# DYNAMICAL LARGE DEVIATIONS FOR THE BOUNDARY DRIVEN SYMMETRIC EXCLUSION PROCESS WITH ROBIN BOUNDARY CONDITIONS. 

T. FRANCO, P. GONÇALVES, C. LANDIM, AND A. NEUMANN

#### Abstract

In this article, we consider a one-dimensional symmetric exclusion process in weak contact with reservoirs at the boundary. In the diffusive time-scaling the empirical measure evolves according to the heat equation with Robin boundary conditions. We prove the associated dynamical large deviations principle.

## 1. Introduction

The investigation of the thermodynamic properties of stationary nonequilibrium states of interacting particle systems has been proven to be an important step in the understanding of nonequilibrium phenomena and a rich source of mathematical problems [11, 5, 21].

In the context of lattices gases, the empirical measure is the only relevant thermodynamical quantity in the macroscopic description of the system, and the thermodynamical functionals, as the free energy, can be identified to the large deviations rate functional.

While in equilibrium the stationary state is given by the Gibbs distribution associated to the Hamiltonian, in nonequilibrium the construction of the stationary state requires solving a dynamical-variational problem which defines the so-called quasi-potential [19].

At the beginning of this century, Derrida, Lebowitz and Speer [14] considered the onedimensional symmetric exclusion process in strong contact with reservoirs. In this context, the empirical measure evolves in the diffusive time-scale according to the heat equation with Dirichlet boundary conditions [22]. Expressing the stationary state as a product of matrices [12], they obtained an explicit formula for the large deviations principle rate functional of the empirical measure under the stationary state, the so-called nonequilibrium free energy.

Later, [2] derived the Derrida-Lebowitz-Speer formula (in short DLS formula) for the nonequilibrium free energy extending to infinite dimensions the dynamical approach introduced in [19]. More precisely, they first proved a dynamical large deviations principle for the empirical measure for symmetric exclusion processes in strong contact with reservoirs [3]. Denote by $I_{[0, T]}(u)$ the large deviations rate function of the dynamical large deviations principle. Hence, $I_{[0, T]}(u)$ represents the cost of observing a trajectory $u(t)$ in the time-interval $[0, T]$. Let $\bar{\rho}$ be the stationary profile of the hydrodynamic equation, that is, the typical density profile under the stationary state. Define the quasi-potential as

$$
V(\gamma)=\inf _{T>0} \inf _{u} I_{[0, T]}(u),
$$

where the second infimum is carried over all trajectories $u(t)$ connecting the stationary density profile $\bar{\rho}$ to a density profile $\gamma$ in the time interval $[0, T]: u(0)=\bar{\rho}, u(T)=\gamma$. It is proven in [2] that the quasi-potential $V$ coincides with the nonequilibrium free energy, i.e., that it satisfies the DLS' equations.

In the sequel, $[8,16]$ derived a large deviations principle for the empirical measure under the stationary state from the dynamical one, with rate functional given by the quasi-potential. This result was later extended to weakly symmetric exclusion processes in strong contact with reservoirs $[15,7,6,4]$ and to reaction-diffusion models [25, 18].

It has long been understood that these results extend to boundary-driven one-dimensional symmetric exclusion processes in weak contact with reservoirs [10]. But only recently, this result appeared in [13] through the matrix ansatz product method.

In this article, we accomplish the first step in the project of deriving the large deviations principle for the empirical measure under the stationary state, through the dynamical approach, for boundary-driven one-dimensional symmetric exclusion processes in weak contact with reservoirs. The law of large numbers has been obtained in [1, 20]. We prove here the dynamical large deviations, while in the companion paper [9], it is shown that the quasi-potential satisfies the DLS' equations obtained in [13] for this model.

## 2. Notation and Results

The model. We consider one-dimensional, symmetric exclusion processes in a weak contact with boundary reservoirs. Fix $N \geq 1$, and let $\mathfrak{e}_{N}=1 / N, \mathfrak{r}_{N}=1-(1 / N), \Lambda_{N}=\left\{\mathfrak{e}_{N}, \ldots,(N-\right.$ 2) $\left.\mathfrak{e}_{N}, \mathfrak{r}_{N}\right\}$. The state-space is represented by $\Omega_{N}=\{0,1\}^{\Lambda_{N}}$ and the configurations by the Greek letters $\eta, \xi$ so that $\eta_{x}, x \in \Lambda_{N}$, represents the number of particles at site $x$ for the
configuration $\eta$. Here and below all notation introduced in the text and not in displayed equations is indicated in blue.

Fix throughout this article, $0<\alpha \leq \beta<1, A>0, B>0$. The generator of the Markov process, represented by $\mathcal{L}_{N}=\mathcal{L}_{N}^{\alpha, A, \beta, B}$, is given by

$$
\mathcal{L}_{N}=L_{N}^{\mathrm{lb}}+L_{N}^{\mathrm{bulk}}+L_{N}^{\mathrm{rb}} .
$$

In this formula, for every function $f: \Omega_{N} \rightarrow \mathbb{R}$,

$$
\begin{equation*}
\left(L_{N}^{\text {bulk }} f\right)(\eta)=N^{2} \sum_{x \in \Lambda_{N}^{o}}\left[f\left(\sigma^{x, x+\mathfrak{e}_{N}} \eta\right)-f(\eta)\right] \tag{2.1}
\end{equation*}
$$

where $\Lambda_{N}^{o}$ represents the interior of $\Lambda_{N}, \Lambda_{N}^{o}:=\Lambda_{N} \backslash\left\{\mathfrak{r}_{N}\right\}=\left\{\mathfrak{e}_{N}, \ldots,(N-2) \mathfrak{e}_{N}\right\}$, and

$$
\begin{align*}
& \left(L_{N}^{\mathrm{lb}} f\right)(\eta)=\frac{N}{A}\left[\left(1-\eta_{\mathfrak{e}_{N}}\right) \alpha+(1-\alpha) \eta_{\mathfrak{e}_{N}}\right]\left[f\left(\sigma^{\mathfrak{e}_{N}} \eta\right)-f(\eta)\right]  \tag{2.2}\\
& \left(L_{N}^{\mathrm{rb}} f\right)(\eta)=\frac{N}{B}\left[\left(1-\eta_{\mathfrak{v}_{N}}\right) \beta+(1-\beta) \eta_{\mathfrak{v}_{N}}\right]\left[f\left(\sigma^{\mathrm{r}_{N}} \eta\right)-f(\eta)\right]
\end{align*}
$$

From now on, we omit the subindex $N$ from $\mathfrak{e}_{N}$ and $\mathfrak{r}_{N}$. In the definitions above,

$$
\left(\sigma^{x, x+\mathfrak{e}} \eta\right)_{y}=\left\{\begin{array}{ll}
\eta_{y} & \text { if } y \neq x, x+\mathfrak{e}  \tag{2.3}\\
\eta_{x+\mathfrak{e}} & \text { if } y=x \\
\eta_{x} & \text { if } y=x+\mathfrak{e}
\end{array} \quad \text { and } \quad\left(\sigma^{x} \eta\right)_{y}= \begin{cases}\eta_{y} & \text { if } y \neq x \\
1-\eta_{x} & \text { if } y=x\end{cases}\right.
$$

For a metric space $\mathbb{X}$, denote by $D([0, T], \mathbb{X}), T>0$, the space of right-continuous functions $x:[0, T] \rightarrow \mathbb{X}$, with left-limits, endowed with the Skorohod topology and its associated Borel $\sigma$-algebra. The elements of $D\left([0, T], \Omega_{N}\right)$ are represent by $\boldsymbol{\eta}(\cdot)$.

For a probability measure $\mu$ on $\Omega_{N}$, let $\mathbb{P}_{\mu}$ be the measure on $D\left([0, T], \Omega_{N}\right)$ induced by the continuous-time Markov process associated to the generator $\mathcal{L}_{N}$ starting from $\mu$. When the measure $\mu$ is the Dirac measure concentrated on a configuration $\eta \in \Omega_{N}$, that is $\mu=\delta_{\eta}$, we represent $\mathbb{P}_{\delta_{\eta}}$ simply by $\mathbb{P}_{\eta}$. Expectation with respect to $\mathbb{P}_{\mu}, \mathbb{P}_{\eta}$ is denoted by $\mathbb{E}_{\mu}, \mathbb{E}_{\eta}$, respectively.

Hydrodynamic limit. Denote by $\mathcal{M}$ the set of non-negative measures on $[0,1]$ with total mass bounded by 1 endowed with the weak topology. Recall that this topology is metrisable and that, with this topology, $\mathcal{M}$ is a compact space. For a continuous function $F:[0,1] \rightarrow \mathbb{R}$ and a measure $\pi \in \mathcal{M}$, denote by $\langle\pi, F\rangle$ the integral of $F$ with respect to $\pi$ :

$$
\langle\pi, F\rangle=\int F(x) \pi(d x)
$$

Given a configuration $\eta \in \Omega_{N}$, denote by $\pi=\pi(\eta)$ the measure in $\mathcal{M}$ obtained by assigning a mass $N^{-1}$ to each particle:

$$
\pi=\pi(\eta)=\frac{1}{N} \sum_{x \in \Lambda_{N}} \eta_{x} \delta_{x}
$$

The measure $\pi$ is called the empirical measure. Denote by $\pi: D\left([0, T], \Omega_{N}\right) \rightarrow D([0, T], \mathcal{M})$ the map which associates to a trajectory $\boldsymbol{\eta}(\cdot)$ its empirical measure:

$$
\begin{equation*}
\boldsymbol{\pi}(t)=\pi(\boldsymbol{\eta}(t))=\frac{1}{N} \sum_{x \in \Lambda_{N}} \eta_{x}(t) \delta_{x} \tag{2.4}
\end{equation*}
$$

For a probability measure $\mu$ in $\Omega_{N}$, let $\mathbb{Q}_{\mu}^{N}$ be the measure on $D([0, T], \mathcal{M})$ given by $\mathbb{Q}_{\mu}^{N}=$ $\mathbb{P}_{\mu}^{N} \circ \pi^{-1}$. The first result, due to [1], establishes the hydrodynamic behavior of the empirical measure.

Theorem 2.1. Fix $T>0$, a measurable density profile $\gamma:[0,1] \rightarrow[0,1]$, and a sequence $\left\{\nu^{N}\right\}_{N \geq 1}$ of probability measures on $\Omega_{N}$ associated to $\gamma$ in the sense that

$$
\begin{equation*}
\lim _{N \rightarrow \infty} \nu^{N}\left[\left|\langle\pi, H\rangle-\int_{0}^{1} \gamma(x) H(x) d x\right|>\delta\right]=0 \tag{2.5}
\end{equation*}
$$

for all continuous functions $H:[0,1] \rightarrow \mathbb{R}$ and $\delta>0$. Then, the sequence of probability measures $\mathbb{Q}_{\nu^{N}}^{N}$ converges weakly to the probability measure $\mathbb{Q}$ concentrated on the trajectory $\pi(t, d x)=u(t, x) d x$, where $u$ is the unique weak solution of the heat equation with Robin boundary conditions

$$
\left\{\begin{array}{l}
\partial_{t} u=\Delta u  \tag{2.6}\\
(\nabla u)(t, 0)=A^{-1}[u(t, 0)-\alpha] \\
(\nabla u)(t, 1)=B^{-1}[\beta-u(t, 1)] \\
u(0, \cdot)=\gamma(\cdot)
\end{array}\right.
$$

In this formula, $\nabla u$ stands for the partial derivative in space of $u, \partial_{t} u$ for its partial derivative in time and $\Delta u$ for the Laplacian of $u$ in the space variable. The definition of weak solutions of equation (2.6) and the proof of uniqueness of weak solutions is provided in Appendix B. It is also presented in [1].

The energy. Denote by $\mathcal{M}_{\mathrm{ac}}$ the subset of $\mathcal{M}$ of all measures which are absolutely continuous with respect to the Lebesgue measure and whose density takes values in the interval $[0,1]$, that is, $\mathcal{M}_{\mathrm{ac}}=\{\pi \in \mathcal{M}: \pi(d x)=\gamma(x) d x$ and $0 \leq \gamma(x) \leq 1\}$.

For $T>0$, let the energy $\mathcal{Q}_{[0, T]}: D\left([0, T], \mathcal{M}_{\mathrm{ac}}\right) \rightarrow[0, \infty]$ be given by

$$
\begin{align*}
& \mathcal{Q}_{[0, T]}(u):=\sup _{G} \mathcal{Q}_{[0, T]}^{G} \\
& \quad:=\sup _{G}\left\{\int_{0}^{T} d t \int_{0}^{1} u(t, x)(\nabla G)(t, x) d x-\frac{1}{2} \int_{0}^{T} d t \int_{0}^{1} G(t, x)^{2} d x\right\}, \tag{2.7}
\end{align*}
$$

where the supremum is carried over all smooth functions $G:[0, T] \times(0,1) \rightarrow \mathbb{R}$ with compact support.

Remark 2.2. In this definition and below, for a functional $\Phi: D\left([0, T], \mathcal{M}_{\mathrm{ac}}\right) \rightarrow \mathbb{R}$, we often write $\Phi(u)$ instead $\Phi(\pi)$ when $\pi(t, d x)=u(t, x) d x$.

Clearly, the energy $\mathcal{Q}_{[0, T]}$ is convex and lower semicontinuous. Moreover, if $\mathcal{Q}_{[0, T]}(u)$ is finite, $u$ has a generalized space derivative, denoted by $\nabla u$, and

$$
\begin{equation*}
\mathcal{Q}_{[0, T]}(u)=\frac{1}{2} \int_{0}^{T} d t \int_{0}^{1}\left(\nabla u_{t}\right)^{2} d x . \tag{2.8}
\end{equation*}
$$

Denote by $D_{\mathcal{E}}\left([0, T], \mathcal{M}_{\mathrm{ac}}\right)$ the trajectories in $D\left([0, T], \mathcal{M}_{\mathrm{ac}}\right)$ with finite energy.

The rate functional. For $T>0$ and positive integers $m, n$, denote by $C^{m, n}([0, T] \times[0,1])$ the space of functions $G:[0, T] \times[0,1] \rightarrow \mathbb{R}$ with $m$ derivatives in time, $n$ derivatives in space which are continuous up to the boundary. Denote by $C_{0}^{m, n}([0, T] \times[0,1])$ the functions $G$ in $C^{m, n}([0, T] \times[0,1])$ such that $G(t, 0)=G(t, 1)=0$ for all $t \in[0, T]$, and by $C_{c}^{m, n}([0, T] \times(0,1))$ the functions in $C^{m, n}([0, T] \times[0,1])$ with compact support in $[0, T] \times(0,1)$.

For $0<\varrho<1, D>0,0<a<1, M \in \mathbb{R}$, let

$$
\begin{equation*}
\mathfrak{b}_{\varrho, D}(a, M)=\frac{1}{D}\left\{[1-a] \varrho\left[e^{M}-1\right]+a[1-\varrho]\left[e^{-M}-1\right]\right\} . \tag{2.9}
\end{equation*}
$$

Fix a trajectory $\pi(t, d x)=u(t, x) d x \in D_{\mathcal{E}}\left([0, T], \mathcal{M}_{\mathrm{ac}}\right)$. Then, for almost all $t \in[0, T]$, $\int_{0}^{1}\left(\nabla u_{t}\right)^{2} d x$ is finite, and therefore $u(t, \cdot)$ is Hölder-continuous. In particular, $u(t, 0)$ and $u(t, 1)$ are well defined for almost all $t$.

Denote by $\langle\cdot, \cdot\rangle$ the usual scalar product in $\mathcal{L}^{2}([0,1]):\langle f, g\rangle=\int_{0}^{1} f(x) g(x) d x$ for $f, g \in$ $\mathcal{L}^{2}([0,1])$. Recall the convention established in Remark 2.2. For each $H$ in $C^{1,2}([0, T] \times[0,1])$, let $J_{T, H}: D_{\mathcal{E}}\left([0, T], \mathcal{M}_{\mathrm{ac}}\right) \longrightarrow \mathbb{R}$ be the functional given by

$$
\begin{align*}
& J_{T, H}(u)=\left\langle u_{T}, H_{T}\right\rangle-\left\langle u_{0}, H_{0}\right\rangle-\int_{0}^{T}\left\langle u_{t}, \partial_{t} H_{t}\right\rangle d t \\
& \quad-\int_{0}^{T}\left\langle u_{t}, \Delta H_{t}\right\rangle d t+\int_{0}^{T} u_{t}(1) \nabla H_{t}(1) d t-\int_{0}^{T} u_{t}(0) \nabla H_{t}(0) d t \\
& \quad-\int_{0}^{T}\left\langle\sigma\left(u_{t}\right),\left(\nabla H_{t}\right)^{2}\right\rangle d t  \tag{2.10}\\
& \quad-\int_{0}^{T}\left\{\mathfrak{b}_{\alpha, A}\left(u_{t}(0), H_{t}(0)\right)+\mathfrak{b}_{\beta, B}\left(u_{t}(1), H_{t}(1)\right)\right\} d t
\end{align*}
$$

In this formula and below, $\sigma(a)=a(1-a)$ stands for the mobility of the exclusion process. Since trajectories in $D_{\mathcal{E}}\left([0, T], \mathcal{M}_{\mathrm{ac}}\right)$ have generalized space-derivatives, we may integrate by parts the second line and write the functional $J_{T, H}(\cdot)$ as

$$
\begin{align*}
J_{T, H}(u) & =\left\langle u_{T}, H_{T}\right\rangle-\left\langle u_{0}, H_{0}\right\rangle-\int_{0}^{T}\left\langle u_{t}, \partial_{t} H_{t}\right\rangle d t \\
& +\int_{0}^{T}\left\langle\nabla u_{t}, \nabla H_{t}\right\rangle d t-\int_{0}^{T}\left\langle\sigma\left(u_{t}\right),\left(\nabla H_{t}\right)^{2}\right\rangle d t  \tag{2.11}\\
& -\int_{0}^{T}\left\{\mathfrak{b}_{\alpha, A}\left(u_{t}(0), H_{t}(0)\right)+\mathfrak{b}_{\beta, B}\left(u_{t}(1), H_{t}(1)\right)\right\} d t
\end{align*}
$$

We extend the definition of $J_{T, H}(\cdot)$ to $D([0, T], \mathcal{M})$ by setting

$$
J_{T, H}(\pi)=\infty \quad \text { if } \pi \notin D_{\mathcal{E}}\left([0, T], \mathcal{M}_{\mathrm{ac}}\right)
$$

Remark 2.3. This definition differs from the one presented in [7, 17, 20] in the context of exclusion processes with Dirichlet boundary conditions. There, one defines $J_{T, H}(\cdot)$ in $D\left([0, T], \mathcal{M}_{\mathrm{ac}}\right)$ by an equation similar to (2.10) with $u_{t}(0)$, $u_{t}(1)$ replaced by the densities $\alpha, \beta$, respectively. Here, as the boundary values appear and are not fixed by the dynamics, in the definition of the functional $J_{T, H}$, one is forced to restrict the definition to trajectories with finite energy. Otherwise, the boundary values of a density profile are not defined.

Let $I_{[0, T]}(\cdot): D\left([0, T], \mathcal{M}_{\mathrm{ac}}\right) \longrightarrow[0,+\infty]$ be the functional defined by

$$
\begin{equation*}
I_{[0, T]}(u):=\sup _{H \in C^{1,2}([0, T] \times[0,1])} J_{T, H}(u) . \tag{2.12}
\end{equation*}
$$

Fix a density profile $\gamma$ in $\mathcal{M}_{\mathrm{ac}}$, and let $I_{[0, T]}(\cdot \mid \gamma): D([0, T], \mathcal{M}) \rightarrow \mathbb{R}$ be given by

$$
I_{[0, T]}(u \mid \gamma)=\left\{\begin{array}{l}
I_{[0, T]}(u) \quad \text { if } u(0, \cdot)=\gamma(\cdot) \text { a.s. }  \tag{2.13}\\
\infty \quad \text { otherwise }
\end{array}\right.
$$

Theorem 2.4. Fix $T>0$ and a measurable function $\gamma:[0,1] \rightarrow[0,1]$. The function $\left.I_{[0, T]} \cdot \mid \gamma\right): D([0, T], \mathcal{M}) \rightarrow[0, \infty]$ is convex, lower semicontinuous and has compact level sets.

This result is proved in Section 3, where we also show, in Lemma 3.1, that any path $\pi$ with finite rate function, $I_{[0, T]}(\pi \mid \gamma)<\infty$, is weakly continuous in time. Moreover, Proposition 3.5 states that there exists a finite constant $C_{0}$ such that

$$
\int_{0}^{T} d t \int_{0}^{1} \frac{[\nabla u]^{2}}{\sigma(u)} d x \leq C_{0}\left\{I_{[0, T]}(u)+1\right\}
$$

for all $u$ in $D_{\mathcal{E}}\left([0, T], \mathcal{M}_{\mathrm{ac}}\right)$.
In Section 4, we obtain an explicit formula for the action functional. Proposition 4.5 states that $I_{[0, T]}(\cdot)$ can be expressed as $I_{[0, T]}^{(1)}(\cdot)+I_{[0, T]}^{(2)}(\cdot)$. The first term provides the contribution to the rate function due to the evolution in the interior of the interval $[0,1]$, while the second one the contribution due to the evolution at the boundary.

In Section 5, we show that trajectories with finite rate function can be approximated by smooth ones. The precise statement requires some notation.

Definition 2.5. Given $\gamma \in \mathcal{M}_{\mathrm{ac}}$, let $\Pi_{\gamma}$ be the collection of all paths $\pi(t, d x)=u(t, x) d x$ in $D\left([0, T], \mathcal{M}_{\mathrm{ac}}\right)$ such that
(a) There exists $\mathfrak{t}>0$, such that $u$ follows the hydrodynamic equation (2.6) in the time interval $[0, \boldsymbol{t}]$. In particular, $u(0, \cdot)=\gamma(\cdot)$.
(b) For every $0<\delta \leq T$, there exists $\varepsilon>0$ such that $\varepsilon \leq u(t, x) \leq 1-\varepsilon$ for all $(t, x)$ in $[\delta, T] \times[0,1] ;$
(c) $u$ is smooth on $(0, T] \times[0,1]$.

Theorem 5.2 states that for all $\gamma:[0,1] \rightarrow[0,1]$, the set $\Pi_{\gamma}$ is $I_{[0, T]}(\cdot \mid \gamma)$-dense. This means that any trajectory $\pi$ in $D([0, T], \mathcal{M})$ with finite rate function can be approximated by a sequence of trajectories $\pi^{n} \in \Pi_{\gamma}$ in such a way that $I_{[0, T]}\left(\pi^{n}\right)$ converges to $I_{[0, T]}(\pi)$. This is one of the main technical difficulties in the proof of the lower bound.

We also provide in Section 4 an explicit formula for the rate function of trajectories in $\Pi_{\gamma}$. For $0<\varrho<1, D>0,0<a<1, M \in \mathbb{R}$, let

$$
\begin{gather*}
\mathfrak{p}_{\varrho, D}(a, M)=\frac{1}{D}\left\{[1-a] \varrho e^{M}-a[1-\varrho] e^{-M}\right\}  \tag{2.14}\\
\mathfrak{c}_{\varrho, D}(a, M)=\frac{1}{D}\left\{[1-a] \varrho\left[1-e^{M}+M e^{M}\right]+a[1-\varrho]\left[1-e^{-M}-M e^{-M}\right]\right\} .
\end{gather*}
$$

Proposition 2.6. Fix a density profile $\gamma:[0,1] \rightarrow[0,1]$ and a trajectory $u$ in $\Pi_{\gamma}$. Then, for each $t>0$, the elliptic equation

$$
\left\{\begin{array}{l}
\partial_{t} u=\Delta u-2 \nabla\{\sigma(u) \nabla H\}  \tag{2.15}\\
\nabla u_{t}(1)-2 \sigma\left(u_{t}(1)\right) \nabla H_{t}(1)=\mathfrak{p}_{\beta, B}\left(u_{t}(1), H_{t}(1)\right) \\
\nabla u_{t}(0)-2 \sigma\left(u_{t}(0)\right) \nabla H_{t}(0)=-\mathfrak{p}_{\alpha, A}\left(u_{t}(0), H_{t}(0)\right)
\end{array}\right.
$$

has a unique solution, denoted by $H_{t}$. The function $H$ belongs to $C^{1,2}([0, T] \times[0,1])$, and the rate functional $I_{[0, T]}(u)$ takes the form

$$
\begin{align*}
I_{[0, T]}(u) & =\int_{0}^{T} d t \int_{0}^{1} \sigma\left(u_{t}\right)\left(\nabla H_{t}\right)^{2} d x+\int_{0}^{T} \mathfrak{c}_{\beta, B}\left(u_{t}(1), H_{t}(1)\right) d t \\
& +\int_{0}^{T} \mathfrak{c}_{\alpha, A}\left(u_{t}(0), H_{t}(0)\right) d t \tag{2.16}
\end{align*}
$$

Dynamical large deviations principle. The main result of this article reads as follows.
Theorem 2.7. Fix $T>0, \gamma \in \mathcal{M}_{\mathrm{ac}}$ and let $\left\{\eta^{N}\right\}_{N \in \mathbb{N}}$ be a sequence of configurations. Assume that $\delta_{\eta^{N}}$ is associated to $\gamma$ in the sense of (2.5). Then, the sequence of probability measures $\left\{\mathbb{Q}_{\eta^{N}}\right\}_{N \geq 1}$ satisfies a large deviation principle with speed $N$ and good rate function $I_{T}(\cdot \mid \gamma)$. Namely, for each closed set $\mathcal{C} \subset D([0, T], \mathcal{M})$ and each open set $\mathcal{O} \subset D([0, T], \mathcal{M})$

$$
\begin{aligned}
& \limsup _{N \rightarrow \infty} \frac{1}{N} \log \mathbb{P}_{\eta^{N}}^{N}\left[\pi^{N} \in \mathcal{C}\right] \leq-\inf _{\pi \in \mathcal{C}} I_{T}(\pi \mid \gamma) \\
& \liminf _{N \rightarrow \infty} \frac{1}{N} \log \mathbb{P}_{\eta^{N}}^{N}\left[\pi^{N} \in \mathcal{O}\right] \geq-\inf _{\pi \in \mathcal{O}} I_{T}(\pi \mid \gamma)
\end{aligned}
$$

Remark 2.8. In contrast to [23, 7], the large deviations principle is formulated for the empirical measure and not the empirical density. We follow [17] to show that the rate function can be set as $+\infty$ for trajectories that do not belong to $D\left([0, T], \mathcal{M}_{\mathrm{ac}}\right)$.

## 3. The rate functional $I_{[0, T]}(\cdot)$

In this section, we present some properties of the rate function $I_{[0, T]}(\cdot)$ and prove Theorem 2.4. Fix, once for all, a measurable density profile $\gamma:[0,1] \rightarrow[0,1]$.
Note: Throughout this article, given a function $u:[0, T] \times[0,1] \rightarrow \mathbb{R}$, we represent by $u_{t}$ and $u(t)$ the function defined on $[0,1]$ and such that $u_{t}(x)=u(t, x)$.

We start with two elementary bounds. The first estimate asserts that the cost of a trajectory in a interval $[0, T]$ is bounded by the sum of its cost in the intervals $[0, S]$ and $[S, T]$. Let $\tau_{r} u: \mathbb{R}_{+} \times[0,1] \rightarrow \mathbb{R}, r>0$, be the function defined by $\tau_{r} u(t, x)=u(t+r, x)$. For all $\pi(t, d x)=u(t, x) d x$ in $D\left([0, T], \mathcal{M}_{\mathrm{ac}}\right)$ and $0<S<T$,

$$
\begin{equation*}
I_{[0, T]}(u) \leq I_{[0, S]}(u)+I_{[0, T-S]}\left(\tau_{S} u\right) . \tag{3.1}
\end{equation*}
$$

The proof of this claim is elementary and left to the reader. It relies on the fact that $\sup _{n}\left\{a_{n}+\right.$ $\left.b_{n}\right\} \leq \sup _{n} a_{n}+\sup _{n} b_{n}$.

The second assertion states that the cost of a trajectory on a subinterval of $[0, T]$ is bounded by its total cost. For all $\pi(t, d x)=u(t, x) d x$ in $D\left([0, T], \mathcal{M}_{\mathrm{ac}}\right)$ and $0<S<T$,

$$
\begin{equation*}
I_{[0, S]}(u) \leq I_{[0, T]}(u) \tag{3.2}
\end{equation*}
$$

To prove this claim, assume that $I_{[0, S]}(u)<\infty$, and fix $\varepsilon>0$. The same argument applies to the case $I_{[0, S]}(u)=\infty$. By definition of the rate function, there exists $H:[0, S] \times[0,1] \rightarrow \mathbb{R}$ smooth such that

$$
I_{[0, S]}(u) \leq J_{S, H}(u)+\varepsilon .
$$

Let $\sigma_{n}:[0, T] \rightarrow[0,1], n \geq 1$, be a sequence of smooth, monotone functions such that $\sigma_{n}(t)=1$ for $0 \leq t \leq S$ and $\sigma_{n}(t)=0$ for $S+(1 / n) \leq t \leq T$. Define the function $H_{n}:[0, T] \times[0,1] \rightarrow \mathbb{R}$ as $H_{n}(t, x)=H(t, x), 0 \leq t \leq S$ and $H_{n}(t, x)=H(S, x) \sigma_{n}(t)$, $S \leq t \leq T$. Then,

$$
J_{S, H}(u)=\lim _{n \rightarrow \infty} J_{T, H_{n}}(u) \leq I_{[0, T]}(u),
$$

as claimed.
A similar argument yields that the cost of a trajectory $u$ in a time-interval $[R, R+S]$ is bounded by the total cost. More precisely,

$$
\begin{equation*}
I_{[0, S]}\left(\tau_{R} u\right) \leq I_{[0, T]}(u) \tag{3.3}
\end{equation*}
$$

for all $S>0, R>0$ such that $R+S \leq T$.
The proof of the next result is similar to the ones of [3, Lemma 3.5], [17, Lemma 4.1]. We present it here in sake of completeness.
Lemma 3.1. Fix $T>0$ and $\gamma \in \mathcal{M}_{\mathrm{ac}}$. Let $u$ be a path in $D\left([0, T], \mathcal{M}_{\mathrm{ac}}\right)$ such that $I_{[0, T]}(u \mid \gamma)<$ $\infty$. Then $u(0, x)=\gamma(x)$. Moreover, for each $M>0, g$ in $C^{2}([0,1])$ and $\varepsilon>0$, there exists $\delta>0$ such that

$$
\sup _{u: I_{T}(u \mid \gamma) \leq M} \sup _{|t-s| \leq \delta}\left|\left\langle u_{t}, g\right\rangle-\left\langle u_{s}, g\right\rangle\right| \leq \varepsilon .
$$

In particular, $u$ belongs to $C\left([0, T], \mathcal{M}_{\mathrm{ac}}\right)$.
Proof. Fix $T>0, \gamma \in \mathcal{M}_{\mathrm{ac}}$ and $u$ in $D\left([0, T], \mathcal{M}_{\mathrm{ac}}\right)$ such that $I_{[0, T]}(u \mid \gamma)<\infty$. We first show that $u(0, \cdot)=\gamma(\cdot)$.

As $I_{[0, T]}(u \mid \gamma)<\infty, u$ has finite energy. For $\delta>0$, consider the function $H_{\delta}(t, x)=$ $h_{\delta}(t) g(x)$, where $h_{\delta}(t)=\left(1-\delta^{-1} t\right)^{+}$and $g$ is a $C^{2}([0,1])$ function which vanishes at the boundary of the interval $[0,1]$. Here $a^{+}$stands for the positive part of $a$. Of course, $H_{\delta}$ can be approximated by smooth functions. Since $u$ is bounded and since $t \rightarrow u(t, \cdot)$ is right continuous for the weak topology,

$$
\lim _{\delta \downarrow 0} J_{T, H_{\delta}}(u)=\langle u(0), g\rangle-\langle\gamma, g\rangle .
$$

This proves that $u(0)=\gamma$ a.s. because $I_{[0, T]}(u \mid \gamma)<\infty$.
We turn to the second assertion of the lemma. Fix $g$ in $C^{2}([0,1])$ and $0 \leq s<t \leq T$ such that $t-s<1$. A convenient test function, depending only on time and similar to the one proposed after equation (4.3) in [17], yields that

$$
\begin{aligned}
& \langle u(t), g\rangle-\langle u(s), g\rangle \leq \frac{1}{a} I_{[0, T]}(u \mid \gamma) \\
& \quad+C_{1}\left(\|\Delta g\|_{\infty},\|\nabla g\|_{\infty}\right) a(t-s)+C_{2}\left(A, B,\|g\|_{\infty}\right) a(t-s) e^{a\|g\|_{\infty}}
\end{aligned}
$$

for all $a>0$. The exponential term comes from the $\mathfrak{b}_{\varrho, D}$ contribution to $J_{T, H}$ in the definition (2.10). Choose $a=-(1 / 2)\left(1+\|g\|_{\infty}\right) \log (t-s)$ to get that there exists a finite positive constant $C_{0}$, depending only on $A, B, g$, such that

$$
\langle u(t), g\rangle-\langle u(s), g\rangle \leq \frac{C_{0}}{\log (t-s)^{-1}}\left\{I_{[0, T]}(u \mid \gamma)+1\right\} .
$$

This completes the proof of the lemma.
Let $\mathcal{H}^{1}$ be the Sobolev space of measurable functions $G:[0,1] \rightarrow \mathbb{R}$ with generalized derivatives $\nabla G$ in $\mathcal{L}^{2}([0,1])$. $\mathcal{H}^{1}$ endowed with the scalar product $\langle\cdot, \cdot\rangle_{1}$, defined by

$$
\begin{equation*}
\langle G, H\rangle_{1}=\langle G, H\rangle+\langle\nabla G, \nabla H\rangle, \tag{3.4}
\end{equation*}
$$

is a Hilbert space. The corresponding norm is denoted by $\|\cdot\|_{\mathcal{H}^{1}}$ :

$$
\|G\|_{\mathcal{H}^{1}}^{2}:=\int_{0}^{1}|G(x)|^{2} d x+\int_{0}^{1}|\nabla G(x)|^{2} d x .
$$

Recall from (A.12) that any function $\gamma$ in $\mathcal{H}^{1}$ has a continuous version. Hereafter, we always replace $\gamma$ by its continuous version $w$.

Consider the function $\phi: \mathbb{R} \rightarrow[0, \infty)$ defined by

$$
\phi(r):=\left\{\begin{array}{lc}
\frac{1}{Z} \exp \left\{-\frac{1}{\left(1-r^{2}\right)}\right\} & \text { if }|r|<1 \\
0 & \text { otherwise }
\end{array}\right.
$$

where the constant $Z$ is chosen so that $\int_{\mathbb{R}} \phi(r) d r=1$. For each $\delta>0$, let

$$
\begin{equation*}
\phi^{\delta}(r):=\frac{1}{\delta} \phi\left(\frac{r}{\delta}\right), \tag{3.5}
\end{equation*}
$$

whose support is contained in $[-\delta, \delta]$.
Denote by $f * g$ the space or time convolution of two functions $f, g$ :

$$
(f * g)(a)=\int f(a-b) g(b) d b
$$

where the integral runs over $\mathbb{R}$.
Throughout this section, we adopt the following notation. Recall from Appendix A that we denote by $\left(P_{t}^{(R)}: t \geq 0\right)$ the semigroup associated to the Robin Laplacian. For a bounded measurable function $u:[0, T] \times[0,1] \rightarrow \mathbb{R}$, define the smooth approximation in space, time and space-time by

$$
\begin{gathered}
u^{\varepsilon}(t, x):=\left[P_{\varepsilon}^{(R)} u_{t}\right](x), \quad u^{\delta}(t, x):=\left[u(\cdot, x) * \phi^{\delta}\right](t)=\int_{-\delta}^{\delta} u(t+r, x) \phi^{\delta}(r) d r, \\
u^{\varepsilon, \delta}(t, x):=\left[P_{\varepsilon}^{(R)} u_{t}^{\delta}\right](x):=\left[P_{\varepsilon}^{(R)} u_{t}\right]^{\delta}(x) .
\end{gathered}
$$

In the above formulas, we extend the definition of $u$ to $[-1, T+1] \times[0,1]$ by setting $u_{t}=u_{0}$ for $-1 \leq t \leq 0, u_{t}=u_{T}$ for $T \leq t \leq T+1$,

Note that we use the same notation, $u^{\varepsilon}$ and $u^{\delta}$, for different objects. However, $u^{\varepsilon}$ and $u^{\delta}$ always represent a smooth approximation of $u$ in space and time, respectively. Moreover, the time-convolution commutes with the operator which explains the identity in the last displayed equation.

We summarize some properties of $u^{\varepsilon}$ in the next result.
Lemma 3.2. Let $u:[0, T] \times[0,1] \rightarrow \mathbb{R}$ be a function in $\mathcal{L}^{2}\left(0, T ; \mathcal{H}^{1}\right)$. Then, $u^{\varepsilon}$ and $\nabla u^{\varepsilon}$ converge to $u$ and $\nabla u$ in $\mathcal{L}^{2}([0, T] \times[0,1])$, respectively. Moreover, if $u$ is bounded in $[0, T] \times$ $[0,1]$ and the application $t \mapsto\left\langle u_{t}, g\right\rangle$ is continuous in the time interval $[0, T]$ for any function $g$ in $C^{\infty}([0,1])$, then, for each $\varepsilon>0, n \geq 1, u^{\varepsilon}$ and $\nabla^{n} u^{\varepsilon}$ are uniformly continuous in $[0, T] \times[0,1]$.

Proof. Recall the notation introduced in Appendix A. As $u$ belongs to $\mathcal{L}^{2}\left(0, T ; \mathcal{H}^{1}\right)$ and the norms $\mathcal{H}^{1}, \mathcal{H}_{R}$ are equivalent,

$$
\int_{0}^{T}\left\|u_{t}\right\|_{\mathcal{H}_{R}}^{2} d t<\infty
$$

This relation can be rewritten in terms of the eigenfunctions $\left(f_{k}: k \geq 1\right)$ of the Robin Laplacian as

$$
\begin{equation*}
\int_{0}^{T} \sum_{k \geq 1} \lambda_{k}\left\langle u_{t}, f_{k}\right\rangle^{2} d t<\infty \tag{3.6}
\end{equation*}
$$

Since

$$
u_{t}=\sum_{k \geq 1}\left\langle u_{t}, f_{k}\right\rangle f_{k}, \quad u_{t}^{\varepsilon}=\sum_{k \geq 1} e^{-\lambda_{k} \varepsilon}\left\langle u_{t}, f_{k}\right\rangle f_{k}
$$

we have that

$$
\int_{0}^{T}\left\|u_{t}^{\varepsilon}-u_{t}\right\|_{2}^{2} d t=\int_{0}^{T} \sum_{k \geq 1}\left[e^{-\lambda_{k} \varepsilon}-1\right]^{2}\left\langle u_{t}, f_{k}\right\rangle^{2} d t
$$

and, by (A.9),

$$
\begin{aligned}
\int_{0}^{T}\left\|\nabla u_{t}^{\varepsilon}-\nabla u_{t}\right\|_{2}^{2} d t & \leq C_{0} \int_{0}^{T}\left\|u_{t}^{\varepsilon}-u_{t}\right\|_{\mathcal{H}_{R}}^{2} d t \\
& =C_{0} \int_{0}^{T} \sum_{k \geq 1} \lambda_{k}\left[e^{-\lambda_{k} \varepsilon}-1\right]^{2}\left\langle u_{t}, f_{k}\right\rangle^{2} d t
\end{aligned}
$$

By (3.6), the left-hand side of the previous two displayed equations vanish as $\varepsilon \rightarrow 0$, which proves the first assertion of the lemma.

We turn to the second assertion. We may represent $u^{\varepsilon}, \nabla^{n} u^{\varepsilon}$ as

$$
u_{t}^{\varepsilon}(x)=\sum_{k \geq 1} e^{-\lambda_{k} \varepsilon}\left\langle u_{t}, f_{k}\right\rangle f_{k}(x), \quad\left(\nabla^{n} u_{t}^{\varepsilon}\right)(x)=\sum_{k \geq 1} e^{-\lambda_{k} \varepsilon}\left\langle u_{t}, f_{k}\right\rangle\left(\nabla^{n} f_{k}\right)(x),
$$

The second assertion follows from these identities and from the two hypotheses of the lemma. Indeed, the bound (A.5) on the eigenfunctions $f_{k}$ permits to restrict the sum to a finite number of terms.

For each $a>0$, define the functions $h_{a}$ and $\sigma_{a}$ on $[0,1]$ by

$$
\begin{gathered}
h_{a}(x):=\frac{1}{2(1+2 a)}\{(x+a) \log (x+a)+(1-x+a) \log (1-x+a)\} \\
\sigma_{a}(x):=(x+a)(1-x+a)
\end{gathered}
$$

Note that $h_{a}^{\prime \prime}=\left(2 \sigma_{a}\right)^{-1}$.
Until the end of this section, $0<C_{0}<\infty$ represents a constant independent of $\varepsilon, \delta$ and $a$ and that may change from line to line.

Fix $T>0$ and a path $u$ in $D_{\mathcal{E}}\left([0, T], \mathcal{M}_{\mathrm{ac}}\right)$. For a smooth function $G:[0, T] \times[0,1] \rightarrow \mathbb{R}$ and a bounded function $H$ in $\mathcal{L}^{2}\left(0, T ; \mathcal{H}^{1}\right)$, define the functionals

$$
\begin{aligned}
& L_{G}(u)=\left\langle u_{T}, G_{T}\right\rangle-\left\langle u_{0}, G_{0}\right\rangle-\int_{0}^{T}\left\langle u_{t}, \partial_{t} G_{t}\right\rangle d t \\
& \qquad B_{H}^{1}(u)=\int_{0}^{T}\left\langle\nabla u_{t}, \nabla H_{t}\right\rangle d t-\int_{0}^{T}\left\langle\sigma\left(u_{t}\right),\left(\nabla H_{t}\right)^{2}\right\rangle d t \\
& \quad B_{H}^{2}(u)=\int_{0}^{T}\left\{\mathfrak{b}_{\alpha, A}\left(u_{t}(0), H_{t}(0)\right)+\mathfrak{b}_{\beta, B}\left(u_{t}(1), H_{t}(1)\right)\right\} d t .
\end{aligned}
$$

By (2.10), for paths $u$ such that $u(0)=\gamma$,

$$
\sup _{H \in C^{1,2}([0, T] \times[0,1])}\left\{L_{H}(u)+B_{H}^{1}(u)-B_{H}^{2}(u)\right\}=I_{[0, T]}(u \mid \gamma) .
$$

Lemma 3.3. For $a>0, \varepsilon>0, \delta>0$, let $H_{\varepsilon, \delta}=h_{a}^{\prime}\left(u^{\varepsilon, \delta}\right)$,

$$
R^{\varepsilon, \delta}=L_{H_{\varepsilon, \delta}}\left(u^{\varepsilon, \delta}\right)-L_{\left(H_{\varepsilon, \delta}\right)^{\varepsilon, \delta}}(u) .
$$

Then, for any fixed $a>0, \varepsilon>0, R^{\varepsilon, \delta}$ converges to 0 as $\delta \downarrow 0$.
Warning: Until the end of Proposition 3.5 proof's, we drop the dependence of $H=H_{\varepsilon, \delta}=$ $h_{a}^{\prime}\left(u^{\varepsilon, \delta}\right)$ on $\varepsilon, \delta$. Hence, $H$ always stands for $H_{\varepsilon, \delta}$.

Proof of Lemma 3.3. Recall that $C_{0}$ represents a constant independent of $\varepsilon, \delta$ and $a$, that may change from line to line. As $P_{\varepsilon}^{(R)}$ is a self-adjoint operator in $\mathcal{L}^{2}([0,1])$ and commutes with the time-derivative,

$$
\begin{aligned}
L_{H}\left(u^{\varepsilon, \delta}\right) & =\left\langle u_{T}^{\delta}, H_{T}^{\varepsilon}\right\rangle-\left\langle u_{0}^{\delta}, H_{0}^{\varepsilon}\right\rangle-\int_{0}^{T}\left\langle u_{t}^{\delta}, \partial_{t} H_{t}^{\varepsilon}\right\rangle d t \\
& =\left\langle u_{T}, H_{T}^{\varepsilon, \delta}\right\rangle-\left\langle u_{0}, H_{0}^{\varepsilon, \delta}\right\rangle-\int_{0}^{T}\left\langle u_{t}^{\delta}, \partial_{t} H_{t}^{\varepsilon}\right\rangle d t+R_{1}^{\varepsilon, \delta}
\end{aligned}
$$

where

$$
R_{1}^{\varepsilon, \delta}:=R^{\varepsilon, \delta, T}-R^{\varepsilon, \delta, 0} \quad \text { and } \quad R^{\varepsilon, \delta, t}:=\left\langle u_{t}^{\delta}-u_{t}, H_{t}^{\varepsilon}\right\rangle+\left\langle u_{t}, H_{t}^{\varepsilon}-H_{t}^{\varepsilon, \delta}\right\rangle
$$

for $0 \leq t \leq T$.
A simple computation yields that

$$
\int_{0}^{T}\left\langle u_{t}^{\delta}, \partial_{t} H_{t}^{\varepsilon}\right\rangle d t=\int_{0}^{T}\left\langle u_{t}, \partial_{t} H_{t}^{\varepsilon, \delta}\right\rangle d t+R_{2}^{\varepsilon, \delta}
$$

where $\left|R_{2}^{\varepsilon, \delta}\right| \leq C_{0} \delta\left\|\partial_{t} H^{\varepsilon}\right\|_{\infty}$. To conclude the proof, it is enough to show that, for each fixed $a>0, \varepsilon>0, R_{1}^{\varepsilon, \delta}$ and $\delta\left\|\partial_{t} H^{\varepsilon}\right\|_{\infty}$ converge to zero as $\delta \downarrow 0$.

We first prove that

$$
\begin{equation*}
\lim _{\delta \downarrow 0} R^{\varepsilon, \delta, t}=0 \quad \text { for } \quad t=0 \text { and } t=T . \tag{3.7}
\end{equation*}
$$

We consider the case $t=T$, the argument being similar for $t=0$. As $P_{t}^{(R)}$ is symmetric,

$$
R^{\varepsilon, \delta, T}=\left\langle u_{T}^{\varepsilon, \delta}-u_{T}^{\varepsilon}, H_{T}\right\rangle+\left\langle u_{T}^{\varepsilon}, H_{T}-H_{T}^{\delta}\right\rangle .
$$

By Lemma 3.2, for each $x \in[0,1], u^{\varepsilon}(\cdot, x)$ is continuous. Therefore, by definition of $H$, for any $(t, x) \in[0, T] \times[0,1]$,

$$
\begin{gathered}
\lim _{\delta \downarrow 0} u^{\varepsilon, \delta}(t, x)=u^{\varepsilon}(t, x) \\
\lim _{\delta \downarrow 0} H^{\delta}(T, x)=\lim _{\delta \downarrow 0} h_{a}^{\prime}\left(u^{\varepsilon, \delta}\right)^{\delta}(T, x)=h_{a}^{\prime}\left(u^{\varepsilon}\right)(T, x)=\lim _{\delta \downarrow 0} h_{a}^{\prime}\left(u^{\varepsilon, \delta}\right)=\lim _{\delta \downarrow 0} H(T, x)
\end{gathered}
$$

because $h_{a}^{\prime}$ is bounded and continuous on $[0,1]$. Note that the dependence on $\delta$ of the last term on the right-hand side is hidden, as $H$ is actually $h_{a}^{\prime}\left(u^{\varepsilon, \delta}\right)$. Claim (3.7) follows from these results, from the boundedness of $u$ and $h_{a}^{\prime}$, and the bounded convergence theorem.

It remains to show that $\delta\left\|\partial_{t} H^{\varepsilon}\right\|_{\infty}$ converges to 0 as $\delta \downarrow 0$. An elementary computation gives that, for any $t \in[0, T]$,

$$
\partial_{t} H^{\varepsilon}(t)=P_{\varepsilon}^{(R)}\left[h_{a}^{\prime \prime}\left(u^{\varepsilon, \delta}(t)\right) \int_{-\delta}^{\delta} u^{\varepsilon}(t-r)\left(\phi^{\delta}\right)^{\prime}(r) d r\right] .
$$

Since $\phi^{\delta}$ is a symmetric function, a change of variables shows that

$$
\int_{-\delta}^{\delta} u^{\varepsilon}(t-r)\left(\phi^{\delta}\right)^{\prime}(r) d r=\int_{0}^{\delta}\left\{u^{\varepsilon}(t-r)-u^{\varepsilon}(t+r)\right\}\left(\phi^{\delta}\right)^{\prime}(r) d r
$$

By Lemma 3.2, $u^{\varepsilon}$ is uniformly continuous on $[-1, T+1] \times[0,1]$. On the other hand, $\delta \int_{0}^{\delta}\left(\phi^{\delta}\right)^{\prime}(r) d r=-\phi(0)$. Therefore, the last expression multiplied by $\delta$ converges to 0 as $\delta \downarrow 0$ uniformly in $[0, T] \times[0,1]$. Since $h_{a}^{\prime \prime}$ is uniformly bounded, by the bounded convergence theorem, $\delta\left\|\partial_{t} H_{\varepsilon}\right\|_{\infty}$ converges to 0 as $\delta \downarrow 0$.
Lemma 3.4. There exists a positive constant $C_{0}<\infty$ such that

$$
\begin{equation*}
\int_{0}^{T} d t \int_{0}^{1} \frac{(\nabla u(t, x))^{2}}{\sigma_{a}(u(t, x))} d x \leq C_{0} B_{h_{a}^{\prime}(u)}^{1}(u), \quad\left|B_{h_{a}^{\prime}(u)}^{2}(u)\right| \leq C_{0} \tag{3.8}
\end{equation*}
$$

for all $u \in D_{\mathcal{E}}\left([0, T], \mathcal{M}_{\mathrm{ac}}\right)$ and $0<a<1$. Moreover, for each $u \in D_{\mathcal{E}}\left([0, T], \mathcal{M}_{\mathrm{ac}}\right)$ and $i=1,2$,

$$
\lim _{\varepsilon \downarrow 0} \lim _{\delta \downarrow 0} B_{H^{\varepsilon, \delta}}^{i}(u)=B_{h_{a}^{\prime}(u)}^{i}(u)
$$

Proof. Let $u$ be a path in $D_{\mathcal{E}}\left([0, T], \mathcal{M}_{\mathrm{ac}}\right)$. We first show that

$$
\begin{equation*}
\lim _{\varepsilon \downarrow 0} \lim _{\delta \downarrow 0} B_{H^{\varepsilon, \delta}}^{1}(u)=B_{h_{a}^{\prime}(u)}^{1}(u) \tag{3.9}
\end{equation*}
$$

By Lemma 3.2, $\nabla u^{\varepsilon}$ is uniformly continuous in $[0, T] \times[0,1]$. Therefore, for any $(t, x) \in$ $[0, T] \times[0,1]$,

$$
\lim _{\delta \downarrow 0} \nabla u^{\varepsilon, \delta}(t, x)=\nabla u^{\varepsilon}(t, x)
$$

Recall from the end of the Appendix B the definition of the semigroup $P_{t}^{(M)}$. By (B.11) $\nabla P_{\varepsilon}^{(R)}=P_{\varepsilon}^{(M)} \nabla$. Hence,

$$
\lim _{\delta \downarrow 0} \nabla H^{\varepsilon, \delta}(t, x)=\lim _{\delta \downarrow 0} P_{\varepsilon}^{(M)}\left[h_{a}^{\prime \prime}\left(u^{\varepsilon, \delta}\right) \nabla u^{\varepsilon, \delta}\right]^{\delta}(t, x)=P_{\varepsilon}^{(M)}\left[h_{a}^{\prime \prime}\left(u_{t}^{\varepsilon}\right) \nabla u_{t}^{\varepsilon}\right](x) .
$$

Hence, as $(\nabla u)(t, x) d x d t$ is a finite measure on $[0, T] \times[0,1]$, by the bounded convergence theorem,

$$
\begin{equation*}
\lim _{\delta \downarrow 0} B_{H^{\varepsilon, \delta}}^{1}(u)=\int_{0}^{T}\left\{\left\langle\nabla u_{t}, G_{t}^{\varepsilon}\right\rangle-\left\langle\sigma\left(u_{t}\right),\left[G_{t}^{\varepsilon}\right]^{2}\right\rangle\right\} d t \tag{3.10}
\end{equation*}
$$

where $G^{\varepsilon}(t, x)=P_{\varepsilon}^{(M)}\left[h_{a}^{\prime \prime}\left(u_{t}^{\varepsilon}\right) \nabla u_{t}^{\varepsilon}\right](x)$.
On the one hand, since $P_{\varepsilon}^{(M)}$ is a contraction in $\mathcal{L}^{2}([0,1]), h_{a}^{\prime \prime}$ is bounded, and since, by Lemma 3.2, $\nabla u^{\varepsilon}$ converges to $\nabla u$ in $\mathcal{L}^{2}([0, T] \times[0,1])$,

$$
\lim _{\varepsilon \downarrow 0} \int_{0}^{T} d t \int_{0}^{1}\left\{P_{\varepsilon}^{(M)}\left[h_{a}^{\prime \prime}\left(u_{t}^{\varepsilon}\right)\left(\nabla u_{t}^{\varepsilon}-\nabla u_{t}\right)\right]\right\}^{2} d x=0
$$

Therefore, on the right-hand side of (3.10), in the formula for $G^{\varepsilon}$ we may replace $\nabla u_{t}^{\varepsilon}$ by $\nabla u_{t}$ at a cost that vanishes as $\varepsilon \rightarrow 0$.

Since $h_{a}^{\prime \prime}$ is Lipschitz continuous, by Lemma 3.2, as $\varepsilon \downarrow 0, h_{a}^{\prime \prime}\left(u^{\varepsilon}\right)$ converges in measure to $h_{a}^{\prime \prime}(u)$. In other words, for any $b>0$, the Lebesgue measure of the set $\{(t, x) \in[0, T] \times$ $\left.[0,1] ;\left|h_{a}^{\prime \prime}\left(u^{\varepsilon}(t, x)\right)-h_{a}^{\prime \prime}(u(t, x))\right| \geq b\right\}$ converges to 0 as $\varepsilon \downarrow 0$. Therefore, as $\nabla u_{t}$ belongs to $\mathcal{L}^{2}([0, T] \times[0,1])$,

$$
\lim _{\varepsilon \downarrow 0} \int_{0}^{T}\left\langle h_{a}^{\prime \prime}\left(u_{t}^{\varepsilon}\right)\left[\nabla u_{t}\right]^{2}\right\rangle d t=\int_{0}^{T}\left\langle h_{a}^{\prime \prime}\left(u_{t}\right)\left[\nabla u_{t}\right]^{2}\right\rangle d t
$$

In consequence, on the right-hand side of (3.10), in the formula for $G^{\varepsilon}$ we may further replace $h_{a}^{\prime \prime}\left(u^{\varepsilon}\right)$ by to $h_{a}^{\prime \prime}(u)$.

To complete the proof of (3.9), it remains to recall that for any $f$ in $\mathcal{L}^{2}([0,1]), P_{\varepsilon}^{(M)} f$ converges in $\mathcal{L}^{2}([0,1])$ to $f$ as $\varepsilon \rightarrow 0$.

We turn to the proof that

$$
\lim _{\varepsilon \downarrow 0} \lim _{\delta \downarrow 0} B_{H^{\varepsilon, \delta}}^{2}(u)=B_{h_{a}^{\prime}(u)}^{2}(u)
$$

We examine the boundary condition at $x=0$, the other one being similar.
By Lemma 3.2, $u^{\varepsilon}$ is uniformly continuous. Hence, as $h_{a}^{\prime}$ is continuous in the interval $[0,1]$, as $\delta \rightarrow 0, H^{\varepsilon, \delta}(t, 0)$ converges to $P_{\varepsilon}^{(R)}\left[h_{a}^{\prime}\left(u_{t}^{\varepsilon}\right)\right](0)$. Therefore,

$$
\begin{equation*}
\lim _{\delta \downarrow 0} \int_{0}^{T} \mathfrak{b}_{\alpha, A}\left(u_{t}(0), H_{\varepsilon, \delta}(t, 0)\right) d t=\int_{0}^{T} \mathfrak{b}_{\alpha, A}\left(u_{t}(0), P_{\varepsilon}^{(R)}\left[h_{a}^{\prime}\left(u_{t}^{\varepsilon}\right)\right](0)\right) d t \tag{3.11}
\end{equation*}
$$

To conclude the proof, we first replace on the right-hand side $P_{\varepsilon}^{(R)}\left[h_{a}^{\prime}\left(u_{t}^{\varepsilon}\right)\right](0)$ by $h_{a}^{\prime}\left(u_{t}^{\varepsilon}(0)\right)$. Since $h_{a}^{\prime}$ is bounded, there exists a finite constant $C_{1}=C_{1}(a, A, \alpha)$ such that

$$
\begin{aligned}
& \left|\int_{0}^{T} \mathfrak{b}_{\alpha, A}\left(u_{t}(0), P_{\varepsilon}^{(R)}\left[h_{a}^{\prime}\left(u_{t}^{\varepsilon}\right)\right](0)\right) d t-\int_{0}^{T} \mathfrak{b}_{\alpha, A}\left(u_{t}(0), h_{a}^{\prime}\left(u_{t}^{\varepsilon}(0)\right)\right) d t\right| \\
& \quad \leq C_{1} \int_{0}^{T}\left|P_{\varepsilon}^{(R)}\left[h_{a}^{\prime}\left(u_{t}^{\varepsilon}\right)\right](0)-h_{a}^{\prime}\left(u_{t}^{\varepsilon}(0)\right)\right| d t
\end{aligned}
$$

By (A.7), Lemma A. 3 and (A.9),

$$
\left|P_{\varepsilon}^{(R)}\left[h_{a}^{\prime}\left(u_{t}^{\varepsilon}\right)\right](0)-h_{a}^{\prime}\left(u_{t}^{\varepsilon}(0)\right)\right| \leq C_{0} \sqrt{A} \varepsilon^{1 / 5}\left\|h_{a}^{\prime}\left(u_{t}^{\varepsilon}\right)\right\|_{\mathcal{H}^{1}}
$$

for some finite constant $C_{0}$. Hence, the term on the right-hand side in the penultimate displayed equation is bounded by

$$
C_{1} \varepsilon^{1 / 5} \int_{0}^{T}\left\|h_{a}^{\prime}\left(u_{t}^{\varepsilon}\right)\right\|_{\mathcal{H}^{1}} d t
$$

By Lemma 3.2, $u^{\varepsilon}$ converges to $u$ in $\mathcal{L}^{2}\left(0, T, \mathcal{H}^{1}\right)$. Since $h_{a}^{\prime}$ and $h_{a}^{\prime \prime}$ are bounded, the previous integral is bounded uniformly in $\varepsilon$. In particular, the previous expression vanishes as $\varepsilon \rightarrow 0$.

It remains to estimate the right-hand side of (3.11) with $P_{\varepsilon}^{(R)}\left[h_{a}^{\prime}\left(u_{t}^{\varepsilon}\right)\right](0)$ replaced by $h_{a}^{\prime}\left(u_{t}^{\varepsilon}(0)\right)$. By (A.7) and since, by Lemma 3.2, $u^{\varepsilon}$ converges to $u$ in $\mathcal{L}^{2}\left(0, T, \mathcal{H}^{1}\right), \lim _{\varepsilon \rightarrow 0} u_{t}^{\varepsilon}(0)=$ $u_{t}(0)$. Hence, as $h_{a}^{\prime}$ is continuous, and since, by (A.16), $u^{\varepsilon}$ is uniformly bounded, by the bounded convergence theorem,

$$
\lim _{\varepsilon \rightarrow 0} \int_{0}^{T} \mathfrak{b}_{\alpha, A}\left(u_{t}(0), h_{a}^{\prime}\left(u_{t}^{\varepsilon}(0)\right)\right) d t=\int_{0}^{T} \mathfrak{b}_{\alpha, A}\left(u_{t}(0), h_{a}^{\prime}\left(u_{t}(0)\right)\right) d t
$$

which completes the proof of first assertion of the lemma.
We turn to the bounds (3.8). As $\sigma(x) \leq \sigma_{a}(x)$, for each $\varepsilon>0$,

$$
\int_{0}^{T}\left\langle\nabla u_{t}^{\varepsilon}, \nabla h_{a}^{\prime}\left(u_{t}^{\varepsilon}\right)\right\rangle d t-\int_{0}^{T}\left\langle\sigma_{a}\left(u_{t}^{\varepsilon}\right),\left(\nabla h_{a}^{\prime}\left(u_{t}^{\varepsilon}\right)\right)^{2}\right\rangle d t \leq B_{h_{a}^{\prime}\left(u^{\varepsilon}\right)}^{1}\left(u^{\varepsilon}\right)
$$

Compute the left-hand side to get that

$$
\frac{1}{4} \int_{0}^{T} d t \int_{0}^{1} \frac{\left(\nabla u^{\varepsilon}\right)^{2}}{\sigma_{a}\left(u^{\varepsilon}\right)} d x \leq B_{h_{a}^{\prime}\left(u^{\varepsilon}\right)}^{1}\left(u^{\varepsilon}\right)
$$

The arguments presented in the first part of the proof permit to let $\varepsilon \rightarrow 0$ on both sides of this inequality and yield the first estimate in (3.8).

To estimate $B_{h_{a}^{\prime}(u)}^{2}(u)$, note that

$$
\begin{aligned}
& \mathfrak{b}_{\varrho, D}\left(v, h_{a}^{\prime}(v)\right)= \\
& \frac{1}{D}\left\{\varrho[1-v]\left[\left(\frac{v+a}{1+a-v}\right)^{1 / 2+4 a}-1\right]+[1-\varrho] v\left[\left(\frac{1+a-v}{v+a}\right)^{1 / 2+4 a}-1\right]\right\} .
\end{aligned}
$$

In particular, $\mathfrak{b}_{o, D}$, as a function of $v$ and $a$ is bounded: for all $0<\varrho<1, D>0$, there exists a finite constant $C_{0}=C_{0}(\varrho, D)$ such that

$$
\sup _{0 \leq a<1} \sup _{v \in[0,1]}\left|\mathfrak{b}_{o, D}\left(v, h_{a}^{\prime}(v)\right)\right| \leq C_{0}
$$

The second inequality in (3.8) follows from this estimate and the definition of $B_{h_{a}^{\prime}(u)}^{2}(u)$.
Proposition 3.5. There exists a constant $C_{0}>0$ such that

$$
\int_{0}^{T} d t \int_{0}^{1} \frac{|\nabla u(t, x)|^{2}}{\sigma(u(t, x))} d x \leq C_{0}\left\{I_{[0, T]}(u)+1\right\}
$$

for any path $u$ in $D_{\mathcal{E}}\left([0, T], \mathcal{M}_{\mathrm{ac}}\right)$.
Proof. We may assume, without loss of generality, that $I_{[0, T]}(u)$ is finite. By the variational formula (2.12) and with the notation of Lemma 3.3,

$$
\begin{equation*}
L_{H}\left(u^{\varepsilon, \delta}\right)+B_{H^{\varepsilon, \delta}}^{1}(u)-B_{H^{\varepsilon, \delta}}^{2}(u)-R^{\varepsilon, \delta} \leq I_{[0, T]}(u) \tag{3.12}
\end{equation*}
$$

where, recall, $H$ stands for the function $h_{a}^{\prime}\left(u^{\varepsilon, \delta}\right)$.
Since $u^{\varepsilon, \delta}$ is smooth, an integration by parts yields that

$$
L_{H}\left(u^{\varepsilon, \delta}\right)=\int_{0}^{1} h_{a}\left(u_{T}^{\varepsilon, \delta}\right) d x-\int_{0}^{1} h_{a}\left(u_{0}^{\varepsilon, \delta}\right) d x
$$

There exists, therefore, a constant $C_{0}$, independent of $\varepsilon, \delta$ and $a$, such that

$$
\left|L_{H}\left(u^{\varepsilon, \delta}\right)\right| \leq C_{0}
$$

In (3.12), let $\delta \downarrow 0$ and then $\varepsilon \downarrow 0$. It follows from the previous bound, and from Lemmata 3.3 and 3.4 that

$$
B_{h_{a}^{\prime}(u)}^{1}(u)-B_{h_{a}^{\prime}(u)}^{2}(u) \leq I_{T}(u)+C_{0} .
$$

Thus, by (3.8),

$$
\int_{0}^{T} d t \int_{0}^{1} \frac{|\nabla u(t, x)|^{2}}{\sigma_{a}(u(t, x))} d x \leq C_{0}\left\{I_{T}(u)+1\right\}
$$

It remains to let $a \downarrow 0$ and to apply Fatou's lemma.
Note: Since the rate function is declared to be infinite on trajectories with infinite energy, this result is not meant to show that a trajectory has finite energy. Its interest lies on the fact that it provides a uniform bound of a strong version of the energy for trajectories with rate function bounded by a constant.

Corollary 3.6. The density $u$ of a path $\pi(t, d x)=u(t, x) d x$ in $D\left([0, T], \mathcal{M}_{\mathrm{ac}}\right)$ is the weak solution of the initial-boundary value problem (2.6) if, and only if $I_{T}(u \mid \gamma)=0$.

Proof. Suppose that the density $u$ of a path $\pi(t, d x)=u(t, x) d x$ in $D\left([0, T], \mathcal{M}_{\mathrm{ac}}\right)$ is the weak solution of the initial-boundary value problem (2.6). Then, by Lemma B.5, $u$ has finite energy. On the other hand, by Definition B. 3 and the equation following it, $u(0)=\gamma$ a.s. and for any $G$ in $C^{1,2}([0, T] \times[0,1])$,

$$
\begin{aligned}
J_{T, G}(u)= & -\int_{0}^{T}\left\langle\sigma\left(u_{t}\right),\left(\nabla G_{t}\right)^{2}\right\rangle d t \\
& -\int_{0}^{T}\left\{\mathfrak{q}_{\beta, B}\left(u_{t}(1), G_{t}(1)\right)+\mathfrak{q}_{\alpha, A}\left(u_{t}(0), G_{t}(0)\right)\right\} d t
\end{aligned}
$$

where

$$
\begin{equation*}
\mathfrak{q}_{\varrho, D}(a, M)=\frac{1}{D}\left\{[1-a] \varrho\left[e^{M}-M-1\right]+a[1-\varrho]\left[e^{-M}+M-1\right]\right\} \tag{3.13}
\end{equation*}
$$

Here we used the fact that $u-a$ can be written as $u(1-a)-(1-u) a$. As $\mathfrak{q}_{\varrho, D}(a, M) \geq 0$, $J_{T, G}(u) \leq 0$. Hence, the supremum in the variational problem (2.12) is attained at $H=0$ and $I_{[0, T]}(u)=0$. Since $u(0)=\gamma, I_{[0, T]}(u \mid \gamma)=0$.

On the other hand, if $I_{[0, T]}(u \mid \gamma)=0$, then, for any $G$ in $C^{1,2}([0, T] \times[0,1])$ and $\varepsilon$ in $\mathbb{R}$, $J_{T, \varepsilon G}(u) \leq 0$. Since $J_{T, 0}(u)=0$, the derivative in $\varepsilon$ of $J_{T, \varepsilon G}(u)$ at $\varepsilon=0$ is equal to 0 . Therefore, by Definition B.3, the density $u$ is a weak solution of the initial-boundary value problem (2.6).

Let $E_{q}, q \geq 0$, be the level set of the rate function $I_{[0, T]}(\cdot \mid \gamma)$ :

$$
E_{q}:=\left\{\pi \in D([0, T], \mathcal{M}) \mid I_{[0, T]}(\pi \mid \gamma) \leq q\right\}
$$

Proof of Theorem 2.4. The rate function $I_{[0, T]}(\cdot \mid \gamma)$ is convex because the energy $\mathcal{Q}_{[0, T]}(\cdot)$ and the functionals $J_{T, H}(\cdot)$ are convex.

Let $\left\{\pi^{n}: n \geq 1\right\}$ be a sequence in $D([0, T], \mathcal{M})$ such that $\pi^{n}$ converges to some element $\pi$ in $D([0, T], \mathcal{M})$. We show that $I_{[0, T]}(\pi \mid \gamma) \leq \liminf _{n \rightarrow \infty} I_{[0, T]}\left(\pi^{n} \mid \gamma\right)$. If $\liminf I_{[0, T]}\left(\pi^{n} \mid \gamma\right)$ is equal to $\infty$, the conclusion is clear. Therefore, we may assume that the set $\left\{\pi^{n}: n \geq 1\right\}$ is contained in $E_{q}$ for some $q>0$. In particular, by definition of $I_{[0, T]}(\cdot \mid \gamma)$ and by Lemma 3.1, $\pi^{n}(t, d x)=u^{n}(t, x) d x$ for some $u^{n} \in C\left([0, T], \mathcal{M}_{\mathrm{ac}}\right)$ with finite energy.

Since $u^{n}$ belongs to $C\left([0, T], \mathcal{M}_{\mathrm{ac}}\right)$ and $\pi^{n}(t, d x)=u^{n}(t, x) d x$ converges to $\pi(t, d x)$ in $D([0, T], \mathcal{M}), \pi(t, d x)=u(t, x) d x$ for some $u \in C\left([0, T], \mathcal{M}_{\mathrm{ac}}\right)$. Moreover, by the lower semicontinuity of the energy $\mathcal{Q}_{[0, T]}$ and by Proposition 3.5,
for some finite constant $C_{0}$.
Claim 1: The sequence $\left\{u^{n}: n \geq 1\right\}$ converges to $u$ in $\mathcal{L}^{2}([0, T] \times[0,1])$.
Indeed, by the triangle inequality,

$$
\begin{aligned}
& \frac{1}{3} \int_{0}^{T}\left\|u_{t}-u_{t}^{n}\right\|_{2}^{2} d t \\
& \quad \leq \int_{0}^{T}\left\|u_{t}-u_{t}^{\varepsilon}\right\|_{2}^{2} d t+\int_{0}^{T}\left\|u_{t}^{\varepsilon}-u_{t}^{n, \varepsilon}\right\|_{2}^{2} d t+\int_{0}^{T}\left\|u_{t}^{n, \varepsilon}-u_{t}^{n}\right\|_{2}^{2} d t
\end{aligned}
$$

where $u_{t}^{\varepsilon}=P_{\varepsilon}^{(R)} u_{t}, u_{t}^{n, \varepsilon}=P_{\varepsilon}^{(R)} u_{t}^{n}$. By Lemma A. 2 and (A.9), and since $\left\|u_{t}\right\|_{\infty} \leq 1$, the first and the last terms are bounded by

$$
C_{0} \varepsilon^{2 / 3} \int_{0}^{T}\left\{\left\|u_{t}\right\|_{\mathcal{H}^{1}}^{2}+\left\|u_{t}^{n}\right\|_{\mathcal{H}^{1}}^{2}\right\} d t \leq C_{0} \varepsilon^{2 / 3}\{q+T+1\} .
$$

On the other hand,

$$
\int_{0}^{T}\left\|u_{t}^{\varepsilon}-u_{t}^{n, \varepsilon}\right\|_{2}^{2} d t \leq \int_{0}^{T} \sum_{k \geq 1} e^{-2 \lambda_{k} \varepsilon}\left\langle u_{t}^{n}-u_{t}, f_{k}\right\rangle^{2} d t
$$

As $\pi^{n}$ converges to $\pi$ in $D([0, T], \mathcal{M})$, for all $g \in C([0,1]),\left\langle u_{t}^{n}-u_{t}, g\right\rangle \rightarrow 0$ for almost all $t \in[0, T]$. In particular, for every $\varepsilon>0$, the right-hand side of the previous displayed equation vanishes as $n \rightarrow \infty$, which proves Claim 1 .
Claim 2: We have that

$$
\begin{equation*}
\lim _{n \rightarrow \infty} \int_{0}^{T}\left\{\left|u_{t}(0)-u_{t}^{n}(0)\right|^{2}+\left|u_{t}(1)-u_{t}^{n}(1)\right|^{2}\right\} d t=0 \tag{3.14}
\end{equation*}
$$

We consider the boundary $x=0$, the argument for $x=1$ being identical. The proof is similar to the one of Claim 1 and relies on Lemma A. 3 instead of Lemma A.2. By the triangle inequality, the previous integral, for $x=0$ only and divided by 3 , is bounded by

$$
\int_{0}^{T}\left|u_{t}(0)-u_{t}^{\varepsilon}(0)\right|^{2} d t+\int_{0}^{T}\left|u_{t}^{\varepsilon}(0)-u_{t}^{n, \varepsilon}(0)\right|^{2} d t+\int_{0}^{T}\left|u_{t}^{n, \varepsilon}(0)-u_{t}^{n}(0)\right|^{2} d t
$$

As $u_{t}, u_{t}^{n}$ are continuous for almost all $t$ [because they have finite energy], we may repeat the argument of Claim 1, using Lemma A. 3 instead of Lemma A.2, to show that the first and third integrals in the previous equation are bounded by $C_{0} \varepsilon^{2 / 5}\{q+T+1\}$.

By (A.13), (A.5) and Schwarz inequality,

$$
\begin{aligned}
\left|u_{t}^{\varepsilon}(0)-u_{t}^{n, \varepsilon}(0)\right|^{2} & \leq \sum_{k \geq 1} e^{-\lambda_{k} \varepsilon}\left\langle u_{t}^{n}-u_{t}, f_{k}\right\rangle^{2} \sum_{k \geq 1} e^{-\lambda_{k} \varepsilon} \\
& =C_{0}(\varepsilon) \sum_{k \geq 1} e^{-\lambda_{k} \varepsilon}\left\langle u_{t}^{n}-u_{t}, f_{k}\right\rangle^{2} .
\end{aligned}
$$

At this point, we may repeat the arguments presented in Claim 1 to complete the proof of Claim 2.

By Claims 1,2 and (2.11), for any function $G$ in $C^{1,2}([0, T] \times[0,1])$,

$$
\begin{equation*}
\lim _{n \rightarrow \infty} J_{G}\left(\pi^{n}\right)=J_{G}(\pi) \tag{3.15}
\end{equation*}
$$

Therefore, $I_{[0, T]}(\pi \mid \gamma) \leq \liminf _{n \rightarrow \infty} I_{[0, T]}\left(\pi^{n} \mid \gamma\right)$, proving that $I_{[0, T]}(\cdot \mid \gamma)$ is lower semicontinuous.

The same argument shows that $E_{q}$ is closed in $D([0, T], \mathcal{M})$. By Lemma 3.7 below, $E_{q}$ is relatively compact in $D([0, T], \mathcal{M})$. Thus, $E_{q}$ is compact in $D([0, T], \mathcal{M})$, as claimed.

The proof of the next result is similar to the one contained in the proof of Theorem 4.2 in [7].
Lemma 3.7. For each $q>0$, the set $E_{q}$ is relatively compact in $D([0, T], \mathcal{M})$.
Proof. Fix $q>0$ and let $\pi^{n}$ be a sequence in $E_{q}$. By Lemma 3.1, $\pi^{n}(t, d x)=u^{n}(t, x) d x$ for some $u^{n} \in C\left([0, T], \mathcal{M}_{\mathrm{ac}}\right)$. Since $0 \leq u^{n}(t, x) \leq 1$, there exists a subsequence, still denoted by ( $u^{n}: n \geq 1$ ), which converges weakly in $\mathcal{L}^{2}([0, T] \times[0,1])$ to some trajectory $u$. by the lower semicontinuity of $\mathcal{Q}_{[0, T]}, \mathcal{Q}_{[0, T]}(u)<\infty$.

The proofs of Claims 1 and 2 in Theorem 2.4 yield that $u^{n}$ converges strongly to $u$ in $\mathcal{L}^{2}([0, T] \times[0,1])$ and that (3.14) holds. Therefore, by (3.15) and the fact that $\pi^{n}$ belongs to $E_{q}, I_{[0, T]}(\pi \mid \gamma) \leq \liminf _{n \rightarrow \infty} I_{[0, T]}\left(\pi^{n} \mid \gamma\right) \leq q$. By Lemma 3.1, $u^{n}, u$ are uniformly weakly continuous in time. In particular, strong convergence in $\mathcal{L}^{2}([0, T] \times[0,1])$ implies convergence in $C\left([0, T], \mathcal{M}_{\mathrm{ac}}\right)$.

## 4. Deconstructing the rate functional

The main result of this section, stated in Proposition 4.5 below, shows that the rate function $I_{[0, T]}(\cdot)$ can be decomposed as the sum of two rate functions. The first one measures the cost of the trajectory due to its evolution in the bulk, while the second one measures the costs due to the boundary evolution. This decomposition of the rate function is the main tool in the proof that any trajectory $u$ with finite rate function can be approximated by a sequence of regular trajectories ( $u^{n}: n \geq 1$ ) in such a way that $I_{[0, T]}\left(u^{n} \mid \gamma\right) \rightarrow I_{[0, T]}(u \mid \gamma)$, the content of the next section.
Weighted Sobolev spaces. Let $\Omega_{T}$ be the cylinder $[0, T] \times[0,1]$. Fix a non-negative weight $\kappa: \Omega_{T} \rightarrow \mathbb{R}_{+}$, and denote by $\mathcal{L}^{2}(\kappa)$ the Hilbert space induced by the smooth functions in $C^{\infty}\left(\Omega_{T}\right)$ endowed with the scalar product defined by

$$
\langle\langle G, H\rangle\rangle_{\kappa}=\int_{0}^{T} d t \int_{0}^{1} \kappa_{t} G_{t} H_{t} d x
$$

Above and hereafter, induced means that we first declare two functions $F, G$ in $C^{\infty}\left(\Omega_{T}\right)$ to be equivalent if $\left\langle\langle F-G, F-G\rangle_{\kappa}=0\right.$ and then we complete the quotient space with respect to the scalar product.

Denote by $C_{K}^{\infty}\left(\Omega_{T}\right)$ the space of smooth functions $H: \Omega_{T} \rightarrow \mathbb{R}$ with support contained in $(0, T) \times(0,1)$. Let $\mathcal{H}^{1}(\kappa), \mathcal{H}_{0}^{1}(\kappa)$ be the Hilbert spaces induced by the sets $C^{\infty}\left(\Omega_{T}\right), C_{K}^{\infty}\left(\Omega_{T}\right)$ endowed with the scalar products, $\langle\langle G, H\rangle\rangle_{1,2, \kappa},\langle\langle G, H\rangle\rangle_{1, \kappa}$, respectively defined by

$$
\begin{gathered}
\langle\langle G, H\rangle\rangle_{1,2, \kappa}=\langle\langle G, H\rangle\rangle_{\kappa}+\langle\langle\nabla G, \nabla H\rangle\rangle_{\kappa}, \\
\langle\langle G, H\rangle\rangle_{1, \kappa}=\langle\langle\nabla G, \nabla H\rangle\rangle_{\kappa} .
\end{gathered}
$$

The Poincaré's inequality yields that the norms induced by the scalar products $\langle\langle G, H\rangle\rangle_{1,2, \kappa}$, $\left\langle\langle G, H\rangle_{1, \kappa}\right.$ are equivalent in $\mathcal{H}_{0}^{1}(\kappa)$.

Denote by $\|\cdot\|_{\kappa},\|\cdot\|_{1, \kappa}$ the norm associated to the scalar product $\langle\langle\cdot, \cdot\rangle\rangle_{\kappa},\langle\langle\cdot, \cdot\rangle\rangle_{1, \kappa}$, respectively. Let $\mathcal{H}^{-1}(\kappa)$ be the dual of $\mathcal{H}_{0}^{1}(\kappa)$; it is a Hilbert space equipped with the norm $\|\cdot\|_{-1, \kappa}$ defined by

$$
\begin{equation*}
\|L\|_{-1, \kappa}^{2}=\sup _{G \in C_{K}^{\infty}\left(\Omega_{T}\right)}\left\{2 L(G)-\|G\|_{1, \kappa}^{2}\right\} . \tag{4.1}
\end{equation*}
$$

By Riesz' representation theorem, an element $L$ of $\mathcal{H}^{-1}(\kappa)$ can be written as $L(H)=$ $\langle\langle\nabla G, \nabla H\rangle\rangle_{\kappa}$ for some $G$ in $\mathcal{H}_{0}^{1}(\kappa)$.

When $\kappa \equiv 1$, we represent $\mathcal{L}^{2}(\kappa)$, $\mathcal{H}^{1}(\kappa), \mathcal{H}_{0}^{1}(\kappa), \mathcal{H}^{-1}(\kappa)$ as $\mathcal{L}^{2}\left(\Omega_{T}\right), \mathcal{H}^{1}\left(\Omega_{T}\right), \mathcal{H}_{0}^{1}\left(\Omega_{T}\right)$ $\mathcal{H}^{-1}\left(\Omega_{T}\right)$, respectively. Next result is [7, Lemma 4.8]. It states that $\mathcal{H}^{-1}(\kappa)$ is formally the space $\left\{\nabla P: P \in \mathcal{L}^{2}\left(\kappa^{-1}\right)\right\}$. For an integrable function $H:[0,1] \rightarrow \mathbb{R}$, let $\langle H\rangle=\int_{0}^{1} H(x) d x$.
Lemma 4.1. A linear functional $L: \mathcal{H}_{0}^{1}(\kappa) \rightarrow \mathbb{R}$ belongs to $\mathcal{H}^{-1}(\kappa)$ if, and only if, there exists $P$ in $\mathcal{L}^{2}\left(\kappa^{-1}\right)$ such that $L(H)=\int_{0}^{T} d t \int_{0}^{1} P_{t} \nabla H_{t} d x$ for every $H$ in $C_{K}^{\infty}\left(\Omega_{T}\right)$. In this case,

$$
\|L\|_{-1, \kappa}^{2}=\int_{0}^{T}\left\{\left\langle P_{t}, P_{t}\right\rangle_{\kappa(t)^{-1}}-c_{t}\right\} d t
$$

where $c_{t}=\left\{\left\langle P_{t} / \kappa_{t}\right\rangle^{2} /\left\langle 1 / \kappa_{t}\right\rangle\right\} \mathbf{1}\left\{\left\langle 1 / \kappa_{t}\right\rangle<\infty\right\}$.
Representation theorems. Until the end of this section, $\pi(t, d x)=u(t, x) d x$ is a path in $D_{\mathcal{E}}\left([0, T], \mathcal{M}_{\mathrm{ac}}\right)$. We assume that $u$ is continuous on $\Omega_{T}$ and smooth in time, there exists $\varepsilon>0$ such that $\varepsilon \leq u(t, x) \leq 1-\varepsilon$ for all $(t, x) \in \Omega_{T}$, and $I_{[0, T]}(u)<\infty$. These conditions are fulfilled in sets of the form $[\delta, T] \times[0,1], \delta>0$, by paths in $\Pi_{3}$, a class of trajectories to be introduced in Section 5. As $u$ is bounded away from 0 and 1, the spaces $\mathcal{L}^{2}(\sigma(u))$ and $\mathcal{L}^{2}\left(\Omega_{T}\right)$ coincide, as well as, the other Hilbert spaces introduced in the previous subsection with $\kappa=\sigma(u)$.

Denote by $\mathfrak{W}: C^{0,1}\left(\Omega_{T}\right) \rightarrow \mathbb{R}$ the functional given by

$$
\mathfrak{W}(H)=\int_{0}^{T} d t \int_{0}^{1} \sigma\left(u_{t}\right)\left|\nabla H_{t}\right|^{2} d x+\int_{0}^{T} \Psi\left(t, H_{t}(0), H_{t}(1)\right) d t,
$$

where

$$
\Psi(t, M, N)=\mathfrak{b}_{\alpha, A}\left(u_{t}(0), M\right)+\mathfrak{b}_{\beta, B}\left(u_{t}(1), N\right)
$$

and $\mathfrak{b}_{\varrho, D}(a, M)$ has been introduced in (2.9). For each $0 \leq t \leq T,(M, N) \mapsto \Psi(t, M, N)$ is a smooth, convex function which takes negative values.

Fix a linear functional $L: C^{0,1}\left(\Omega_{T}\right) \rightarrow \mathbb{R}$. Denote by $L_{0}$ its restriction to $C_{0}^{0,1}\left(\Omega_{T}\right)$ :

$$
\begin{equation*}
L_{0}(H)=L(H), \quad H \in C_{0}^{0,1}\left(\Omega_{T}\right) \tag{4.2}
\end{equation*}
$$

where

$$
C_{0}^{0,1}\left(\Omega_{T}\right):=\left\{H \in C^{0,1}\left(\Omega_{T}\right): H(t, 0)=H(t, 1)=0,0 \leq t \leq T\right\}
$$

Let $\Xi: \Omega_{T} \rightarrow \mathbb{R}$ the function given by

$$
\begin{equation*}
\Xi(t, x)=\frac{1}{\int_{0}^{1} 1 / \sigma(u(t, y)) d y} \int_{0}^{x} \frac{1}{\sigma(u(t, y))} d y \tag{4.3}
\end{equation*}
$$

Note that $\Xi$ belongs to $C^{\infty, 1}\left(\Omega_{T}\right)$, and that $\Xi(t, 0)=0, \Xi(t, 1)=1$ for all $0 \leq t \leq T$. Let $\ell^{(0)}$, $\ell^{(1)}: C([0, T]) \rightarrow \mathbb{R}$ be the linear functionals given by

$$
\begin{equation*}
\ell^{(0)}(h)=L(h(t)[1-\Xi(t, x)]), \quad \ell^{(1)}(h)=L(h(t) \Xi(t, x)) . \tag{4.4}
\end{equation*}
$$

Note that the right-hand sides of the previous identities are well defined because $\Xi$ belongs to $C^{0,1}\left(\Omega_{T}\right)$.
Note: The definition of $\ell^{0}$, $\ell^{1}$ explains why we defined $L$ in $C^{0,1}\left(\Omega_{T}\right)$ and not in $C^{\infty, \infty}\left(\Omega_{T}\right)$. For $L(h(t)[1-\Xi(t, x)])$ to make sense, we need the map $(t, x) \mapsto h(t)[1-\Xi(t, x)]$ to belong to the domain of definition of $L$.

Decompose a function $H: \Omega_{T} \rightarrow \mathbb{R}$ as $H=H^{(0)}+H^{(1)}$, where

$$
\begin{equation*}
H^{(1)}(t, x)=H(t, 0)+[H(t, 1)-H(t, 0)] \Xi(t, x) . \tag{4.5}
\end{equation*}
$$

Note that $H^{(0)}(t, 0)=H^{(0)}(t, 1)=0$ for all $0 \leq t \leq T$. In particular, $H^{(0)}$ belongs to $C_{0}^{0,1}\left(\Omega_{T}\right)$ so that $L_{0}\left(H^{(0)}\right)$ is well defined and $L_{0}\left(H^{(0)}\right)=L\left(H^{(0)}\right)$.

By linearity and the previous paragraph, $L(H)=L_{0}\left(H^{(0)}\right)+L\left(H^{(1)}\right)$. By definition of $H^{(1)}$, $\ell^{0}, \ell^{1}, L\left(H^{(1)}\right)=L(H(t, 0)[1-\Xi])+L(H(t, 1) \Xi)=\ell^{0}(H(\cdot, 0))+\ell^{1}(H(\cdot, 1))$, Hence, for all $H$ in $C^{0,1}\left(\Omega_{T}\right)$,

$$
L(H)=L_{0}\left(H^{(0)}\right)+\ell^{0}(H(\cdot, 0))+\ell^{1}(H(\cdot, 1)) .
$$

Lemma 4.2. Let $L: C^{0,1}\left(\Omega_{T}\right) \rightarrow \mathbb{R}$ be a linear functional. Then,

$$
\begin{equation*}
\sup _{H \in C^{0,1}\left(\Omega_{T}\right)}\{L(H)-\mathfrak{W}(H)\}=S_{1}+S_{2}, \tag{4.6}
\end{equation*}
$$

where

$$
\begin{equation*}
S_{1}=\sup _{G \in C_{0}^{0,1}\left(\Omega_{T}\right)}\left\{L_{0}(G)-\int_{0}^{T} d t \int_{0}^{1} \sigma\left(u_{t}\right)\left|\nabla G_{t}\right|^{2} d x\right\} \tag{4.7}
\end{equation*}
$$

and

$$
S_{2}=\sup _{h, g \in C([0, T])}\left\{\ell(g, h)-\int_{0}^{T} \zeta_{t}[h(t)-g(t)]^{2} d t-\int_{0}^{T} \Psi\left(t, g_{t}, h_{t}\right) d t\right\} .
$$

In this formula, $\zeta_{t}=1 /\left\langle 1 / \sigma\left(u_{t}\right)\right\rangle$ and $\ell(g, h)=\ell^{(0)}(g)+\ell^{(1)}(h)$.
The first variational problem concerns the interior of $\Omega_{T}$, while the second one the boundary of the cylinder $\Omega_{T}$.

Proof of Lemma 4.2. Fix a linear functional $L: C^{0,1}\left(\Omega_{T}\right) \rightarrow \mathbb{R}$. Write $H=H^{(0)}+H^{(1)}$, as in (4.5). Since $H^{(0)}$ belongs to $C_{0}^{0,1}\left(\Omega_{T}\right), L_{0}\left(H^{(0)}\right)$ is well defined and $L_{0}\left(H^{(0)}\right)=L\left(H^{(0)}\right)$.

By linearity, $L(H)=L_{0}\left(H^{(0)}\right)+L\left(H^{(1)}\right)$. On the other hand, an elementary computation yields that $\nabla H^{(0)}$ and $\nabla H^{(1)}$ are orthogonal in $\mathcal{L}^{2}(\sigma(u))$ :

$$
\int_{0}^{T} d t \int_{0}^{1} \sigma\left(u_{t}\right) \nabla H_{t}^{(0)} \nabla H_{t}^{(1)} d x=0 .
$$

Therefore, the supremum appearing in (4.6) can be written as

$$
\begin{aligned}
& \sup _{H \in C^{0,1}\left(\Omega_{T}\right)}\left\{L_{0}\left(H^{(0)}\right)-\int_{0}^{T} d t \int_{0}^{1} \sigma\left(u_{t}\right)\left|\nabla H_{t}^{(0)}\right|^{2} d x\right. \\
& \left.\quad+L\left(H^{(1)}\right)-\int_{0}^{T} \zeta_{t}[H(t, 1)-H(t, 0)]^{2} d t-\int_{0}^{T} \Psi\left(t, H_{t}(0), H_{t}(1)\right) d t\right\} .
\end{aligned}
$$

The first line depends only on $H^{(0)}$, while the second one only on $H_{t}(0), H_{t}(1)$. We may, therefore, split the supremum in two pieces. Recall the definition of the functionals $\ell$ to
rewrite the previous supremum as

$$
\begin{aligned}
& \sup _{G \in C_{0}^{0,1}\left(\Omega_{T}\right)}\left\{L_{0}(G)-\int_{0}^{T} d t \int_{0}^{1} \sigma\left(u_{t}\right)\left|\nabla G_{t}\right|^{2} d x\right\} \\
& +\sup _{h, g \in C([0, T])}\left\{\ell(g, h)-\int_{0}^{T} \zeta_{t}[h(t)-g(t)]^{2} d t-\int_{0}^{T} \Psi\left(t, g_{t}, h_{t}\right) d t\right\},
\end{aligned}
$$

as claimed.
We apply Lemma 4.2 to the linear functionals appearing in the definition of the rate functional $I_{[0, T]}(\cdot)$. Denote $L^{\left(\partial_{t}\right)}, L^{(\nabla)}: C^{0,1}\left(\Omega_{T}\right) \rightarrow \mathbb{R}$ the linear functionals given by

$$
\begin{equation*}
L^{\left(\partial_{t}\right)}(G)=\int_{0}^{T}\left\langle\partial_{t} u_{t}, G_{t}\right\rangle d t, \quad L^{(\nabla)}(H)=\int_{0}^{T}\left\langle\nabla u_{t}, \nabla H_{t}\right\rangle d t \tag{4.8}
\end{equation*}
$$

and let $\mathfrak{L}=L^{\left(\partial_{t}\right)}+L^{(\nabla)}$. Denote by $\mathfrak{L}_{0}, \mathfrak{l}^{0}, \mathfrak{l}^{1}$ the linear functionals associated to $\mathfrak{L}$ by (4.2), (4.4), so that

$$
\begin{gathered}
\mathfrak{L}_{0}(G)=\int_{0}^{T}\left\langle\partial_{t} u_{t}, G_{t}\right\rangle d t+\int_{0}^{T}\left\langle\nabla u_{t}, \nabla G_{t}\right\rangle d t \\
\mathfrak{l}^{0}(g)=\int_{0}^{T} a(t) g(t) d t, \quad \mathfrak{l}^{1}(g)=\int_{0}^{T} b(t) g(t) d t
\end{gathered}
$$

where

$$
\begin{equation*}
a(t)=\left\langle\partial_{t} u_{t},\left[1-\Xi_{t}\right]\right\rangle-\left\langle\nabla u_{t}, \nabla \Xi_{t}\right\rangle, \quad b(t)=\left\langle\partial_{t} u_{t}, \Xi_{t}\right\rangle+\left\langle\nabla u_{t}, \nabla \Xi_{t}\right\rangle . \tag{4.9}
\end{equation*}
$$

With this notation,

$$
\begin{equation*}
\mathfrak{L}(H)=\mathfrak{L}_{0}\left(H^{(0)}\right)+\mathfrak{l}^{0}(H(\cdot, 0))+\mathfrak{l}^{1}(H(\cdot, 1)) . \tag{4.10}
\end{equation*}
$$

Denote by $\Upsilon_{t}: \mathbb{R}^{2} \rightarrow \mathbb{R}, 0 \leq t \leq T$, the strictly convex map defined by

$$
\Upsilon_{t}(x, y)=\zeta_{t}[x-y]^{2}+\mathfrak{b}_{\alpha, A}\left(u_{t}(0), x\right)+\mathfrak{b}_{\beta, B}\left(u_{t}(1), y\right),
$$

and let $\Phi_{t}: \mathbb{R}^{2} \rightarrow \mathbb{R}, t \geq 0$ be its Legendre transform:

$$
\begin{equation*}
\Phi_{t}(a, b)=\sup _{x, y \in \mathbb{R}}\left\{a x+b y-\Upsilon_{t}(x, y)\right\} . \tag{4.11}
\end{equation*}
$$

Lemma 4.3. Under the hypotheses stated at the beginning of this subsection,

$$
I_{[0, T]}(u)=I_{[0, T]}^{(1)}(u)+I_{[0, T]}^{(2)}(u),
$$

where

$$
I_{[0, T]}^{(1)}(u)=\frac{1}{4}\left\|\mathfrak{L}_{0}\right\|_{-1, \sigma(u)}^{2}, \quad I_{[0, T]}^{(2)}(u)=\int_{0}^{T} \Phi_{t}\left(a_{t}, b_{t}\right) d t
$$

Proof. By definition of the rate functional $I_{[0, T]}$, given in (2.12),

$$
I_{[0, T]}(u)=\sup _{H \in C^{0,1}\left(\Omega_{T}\right)}\{\mathfrak{L}(H)-\mathfrak{W}(H)\}
$$

Hence, by Lemma 4.2, (4.1) and the definition of $\mathfrak{l}^{0}, \mathfrak{l}^{1}$, given above (4.9),

$$
I_{[0, T]}(u)=I_{[0, T]}^{(1)}(u)+I_{[0, T]}^{(2)}(u),
$$

where

$$
\begin{gather*}
I_{[0, T]}^{(1)}(u)=\frac{1}{4}\left\|\mathfrak{L}_{0}\right\|_{-1, \sigma(u)}^{2}, \\
I_{[0, T]}^{(2)}(u)=\sup _{h, g \in C([0, T])}\left\{\mathfrak{l}(g, h)-\int_{0}^{T} \Upsilon_{t}\left(g_{t}, h_{t}\right) d t\right\} \tag{4.12}
\end{gather*}
$$

and $\mathfrak{l}(g, h)=\mathfrak{l}^{0}(g)+\mathfrak{l}^{1}(h)$. The second term can be written as

$$
\begin{aligned}
& \sup _{h, g \in C([0, T])} \int_{0}^{T}\left\{a(t) g(t)+b(t) h(t)-\Upsilon_{t}\left(g_{t}, h_{t}\right)\right\} d t \\
& =\int_{0}^{T} \sup _{x, y \in \mathbb{R}}\left\{a(t) x+b(t) y-\Upsilon_{t}(x, y)\right\} d t=\int_{0}^{T} \Phi_{t}\left(a_{t}, b_{t}\right) d t
\end{aligned}
$$

This completes the proof of the lemma.
The function $\Phi_{t}$ is convex and continuous. Moreover, $\Phi_{t}(a, b) \geq 0$ [take $x=y=0$ in the supremum and $\Phi_{t}(a, b) \leq \Phi_{t}^{0}(a)+\Phi_{t}^{1}(b)$, where $\Phi_{t}^{0}$, $\Phi_{t}^{1}$ are the Legendre transform of $\mathfrak{b}_{\alpha, A}\left(u_{t}(0), \cdot\right), \mathfrak{b}_{\beta, B}\left(u_{t}(1), \cdot\right)$, respectively:

$$
0 \leq \Phi_{t}(a, b) \leq \Phi_{u_{t}(0)}^{0}(a)+\Phi_{u_{t}(1)}^{1}(b)
$$

where

$$
\Phi_{u}^{0}(a)=a \ln \left\{\frac{\sqrt{a^{2}+4 \mathfrak{f}_{0, u} \mathfrak{g}_{0, u}}+a}{2 \mathfrak{f}_{0, u}}\right\}-\sqrt{a^{2}+4 \mathfrak{f}_{0, u} \mathfrak{g}_{0, u}}+\mathfrak{f}_{0, u}+\mathfrak{g}_{0, u}
$$

$\mathfrak{f}_{0, u}=(1 / A)[1-u] \alpha, \mathfrak{g}_{0, u}=(1 / A) u[1-\alpha]$. The formula for $\Phi_{u}^{1}$ is similar. One just needs to replace $A, \alpha$ by $B, \beta$, respectively. In particular,

$$
\begin{equation*}
0 \leq \Phi_{t}(a, b) \leq C_{0}\left\{1+|a| \ln ^{+}|a|+|b| \ln ^{+}|b|\right\} \tag{4.13}
\end{equation*}
$$

where $\ln ^{+} x=0$ for $0<x \leq 1$ and $\ln ^{+} x=\ln x$ for $x \geq 1$.
Note: It might be disconcerting that $\Phi_{t}(0,0)$ is not equal to 0 . This is a consequence of the fact that $\mathfrak{b}_{\beta, B}(a, \cdot)$ takes negative values. To remedy, one can add and subtract a linear term to $\mathfrak{b}_{\beta, B}(a, \cdot)$, transforming $\mathfrak{b}_{\beta, B}(a, \cdot)$ into $\mathfrak{q}_{\beta, B}(a, \cdot)$, given by (3.13). In constrast with $\mathfrak{b}_{\beta, B}(a, \cdot)$, $\mathfrak{q}_{\beta, B}(a, \cdot)$ is nonnegative and attains its minimum at 0 .

After these modifications, $\Phi_{t}$ becomes

$$
\Phi_{t}(a, b)=\widehat{\Phi}_{t}\left(a+\frac{1}{A}\left[\alpha-u_{t}(0)\right], b+\frac{1}{B}\left[\beta-u_{t}(1)\right]\right)
$$

where

$$
\widehat{\Phi}_{t}(a, b)=\sup _{x, y \in \mathbb{R}}\left\{a x+b y-\zeta_{t}[x-y]^{2}-\mathfrak{q}_{\alpha, A}\left(u_{t}(0), x\right)-\mathfrak{q}_{\beta, B}\left(u_{t}(1), y\right)\right\}
$$

and $\widehat{\Phi}_{t}(a, b) \geq \widehat{\Phi}_{t}(0,0)=0$.
Both functions $\Phi_{t}$ and $\widehat{\Phi}_{t}$ are convex and continuous. As $\Phi_{t}, \widehat{\Phi}_{t}$ depend on the trajectory $u$, whenever we wish to stress this dependence, we represent $\Phi_{t}(a, b)$, $\widehat{\Phi}_{t}(a, b)$, by $\Phi_{t}^{(u)}(a, b)$, $\widehat{\Phi}_{t}^{(u)}(a, b)$, respectively.

Lemma 4.3 decomposes the rate function as the sum of two independent functionals. The first piece can still be simplified. This is the content of the next result. Under the hypotheses
of this subsection, $\left\|L_{0}^{(\nabla)}\right\|_{-1, \sigma(u)}^{2}<\infty$. Since $\int_{0}^{T} \Phi_{t}\left(a_{t}, b_{t}\right) d t$ is finite as well, it follows from the previous lemma that

$$
\begin{equation*}
I_{[0, T]}(u)<\infty \text { if, and only if, }\left\|L_{0}^{\left(\partial_{t}\right)}\right\|_{-1, \sigma(u)}^{2}<\infty \tag{4.14}
\end{equation*}
$$

Suppose that $L_{0}^{\left(\partial_{t}\right)}$ belongs to $\mathcal{H}^{-1}(\sigma(u))$. By Lemma 4.1, there exists $P$ in $\mathcal{L}^{2}\left(\sigma(u)^{-1}\right)$ such that

$$
L_{0}^{\left(\partial_{t}\right)}(H)=\int_{0}^{T}\left\langle P_{t}, \nabla H_{t}\right\rangle d t
$$

for all $H$ in $C_{K}^{\infty}\left(\Omega_{T}\right)$. This identity extends to $C_{0}^{0,1}\left(\Omega_{T}\right)$. Since $H_{t}$ vanishes at the boundary $x=0, x=1$, the same identity holds if we replace $P_{t}$ by $P_{t}-c_{t}$ for some function $c$ in $\mathcal{L}^{1}([0, T])$. By choosing the right constant [that is $\left.c_{t}=\left\langle P_{t} / \sigma\left(u_{t}\right)\right\rangle /\left\langle 1 / \sigma\left(u_{t}\right)\right\rangle\right]$, we may assume that $\left\langle P_{t} / \sigma\left(u_{t}\right)\right\rangle=0$ for almost all $0 \leq t \leq T$. We denote by $M$ the element of $\mathcal{L}^{2}\left(\sigma(u)^{-1}\right)$ satisfying this condition and the previous displayed equation:

$$
\begin{equation*}
L_{0}^{\left(\partial_{t}\right)}(H)=\int_{0}^{T}\left\langle M_{s}, \nabla H_{s}\right\rangle d s, \quad \int_{0}^{1} \frac{M_{t}}{\sigma\left(u_{t}\right)} d x=0 \tag{4.15}
\end{equation*}
$$

for all $H \in C_{0}^{0,1}\left(\Omega_{T}\right)$ and almost all $0 \leq t \leq T$. Moreover, as $\left\langle M_{t} / \sigma\left(u_{t}\right)\right\rangle=0$ for almost all $t$, by Lemma 4.1,

$$
\left\|L_{0}^{\left(\partial_{t}\right)}\right\|_{-1, \sigma(u)}^{2}=\int_{0}^{T} d t \int_{0}^{1} \frac{M_{t}^{2}}{\sigma\left(u_{t}\right)} d x
$$

Lemma 4.4. Fix a trajectory satisfying the hypotheses stated at the beginning of this section. Then,

$$
I_{[0, T]}^{(1)}(u)=\frac{1}{4} \int_{0}^{T}\left\{\left\|M_{t}+\nabla u_{t}\right\|_{\sigma\left(u_{t}\right)^{-1}}^{2}-R_{t}\right\} d t
$$

where

$$
R_{t}=\left\langle\frac{\nabla u_{t}}{\sigma\left(u_{t}\right)}\right\rangle^{2} \frac{1}{\left\langle\sigma\left(u_{t}\right)^{-1}\right\rangle}=\left\{\log \frac{u_{t}(1)}{1-u_{t}(1)}-\log \frac{u_{t}(0)}{1-u_{t}(0)}\right\}^{2} \frac{1}{\left\langle\sigma\left(u_{t}\right)^{-1}\right\rangle} .
$$

Proof. As $I_{[0, T]}(u)$ is finite, by (4.14) and the paragraph preceding the statement of the lemma, $L_{0}^{\left(\partial_{t}\right)}$ belongs to $\mathcal{H}^{-1}(\sigma(u))$ and there exists $M$ in $\mathcal{L}^{2}\left(\sigma(u)^{-1}\right)$ satisfying (4.15). Therefore, for all $H$ in $C_{0}^{0,1}\left(\Omega_{T}\right)$,

$$
\mathfrak{L}_{0}(H)=L_{0}^{(\nabla)}(H)+L_{0}^{\left(\partial_{t}\right)}(H)=\int_{0}^{T}\left\langle M_{t}+\nabla u_{t}, \nabla H_{t}\right\rangle d t
$$

By Lemma 4.1,

$$
\left\|\mathfrak{L}_{0}\right\|_{-1, \sigma(u)}^{2}=\int_{0}^{T}\left\{\left\|M_{t}+\nabla u_{t}\right\|_{\sigma\left(u_{t}\right)^{-1}}^{2}-R_{t}\right\} d t
$$

where $R_{t}$ has been introduced in the statement of the lemma. This completes the proof of the lemma.

We summarize the last two results in the next proposition.

Proposition 4.5. Fix a path $\pi(t, d x)=u(t, x) d x$ in $D\left([0, T], \mathcal{M}_{\mathrm{ac}}\right)$. Assume that $u$ is continuous on $\Omega_{T}$ and smooth in time, that there exists $\varepsilon>0$ such that $\varepsilon \leq u(t, x) \leq 1-\varepsilon$ for all $(t, x) \in \Omega_{T}$, and that $I_{[0, T]}(u)<\infty$. Then,

$$
I_{[0, T]}(u)=I_{[0, T]}^{(1)}(u)+I_{[0, T]}^{(2)}(u),
$$

where Lemma 4.4 provides a formula for first term and Lemma 4.3 for the second.
Remark 4.6. In the statement of Proposition 4.5, we imposed many regularity assumptions on $u$ because this is the context in which this result is applied in the next section. The proof shows that they can be relaxed.

## 5. $I_{[0, T]}(\cdot)$-DENSITY

In this section, we prove that any trajectory $\pi \in D([0, T], \mathcal{M})$ with finite rate function can be approximated by a sequence of smooth trajectories $\left\{\pi^{n}: n \geq 1\right\}$ such that

$$
\pi^{n} \longrightarrow \pi \quad \text { and } \quad I_{[0, T]}\left(\pi^{n} \mid \gamma\right) \longrightarrow I_{[0, T]}(\pi \mid \gamma) .
$$

We follow an approach proposed in $[28,7,17]$. Here, and throughout this section, $\gamma:[0,1] \rightarrow$ $[0,1]$ is a fixed density profile. We first introduce some terminology.

Definition 5.1. A subset $A$ of $D([0, T], \mathcal{M})$ is said to be $I_{[0, T]}(\cdot \mid \gamma)$-dense if for any $\pi$ in $D([0, T], \mathcal{M})$ such that $I_{[0, T]}(\pi \mid \gamma)<\infty$, there exists a sequence $\left\{\pi^{n}: n \geq 1\right\}$ in $A$ such that $\pi^{n}$ converges to $\pi$ in $D([0, T], \mathcal{M})$ and $I_{[0, T]}\left(\pi^{n} \mid \gamma\right)$ converges to $I_{[0, T]}(\pi \mid \gamma)$.
Theorem 5.2. For all $\gamma:[0,1] \rightarrow[0,1]$, the set $\Pi_{\gamma}$ is $I_{[0, T]}(\cdot \mid \gamma)$-dense. If there exists $\varepsilon_{0}>0$ such that $\varepsilon_{0} \leq \gamma \leq 1-\varepsilon_{0}$, condition (b) in Definition 2.5 can be replaced by the existence of $\varepsilon>0$ such that $\varepsilon \leq u(t, x) \leq 1-\varepsilon$ for all $(t, x) \in[0, T] \times[0,1]$.

The proof of Theorem 5.2 is divided into several steps. Throughout this section, denote by $u^{(\gamma)}:[0, T] \times[0,1] \rightarrow[0,1]$ the unique weak solution of the boundary-initial valued problem (2.6) with initial profile $u_{0}=\gamma$.

Let $\Pi_{1}$ be the set of all paths $\pi(t, d x)=u(t, x) d x$ in $D_{\mathcal{E}}\left([0, T], \mathcal{M}_{\mathrm{ac}}\right)$, whose density $u$ is a weak solution of the Cauchy problem (2.6) in some positive time interval. In other words, there exists $\delta>0$ such that $u_{t}=u_{t}^{(\gamma)}$ for $0 \leq t \leq \delta$.

Lemma 5.3. The set $\Pi_{1}$ is $I_{[0, T]}(\cdot \mid \gamma)$-dense.
Proof. Fix $\pi$ in $D([0, T], \mathcal{M})$ such that $I_{[0, T]}(\pi \mid \gamma)<\infty$. By definition of the rate function, $\pi$ belongs to $D\left([0, T], \mathcal{M}_{\mathrm{ac}}\right), \pi(t, d x)=u(t, x) d x$, and $\mathcal{Q}_{[0, T]}(u)<\infty$.

For each $\delta>0$, consider the path $\pi^{\delta}(t, d x)=u^{\delta}(t, x) d x$ defined by

$$
u^{\delta}(t, x)= \begin{cases}u^{(\gamma)}(t, x) & \text { if } t \in[0, \delta] \\ u^{(\gamma)}(2 \delta-t, x) & \text { if } t \in[\delta, 2 \delta] \\ u(t-2 \delta, x) & \text { if } t \in[2 \delta, T]\end{cases}
$$

Claim A: The trajectory $\pi^{\delta}$ belongs to $\Pi_{1}$. Indeed, by definition, $u^{\delta}$ is the weak solution of the Cauchy problem (2.6) in the time-interval $[0, \delta]$. On the other hand, by definition of $u^{\delta}$, $\mathcal{Q}_{[0, T]}\left(u^{\delta}\right) \leq 2 \mathcal{Q}_{[0, \delta]}\left(u^{(\gamma)}\right)+\mathcal{Q}_{[0, T]}(u)$. By Corollary 3.6, $\mathcal{Q}_{[0, \delta]}\left(u^{(\gamma)}\right)<\infty$. On the other hand, $\mathcal{Q}_{[0, T]}(u)$ is finite because $I_{[0, T]}(\pi \mid \gamma)<\infty$. Therefore, $u^{\delta}$ has finite energy, which completes the proof of Claim A.

It is clear that $\pi^{\delta}$ converges to $\pi$ in $D([0, T], \mathcal{M})$ as $\delta \downarrow 0$. To conclude the proof of the lemma it is enough to show that $I_{[0, T]}\left(\pi^{\delta} \mid \gamma\right)$ converges to $I_{[0, T]}(\pi \mid \gamma)$ as $\delta \downarrow 0$.

Since the rate function is lower semicontinuous, $I_{[0, T]}(\pi \mid \gamma) \leq \liminf _{\delta \rightarrow 0} I_{[0, T]}\left(\pi^{\delta} \mid \gamma\right)$. To prove that $\lim \sup _{\delta \rightarrow 0} I_{[0, T]}\left(\pi^{\delta} \mid \gamma\right) \leq I_{[0, T]}(\pi \mid \gamma)$, decompose the rate function $I_{[0, T]}\left(\pi^{\delta} \mid \gamma\right)$ into the sum of the contributions on each time interval $[0, \delta],[\delta, 2 \delta]$ and $[2 \delta, T]$.

Recall the notation introduced at the beginning of Section 3. By (3.1), (3.2), since in the interval $[2 \delta, T] \pi^{\delta}$ is a time translation of the path $\pi$,

$$
I_{[0, T]}\left(\pi^{\delta} \mid \gamma\right) \leq I_{[0, \delta]}\left(\pi^{\delta} \mid \gamma\right)+I_{[0, \delta]}\left(\tau_{\delta} u^{\delta} \mid u_{\delta}^{(\gamma)}\right)+I_{[0, T]}(\pi \mid \gamma)
$$

Since the density $u^{\delta}$ is a weak solution of the equation (2.6) on the interval $[0, \delta]$, by Corollary 3.6 , the first contribution is equal to 0 . It remains to show that the second term on the right-hand side vanishes as $\delta \rightarrow 0$.

Let $v^{\delta}=\tau_{\delta} u^{\delta}$. As $v^{\delta}(t)=u^{(\gamma)}(\delta-t)$, the density $v^{\delta}$ solves the backward heat equation: $\partial_{t} v^{\delta}=-\Delta v^{\delta}$. Thus, by Definition B. 1 and (2.11), for each $H$ in $C^{1,2}([0, T] \times[0,1])$,

$$
\begin{aligned}
J_{\delta, H}\left(v^{\delta}\right) & =\int_{0}^{\delta}\left\{2\left\langle\nabla u_{t}^{(\gamma)}, \nabla H_{t}\right\rangle-\left\langle\sigma\left(u_{t}^{(\gamma)}\right),\left(\nabla H_{t}\right)^{2}\right\rangle\right\} d t \\
& -\int_{0}^{T}\left\{\widehat{\mathfrak{b}}_{\alpha, A}\left(u_{t}^{(\gamma)}(0), H_{t}(0)\right)+\widehat{\mathfrak{b}}_{\beta, B}\left(u_{t}^{(\gamma)}(1), H_{t}(1)\right)\right\} d t
\end{aligned}
$$

where

$$
\widehat{\mathfrak{b}}_{\varrho, D}(a, M)=\frac{1}{D}\left\{[1-a] \varrho\left[e^{M}-1+M\right]+a[1-\varrho]\left[e^{-M}-1-M\right]\right\} .
$$

By Schwarz inequality, the first integral on the right-hand side is bounded above by

$$
\int_{0}^{\delta} d t \int_{0}^{1} \frac{\left|\nabla u^{(\gamma)}(t, x)\right|^{2}}{\sigma\left(u^{(\gamma)}(t, x)\right)} d x .
$$

By (B.6), this expression vanishes as $\delta \rightarrow 0$. On the other hand, maximizing $\widehat{\mathfrak{b}}_{o, D}(a, M)$ over $M$ yields that the second integral is bounded above by

$$
\begin{aligned}
& \int_{0}^{\delta}\left\{\frac{1}{B}\left[\beta-u_{t}^{(\gamma)}(1)\right] \log \frac{\left[1-u_{t}^{(\gamma)}(1)\right] \beta}{u_{t}^{(\gamma)}(1)[1-\beta]}+\frac{1}{A}\left[\alpha-u_{t}^{(\gamma)}(0)\right] \log \frac{\left[1-u_{t}^{(\gamma)}(0)\right] \alpha}{u_{t}^{(\gamma)}(0)[1-\alpha]}\right\} d t \\
& \leq \int_{0}^{\delta}\left|\frac{\beta-u_{t}^{(\gamma)}(1)}{B} \log \frac{\left[1-u_{t}^{(\gamma)}(1)\right]}{u_{t}^{(\gamma)}(1)}+\frac{\alpha-u_{t}^{(\gamma)}(0)}{A} \log \frac{\left[1-u_{t}^{(\gamma)}(0)\right]}{u_{t}^{(\gamma)}(0)}\right| d t+C_{0} \delta
\end{aligned}
$$

for some finite constant $C_{0}=C_{0}(\alpha, \beta, A, B)$. By (B.6), this expression vanishes as $\delta \rightarrow 0$.
Putting together the previous estimates shows that there exists a function $c(\delta)$, independent of $H$, such that $\lim _{\delta \rightarrow 0} c(\delta)=0$ and

$$
J_{\delta, H}\left(\tau_{\delta} u^{\delta}\right) \leq c(\delta)
$$

for all $H \in C^{1,2}([0, T] \times[0,1])$. This shows that $\lim _{\delta \rightarrow 0} I_{[0, \delta]}\left(\tau_{\delta} u^{\delta} \mid u_{\delta}^{(\gamma)}\right)=0$, and completes the proof of the lemma.

Let $\Pi_{2}$ be the set of all paths $\pi(t, d x)=u(t, x) d x$ in $\Pi_{1}$ with the property that for every $\delta>0$ there exists $\varepsilon>0$ such that $\varepsilon \leq u(t, x) \leq 1-\varepsilon$ for all $(t, x) \in[\delta, T] \times[0,1]$.
Lemma 5.4. The set $\Pi_{2}$ is $I_{T}(\cdot \mid \gamma)$-dense.

Proof. Fix $\pi(t, d x)=u(t, x) d x$ in $\Pi_{1}$ such that $I_{[0, T]}(\pi \mid \gamma)<\infty$. For each $0<\varepsilon<1$, define the path $\pi^{\varepsilon}(t, d x)=u^{\varepsilon}(t, x) d x$ by $u^{\varepsilon}=(1-\varepsilon) u+\varepsilon u^{(\gamma)}$.
Claim A: For each $0<\varepsilon<1$, the trajectory $\pi^{\varepsilon}$ belongs to $\Pi_{1}$. Since $\pi$ belongs to $\Pi_{1}$, by definition, there exists $\delta>0$ such that $\pi_{t}^{\varepsilon}=\pi_{t}$ for $0 \leq t \leq \delta$. Therefore, $\pi^{\varepsilon}$ follows the hydrodynamic equation in the time-interval $[0, \delta]$. On the other hand, by the convexity of the energy, $\mathcal{Q}_{[0, T]}\left(u^{\varepsilon}\right) \leq \varepsilon \mathcal{Q}_{[0, T]}\left(u^{(\gamma)}\right)+(1-\varepsilon) \mathcal{Q}_{[0, T]}(u)$. Hence, by lemma B.5, $\mathcal{Q}_{[0, T]}\left(u^{\varepsilon}\right)<\infty$. Therefore, $\pi^{\varepsilon}$ belongs to $\Pi_{1}$, as claimed.
Claim B: For each $0<\varepsilon<1$, the trajectory $\pi^{\varepsilon}$ belongs to $\Pi_{2}$. By Theorem B.4, for every $\delta>0$ there exists $\kappa>0$ such that $\kappa \leq u_{t}^{(\gamma)} \leq 1-\kappa$ for all $\delta \leq t \leq T$. This property is inherited by $u^{\varepsilon}$ for a different $\kappa=\kappa(\varepsilon)$ because $0 \leq u \leq 1$, which proves Claim B.

It is clear that $\pi^{\varepsilon}$ converges to $\pi$ in $D([0, T], \mathcal{M})$ as $\varepsilon \downarrow 0$. Therefore, to conclude the proof it is enough to show that $I_{[0, T]}\left(\pi^{\varepsilon} \mid \gamma\right)$ converges to $I_{[0, T]}(\pi \mid \gamma)$ as $\varepsilon \downarrow 0$. Since the rate function is lower semicontinuous, $I_{[0, T]}(\pi \mid \gamma) \leq \liminf _{\varepsilon \downarrow 0} I_{[0, T]}\left(\pi^{\varepsilon} \mid \gamma\right)$. On the other hand, as the rate function $I_{[0, T]}(\cdot \mid \gamma)$ is convex, by Corollary 3.6,

$$
I_{[0, T]}\left(\pi^{\varepsilon} \mid \gamma\right) \leq(1-\varepsilon) I_{[0, T]}(\pi \mid \gamma)+\varepsilon I_{[0, T]}\left(u^{(\gamma)} \mid \gamma\right) \leq(1-\varepsilon) I_{[0, T]}(\pi \mid \gamma)
$$

This completes the proof of the lemma.
Let $\Pi_{3}$ be the set of all paths $\pi(t, d x)=u(t, x) d x$ in $\Pi_{2}$ whose density $u$ is continuous in $(0, T] \times[0,1]$ and smooth in time: For all $x \in[0,1], u(x, \cdot)$ belongs to $C^{\infty}((0, T])$.

Lemma 5.5. The set $\Pi_{3}$ is $I_{[0, T]}(\cdot \mid \gamma)$-dense.
Proof. Fix $\pi(t, d x)=u(t, x) d x$ in $\Pi_{2}$ such that $I_{[0, T]}(\pi \mid \gamma)<\infty$. Since $\pi$ belongs to the set $\Pi_{1}$, the density $u$ solves the equation (2.6) in a time interval $[0,3 \delta]$ for some $\delta>0$. Let $\varphi: \mathbb{R} \rightarrow \mathbb{R}$ be a smooth, nonnegative function such that

$$
\operatorname{supp} \varphi \subset(0,1) \text { and } \int_{0}^{1} \varphi(s) d s=1
$$

Set $\varphi_{\varepsilon}(s)=\varepsilon^{-1} \varphi(s / \varepsilon)$.
Let $\chi:[0, T] \rightarrow[0,1]$ be a smooth, nondecreasing function such that

$$
\begin{cases}\chi(t)=0 & \text { if } t \in[0, \delta]  \tag{5.1}\\ 0<\chi(t)<1 & \text { if } t \in(\delta, 2 \delta) \\ \chi(t)=1 & \text { if } t \in[2 \delta, T]\end{cases}
$$

and set $\chi_{n}(t)=\chi(t) / n$ for $n \geq 1$. Hence, $\chi_{n}(t)=1 / n$ for $t \geq 2 \delta$.
Let $\pi^{n}(t, d x)=u^{n}(t, x) d x$ where

$$
u^{n}(t, x)=\int_{0}^{1} u\left(t+\chi_{n}(t) s\right) \varphi(s) d s=\int_{\mathbb{R}} u(t+s) \varphi_{\chi_{n}(t)}(s) d s
$$

In the above formula, we extend the definition of $u$ to $[0, T+1]$ by setting $u_{t}=u_{t-T}^{\left(u_{T}\right)}$ for $T \leq t \leq T+1$. This means that on the interval $[T, T+1]$, $u_{t}$ follows the hydrodynamic equation (2.6) starting from the initial condition $u_{T}$. [If $w$ represents the solution of equation (2.6) with $\gamma=u_{T}, u_{T+t}=w_{t}$ for $\left.0 \leq t \leq 1\right]$.

Claim A: The trajectory $\pi^{n}$ belongs to $\Pi_{1}$ for all $n>\delta^{-1}$.

Fix such $n \in \mathbb{N}$. By construction, the density $u^{n}$ coincides with the solution $u^{(\gamma)}$ of the hydrodynamic in the time-interval $[0, \delta]$. To estimate the energy of $u^{n}$, we consider the timeintervals $[0, \delta],[\delta, 2 \delta]$ and $[2 \delta, T]$ separately. On $[0, \delta], u^{n}$ coincides with $u^{(\gamma)}$. Therefore, by Lemma B.5, the energy of $u^{n}$ in this interval is bounded (uniformly in $n$ ). In the interval [ $\delta, 2 \delta], u_{t}^{n}$ is a convex combination of $u_{t+s}$ for $0 \leq s \leq 1 / n \leq \delta$. Since $u$ coincides with $u^{(\gamma)}$ in the interval $[\delta, 3 \delta]$, and since the solution is smooth in this interval and bounded away from 0 and 1 , the energy of $u^{n}$ in this interval is bounded (uniformly in $n$ ). Finally, for $2 \delta \leq t \leq T$,

$$
u^{n}(t, x)=\int_{0}^{1 / n} u(t+s) \varphi_{1 / n}(s) d s
$$

By convexity of the energy,

$$
Q_{[2 \delta, T]}\left(\pi^{n}\right) \leq \int_{0}^{1 / n} Q_{[2 \delta, T]}\left(\tau_{s} \pi\right) \varphi_{1 / n}(s) d s \leq Q_{[2 \delta, T+1 / n]}(\pi)
$$

where the translation $\tau_{s}$ has been introduced in (3.1). This quantity is finite because $u$ has finite energy and by Lemma B.5. This proves Claim A.
Claim B: The trajectory $\pi^{n}$ belongs to $\Pi_{3}$ for all $n>\delta^{-1}$.
As $\pi$ belongs to $\Pi_{2}$, by construction, so does $\pi^{n}$. By Definition B. 3 and Theorem B.2, the function $u$ is smooth in the set $(0,3 \delta) \times[0,1]$. Therefore, by definition, the function $u^{n}$ is smooth in time on $(0, T] \times[0,1]$. As $n>\delta^{-1}$, and since $u=u^{(\gamma)}$ is continuous in $(0,3 \delta) \times[0,1]$, by definition, $u^{n}$ is continuous in $(0,2 \delta) \times[0,1]$. We turn to the set $[2 \delta, T] \times[0,1]$. By convexity, for all $2 \delta \leq t \leq T$,

$$
\begin{aligned}
& \int_{0}^{1}\left(\nabla u_{t}^{n}\right)^{2} d x \leq \int_{0}^{1 / n} d s \varphi_{1 / n}(s) \int_{0}^{1}\left[\nabla u_{t+s}\right]^{2} d x \\
& \quad \leq C_{n} \int_{t}^{t+(1 / n)} d s \int_{0}^{1}\left[\nabla u_{s}\right]^{2} d x \leq C_{n} \int_{0}^{T+1} d s \int_{0}^{1}\left[\nabla u_{s}\right]^{2} d x
\end{aligned}
$$

for some finite constant $C_{n}$. The last integral is finite for two reasons. By Lemma B.5, the integral restricted to $[T, T+1]$ is finite. The integral on $[0, T]$ is finite because $\pi$ has finite energy as all elements of $\Pi_{2}$. It follows from this bound and from its definition that $u_{t}^{n}$ is continuous on $[2 \delta, T] \times[0,1]$, which proves Claim B.

It is clear that $\pi^{n}$ converges to $\pi$ in $D([0, T], \mathcal{M})$. It remains to show that $I_{[0, T]}\left(u^{n} \mid \gamma\right) \rightarrow$ $I_{[0, T]}(u \mid \gamma)$. As the rate-function $I_{[0, T]}(\cdot \mid \gamma)$ is lower semicontinuous, we turn to the bound $\limsup _{n \rightarrow \infty} I_{[0, T]}\left(\pi^{n} \mid \gamma\right) \leq I_{[0, T]}(\pi \mid \gamma)$.

By (3.2), the cost of the trajectory $\pi^{n}$ in the interval $[0, T]$ is bounded by the sum of its cost in the intervals $[0, \delta],[\delta, 2 \delta],[2 \delta, T]$. As $u^{n}=u$ in the time-interval $[0, \delta]$, and as $u$ is the solution of the hydrodynamic equation in this interval,

$$
\begin{equation*}
I_{[0, \delta]}\left(\pi^{n} \mid \gamma\right)=0 \tag{5.2}
\end{equation*}
$$

Consider the contribution to $I_{[0, T]}\left(\pi^{n} \mid \gamma\right)$ of the piece of the trajectory corresponding to the time interval $[2 \delta, T]$. Recall the definition of the functional $\tau_{t}$, introduced just above (3.1). Since $\chi_{n}(t)=1 / n$ in this interval, by the concavity of $\sigma(\cdot)$, for any smooth function
$H:[0, T-2 \delta] \times[0,1] \rightarrow \mathbb{R}$,

$$
\begin{aligned}
J_{T-2 \delta, H}\left(\tau_{2 \delta} u^{n}\right) & \leq \int \varphi_{1 / n}(s) J_{T-2 \delta, H}\left(\tau_{2 \delta+s} u\right) d s \\
& \leq \int \varphi_{1 / n}(s) I_{[0, T-2 \delta]}\left(\tau_{2 \delta+s} u\right) d s
\end{aligned}
$$

By (3.1), the right-hand side is bounded by

$$
\int \varphi_{1 / n}(s)\left\{I_{[0, T-2 \delta-s]}\left(\tau_{2 \delta+s} u\right)+I_{[0, s]}\left(\tau_{T} u\right)\right\} d s
$$

Since $u$ solves the hydrodynamic equation on the interval $[T, T+1]$, by Corollary 3.6, $I_{[0, s]}\left(\tau_{T} u\right)=$ 0 for $s \leq 1$. Hence, by (3.3), the previous integral is bounded by

$$
\int \varphi_{1 / n}(s) I_{[0, T]}(u) d s \leq I_{[0, T]}(u)
$$

Therefore, optimizing over $H$,

$$
\begin{equation*}
I_{[0, T-2 \delta]}\left(\tau_{2 \delta} \pi^{n}\right) \leq I_{[0, T]}(u) \tag{5.3}
\end{equation*}
$$

We turn to the contribution to $I_{[0, T]}\left(\pi^{n} \mid \gamma\right)$ of the piece of the trajectory corresponding to the time interval $[\delta, 2 \delta]$. Since $u$ solves the hydrodynamic equation (2.6) on the time interval $[\delta, 3 \delta]$, it is smooth in $(0,3 \delta) \times[0,1]$. Hence, by definition of $u^{n}$,

$$
\partial_{t} u^{n}(t, x)=\int_{\mathbb{R}} \partial_{t} u(t+s, x) \varphi_{\chi_{n}(t)}(s) d s+\int_{\mathbb{R}} u(t+s, x) \partial_{t} \varphi_{\chi_{n}(t)}(s) d s
$$

As $u$ solves the hydrodynamic equation (2.6) on the time interval [ $\delta, 3 \delta$ ], for any function $G$ in $C^{1,2}([0, T] \times[0,1])$,

$$
\begin{aligned}
& \left\langle u_{2 \delta}^{n}, G_{2 \delta}\right\rangle-\left\langle u_{\delta}^{n}, G_{\delta}\right\rangle-\int_{\delta}^{2 \delta}\left\langle u_{t}^{n}, \partial_{t} G_{t}\right\rangle d t=-\int_{\delta}^{2 \delta}\left\langle\nabla u_{t}^{n}, \nabla G_{t}\right\rangle d t \\
& \quad+\int_{\delta}^{2 \delta}\left\{\frac{1}{B}\left[\beta-u_{t}^{n}(1)\right] G_{t}(1)+\frac{1}{A}\left[\alpha-u_{t}^{n}(0)\right] G_{t}(0)\right\} d t+\int_{\delta}^{2 \delta}\left\langle r_{t}^{n}, G_{t}\right\rangle d t
\end{aligned}
$$

where

$$
r_{t}^{n}(x)=\int_{\mathbb{R}} u(t+s, x) \partial_{t} \varphi_{\chi_{n}(t)}(s) d s
$$

Therefore,

$$
\begin{aligned}
J_{\delta, G}\left(\tau_{\delta} u^{n}\right) & \leq \int_{\delta}^{2 \delta}\left\langle r_{t}^{n}, G_{t}\right\rangle d t-\int_{\delta}^{2 \delta} d t \int_{0}^{1} \sigma\left(u_{t}^{n}\right)\left[\nabla G_{t}\right]^{2} d x \\
& -\int_{\delta}^{2 \delta}\left\{\mathfrak{q}_{\beta, B}\left(u_{t}^{n}(1), G_{t}(1)\right)+\mathfrak{q}_{\alpha, A}\left(u_{t}^{n}(0), G_{t}(0)\right)\right\} d t
\end{aligned}
$$

where $\mathfrak{q}_{\varrho, D}(a, M)$ has been introduced in (3.13). Since $u$ belongs to $\Pi_{2}$, there exists $\varepsilon>0$ such that $\varepsilon \leq u(t, x) \leq 1-\varepsilon$ for all $\delta \leq t \leq T, 0 \leq x \leq 1$. By Theorem B.4, this bound extends to $T \leq t \leq T+1,0 \leq x \leq 1$. By definition, it is inherited by $u^{n}$. Therefore, there
exists a positive constant $c_{0}=c_{0}(\varepsilon)$ such that

$$
\begin{aligned}
J_{\delta, G}\left(\tau_{\delta} u^{n}\right) & \leq \int_{\delta}^{2 \delta}\left\langle r_{t}^{n}, G_{t}\right\rangle d t-c_{0} \int_{\delta}^{2 \delta} d t \int_{0}^{1}\left[\nabla G_{t}\right]^{2} d x \\
& -c_{0} \int_{\delta}^{2 \delta}\left\{G_{t}(1)^{2}+G_{t}(0)^{2}\right\} d t,
\end{aligned}
$$

Adding and subtracting $G_{t}(0)$ to $G_{t}$ in $\left\langle r_{t}^{n}, G_{t}\right\rangle$ yields, by Young's inequality, that this scalar product is bounded by $\left(1 / 2 A_{1}\right)\left\langle\left(r_{t}^{n}\right)^{2}\right\rangle+A_{1}\left\langle\left[G_{t}-G_{t}(0)\right]^{2}\right\rangle+A_{1} G_{t}(0)^{2}$ for all $A_{1}>0$. Hence, by choosing $A_{1}$ appropriately,

$$
J_{\delta, G}\left(\tau_{\delta} u^{n}\right) \leq C_{0} \int_{\delta}^{2 \delta} d t \int_{0}^{1}\left(r_{t}^{n}\right)^{2} d x
$$

so that

$$
\begin{equation*}
I_{[0, \delta]}\left(\tau_{\delta} u^{n}\right) \leq C_{0} \int_{\delta}^{2 \delta} d t \int_{0}^{1}\left(r_{t}^{n}\right)^{2} d x \tag{5.4}
\end{equation*}
$$

It remains to show that $r^{n}(t, x)$ converges to 0 , as $n \rightarrow \infty$, in $\mathcal{L}^{2}[(\delta, 2 \delta) \times[0,1])$. Fix a point $(t, x)$ in this set. Since $\int_{\mathbb{R}} \partial_{t} \varphi_{\chi_{n}(t)}(s) d s=\partial_{t} \int_{\mathbb{R}} \varphi_{\chi_{n}(t)}(s) d s=0, r^{n}(t, x)$ can be written as

$$
\int_{\mathbb{R}}[u(t+s, x)-u(t, x)] \partial_{t} \varphi_{\chi_{n}(t)}(s) d s
$$

Since $u$ is Lipschitz continuous on $[\delta, 3 \delta] \times[0,1]$, there exists a positive constant $C(\delta)>0$, depending only on $\delta$, such that

$$
|u(t+s, x)-u(t, x)| \leq C(\delta) s
$$

for any $(t, x) \in[\delta, 2 \delta] \times[0,1]$ and $s \in[0, \delta]$. Therefore $r^{n}(t, x)$ is bounded above by

$$
C(\delta) \int_{\mathbb{R}} s\left|\partial_{t} \varphi_{\chi_{n}(t)}(s)\right| d s
$$

By the change of variables $s^{\prime}=s / \chi_{n}(t)$,

$$
\int_{\mathbb{R}} s\left|\partial_{t} \varphi_{\chi_{n}(t)}(s)\right| d s \leq \frac{\left\|\chi^{\prime}\right\|_{\infty}}{n} \int_{0}^{1}\left\{s \varphi(s)+s^{2}\left|\varphi^{\prime}(s)\right|\right\} d s
$$

Therefore, as $n \rightarrow \infty, r^{n}$ converges to 0 uniformly in $(\delta, 2 \delta) \times[0,1]$, and, by (5.4),

$$
\lim _{n \rightarrow \infty} I_{[0, \delta]}\left(\tau_{\delta} \pi^{n}\right)=0
$$

 which completes the proof of the lemma.

Let $\Pi_{4}$ be the set of all paths $\pi(t, d x)=u(t, x) d x$ in $\Pi_{3}$ whose density $u(t, \cdot)$ belongs to the space $C^{\infty}([0,1])$ for any $t \in(0, T]$. Note that $\Pi_{4}=\Pi_{\gamma}$, introduced in Definition 2.5.

Denote by $\left(P_{t}^{(D)}: t \geq 0\right),\left(P_{t}^{(N)}: t \geq 0\right)$ the semigroup associated to the Laplacian on $[0,1]$ with Dirichlet, Neumann boundary conditions, respectively. The following property will be used many times below. For all $s \geq 0$ and function $f$ in $C^{1}([0,1])$,

$$
\begin{equation*}
\nabla P_{s}^{(D)} f=P_{s}^{(N)} \nabla f . \tag{5.5}
\end{equation*}
$$

To check this identity, fix $f$ in $C^{1}([0,1])$, and let $u_{s}:=P_{s}^{(D)} f$. Clearly $u_{s}$ is the solution of the heat equation on $[0,1]$ with boundary conditions $u_{s}(0)=u_{s}(1)=0$ and initial condition $u_{0}=f$. Let $v_{s}:=\nabla u_{s}$, Then, $v_{s}$ solves the heat equation on [0,1] with boundary conditions
$\nabla v_{s}(0)=\nabla v_{s}(1)=0$ and initial condition $v_{0}=\nabla f$. Hence, $v_{s}$ can be represented as $v_{s}=P_{s}^{(N)} \nabla f$, that is, $P_{s}^{(N)} \nabla f=v_{s}=\nabla u_{s}=\nabla P_{s}^{(D)} f$, as claimed.

Fix $\pi(t, d x)=u(t, x) d x$ in $\Pi_{3}$ such that $I_{[0, T]}(\pi \mid \gamma)<\infty$. Since $\pi$ belongs to the set $\Pi_{1}$, the density $u$ solves the equation (2.6) in some time interval $[0,3 \delta], \delta>0$. Recall the definition of the function $\chi_{n}(\cdot)$ introduced in (5.1). Let $\pi^{n}(t, d x)=u^{n}(t, x) d x$, where

$$
\begin{equation*}
u_{t}^{n}=w_{t}+P_{\chi_{n}(t)}^{(D)}\left[u_{t}-w_{t}\right] . \tag{5.6}
\end{equation*}
$$

In this formula, $w_{t}(\cdot)$ is the smooth function given by $w_{t}(x)=u_{t}(0)+\left[u_{t}(1)-u_{t}(0)\right] x$.
Lemma 5.6. Fix $\pi(t, d x)=u(t, x) d x$ in $\Pi_{3}$ such that $I_{[0, T]}(\pi \mid \gamma)<\infty$. Define $u^{n}, n \geq 1$, by (5.6). For each $n \geq 1, \pi^{n}(t, d x)=u^{n}(t, x) d x$ belongs to $\Pi_{4}$ and the trajectory $u^{n}$ has finite energy.
Proof. Claim A: The trajectory $\pi^{n}$ belongs to $\Pi_{1}$.
By definition, $u_{t}^{n}=u_{t}=u_{t}^{(\gamma)}$ for $0 \leq t \leq \delta$. It remains to estimate its energy. As $u_{t}^{n}=u_{t}^{(\gamma)}$ for $0 \leq t \leq \delta$, by Lemma B. 5 , the contribution to the total energy of the evolution of $u^{n}$ in the time interval $[0, \delta]$ is bounded. We turn to the contribution in the time interval $[\delta, T]$.

By definition and (5.5), $\nabla u_{t}^{n}=\nabla w_{t}+P_{\chi_{n}(t)}^{(N)} \nabla\left[u_{t}-w_{t}\right]$, so that $\left(\nabla u_{t}^{n}\right)^{2} \leq 2\left(\nabla w_{t}\right)^{2}+$ $2\left\{P_{\chi_{n}(t)}^{(N)} \nabla\left[u_{t}-w_{t}\right]\right\}^{2}$. Therefore, as $\varepsilon(\delta) \leq u_{t}^{n} \leq 1-\varepsilon(\delta)$ for $\delta \leq t \leq T$,

$$
\begin{aligned}
& \int_{\delta}^{T} d t \int_{0}^{1} \frac{\left|\nabla u_{t}^{n}\right|^{2}}{\sigma\left(u_{t}^{n}\right)} d x \leq C_{0}(\varepsilon) \int_{\delta}^{T} d t \int_{0}^{1}\left|\nabla u_{t}^{n}\right|^{2} d x \\
& \quad \leq C_{0}(\varepsilon) \int_{\delta}^{T} d t \int_{0}^{1}\left(\nabla w_{t}\right)^{2} d x+C_{0}(\varepsilon) \int_{\delta}^{T} d t \int_{0}^{1}\left\{P_{\chi_{n}(t)}^{(N)} \nabla\left[u_{t}-w_{t}\right]\right\}^{2} d x
\end{aligned}
$$

where the constant $C_{0}(\varepsilon)$ changed from line to line. The first term is bounded by the definition of $w_{t}$. As $P_{s}^{(N)}$ is a contraction in $\mathcal{L}^{2}([0,1])$, the second term is bounded by

$$
C_{0}(\varepsilon) \int_{\delta}^{T} d t \int_{0}^{1}\left(\nabla u_{t}\right)^{2} d x+C_{0}(\varepsilon) \int_{\delta}^{T} d t \int_{0}^{1}\left(\nabla w_{t}\right)^{2} d x
$$

The first term is bounded because $\pi_{t}(d x)=u(t, x) d x$ belongs to $\Pi_{3}$. We already estimated the second one. This completes the proof of Claim A.
Claim B: The trajectory $\pi^{n}$ belongs to $\Pi_{2}$. By Theorem B.4, and since $\pi$ belongs to $\Pi_{2}$, for every $\delta^{\prime}>0$, there exists $\varepsilon>0$ such that $\varepsilon \leq u_{t} \leq 1-\varepsilon$ for all $t \in\left[\delta^{\prime}, T\right]$. Denote by $\varepsilon(\delta)$ the constant $\varepsilon$ when $\delta^{\prime}=\delta$. As $u_{t}^{n}=u_{t}$ for $0 \leq t \leq \delta$, this property extends to $u_{t}^{n}$ in the interval $[0, \delta]$ : for every $0<\delta^{\prime} \leq \delta$, there exists $\varepsilon>0$ such that $\varepsilon \leq u_{t}^{n} \leq 1-\varepsilon$ for all $t \in\left[\delta^{\prime}, \delta\right]$.

We turn to the interval $[\delta, T]$. Fix $\delta \leq t \leq T$. Let $v_{s}=v_{s}^{(t)}=w_{t}+P_{s}^{(D)}\left[u_{t}-w_{t}\right], s \geq 0$. Note that $u_{t}^{n}=v_{\chi_{n}(t)}^{(t)}$. By definition, $v$ is the unique solution of the heat equation with Dirichlet boundary conditions:

$$
\left\{\begin{array}{l}
\partial_{s} v=\Delta v \\
v_{s}(0)=u_{t}(0), \quad v_{s}(1)=u_{t}(1) \\
v(0, \cdot)=u_{t}(\cdot)
\end{array}\right.
$$

Here we used the fact that $w(t, 0)=u(t, 0), w(t, 1)=u(t, 1)$ and that $\Delta w_{t}=0$. By the maximum principle, for all $s \geq 0$, $\min _{0 \leq x \leq 1} u_{t}(x) \leq \min _{0 \leq x \leq 1} v_{s}(x) \leq \max _{0 \leq x \leq 1} v_{s}(x) \leq$ $\max _{0 \leq x \leq 1} u_{t}(x)$. Hence, the bound $\varepsilon(\delta) \leq u_{t} \leq 1-\varepsilon(\delta)$, which holds for all $t \in[\delta, T]$ by definition of $\varepsilon(\delta)$, extends to $v_{\chi_{n}(t)}^{(t)}=u_{t}^{n}$. Therefore, $\pi^{n}$ belongs to $\Pi_{2}$, as claimed.

The condition $\Delta w_{t}=0$ selects $w_{t}$ among other possible choices. More precisely, in principle one could define $w_{t}$ as $w_{t}(x)=u_{t}(0)+\left[u_{t}(1)-u_{t}(0)\right] f(x)$ for any smooth function $f(x)$ such that $f(0)=0, f(1)=1$. However, the proof that $u^{n}$ belongs to $\Pi_{2}$ is based on the maximum principle for the heat equation with Dirichlet boundary conditions. For $v$ to be a solution we need $\Delta w_{t}=0$ which imposes the choice $f(x)=x$.

It remains to examine the regularity in space and time of the trajectory $u_{t}^{n}$. Since $u_{t}$ belongs to $\Pi_{3}$ and as the time-derivative commutes with the operator $P_{s}^{(D)}$, by definition, the trajectory $u_{t}^{n}$ also belongs to $\Pi_{3}$. Furthermore, as $w_{t}$ is smooth in space, by Theorem B. 4 and its equivalent version for the heat equation with Dirichlet boundary conditions, $u_{t}^{n} \in C^{\infty}([0,1])$ for all $0<t \leq T$, and $u_{t}^{n}$ belongs to $\Pi_{4}$. This completes the proof of the lemma.

Lemma 5.7. The set $\Pi_{4}$ is $I_{[0, T]}(\cdot \mid \gamma)$-dense.
Proof. Fix $\pi(t, d x)=u(t, x) d x$ in $\Pi_{3}$ such that $I_{[0, T]}(\pi \mid \gamma)<\infty$. Keep in mind that $u$ is continuous in $(0, T] \times[0,1]$. Define $u^{n}, n \geq 1$, by (5.6), and let $\pi^{n}(t, d x)=u^{n}(t, x) d x$. By Lemma 5.6, $\pi^{n}$ belongs to $\Pi_{4}$.

By definition, $\pi^{n}$ converges to $\pi$ in $D([0, T], \mathcal{M})$. Hence, by the lower semicontinuous of the rate function, it remains to show that $\limsup _{n \rightarrow \infty} I_{[0, T]}\left(\pi^{n} \mid \gamma\right) \leq I_{[0, T]}(\pi \mid \gamma)$.

By (3.1), the cost of the trajectory $\pi^{n}$ in the interval $[0, T]$ is bounded by the sum of its cost in the intervals $[0, \delta],[\delta, T]$ :

$$
\begin{equation*}
I_{[0, T]}\left(u^{n}\right) \leq I_{[0, \delta]}\left(u^{n}\right)+I_{[0, T-\delta]}\left(\tau_{\delta} u^{n}\right) . \tag{5.7}
\end{equation*}
$$

As $u^{n}=u^{(\gamma)}$ in the time-interval $[0, \delta]$,

$$
\begin{equation*}
I_{[0, \delta]}\left(u^{n}\right)=0 . \tag{5.8}
\end{equation*}
$$

We turn to the interval $[\delta, T]$. Recall the notation introduced in (3.1). The cost of the trajectory in this interval is given by $I_{[0, T-\delta]}\left(\tau_{\delta} u^{n}\right)$. Let $\widehat{\chi}_{n}(t)=\chi_{n}(t-\delta), T_{\delta}=T-\delta$, $v=\tau_{\delta} u, v^{n}=\tau_{\delta} u^{n}, \widehat{w}=\tau_{\delta} w$, and observe that $v_{t}^{n}=\widehat{w}_{t}+P_{\widehat{\chi}_{n}(t)}^{(D)}\left[v_{t}-\widehat{w}_{t}\right], 0 \leq t \leq T_{\delta}$. Moreover,

$$
\begin{equation*}
\varepsilon(\delta) \leq v_{t}^{n} \leq 1-\varepsilon(\delta) \tag{5.9}
\end{equation*}
$$

for $0 \leq t \leq T_{\delta}$, where $\varepsilon(\delta)$ has been introduced at the beginning of the proof of Lemma 5.6. With this notation, $I_{[0, T-\delta]}\left(\tau_{\delta} u^{n}\right)=I_{\left[0, T_{\delta}\right]}\left(v^{n}\right)$.

By Lemma 4.3, $I_{\left[0, T_{\delta}\right]}\left(v^{n}\right)=I_{\left[0, T_{\delta}\right]}^{(1)}\left(v^{n}\right)+I_{\left[0, T_{\delta}\right]}^{(2)}\left(v^{n}\right)$. We estimate each term of this sum separately. The next observation will be useful in the argument.

Let $L^{\left(\partial_{t}\right)}, L_{0}^{\left(\partial_{t}\right)}$ be the functional introduced in (4.8), (4.2) with $T, u_{t}$ replaced by $T_{\delta}, v_{t}$, respectively. Keep in mind that these linear functionals depend on the trajectory $u(\cdot, \cdot)$, that is, on $v$. Since $I_{\left[0, T_{\delta}\right]}(v)=I_{[0, T-\delta]}\left(\tau_{\delta} u\right) \leq I_{[0, T]}(u)<\infty$, by (4.14), (4.15), $L_{0}^{\left(\partial_{t}\right)}$ belongs to $\mathcal{H}^{-1}(\sigma(v))$ and there exists $M$ in $\mathcal{L}^{2}\left(\sigma(v)^{-1}\right)$ such that

$$
\begin{equation*}
L_{0}^{\left(\partial_{t}\right)}(H)=\int_{0}^{T_{\delta}}\left\langle M_{s}, \nabla H_{s}\right\rangle d s, \quad \int_{0}^{1} \frac{M_{s}}{\sigma\left(v_{s}\right)} d x=0 \tag{5.10}
\end{equation*}
$$

for all $H$ in $C_{K}^{\infty}\left(\Omega_{T_{\delta}}\right)$, and almost all $0 \leq s \leq T_{\delta}$.
We turn to $I_{\left[0, T_{\delta}\right]}^{(1)}\left(v^{n}\right)$. By Lemma 4.3, $I_{\left[0, T_{\delta}\right]}^{(1)}\left(v^{n}\right)=(1 / 4)\left\|\mathfrak{L}_{0}\right\|_{-1, \sigma\left(v^{n}\right)}^{2}$. The linear functional $\mathfrak{L}_{0}$ introduced just below (4.8) is the sum of $L_{0}^{\left(\partial_{t}\right)}$ with $L_{0}^{(\nabla)}$. We first examine $L_{0}^{\left(\partial_{t}\right)}$.

The linear functional $L_{0}^{\left(\partial_{t}\right)}$. By definition, since $P_{s}^{(D)}$ is a symmetric operator in $\mathcal{L}^{2}([0,1])$, for every $H \in C_{K}^{\infty}\left(\Omega_{T}\right)$,

$$
\begin{aligned}
& \int_{0}^{T_{\delta}}\left\langle\partial_{t} v_{t}^{n}, H_{t}\right\rangle d t=\int_{0}^{T_{\delta}}\left\langle\left(I-P_{\widehat{\chi}_{n}(t)}^{(D)}\right) \partial_{t} \widehat{w}_{t}, H_{t}\right\rangle d t \\
& \quad+\int_{0}^{T_{\delta}}\left\langle\partial_{t} v_{t}, P_{\widehat{\chi}_{n}(t)}^{(D)} H_{t}\right\rangle d t+\int_{0}^{\delta} \widehat{\chi}_{n}^{\prime}(t)\left\langle\Delta P_{\widehat{\chi}_{n}(t)}^{(D)}\left[v_{t}-\widehat{w}_{t}\right], H_{t}\right\rangle d t
\end{aligned}
$$

The last integral runs from 0 to $\delta$ because $\widehat{\chi}_{n}^{\prime}(t)$ vanishes for $t \geq \delta$.
As $(t, x) \mapsto\left(P_{\widehat{\chi}_{n}(t)}^{(D)} H_{t}\right)(x)$ is a smooth function which vanishes at $x=0$ and $x=1$, by (5.10), the second term on the right-hand side is equal to the time integral of $\left\langle M_{t}, \nabla P_{\widehat{\chi}_{n}(t)}^{(D)} H_{t}\right\rangle$. By (5.5), this scalar product is equal to $\left\langle M_{t}, P_{\widehat{\chi}_{n}(t)}^{(N)} \nabla H_{t}\right\rangle=\left\langle P_{\widehat{\chi}_{n}(t)}^{(N)} M_{t}, \nabla H_{t}\right\rangle$ because the operator $P_{\widehat{\chi}_{n}(t)}^{(N)}$ is symmetric in $\mathcal{L}^{2}([0,1])$.

On the other hand, as $H_{t}$ vanishes at the boundary, an integration by parts yields that the third term on the right-hand side is equal to

$$
-\int_{0}^{\delta} \widehat{\chi}_{n}^{\prime}(t)\left\langle\nabla P_{\widehat{\chi}_{n}(t)}^{(D)}\left[v_{t}-\widehat{w}_{t}\right], \nabla H_{t}\right\rangle d t=-\int_{0}^{\delta} \widehat{\chi}_{n}^{\prime}(t)\left\langle P_{\widehat{\chi}_{n}(t)}^{(N)} \nabla\left[v_{t}-\widehat{w}_{t}\right], \nabla H_{t}\right\rangle d t,
$$

where we apllied the identity (5.5) once more.
In conclusion,

$$
\begin{align*}
& \int_{0}^{T_{\delta}}\left\langle\partial_{t} v_{t}^{n}, H_{t}\right\rangle d t=\int_{0}^{T_{\delta}}\left\langle\left(I-P_{\widehat{\chi}_{n}(t)}^{(D)}\right) \partial_{t} \widehat{w}_{t}, H_{t}\right\rangle d t  \tag{5.11}\\
& \quad+\int_{0}^{T_{\delta}}\left\langle P_{\widehat{\chi}_{n}(t)}^{(N)} M_{t}, \nabla H_{t}\right\rangle d t-\int_{0}^{\delta} \widehat{\chi}_{n}^{\prime}(t)\left\langle P_{\widehat{\chi}_{n}(t)}^{(N)} \nabla\left[v_{t}-\widehat{w}_{t}\right], \nabla H_{t}\right\rangle d t
\end{align*}
$$

We estimate the first and the last term on the right-hand side. By Young's inequality $x y \leq\left(1 / 2 A_{1}\right) x^{2}+\left(A_{1} / 2\right) y^{2}, A_{1}>0$, the first term on the right-hand side is bounded by

$$
\frac{1}{2 A_{1}} \int_{0}^{T_{\delta}}\left\langle\left[\left(I-P_{\widehat{\chi}_{n}(t)}^{(D)}\right) \partial_{t} \widehat{w}_{t}\right]^{2}\right\rangle d t+\frac{A_{1}}{2} \int_{0}^{T_{\delta}}\left\langle H_{t}^{2}\right\rangle d t
$$

for all $A_{1}>0$. As $H_{t}$ vanishes at the boundary of [ 0,1 ], by Poincaré's inequality and (5.9), this sum is bounded by

$$
\begin{aligned}
& \frac{1}{2 A_{1}} \int_{0}^{T_{\delta}}\left\langle\left[\left(I-P_{\widehat{\chi}_{n}(t)}^{(D)}\right) \partial_{t} \widehat{w}_{t}\right]^{2}\right\rangle d t+C_{0} A_{1} \int_{0}^{T_{\delta}}\left\langle\left(\nabla H_{t}\right)^{2}\right\rangle d t \\
& \quad \leq \frac{1}{2 A_{1}} \int_{0}^{T_{\delta}}\left\langle\left[\left(I-P_{\widehat{\chi}_{n}(t)}^{(D)}\right) \partial_{t} \widehat{w}_{t}\right]^{2}\right\rangle d t+C_{0} A_{1} \int_{0}^{T_{\delta}} d t \int_{0}^{1} \sigma\left(v_{t}^{n}\right)\left(\nabla H_{t}\right)^{2} d x
\end{aligned}
$$

for some finite constant $C_{0}=C_{0}(u)$ which may change from line to line.
Since $\widehat{\chi}_{n}^{\prime}(t)=(1 / n) \chi^{\prime}(t-\delta)$, by Young's inequality, the third term on the right-hand side of (5.11) is bounded by

$$
\frac{C_{0}}{n} \int_{0}^{\delta}\left\langle\left\{P_{\widehat{\chi}_{n}(t)}^{(N)} \nabla\left[v_{t}-\widehat{w}_{t}\right]\right\}^{2}\right\rangle d t+\frac{1}{n} \int_{0}^{\delta}\left\langle\left(\nabla H_{t}\right)^{2}\right\rangle d t
$$

for some finite constant $C_{0}$ which depends on $\chi(\cdot)$. As $P_{s}^{(N)}, s \geq 0$, is a contraction in $L^{2}([0,1])$ and since $\varepsilon(\delta) \leq v_{t}^{n} \leq 1-\varepsilon(\delta)$, this expression is less than or equal to

$$
\frac{C_{0}}{n} \int_{0}^{\delta} d t \int_{0}^{1}\left[\nabla v_{t}-\nabla \widehat{w}_{t}\right]^{2} d x+\frac{C_{1}}{n} \int_{0}^{\delta} d t \int_{0}^{1} \sigma\left(v_{t}^{n}\right)\left[\nabla H_{t}\right]^{2} d x
$$

for some finite constant $C_{1}=C_{1}(u)$. We turn to the linear functional $L_{0}^{(\nabla)}$.
The linear functional $L_{0}^{(\nabla)}$. By definition of $v_{t}^{n}$,

$$
\int_{0}^{T_{\delta}}\left\langle\nabla v_{t}^{n}, \nabla H_{t}\right\rangle d t=\int_{0}^{T_{\delta}}\left\langle\left(I-P_{\widehat{\chi}_{n}(t)}^{(N)}\right) \nabla \widehat{w}_{t}, \nabla H_{t}\right\rangle d t+\int_{0}^{T_{\delta}}\left\langle P_{\widehat{\chi}_{n}(t)}^{(N)} \nabla v_{t}, \nabla H_{t}\right\rangle d t
$$

For similar reasons to the ones presented above, the first term on the right-hand side is bounded by

$$
\frac{1}{2 A_{2}} \int_{0}^{T_{\delta}}\left\langle\left[\left(I-P_{\widehat{\chi}_{n}(t)}^{(N)}\right) \nabla \widehat{w}_{t}\right]^{2}\right\rangle d t+C_{0} A_{2} \int_{0}^{T_{\delta}} d t \int_{0}^{1} \sigma\left(v_{t}^{n}\right)\left(\nabla H_{t}\right)^{2} d x
$$

for all $A_{2}>0$ and some finite constant $C_{0}=C_{0}(u)$.
The linear functional $\mathfrak{L}_{0}$. We are now in a position to estimate $I_{\left[0, T_{\delta}\right]}^{(1)}\left(v^{n}\right)=(1 / 4)\left\|\mathfrak{L}_{0}\right\|_{-1, \sigma\left(v^{n}\right)}^{2}$. Let

$$
\begin{gathered}
r_{1}(n)=\int_{0}^{T_{\delta}}\left\langle\left[\left(I-P_{\widehat{\chi}_{n}(t)}^{(D)}\right) \partial_{t} \widehat{w}_{t}\right]^{2}\right\rangle d t, \quad r_{2}(n)=\frac{C_{0}}{n} \int_{0}^{\delta} d t \int_{0}^{1}\left[\nabla v_{t}-\nabla \widehat{w}_{t}\right]^{2} d x \\
r_{3}(n)=\int_{0}^{T_{\delta}}\left\langle\left[\left(I-P_{\widehat{\chi}_{n}(t)}^{(N)}\right) \nabla \widehat{w}_{t}\right]^{2}\right\rangle d t
\end{gathered}
$$

As both semigroups are continuous, $\lim _{n \rightarrow \infty} r_{j}(n)=0$ for $j=1,3$. As $u$ (and, thus, $v$ ) has finite energy, by definition of $\widehat{w}, \lim _{n \rightarrow \infty} r_{2}(n)=0$. Set $A_{j}=\sqrt{r_{j}(n)}=: c_{j}(n), j=1,3$, and $c_{2}(n):=r_{2}(n)$, to get from the bounds obtained above that

$$
\begin{aligned}
& 2 \int_{0}^{T_{\delta}}\left\langle\partial_{t} v_{t}^{n}, H_{t}\right\rangle d t+2 \int_{0}^{T_{\delta}}\left\langle\nabla v_{t}^{n}, \nabla H_{t}\right\rangle d t-\int_{0}^{T_{\delta}} d t \int_{0}^{1} \sigma\left(v_{t}^{n}\right)\left(\nabla H_{t}\right)^{2} d x \\
& \quad \leq 2 \int_{0}^{T_{\delta}}\left\langle P_{\hat{\chi}_{n}(t)}^{(N)} M_{t}, \nabla H_{t}\right\rangle d t+2 \int_{0}^{T_{\delta}}\left\langle P_{\widehat{\chi}_{n}(t)}^{(N)} \nabla v_{t}, \nabla H_{t}\right\rangle d t \\
& \quad-\left[1-\varepsilon_{n}\right] \int_{0}^{T_{\delta}} d t \int_{0}^{1} \sigma\left(v_{t}^{n}\right)\left(\nabla H_{t}\right)^{2} d x+c_{n}
\end{aligned}
$$

where $c_{n}=\sum_{1 \leq j \leq 3} c_{j}(n), \varepsilon_{n}=C_{0}\left[c_{1}(n)+c_{2}(n)+(1 / n)\right]$ so that $\lim _{n \rightarrow \infty} \varepsilon_{n}=0$. Note that $c_{n}, \varepsilon_{n}$ do not depend on $H$. Hence, by definition of $I_{\left[0, T_{\delta}\right]}^{(1)}(\cdot)$ and (4.1),

$$
I_{\left[0, T_{\delta}\right]}^{(1)}\left(v^{n}\right) \leq \frac{1}{4\left(1-\varepsilon_{n}\right)}\left\|L_{0}^{n}\right\|_{-1, \sigma\left(v^{n}\right)}^{2}+c_{n}
$$

where $L_{0}^{n}(H)=\int_{0}^{T_{\delta}}\left\langle P_{\widehat{\chi}_{n}(t)}^{(N)} M_{t}+P_{\widehat{\chi}_{n}(t)}^{(N)} \nabla v_{t}, \nabla H_{t}\right\rangle d t$.
By Lemma 4.1, the first term on the right-hand side of the previous displayed equation is equal to

$$
\frac{1}{4\left(1-\varepsilon_{n}\right)} \int_{0}^{T_{\delta}}\left\{\int_{0}^{1} \frac{1}{\sigma\left(v_{t}^{n}\right)}\left[P_{\hat{\chi}_{n}(t)}^{(N)} M_{t}+P_{\hat{\chi}_{n}(t)}^{(N)} \nabla v_{t}\right]^{2} d x-R_{t}^{n}\right\} d t
$$

where $R_{t}^{n}=\left\langle\left[P_{\hat{\chi}_{n}(t)}^{(N)} M_{t}+P_{\hat{\chi}_{n}(t)}^{(N)} \nabla v_{t}\right] / \sigma\left(v_{t}^{n}\right)\right\rangle^{2} /\left\langle 1 / \sigma\left(v_{t}^{n}\right)\right\rangle$.

Consider the limit, as $n \rightarrow \infty$, of the two previous displayed equations. Since $\varepsilon_{n} \rightarrow 0$ and $c_{n} \rightarrow 0$ we may ignore these constants. On the other hand, by (5.9), $\varepsilon(\delta) \leq v_{t}^{n} \leq 1-\varepsilon(\delta)$. Therefore, as the semigroup $\left(P_{t}^{(N)}: t \geq 0\right)$ is continuous in $\mathcal{L}^{2}([0,1])$, we may replace in the previous equations $P_{\widehat{\chi}_{n}(t)}^{(N)} M_{t}, P_{\widehat{\chi}_{n}(t)}^{(N)} \nabla v_{t}$ by $M_{t}, \nabla v_{t}$, respectively, at a cost which vanishes as $n \rightarrow \infty$. Finally, as $v_{t}^{n} \rightarrow v_{t}$ a.e., we conclude that

$$
\limsup _{n \rightarrow \infty} I_{\left[0, T_{\delta}\right]}^{(1)}\left(v^{n}\right) \leq \frac{1}{4} \int_{0}^{T_{\delta}}\left\{\int_{0}^{1} \frac{1}{\sigma\left(v_{t}\right)}\left[M_{t}+\nabla v_{t}\right]^{2} d x-R_{t}^{\prime}\right\} d t
$$

where $R_{t}^{\prime}=\left\langle\left[M_{t}+\nabla v_{t}\right] / \sigma\left(v_{t}\right)\right\rangle^{2} /\left\langle 1 / \sigma\left(v_{t}\right)\right\rangle$. By (5.10), this expression is equal to $R_{t}$, where $R_{t}=\left\langle\nabla v_{t} / \sigma\left(v_{t}\right)\right\rangle^{2} /\left\langle 1 / \sigma\left(v_{t}\right)\right\rangle$. Hence, by Lemma 4.4 [with $u_{t}$ replaced by $v_{t}$ ],

$$
\limsup _{n \rightarrow \infty} I_{\left[0, T_{\delta}\right]}^{(1)}\left(v^{n}\right) \leq I_{\left[0, T_{\delta}\right]}^{(1)}(v)
$$

We turn to $I_{\left[0, T_{\delta}\right]}^{(2)}\left(v^{n}\right)$. By Lemma 4.3,

$$
I_{\left[0, T_{\delta}\right]}^{(2)}\left(v^{n}\right)=\int_{0}^{T_{\delta}} \Phi^{v_{n}}\left(a_{t}^{n}, b_{t}^{n}\right) d t
$$

where $a_{t}^{n}, b_{t}^{n}$ are given by (4.9), (4.3) with $u$ replaced by $v^{n}$. To stress the dependence of $\Phi$ on $v_{n}$, we denoted this functional by $\Phi^{v_{n}}$. However, as $v^{n}(t, 1)=v(t, 1), v^{n}(t, 0)=v(t, 0)$, $\Phi^{v_{n}}=\Phi^{v}$.

Let $\Xi^{n}, \Xi$ be given by (4.3) with $v^{n}, v$ in place of $u$, respectively. As $v^{n} \rightarrow v$ almost everywhere, and since $\varepsilon(\delta) \leq v^{n} \leq 1-\varepsilon(\delta)$, the continuous function $\Xi^{n}$ converges to $\Xi$ pointwisely.

An elementary computation, similar to the one presented above when we examined the rate function $I_{\left[0, T_{\delta}\right]}^{(1)}$, yields that

$$
\begin{aligned}
a_{t}^{n}= & \left\langle\left(I-P_{\widehat{\chi}_{n}(t)}^{(D)}\right) \partial_{t} \widehat{w}_{t}, 1-\Xi_{t}^{n}\right\rangle-\left\langle\left(I-P_{\widehat{\chi}_{n}(t)}^{(N)}\right) \nabla \widehat{w}_{t}, \nabla \Xi_{t}^{n}\right\rangle \\
& +\left\langle P_{\widehat{\chi}_{n}(t)}^{(D)} \partial_{t} v_{t}, 1-\Xi_{t}^{n}\right\rangle-\left\langle P_{\widehat{\chi}_{n}(t)}^{(N)} \nabla v_{t}, \nabla \Xi_{t}^{n}\right\rangle \\
& +\widehat{\chi}_{n}^{\prime}(t)\left\langle v_{t}-\widehat{w}_{t}, \Delta P_{\widehat{\chi}_{n}(t)}^{(D)}\left[1-\Xi_{t}^{n}\right]\right\rangle .
\end{aligned}
$$

Note that in the last term the operator $\Delta P_{\widehat{\chi}_{n}(t)}^{(D)}$ is acting on $\left[1-\Xi_{t}^{n}\right]$ instead of $v_{t}-\widehat{w}_{t}$, as in the first part of the proof. Here, we simply used the fact that the semigroup $P_{r}^{(D)}$ is symmetric.

As $v_{t}-\widehat{w}_{t}$ vanishes at the boundary, an integration by parts and (5.5) yield that the last term is equal to

$$
-\widehat{\chi}_{n}^{\prime}(t)\left\langle\nabla\left[v_{t}-\widehat{w}_{t}\right], \nabla P_{\widehat{\chi}_{n}(t)}^{(D)}\left[1-\Xi_{t}^{n}\right]\right\rangle=\widehat{\chi}_{n}^{\prime}(t)\left\langle P_{\widehat{\chi}_{n}(t)}^{(N)} \nabla\left[v_{t}-\widehat{w}_{t}\right], \nabla \Xi_{t}^{n}\right\rangle,
$$

where we used that the semigroup $P_{s}^{(N)}$ is symmetric in $\mathcal{L}^{2}([0,1])$.
Since $\varepsilon(\delta) \leq v^{n} \leq 1-\varepsilon(\delta)$, there exists a finite constant $C_{0}$ such that $\left|\Xi_{t}^{n}\right| \leq C_{0}$, $\left|\nabla \Xi_{t}^{n}\right| \leq C_{0}$ for all $n \geq 1,0 \leq t \leq T_{\delta}$. Therefore, as $\widehat{\chi}_{n}^{\prime}(t)=(1 / n) \chi^{\prime}(t-\delta)$ and since the operators $P_{s}^{(N)}, P_{s}^{(D)}$ are contractions in $\mathcal{L}^{2}([0,1])$, there exists a finite constant $C_{0}$ such that $\left|a_{t}^{n}\right|^{2} \leq C_{0}\left\{1+\left\langle\left(\partial_{t} v_{t}\right)^{2}\right\rangle+\left\langle\left(\nabla v_{t}\right)^{2}\right\rangle\right\}$ for all $n \geq 1,0 \leq t \leq T_{\delta}$. Moreover,

$$
\lim _{n \rightarrow \infty} \widehat{\chi}_{n}^{\prime}(t)\left\langle P_{\widehat{\chi}_{n}(t)}^{(N)} \nabla\left[v_{t}-\widehat{w}_{t}\right], \nabla \Xi_{t}^{n}\right\rangle=0,
$$

and, as $\Xi_{t}^{n} \rightarrow \Xi_{t}, \nabla \Xi_{t}^{n} \rightarrow \nabla \Xi_{t}$ in $\mathcal{L}^{2}([0,1])$, for all $0 \leq t \leq T_{\delta}$,

$$
\begin{equation*}
\lim _{n \rightarrow \infty} a_{t}^{n}=a_{t}:=\left\langle\partial_{t} v_{t}, 1-\Xi_{t}\right\rangle-\left\langle\nabla v_{t}, \nabla \Xi_{t}\right\rangle \tag{5.12}
\end{equation*}
$$

A similar bound and limit hold for the sequence $b_{t}^{n}$. Since $\Phi^{v}$ is continuous and the map $t \mapsto\left\langle\left(\partial_{t} v_{t}\right)^{2}\right\rangle+\left\langle\left(\nabla v_{t}\right)^{2}\right\rangle$ is integrable, by (4.13), (5.12) and the dominated convergence theorem,

$$
\lim _{n \rightarrow \infty} \int_{0}^{T_{\delta}} \Phi^{v}\left(a_{t}^{n}, b_{t}^{n}\right) d t=\int_{0}^{T_{\delta}} \Phi^{v}\left(a_{t}, b_{t}\right) d t
$$

By Lemma 4.3, the right-hand side is equal to $I_{\left[0, T_{\delta}\right]}^{(2)}(v)$. Therefore,

$$
\lim _{n \rightarrow \infty} I_{\left[0, T_{\delta}\right]}^{(2)}\left(v^{n}\right)=I_{\left[0, T_{\delta}\right]}^{(2)}(v) .
$$

Since $v^{n}=\tau_{\delta} u^{n}, v=\tau_{\delta} u$, adding together the estimates on $I_{\left[0, T_{\delta}\right]}^{(1)}\left(v^{n}\right)$ and $I_{\left[0, T_{\delta}\right]}^{(2)}\left(v^{n}\right)$, yield that

$$
\limsup _{n \rightarrow \infty} I_{\left[0, T_{\delta}\right]}\left(\tau_{\delta} u^{n}\right) \leq I_{\left[0, T_{\delta}\right]}\left(\tau_{\delta} u\right)
$$

By (3.3), this expression is bounded by $I_{[0, T]}(u \mid \gamma)$, which completes the proof of the lemma in view of (5.7), (5.8).

Proof of Theorem 5.2. The first assertion follows from Lemma 5.7 and the definition of the set $\Pi_{4}$.

Assume that there exists $\varepsilon_{0}>0$ such that $\varepsilon_{0} \leq \gamma \leq 1-\varepsilon_{0}$. Fix $\pi \in D([0, T], \mathcal{M})$ such that $I_{[0, T]}(\pi \mid \gamma)<\infty$. Let $\pi^{n}(t, d x)=u^{n}(t, x) d x$ be the sequence in $\Pi_{\gamma}$ which $I_{[0, T]}(\cdot \mid \gamma)$ approximates $\pi$ in the sense of Definition 5.1. Since $\pi^{n}$ belongs to $\Pi_{\gamma}$, there exists $\delta>0$ and $\varepsilon>0$ such that $u_{t}^{n}=u_{t}^{(\gamma)}$ for $0 \leq t \leq \delta$ and $\varepsilon \leq u^{n}(t, x) \leq 1-\varepsilon$ for all $(t, x) \in[\delta, T] \times[0,1]$. By (B.4), there exists $\varepsilon_{1}>0$ such that $\varepsilon_{1} \leq u^{n}(t, x) \leq 1-\varepsilon_{1}$ for all $(t, x) \in[0, \delta] \times[0,1]$. This completes the proof of the theorem.

Remark 5.8. The difference between the present context and [7] is that the rate function is convex. We used this property to restrict our attention to trajectories bounded away from 0 and 1 and smooth in time [that is to paths in $\Pi_{3}$ ].

We conclude this section deriving the explicit formula for the rate functions of trajectories in $\Pi_{\gamma}$.

Proof of Proposition 2.6. As $u$ belongs to $\Pi_{\gamma}, u$ is smooth in $(0, T] \times[0,1]$, and for each $0<t \leq T$, there exists $\delta=\delta(t)>0$ such that $\delta \leq u(t, x) \leq 1-\delta$. Therefore, equation (2.15) is strictly elliptic and can be solved explicitly. The solution $H$ inherits the smoothness from $u$. In particular, it belongs to $C^{1,2}((0, T] \times[0,1])$.

As $u$ belongs to $\Pi_{\gamma}, u$ follows the hydrodynamic equation in a time-interval $[0, \mathfrak{t}]$ for some $\mathfrak{t}>0$. Hence, for $0<t \leq \mathfrak{t}$, the solution of (2.15) vanishes: $H(t, x)=0$ for all $(t, x) \in$ $[0, t] \times[0,1]$. Hence, $H$ actually belongs to $C^{1,2}([0, T] \times[0,1])$.

We turn to the formula for the rate function. For a function $G$ in $C^{1,2}([0, T] \times[0,1])$, let

$$
L_{T, G}(u)=\left\langle u_{T}, G_{T}\right\rangle-\left\langle u_{0}, G_{0}\right\rangle-\int_{0}^{T}\left\langle u_{t}, \partial_{t} G_{t}\right\rangle d t+\int_{0}^{T}\left\langle\nabla u_{t}, \nabla G_{t}\right\rangle d t
$$

Multiply equation (2.15) by $G$, integrate over space and time, integrate by parts in space, and recall the boundary conditions to get that

$$
\begin{aligned}
L_{T, G}(u) & =2 \int_{0}^{T}\left\langle\sigma\left(u_{t}\right) \nabla H_{t}, \nabla G_{t}\right\rangle d t \\
& +\int_{0}^{T}\left\{G_{t}(1) \mathfrak{p}_{\beta, B}\left(u_{t}(1), H_{t}(1)\right)+G_{t}(0) \mathfrak{p}_{\alpha, A}\left(u_{t}(0), H_{t}(0)\right)\right\} d t
\end{aligned}
$$

Insert this expression in (2.11) and add and subtract some terms to get that

$$
\begin{aligned}
J_{T, G}(u)= & -\int_{0}^{T}\left\langle\sigma\left(u_{t}\right)\left[\nabla H_{t}-\nabla G_{t}\right]^{2}\right\rangle d t \\
& -\frac{1}{A} \int_{0}^{T}\left[1-u_{t}(0)\right] \alpha\left[e^{G_{t}(0)}-e^{H_{t}(0)}-\left[G_{t}(0)-H_{t}(0)\right] e^{H_{t}(0)}\right] d t \\
& -\frac{1}{A} \int_{0}^{T} u_{t}(0)(1-\alpha)\left[e^{-G_{t}(0)}-e^{-H_{t}(0)}-\left[G_{t}(0)-H_{t}(0)\right] e^{-H_{t}(0)}\right] d t \\
& -\mathfrak{B}+\mathbb{I}_{[0, T]}(u)
\end{aligned}
$$

where $\mathbb{I}_{[0, T]}(u)$ is the expression appearing on the right-hand side of $(2.16)$ and $\mathfrak{B}$ is a term similar to the second and third lines of this formula with the left boundary conditions replaced by the right ones. Since the expressions inside the integrals are all positive, the supremum in $G$ is attained at $G=H$, so that

$$
I_{[0, T]}(u)=\sup _{G} J_{T, G}(u)=\mathbb{I}_{[0, T]}(u)
$$

which completes the proof of the lemma.

## 6. Proof of Theorem 2.7

In this section, we prove the dynamical large deviations. The strategy is by now classical and we just indicate the main steps. The main point here is that the dynamics can be considered as a small perturbation of the exclusion process with Neumann boundary conditions (the process induced by the generator $L_{N}^{\text {bulk }}$ ) because the boundary dynamics is speeded-up only by $N$.

The reversible stationary measures for the exclusion process with Neumann boundary conditions are the uniform measures with a fixed total number of particles. The grand canonical versions are the product Bernoulli measures with a fixed density. For this reason, we take one of these measures as reference measure.

There is an important difference between our model and the exclusion process with Dirichlet boundary conditions. Recall the definition the functional $J_{T, H}$ introduced in (2.10) and (2.11). For the sake of this discussion, denote by $J_{T, H}^{\mathrm{DBC}}$ the corresponding functional in the context of exclusion dynamics with Dirichlet boundary conditions [3, 7, 17, 20]. While $J_{T, H}^{\mathrm{DBC}}$ is defined on the set $D\left([0, T], \mathcal{M}_{\mathrm{ac}}\right)$, in the present context, the functionals $J_{T, H}$ are defined only on the subset $D_{\mathcal{E}}\left([0, T], \mathcal{M}_{\mathrm{ac}}\right)$ of trajectories with finite energy because only for such trajectories are the boundary densities well defined. As a consequence, in the two-blocks estimate, the usual empirical density, $(2 N \varepsilon+1)^{-1} \sum_{y \in \Lambda_{N},|y-x|<\varepsilon} \eta_{y}$ which, as a function of $x$, has jumps needs to be replaced by a smooth approximation. See (6.1) below.

A super-exponential estimate. We follow the proofs presented in [7, Section 3], [17, Section $6]$, [20]. Denote by $\nu_{N}$ the Bernoulli product measure on $\Omega_{N}$ with density $1 / 2$ and by $\mathbb{D}_{N}$ the Dirichlet form given by

$$
\mathbb{D}_{N}(f):=\left\langle-L_{N}^{\text {bulk }} f, f\right\rangle_{\nu_{N}}, \quad f: \Omega_{N} \rightarrow \mathbb{R}_{+}
$$

Next result is [7, Lemma 3.1] adapted to the present context. The proof is elementary and left to the reader. It relies on a Schwarz inequality.

Lemma 6.1. There exists a finite constant $C_{0}$, which only depends on the parameters $\alpha, \beta$, $A, B$, such that

$$
\left\langle\mathcal{L}_{N} f, f\right\rangle_{\nu_{N}} \leq-\mathbb{D}_{N}(f)+C_{0} N E_{\nu_{N}}\left[f^{2}\right]
$$

for all $f: \Omega_{N} \rightarrow \mathbb{R}_{+}$.
Given a cylinder function $h$, that is a function on $\{0,1\}^{\mathbb{Z}}$ depending on $\eta_{x}, x \in \mathbb{Z}$, only through finitely many $x$, denote by $\widetilde{h}(\alpha)$ the expectation of $h$ with respect to $\nu_{\alpha}$, the Bernoulli product measure with density $\alpha$ :

$$
\widetilde{h}(\alpha)=E_{\nu_{\alpha}}[h] .
$$

Denote by $\left\{\tau_{x}: x \in \mathbb{Z}\right\}$ the group of translations in $\{0,1\}^{\mathbb{Z}}$ so that $\left(\tau_{x} \zeta\right)_{z}=\zeta_{x+z}$ for all $x$, $z$ in $\mathbb{Z}$ and configuration $\zeta$ in $\{0,1\}^{\mathbb{Z}}$. Translations are extended to functions and measures in a natural way. They are also extended to configurations, functions and measures in $\Omega_{N}$. In this case, for $x, y \in\{k / N: k \in \mathbb{Z}\}$ such that $y, x+y \in \Lambda_{N},\left(\tau_{x} \eta\right)_{y}=\eta_{x+y}$.

Fix a strictly decreasing sequence $\left\{U_{\varepsilon}: \varepsilon>0\right\}$ converging to $1: U_{\varepsilon}>U_{\varepsilon^{\prime}}>1$ for $\varepsilon>\varepsilon^{\prime}>0$, $\lim _{\varepsilon \rightarrow 0} U_{\varepsilon}=1$. Recall from (3.5) the definition of the approximation of the unity $\phi^{\delta}$. For $\varepsilon>0$, $\pi \in \mathcal{M}$, denote by $\Xi_{\varepsilon}(\pi)$ the measure in $\mathcal{M}_{\mathrm{ac}}$ defined by

$$
\begin{equation*}
\Xi_{\varepsilon}(\pi)(d x)=\frac{1}{U_{\varepsilon}} \int_{0}^{1} \phi^{\varepsilon}(y-x) \pi(d y) d x . \text { Let } \pi^{N, \varepsilon}=\Xi_{\varepsilon}\left(\pi^{N}\right) \tag{6.1}
\end{equation*}
$$

Clearly, $\pi^{N, \varepsilon}$ belongs to $\mathcal{M}_{\mathrm{ac}}$ for $N$ sufficiently large because $U_{\varepsilon}>1$. Denote its density by $u^{N, \varepsilon}$. We have just pointed out that $0 \leq u^{N, \varepsilon}(x) \leq 1$ for $N$ large. The map $x \mapsto u^{N, \varepsilon}(x)$ is smooth, and, if $x$ is at distance less than $\varepsilon$ from the boundary of the interval $[0,1], u^{N, \varepsilon}(x)$ does not represent the density of particles around $x$ because the integral is carried over an interval which does not contain the support of $\phi(\cdot-x)$.

Let $H \in C([0, T] \times[0,1])$ and $h$ a cylinder function. For $\varepsilon>0$ and $N$ large enough, define $V_{N, \varepsilon}^{H, h}:[0, T] \times \Omega_{N} \rightarrow \mathbb{R}$ by

$$
V_{N, \varepsilon}^{H, h}(t, \eta)=\frac{1}{N} \sum_{x \in \Lambda_{N}} H(t, x / N)\left\{\tau_{x} h(\eta)-\widetilde{h}\left(u^{N, \varepsilon}(x)\right)\right\}
$$

The sum is carried over all $x \in \Lambda_{N}$ for which the support of $\tau_{x} h$ is contained in $\Lambda_{N}$. For a function $G \in C([0, T])$ and cylinder functions $h, f$ whose supports are contained in $\mathbb{N},-\mathbb{N}$, respectively, let $W_{G}^{ \pm}:[0, T] \times \Lambda_{N} \rightarrow \mathbb{R}$ be defined by

$$
\begin{gathered}
W_{N, \varepsilon}^{G, h,-}(t, \eta)=G(t)\left\{h(\eta)-\widetilde{h}\left(u^{N, \varepsilon}(\varepsilon)\right)\right\} \\
W_{N, \varepsilon}^{G, f,+}(t, \eta)=G(t)\left\{\left(\tau_{N} f\right)(\eta)-\widetilde{f}\left(u^{N, \varepsilon}(1-\varepsilon)\right)\right\} .
\end{gathered}
$$

Theorem 6.2. Fix $H$ in $C([0, T] \times[0,1])$, $G$ in $C([0, T])$, a cylinder function $h$ whose support ia contained in $\mathbb{N}$, a sequence of configurations $\left\{\eta^{N} \in \Omega_{N}: N \geq 1\right\}$ and $\delta>0$. Then

$$
\begin{gathered}
\lim _{\varepsilon \rightarrow 0} \limsup _{N \rightarrow \infty} \frac{1}{N} \log \mathbb{P}_{\eta^{N}}\left[\left|\int_{0}^{T} V_{N, \varepsilon}^{H, h}\left(t, \eta_{t}\right) d t\right|>\delta\right]=-\infty \\
\lim _{\varepsilon \rightarrow 0} \limsup _{N \rightarrow \infty} \frac{1}{N} \log \mathbb{P}_{\eta^{N}}\left[\left|\int_{0}^{T} W_{N, \varepsilon}^{G, h,-}\left(t, \eta_{t}\right) d t\right|>\delta\right]=-\infty
\end{gathered}
$$

A similar result holds if the cylinder functions $h$ has support contained in $-\mathbb{N}$ and the minus sign in $W_{N, \varepsilon}^{G, h,-}\left(t, \eta_{t}\right)$ is replaced by a plus sign. The proof of this result follows from Lemma 6.1 and the computation presented in the proof of [24, Lemma 3.2].

An energy estimate. The next result is Lemma 3.3 and Corollary 3.4 in [7]. The proof is similar and the details are left to the reader.

Proposition 6.3. Fix a sequence $\left\{G_{j}: j \geq 1\right\}$ of functions in $C^{0,1}([0, T] \times[0,1])$ with compact support in $[0, T] \times(0,1)$ and a sequence $\left\{\eta^{N} \in \Omega_{N}: N \geq 1\right\}$ of configurations. There exists a finite constant $C_{0}$, depending only on $\alpha, \beta, A, B$, such that

$$
\limsup _{\varepsilon \rightarrow 0} \limsup _{N \rightarrow \infty} \frac{1}{N} \log \mathbb{P}_{\eta^{N}}^{N}\left[\max _{1 \leq j \leq k} \mathcal{Q}_{G_{j}}\left(u^{N, \varepsilon}\right) \geq \ell\right] \leq-\ell+C_{0}(T+1)
$$

for all $k, \ell \geq 1$.
Upper bound. The upper bound proof relies on the super-exponential estimate presented in Theorem 6.2 and on the energy estimate stated in Proposition 6.3. It is similar to the one presented in [17, Subsection 6.3]. As a consequence of the argument, the rate function can be set as $+\infty$ for trajectories that are not absolutely continuous with respect to the Lebesgue measure or which do not have finite energy. In other words, in the proof of the upper bound one can set $I_{[0, T]}(\pi \mid \gamma)=+\infty$ for $\pi \notin D_{\mathcal{E}}\left([0, T], \mathcal{M}_{\mathrm{ac}}\right)$.

Lower bound. We follow the arguments presented in [7, Subsection 3.4] and [17, Subsection 6.4]. Fix an open set $\mathcal{G}$ of $D([0, T], \mathcal{M})$ and a density profile $\gamma:[0,1] \rightarrow[0,1]$. Recall the definition of the set $\Pi_{\gamma}$ introduced in Definition 2.5. Fix a path $\pi(t, d x)=u(t, x) d x \in \Pi_{\gamma} \cap \mathcal{G}$.

Let $\left(\eta^{N}: N \geq 1\right)$ be a sequence of configurations associated to the density profile in the sense (2.5). Denote by $\mathbb{P}_{\eta^{N}}^{H}$ the probability measure on $D\left([0, T], \Omega_{N}\right)$ induced by the weakly asymmetric exclusion process with Robin boundary conditions defined in Section 7.

Given two probability measures $P$ and $Q$ we denote by $\operatorname{Ent}(Q \mid P)$ the relative entropy of $Q$ with respect to $P$. By Theorem 7.1, Proposition 2.6 and an elementary computation,

$$
\lim _{N \rightarrow \infty} \frac{1}{N} \operatorname{Ent}\left(\mathbb{P}_{\eta^{N}}^{H} \mid \mathbb{P}_{\eta^{N}}\right)=I_{[0, T]}(\pi \mid \gamma)
$$

Therefore, since $N^{-1} \log \left(d \mathbb{P}_{\eta^{N}}^{H} / d \mathbb{P}_{\eta^{N}}\right)$ is absolutely bounded, by the proof of the lower bound presented at [22, page 277],

$$
\liminf _{n \rightarrow \infty} \frac{1}{N} \log \mathbb{P}_{\eta^{N}}[\mathcal{G}] \geq-\inf _{\pi \in \mathcal{G} \cap \Pi_{\gamma}} I_{[0, T]}(u \mid \gamma)
$$

The lower bound follows from this result and the $I_{[0, T]}(\cdot \mid \gamma)$-density stated in Theorem 5.2.

## 7. Weakly asymmetric exclusion with Robin boundary conditions

Recall the notation introduced in Section 2. Fix $H \in C^{1,2}([0, T] \times[0,1])$. Consider the weakly asymmetric exclusion process induced by the external field $H$ with Robin boundary conditions. The generator of this process, denoted by $\mathcal{L}_{N}^{H}$, is given by

$$
\begin{equation*}
\mathcal{L}_{N}^{H}=L_{N}^{H, \mathrm{lb}}+L_{N}^{H, \mathrm{bulk}}+L_{N}^{H, \mathrm{rb}} \tag{7.1}
\end{equation*}
$$

where, for a function $f: \Omega_{N} \rightarrow \mathbb{R}$,

$$
\begin{aligned}
& \left(L_{N}^{H, \text { bulk }} f\right)(\eta)=N^{2} \sum_{x \in \Lambda_{N}^{0}} e^{-\left(\eta_{x+\mathfrak{e}}-\eta_{x}\right)\left[H_{t}(x+\mathfrak{c})-H_{t}(x)\right]}\left\{f\left(\sigma^{x, x+\mathfrak{e}} \eta\right)-f(\eta)\right\}, \\
& \left(L_{N}^{H, \mathrm{lb}} f\right)(\eta)=\frac{N}{A}\left\{e^{H_{t}(\mathfrak{e})} \alpha\left(1-\eta_{\mathfrak{e}}\right)+e^{-H_{t}(\mathfrak{e})}(1-\alpha) \eta_{\mathfrak{e}}\right\}\left\{f\left(\sigma^{\mathfrak{e}} \eta\right)-f(\eta)\right\}, \\
& \left(L_{N}^{H, \mathrm{rb}} f\right)(\eta)=\frac{N}{B}\left\{e^{H_{t}(\mathfrak{r})} \beta\left(1-\eta_{\mathfrak{r}}\right)+e^{-H_{t}(\mathfrak{r})}(1-\beta) \eta_{\mathfrak{r}}\right\}\left\{f\left(\sigma^{\mathfrak{r}} \eta\right)-f(\eta)\right\} .
\end{aligned}
$$

Denote by $\mathbb{P}_{\mu}^{H}, \mu$ a probability measure on $\Omega_{N}$, the measure on $D\left([0, T], \Omega_{N}\right)$ induced by the Markov process with infinitesimal generator $\mathcal{L}_{N}^{H}$ and initial state $\mu$. Let $\mathbb{Q}_{\mu}^{H}$ be the probability on $D([0, T], \mathcal{M})$ induced by the empirical measure $\boldsymbol{\pi}$ and the measure $\mathbb{P}_{\mu}^{H}: \mathbb{Q}_{\mu}^{H}=\mathbb{P}_{\mu}^{H} \circ \boldsymbol{\pi}^{-1}$.
Theorem 7.1. Fix a measurable profile $\gamma:[0,1] \rightarrow[0,1]$. Let $\left\{\mu_{N}: N \geq 1\right\}$ be a sequence of probability measures on $\Omega_{N}$ associated to $\gamma$ in the sense (2.5). Then, the sequence of probability measures $\mathbb{Q}_{\mu_{N}}^{H}$ converges to the probability measure $\mathbb{Q}^{H}$ concentrated on the trajectory $\pi(t, d x)=u(t, x) d x$, whose density $u$ is the unique weak solution of

$$
\left\{\begin{array}{l}
\partial_{t} u=\Delta u-2 \nabla\{\sigma(u) \nabla H\}  \tag{7.2}\\
\nabla u_{t}(1)-2 \sigma\left(u_{t}(1)\right) \nabla H_{t}(1)=\mathfrak{p}_{\beta, B}\left(u_{t}(1), H_{t}(1)\right) \\
\nabla u_{t}(0)-2 \sigma\left(u_{t}(0)\right) \nabla H_{t}(0)=-\mathfrak{p}_{\alpha, A}\left(u_{t}(0), H_{t}(0)\right), \\
u(0, \cdot)=\gamma(\cdot)
\end{array}\right.
$$

The proof of this result is by now classical and divided in several steps. One first proves tightness. Then, one shows that any limit point of the sequence $\mathbb{Q}_{\mu_{N}}^{H}$ is concentrated on trajectories $\pi(t, d x)=u(t, x) d x$ whose density belongs to $\mathcal{L}^{2}\left(0, T ; \mathcal{H}^{1}\right)$, where the $\mathcal{H}^{1}$ is the Sobolev space introduced in Section 4. Finally, one shows that limit points of the sequence $\mathbb{Q}_{\mu_{N}}^{H}$ are concentrated on trajectories which satisfy the identity (B.7). It remains to invoke the uniqueness of weak solutions, stated in Theorem B.7, to complete the proof. The technical details are standard and the arguments rely on the bound presented in Lemma 6.1. We refer to $[22,1]$.

## Appendix A. The Robin Laplacian

We present in this section some results on the Robin Laplacian needed in the previous section. We refer to [26, 29] for details. Denote by $\Delta_{R}$ the Laplacian on $[0,1]$ with Robin boundary conditions, sometimes called the Robin Laplacian [29, Section 4.3].

Fix $\lambda \in \mathbb{R}$ and consider the eigenvalue problem

$$
\left\{\begin{array}{l}
-\Delta f=\lambda f,  \tag{A.1}\\
(\nabla f)(0)=A^{-1} f(0), \\
(\nabla f)(1)=-B^{-1} f(1) .
\end{array}\right.
$$

This problem has only the trivial solution $f=0$ for $\lambda \leq 0$. For $\lambda>0$, the equation $-\Delta f=\lambda f$ can be turned into a two-dimensional ODE which yields that the solutions of (A.1) are given by $f(x)=a[\cos (\sqrt{\lambda} x)+b \sin (\sqrt{\lambda} x)]$ for some $a, b \in \mathbb{R}$. The boundary conditions are satisfied if and only if

$$
\begin{equation*}
\tan \sqrt{\lambda}=(A+B) \frac{\sqrt{\lambda}}{\lambda A B-1} \tag{A.2}
\end{equation*}
$$

in which case $b=(A \sqrt{\lambda})^{-1}$. This identity excludes $\lambda=0$ from the set of eigenvalues of the Robin Laplacian.

An analysis of (A.2) shows that it has a countable set of solutions $\left\{\lambda_{j}: j \geq 1\right\}$, where $0<\lambda_{1}, \lambda_{j}<\lambda_{j+1}$ and $\lambda_{j} \sim j^{2}$ in the sense that there exists $0<c_{0}<c_{1}<\infty$ such that

$$
\begin{equation*}
c_{0} j^{2} \leq \lambda_{j} \leq c_{1} j^{2} \text { for all } j \geq 1 \tag{A.3}
\end{equation*}
$$

Denote by $\left\{f_{j}: j \geq 1\right\}$ the associated orthonormal eigenvectors, which form a basis of $\mathcal{L}^{2}([0,1])$. By the previous analysis,

$$
\begin{equation*}
f_{j}(x)=a_{j}\left\{\cos \left(\sqrt{\lambda_{j}} x\right)+\frac{1}{A \sqrt{\lambda_{j}}} \sin \left(\sqrt{\lambda_{j}} x\right)\right\} \tag{A.4}
\end{equation*}
$$

where $a_{j}$ is chosen for $f_{j}$ to have $\mathcal{L}^{2}$-norm equal to 1 . It can be shown that $\left|a_{j}\right| \leq C_{0}$ for all $j \geq 1$, where $C_{0}$ is a finite constant depending only on $A$ and $B$. Therefore, by (A.3),

$$
\begin{equation*}
\left\|f_{j}\right\|_{\infty} \leq C_{0}, \quad\left\|\nabla^{n} f_{j}\right\|_{\infty} \leq C_{0}\left(\lambda_{j}\right)^{n / 2} \leq C_{0} j^{n} \tag{A.5}
\end{equation*}
$$

for all $j \geq 1, n \geq 1$. A straightforward computation provides a formula for the Green function of the Robin Laplacian: Let $K_{R}:[0,1] \times[0,1] \rightarrow \mathbb{R}_{+}$be given by

$$
K_{R}(x, y)=\frac{1}{1+A+B} \begin{cases}(B+1-x)(A+y), & 0 \leq y \leq x \leq 1  \tag{A.6}\\ (B+1-y)(A+x), & 0 \leq x \leq y \leq 1\end{cases}
$$

Denote by $K_{R}$ the integral operator defined by

$$
\left(K_{R} f\right)(x)=\int_{0}^{1} K_{R}(x, y) f(y) d y
$$

Then, $K_{R}=\left(-\Delta_{R}\right)^{-1}$.
Denote by $\mathcal{H}_{R}$ the Hilbert space obtained by completing the space

$$
C_{A, B}^{2}([0,1])=\left\{f \in C^{2}([0,1]):(\nabla f)(0)=A^{-1} f(0),(\nabla f)(1)=-B^{-1} f(1)\right\}
$$

endowed with the scalar product $\langle\cdot, \cdot\rangle_{\mathcal{H}_{R}}$ defined by

$$
\begin{align*}
\langle f, g\rangle_{\mathcal{H}_{R}} & =\left\langle f,\left(-\Delta_{R}\right) g\right\rangle \\
& =\frac{1}{A} f(0) g(0)+\int_{0}^{1}(\nabla f)(x)(\nabla g)(x) d x+\frac{1}{B} f(1) g(1) \tag{A.7}
\end{align*}
$$

Denote by $\|f\|_{\mathcal{H}_{R}}$ the norm induced by the scalar product $\langle\cdot, \cdot\rangle_{\mathcal{H}_{R}}$. We have that

$$
\begin{equation*}
\|f\|_{\mathcal{H}_{R}}^{2}=\sum_{k \geq 1} \lambda_{k}\left\langle f, f_{k}\right\rangle^{2} \tag{A.8}
\end{equation*}
$$

for all $f \in \mathcal{H}_{R}$.
Recall from (3.4) the definition of the Sobolev space $\mathcal{H}^{1}$. The norms $\|\cdot\|_{\mathcal{H}_{R}}$ and $\|\cdot\|_{\mathcal{H}^{1}}$ are equivalent. There exist finite constants $0<C_{1}<C_{2}<\infty$ such that

$$
\begin{equation*}
C_{1}\|f\|_{\mathcal{H}^{1}} \leq\|f\|_{\mathcal{H}_{R}} \leq C_{2}\|f\|_{\mathcal{H}^{1}} \tag{A.9}
\end{equation*}
$$

for all $f \in C^{2}([0,1])$. In particular, the spaces $\mathcal{H}_{R}$ and $\mathcal{H}^{1}$ coincide.
In terms of the eigenfunctions $f_{k}$,

$$
\begin{equation*}
\|f\|_{\mathcal{H}_{R}}^{2}=\sum_{k \geq 1} \lambda_{k}\left|\left\langle f, f_{k}\right\rangle\right|^{2} . \tag{A.10}
\end{equation*}
$$

Moreover, a straightforward computation yields that for all $f \in C_{A, B}^{2}([0,1])$,

$$
\begin{equation*}
\|f\|_{\infty}^{2} \leq 2(A \vee 1)\|f\|_{\mathcal{H}_{R}}^{2} . \tag{A.11}
\end{equation*}
$$

Fix a function $f$ in $\mathcal{H}^{1}$. It is well known that there exists a continuous function $f^{(c)}$ : $[0,1] \rightarrow \mathbb{R}$ (actually Hölder continuous, $\left|f^{(c)}(y)-f^{(c)}(x)\right| \leq\|f\|_{2}|y-x|^{1 / 2}$ ) such that $f=f^{(c)}$ almost surely. Moreover, for all $h \in C^{1}([0,1])$,

$$
\begin{equation*}
\int_{0}^{1} f \nabla h d x=f^{(c)}(1) h(1)-f^{(c)}(0) h(0)-\int_{0}^{1} \nabla f h d x . \tag{A.12}
\end{equation*}
$$

The next result provides an explicit formula for $f^{(c)}$ in terms of the eigenvectors $f_{k}$.
Lemma A.1. There exists a finite constant $C_{0}$ such that

$$
\sum_{k \geq 1}\left|\left\langle f, f_{k}\right\rangle\right| \leq C_{0}\|f\|_{\mathcal{H}_{R}}
$$

for all $f \in \mathcal{H}^{1}$. In particular, $\sum_{k \geq 1}\left\langle f, f_{k}\right\rangle f_{k}(\cdot)$ defines a continuous function, and, for almost all $x \in[0,1]$,

$$
\begin{equation*}
f(x)=\sum_{k \geq 1}\left\langle f, f_{k}\right\rangle f_{k}(x) . \tag{A.13}
\end{equation*}
$$

Proof. By (A.9), $f$ belongs to $\mathcal{H}_{R}$. By Schwarz inequality,

$$
\left(\sum_{k \geq 1}\left|\left\langle f, f_{k}\right\rangle\right|\right)^{2} \leq \sum_{k \geq 1} \lambda_{k}\left|\left\langle f, f_{k}\right\rangle\right|^{2} \sum_{k \geq 1} \frac{1}{\lambda_{k}}
$$

The second sum is finite by (A.3) and the first one is finite by (A.10). This proves the first assertion.

Since each function $f_{k}$ is continuous, and a summable sum of uniformly bounded continuous functions is continuous, $\sum_{k \geq 1}\left\langle f, f_{k}\right\rangle f_{k}(\cdot)$ defines a continuous function. As $\left(f_{k}: k \geq 1\right)$ forms an orthonormal basis of $\mathcal{L}^{2}([0,1]), f=\sum_{k \geq 1}\left\langle f, f_{k}\right\rangle f_{k}$ as an identity in $\mathcal{L}^{2}([0,1])$. In particular, these functions are equal almost everywhere.

Denote by $\left(P_{t}^{(R)}: t \geq 0\right)$ the semigroup in $\mathcal{L}^{2}([0,1])$ generated by the Robin Laplacian: For any function $f \in \mathcal{L}^{2}([0,1]), t>0$,

$$
\begin{equation*}
P_{t}^{(R)} f=\sum_{k \geq 1} e^{-\lambda_{k} t}\left\langle f, f_{k}\right\rangle f_{k} \tag{A.14}
\end{equation*}
$$

In particular, for each $t \geq 0, P_{t}^{(R)}$ is a symmetric operator in $\mathcal{L}^{2}([0,1])$ and $P_{t}^{(R)} f \in C^{\infty}([0,1])$ for all $f \in \mathcal{L}^{2}([0,1])$. Moreover, as $P_{t}^{(R)}$ is symmetric, by (A.10), $P_{t}^{(R)}$ is a contraction in $\mathcal{H}_{R}$
and $\mathcal{L}^{2}([0,1])$ :

$$
\begin{gather*}
\left\|P_{t}^{(R)} f\right\|_{\mathcal{H}_{R}}^{2}=\sum_{k \geq 1} e^{-2 \lambda_{k} t} \lambda_{k}\left|\left\langle f, f_{k}\right\rangle\right|^{2} \leq\|f\|_{\mathcal{H}_{R}}^{2} \\
\left\|P_{t}^{(R)} f\right\|_{2}^{2}=\sum_{k \geq 1} e^{-2 \lambda_{k} t}\left|\left\langle f, f_{k}\right\rangle\right|^{2} \leq\|f\|_{2}^{2} \tag{A.15}
\end{gather*}
$$

Let $f \in \mathcal{L}^{2}([0,1])$ be given by $f=\sum_{k \geq 1}\left\langle f, f_{k}\right\rangle f_{k}$. For each $t>0$, there exists a finite constant $C_{0}(t)$ such that

$$
\begin{equation*}
\left\|P_{t}^{(R)} f\right\|_{\infty}^{2} \leq C_{0}(t)\|f\|_{2}^{2}, \quad\left\|P_{t}^{(R)} f\right\|_{\mathcal{H}_{R}}^{2} \leq C_{0}(t)\|f\|_{2}^{2} . \tag{A.16}
\end{equation*}
$$

Indeed, by (A.10) and since $P_{t}^{(R)}$ is symmetric and $P_{t}^{(R)} f_{k}=e^{-\lambda_{k} t} f_{k}$,

$$
\left\|P_{t}^{(R)} f\right\|_{\mathcal{H}_{R}}^{2}=\sum_{k \geq 1} \lambda_{k} e^{-2 \lambda_{k} t}\left|\left\langle f, f_{k}\right\rangle\right|^{2} \leq C_{0}(t) \sum_{k \geq 1}\left|\left\langle f, f_{k}\right\rangle\right|^{2}=C_{0}(t)\|f\|_{2}^{2}
$$

for some finite constant $C_{0}(t)$. On the other hand, by Schwarz inequality and (A.5),

$$
\left\|P_{t}^{(R)} f\right\|_{\infty}^{2}=\left\|\sum_{k \geq 1} e^{-\lambda_{k} t}\left\langle f, f_{k}\right\rangle f_{k}\right\|_{\infty}^{2} \leq \sum_{k \geq 1} e^{-2 \lambda_{k} t} \sum_{k \geq 1}\left\langle f, f_{k}\right\rangle^{2}=C_{0}(t)\|f\|_{2}^{2}
$$

for some finite constant $C_{0}(t)$.
Lemma A.2. There exists a finite constant $C_{0}$ such that

$$
\left\|P_{t}^{(R)} f-f\right\|_{2} \leq C_{0} t^{1 / 3}\|f\|_{\mathcal{H}_{R}}
$$

for all $t \geq 0, f \in \mathcal{H}_{R}$.
Proof. Since $\left(f_{k}: k \geq 1\right)$ is an orthonormal basis of $\mathcal{L}^{2}([0,1])$,

$$
\left\|P_{t}^{(R)} f-f\right\|_{2}^{2}=\sum_{k \geq 1}\left[e^{-\lambda_{k} t}-1\right]^{2}\left|\left\langle f, f_{k}\right\rangle\right|^{2}
$$

Fix $k_{0} \geq 1$. Since the sequence $\lambda_{k}$ increases, the right-hand side can be bounded by

$$
\left[e^{-\lambda_{k_{0}} t}-1\right]^{2} \sum_{k=1}^{k_{0}-1}\left|\left\langle f, f_{k}\right\rangle\right|^{2}+\frac{1}{\lambda_{k_{0}}} \sum_{k \geq k_{0}} \lambda_{k}\left|\left\langle f, f_{k}\right\rangle\right|^{2} .
$$

The first sum is bounded by $\|f\|_{2}^{2}$. In view of (A.10), the second one is bounded by $\|f\|_{\mathcal{H}_{R}}^{2}$ so that

$$
\left\|P_{t}^{(R)} f-f\right\|_{2}^{2} \leq\left[1-e^{-\lambda_{k_{0}} t}\right]^{2}\|f\|_{2}^{2}+\frac{1}{\lambda_{k_{0}}}\|f\|_{\mathcal{H}_{R}}^{2}
$$

As $1-e^{-x} \leq x, x>0$, and since, by (A.9), $\|f\|_{2} \leq C_{0}\|f\|_{\mathcal{H}_{R}}$ for some finite constant $C_{0}$,

$$
\left\|P_{t}^{(R)} f-f\right\|_{2}^{2} \leq\left\{C_{0}\left(\lambda_{k_{0}} t\right)^{2}+\frac{1}{\lambda_{k_{0}}}\right\}\|f\|_{\mathcal{H}_{R}}^{2}
$$

To complete the proof, it remains to choose $k_{0}$ such that $\lambda_{k_{0}}^{-3} \sim t^{2}$.
Lemma A.3. There exists a finite constant $C_{0}$ such that

$$
\left\|P_{t}^{(R)} f-f\right\|_{\infty} \leq C_{0} t^{1 / 5}\|f\|_{\mathcal{H}_{R}}
$$

for all $t \geq 0, f \in C([0,1]) \cap \mathcal{H}_{R}$.

Proof. Fix $x \in[0,1]$. Since $f$ is continuous, by (A.13) and (A.5),

$$
\left\{P_{t}^{(R)} f(x)-f(x)\right\}^{2} \leq C_{0}^{2}\left(\sum_{k \geq 1}\left[1-e^{-\lambda_{k} t}\right]\left|\left\langle f, f_{k}\right\rangle\right|\right)^{2}
$$

for some finite constant $C_{0}$. By Schwarz inequality and (A.10), the right-hand side is bounded by

$$
C_{0}^{2} \sum_{k \geq 1} \frac{1}{\lambda_{k}}\left[1-e^{-\lambda_{k} t}\right]^{2} \sum_{k \geq 1} \lambda_{k}\left|\left\langle f, f_{k}\right\rangle\right|^{2}=C_{0}^{2} \sum_{k \geq 1} \frac{1}{\lambda_{k}}\left[1-e^{-\lambda_{k} t}\right]^{2}\|f\|_{\mathcal{H}_{R}}^{2} .
$$

It remains to estimate the sum. Fix $k_{0} \geq 1$. Since the sequence $\lambda_{k}$ increases, as $1-e^{-x} \leq x$, $x>0$, by (A.3), the sum is less than or equal to

$$
C\left[1-e^{-\lambda_{k_{0}} t}\right]^{2}+\sum_{k \geq k_{0}} \frac{1}{\lambda_{k}} \leq C\left\{\left(k_{0}^{2} t\right)^{2}+\frac{1}{k_{0}}\right\}
$$

for some finite constant $C$. It remains to choose $k_{0}$ such that $k_{0}^{5} \sim t^{-2}$.
Appendix B. Initial-value problems with Robin boundary conditions
We present in this section some result on the initial-boundary value problems (2.6), (7.2). Recall the definition of the Sobolev space $\mathcal{H}^{1}$ introduced in (3.4). Fix a function $\phi \in \mathcal{L}^{2}([0,1])$, and consider the initial-boundary problem

$$
\left\{\begin{array}{l}
\partial_{t} u=\Delta u  \tag{B.1}\\
(\nabla u)(t, 0)=A^{-1} u(t, 0) \\
(\nabla u)(t, 1)=-B^{-1} u(t, 1) \\
u(0, \cdot)=\phi(\cdot)
\end{array}\right.
$$

Definition B.1. A function $u$ in $\mathcal{L}^{2}\left(0, T ; \mathcal{H}^{1}\right)$ is said to be a generalized solution in the cylinder $[0, T] \times[0,1]$ of the equation (B.1) if

$$
\begin{aligned}
& \int_{0}^{1} u_{t} H_{t} d x-\int_{0}^{1} \phi H_{0} d x-\int_{0}^{t} d s \int_{0}^{1} u_{s} \partial_{s} H_{s} d x \\
& \quad=-\int_{0}^{t} d s \int_{0}^{1} \nabla u_{s} \nabla H_{s} d x-\int_{0}^{t}\left\{\frac{1}{B} u_{s}(1) H_{s}(1)+\frac{1}{A} u_{s}(0) H_{s}(0)\right\} d s
\end{aligned}
$$

for every $0<t \leq T$, function $H$ in $C^{1,2}([0, T] \times[0,1])$.
Next result is proved in [1]. We present it here in sake of completeness.
Theorem B.2. For each $\phi \in \mathcal{L}^{2}([0,1])$, there exists one and only one generalized solution to (B.1). The solution is smooth in $(0, \infty) \times[0,1]$ and can be represented as $u(t, x)=\left(P_{t}^{(R)} \phi\right)(x)$, where $P_{t}^{(R)}$ is the semigroup associated to the Robin Laplacian. Moreover,

$$
\begin{equation*}
\min \{0, \operatorname{ess} \inf \phi\} \leq u(t, x) \leq \max \{0, \operatorname{ess} \sup \phi\} \tag{B.2}
\end{equation*}
$$

for all $(t, x) \in \mathbb{R}_{+} \times[0,1]$. Finally, if $\phi(x) \leq b$ for some $b>0$, then, for each $t_{0}>0$ there exists $\varepsilon>0$ such that $u(t, x) \leq b-\varepsilon$ for all $(t, x) \in\left[t_{0}, \infty\right) \times[0,1]$. Analogously, if $\phi(x) \geq a$ for some $a<0$, then, for each $t_{0}>0$ there exists $\varepsilon>0$ such that $u(t, x) \geq a+\varepsilon$ for all $(t, x) \in\left[t_{0}, \infty\right) \times[0,1]$.

Proof. Existence and uniqueness of generalized solutions, as well as their representation in terms of the semigroup $P_{t}^{(R)}$ is the content of Theorems 1 and 3 in [26, Section VI.2].

We turn to (B.2). Assume first that $\phi$ belongs to $\mathcal{H}^{1}$. By (A.9), $\phi \in \mathcal{H}_{R}$, and, by Lemma A.3, $u(t)$ converges to $\phi$ in $\mathcal{L}^{\infty}([0,1])$ as $t \rightarrow 0$. Since the solution is smooth in $(0, \infty) \times[0,1]$, by the maximum principle stated in Theorems 2 and 3 of [27, Chapter 3],

$$
\min \left\{0, \inf _{0 \leq y \leq 1} u\left(t_{0}, y\right)\right\} \leq u(t, x) \leq \max \left\{0, \sup _{0 \leq y \leq 1} u\left(t_{0}, y\right)\right\}
$$

for all $(t, x) \in\left[t_{0}, \infty\right) \times[0,1]$. Letting $t_{0} \rightarrow 0$, as $u\left(t_{0}\right)$ converges to $\phi$ in $\mathcal{L}^{\infty}([0,1])$, yields (B.2).

To extend this result to $\phi \in \mathcal{L}^{2}([0,1])$, we consider a sequence $\phi_{n} \in \mathcal{H}^{1}$ which converges to $\phi$ in $\mathcal{L}^{2}([0,1])$ and such that essinf $\phi \leq \phi_{n}(x) \leq \operatorname{ess} \sup \phi$ for all $0 \leq x \leq 1$. Denote by $u^{n}$ the solution of (B.1) with initial condition $\phi_{n}$. Fix $t>0$. By the result for initial conditions in $\mathcal{H}^{1}$,

$$
\begin{aligned}
& \min \{0, \operatorname{ess} \inf \phi\} \leq \min \left\{0, \inf _{0 \leq y \leq 1} \phi_{n}(y)\right\} \\
& \quad \leq u^{n}(t, x) \leq \max \left\{0, \sup _{0 \leq y \leq 1} \phi_{n}(y)\right\} \leq \max \{0, \operatorname{ess} \sup \phi\}
\end{aligned}
$$

for all $0 \leq x \leq 1$. By (A.16), $u^{n}(t)$ converges to $u(t)$ in $\mathcal{L}^{\infty}([0,1])$. This completes the proof of (B.2).

Assume that $\phi(x) \leq b$ for some $b>0$. By (B.2), $u(t, x) \leq b$ for all $t \geq 0,0 \leq x \leq 1$. Fix $t_{0}>0$, and assume that $\max _{0 \leq x \leq 1} u\left(t_{0}, x\right)=b$. As $b>0$, the boundary conditions imply that the maximum cannot be attained at the boundary. On the other hand, if it is attained at the interior, by Theorem 2 of [27, Chapter 3] and by the smoothness of the solution, $u(t, x)=b$ for all $(t, x) \in\left(0, t_{0}\right] \times[0,1]$. This is not possible at the boundary. Therefore, $\max _{0 \leq x \leq 1} u\left(t_{0}, x\right)<b$. By the maximum principle, this bound can be extended to all $(t, x) \in\left[t_{0}, \infty\right) \times[0,1]$. The same argument applies to the lower bound.

Let $\bar{\rho} \in \mathcal{M}_{\mathrm{ac}}$ be the unique stationary solution of the equation (2.6). That, is $\bar{\rho}$ is the solution of the elliptic equation

$$
\left\{\begin{array}{l}
\Delta \rho=0  \tag{B.3}\\
(\nabla \rho)(0)=A^{-1}[\rho(0)-\alpha] \\
(\nabla \rho)(1)=B^{-1}[\beta-\rho(1)]
\end{array}\right.
$$

An elementary computation yields that $\bar{\rho}$ is given by

$$
\bar{\rho}(x)=\frac{\alpha(1+B)+\beta A}{1+B+A}+\frac{(\beta-\alpha) x}{1+B+A} .
$$

Note that $\bar{\rho}$ is the linear interpolation between $\bar{\rho}(-A)=\alpha$ and $\bar{\rho}(1+B)=\beta$.
Definition B.3. Fix $\gamma:[0,1] \rightarrow[0,1]$. A function $u$ in $\mathcal{L}^{2}\left(0, T ; \mathcal{H}^{1}\right)$ is said to be a generalized solution in the cylinder $[0, T] \times[0,1]$ of the equation (2.6) if $u(t, x)-\bar{\rho}$ is a generalized solution of the initial-boundary problem (B.1) with initial condition $\gamma-\bar{\rho}$.

Therefore, a function $u$ in $\mathcal{L}^{2}\left(0, T ; \mathcal{H}^{1}\right)$ is a generalized solution in the cylinder $[0, T] \times[0,1]$ of the equation (2.6) if

$$
\begin{aligned}
& \int_{0}^{1} u_{t} H_{t} d x-\int_{0}^{1} \gamma H_{0} d x-\int_{0}^{t} d s \int_{0}^{1} u_{s} \partial_{s} H_{s} d x=-\int_{0}^{t} d s \int_{0}^{1} \nabla u_{s} \nabla H_{s} d x \\
& \quad-\int_{0}^{t}\left\{\frac{1}{B}\left[u_{s}(1)-\beta\right] H_{s}(1)+\frac{1}{A}\left[u_{s}(0)-\alpha\right] H_{s}(0)\right\} d s
\end{aligned}
$$

for every $0<t \leq T$, function $H$ in $C^{1,2}([0, T] \times[0,1])$.
Theorem B.4. Fix $\gamma:[0,1] \rightarrow[0,1]$. There exists a unique generalized solution of (2.6).
The solution is smooth in $(0, T] \times[0,1]$ and satisfies the bounds

$$
\begin{equation*}
\min \{\alpha, \operatorname{ess} \inf \gamma\} \leq u(t, x) \leq \max \{\beta, \operatorname{ess} \sup \gamma\} \tag{B.4}
\end{equation*}
$$

for all $(t, x) \in[0, T] \times[0,1]$. Moreover, for all $0<t_{0} \leq T$ there exists $\varepsilon>0$ such that $\varepsilon \leq u(t, x) \leq 1-\varepsilon$ for all $(t, x) \in\left[t_{0}, T\right] \times[0,1]$.

Proof. The proof of this result is similar to the one of Theorem B.2.
Fix $\gamma:[0,1] \rightarrow[0,1]$, and denote by $u^{(\gamma)}$ the unique weak solution of (2.6) with initial condition $\gamma$.
Lemma B.5. There exists a finite constant $C_{0}$, which depends only on $\alpha, \beta, A, B$ such that

$$
\begin{aligned}
& \int_{0}^{t} d s \int_{0}^{1} \frac{\left(\nabla u_{s}\right)^{2}}{\sigma\left(u_{s}\right)} d x+\frac{1}{A} \int_{0}^{t}\left|\left[u_{s}(0)-\alpha\right] \log \frac{u_{s}(0)}{1-u_{s}(0)}\right| d s \\
& \quad+\frac{1}{B} \int_{0}^{t}\left|\left[u_{s}(1)-\beta\right] \log \frac{u_{s}(1)}{1-u_{s}(1)}\right| d s \leq C_{0} t+\int_{0}^{1} F_{0}(\gamma) d x-\int_{0}^{1} F_{0}\left(u_{t}\right) d x
\end{aligned}
$$

for all $t>0$ and all $\gamma:[0,1] \rightarrow[0,1]$.
Proof. Fix $F \in C^{2}([0,1])$, an initial profile $\gamma:[0,1] \rightarrow[0,1]$, and denote by $u$ the solution of (2.6). Since $u$ is smooth on $(0, \infty) \times[0,1]$, integrating by parts and in view of the boundary conditions, for all $0<\delta<t<\infty$,

$$
\begin{aligned}
& \int_{0}^{1} F\left(u_{t}\right) d x-\int_{0}^{1} F\left(u_{\delta}\right) d x=-\int_{\delta}^{t} d s \int_{0}^{1} F^{\prime \prime}\left(u_{s}\right)\left(\nabla u_{s}\right)^{2} d x \\
& -\int_{\delta}^{t} \frac{1}{A}\left[u_{s}(0)-\alpha\right] F^{\prime}\left(u_{s}(0)\right) d s-\int_{\delta}^{t} \frac{1}{B}\left[u_{s}(1)-\beta\right] F^{\prime}\left(u_{s}(1)\right) d s
\end{aligned}
$$

As $u_{\delta}$ converges to $\gamma$ in $\mathcal{L}^{2}([0,1])$, letting $\delta \rightarrow 0$ yields that for all $t>0$,

$$
\begin{aligned}
& \int_{0}^{t} d s \int_{0}^{1} F^{\prime \prime}\left(u_{s}\right)\left(\nabla u_{s}\right)^{2} d x+\int_{0}^{t} \frac{1}{A}\left[u_{s}(0)-\alpha\right] F^{\prime}\left(u_{s}(0)\right) d s \\
& \quad+\int_{0}^{t} \frac{1}{B}\left[u_{s}(1)-\beta\right] F^{\prime}\left(u_{s}(1)\right) d s=\int_{0}^{1} F(\gamma) d x-\int_{0}^{1} F\left(u_{t}\right) d x
\end{aligned}
$$

Since for each $t>0$, there exists $\varepsilon>0$ such that $\varepsilon \leq u(s, x) \leq 1-\varepsilon$ for all $(s, x) \in[t, \infty) \times$ $[0,1]$, the previous argument can be applied to the function $F_{0}(r)=r \log r+(1-r) \log (1-r)$.

It yields that

$$
\begin{align*}
& \int_{0}^{t} d s \int_{0}^{1} \frac{\left(\nabla u_{s}\right)^{2}}{\sigma\left(u_{s}\right)} d x+\int_{0}^{t} \frac{1}{A}\left[u_{s}(0)-\alpha\right] \log \frac{u_{s}(0)}{1-u_{s}(0)} d s \\
& \quad+\int_{0}^{t} \frac{1}{B}\left[u_{s}(1)-\beta\right] \log \frac{u_{s}(1)}{1-u_{s}(1)} d s=\int_{0}^{1} F_{0}(\gamma) d x-\int_{0}^{1} F_{0}\left(u_{t}\right) d x \tag{B.5}
\end{align*}
$$

for all $t>0$. Clearly, for each $\varrho>0$, the function $f_{\varrho}:(0,1) \rightarrow \mathbb{R}$ defined by $f_{\varrho}(r)=$ $[r-\varrho] \log [r /(1-r)]$ is bounded below by a finite constant, say $-c_{1}(\varrho)<0$. Hence, $\left|f_{\varrho}(r)\right| \leq f_{\varrho}(r)+2 c_{1}$. Therefore, there exists a finite constant $C_{0}=C_{0}(A, B, \alpha, \beta)$ such that

$$
\begin{aligned}
& \int_{0}^{t} d s \int_{0}^{1} \frac{\left(\nabla u_{s}\right)^{2}}{\sigma\left(u_{s}\right)} d x+\frac{1}{A} \int_{0}^{t}\left|\left[u_{s}(0)-\alpha\right] \log \frac{u_{s}(0)}{1-u_{s}(0)}\right| d s \\
& \quad+\frac{1}{B} \int_{0}^{t}\left|\left[u_{s}(1)-\beta\right] \log \frac{u_{s}(1)}{1-u_{s}(1)}\right| d s \leq C_{0} t+\int_{0}^{1} F_{0}(\gamma) d x-\int_{0}^{1} F_{0}\left(u_{t}\right) d x
\end{aligned}
$$

for all $t>0$, as claimed.

As $u_{t}$ converges to $\gamma$ in $\mathcal{L}^{2}([0,1])$, letting $t \rightarrow 0$ in the previous lemma yields that

$$
\begin{align*}
\lim _{t \rightarrow 0}\left\{\int_{0}^{t} d s \int_{0}^{1} \frac{\left(\nabla u_{s}\right)^{2}}{\sigma\left(u_{s}\right)} d x+\frac{1}{A}\right. & \int_{0}^{t}\left|\left[u_{s}(0)-\alpha\right] \log \frac{u_{s}(0)}{1-u_{s}(0)}\right| d s \\
& \left.+\frac{1}{B} \int_{0}^{t}\left|\left[u_{s}(1)-\beta\right] \log \frac{u_{s}(1)}{1-u_{s}(1)}\right| d s\right\}=0 \tag{B.6}
\end{align*}
$$

Definition B.6. Fix $H \in C^{0,1}([0, T] \times[0,1])$. A function $u$ in $\mathcal{L}^{2}\left(0, T ; \mathcal{H}^{1}\right)$ such that $0 \leq u \leq 1$ a.e. is said to be a generalized solution in the cylinder $[0, T] \times[0,1]$ of the equation (7.2) if

$$
\begin{align*}
& \int_{0}^{1} u_{t} G_{t} d x-\int_{0}^{1} \gamma G_{0} d x-\int_{0}^{t} d s \int_{0}^{1} u_{s} \partial_{s} G_{s} d x \\
& \quad=\int_{0}^{t} d s \int_{0}^{1}\left\{-\nabla u_{s} \nabla G_{s}+2 \sigma\left(u_{s}\right) \nabla H_{s} \nabla G_{s}\right\} d x  \tag{B.7}\\
& \quad+\int_{0}^{t}\left\{\mathfrak{p}_{\beta, B}\left(u_{s}(1), H_{s}(1)\right) G_{s}(1)+\mathfrak{p}_{\alpha, A}\left(u_{s}(0), H_{s}(0)\right) G_{s}(0)\right\} d s
\end{align*}
$$

for every $0<t \leq T$ and function $G$ in $C^{1,2}([0, T] \times[0,1])$.
Theorem B.7. Fix $\gamma:[0,1] \rightarrow[0,1]$ and $H$ in $C^{0,1}([0, T] \times[0,1])$. There exists a unique weak solution of (7.2).

Proof. Existence follows from the hydrodynamic limit of the WASEP. Uniqueness is based on the energy estimate. Fix two initial conditions $\gamma^{(1)}, \gamma^{(2)}$, and denote by $u^{(1)}, u^{(2)}$ two weak solutions of (7.2) with initial conditions $\gamma^{(1)}, \gamma^{(2)}$, respectively.

Before presenting a rigorous argument we provide an heuristic one. Approximate $w=$ $u^{(2)}-u^{(1)}$ by a sequence of functions $G$ in $C^{1,2}([0, T] \times[0,1])$. By (B.7), for all $0<t \leq T$,

$$
\begin{align*}
& \frac{1}{2} \int_{0}^{1} w_{t}^{2} d x-\frac{1}{2} \int_{0}^{1}\left[\gamma^{(2)}-\gamma^{(1)}\right]^{2} d x+\int_{0}^{t} d s \int_{0}^{1}\left(\nabla w_{s}\right)^{2} d x \\
& \quad=2 \int_{0}^{t} d s \int_{0}^{1}\left[\sigma\left(u_{s}^{(2)}\right)-\sigma\left(u_{s}^{(1)}\right)\right] \nabla H_{s} \nabla w_{s} d x  \tag{B.8}\\
& \quad-\int_{0}^{t}\left\{w_{s}(1)^{2} \overline{\mathfrak{p}}_{\beta, B}\left(H_{s}(1)\right)+w_{s}(0)^{2} \overline{\mathfrak{p}}_{\alpha, A}\left(H_{s}(0)\right)\right\} d s
\end{align*}
$$

where $\overline{\mathfrak{p}}_{\varrho, D}(M)=D^{-1}\left\{\varrho e^{M}+(1-\varrho) e^{-M}\right\}$. As $\overline{\mathfrak{p}}_{\varrho, D}(M) \geq 0$, the last integral is negative. Therefore, by Young's inequality $2 x y \leq a x^{2}+a^{-1} x^{2}$, and since $\nabla H$ is uniformly bounded and $\sigma$ Lipschitz continuous,

$$
\begin{aligned}
& \frac{1}{2} \int_{0}^{1} w_{t}^{2} d x-\frac{1}{2} \int_{0}^{1}\left[\gamma^{(2)}-\gamma^{(1)}\right]^{2} d x+\frac{1}{2} \int_{0}^{t} d s \int_{0}^{1}\left(\nabla w_{s}\right)^{2} d x \\
& \quad \leq C_{0}(H) \int_{0}^{t} d s \int_{0}^{1} w_{s}^{2} d x
\end{aligned}
$$

for some finite constant $C_{0}(H)$ which depends on $H$. It remains to apply Gronwal inequality to conclude that

$$
\int_{0}^{1} w_{t}^{2} d x \leq e^{C_{0} t} \int_{0}^{1}\left[\gamma^{(2)}-\gamma^{(1)}\right]^{2} d x
$$

which yields uniqueness.
We turn to a rigorous proof. Recall the notation introduced in the proof of Lemma 3.3. Fix a smooth function $F: \mathbb{R} \rightarrow \mathbb{R}$ and recall that $w=u^{(2)}-u^{(1)}$. As $w^{\varepsilon, \delta}$ is a smooth function, for $0<t \leq T$,

$$
\left\langle F\left(w_{t}^{\varepsilon, \delta}\right)\right\rangle-\left\langle F\left(w_{0}^{\varepsilon, \delta}\right)\right\rangle=\int_{0}^{t} d s \int_{0}^{1} F^{\prime}\left(w_{s}^{\varepsilon, \delta}\right) \partial_{s} w_{s}^{\varepsilon, \delta} d x .
$$

Integrating by parts, the right-hand side becomes

$$
\int_{0}^{1} w_{t}^{\varepsilon, \delta} F^{\prime}\left(w_{t}^{\varepsilon, \delta}\right) d x-\int_{0}^{1} w_{0}^{\varepsilon, \delta} F^{\prime}\left(w_{0}^{\varepsilon, \delta}\right) d x-\int_{0}^{t} d s \int_{0}^{1} w_{s}^{\varepsilon, \delta} \partial_{s} F^{\prime}\left(w_{s}^{\varepsilon, \delta}\right) d x
$$

By Lemma 3.3, actually its proof since we changed the definition of $w^{\varepsilon}$, this expression is equal to

$$
\begin{equation*}
\int_{0}^{1} w_{t} F^{\prime}\left(w_{t}^{\varepsilon, \delta}\right)^{\varepsilon, \delta} d x-\int_{0}^{1} w_{0} F^{\prime}\left(w_{0}^{\varepsilon, \delta}\right)^{\varepsilon, \delta} d x-\int_{0}^{t} d s \int_{0}^{1} w_{s} \partial_{s}\left[F^{\prime}\left(w_{s}^{\varepsilon, \delta}\right)^{\varepsilon, \delta}\right] d x+R_{\varepsilon, \delta}, \tag{B.9}
\end{equation*}
$$

where for all $\varepsilon>0, \lim _{\delta \rightarrow 0} R_{\varepsilon, \delta}=0$.
Take $F(a)=(1 / 2) a^{2}$. Let $\phi^{(2)}$ be the convolution of $\phi$ with itself:

$$
\phi^{(2)}(t)=\int_{\mathbb{R}} \phi(t-s) \phi(s) d s
$$

and set $\phi_{\delta}^{(2)}(t)=\delta^{-1} \phi^{(2)}(t / \delta)$. Since $P_{t}^{(R)}$ is a semigroup and since $P_{t}^{(R)}$ comutes with the time convolution, for any function $f \in \mathcal{L}^{2}([0, T] \times[0,1])$,

$$
\left(f^{\varepsilon, \delta}\right)^{\varepsilon, \delta}(t, x)=\int_{\mathbb{R}}\left[P_{2 \varepsilon}^{(R)} f(t+s)\right](x) \phi_{\delta}^{(2)}(s) d s .
$$

Therefore, the first three terms of (B.9) are equal to

$$
\int_{0}^{1} w_{t} w_{t}^{2 \varepsilon, \delta} d x-\int_{0}^{1} w_{0} w_{0}^{2 \varepsilon, \delta} d x-\int_{0}^{t} d s \int_{0}^{1} w_{s} \partial_{s} w_{s}^{2 \varepsilon, \delta} d x
$$

with the convention, starting from this equation and up to the end of the proof, that the superscript $\delta$ represent now convolution with $\phi_{\delta}^{(2)}$ instead of $\phi_{\delta}$.

By (B.7), this sum is equal to

$$
\begin{aligned}
& \int_{0}^{t} d s \int_{0}^{1}\left\{-\nabla w_{s} \nabla w_{s}^{2 \varepsilon, \delta}+2\left\{\sigma\left(u_{s}^{(2)}\right)-\sigma\left(u_{s}^{(1)}\right)\right\} \nabla H_{s} \nabla w_{s}^{2 \varepsilon, \delta}\right\} d x \\
& \quad-\int_{0}^{t}\left\{\overline{\mathfrak{p}}_{\beta, B}\left(H_{s}(1)\right) w_{s}(1) w_{s}^{2 \varepsilon, \delta}(1)+\overline{\mathfrak{p}}_{\alpha, A}\left(H_{s}(0)\right) w_{s}(0) w_{s}^{2 \varepsilon, \delta}(0)\right\} d s
\end{aligned}
$$

where $\overline{\mathfrak{p}}_{\varrho, D}(M)$ has been introduced in (B.8). By (A.16), (A.9), for each $\varepsilon>0, \nabla w^{2 \varepsilon}$ belongs to $\mathcal{L}^{2}([0, T] \times[0,1])$. Therefore, as $\delta \rightarrow 0, \nabla w^{2 \varepsilon, \delta}=\left(\nabla w^{2 \varepsilon}\right)^{\delta} \rightarrow \nabla w^{2 \varepsilon}$ in $\mathcal{L}^{2}([0, T] \times[0,1])$.

On the other hand, by (A.7) and (A.9),

$$
\left|w_{t}^{2 \varepsilon, \delta}(1)-w_{t}^{2 \varepsilon}(1)\right|^{2} \leq C_{0}\left\|w_{t}^{2 \varepsilon, \delta}-w_{t}^{2 \varepsilon}\right\|_{\mathcal{H}^{1}}^{2}
$$

for some finite constant $C_{0}$ independent of $\varepsilon$ and $t$. A similar inequality holds at $x=0$. Therefore, as $\nabla w^{2 \varepsilon, \delta} \rightarrow \nabla w^{2 \varepsilon}$ in $\mathcal{L}^{2}([0, T] \times[0,1])$ as $\delta \rightarrow 0, w_{t}^{2 \varepsilon, \delta}(1) \rightarrow w_{t}^{2 \varepsilon}(1)$ in $\mathcal{L}^{2}([0, T])$ as $\delta \rightarrow 0$. In conclusion, letting $\delta \rightarrow 0$, the sum appearing in the penultimate displayed equation converges to

$$
\begin{aligned}
& \int_{0}^{t} d s \int_{0}^{1}\left\{-\nabla w_{s} \nabla w_{s}^{2 \varepsilon}+2\left\{\sigma\left(u_{s}^{(2)}\right)-\sigma\left(u_{s}^{(1)}\right)\right\} \nabla H_{s} \nabla w_{s}^{2 \varepsilon}\right\} d x \\
& \quad-\int_{0}^{t}\left\{\overline{\mathfrak{p}}_{\beta, B}\left(H_{s}(1)\right) w_{s}(1) w_{s}^{2 \varepsilon}(1)+\overline{\mathfrak{p}}_{\alpha, A}\left(H_{s}(0)\right) w_{s}(0) w_{s}^{2 \varepsilon}(0)\right\} d s
\end{aligned}
$$

By the first assertion of Lemma 3.2, as $\varepsilon \rightarrow 0, \nabla w^{2 \varepsilon}$ converges to $\nabla w$ in $\mathcal{L}^{2}([0, T] \times[0,1])$. Therefore, as $\varepsilon \rightarrow 0$, the first line converges to

$$
\int_{0}^{t} d s \int_{0}^{1}\left\{-\nabla w_{s} \nabla w_{s}+2\left[\sigma\left(u_{s}^{(2)}\right)-\sigma\left(u_{s}^{(1)}\right)\right] \nabla H_{s} \nabla w_{s}\right\} d x .
$$

On the other hand, as $w \in \mathcal{L}^{2}\left(0, T ; \mathcal{H}^{1}\right)$, by Lemma A.3, $w_{t}^{\varepsilon}(1) \rightarrow w_{t}(1)$ in $\mathcal{L}^{2}([0, T])$. Hence, by the dominated convergence theorem, as $\varepsilon \rightarrow 0$, the second line converges to

$$
-\int_{0}^{t}\left\{\overline{\mathfrak{p}}_{\beta, B}\left(H_{s}(1)\right) w_{s}(1)^{2}+\overline{\mathfrak{p}}_{\alpha, A}\left(H_{s}(0)\right) w_{s}(0)^{2}\right\} d s
$$

This proves that equation (B.8) is in force and completes the proof of the theorem.
We conclude this section with a heat equation with mixed boundary equations. Fix a function $\phi \in \mathcal{L}^{2}([0,1])$, and consider the initial-boundary problem

$$
\left\{\begin{array}{l}
\partial_{t} u=\Delta u  \tag{B.10}\\
(\Delta u)(t, 0)=A^{-1} \nabla u(t, 0) \\
(\Delta u)(t, 1)=-B^{-1} \nabla u(t, 1) \\
u(0, \cdot)=\phi(\cdot)
\end{array}\right.
$$

One can define generalized solutions of this problem as in Definition B. 1 and prove existence and uniqueness as stated in Theorem B.2. The solution can be represented as $u_{t}=P_{t}^{(M)} \phi$, where $\left(P_{t}^{(M)}: t \geq 0\right)$ represents the semigroup associated to the Laplacian with boundary conditions

$$
(\Delta f)(0)=A^{-1}(\nabla f)(0), \quad(\Delta f)(1)=-B^{-1}(\nabla f)(1)
$$

Denote this operator by $\Delta_{M}$. An elementary computation shows that the eigenvalues of $\Delta_{M}$ coincide with those of $\Delta_{R}$.

We claim that for all $s \geq 0$ and function $f$ in $C^{1}([0,1])$,

$$
\begin{equation*}
\nabla P_{s}^{(R)} f=P_{s}^{(M)} \nabla f \tag{B.11}
\end{equation*}
$$

To check this identity, fix $f$ in $C^{1}([0,1])$, and let $u_{s}:=P_{s}^{(R)} f$. Clearly $u_{s}$ is the solution of (B.1) with initial condition $u_{0}=f$. Let $v_{s}:=\nabla u_{s}$, Then, $v_{s}$ solves (B.10) initial condition $v_{0}=\nabla f$. Hence, $v_{s}$ can be represented as $v_{s}=P_{s}^{(M)} \nabla f$, that is, $P_{s}^{(M)} \nabla f=v_{s}=\nabla u_{s}=\nabla P_{s}^{(R)} f$, as claimed.
Acknowledgment. T. F. has been partially supported by the CNPq Bolsa de Produtividade em Pesquisa PQ 301269/2018-1. P.G. thanks FCT/Portugal for financial support through the project UID/MAT/04459/2013. This project has received funding from the European Research Council (ERC) under the European Union's Horizon 2020 research and innovative programme (grant agreement n. 715734). C. L. has been partially supported by FAPERJ CNE E-26/201.207/2014, by CNPq Bolsa de Produtividade em Pesquisa PQ 303538/20147, by ANR-15-CE40-0020-01 LSD of the French National Research Agency. A. N. has been partially supported by the CNPq Bolsa de Produtividade em Pesquisa PQ 310589/2018-5.
