgraph of $G^{\prime}$ such that $\mathcal{F}\left(G_{p^{\prime}}\right)=\mathcal{F}$, by $\ell_{\mathcal{F}^{\prime}}$ the corresponding $\mathcal{F}$-length and by $\ell_{\text {exp }^{\prime}}$ the corresponding exponential length. Let $\mathfrak{g}^{\prime}$ be the corresponding goodness function. If $w \in F_{\mathrm{n}}$, we denote by $\gamma_{w}^{\prime}$ the corresponding circuit in $G^{\prime}$.

We also need a result which shows that the exponential length is invariant by $F_{\mathrm{n}}{ }^{-}$ equivariant quasi-isometry. In order to prove this, we need some additional definitions. Let $G$ be a connected (pointed) graph whose fundamental group is isomorphic to $F_{\mathrm{n}}$ and let $\widetilde{G}$ be the universal cover of $G$. Let $\phi \in \operatorname{Out}\left(F_{\mathrm{n}}\right)$ be an exponentially growing outer automorphism. Let $\widehat{G}$ be the graph obtained from $\widetilde{G}$ as follows. We add one vertex $v_{g A}$ for every left class $g A$, with $g \in F_{\mathrm{n}}$ and $A$ is a subgroup of $F_{\mathrm{n}}$ such that $[A] \in \mathcal{A}(\phi)$ and we add one edge between $v_{g A}$ and a vertex $v$ of $\widetilde{G}$ if and only if the vertex $v$ is contained in the tree $T_{g A g^{-1}}$. The graph $\widehat{G}$ is known as the electrification of $\widetilde{G}$ (see for instance (Bow). For a path $\gamma$ in $G$, we denote by $\widetilde{\gamma}$ a lift of $\gamma$ in $\widetilde{G}$. Let $\hat{\gamma}$ be the path in $\widehat{G}$ constructed as follows. Let $\tilde{\gamma}=a_{1} b_{1} \ldots a_{k} b_{k}$ be the decomposition of $\tilde{\gamma}$ such that, for every $i \in\{1, \ldots, k\}$, the path $b_{i}$ is contained in some tree $T_{g_{i} A_{i} g_{i}^{-1}}$ with $g_{i} \in F_{\mathrm{n}}, A_{i}$ a subgroup of $F_{\mathrm{n}}$ such that $\left[A_{i}\right] \in \mathcal{A}(\phi)$ and $b_{i}$ is maximal for the property of being contained in such a tree $T_{g_{i} A_{i} g_{i}^{-1}}$. Then $\hat{\gamma}$ is a path $\hat{\gamma}=a_{1} c_{1} \ldots a_{k} c_{k}$ where, for every
$i \in\{1, \ldots, k\}$, the path $c_{i}$ is the two-edge path whose endpoints are the endpoints of $b_{i}$ and the middle vertex of $c_{i}$ is $v_{g_{i} A_{i}}$. Note that the path $\hat{\gamma}$ is not uniquely determined. Indeed, it is possible that there exists $i \in\{1, \ldots, k\}$ such that $b_{i}$ is contained in two distinct trees $T_{A}$ and $T_{B}$ with $[A],[B] \in \mathcal{A}(\phi)$. However, if $\hat{\gamma}$ and $\hat{\gamma}^{\prime}$ are two such paths associated with $\widetilde{\gamma}$, then $\ell(\hat{\gamma})=\ell\left(\hat{\gamma}^{\prime}\right)$.

Proposition 5.22. Let $\mathrm{n} \geqslant 3$, let $\phi \in \operatorname{Out}\left(F_{\mathrm{n}}\right)$ and let $f: G \rightarrow G$ be a CT map representing a power of $\phi$.
(1) There exists a constant $B_{0} \geqslant 1$ such that, for every element $w \in F_{\mathrm{n}}$ with $\ell_{\exp }\left(\gamma_{w}\right)>0$, we have:

$$
\frac{1}{B_{0}} \ell_{\exp }\left(\gamma_{w}\right) \leqslant \ell\left(\widehat{\gamma_{w}}\right) \leqslant B_{0} \ell_{\exp }\left(\gamma_{w}\right) .
$$

(2) Let $f^{\prime}: G^{\prime} \rightarrow G^{\prime}$ be a CT map representing a power of $\phi^{-1}$. There exists a constant $B>0$ such that, for every element $w \in F_{\mathrm{n}}$, we have:

$$
\frac{1}{B} \ell_{e x p^{\prime}}\left(\gamma_{w}^{\prime}\right) \leqslant \ell_{\text {exp }}\left(\gamma_{w}\right) \leqslant B \ell_{\text {exp }^{\prime}}\left(\gamma_{w}^{\prime}\right)
$$

Proof. (1) Recall the definition of the graph $G^{*}$ from just above Lemma 3.11. We can turn the graph $G^{*}$ into a metric graph by assigning, to every edge $e \in \vec{E} G^{*}$, the length equal to the length of the path $p_{G^{*}}(e)$ in $G$. Since the graph $G^{*}$ is finite, there exists a constant $B^{\prime}$ such that the diameter of every maximal subtree of $G^{*}$ is at most $B^{\prime}$. Let $B_{0}=2 B^{\prime}+2$.

Let $w \in F_{\mathrm{n}}$. Let $\gamma_{w}=a_{1} b_{1} \ldots a_{k} b_{k}$ be the decomposition of $\gamma_{w}$ with $a_{1}$ and $b_{k}$ possibly empty such that, for every $i \in\{1, \ldots, k\}$, the path $b_{i}$ is a maximal concatenation of paths in $G_{P G}^{\prime}$ and in $\mathcal{N}_{P G}$ and, for every $i \in\{1, \ldots, k\}$ and every edge $e$ of $a_{i}$, we have $\ell_{\text {exp }}^{\gamma_{w}}(e)=1$. Note that by the definition of the exponential length we have

$$
\ell_{\exp }\left(\gamma_{w}\right)=\sum_{i=1}^{k} \ell\left(a_{i}\right) .
$$

Let $A$ be a subgroup of $F_{\mathrm{n}}$ such that $[A] \in \mathcal{A}(\phi)$. Let $i \in\{1, \ldots, k\}$ and let $\alpha$ be a subpath of $a_{i}$ whose lift is contained in $T_{A}$. By Proposition 3.13, the subpath $\alpha$ is contained in a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$. Since $a_{i}$ does not contain any concatenation of paths in $G_{P G}$ and $\mathcal{N}_{P G}$, the path $\alpha$ is a proper subpath of an EG INP. By the definition of $C$ (see Equation (7)), we see that $\ell(\alpha) \leqslant C$. Thus, we have: $\ell\left(a_{i}\right) \leqslant C \ell\left(\widehat{a}_{i}\right)$ and

$$
\ell_{\exp }\left(\gamma_{w}\right) \leqslant C \sum_{i=1}^{k} \ell\left(\widehat{a}_{i}\right) .
$$

Claim. Let $A$ be a subgroup of $F_{\mathrm{n}}$ such that $[A] \in \mathcal{A}(\phi)$. Let $\beta$ be a subpath of $\gamma_{w}$ such that a lift of $\beta$ is contained in $T_{A}$. There does not exist $i \in\{1, \ldots, k\}$ such that both $\beta \cap b_{i}$ and $\beta \cap b_{i+1}$ are not reduced to a point.
Proof. Suppose towards a contradiction that such an element $i \in\{1, \ldots, k\}$ exists. Then $a_{i+1}$ is contained in $\beta$. By the above, the path $a_{i+1}$ is contained in an EG INP $\sigma$. Since
both $b_{i}$ and $b_{i+1}$ are concatenations of paths in $G_{P G}^{\prime}$ and $\mathcal{N}_{P G}$, the path $a_{i+1}$ must contain the initial or the terminal segment of $\sigma$. Since $\beta$ is contained in a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$ by Proposition 3.13, the EG INP $\sigma$ must be contained in $\beta$ and $\beta \cap a_{i+1} \subseteq \sigma$. This contradicts the maximality of the paths $b_{i}$ and $b_{i+1}$.

Hence $\beta$ is either contained in $b_{i} a_{i+1}$ or in $a_{i+1} b_{i+1}$. Let $i \in\{1, \ldots, k\}$ and let $\beta$ be a maximal subpath of $\gamma_{w}$ containing edges of $a_{i}$ and such that a lift of $\beta$ is contained in some $T_{A}$ with $A$ a subgroup of $F_{\mathrm{n}}$ such that $[A] \in \mathcal{A}(\phi)$. By the claim, the path $a_{i}$ has a decomposition $a_{i}=c_{i}^{+} d_{i} c_{i}^{-}$such that $c_{i}^{+}$and $c_{i}^{-}$are possibly trivial, lifts of $c_{i}^{+}$ and $c_{i}^{-}$are contained in trees $T_{A_{+}}$and $T_{A_{-}}$with $A_{+}$and $A_{-}$subgroups of $F_{\mathrm{n}}$ such that $\left[A_{+}\right],\left[A_{-}\right] \in \mathcal{A}(\phi)$ and one of the following holds:
(a) $\beta \subseteq d_{i}$;
(b) $\beta \cap a_{i} \neq \beta$ and $\beta \cap a_{i} \in\left\{c_{i}^{+}, c_{i}^{-}\right\}$.

Note that for every $i \in\{1, \ldots, k\}$, we have $\ell\left(\widehat{a_{i}}\right) \leqslant \ell\left(\widehat{d_{i}}\right)+4$. Then

$$
\ell\left(\widehat{\gamma_{w}}\right) \geqslant \sum_{i=1}^{k} \ell\left(\widehat{d}_{i}\right) \geqslant \sum_{i=1}^{k}\left(\ell\left(\widehat{a_{i}}\right)-4\right)=\sum_{i=1}^{k} \ell\left(\widehat{a}_{i}\right)-4 k .
$$

Moreover, if $\beta$ is a path which satisfies the hypothesis of the claim, then there exists at most one $i \in\{1, \ldots, k\}$ such that $\beta \cap b_{i}$ is not reduced to a point. Therefore, we see that $\ell\left(\widehat{\gamma_{w}}\right) \geqslant k$. Thus, we have

$$
\ell_{e x p}\left(\gamma_{w}\right) \leqslant C \sum_{i=1}^{k} \ell\left(\widehat{a}_{i}\right) \leqslant C\left(\ell\left(\hat{\gamma}_{w}\right)+4 k\right) \leqslant 5 C \ell\left(\hat{\gamma}_{w}\right) .
$$

This proves the first inequality of Assertion (1). We now prove the second inequality. For every $i \in\{1, \ldots, k\}$, there exists a unique edge path $b_{i}^{*} \subseteq G^{*}$ such that $p^{*}\left(b_{i}^{*}\right)=b_{i}$. Let $i \in\{1, \ldots, k\}$. Since $G^{*}$ is a finite graph, there exist (possibly trivial) reduced paths $\beta_{i}^{*}, \delta_{i}^{*}$ and $\delta_{i}^{*^{\prime}}$ such that:
(i) the path $\beta_{i}^{*}$ is a circuit;
(ii) the paths $\delta_{i}^{*}$ and $\delta_{i}^{*^{\prime}}$ are contained in maximal trees of $G^{*}$;
(iii) we have $b_{i}^{*}=\delta_{i}^{*} \beta_{i}^{*} \delta_{i}^{*^{\prime}}$.

By Lemma $3.11(1)$, the paths $p^{*}\left(\delta_{i}^{*}\right), p^{*}\left(\beta_{i}^{*}\right)$ and $p^{*}\left(\delta_{i}^{*^{\prime}}\right)$ are reduced edge paths of $G$. By definition of $B^{\prime}$, we have $\ell\left(\delta_{i}^{*}\right), \ell\left(\delta_{i}^{*^{\prime}}\right) \leqslant B^{\prime}$. Since $p^{*}\left(\beta_{i}^{*}\right)$ is a circuit which is a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$, by Proposition 3.13, there exists a subgroup $H_{i}$ of $F_{\mathrm{n}}$ such that $\left[H_{i}\right] \in \mathcal{A}(\phi)$ and the conjugacy classes of elements of $F_{\mathrm{n}}$ represented by $p^{*}\left(\beta_{i}^{*}\right)$ are contained in $\left[H_{i}\right]$. Hence the length of $\widehat{p^{*}\left(\beta_{i}^{*}\right)}$ is bounded by 2. Hence the length of the path $\widehat{b}_{i}$ is bounded by $2+2 B^{\prime}=B_{0}$. Therefore, since $\ell_{\text {exp }}\left(\gamma_{w}\right)>0$, we have

$$
\ell\left(\hat{\gamma}_{w}\right)=\sum_{i=1}^{k} \ell\left(a_{i}\right)+\ell\left(\widehat{b}_{i}\right) \leqslant \sum_{i=1}^{k}\left(\ell\left(a_{i}\right)+B_{0}\right) \leqslant\left(B_{0}+1\right) \sum_{i=1}^{k} \ell\left(a_{i}\right)=\left(B_{0}+1\right) \ell_{\exp }\left(\gamma_{w}\right) .
$$

This proves Assertion (1).
(2) Let $f^{\prime}$ be as in Assertion (2) and let $w \in F_{\mathrm{n}}$. Suppose first that $\ell_{\exp }\left(\gamma_{w}\right)=0$. Then $\gamma_{w}$ is a concatenation of paths in $G_{P G}^{\prime}$ and in $\mathcal{N}_{P G}$. By Proposition 2.5 (4) and Lemma 2.9, there does not exist an edge in a zero stratum which is adjacent to a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$. Since zero strata are contractible by Proposition 2.5 (3), it follows that $\gamma_{w}$ is a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$. By Proposition 3.13, there exists a subgroup $A$ of $F_{\mathrm{n}}$ such that $[A] \in \mathcal{A}(\phi)$ and $w \in A$. Since $\mathcal{A}(\phi)=\mathcal{A}\left(\phi^{-1}\right)$ by Equation (11), by Proposition 3.13, we have $\ell_{\text {exp }}\left(\gamma_{w}^{\prime}\right)=0$. So we may suppose that $\ell_{e x p}\left(\gamma_{w}\right)>0$ and that $\ell_{\text {exp }}\left(\gamma_{w}^{\prime}\right)>0$. By Assertion (1), in order to prove Assertion (2), it suffices to prove that $\widehat{G}$ and $\widehat{G}^{\prime}$ are $F_{\mathrm{n}}$-equivariantly quasi-isometric. Since $\mathcal{A}(\phi)$ is a malnormal subgroup system, this follows from [Bow, Theorem 7.11] and [Hru, proof of Theorem 5.1].
Proposition 5.23. Let $\phi \in \operatorname{Out}\left(F_{\mathrm{n}}, \mathcal{F}\right)$ and let $f: G \rightarrow G$ be as in Remark 5.15. Let $f^{\prime}: G^{\prime} \rightarrow G^{\prime}$ be as in the above convention. Let $\delta \in(0,1)$ and let $W$ be a neighborhood of $K_{P G}(\phi)$ in $\mathbb{P} \operatorname{Curr}\left(F_{\mathrm{n}}, \mathcal{F} \wedge \mathcal{A}(\phi)\right)$. There exists $n_{0} \in \mathbb{N}^{*}$ such that for every $n \geqslant n_{0}$ and every nonperipheral element $w \in F_{\mathrm{n}}$ such that $\eta_{[w]} \notin W$, one of the following holds:

$$
\mathfrak{g}\left(\left[f^{n}\left(\gamma_{w}\right)\right]\right) \geqslant \delta
$$

or

$$
\mathfrak{g}^{\prime}\left(\left[f^{\prime n}\left(\gamma_{w}^{\prime}\right)\right]\right) \geqslant \delta
$$

Proof. Let $w \in F_{\mathrm{n}}$ be a nonperipheral element such that $\eta_{[w]} \notin W$. Let $R=\frac{10 C}{(1-\delta)^{2}} 8 C^{\prime} B^{2}$. We use the alternative given by Lemma 5.21 with the constants $\delta$ and $R$. If the first alternative of Lemma 5.21 occurs, then we are done. Suppose that $\mathfrak{g}\left(\left[f^{n}\left(\gamma_{w}\right)\right]\right)<\delta$. There exists $n_{0} \in \mathbb{N}^{*}$ depending only on $f$ such that for every $n \geqslant n_{0}$, we have

$$
\ell_{e x p}^{\left[f^{n}\left(\gamma_{w}\right)\right]}\left(\operatorname{Inc}\left(\left[f^{n}\left(\gamma_{w}\right)\right]\right)\right) \leqslant \frac{10 C}{R} \ell_{e x p}^{\gamma_{w}}\left(\operatorname{Inc}\left(\gamma_{w}\right)\right)
$$

By Lemma 5.14, since $\mathfrak{g}\left(\left[f^{n}\left(\gamma_{w}\right)\right]\right)<\delta$, we have $\mathfrak{g}\left(\gamma_{w}\right)<\delta$. Thus, we see that

$$
\ell_{e x p}^{\gamma_{w}}\left(\operatorname{Inc}\left(\gamma_{w}\right)\right) \geqslant(1-\delta) \ell_{e x p}\left(\gamma_{w}\right)
$$

Let $\gamma^{\prime \prime}$ be the reduced circuit in $G$ such that $\left[f^{n_{0}}\left(\gamma^{\prime \prime}\right)\right]=\gamma_{w}$. Since $\mathfrak{g}\left(\gamma_{w}\right)<\delta$ and $\left[\eta_{[w]}\right] \notin K_{P G}(\phi)$, by Lemma 5.21, we see that

$$
\ell_{e x p}^{\gamma_{w}}\left(\operatorname{Inc}\left(\gamma_{w}\right)\right) \leqslant \frac{10 C}{R} \ell_{e x p}^{\gamma^{\prime \prime}}\left(\operatorname{Inc}\left(\gamma^{\prime \prime}\right)\right)
$$

We have

$$
\begin{aligned}
\ell_{\exp ^{\prime}}\left(\left[f^{\prime n_{0}}\left(\gamma_{w}^{\prime}\right)\right]\right) & \geqslant \frac{1}{B} \ell_{\exp }\left(\gamma^{\prime \prime}\right) \geqslant \frac{1}{B} \ell_{\exp }^{\gamma^{\prime \prime}}\left(\operatorname{Inc}\left(\gamma^{\prime \prime}\right)\right) \\
& \geqslant \frac{1}{B} \frac{R}{10 C} \ell_{e x p}^{\gamma_{w}}\left(\operatorname{Inc}\left(\gamma_{w}\right)\right) \geqslant \frac{1}{B} \frac{1-\delta) R}{10 C} \ell_{\exp }\left(\gamma_{w}\right) \\
& \geqslant \frac{1}{B^{2}} \frac{(1-\delta) R}{10 C} \ell_{\exp ^{\prime}}\left(\gamma_{w}^{\prime}\right)=8 C^{\prime} \frac{1}{1-\delta} \ell_{e x p^{\prime}}\left(\gamma_{w}^{\prime}\right)
\end{aligned}
$$

But by Lemma 5.12, we have:

$$
\left.\ell_{e x p^{\prime}}^{\left[f^{\prime n_{0}}\right.}\left(\gamma_{w}^{\prime}\right)\right]\left(\operatorname{Inc}\left(f^{\prime n_{0}}\left(\gamma_{w}^{\prime}\right)\right) \leqslant \ell_{\exp ^{\prime}}\left(\operatorname{Inc}\left(f^{\prime n_{0}}\left(\gamma_{w}^{\prime}\right)\right) \leqslant 8 C^{\prime} \ell_{\exp ^{\prime}}\left(\gamma_{w}^{\prime}\right)\right.\right.
$$

Therefore, we see that

$$
\mathfrak{g}^{\prime}\left(\left[f^{\prime n_{0}}\left(\gamma_{w}^{\prime}\right)\right]\right)=1-\frac{\left.\ell_{\text {exp }}^{\left[f^{\prime n_{0}}\right.}\left(\gamma_{w}^{\prime}\right)\right]}{}\left(\operatorname{Inc}\left(\left[f^{\prime n_{0}}\left(\gamma_{w}^{\prime}\right)\right]\right) \text { exp }\left(\left[f^{\prime n_{0}}\left(\gamma_{w}^{\prime}\right)\right]\right)\right. \text {. }
$$

By Lemma 5.16, we see that there exists $n_{1} \geqslant n_{0}$ depending only on $f^{\prime}$ such that for every $n \geqslant n_{1}$,

$$
\mathfrak{g}^{\prime}\left(\left[f^{\prime n}\left(\gamma_{w}^{\prime}\right)\right]\right) \geqslant \delta .
$$

This concludes the proof.
Proposition 5.24. Let $\phi \in \operatorname{Out}\left(F_{\mathrm{n}}, \mathcal{F}\right)$ and let $f: G \rightarrow G$ be as in Remark 5.15, Let $U_{+}$ be a neighborhood of $\Delta_{+}(\phi)$, let $U_{-}$be a neighborhood of $\Delta_{-}(\phi)$, let $V$ be a neighborhood of $K_{P G}(\phi)$. There exists $N \in \mathbb{N}^{*}$ such that for every $n \geqslant 1$ and every $\mathcal{F} \wedge \mathcal{A}(\phi)$ nonperipheral $w \in F_{\mathrm{n}}$ such that $\eta_{[w]} \notin V$, one of the following holds

$$
\phi^{N n}\left(\eta_{[w]}\right) \in U_{+} \quad \text { or } \quad \phi^{-N n}\left(\eta_{[w]}\right) \in U_{-} .
$$

Proof. Let $\delta \in(0,1)$ and let $w \in F_{\mathrm{n}}$ be a nonperipheral element with $\eta_{[w]} \notin V$. By Proposition [5.23, there exists $n_{0} \in \mathbb{N}^{*}$ such that for every $n \geqslant n_{0}$, we have $\mathfrak{g}\left(\left[f^{n}\left(\gamma_{w}\right)\right]\right) \geqslant$ $\delta$ or $\mathfrak{g}^{\prime}\left(\left[f^{\prime n}\left(\gamma_{w}^{\prime}\right)\right]\right) \geqslant \delta$. By Lemma 5.20 (1), there exists $n_{1} \geqslant n_{0}$ such that for every $n \geqslant n_{1}$, we have

$$
\phi^{N n}\left(\eta_{[w]}\right) \in U_{+} \quad \text { or } \quad \phi^{-N n}\left(\eta_{[w]}\right) \in U_{-} .
$$

This concludes the proof.
The above proposition gives a result of North-South dynamics outside of a neighborhood of $K_{P G}(\phi)$. As $K_{P G}(\phi)$ is empty for a relative expanding outer automorphism by Lemma 3.27 (1), we can now prove Theorem 5.1.

Proof of Theorem 5.1. Let $\phi \in \operatorname{Out}\left(F_{\mathrm{n}}, \mathcal{F}\right)$ be an expanding outer automorphism relative to $\mathcal{F}$. By Lemma 3.27, we have $K_{P G}(\phi)=\varnothing$. Let $U_{+}$be a neighborhood of $\Delta_{+}(\phi)$ and let $U_{-}$be a neighborhood of $\Delta_{-}(\phi)$. By Proposition 5.24, there exists $N \in \mathbb{N}^{*}$ such that for every $n \geqslant 1$ and every nonperipheral element $w \in F_{\mathrm{n}}$, we have

$$
\phi^{N n}\left(\eta_{[w]}\right) \in U_{+} \quad \text { or } \quad \phi^{-N n}\left(\eta_{[w]}\right) \in U_{-} .
$$

Recall that, by Proposition 2.15, the rational currents are dense in $\mathbb{P C u r r}\left(F_{\mathrm{n}}, \mathcal{F} \wedge \mathcal{A}(\phi)\right)$. Hence we can apply [LU2, Proposition 3.3] to see that $\phi^{2 N}$ has generalized North-South dynamics. Then, using [LU2, Proposition 3.4], we conclude that $\phi$ has generalized NorthSouth dynamics.

## 6 North-South dynamics for almost atoroidal relative outer automorphism

Let $\mathrm{n} \geqslant 3$ and let $\mathcal{F}$ be a free factor system of $F_{\mathrm{n}}$. Let $\phi \in \operatorname{Out}\left(F_{\mathrm{n}}, \mathcal{F}\right)$ be an almost atoroidal outer automorphism which satisfies Definition 4.3 (2). Let $\mathcal{F} \leqslant \mathcal{F}_{1} \leqslant \mathcal{F}_{2}=$ $\left\{\left[F_{\mathrm{n}}\right]\right\}$ be a sequence of free factor system given in this definition. We use the convention of Remark 5.19, We will show a result of North-South type dynamics for $\phi$ (see Theorem [6.4). Note that, if $\mathcal{A}(\phi) \neq\left\{\left[F_{\mathrm{n}}\right]\right\}$ the simplices $\Delta_{ \pm}(\phi)$ are still defined. Note that, by Lemma 3.27 (3) and Lemma 5.18 (4), for every current $\mu \in \operatorname{Curr}\left(F_{\mathrm{n}}, \mathcal{F} \wedge \mathcal{A}(\phi)\right)$, we have $\|\mu\|_{\mathcal{F}_{1}}>0$. Let $K_{P G}(\phi)$ be the set of polynomially growing currents of $\phi$. Note that, combining Lemma 4.8 and Lemma 5.18 (5), we have $K_{P G}(\phi) \cap \Delta_{ \pm}(\phi)=\varnothing$. Let

$$
\widehat{\Delta}_{ \pm}(\phi)=\left\{[t \mu+(1-t) \nu] \mid t \in[0,1],[\mu] \in \Delta_{ \pm}(\phi),[\nu] \in K_{P G}(\phi),\|\mu\|_{\mathcal{F}_{1}}=\|\nu\|_{\mathcal{F}_{1}}=1\right\}
$$

be the convexes of attraction and repulsion of $\phi$.
In order to promote a global North-South type dynamics, we need to construct contracting neighborhoods of $\widehat{\Delta}_{+}(\phi)$. To this end, following [CU, we introduce a notion of goodness for currents of $\mathbb{P C u r r}\left(F_{\mathrm{n}}, \mathcal{F} \wedge \mathcal{A}(\phi)\right)$.

Let $f: G \rightarrow G$ be as in Remark 5.15. By Lemma 3.21, let $N \in \mathbb{N}^{*}$ be such that, for every edge $e$ of $\overline{G-G_{P G}^{\prime}}$, we have $\ell_{\exp }\left(\left[f^{N}(e)\right]\right) \geqslant 4 C+1$. Let $C_{N}=C_{f^{N}}$ be a constant associated with $f^{N}$ given by Lemma 4.9. Let $L>0$ be such that for every path $\gamma$ of $G$ of length at least $L$, we have $\ell\left(\left[f^{N}(\gamma)\right]\right) \geqslant C_{N}+1$. The constant $L$ exists since $f^{N}$ lifts to a quasi-isometry on the universal cover of $G$. Let $\mathcal{P}_{c s}$ be the finite set of paths of the form $\gamma=\gamma_{1} e \gamma_{2}$, where, for every $i \in\{1,2\}$, the path $\gamma_{i}$ has length equal to $L$, the path $e$ is an edge in $\overline{G-G_{P G}^{\prime}}$ and $\gamma_{1} e \gamma_{2}$ is a splitting of $\gamma$. In Lemma 6.1 (2), we prove in particular that $\mathcal{P}_{\text {cs }}$ is not empty. We will denote by $\hat{\gamma}$ the edge $e$.

Let $[\mu] \in \mathbb{P} \operatorname{Curr}\left(F_{\mathrm{n}}, \mathcal{F} \wedge \mathcal{A}(\phi)\right)$. Recall the definition of $\Psi_{0}$ just above Definition 3.25. By Lemma 3.27 (1), (2), we have $\phi\left(K_{P G}(\phi)\right)=K_{P G}(\phi)$. Hence, for every current $[\mu] \notin K_{P G}(\phi)$, we have $\Psi_{0}(\phi(\mu))>0$. Thus, for every current $[\mu] \in \mathbb{P} \operatorname{Curr}\left(F_{\mathrm{n}}, \mathcal{F} \wedge\right.$ $\mathcal{A}(\phi))-K_{P G}(\phi)$, we can define the completely split goodness $\overline{\mathfrak{g}}(\mu)$ of $\mu$ by

$$
\overline{\mathfrak{g}}(\mu)=\frac{1}{\Psi_{0}\left(\phi^{N}(\mu)\right)} \sum_{\gamma \in \mathcal{P}_{c s}}\langle\gamma, \mu\rangle .
$$

Observe that the function $\overline{\mathfrak{g}}$ is continuous and that it defines a well-defined continuous function $\mathbb{P C u r r}\left(F_{\mathrm{n}}, \mathcal{F} \wedge \mathcal{A}(\phi)\right)-K_{P G}(\phi) \rightarrow \mathbb{R}$.

Lemma 6.1. Let $f: G \rightarrow G$ be as in Remark 5.15.
(1) Let $w \in F_{\mathrm{n}}$ be such that $\ell_{\text {exp }}\left(\gamma_{w}\right)>0$. We have $\mathfrak{g}\left(\left[f^{N}\left(\gamma_{w}\right)\right]\right) \geqslant \overline{\mathfrak{g}}\left(\eta_{[w]}\right)$.
(2) For every $[\mu] \in \Delta_{+}(\phi)$, we have $\overline{\mathfrak{g}}([\mu])>0$

Proof. (1) The proof of this assertion is similar to the one of [CU, Lemma 4.9 (2)]. Let $\gamma \in \mathcal{P}_{c s}$ be such that $\left\langle\gamma, \eta_{[w]}\right\rangle>0$. Then $\gamma \subseteq \gamma_{w}$. For every occurrence of $\gamma$ in $\gamma_{w}$, by the choice of $L, C_{N}$ and by Lemma 4.9, the path $\left[f^{N}\left(\gamma_{w}\right)\right]$ contains $\left[f^{N}(\hat{\gamma})\right]$, which has
exponential length at least equal to $4 C_{N}+1$. Therefore, Lemma 5.8 implies that the path $\left[f^{N}\left(\gamma_{w}\right)\right]$ contains a subpath of $\left[f^{N}(\hat{\gamma})\right]$ of exponential length at least 1 which is a complete factor of $\left[f^{N}\left(\gamma_{w}\right)\right]$ relative to $G_{P G}$. Hence we have:

$$
\ell_{\exp }\left(\left[f^{N}\left(\gamma_{w}\right)\right]\right) \mathfrak{g}\left(\left[f^{N}\left(\gamma_{w}\right)\right]\right) \geqslant \sum_{\gamma \in \mathcal{P}_{c s}}\left\langle\gamma, \eta_{[w]}\right\rangle .
$$

By Lemma 3.26, we have

$$
\Psi_{0}\left(\phi^{N}\left(\eta_{[w]}\right)\right)=\ell_{\exp }\left(\left[f^{N}\left(\gamma_{w}\right)\right]\right)=\Psi_{0}\left(\eta_{\left[\phi^{N}(w)\right]}\right)=\ell_{\exp }\left(\gamma_{\phi^{N}([w])}\right) .
$$

Therefore, we have

$$
\mathfrak{g}\left(\left[f^{N}\left(\gamma_{w}\right)\right]\right) \geqslant \overline{\mathfrak{g}}\left(\eta_{[w]}\right) .
$$

(2) Let $[\mu] \in \Delta_{+}(\phi)$. Since $[\mu]$ is a convex combination of extremal points of $\Delta_{+}(\phi)$ and since for every element $\gamma \in \mathcal{P}_{c s}$, the application $\langle\gamma,$.$\rangle is linear, it suffices to prove$ the result for every extremal point of $\Delta_{+}(\phi)$. So we may suppose that $[\mu]$ is an extremal point of $\Delta_{+}(\phi)$. Let $G_{i}$ be the minimal subgraph of $G$ such that $\mathcal{F}\left(G_{i}\right)=\mathcal{F}_{1}$. Since $[\mu]$ is extremal and since $\left.\phi\right|_{\mathcal{F}_{1}}$ is expanding relative to $\mathcal{F}$, by Proposition 4.4, there exists an expanding splitting unit $\sigma$ in $G_{i}$ whose initial direction is fixed by $f$ and such that, for every path $\gamma \in \mathcal{P}\left(\mathcal{F}_{1} \wedge \mathcal{A}(\phi)\right)$, we have

$$
\langle\gamma, \mu\rangle=\mu(C(\gamma))=\lim _{n \rightarrow \infty} \frac{\left\langle\gamma,\left[f^{n}(\sigma)\right]\right\rangle}{\ell_{\mathcal{F}_{1}}\left(\left[f^{n}(\sigma)\right]\right)} .
$$

By Lemma 5.18 (5), since the path $\left[f^{n}(\sigma)\right]$ is contained in $G_{i}$ and, for every path $\gamma \in \mathcal{P}(\mathcal{F} \wedge \mathcal{A}(\phi))$, the above limit is finite, we have

$$
\lim _{n \rightarrow \infty} \frac{\left\langle\gamma,\left[f^{n}(\sigma)\right]\right\rangle}{\ell_{\mathcal{F}_{1}}\left(\left[f^{n}(\sigma)\right]\right)}=\lim _{n \rightarrow \infty} \frac{\left\langle\gamma,\left[f^{n}(\sigma)\right]\right\rangle}{\ell_{\exp }\left(\left[f^{n}(\sigma)\right]\right)} .
$$

Hence it suffices to prove that there exists $\gamma \in \mathcal{P}_{c s}$ such that

$$
\lim _{n \rightarrow \infty} \frac{\left\langle\gamma,\left[f^{n}(\sigma)\right]\right\rangle}{\ell_{\exp }\left(\left[f^{n}(\sigma)\right]\right)}>0 .
$$

Let $e$ be an edge of $\overline{G-G_{P G}^{\prime}}$. Note that, since $\sigma$ is a splitting unit, for every $m \in \mathbb{N}^{*}$, the path $\left[f^{m}(\sigma)\right]$ is completely split. Hence an occurrence of $e$ in $\lim _{m \rightarrow \infty}\left[f^{m}(\sigma)\right]$ is contained in a splitting unit of $\lim _{m \rightarrow \infty}\left[f^{m}(\sigma)\right]$ which is either an INP or is equal to $e$. By Lemma 3.7 if an INP $\gamma^{\prime}$ contains $e$, there exists $\gamma_{0}^{\prime} \in \mathcal{N}_{P G}$ such that $e \subseteq \gamma_{0}^{\prime} \subseteq \gamma^{\prime}$. For every $m \in \mathbb{N}^{*}$, we denote by $N(m, e)$ the number of occurrences of $e$ or $e^{-1}$ in $\left[f^{m}(\sigma)\right]$ which are splitting units of $\left[f^{m}(\sigma)\right]$ and by $E G I N P(e)$ the set of all EG INPs containing $e$. Note that, since the set $\mathcal{N}_{P G}$ is finite by Lemma 3.4, so is the limit

$$
\lim _{n \rightarrow \infty} \sum_{\gamma \in E G I N P(e)} \frac{\left\langle\gamma,\left[f^{n}(\sigma)\right]\right\rangle}{\ell_{\exp }\left(\left[f^{n}(\sigma)\right]\right)} .
$$

Since for every $m \in \mathbb{N}^{*}$, we have

$$
\left\langle e,\left[f^{m}(\sigma)\right]\right\rangle=N(m, e)+\sum_{\gamma \in E G I N P(e)}\left\langle\gamma,\left[f^{n}(\sigma)\right]\right\rangle,
$$

we see that the limit

$$
\lim _{m \rightarrow \infty} \frac{N(m, e)}{\ell_{\exp }\left(\left[f^{m}(\sigma)\right]\right)}
$$

exists. We claim that there exists an edge $e$ of $\overline{G-G_{P G}^{\prime}}$ such that

$$
\lim _{m \rightarrow \infty} \frac{N(m, e)}{\ell_{\exp }\left(\left[f^{m}(\sigma)\right]\right)}>0
$$

Indeed, note that, by Lemma 3.23 since $\left[f^{m}(\sigma)\right]$ is $P G$-relative completely split, we have

$$
\ell_{\exp }\left(\left[f^{m}(\sigma)\right]\right)=\sum_{e \in \vec{E}\left(\overline{G-G_{P G}^{\prime}}\right)} N(m, e) .
$$

Hence

$$
\sum_{e \in \vec{E}\left(\overline{G-G_{P G}^{\prime}}\right)} \lim _{m \rightarrow \infty} \frac{N(m, e)}{\ell_{\text {exp }}\left(\left[f^{m}(\sigma)\right]\right)}=1,
$$

which implies the claim. Let $e_{0}$ be an edge of $\overline{G-G_{P G}^{\prime}}$ which satisfies the claim. Since, for every $m \in \mathbb{N}^{*}$, the path $\left[f^{m}(\sigma)\right]$ is completely split, if an occurrence of $e_{0}$ or $e_{0}^{-1}$ in [ $\left.f^{m}(\sigma)\right]$ is a splitting unit and if $\gamma$ is a path in $\left[f^{m}(\sigma)\right]$ of the form $\gamma=\gamma_{1} e_{0} \gamma_{2}$ or $\gamma=$ $\gamma_{1} e_{0}^{-1} \gamma_{2}$, then such a decomposition of $\gamma$ is a splitting of $\gamma$. Thus, if $\ell\left(\gamma_{1}\right)=\ell\left(\gamma_{2}\right)=L$, then the path $\gamma$ is in $\mathcal{P}_{\text {cs }}$ and it contains the occurrence of $e_{0}$. Hence since $\mu=\mu(\sigma)$, we have

$$
\lim _{m \rightarrow \infty} \frac{N(m, e)}{\ell_{\text {exp }}\left(\left[f^{m}(\sigma)\right]\right)}=\sum_{\gamma \in \mathcal{P}_{c s,}, e_{0} \subseteq \gamma}\langle\gamma, \mu\rangle>0 .
$$

Therefore, there exists $\gamma \in \mathcal{P}_{c s}$ such that $\langle\gamma, \mu\rangle>0$ and $\overline{\mathfrak{g}}([\mu])>0$.
Lemma 6.2. Let $f: G \rightarrow G$ be as in Remark 5.15, Let $U_{ \pm}$be open neighborhoods of $\Delta_{ \pm}(\phi)$. There exist open neighborhoods $U_{ \pm}^{\prime} \subseteq U_{ \pm}$of $\Delta_{ \pm}(\phi)$ such that $\phi^{ \pm 1}\left(U_{ \pm}^{\prime}\right) \subseteq U_{ \pm}^{\prime}$.

Proof. The proof is similar to the one of [CU, Lemma 4.13]. We prove the result for $\Delta_{+}(\phi)$, the proof for $\Delta_{-}(\phi)$ being symmetric. By Lemma 6.1 (2), for every $[\mu] \in$ $\Delta_{+}(\phi)$, we have $\overline{\mathfrak{g}}([\mu])>0$. By compactness of $\Delta_{+}(\phi)$ and continuity of $\overline{\mathfrak{g}}$, there exists $\delta_{0}>0$ such that, for every $\mu \in \Delta_{+}(\phi)$, we have $\overline{\mathfrak{g}}(\mu) \geqslant \delta_{0}$. Let $\delta \in\left(0, \delta_{0}\right)$. Let $U_{+}$ be a neighborhood of $\Delta_{+}(\phi)$. Since the function $\overline{\mathfrak{g}}$ is continuous, there exists an open neighborhood $U_{+}^{0} \subseteq U_{+}$of $\Delta_{+}(\phi)$ such that, for every $[\mu] \in U_{+}^{0}$, we have $\overline{\mathfrak{g}}([\mu])>\delta$. Up to taking a smaller $U_{+}^{0}$, we may suppose that $K_{P G}(\phi) \cap U_{+}^{0}=\varnothing$ (this is possible since $K_{P G}(\phi)$ is compact and $\left.\Delta_{+}(\phi) \cap K_{P G}(\phi)=\varnothing\right)$. In particular, by Lemma 3.26, for every nonperipheral element $w \in F_{\mathrm{n}}$ such that $\eta_{[w]} \in U_{0}^{+}$, we have $\ell_{\exp }\left(\gamma_{w}\right)>0$.

Let $w \in F_{\mathrm{n}}$ be a nonperipheral element such that $\eta_{[w]} \in U_{0}^{+}$. By Lemma 6.1 (1), we have

$$
\mathfrak{g}\left(\left[f^{N}\left(\gamma_{w}\right)\right]\right) \geqslant \overline{\mathfrak{g}}\left(\eta_{[w]}\right)>\delta .
$$

By Lemma 5.20 (1), there exists $M \geqslant N$ such that, for every $w \in F_{\mathrm{n}}$ such that $\eta_{[w]} \in U_{+}^{0}$, we have $\phi^{M}\left(\left[\eta_{[w]}\right]\right) \in U_{+}^{0}$. Let

$$
U_{+}^{\prime}=\bigcap_{i=0}^{M-1} \phi^{i}\left(U_{+}^{0}\right) .
$$

Since $\phi\left(\Delta_{+}(\phi)\right)=\Delta_{+}(\phi)$ by Proposition 4.12, the set $U_{+}^{\prime}$ is an open neighborhood of $\Delta_{+}(\phi)$ which is stable by $\phi$ by density of rational currents (see Proposition 2.15) and continuity of $\phi$. This concludes the proof.

Lemma 6.3. Let $f: G \rightarrow G$ be as in Remark 5.15. Suppose that the outer automorphism $\phi$ is of type (2) in Definition 4.3. Let $\mathcal{F} \leqslant \mathcal{F}_{1} \leqslant \mathcal{F}_{2}=\left\{F_{\mathrm{n}}\right\}$ be as in the beginning of Section [6. Let $i \in\{1, \ldots, k-1\}$ be such that $\mathcal{F}\left(G_{i}\right)=\mathcal{F}_{1}$. Let $\hat{V}_{ \pm}$be open neighborhoods of $\widehat{\Delta}_{ \pm}(\phi)$. There exist open neighborhoods $\widehat{V}_{ \pm}^{\prime}$ of $\widehat{\Delta}_{ \pm}(\phi)$ contained in $\widehat{V}_{ \pm}$such that $\phi^{ \pm}\left(\hat{V}_{ \pm}^{\prime}\right) \subseteq \widehat{V}_{ \pm}^{\prime}$.

Proof. The proof follows [CU, Lemma 4.14]. We prove the result for $\widehat{\Delta}_{+}(\phi)$, the proof for $\widehat{\Delta}_{-}(\phi)$ being symmetric. Given $[\mu] \in \mathbb{P} \operatorname{Curr}\left(F_{\mathrm{n}}, \mathcal{F} \wedge \mathcal{A}(\phi)\right)-K_{P G}(\phi)$, a finite set of reduced edge paths $\mathcal{P}$ in $G$ and some $\epsilon>0$ determine an open neighborhood $N([\mu], \mathcal{P}, \epsilon)$ of $[\mu]$ in $\mathbb{P} \operatorname{Curr}\left(F_{\mathrm{n}}, \mathcal{F} \wedge \mathcal{A}(\phi)\right)-K_{P G}(\phi)$ as follows:
$N([\mu], \mathcal{P}, \epsilon)=\left\{[\nu] \in \mathbb{P} \operatorname{Curr}\left(F_{\mathrm{n}}, \mathcal{F} \wedge \mathcal{A}(\phi)\right)-K_{P G}(\phi)\left|\forall \gamma \in \mathcal{P},\left|\frac{\langle\gamma, \nu\rangle}{\Psi_{0}(\nu)}-\frac{\langle\gamma, \mu\rangle}{\Psi_{0}(\mu)}\right|<\epsilon\right\}\right.$.
Since $K_{P G}(\phi)$ is compact, if $\epsilon$ is small enough, this defines an open neighborhood of $[\mu]$ in $\mathbb{P} \operatorname{Curr}\left(F_{\mathrm{n}}, \mathcal{F} \wedge \mathcal{A}(\phi)\right)$. For a subset $X \subseteq \mathbb{P} \operatorname{Curr}\left(F_{\mathrm{n}}, \mathcal{F} \wedge \mathcal{A}(\phi)\right)-K_{P G}(\phi)$, let

$$
N(X, \mathcal{P}, \epsilon)=\bigcup_{[\mu] \in X} N([\mu], \mathcal{P}, \epsilon) .
$$

For $L>0$, let $\mathcal{P}_{+}(L)$ be the set of reduced edge paths in $G_{i}$ of length at most equal to $L$ which are not contained in any concatenation of paths in $G_{P G, \mathcal{F}_{1}}$ and $\mathcal{N}_{P G, \mathcal{F}_{1}}$. By Lemma 5.18 (3), the set $\mathcal{P}_{+}(L)$ is also the set of reduced edge paths in $G_{i}$ of length at most equal to $L$ which are not contained in any concatenation of paths in $G_{P G}$ and $\mathcal{N}_{P G}$. Let $[\mu] \in \Delta_{+}(\phi)$ and let $t \in[0,1]$. Let

$$
K_{P G}([\mu], t)=\left\{[(1-t) \nu+t \mu] \mid[\nu] \in K_{P G}(\phi),\|\nu\|_{\mathcal{F}_{1}}=\|\mu\|_{\mathcal{F}_{1}}=1\right\} .
$$

Remark that

$$
\widehat{\Delta}_{+}(\phi)=\bigcup_{[\mu] \in \Delta_{+}(\phi), t \in[0,1]} K_{P G}([\mu], t) .
$$

Let $\epsilon>0$. Let $V_{\text {poly }}(\epsilon)=\left[\Psi_{0}^{-1}((-\epsilon, \epsilon))\right]$. It is clear, by the continuity of $\Psi_{0}$ and the definition 3.25 of $K_{P G}(\phi)$, that $\bigcap_{\epsilon>0} V_{p o l y}(\epsilon)=K_{P G}(\phi)$. Let $t \in(0,1]$ and $[\mu] \in \Delta_{+}(\phi)$ and let $\mu$ be such that $\|\mu\|_{\mathcal{F}_{1}}=1$. By Lemma $5.18(5)$, we have $\Psi_{0}(\mu)=1$. Let

$$
V_{\text {poly }}([\mu], t, \epsilon)=\left\{[\nu] \in \mathbb{P} \operatorname{Curr}\left(F_{\mathrm{n}}, \mathcal{F} \wedge \mathcal{A}(\phi)\right) \left\lvert\, \begin{array}{c}
\|\nu\|_{\mathcal{F}_{1}}=\|\mu\|_{\mathcal{F}_{1}}=1 \\
t(1+\epsilon)>\Psi_{0}(\nu)>t(1-\epsilon)
\end{array}\right.\right\} .
$$

Note that, since $\Psi_{0}(\mu)=1$, we have $[\nu] \in V_{\text {poly }}([\mu], t, \epsilon)$ if for $[\nu]$ such that $\|\nu\|_{\mathcal{F}_{1}}=1$, we have

$$
t \Psi_{0}(\mu)(1+\epsilon)>\Psi_{0}(\nu)>t \Psi_{0}(\mu)(1-\epsilon)
$$

Let

$$
V_{\infty}([\mu], t)=\bigcap_{L \rightarrow \infty, \epsilon \rightarrow 0} N\left(K_{P G}([\mu], t), \mathcal{P}_{+}(L), \epsilon\right) \cap V_{p o l y}([\mu], t, \epsilon) .
$$

Claim. For every $[\mu] \in \Delta_{+}(\phi)$ and every $t \in(0,1]$, we have $\left.V_{\infty}([\mu], t]\right)=K_{P G}([\mu], t)$.
Proof. The inclusion $\left.K_{P G}([\mu], t) \subseteq V_{\infty}([\mu], t]\right)$ being immediate since $\Psi_{0}$ is linear and vanishes on $K_{P G}(\phi)$, we prove the converse inclusion. Let $\nu \in V_{\infty}([\mu], t)$. By definition 4.5 of $\Delta_{+}(\phi)$, for every $\left[\mu^{\prime}\right] \in \Delta_{+}(\phi)$ and for every reduced edge path $\gamma$ not contained in $G_{i}$, we have $\left\langle\gamma, \mu^{\prime}\right\rangle=0$. Hence, by Lemma 5.18 (4), the current [ $\mu$ ] is entirely determined by the cylinder sets determined by reduced edge paths contained in $G_{i}$ which are not contained in concatenation of paths in $G_{P G, \mathcal{F}_{1}}$ and $\mathcal{N}_{P G, \mathcal{F}_{1}}$. By Lemma 5.18 (3), the current $[\mu]$ is entirely determined by the cylinder sets determined by reduced edge paths contained in $G_{i}$ which are not contained in concatenation of paths in $G_{P G}$ and $\mathcal{N}_{P G}$. Let $\gamma$ be a reduced edge path which is contained in $G_{i}$ and which is not contained in a concatenation of paths in $G_{P G}$ and $\mathcal{N}_{P G}$. By Lemma 3.27, for every projective current $\left[\nu^{\prime}\right] \in K_{P G}(\phi)$, the support of $\nu^{\prime}$ is contained in $\partial^{2} \mathcal{A}(\phi)$. By Proposition 3.13, if $g \in F_{\mathrm{n}}$ is such that there exists a subgroup $A$ of $F_{\mathrm{n}}$ such that $[A] \in \mathcal{A}(\phi)$ and $g \in A$, then $\gamma_{g}$ is a concatenation of paths in $G_{P G}$ and $\mathcal{N}_{P G}$. In particular, if $\gamma^{\prime}$ is a path of $G$ such that $\left\{g^{+\infty}, g^{-\infty}\right\} \in C\left(\gamma^{\prime}\right)$, then $\gamma^{\prime}$ is contained in a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$. In particular, since $\gamma$ is not contained in a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$, for every projective current $\left[\nu^{\prime}\right] \in K_{P G}(\phi)$, we have $\left\langle\gamma, \nu^{\prime}\right\rangle=0$.

Suppose that $\|\nu\|_{\mathcal{F}_{1}}=\|\mu\|_{\mathcal{F}_{1}}=1$. By Lemma 5.18 (5), we also have $\Psi_{0}(\mu)=1$. There exists $\lambda>0$ such that for every path $\gamma$ which is contained in $G_{i}$ and which is not contained in a concatenation of paths in $G_{P G}$ and $\mathcal{N}_{P G}$, we have $\langle\gamma, \nu\rangle=\langle\gamma, \lambda t \mu\rangle$. We claim that $\nu-\lambda t \mu \in \operatorname{Curr}\left(F_{\mathrm{n}}, \mathcal{F} \wedge \mathcal{A}(\phi)\right)$ and that $[\nu-\lambda t \mu] \in K_{P G}(\phi)$. Indeed, for the first part, it suffices to show that for every path $\gamma \in \mathcal{P}\left(\mathcal{F}_{1} \wedge \mathcal{A}(\phi)\right)$, we have $(\nu-\lambda t \mu)(C(\gamma)) \geqslant 0$. This follows from the fact that, for every path $\gamma \in \mathcal{P}\left(\mathcal{F}_{1} \wedge \mathcal{A}(\phi)\right)$ such that $\gamma \subseteq G_{i}$, the path $\gamma$ is not contained in a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$. Hence we have $\langle\gamma, \nu\rangle=\langle\gamma, \lambda t \mu\rangle$. Moreover, if $\gamma \in \mathcal{P}\left(\mathcal{F}_{1} \wedge \mathcal{A}(\phi)\right)$, then we have $\mu(C(\gamma))=0$. This shows that $\nu-\lambda t \mu \in \operatorname{Curr}\left(F_{\mathrm{n}}, \mathcal{F} \wedge \mathcal{A}(\phi)\right)$.

We now prove that $[\nu-\lambda t \mu] \in K_{P G}(\phi)$. Otherwise, by Lemma 3.27, the support of $\nu-\lambda t \mu$ is not contained in $\partial^{2} \mathcal{A}(\phi)$. By Proposition 3.13, there exists a path $\gamma$ which is not contained in a concatenation of paths in $G_{P G}$ and in $\mathcal{N}_{P G}$ such that

$$
\langle\gamma, \nu-\lambda t \mu\rangle>0
$$

Consider a decomposition of $\gamma=a_{1} b_{1} \ldots a_{k} b_{k}$ where, for every $j \in\{1, \ldots, k\}$, the path $a_{j}$ is contained in $\overline{G-G_{i}}$ and, for every $j \in\{1, \ldots, k\}$, the path $b_{j}$ is contained in $G_{i}$ with $a_{1}$ and $b_{k}$ possibly empty. By Lemma 5.18(1), (2) and Remark 5.19, up to taking a larger path $\gamma$, we may suppose that $b_{1}$ is nontrivial. By Lemma 5.18 (2) and Remark 5.19, for every $j \in\{1, \ldots, k\}$, the path $a_{j}$ is contained in $G_{P G}$. Since $\gamma$ is not contained in a concatenation of paths in $G_{P G}$ and $\mathcal{N}_{P G}$, there exists $j \in\{1, \ldots, k\}$ such that $b_{j}$ is not contained in a concatenation of paths in $G_{P G}$ and $\mathcal{N}_{P G}$. But then $\left\langle b_{j}, \nu\right\rangle=\left\langle b_{j}, \lambda t \mu\right\rangle$, that is $\left\langle b_{j}, \nu-\lambda t \mu\right\rangle=0$. By additivity of $\nu-\lambda t \mu$, we have

$$
\langle\gamma, \nu-\lambda t \mu\rangle \leqslant\left\langle b_{j}, \nu-\lambda t \mu\right\rangle=0 .
$$

This contradicts the choice of $\gamma$. Hence $[\nu-\lambda t \mu] \in K_{P G}(\phi)$. Therefore, we have $\Psi_{0}(\nu-\lambda t \mu)=0$. Since $[\nu] \in V_{\infty}([\mu], t)$ and since $\|\nu\|_{\mathcal{F}_{1}}=\|\mu\|_{\mathcal{F}_{1}}=1$, we see that

$$
\Psi_{0}(\nu)=t \Psi_{0}(\mu) .
$$

By linearity of $\Psi_{0}$ and the fact that $\Psi_{0}(\mu)=1$, we have

$$
t=t \Psi_{0}(\mu)=\Psi_{0}(\nu)=\lambda t \Psi_{0}(\mu)=\lambda t .
$$

Since $t>0$ and $\Psi_{0}(\mu)=1$, we have $\lambda=1$. Suppose first that $t \neq 1$. Let $\nu^{\prime}=\frac{1}{1-t}(\nu-t \mu)$, so that $\left[\nu^{\prime}\right] \in K_{P G}(\phi)$ and $\left\|\nu^{\prime}\right\|_{\mathcal{F}}=1$. Then $[\nu]=\left[(1-t) \nu^{\prime}+t \mu\right] \in K_{P G}([\mu], t)$. Thus, we have $V_{\infty}([\mu], t)=K_{P G}([\mu], t)$.

Suppose now that $t=1$. Then $\Psi_{0}(\nu)=1=\|\nu\|_{\mathcal{F}}$. We claim that if $\gamma \in \mathcal{P}\left(\mathcal{F}_{1} \wedge \mathcal{A}(\phi)\right)$ is such that $\nu(C(\gamma))>0$, then $\gamma \subseteq G_{i}$. Indeed, otherwise there would exist an edge $e$ contained in $\overline{G-G_{i}}$ such that $\nu(C(e))>0$. By the description of $\overline{G-G_{i}}$ given in Lemma 5.18 (1), (2) and additivity of the current $\nu$, we can choose the edge $e \in \overline{G-G_{i}}$ in such a way that $e \in G_{P G}$. This would imply that $\|\nu\|_{\mathcal{F}_{1}}>\Psi_{0}(\nu)$, a contradiction. The claim follows. But, since for every path $\gamma \in \mathcal{P}\left(\mathcal{F}_{1} \wedge \mathcal{A}(\phi)\right)$ such that $\gamma \subseteq G_{i}$, we have $\nu(C(\gamma))=\mu(C(\gamma))$, we see that $\nu=\mu$ and that $\nu \in K_{P G}([\mu], 1)$. This concludes the proof of the claim.

Since $\widehat{\Delta}_{+}(\phi)$ is compact, there exist $L>0$ and $\epsilon>0$ such that, for every $[\mu] \in \Delta_{+}(\phi)$ and every $t \in(0,1]$, we have

$$
V([\mu], t, L, \epsilon)=N\left(K_{P G}([\mu], t), \mathcal{P}_{+}(L), \epsilon\right) \cap V_{\text {poly }}(t, \epsilon) \subseteq \widehat{V}_{+} .
$$

When $t=0$, there exists $\epsilon>0$ such that $V_{\text {poly }}(\epsilon) \subseteq \hat{V}_{+}$. Let $s \in(0,1)$, and let $V$ be an open neighborhood of $K_{P G}(\phi)$ such that, for every $[\nu] \in V$ with $\|\nu\|_{\mathcal{F}_{1}}=1$, we have:

$$
\begin{equation*}
\Psi_{0}(\nu)<s \tag{27}
\end{equation*}
$$

For every $[\mu] \in\left(N\left(\widehat{\Delta}_{+}(\phi), \widehat{\mathcal{P}}_{+}(L), \epsilon\right)-V\right) \cap \widehat{\Delta}_{+}(\phi)$, there exist $\left[\mu_{p o l y}\right] \in K_{P G}(\phi)$, $\left[\mu_{\text {exp }}\right] \in \Delta_{+}(\phi)$ and $t \in(0,1]$ such that

$$
[\mu]=\left[t \mu_{e x p}+(1-t) \mu_{p o l y}\right] .
$$

By Lemma $6.1(2)$, for every $[\mu] \in \Delta_{+}(\phi)$, we have $\overline{\mathfrak{g}}([\mu])>0$. By compactness of $\Delta_{+}(\phi)$ and continuity of $\overline{\mathfrak{g}}$, there exists $\delta_{1}>0$ such that, for every $\mu \in \Delta_{+}(\phi)$, we have $\overline{\mathfrak{g}}(\mu) \geqslant \delta_{1}$. Since $\overline{N\left(\widehat{\Delta}_{+}(\phi), \widehat{\mathcal{P}}_{+}(L), \epsilon\right)-V} \cap \widehat{\Delta}_{+}(\phi)$ is compact, and since the function $\overline{\mathfrak{g}}$ is continuous, there exists $\delta_{0}^{\prime}>0$ such that the set $U=\overline{\mathfrak{g}}^{-1}\left(\left(\delta_{0}^{\prime},+\infty\right)\right)$ is an open neighborhood of $\left(N\left(\widehat{\Delta}_{+}(\phi), \widehat{\mathcal{P}}_{+}(L), \epsilon\right)-V\right) \cap \widehat{\Delta}_{+}(\phi)$ intersecting $V$. Note that $U \cap K_{P G}(\phi)=\varnothing$. We set

$$
\widehat{V}_{+}^{\prime}=\left(\bigcup_{[\mu] \in \Delta_{+}(\phi), t \in(0,1]} V([\mu], t, L, \epsilon) \cup V_{p o l y}(\epsilon)\right) \cap(U \cup V)
$$

Let $\delta_{0}$ and $M_{0}$ be the constants given by Lemma 5.20 (2) for the above choice of $\epsilon>0$ and $L>0$. By replacing $\delta_{0}$ with a smaller constant and $M_{0}$ with a larger one, we may suppose that $\delta_{0}$ and $M_{0}$ also satisfy the conclusion of Lemma 5.20 (1) for $U$ as well (where the open neighborhood $W$ of $K_{P G}(\phi)$ needed in Lemma 5.20 (1) is such that $W \subseteq V-U)$.
Claim 2 There exists $N \in \mathbb{N}^{*}$ such that $\phi^{N}\left(\hat{V}_{+}^{\prime}\right) \subseteq \widehat{V}_{+}^{\prime}$.
Proof. Let $w \in F_{\mathrm{n}}$ be a nonperipheral element such that $\eta_{[w]} \in \widehat{V}_{+}^{\prime}$. Suppose first that $\eta_{[w]} \in U \cap \widehat{V}_{+}^{\prime}$. Since $\eta_{[w]} \notin K_{P G}(\phi)$, by Lemma 3.26, we have $\ell_{e x p}\left(\gamma_{w}\right)>0$. By Lemma 6.1 (1), we have:

$$
\mathfrak{g}\left(\left[f^{N}\left(\gamma_{w}\right)\right]\right) \geqslant \overline{\mathfrak{g}}\left(\eta_{[w]}\right)>\delta_{0}^{\prime}
$$

By Lemma 5.20 (1), there exists $M \geqslant M_{0}+N$ such that, for every $w \in F_{\mathrm{n}}$ such that $\eta_{[w]} \in U \cap \widehat{V}_{+}^{\prime}$ and every $n \geqslant 1$, we have $\phi^{M n}\left(\left[\eta_{[w]}\right]\right) \in U \cap \widehat{V}_{+}^{\prime} \subseteq \widehat{V}_{+}^{\prime}$.

Suppose now that $\eta_{[w]} \in V \cap \hat{V}_{+}^{\prime}$. By Lemma 3.27 (3) and Lemma 5.18 (4) for every projective current $[\mu] \in \mathbb{P} \operatorname{Curr}\left(F_{\mathrm{n}}, \mathcal{F} \wedge \mathcal{A}(\phi)\right)$, we have $\|\mu\|_{\mathcal{F}_{1}}>0$. For a projective current $[\mu] \in \mathbb{P} \operatorname{Curr}\left(F_{\mathrm{n}}, \mathcal{F} \wedge \mathcal{A}(\phi)\right)$, let

$$
\Psi_{\mathcal{F}_{1}}([\mu])=\frac{\Psi_{0}(\mu)}{\|\mu\|_{\mathcal{F}_{1}}} .
$$

Then, by definition of $V$ and by Lemma 3.26, we have

$$
\Psi_{\mathcal{F}_{1}}\left(\left[\eta_{[w]}\right]\right)=\frac{\ell_{\exp }\left(\gamma_{w}\right)}{\ell_{\mathcal{F}_{1}}\left(\gamma_{w}\right)}<s
$$

If $\left[\eta_{[w]}\right] \in K_{P G}(\phi)$, then since $\phi\left(K_{P G}(\phi)\right)=K_{P G}(\phi)$, we are done. Therefore, we may suppose that $\left[\eta_{[w]}\right] \notin K_{P G}(\phi)$ and, by Lemma 3.26, for every $n \in \mathbb{N}^{*}$, we have $\ell_{\exp }\left(\left[f^{n}\left(\gamma_{w}\right)\right]\right) \geqslant 1$. Let $R>1$ be such that $\frac{1}{1+\frac{R\left(1-\delta_{0}\right)}{10 C}(1-s)} \leqslant \epsilon$. By Lemma 5.21, one of the following assertion holds:
(1) $\mathfrak{g}\left(\left[f^{M}\left(\gamma_{w}\right)\right]\right)>\delta_{0}$,
(2) $\ell_{\exp }\left(\left[f^{M}\left(\gamma_{w}\right)\right]\right)<\frac{10 C}{\left(1-\delta_{0}\right) R} \ell_{\exp }\left(\gamma_{w}\right)$.

First assume that Assertion (1) holds. Let $\left[\mu_{\left[\phi^{M}([w])\right]}\right] \in \Delta_{+}(\phi)$ be the projective current associated with $\left[\phi^{M}([w])\right]$ given by Lemma 5.20 (2). Let

$$
t=\Psi_{\mathcal{F}_{1}}\left(\left[\eta_{\left[\phi^{M}([w])\right]}\right]\right)
$$

We claim that $\left[\eta_{\left[\phi^{M}([w])\right]}\right] \in V\left(\left[\mu_{\left[\phi^{M}([w])\right]}\right], t, L, \epsilon\right)$. Indeed, we clearly have

$$
\left[\eta_{\phi^{M}([w])}\right] \in V_{p o l y}\left(\left[\mu_{\left[\phi^{M}([w])\right]}\right], t, \epsilon\right) .
$$

By Lemma 5.20 (2), for every reduced edge path $\gamma \in \mathcal{P}_{+}(L)$, we have

$$
\left|\frac{\left\langle\gamma, \eta_{\left[\phi^{M}([w])\right]}\right\rangle}{\Psi_{0}\left(\eta_{\left[\phi^{M}([w])\right]}\right)}-\frac{\left\langle\gamma, \mu_{\left[\phi^{M}([w])\right]}\right\rangle}{\Psi_{0}\left(\mu_{\left[\phi^{M}([w])\right]}\right)}\right|<\epsilon .
$$

Therefore we have $\left[\eta_{\left[\phi^{M}([w])\right]}\right] \in N\left(K_{P G}\left(\left[\mu_{\left[\phi^{M}([w])\right]}\right], t\right), \mathcal{P}_{+}(L), \epsilon\right)$. The claim follows by Equation (27). By definition of $\hat{V}_{+}^{\prime}$, we see that $\phi^{M}\left(\left[\eta_{[w]}\right]\right)=\left[\eta_{\left[\phi^{M}([w])\right]}\right] \in \hat{V}_{+}^{\prime}$.

Suppose now that Assertion (2) holds. We claim that $\left[\eta_{\left[\phi^{M}([w])\right]}\right] \in V_{\text {poly }}(\epsilon)$. By Lemma 5.18 (1), (2) and Remark 5.19, the graph $\overline{G-G_{i}}$ consists in edges in $G_{P G}$. By Lemma 5.18 (6), we have

$$
\ell_{\mathcal{F}_{1}}\left(\left[f^{M}\left(\gamma_{w}\right)\right]\right)-\ell_{\exp }\left(\left[f^{M}\left(\gamma_{w}\right)\right]\right)=\ell_{\mathcal{F}_{1}}\left(\gamma_{w}\right)-\ell_{\exp }\left(\gamma_{w}\right) .
$$

Hence we have

$$
\begin{aligned}
& \left.\Psi_{\mathcal{F}_{1}}\left(\left[\eta_{\left[\phi^{M}\right.}\left(\gamma_{w}\right)\right]\right]\right)=\frac{\ell_{\exp }\left(\left[f^{M}\left(\gamma_{w}\right)\right]\right)}{\ell_{\mathcal{F}_{1}}\left(\left[f^{M}\left(\gamma_{w}\right)\right]\right)}=\frac{\ell_{\exp }\left(\left[f^{M}\left(\gamma_{w}\right)\right]\right)}{\ell_{\exp }\left(\left[f^{M}\left(\gamma_{w}\right)\right]\right)+\ell_{\mathcal{F}_{1}}\left(\left[f^{M}\left(\gamma_{w}\right)\right]\right)-\ell_{\text {exp }}\left(\left[f^{M}\left(\gamma_{w}\right)\right]\right)} \\
& =\frac{\ell_{\exp }\left[\left[f^{M}\left(\gamma_{w}\right)\right]\right)}{\ell_{\exp }\left(\left[f^{M}\left(\gamma_{w}\right)\right]\right)+\ell_{\mathcal{F}_{1}}\left(\gamma_{w}\right)-\ell_{\exp }\left(\gamma_{w}\right)}
\end{aligned}
$$

Note that $\psi_{\mathcal{F}_{1}}^{-1}((0, \epsilon)) \subseteq V_{\text {poly }}(\epsilon)$. Thus, we have $\Phi^{M}\left(\left[\eta_{[w]}\right]\right)=\left[\eta_{\left[\phi^{M}([w])\right]}\right] \in V_{\text {poly }}(\epsilon) \subseteq$ $\hat{V}_{+}^{\prime}$. Therefore, by density of the rational currents (see Proposition 2.15) and continuity of $\phi$, we have $\phi^{M}\left(\widehat{V}_{+}^{\prime}\right) \subseteq \widehat{V}_{+}^{\prime}$. This proves Claim 2 .

Let

$$
\widehat{V}_{+}^{\prime \prime}=\bigcap_{i=0}^{M-1} \phi^{i}\left(\widehat{V}_{+}^{\prime}\right) .
$$

Since $\phi\left(\widehat{\Delta}_{+}(\phi)\right)=\widehat{\Delta}_{+}(\phi)$, the set $\widehat{V}_{+}^{\prime \prime}$ is an open neighborhood of $\widehat{\Delta}_{+}(\phi)$ which is stable by $\phi$ by construction. This concludes the proof.

Theorem 6.4. Let $\mathrm{n} \geqslant 3$ and let $\mathcal{F}$ be a free factor system of $F_{\mathrm{n}}$. Let $\mathcal{F} \leqslant \mathcal{F}_{1} \leqslant$ $\mathcal{F}_{2}$ be a sequence of free factor systems such that the extension $\mathcal{F}_{1} \leqslant \mathcal{F}_{2}$ is sporadic. Let $\phi \in \operatorname{Out}\left(F_{\mathrm{n}}, \mathcal{F}\right)$ be such that $\phi$ preserves $\mathcal{F} \leqslant \mathcal{F}_{1} \leqslant \mathcal{F}_{2}$ and $\left.\phi\right|_{\mathcal{F}_{1}}$ is an expanding automorphism relative to $\mathcal{F}$. Let $\widehat{\Delta}_{ \pm}(\phi)$ be the convexes of attraction and repulsion of $\phi$ and $\Delta_{ \pm}(\phi)$ be the simplices of attraction and repulsion of $\phi$. Let $U_{ \pm}$be open neighborhoods of $\Delta_{ \pm}(\phi)$ in $\mathbb{P} \operatorname{Curr}\left(F_{\mathrm{n}}, \mathcal{F} \wedge \mathcal{A}(\phi)\right)$ and $\widehat{V}_{ \pm}$be open neighborhoods of $\widehat{\Delta}_{ \pm}(\phi)$ in $\mathbb{P} \operatorname{Curr}\left(F_{\mathrm{n}}, \mathcal{F} \wedge \mathcal{A}(\phi)\right)$. There exists $M \in \mathbb{N}^{*}$ such that for every $n \geqslant M$, we have

$$
\phi^{ \pm n}\left(\mathbb{P C u r r}\left(F_{\mathrm{n}}, \mathcal{F} \wedge \mathcal{A}(\phi)\right)-\widehat{V}_{\mp}\right) \subseteq U_{ \pm}
$$

Proof. The proof is similar to [CU, Theorem 4.15]. We replace $\phi$ by a power so that $\phi$ satisfies Remark 5.15, By Lemmas 6.2 and 6.3, we may suppose that $\phi\left(U_{+}\right) \subseteq U_{+}$and that $\phi\left(\hat{V}_{+}\right) \subseteq \widehat{V}_{+}$. Let $M$ be the exponent given by Proposition 5.24 by using $U_{+}=U_{+}$ and $U_{-}=V=\widehat{V}_{-}$. For every current $[\mu] \in \mathbb{P} \operatorname{Curr}\left(F_{\mathrm{n}}, \mathcal{F} \wedge \mathcal{A}(\phi)\right)-\phi^{M}\left(\widehat{V}_{\mp}\right)$, we have $\phi^{M}([\mu]) \in U_{+}$since $\phi^{-M}([\mu]) \notin \widehat{V}_{-}$. Therefore, for every $[\mu] \in \mathbb{P} \operatorname{Curr}\left(F_{\mathrm{n}}, \mathcal{F} \wedge \mathcal{A}(\phi)\right)-\widehat{V}_{-}$, we have $\phi^{2 M}([\mu]) \in U_{+}$and for every $n \geqslant M$, we have $\phi^{2 n}([\mu]) \in U_{+}$since $\phi\left(U_{+}\right) \subseteq U_{+}$. Therefore for every $n \geqslant M$, we see that

$$
\phi^{2 n}\left(\mathbb{P} \operatorname{Curr}\left(F_{\mathrm{n}}, \mathcal{F} \wedge \mathcal{A}(\phi)\right)-\widehat{V}_{-}\right) \subseteq U_{+}
$$

A symmetric argument for $\phi^{-1}$ shows that $\phi^{2}$ acts with generalized North-South dynamics. By [LU2, Proposition 3.4], we see that $\phi$ acts with generalized North-South dynamics. This concludes the proof.

Corollary 6.5. For every open neighborhood $\widehat{V}_{-} \subseteq \mathbb{P} \operatorname{Curr}\left(F_{\mathrm{n}}, \mathcal{F} \wedge \mathcal{A}(\phi)\right)$ of $\widehat{\Delta}_{-}$, there exist $M \in \mathbb{N}^{*}$ and a constant $L_{0}$ such that, for every current $[\mu] \in \mathbb{P} \operatorname{Curr}\left(F_{\mathrm{n}}, \mathcal{F} \wedge \mathcal{A}(\phi)\right)-\widehat{V}_{-}$, and every $m \geqslant M$, we have

$$
\left\|\phi^{m}(\mu)\right\|_{\mathcal{F}} \geqslant 3^{m-M} L_{0}\|\mu\|_{\mathcal{F}}
$$

Proof. Let $f: G \rightarrow G$ be as in Remark 5.15. By Lemma 6.1 (2), there exist a constant $\delta>0$ and an open neighborhood $U$ of $\Delta_{+}(\phi)$ such that, for every projective current $[\mu] \in U$, we have $\overline{\mathfrak{g}}([\mu]) \geqslant \delta$. We first prove Corollary 6.5 for currents $[\mu] \in U$. By Proposition 2.15, it suffices to prove the result for rational currents. By Lemma 6.1(1), since $U \cap K_{P G}(\phi)=\varnothing$, for every element $w \in F_{\mathrm{n}}$ such that $\left[\eta_{[w]}\right] \in U$, we have $\mathfrak{g}\left(\left[f^{N}\left(\gamma_{w}\right)\right]\right) \geqslant \delta$. By Lemma 5.16 (1) and Lemma 5.3, there exists a constant $K_{1}>0$ depending on $\delta$ such that for every $m \geqslant N$ and for every element $w \in F_{\mathrm{n}}$ such that $\left[\eta_{w}\right] \in U$, we have $\ell_{\exp }\left(\left[f^{m}\left(\gamma_{w}\right)\right]\right) \geqslant T E L\left(m-N,\left[f^{N}\left(\gamma_{w}\right)\right]\right) \geqslant 3^{m-N} K_{1} \ell_{e x p}\left(\left[f^{N}\left(\gamma_{w}\right)\right]\right)$. Since $\mathbb{P} \operatorname{Curr}\left(F_{\mathrm{n}}, \mathcal{F} \wedge \mathcal{A}(\phi)\right)-\widehat{V}_{-}$is compact and since $K_{P G}(\phi) \subseteq \widehat{V}_{-}$, by Lemma 3.26 and Lemma 3.27 (3), there exists a constant $K_{2}>0$ such that such that for every $m \geqslant N$ and for every element $w \in F_{\mathrm{n}}$ such that $\left[\eta_{[w]}\right] \in U$, we have $\frac{\ell_{\exp }\left(\left[f^{N}\left(\gamma_{w}\right)\right]\right)}{\ell_{\mathcal{F}}\left(\left[f^{N}\left(\gamma_{w}\right)\right]\right)} \geqslant K_{2}$. Thus, we have

$$
\ell_{\mathcal{F}}\left(\left[f^{m}\left(\gamma_{w}\right)\right]\right) \geqslant \ell_{\exp }\left(\left[f^{m}\left(\gamma_{w}\right)\right]\right) \geqslant 3^{m-N} K_{1} \ell_{\exp }\left(\left[f^{N}\left(\gamma_{w}\right)\right]\right) \geqslant 3^{n-M} K_{1} K_{2} \ell_{\mathcal{F}}\left(\left[f^{N}\left(\gamma_{w}\right)\right]\right)
$$

We set $K_{3}=K_{1} K_{2}$. By compactness of $\mathbb{P C u r r}\left(F_{\mathrm{n}}, \mathcal{F} \wedge \mathcal{A}(\phi)\right)$ and Lemma 3.27 (3), there exists $L>0$ such that for every current $[\mu] \in \mathbb{P} \operatorname{Curr}\left(F_{\mathrm{n}}, \mathcal{F} \wedge \mathcal{A}(\phi)\right)$, we have $\frac{\left\|\phi^{N}(\mu)\right\|_{\mathcal{F}}}{\|\mu\|_{\mathcal{F}}} \geqslant L$. Hence for every $m \geqslant N$ and for every element $w \in F_{\mathrm{n}}$ such that $\left[\eta_{[w]}\right] \in U$, we have

$$
\ell_{\mathcal{F}}\left(\left[f^{m}\left(\gamma_{w}\right)\right]\right) \geqslant 3^{m-N} K_{3} L \ell_{\mathcal{F}}\left(\gamma_{w}\right) .
$$

Hence the proof follows when $[\mu] \in U$.
By Theorem [6.4, there exists $M_{1} \in \mathbb{N}^{*}$ such that, for every $m \geqslant M_{1}$ and every $[\mu] \in \mathbb{P} \operatorname{Curr}\left(F_{\mathrm{n}}, \mathcal{F} \wedge \mathcal{A}(\phi)\right)-\hat{V}_{-}$, we have $\phi^{m}([\mu]) \in U$. Let $M=M_{1}+N$. By the above, Lemma 3.26, the density of rational currents (see Proposition 2.15) and continuity of $\phi$, for every current $[\mu] \notin \hat{V}_{-}$, for every $n \geqslant M$, we have

$$
\left\|\phi^{n}(\mu)\right\|_{\mathcal{F}} \geqslant 3^{n-M} K_{3} L\left\|\phi^{M_{1}}(\mu)\right\|_{\mathcal{F}} .
$$

By compactness of $\mathbb{P} \operatorname{Curr}\left(F_{\mathrm{n}}, \mathcal{F} \wedge \mathcal{A}(\phi)\right)$ and Lemma 3.27 (3), there exists $L^{\prime}>0$ such that for every current $[\mu] \in \mathbb{P} \operatorname{Curr}\left(F_{\mathrm{n}}, \mathcal{F} \wedge \mathcal{A}(\phi)\right)$, we have $\frac{\left\|\phi^{M_{1}}(\mu)\right\|_{\mathcal{F}}}{\|\mu\|_{\mathcal{F}}} \geqslant L^{\prime}$. Hence for every $n \geqslant M$, we have

$$
\left\|\phi^{n}(\mu)\right\|_{\mathcal{F}} \geqslant 3^{n-M} K_{3} L L^{\prime}\|\mu\|_{\mathcal{F}} .
$$

This concludes the proof.
