#### Abstract

Let $\mathcal{F}, \mathcal{G}$ be two cross-intersecting families of $k$-subsets of $\{1,2, \ldots, n\}$. Let $\mathcal{F} \wedge \mathcal{G}$, $\mathcal{I}(\mathcal{F}, \mathcal{G})$ denote the families of all intersections $F \cap G$ with $F \in \mathcal{F}, G \in \mathcal{G}$, and all distinct intersections $F \cap G$ with $F \neq G, F \in \mathcal{F}, G \in \mathcal{G}$, respectively. For a fixed $T \subset$ $\{1,2, \ldots, n\}$, let $\mathcal{S}_{T}$ be the family of all $k$-subsets of $\{1,2, \ldots, n\}$ containing $T$. In the present paper, we show that $|\mathcal{F} \wedge \mathcal{G}|$ is maximized when $\mathcal{F}=\mathcal{G}=\mathcal{S}_{\{1\}}$ for $n \geq 2 k^{2}+8 k$, while surprisingly $|\mathcal{I}(\mathcal{F}, \mathcal{G})|$ is maximized when $\mathcal{F}=\mathcal{S}_{\{1,2\}} \cup \mathcal{S}_{\{3,4\}} \cup \mathcal{S}_{\{1,4,5\}} \cup \mathcal{S}_{\{2,3,6\}}$ and $\mathcal{G}=\mathcal{S}_{\{1,3\}} \cup \mathcal{S}_{\{2,4\}} \cup \mathcal{S}_{\{1,4,6\}} \cup \mathcal{S}_{\{2,3,5\}}$ for $n \geq 100 k^{2}$. The maximum number of distinct intersections in a $t$-intersecting family is determined for $n \geq 3(t+2)^{3} k^{2}$ as well.

## 1 Introduction

Let $n, k$ be positive integers and let $[n]=\{1,2, \ldots, n\}$ denote the standard $n$-element set. Let $\binom{[n]}{k}$ denote the collection of all $k$-subsets of $[n]$. Subsets of $\binom{[n]}{k}$ are called $k$-uniform hypergraphs or $k$-graphs for short. A $k$-graph $\mathcal{F}$ is called intersecting if $F \cap F^{\prime} \neq \emptyset$ for all $F, F^{\prime} \in \mathcal{F}$. For a fixed set $T \subset[n]$, define the $T$-star $\mathcal{S}_{T}$ by $\mathcal{S}_{T}=\left\{S \in\binom{[n]}{k}: T \subset S\right\}$. We often write $\mathcal{S}_{p}, \mathcal{S}_{p q}$ and $\mathcal{S}_{p q r}$ for $\mathcal{S}_{\{p\}}, \mathcal{S}_{\{p, q\}}$ and $\mathcal{S}_{\{p, q, r\}}$, respectively. One of the most fundamental theorems in extremal set theory is the following:

Erdős-Ko-Rado Theorem ([1]). Suppose that $n \geq 2 k$ and $\mathcal{F} \subset\binom{[n]}{k}$ is intersecting. Then

$$
\begin{equation*}
|\mathcal{F}| \leq\binom{ n-1}{k-1} \tag{1}
\end{equation*}
$$

Hilton and Milner [6] proved that $\mathcal{S}_{1}$ is the only family that achieves equality in (1) up to isomorphism for $n>2 k$.

Two families $\mathcal{F}, \mathcal{G} \subset\binom{[n]}{k}$ are called cross-intersecting if any two sets $F \in \mathcal{F}, G \in \mathcal{G}$ have non-empty intersection. If $\mathcal{A} \subset\binom{[n]}{k}$ is intersecting, then $\mathcal{F}=\mathcal{A}, \mathcal{G}=\mathcal{A}$ are crossintersecting. Therefore the following result is a strengthening of (11).

Theorem 1.1 ([7]). Suppose that $n \geq 2 k$ and $\mathcal{F}, \mathcal{G} \subset\binom{[n]}{k}$ are cross-intersecting. Then

$$
\begin{equation*}
|\mathcal{F}||\mathcal{G}| \leq\binom{ n-1}{k-1}^{2} \tag{2}
\end{equation*}
$$

Let us introduce the central notion of the present paper.
Definition 1.2. For $\mathcal{F}, \mathcal{G} \subset\binom{[n]}{k}$ define

$$
\mathcal{F} \wedge \mathcal{G}=\{F \cap G: F \in \mathcal{F}, G \in \mathcal{G}\} \text { and } \mathcal{I}(\mathcal{F}, \mathcal{G})=\{F \cap G: F \in \mathcal{F}, G \in \mathcal{G}, F \neq G\}
$$

Clearly $\mathcal{F} \wedge \mathcal{G}=(\mathcal{F} \cap \mathcal{G}) \cup \mathcal{I}(\mathcal{F}, \mathcal{G})$. For $\mathcal{F}=\mathcal{G}$, we often write $\mathcal{I}(\mathcal{F})$ instead of $\mathcal{I}(\mathcal{F}, \mathcal{F})$.
The first result of the present paper shows another extremal property of the full star.
Theorem 1.3. Suppose that $n \geq 2 k^{2}+8 k, \mathcal{F}, \mathcal{G} \subset\binom{[n]}{k}$ are cross-intersecting. Then

$$
\begin{equation*}
|\mathcal{F} \wedge \mathcal{G}| \leq \sum_{0 \leq i \leq k-1}\binom{n-1}{i} \tag{3}
\end{equation*}
$$

where equality holds if and only if $\mathcal{F}=\mathcal{G}=\mathcal{S}_{1}$ up to isomorphism.
Corollary 1.4. Suppose that $n \geq 2 k^{2}+8 k, \mathcal{F} \subset\binom{[n]}{k}$ is intersecting. Then

$$
|\mathcal{F} \wedge \mathcal{F}| \leq \sum_{0 \leq i \leq k-1}\binom{n-1}{i}
$$

where equality holds if and only if $\mathcal{F}=\mathcal{S}_{1}$ up to isomorphism.
One would expect that both Theorem 1.3 and Corollary 1.4 hold for $n>c k$ for some absolute constant $c$. Unfortunately, we could not prove it. We can demonstrate the same results for $n>c^{\prime} k^{2} / \log k$ with a more complicated proof.

Let us now consider the probably more natural quantity $|\mathcal{I}(\mathcal{F}, \mathcal{G})|$, namely the case that intersections of identical sets are not counted. Quite surprisingly the pairs of families maximizing $|\mathcal{I}(\mathcal{F}, \mathcal{G})|$ is rather peculiar. The fact that we can prove the optimality of such a pair shows the strength of our methods.

Let us define the two families

$$
\mathcal{A}_{1}=\mathcal{S}_{12} \cup \mathcal{S}_{34} \cup \mathcal{S}_{145} \cup \mathcal{S}_{236} \text { and } \mathcal{A}_{2}=\mathcal{S}_{13} \cup \mathcal{S}_{24} \cup \mathcal{S}_{146} \cup \mathcal{S}_{235} .
$$

One can check that $\mathcal{A}_{1}, \mathcal{A}_{2}$ are cross-intersecting.

## Proposition 1.5.

$$
\begin{align*}
\left|\mathcal{I}\left(\mathcal{A}_{1}, \mathcal{A}_{2}\right)\right|=4 \sum_{0 \leq i \leq k-2} & \binom{n-4}{i}+6 \sum_{0 \leq i \leq k-3}\binom{n-4}{i}+4 \sum_{0 \leq i \leq k-4}\binom{n-4}{i} \\
& +\sum_{0 \leq i \leq k-5}\binom{n-4}{i}+2 \sum_{i \leq i \leq k-3}\binom{n-6}{i}+\sum_{0 \leq i \leq k-4}\binom{n-6}{i} . \tag{4}
\end{align*}
$$

Proof. For any $A_{1} \in \mathcal{A}_{1}$ and $A_{2} \in \mathcal{A}_{2}$, there are $\binom{4}{1} \sum_{0 \leq i \leq k-2}\binom{n-4}{i}$ distinct intersections for $\left|A_{1} \cap A_{2} \cap\{1,2,3,4\}\right|=1$. There are $\binom{4}{2} \sum_{0 \leq i \leq k-3}\binom{n-4}{i}$ distinct intersections for $\mid A_{1} \cap$ $A_{2} \cap\{1,2,3,4\} \mid=2$. There are $\binom{4}{3} \sum_{0 \leq i \leq k-4}\binom{n-4}{i}$ distinct intersections for $\mid A_{1} \cap A_{2} \cap$ $\{1,2,3,4\} \mid=3$. There are $\sum_{0 \leq i \leq k-5}\binom{n-4}{i}$ distinct intersections for $\left|A_{1} \cap A_{2} \cap\{1,2,3,4\}\right|=4$. There are $2 \sum_{0 \leq i \leq k-3}\binom{n-6}{i}$ distinct intersections for $\left|A_{1} \cap A_{2} \cap\{1,2,3,4\}\right|=0$ and $\mid A_{1} \cap A_{2} \cap$ $\{5,6\} \mid=1$. There are $\sum_{0 \leq i \leq k-4}\binom{n-6}{i}$ distinct intersections for $\left|A_{1} \cap A_{2} \cap\{1,2,3,4\}\right|=0$ and $\left|A_{1} \cap A_{2} \cap\{5,6\}\right|=2$. Thus the proposition follows.

Our main result shows that $|\mathcal{I}(\mathcal{F}, \mathcal{G})|$ is maximized by $\mathcal{A}_{1}, \mathcal{A}_{2}$ over all cross-intersecting families $\mathcal{F}, \mathcal{G} \subset\binom{[n]}{k}$ for $n \geq 100 k^{2}$.

Theorem 1.6. If $\mathcal{F}, \mathcal{G} \subset\binom{[n]}{k}$ are cross-intersecting families and $n \geq 100 k^{2}$, then $|\mathcal{I}(\mathcal{F}, \mathcal{G})| \leq$ $\left|\mathcal{I}\left(\mathcal{A}_{1}, \mathcal{A}_{2}\right)\right|$.

Let $n \geq k>t$. A family $\mathcal{F} \subset\binom{[n]}{k}$ is called $t$-intersecting if any two members of it intersect in at least $t$ elements. Note that for $n \leq 2 k-t$ the whole set $\binom{[n]}{k}$ is $t$ intersecting. Thus we always assume that $n>2 k-t$ when considering extremal problems for $t$-intersecting families.

Define

$$
\mathcal{A}(n, k, t)=\left\{A \in\binom{[n]}{k}:|A \cap[t+2]| \geq t+1\right\} .
$$

This family was first defined in [2] and it is easily seen to be $t$-intersecting.

## Proposition 1.7.

$$
\begin{aligned}
|\mathcal{I}(\mathcal{A}(n, k, t))|=\binom{t+2}{t} & \sum_{0 \leq i \leq k-t-1}\binom{n-t-2}{i}+\binom{t+2}{t+1} \sum_{0 \leq i \leq k-t-2}\binom{n-t-2}{i} \\
& +\sum_{0 \leq i \leq k-t-3}\binom{n-t-2}{i} .
\end{aligned}
$$

Proof. For any $A_{1}, A_{2} \in \mathcal{A}(n, k, t)$, we have $\left|A_{1} \cap A_{2} \cap[t+2]\right| \geq t$. Note that $\left|A_{i} \cap[t+2]\right| \geq$ $t+1$ for $i=1,2$. There are $\binom{t+2}{t} \sum_{0 \leq i \leq k-t-1}\binom{n-t-2}{i}$ distinct intersections for $\mid A_{1} \cap A_{2} \cap[t+$ $2] \mid=t$. There are $\binom{t+2}{t+1} \sum_{0 \leq i \leq k-t-2}\binom{n-t-2}{i}$ distinct intersections for $\left|A_{1} \cap A_{2} \cap[t+2]\right|=t+1$. There are $\sum_{0 \leq i \leq k-t-2}\binom{n-t-2}{i}$ distinct intersections for $\left|A_{1} \cap A_{2} \cap[t+2]\right|=t+2$. Thus the proposition follows.

Our third result shows that $|\mathcal{I}(\mathcal{F})|$ is maximized by $\mathcal{A}(n, k, t)$ over all intersecting families $\mathcal{F} \subset\binom{[n]}{k}$ for $n \geq 3(t+2)^{3} k^{2}$.

Theorem 1.8. If $\mathcal{F} \subset\binom{[n]}{k}$ is a t-intersecting family and $n \geq 3(t+2)^{3} k^{2}$, then $\mathcal{I}(\mathcal{F}) \leq$ $|\mathcal{I}(\mathcal{A}(n, k, t))|$.

We should mention that this result was proved for the case $t=1$ in [5].

Let us list some notions and results that we need for the proofs. Define the family of $t$-transversals of $\mathcal{F} \subset\binom{[n]}{k}$ :

$$
\mathcal{T}_{t}(\mathcal{F})=\{T \subset[n]:|T| \leq k,|T \cap F| \geq t \text { for all } F \in \mathcal{F}\} .
$$

Clearly, if $\mathcal{F}$ is $t$-intersecting then $\mathcal{F} \subset \mathcal{T}_{t}(\mathcal{F})$ and vice versa. The $t$-covering number $\tau_{t}(\mathcal{F})$ is defined as follows:

$$
\tau_{t}(\mathcal{F})=\min \{|T|:|T \cap F| \geq t \text { for all } F \in \mathcal{F}\} .
$$

For $t=1$, we often write $\mathcal{T}(\mathcal{F}), \tau(\mathcal{F})$ instead of $\mathcal{T}_{1}(\mathcal{F}), \tau_{1}(\mathcal{F})$, respectively. If $\mathcal{F}, \mathcal{G}$ are cross-intersecting, then clearly $\mathcal{F} \subset \mathcal{T}(\mathcal{G})$ and $\mathcal{G} \subset \mathcal{T}(\mathcal{F})$.

Let us recall the following common notations:

$$
\mathcal{F}(i)=\{F \backslash\{i\}: i \in F \in \mathcal{F}\}, \quad \mathcal{F}(\bar{i})=\{F \in \mathcal{F}: i \notin F\} .
$$

Note that $|\mathcal{F}|=|\mathcal{F}(i)|+|\mathcal{F}(\bar{i})|$.
Define $\nu(\mathcal{F})$, the matching number of $\mathcal{F}$ as the maximum number of pairwise disjoint edges in $\mathcal{F}$. Note that $\nu(\mathcal{F})=1$ iff $\mathcal{F}$ is intersecting. We need the following inequality generalising the Erdős-Ko-Rado Theorem.

Proposition 1.9 ([3]). Suppose that $\mathcal{F} \subset\binom{[n]}{k}$ then

$$
\begin{equation*}
|\mathcal{F}| \leq \nu(\mathcal{F})\binom{n-1}{k-1} . \tag{6}
\end{equation*}
$$

An intersecting family $\mathcal{F}$ is called non-trivial if $\cap_{F \in \mathcal{F}} F=\emptyset$. We also need the following stability theorem concerning the Erdős-Ko-Rado Theorem.

Hilton-Milner Theorem ([6]). If $n>2 k$ and $\mathcal{F} \subset\binom{[n]}{k}$ is non-trivial intersecting, then

$$
\begin{equation*}
|\mathcal{F}| \leq\binom{ n-1}{k-1}-\binom{n-k-1}{k-1}+1 . \tag{7}
\end{equation*}
$$

Let us list some inequalities that will be used frequently in the proof.
Proposition 1.10. Let $n, k, \ell, t, p$ be positive integers with $k>\ell, k>t$ and $n>2 k+p$. Then

$$
\begin{align*}
& \binom{n}{k} \leq \frac{n-p}{n-p(k+1)}\binom{n-p}{k},  \tag{8}\\
& \sum_{0 \leq i \leq k-\ell}\binom{n-t}{i} \leq \frac{n-t-p}{n-t-p k} \sum_{0 \leq i \leq k-\ell}\binom{n-t-p}{i}, \\
& \sum_{0 \leq i \leq k-\ell-1}\binom{n-t}{i} \leq \frac{k}{n-t-k} \sum_{0 \leq i \leq k-\ell}\binom{n-t}{i}, \\
& \text { for } \ell \geq t+1, \quad \sum_{t \leq j \leq \ell}\binom{\ell}{j} \geq \frac{1}{2 t+2} \sum_{t \leq j \leq \ell+1}\binom{\ell+1}{j} .
\end{align*}
$$

Proof. Note that

$$
\frac{\binom{n-p}{k}}{\binom{n}{k}}=\frac{(n-k)(n-k-1) \cdots(n-k-p+1)}{n(n-1) \cdots(n-p+1)} \geq\left(1-\frac{k}{n-p}\right)^{p} \geq 1-\frac{p k}{n-p} .
$$

Then (8) holds. By (8), we have for $i<k$

$$
\binom{n-t}{i} \leq \frac{n-t-p}{n-t-p(i+1)}\binom{n-t-p}{i} \leq \frac{n-t-p}{n-t-p k}\binom{n-t-p}{i}
$$

and thereby (9) follows. Since

$$
\binom{n-t}{i-1} /\binom{n-t}{i}=\frac{i}{n-t-i+1} \leq \frac{k}{n-t-k}
$$

we obtain (10).
For $\ell \geq 2 t$, since

$$
\sum_{t \leq j \leq \ell}\binom{\ell}{j} \geq 2^{\ell-1} \text { and } \sum_{t \leq j \leq \ell+1}\binom{\ell+1}{j} \leq 2^{\ell+1}
$$

we see that

$$
\frac{\sum_{t \leq j \leq \ell}\binom{\ell}{j}}{\sum_{t \leq j \leq \ell+1}\binom{\ell+1}{j}} \geq \frac{1}{4}
$$

For $t+1 \leq \ell \leq 2 t$,

$$
\begin{aligned}
\sum_{t \leq j \leq \ell}\binom{\ell}{j} & \geq \sum_{t \leq j \leq \ell} \frac{\ell+1-j}{\ell+1}\binom{\ell+1}{j} \\
& \geq \sum_{t \leq j \leq \ell-1} \frac{\ell+1-j}{\ell+1}\binom{\ell+1}{j}+\frac{1}{\ell+1}\binom{\ell+1}{\ell} \\
& \geq \frac{1}{\ell+1} \sum_{t \leq j \leq \ell-1}\binom{\ell+1}{j}+\frac{1}{\ell+2}\left(\binom{\ell+1}{\ell}+\binom{\ell+1}{\ell+1}\right) \\
& >\frac{1}{2 t+2} \sum_{t \leq j \leq \ell+1}\binom{\ell+1}{j}
\end{aligned}
$$

Thus (11) holds.

## 2 Intersections in cross-intersecting families

In this section, we determine the maximum size of $\mathcal{F} \wedge \mathcal{G}$ over all cross-intersecting families $\mathcal{F}, \mathcal{G} \subset\binom{[n]}{k}$. We also determine the maximum size of $\left(\mathcal{F}_{1} \wedge \mathcal{G}_{1}\right) \cup\left(\mathcal{F}_{2} \wedge \mathcal{G}_{2}\right)$ over all families $\mathcal{F}_{1}, \mathcal{F}_{2}, \mathcal{G}_{1}, \mathcal{G}_{2} \subset\binom{[n]}{k}$ with $\mathcal{F}_{1}, \mathcal{G}_{1}$ being cross-intersecting and $\mathcal{F}_{2}, \mathcal{G}_{2}$ being crossintersecting. This result will be used in Section 3.

First we prove a key proposition to the proof of Theorem 1.3 .
Proposition 2.1. Let $\mathcal{F}, \mathcal{G} \subset\binom{[n]}{k}$ be cross-intersecting families and set $\mathcal{H}=\mathcal{I}(\mathcal{F}, \mathcal{G}) \cap$ $\binom{[n]}{k-1}$. Then $\nu(\mathcal{H}) \leq 4$.

Proof. Suppose that $F_{i} \cap G_{i}=D_{i}$ are pairwise disjoint $(k-1)$-sets, $0 \leq i \leq 4$. Define $x_{i}, y_{i}$ by $F_{i}=D_{i} \cup\left\{x_{i}\right\}, G_{i}=D_{i} \cup\left\{y_{i}\right\}$ and note that $x_{i} \neq y_{i}$. There are altogether $5 \times 4$ conditions $F_{i} \cap G_{j} \neq \emptyset$ to satisfy. Each of them is assured by either of the following three relations: $x_{i} \in D_{j}, y_{j} \in D_{i}, x_{i}=y_{j}$. From the first two types there are at most one for each $x_{i}$ and $y_{j}$. Altogether at most $5+5=10$. If no multiple equalities (e.g. $x_{1}=y_{2}=y_{3}$ )
exist, we get only at most 5 more relations and $10+5<20$. Thus there must be places of coincidence, say by symmetry that of the form $x_{i}=x_{i^{\prime}}$. Thus, again by symmetry, we may assume that $x_{i} \notin D_{0}$ for $0 \leq i \leq 4$. Note that $y_{0} \in D_{i}$ holds for at most one value of $i$. Without loss of generality assume $y_{0} \notin D_{i}, 1 \leq i \leq 3$. By $F_{i} \cap G_{0} \neq \emptyset, y_{0}=x_{i}$, $i=1,2,3$. Look at $y_{1}$. By symmetry assume $y_{1} \notin D_{2}$. Now $G_{1} \cap F_{2} \neq \emptyset$ implies $y_{1}=x_{2}$. Hence $y_{1}=x_{1}$, a contradiction.

Let $D_{1}, D_{2}, D_{3}, D_{4}$ be pairwise disjoint $(k-1)$-sets. Pick an element $d_{i} \in D_{i}, i=1,2,3$. Define $x_{i}, y_{i}$ by $x_{1}=x_{2}=y_{4}=d_{3}, x_{3}=y_{1}=d_{2}$ and $x_{4}=y_{2}=y_{3}=d_{1}$. Setting $F_{i}=D_{i} \cup\left\{x_{i}\right\}, G_{i}=D_{j} \cup\left\{y_{j}\right\}$. One can check easily that $F_{i} \cap G_{j} \neq \emptyset$ for $1 \leq i \neq j \leq 4$. This example shows that Proposition 2.1 is best possible.

Proof of Theorem 1.3. We distinguish two cases. First we suppose that

$$
\begin{equation*}
|\mathcal{F} \cap \mathcal{G}|>\binom{n-1}{k-1}-\binom{n-k-1}{k-1}+1 \tag{12}
\end{equation*}
$$

Since $\mathcal{F}, \mathcal{G}$ are cross-intersecting, $\mathcal{F} \cap \mathcal{G}$ is intersecting. By (7) and (12), without loss of generality, we assume that $1 \in F$ for all $F \in \mathcal{F} \cap \mathcal{G}$. We claim that $1 \in H$ for all $H \in \mathcal{F} \cup \mathcal{G}$. Indeed, if $1 \notin H \in \mathcal{F} \cup \mathcal{G}$ then $H \cap F \neq \emptyset$ for $F \in \mathcal{F} \cap \mathcal{G}$ yields

$$
|\mathcal{F} \cap \mathcal{G}| \leq\binom{ n-1}{k-1}-\binom{n-k-1}{k-1}
$$

contradicting (12). We proved that $1 \in H$ for all $H \in \mathcal{F} \cup \mathcal{G}$ and thereby (3) holds.
Suppose next that (12) does not hold. By Proposition 2.1 and (6), we have for $n \geq 5 k$,

$$
\left|\mathcal{I}(\mathcal{F}, \mathcal{G}) \cap\binom{[n]}{k-1}\right| \leq 4\binom{n-1}{k-2} \stackrel{[8]}{\leq} \frac{4(n-2)}{n-k}\binom{n-2}{k-2} \leq 5\binom{n-2}{k-2}
$$

Since the remaining sets in $\mathcal{I}(\mathcal{F}, \mathcal{G})$ are of size at most $k-2$, we have

$$
|\mathcal{I}(\mathcal{F}, \mathcal{G})| \leq 5\binom{n-2}{k-2}+\sum_{0 \leq i \leq k-2}\binom{n}{i}
$$

Moreover,

$$
|\mathcal{F} \cap \mathcal{G}| \leq\binom{ n-1}{k-1}-\binom{n-k-1}{k-1}+1 \leq k\binom{n-2}{k-2}
$$

Thus, for $n \geq 2 k+1$ we have

$$
\begin{aligned}
|\mathcal{F} \wedge \mathcal{G}| & \leq(k+5)\binom{n-2}{k-2}+\sum_{0 \leq i \leq k-2}\binom{n}{i} \\
& \stackrel{(10)}{\leq} \frac{(k+5)(k-1)}{n-1}\binom{n-1}{k-1}+\frac{k}{n-k} \sum_{0 \leq i \leq k-1}\binom{n}{i} \\
& \leq \frac{(k+5)(k-1)}{n-1}\binom{n-1}{k-1}+\frac{k}{n-k} \frac{n-1}{n-k} \sum_{0 \leq i \leq k-1}\binom{n-1}{i} .
\end{aligned}
$$

Note that $n \geq 2 k^{2}+8 k$ implies

$$
\frac{(k+5)(k-1)}{n-1} \leq \frac{1}{2}
$$

and

$$
\frac{k}{n-k} \frac{n-1}{n-k}<\frac{k}{n-k}\left(1+\frac{k}{n-k}\right)<\frac{k}{2 k^{2}+7 k}\left(1+\frac{k}{2 k^{2}}\right)=\frac{2 k+1}{2 k(2 k+7)} \leq \frac{1}{2} .
$$

Thus,

$$
|\mathcal{F} \wedge \mathcal{G}| \leq \frac{1}{2}\binom{n-1}{k-1}+\frac{1}{2} \sum_{0 \leq i \leq k-1}\binom{n-1}{i}<\sum_{0 \leq i \leq k-1}\binom{n-1}{i} .
$$

Lemma 2.2. Suppose that $n \geq 2 k^{2}+9 k, \mathcal{F}_{1}, \mathcal{G}_{1} \subset\binom{[n]}{k}$ are cross-intersecting and $\mathcal{F}_{2}, \mathcal{G}_{2} \subset$ $\binom{[n]}{k}$ are cross-intersecting. Then

$$
\begin{equation*}
\left|\left(\mathcal{F}_{1} \wedge \mathcal{G}_{1}\right) \cup\left(\mathcal{F}_{2} \wedge \mathcal{G}_{2}\right)\right| \leq 2 \sum_{0 \leq i \leq k-1}\binom{n-2}{i}+\sum_{0 \leq i \leq k-2}\binom{n-2}{i} . \tag{13}
\end{equation*}
$$

with equality holding if and only if $\mathcal{F}_{1}=\mathcal{G}_{1}=\mathcal{S}_{1}$ and $\mathcal{F}_{2}=\mathcal{G}_{2}=\mathcal{S}_{2}$ up to isomorphism.
Proof. By Theorem 1.3, for $j=1,2$

$$
\left|\mathcal{F}_{j} \wedge \mathcal{G}_{j}\right| \leq \sum_{0 \leq i \leq k-1}\binom{n-1}{i} .
$$

By Proposition (2.1 and (6), for $j=1,2$

$$
\left|\mathcal{I}\left(\mathcal{F}_{j}, \mathcal{G}_{j}\right) \cap\binom{[n]}{k-1}\right| \leq 4\binom{n-1}{k-2} \stackrel{\boxed{8} \mid}{\leq} \frac{4(n-2)}{n-k}\binom{n-2}{k-2} \leq 5\binom{n-2}{k-2} .
$$

Since the remaining sets in $\mathcal{I}\left(\mathcal{F}_{j}, \mathcal{G}_{j}\right)$ are of size at most $k-2$, for $j=1,2$

$$
\left|\mathcal{I}\left(\mathcal{F}_{j}, \mathcal{G}_{j}\right)\right| \leq 5\binom{n-2}{k-2}+\sum_{0 \leq i \leq k-2}\binom{n}{i} .
$$

If $\left|\mathcal{F}_{j} \cap \mathcal{G}_{j}\right| \leq\binom{ n-1}{k-1}-\binom{n-k-1}{k-1} \leq k\binom{n-2}{k-2}$ for some $j \in\{1,2\}$, then for $n \geq 2 k+2$

$$
\begin{aligned}
& \left|\left(\mathcal{F}_{1} \wedge \mathcal{G}_{1}\right) \cup\left(\mathcal{F}_{2} \wedge \mathcal{G}_{2}\right)\right| \\
\leq & \left|\mathcal{F}_{1} \wedge \mathcal{G}_{1}\right|+\left|\mathcal{F}_{2} \wedge \mathcal{G}_{2}\right| \\
\leq & k\binom{n-2}{k-2}+5\binom{n-2}{k-2}+\sum_{0 \leq i \leq k-2}\binom{n}{i}+\sum_{0 \leq i \leq k-1}\binom{n-1}{i} \\
\text { (9) } & \frac{(k+5)(k-1)}{n-k}\binom{n-2}{k-1}+\frac{n-2}{n-2 k} \sum_{0 \leq i \leq k-2}\binom{n-2}{i}+\frac{n-2}{n-1-k} \sum_{0 \leq i \leq k-1}\binom{n-2}{i} .
\end{aligned}
$$

Note that $n \geq 2 k^{2}+9 k \geq 10 k$ implies

$$
\frac{(k+5)(k-1)}{n-k} \leq \frac{1}{2}, \frac{n-2}{n-2 k} \leq \frac{5}{4} \text { and } \frac{n-2}{n-1-k} \leq \frac{5}{4} .
$$

Thus,

$$
\begin{aligned}
& \left|\left(\mathcal{F}_{1} \wedge \mathcal{G}_{1}\right) \cup\left(\mathcal{F}_{2} \wedge \mathcal{G}_{2}\right)\right| \\
\leq & \frac{1}{2}\binom{n-2}{k-1}+\frac{5}{4} \sum_{0 \leq i \leq k-2}\binom{n-2}{i}+\frac{5}{4} \sum_{0 \leq i \leq k-1}\binom{n-2}{i} \\
< & 2 \sum_{0 \leq i \leq k-1}\binom{n-2}{i}+\sum_{0 \leq i \leq k-2}\binom{n-2}{i} .
\end{aligned}
$$

Thus we may assume that $\left|\mathcal{F}_{j} \cap \mathcal{G}_{j}\right| \geq\binom{ n-1}{k-1}-\binom{n-k-1}{k-1}+1$ for each $j=1,2$. By (7), both $\mathcal{F}_{1} \cap \mathcal{G}_{1}$ and $\mathcal{F}_{2} \cap \mathcal{G}_{2}$ are trivial intersecting families. By the same argument as in Theorem [1.3, we see that there exist $x, y$ such that $\mathcal{F}_{1} \cup \mathcal{G}_{1} \subset \mathcal{S}_{x}$ and $\mathcal{F}_{2} \cup \mathcal{G}_{2} \subset \mathcal{S}_{y}$. If $x \neq y$, then we are done. If $x=y$, then

$$
\begin{aligned}
\left|\left(\mathcal{F}_{1} \wedge \mathcal{G}_{1}\right) \cup\left(\mathcal{F}_{2} \wedge \mathcal{G}_{2}\right)\right| & \leq\left|\mathcal{S}_{x} \wedge \mathcal{S}_{x}\right| \\
& =\sum_{0 \leq i \leq k-1}\binom{n-1}{i} \\
& <2 \sum_{0 \leq i \leq k-1}\binom{n-2}{i}+\sum_{0 \leq i \leq k-2}\binom{n-2}{i} .
\end{aligned}
$$

## 3 Distinct intersections in cross-intersecting families

In this section, we determine the maximum number of distinct intersections in crossintersecting families.

For the proof, we need the following notion of basis. Two cross-intersecting families $\mathcal{F}, \mathcal{G}$ are called saturated if any cross-intersecting families $\tilde{\mathcal{F}}, \tilde{\mathcal{G}}$ with $\mathcal{F} \subset \tilde{\mathcal{F}}, \mathcal{G} \subset \tilde{\mathcal{G}}$ have $\mathcal{F}=\tilde{\mathcal{F}}$ and $\mathcal{G}=\tilde{\mathcal{G}}$. Since $\mathcal{F} \subset \tilde{\mathcal{F}}$ and $\mathcal{G} \subset \tilde{\mathcal{G}}$ imply $\mathcal{I}(\mathcal{F}, \mathcal{G}) \subset \mathcal{I}(\tilde{\mathcal{F}}, \tilde{\mathcal{G}})$, we may always assume that $\mathcal{F}, \mathcal{G}$ are saturated when maximizing the size of $\mathcal{I}(\mathcal{F}, \mathcal{G})$. Let $\mathcal{B}(\mathcal{F})$ be the family of minimal (for containment) sets in $\mathcal{T}(\mathcal{G})$ and let $\mathcal{B}(\mathcal{G})$ be the family of minimal sets in $\mathcal{T}(\mathcal{F})$. Let us prove some properties of the basis.
Lemma 3.1. Suppose that $\mathcal{F}, \mathcal{G} \subset\binom{[n]}{k}$ are saturated cross-intersecting families. Then (i) and (ii) hold.
(i) Both $\mathcal{B}(\mathcal{F})$ and $\mathcal{B}(\mathcal{G})$ are antichains, and $\mathcal{B}(\mathcal{F}), \mathcal{B}(\mathcal{G})$ are cross-intersecting,
(ii) $\mathcal{F}=\left\{F \in\binom{[n]}{k}: \exists B \in \mathcal{B}(\mathcal{F}), B \subset F\right\}$ and $\mathcal{G}=\left\{G \in\binom{[n]}{k}: \exists B \in \mathcal{B}(\mathcal{G}), B \subset G\right\}$.

Proof. (i) Clearly, $\mathcal{B}(\mathcal{F})$ and $\mathcal{B}(\mathcal{G})$ are both anti-chains. Suppose for contradiction that $B \in \mathcal{B}(\mathcal{F}), B^{\prime} \in \mathcal{B}(\mathcal{G})$ but $B \cap B^{\prime}=\emptyset$. If $|B|=\left|B^{\prime}\right|=k$, then $B \in \mathcal{F}, B^{\prime} \in \mathcal{G}$ follows from saturatedness, a contradiction. If $|B|<k$, then there exists $F \supset B$ such that $|F|=k$ and $\left|F \cap B^{\prime}\right|=\left|B \cap B^{\prime}\right|=0$. By definition $F \in \mathcal{T}(\mathcal{G})$. Since $\mathcal{F}, \mathcal{G}$ are saturated, we see that $F \in \mathcal{F}$. But this contradicts the assumption that $B^{\prime}$ is a transversal of $\mathcal{F}$. Since $\mathcal{F}, \mathcal{G}$ are saturated, (ii) is immediate from the definition of $\mathcal{B}(\mathcal{F})$ and $\mathcal{B}(\mathcal{G})$.

Let $r(\mathcal{B})=\max \{|B|: B \in \mathcal{B}\}$ and $s(\mathcal{B})=\min \{|B|: B \in \mathcal{B}\}$. For any $\ell$ with $s(\mathcal{B}) \leq$ $\ell \leq r(\mathcal{B})$, define

$$
\mathcal{B}^{(\ell)}=\{B \in \mathcal{B}:|B|=\ell\} \text { and } \mathcal{B}^{(\leq \ell)}=\bigcup_{i=s(\mathcal{B})}^{\ell} \mathcal{B}^{(i)} .
$$

It is easy to see that $s(\mathcal{B}(\mathcal{G}))=\tau(\mathcal{F})$.
By a branching process, we establish an upper bound on the size of the basis.
Lemma 3.2. Suppose that $\mathcal{F}, \mathcal{G} \subset\binom{[n]}{k}$ are saturated cross-intersecting families. Let $\mathcal{B}_{1}=$ $\mathcal{B}(\mathcal{F})$ and $\mathcal{B}_{2}=\mathcal{B}(\mathcal{G})$. For each $i=1,2$, if $s\left(\mathcal{B}_{i}\right) \geq 2$ and $\tau\left(\mathcal{B}_{i}^{\left(\leq r_{i}\right)}\right) \geq 2$ then

$$
\begin{equation*}
\sum_{r_{i} \leq \ell \leq k} \ell^{-2} k^{-\ell+2}\left|\mathcal{B}_{3-i}^{(\ell)}\right| \leq 1 . \tag{14}
\end{equation*}
$$

Proof. By symmetry, it is sufficient to prove the lemma only for $i=1$. For the proof we use a branching process. During the proof a sequence $S=\left(x_{1}, x_{2}, \ldots, x_{\ell}\right)$ is an ordered sequence of distinct elements of $[n]$ and we use $\widehat{S}$ to denote the underlying unordered set $\left\{x_{1}, x_{2}, \ldots, x_{\ell}\right\}$. At the beginning, we assign weight 1 to the empty sequence $S_{\emptyset}$. At the first stage, we choose $B_{1,1} \in \mathcal{B}_{1}$ with $\left|B_{1,1}\right|=s\left(\mathcal{B}_{1}\right)$. For any vertex $x_{1} \in B_{1,1}$, define one sequence $\left(x_{1}\right)$ and assign the weight $s\left(\mathcal{B}_{1}\right)^{-1}$ to it.

At the second stage, since $\tau\left(\mathcal{B}_{1}^{\left(\leq r_{1}\right)}\right) \geq 2$, for each sequence $S=\left(x_{1}\right)$ we may choose $B_{1,2} \in \mathcal{B}_{1}^{\left(\leq r_{1}\right)}$ such that $x_{1} \notin B_{1,2}$. Then we replace $S=\left(x_{1}\right)$ by $\left|B_{1,2}\right|$ sequences of the form $\left(x_{1}, y\right)$ with $y \in B_{1,2}$ and weight $\frac{w(S)}{\left|B_{1,2}\right|}$.

In each subsequent stage, we pick a sequence $S=\left(x_{1}, \ldots, x_{p}\right)$ and denote its weight by $w(S)$. If $\widehat{S} \cap B_{1} \neq \emptyset$ holds for all $B_{1} \in \mathcal{B}_{1}$ then we do nothing. Otherwise we pick $B_{1} \in \mathcal{B}_{1}$ satisfying $\widehat{S} \cap B_{1}=\emptyset$ and replace $S$ by the $\left|B_{1}\right|$ sequences $\left(x_{1}, \ldots, x_{p}, y\right)$ with $y \in B_{1}$ and assign weight $\frac{w(S)}{\left|B_{1}\right|}$ to each of them. Clearly, the total weight is always 1 .

We continue until $\widehat{S} \cap B_{1} \neq \emptyset$ for all sequences and all $B_{1} \in \mathcal{B}_{1}$. Since $[n]$ is finite, each sequence has length at most $n$ and eventually the process stops. Let $\mathcal{S}$ be the collection of sequences that survived in the end of the branching process and let $\mathcal{S}^{(\ell)}$ be the collection of sequences in $\mathcal{S}$ with length $\ell$.

Claim 1. To each $B_{2} \in \mathcal{B}_{2}^{(\ell)}$ with $\ell \geq r_{1}$ there is some sequence $S \in \mathcal{S}^{(\ell)}$ with $\widehat{S}=B_{2}$.
Proof. Let us suppose the contrary and let $S=\left(x_{1}, \ldots, x_{p}\right)$ be a sequence of maximal length that occurred at some stage of the branching process satisfying $\widehat{S} \varsubsetneqq B_{2}$. Since $\mathcal{B}_{1}, \mathcal{B}_{2}$ are cross-intersecting, $B_{1,1} \cap B_{2} \neq \emptyset$, implying that $p \geq 1$. Since $S$ is a proper subset of $B_{2}$ and $B_{2} \in \mathcal{B}_{2}=\mathcal{B}(\mathcal{G})$, it follows that $\widehat{S} \notin \mathcal{B}(\mathcal{G}) \subset \mathcal{T}(\mathcal{F})$. Thereby there exists $F \in \mathcal{F}$ with $\widehat{S} \cap F=\emptyset$. In view of Lemma 3.1 (ii), we can find $B_{1}^{\prime} \in \mathcal{B}_{1}$ such that $\widehat{S} \cap B_{1}^{\prime}=\emptyset$. Thus at some point we picked $S$ and some $\tilde{B}_{1} \in \mathcal{B}_{1}$ with $\widehat{S} \cap \tilde{B}_{1}=\emptyset$. Since $\mathcal{B}_{1}, \mathcal{B}_{2}$ are cross-intersecting, $B_{2} \cap \tilde{B}_{1} \neq \emptyset$. Consequently, for each $y \in B_{2} \cap \tilde{B}_{1}$ the sequence $\left(x_{1}, \ldots, x_{p}, y\right)$ occurred in the branching process. This contradicts the maximality of $p$. Hence there is an $S$ at some stage satisfying $\widehat{S}=B_{2}$. Since $\mathcal{B}_{1}, \mathcal{B}_{2}$ are cross-intersecting, $\widehat{S} \cap B_{1}^{\prime}=B_{2} \cap B_{1}^{\prime} \neq \emptyset$ for all $B_{1}^{\prime} \in \mathcal{B}_{1}$. Thus $\widehat{S} \in \mathcal{S}$ and the claim holds.

By Claim 1, we see that $\left|\mathcal{B}_{2}^{(\ell)}\right| \leq\left|\mathcal{S}^{(\ell)}\right|$ for all $\ell \geq r_{1}$. Let $S=\left(x_{1}, \ldots, x_{\ell}\right) \in \mathcal{S}^{(\ell)}$ and let $S_{i}=\left(x_{1}, \ldots, x_{i}\right)$ for $i=1, \ldots, \ell$. At the first stage, $w\left(S_{1}\right)=1 / s\left(\mathcal{B}_{1}\right)$. Assume that $B_{1, i}$ is the selected set when replacing $S_{i-1}$ in the branching process for $i=2, \ldots, \ell$. Clearly, $x_{i} \in B_{i}, B_{1,2} \in \mathcal{B}_{1}^{\left(\leq r_{1}\right)}$ and

$$
w(S)=\frac{1}{s\left(\mathcal{B}_{1}\right)} \prod_{i=2}^{\ell} \frac{1}{\left|B_{1, i}\right|}
$$

Note that $s\left(\mathcal{B}_{1}\right) \leq \ell,\left|B_{1,2}\right|=r_{1} \leq \ell$ and $\left|B_{1, i}\right| \leq k$ for $i \geq 3$. It follows that

$$
w(S) \geq\left(\ell^{2} k^{\ell-2}\right)^{-1}=\ell^{-2} k^{-\ell+2}
$$

Thus,

$$
\sum_{r_{1} \leq \ell \leq k} \ell^{-2} k^{-\ell+2}\left|\mathcal{B}_{2}^{(\ell)}\right| \leq \sum_{r_{1} \leq \ell \leq k} \sum_{S \in \mathcal{S}^{(\ell)}} w(S) \leq \sum_{S \in \mathcal{S}} w(S)=1
$$

For the proof of Theorem 1.6, we also need the following lemma.

Lemma 3.3. Suppose that $\mathcal{F} \subset\binom{[n]}{k}, \mathcal{G} \subset\binom{[n]}{k-1}$ are cross-intersecting. Then

$$
|\mathcal{I}(\mathcal{F}, \mathcal{G})| \leq 2\binom{n-1}{k-2}+(2 k+1)\binom{n-1}{k-3}+\sum_{0 \leq i \leq k-3}\binom{n}{i} .
$$

Proof. Let $\mathcal{H}_{1}=\mathcal{I}(\mathcal{F}, \mathcal{G}) \cap\binom{[n]}{k-1}$. We claim that $\nu\left(\mathcal{H}_{1}\right) \leq 2$. Otherwise, let $G_{i}=F_{i} \cap G_{i}$, $i=1,2,3$, be three pairwise disjoint members in $\mathcal{H}_{1}$ with $F_{i} \in \mathcal{F}, G_{i} \in \mathcal{G}$. Define $x_{i}$ by $F_{i} \backslash G_{i}=\left\{x_{i}\right\}$. By symmetry we may assume that $x_{1} \notin G_{3}$. Then $F_{1}, G_{3}$ are disjoint, contradicting the fact that $\mathcal{F}, \mathcal{G}$ are cross-intersecting. Thus $\nu\left(\mathcal{H}_{1}\right) \leq 2$.

If $\nu\left(\mathcal{H}_{1}\right) \leq 1$, then (11) implies $\left|\mathcal{H}_{1}\right| \leq\binom{ n-1}{k-2}$. Since the remaining sets in $\mathcal{I}(\mathcal{F}, \mathcal{G})$ are all of size at most $k-2$, it follows that

$$
|\mathcal{I}(\mathcal{F}, \mathcal{G})| \leq\binom{ n-1}{k-2}+\sum_{0 \leq i \leq k-2}\binom{n}{i} .
$$

If $\nu\left(\mathcal{H}_{1}\right)=2$, let $G_{1}=F_{1} \cap G_{1}, G_{2}=F_{2} \cap G_{2}$ be two disjoint members in $\mathcal{H}_{1}$ and let $\mathcal{H}_{2}=\mathcal{I}(\mathcal{F}, \mathcal{G}) \cap\binom{\left[n \backslash \backslash\left(F_{1} \cup F_{2}\right)\right.}{k-2}$. We claim that $\mathcal{H}_{2}$ is intersecting. Suppose not, let $D_{3}=F_{3} \cap G_{3}, D_{4}=F_{4} \cap G_{4}$ be two disjoint members in $\mathcal{H}_{2}$. Define $x_{i}$ by $F_{i} \backslash G_{i}=\left\{x_{i}\right\}$ for $i=1,2$ and define $x_{i}, y_{i}, z_{i}$ by $F_{i} \backslash D_{i}=\left\{x_{i}, y_{i}\right\}, G_{i} \backslash D_{i}=\left\{z_{i}\right\}$ for $i=3,4$. Since $F_{3} \cap G_{1} \neq \emptyset$ and $F_{3} \cap G_{2} \neq \emptyset$, by symmetry we may assume that $x_{3} \in G_{1}$ and $y_{3} \in G_{2}$. Similarly, assume that $x_{4} \in G_{1}$ and $y_{4} \in G_{2}$. Since $F_{1} \cap G_{3} \neq \emptyset$ and $F_{2} \cap G_{3} \neq \emptyset$, we see that $z_{3} \in F_{1} \cap F_{2}$. It follows that $x_{1}=x_{2}=z_{3}$. Similarly we have $x_{1}=x_{2}=z_{4}$. But then $F_{3}, G_{4}$ are disjoint, contradicting the fact that $\mathcal{F}, \mathcal{G}$ are cross-intersecting. Thus $\mathcal{H}_{2}$ is intersecting. By (1) we have

$$
\left|\mathcal{I}(\mathcal{F}, \mathcal{G}) \cap\binom{[n]}{k-2}\right| \leq\left|F_{1} \cup F_{2}\right|\binom{n-1}{k-3}+\binom{n-2 k}{k-3} \leq(2 k+1)\binom{n-1}{k-3}
$$

By (6) we obtain that

$$
\left|\mathcal{I}(\mathcal{F}, \mathcal{G}) \cap\binom{[n]}{k-1}\right| \leq 2\binom{n-1}{k-2}
$$

Hence

$$
|\mathcal{I}(\mathcal{F}, \mathcal{G})| \leq 2\binom{n-1}{k-2}+(2 k+1)\binom{n-1}{k-3}+\sum_{0 \leq i \leq k-3}\binom{n}{i}
$$

Corollary 3.4. Let $\mathcal{F}, \mathcal{G} \subset\binom{[n]}{k}$ be cross-intersecting families. If $\mathcal{G}$ is a star, then

$$
\begin{equation*}
\mathcal{I}(\mathcal{F}, \mathcal{G}) \leq 2 \sum_{0 \leq i \leq k-2}\binom{n-1}{i}+\binom{n-2}{k-2}+(2 k+1)\binom{n-2}{k-3} . \tag{15}
\end{equation*}
$$

Proof. Assume without loss of generality that $\mathcal{F}$ and $\mathcal{G}$ are saturated. Since $\mathcal{G}$ is a star, we may assume that $\mathcal{G} \subset \mathcal{S}_{1}$. Then $\{1\} \in \mathcal{T}(\mathcal{G})$ whence $\{1\} \in \mathcal{B}(\mathcal{F})$. By Lemma 3.1 (ii) $\mathcal{S}_{1} \subset \mathcal{F}$. Note that $\mathcal{F}(\overline{1}) \subset\binom{[2, n]}{k}, \mathcal{G}(1) \subset\binom{2, n]}{k-1}$ are cross-intersecting. By Lemma 3.3, we have

$$
\begin{aligned}
|\mathcal{I}(\mathcal{F}(\overline{1}), \mathcal{G}(1))| & \leq 2\binom{n-2}{k-2}+(2 k+1)\binom{n-2}{k-3}+\sum_{0 \leq i \leq k-3}\binom{n-1}{i} \\
& \leq \sum_{0 \leq i \leq k-2}\binom{n-1}{i}+\binom{n-2}{k-2}+(2 k+1)\binom{n-2}{k-3}
\end{aligned}
$$

Thus,

$$
\begin{aligned}
|\mathcal{I}(\mathcal{F}, \mathcal{G})| & \leq\left|\mathcal{I}\left(\mathcal{S}_{1}, \mathcal{S}_{1}\right)\right|+|\mathcal{I}(\mathcal{F}(\overline{1}), \mathcal{G}(1))| \\
& \leq 2 \sum_{0 \leq i \leq k-2}\binom{n-1}{i}+\binom{n-2}{k-2}+(2 k+1)\binom{n-2}{k-3}
\end{aligned}
$$

Now we are in position to prove the main theorem.
Proof of Theorem 1.6. Let $\mathcal{B}_{1}=\mathcal{B}(\mathcal{F}), \mathcal{B}_{2}=\mathcal{B}(\mathcal{G})$ and let $s_{1}=s\left(\mathcal{B}_{1}\right), s_{2}=s\left(\mathcal{B}_{2}\right)$. Suppose first that $\min \left\{s_{1}, s_{2}\right\}=1$. By symmetry let $s_{2}=1$, then $\mathcal{G}$ is a star. By (15) and $n \geq 2 k+3$, we have

$$
\begin{aligned}
& |\mathcal{I}(\mathcal{F}, \mathcal{G})| \\
& \leq 2 \sum_{0 \leq i \leq k-2}\binom{n-1}{i}+\binom{n-2}{k-2}+(2 k+1)\binom{n-2}{k-3} \\
& \stackrel{\text { (8) }}{\leq} \sum_{0 \leq i \leq k-2}\binom{n-1}{i}+\frac{n-2-2}{n-2-2(k-1)}\binom{n-4}{k-2}+\frac{(2 k+1)(k-2)}{n-1}\binom{n-1}{k-2} \\
& \text { (8) } 2 \sum_{0 \leq i \leq k-2}\binom{n-1}{i}+\frac{n-4}{n-2 k}\binom{n-4}{k-2}+\frac{(2 k+1)(k-2)}{n-1} \frac{n-1-3}{n-1-3(k-1)}\binom{n-4}{k-2} \\
& \text { (99) } \frac{2(n-4)}{n-1-3 k} \sum_{0 \leq i \leq k-2}\binom{n-4}{i}+\frac{n-4}{n-2 k}\binom{n-4}{k-2}+\frac{(2 k+1)(k-2)(n-4)}{(n-1)(n-3 k)}\binom{n-2}{k-3} .
\end{aligned}
$$

Note that $n \geq 63 k$ implies

$$
\frac{2(n-4)}{n-1-3 k} \leq \frac{21}{10}, \frac{n-4}{n-2 k} \leq \frac{11}{10}
$$

and $n \geq 44 k^{2}$ implies

$$
\frac{(2 k+1)(k-2)}{n-1} \leq \frac{1}{22}, \frac{n-4}{n-3 k} \leq \frac{11}{10} .
$$

Thus,

$$
\begin{align*}
|\mathcal{I}(\mathcal{F}, \mathcal{G})| & \leq \frac{21}{10} \sum_{0 \leq i \leq k-2}\binom{n-4}{i}+\frac{11}{10}\binom{n-4}{k-2}+\frac{1}{20}\binom{n-4}{k-2} \\
& <\frac{13}{4} \sum_{0 \leq i \leq k-2}\binom{n-4}{i}<\left|\mathcal{I}\left(\mathcal{A}_{1}, \mathcal{A}_{2}\right)\right| \tag{16}
\end{align*}
$$

Thus, we may assume that $s_{1}, s_{2} \geq 2$. Let us partition $\mathcal{F}$ into $\mathcal{F}^{\left(s_{1}\right)} \cup \ldots \cup \mathcal{F}^{(k)}$ where $F \in \mathcal{F}^{(\ell)}$ if $\max \left\{|B|: B \in \mathcal{B}_{1}, B \subset F\right\}=\ell$. Similarly, partition $\mathcal{G}$ into $\mathcal{G}^{\left(s_{2}\right)} \cup \ldots \cup \mathcal{G}^{(k)}$ where $G \in \mathcal{G}^{(\ell)}$ if $\max \left\{|B|: B \in \mathcal{B}_{2}, B \subset G\right\}=\ell$.

Fix an $F \in \mathcal{F}^{(\ell)}$ with $B_{1} \subset F, B_{1} \in \mathcal{B}_{1}^{(\ell)}$. For an arbitrary $G \in \mathcal{G}$, we have

$$
F \cap G=\left(B_{1} \cap G\right) \cup\left(\left(F \backslash B_{1}\right) \cap G\right)
$$

where $B_{1} \cap G \neq \emptyset$ and $\left|\left(F \backslash B_{1}\right) \cap G\right| \leq\left|F \backslash B_{1}\right|=k-\ell$. It follows that for $s_{1} \leq \ell \leq k$

$$
\begin{equation*}
\left|\mathcal{I}\left(\mathcal{F}^{(\ell)}, \mathcal{G}\right)\right| \leq\left|\mathcal{B}_{1}^{(\ell)}\right|\left(2^{\ell}-1\right) \sum_{0 \leq i \leq k-\ell}\binom{n-1}{i} \tag{17}
\end{equation*}
$$

Similarly, for $s_{2} \leq \ell \leq k$

$$
\begin{equation*}
\left|\mathcal{I}\left(\mathcal{F}, \mathcal{G}^{(\ell)}\right)\right| \leq\left|\mathcal{B}_{2}^{(\ell)}\right|\left(2^{\ell}-1\right) \sum_{0 \leq i \leq k-\ell}\binom{n-1}{i} . \tag{18}
\end{equation*}
$$

Let $\alpha$ be the smallest integer such that $\tau\left(\mathcal{B}_{1}^{(\leq \alpha)}\right) \geq 2$ and let $\beta$ be the smallest integer such that $\tau\left(\mathcal{B}_{2}^{(\leq \beta)}\right) \geq 2$. By symmetry, we may assume that $\alpha \geq \beta$. We distinguish three cases.

Case 1. $\beta \geq 3$. Let $\mathcal{F}^{\prime}=\mathcal{F}^{\left(s_{1}\right)} \cup \cdots \cup \mathcal{F}^{(\beta-1)}$. Note that $\mathcal{F}^{\prime}$ and $\mathcal{G}$ are cross-intersecting and $\mathcal{F}^{\prime}$ is a star. By (15) and (16), we have

$$
\begin{equation*}
\left|\mathcal{I}\left(\mathcal{F}^{\prime}, \mathcal{G}\right)\right| \leq 2 \sum_{0 \leq i \leq k-2}\binom{n-1}{i}+\binom{n-2}{k-2}+(2 k+1)\binom{n-2}{k-3}<\frac{13}{4} \sum_{0 \leq i \leq k-2}\binom{n-4}{i} \tag{19}
\end{equation*}
$$

Define

$$
f(n, k, \ell)=2^{\ell} \ell^{2} k^{\ell-2} \sum_{0 \leq i \leq k-\ell}\binom{n-1}{i} .
$$

and let

$$
\lambda_{\ell}=\ell^{-2} k^{-\ell+2}\left|\mathcal{B}_{1}^{(\ell)}\right| .
$$

By (17), we see

$$
\sum_{\beta \leq \ell \leq k}\left|\mathcal{I}\left(\mathcal{F}^{(\ell)}, \mathcal{G}\right)\right|=\sum_{\beta \leq \ell \leq k} \lambda_{\ell} f(n, k, \ell) .
$$

Since

$$
\frac{f(n, k, \ell)}{f(n, k, \ell+1)}=\frac{\ell^{2}}{2 k(\ell+1)^{2}} \cdot \frac{\sum_{0 \leq i \leq k-\ell}\binom{n-1}{i}}{\sum_{0 \leq i \leq k-\ell-1}\binom{n-1}{i}} \stackrel{\text { g }}{\geq} \frac{(n-1-k) \ell^{2}}{2 k^{2}(\ell+1)^{2}} \geq 1 \text { for } n \geq 5 k^{2},
$$

$f(n, k, \ell)$ is decreasing as a function of $\ell$. Moreover, by (14) we have

$$
\sum_{\beta \leq \ell \leq k} \lambda_{\ell} \leq 1
$$

Hence,

$$
\begin{equation*}
\sum_{\beta \leq \ell \leq k}\left|\mathcal{I}\left(\mathcal{F}^{(\ell)}, \mathcal{G}\right)\right| \leq f(n, k, \beta) \leq f(n, k, 3)=72 k \sum_{0 \leq i \leq k-3}\binom{n-1}{i} . \tag{20}
\end{equation*}
$$

Using (9) and (10), for $n \geq 2 k+3$ we have

$$
\begin{aligned}
\sum_{\beta \leq \ell \leq k}\left|\mathcal{I}\left(\mathcal{F}^{(\ell)}, \mathcal{G}\right)\right| & \leq 72 k \sum_{0 \leq i \leq k-3}\binom{n-1}{i} \\
& \stackrel{1100}{\leq} \frac{72 k^{2}}{n-1-k} \sum_{0 \leq i \leq k-2}\binom{n-1}{i} \\
& \leq \frac{72 k^{2}}{n-1-k} \frac{n-1-3}{n-1-3 k} \sum_{0 \leq i \leq k-2}\binom{n-4}{i} .
\end{aligned}
$$

Since $n \geq 100 k^{2} \geq 100 k$, we infer

$$
\frac{72 k^{2}}{n-1-k} \leq \frac{8}{11} \text { and } \frac{n-1-3}{n-1-3 k} \leq \frac{33}{32} .
$$

It follows that for $\beta \geq 3$

$$
\begin{equation*}
\sum_{\beta \leq \ell \leq k}\left|\mathcal{I}\left(\mathcal{F}^{(\ell)}, \mathcal{G}\right)\right| \leq \frac{3}{4} \sum_{0 \leq i \leq k-2}\binom{n-4}{i} . \tag{21}
\end{equation*}
$$

Using (19) and (21), we have

$$
|\mathcal{I}(\mathcal{F}, \mathcal{G})| \leq\left|\mathcal{I}\left(\mathcal{F}^{\prime}, \mathcal{G}\right)\right|+\sum_{\beta \leq \ell \leq k}\left|\mathcal{I}\left(\mathcal{F}^{(\ell)}, \mathcal{G}\right)\right| \leq 4 \sum_{0 \leq i \leq k-2}\binom{n-4}{i}<\left|\mathcal{I}\left(\mathcal{A}_{1}, \mathcal{A}_{2}\right)\right| .
$$

Case 2. $\beta=2$ and $\alpha>2$.
By (21) we have

$$
\sum_{3 \leq \ell \leq k}\left|\mathcal{I}\left(\mathcal{F}^{(\ell)}, \mathcal{G}\right)\right| \leq \frac{3}{4} \sum_{0 \leq i \leq k-2}\binom{n-4}{i} .
$$

Since $\alpha>2$, it follows that $\mathcal{F}^{(2)}$ is a star. By (15) and (16), we have

$$
\left|\mathcal{I}\left(\mathcal{F}^{(2)}, \mathcal{G}\right)\right|<\frac{13}{4} \sum_{0 \leq i \leq k-2}\binom{n-4}{i} .
$$

Thus,

$$
|\mathcal{I}(\mathcal{F}, \mathcal{G})| \leq\left|\mathcal{I}\left(\mathcal{F}^{(2)}, \mathcal{G}\right)\right|+\sum_{3 \leq \ell \leq k}\left|\mathcal{I}\left(\mathcal{F}^{(\ell)}, \mathcal{G}\right)\right| \leq 4 \sum_{0 \leq i \leq k-2}\binom{n-4}{i}<\left|\mathcal{I}\left(\mathcal{A}_{1}, \mathcal{A}_{2}\right)\right| .
$$

Case 3. $\beta=\alpha=2$.
Since $\mathcal{B}_{1}^{(2)}, \mathcal{B}_{2}^{(2)}$ are cross-intersecting, we see that $\nu\left(\mathcal{B}_{1}^{(2)}\right) \leq 2$ and $\nu\left(\mathcal{B}_{2}^{(2)}\right) \leq 2$. Moreover, $\beta=\alpha=2$ implies $\tau\left(\mathcal{B}_{1}^{(2)}\right) \geq 2$ and $\tau\left(\mathcal{B}_{2}^{(2)}\right) \geq 2$. It follows that $\mathcal{B}_{1}^{(2)}, \mathcal{B}_{2}^{(2)}$ are either both triangles or both subgraphs of $K_{4}$ with a matching of size two.

Case 3.1. $\mathcal{B}_{1}^{(2)}, \mathcal{B}_{2}^{(2)}$ are both triangles.
Without loss of generality, assume that $\mathcal{B}_{1}^{(2)}=\mathcal{B}_{2}^{(2)}=\{(1,2),(1,3),(2,3)\}$. By saturatedness, we have

$$
\mathcal{F}=\mathcal{G}=\mathcal{A}_{3}=\left\{A \in\binom{[n]}{k}:|A \cap\{1,2,3\}| \geq 2\right\} .
$$

Therefore,

$$
\begin{aligned}
|\mathcal{I}(\mathcal{F}, \mathcal{G})| & =\left|\mathcal{I}\left(\mathcal{A}_{3}, \mathcal{A}_{3}\right)\right| \\
& =3 \sum_{0 \leq i \leq k-2}\binom{n-3}{i}+3 \sum_{0 \leq i \leq k-3}\binom{n-3}{i}+\sum_{0 \leq i \leq k-4}\binom{n-3}{i} \\
& \stackrel{\text { (9) }}{\leq} \frac{n-4}{n-3-k}\left(3 \sum_{0 \leq i \leq k-2}\binom{n-4}{i}+3 \sum_{0 \leq i \leq k-3}\binom{n-4}{i}+\sum_{0 \leq i \leq k-4}\binom{n-4}{i}\right) .
\end{aligned}
$$

Since $n \geq 13 k$ implies $\frac{n-4}{n-3-k} \leq \frac{13}{12}$, we obtain that
$|\mathcal{I}(\mathcal{F}, \mathcal{G})|<\frac{13}{4} \sum_{0 \leq i \leq k-2}\binom{n-4}{i}+\frac{13}{4} \sum_{0 \leq i \leq k-3}\binom{n-4}{i}+2 \sum_{0 \leq i \leq k-4}\binom{n-4}{i}<\left|\mathcal{I}\left(\mathcal{A}_{1}, \mathcal{A}_{2}\right)\right|$.

Case 3.2. $\mathcal{B}_{1}^{(2)}, \mathcal{B}_{2}^{(2)}$ are both subgraphs of $K_{4}$ with a matching of size two.
By symmetry, we may assume that $(1,3),(2,4) \in \mathcal{B}_{1}^{(2)}$ and $(1,2),(3,4) \in \mathcal{B}_{2}^{(2)}$. We further assume that $\left|\mathcal{B}_{1}^{(2)}\right| \geq\left|\mathcal{B}_{2}^{(2)}\right|$.

Case 3.2.1. $\mathcal{B}_{1}^{(2)}=\{(1,3),(2,4),(1,4),(2,3)\}$ and $\mathcal{B}_{2}^{(2)}=\{(1,2),(3,4)\}$.
Since $\mathcal{F}, \mathcal{G}$ are saturated, we have $\mathcal{F}=\mathcal{F}^{(2)}$ and $\mathcal{G}=\mathcal{G}^{(2)}$. Thus,

$$
\begin{aligned}
& |\mathcal{I}(\mathcal{F}, \mathcal{G})|=4 \sum_{0 \leq i \leq k-2}\binom{n-4}{i}+6 \sum_{0 \leq i \leq k-3}\binom{n-4}{i}+4 \sum_{0 \leq i \leq k-4}\binom{n-4}{i} \\
& \quad+\sum_{0 \leq i \leq k-5}\binom{n-4}{i} \\
& <
\end{aligned}
$$

Case 3.2.2. $\mathcal{B}_{1}^{(2)}=\{(1,3),(2,4),(1,4)\}$ and $\mathcal{B}_{2}^{(2)}=\{(1,2),(3,4),(1,4)\}$.
Since $\mathcal{F}, \mathcal{G}$ are saturated, we have $\mathcal{F}=\mathcal{F}^{(2)}$ and $\mathcal{G}=\mathcal{G}^{(2)}$. Thus,

$$
\begin{aligned}
|\mathcal{I}(\mathcal{F}, \mathcal{G})|= & 4 \sum_{0 \leq i \leq k-2}\binom{n-4}{i}+6 \sum_{0 \leq i \leq k-3}\binom{n-4}{i}+4 \sum_{0 \leq i \leq k-4}\binom{n-4}{i} \\
& +\sum_{0 \leq i \leq k-5}\binom{n-4}{i} \\
< & \left|\mathcal{I}\left(\mathcal{A}_{1}, \mathcal{A}_{2}\right)\right| .
\end{aligned}
$$

Case 3.2.3. $\mathcal{B}_{1}^{(2)}=\{(1,3),(2,4)\}$ and $\mathcal{B}_{2}^{(2)}=\{(1,2),(3,4)\}$.
By Lemma 3.1, we have $\mathcal{S}_{13} \cup \mathcal{S}_{24} \subset \mathcal{F}$ and $\mathcal{S}_{12} \cup \mathcal{S}_{34} \subset \mathcal{G}$. Let $\mathcal{F}^{\prime}=\mathcal{F} \backslash\left(\mathcal{S}_{13} \cup \mathcal{S}_{24}\right)$ and $\mathcal{G}^{\prime}=\mathcal{G} \backslash\left(\mathcal{S}_{12} \cup \mathcal{S}_{34}\right)$. Since $\mathcal{B}_{1}^{(2)}, \mathcal{G}^{\prime}$ are cross-intersecting, $G \cap\{1,3\} \neq \emptyset$ and $G \cap\{2,4\} \neq \emptyset$ for all $G \in \mathcal{G}^{\prime}$. Moreover, $G \notin \mathcal{S}_{12} \cup \mathcal{S}_{34}$. It follows that $G \cap[4]=\{1,4\}$ or $G \cap[4]=\{2,3\}$ for all $G \in \mathcal{G}^{\prime}$. Similarly, $F \cap[4]=\{1,4\}$ or $F \cap[4]=\{2,3\}$ for all $F \in \mathcal{F}^{\prime}$. Let

$$
\mathcal{F}_{14}^{\prime}=\left\{F: F \in \mathcal{F}^{\prime}, F \cap[4]=\{1,4\}\right\}, \mathcal{F}_{23}^{\prime}=\left\{F: F \in \mathcal{F}^{\prime}, F \cap[4]=\{2,3\}\right\}
$$

and

$$
\mathcal{G}_{14}^{\prime}=\left\{G: G \in \mathcal{G}^{\prime}, G \cap[4]=\{1,4\}\right\}, \mathcal{G}_{23}^{\prime}=\left\{G: G \in \mathcal{G}^{\prime}, G \cap[4]=\{2,3\}\right\} .
$$

Since $\mathcal{F}_{14}^{\prime}, \mathcal{G}_{23}^{\prime}$ are cross-intersecting and $\mathcal{F}_{23}^{\prime}, \mathcal{G}_{14}^{\prime}$ are cross-intersecting, by (13) we have

$$
\left|\left(\mathcal{F}_{14}^{\prime} \wedge \mathcal{G}_{23}^{\prime}\right) \cup\left(\mathcal{F}_{23}^{\prime} \wedge \mathcal{G}_{14}^{\prime}\right)\right| \leq 2 \sum_{0 \leq i \leq k-3}\binom{n-6}{i}+\sum_{0 \leq i \leq k-4}\binom{n-6}{i} .
$$

Note that $\mathcal{I}\left(\mathcal{F}_{14}^{\prime}, \mathcal{G} \backslash \mathcal{G}_{23}^{\prime}\right) \subset \mathcal{I}\left(\mathcal{S}_{13} \cup \mathcal{S}_{24}, \mathcal{S}_{12} \cup \mathcal{S}_{34}\right)$ and $\mathcal{I}\left(\mathcal{F}_{23}^{\prime}, \mathcal{G} \backslash \mathcal{G}_{14}^{\prime}\right) \subset \mathcal{I}\left(\mathcal{S}_{13} \cup \mathcal{S}_{24}, \mathcal{S}_{12} \cup\right.$ $\mathcal{S}_{34}$ ). Thus,

$$
\begin{aligned}
|\mathcal{I}(\mathcal{F}, \mathcal{G})|= & \left|\mathcal{I}\left(\mathcal{S}_{13} \cup \mathcal{S}_{24}, \mathcal{S}_{12} \cup \mathcal{S}_{34}\right)\right|+\left|\left(\mathcal{F}_{14}^{\prime} \wedge \mathcal{G}_{23}^{\prime}\right) \cup\left(\mathcal{F}_{23}^{\prime} \wedge \mathcal{G}_{14}^{\prime}\right)\right| \\
\leq & 4 \sum_{0 \leq i \leq k-2}\binom{n-4}{i}+6 \sum_{0 \leq i \leq k-3}\binom{n-4}{i}+4 \sum_{0 \leq i \leq k-4}\binom{n-4}{i} \\
& +\sum_{0 \leq i \leq k-5}\binom{n-4}{i}+2 \sum_{0 \leq i \leq k-3}\binom{n-6}{i}+\sum_{0 \leq i \leq k-4}\binom{n-6}{i} \\
= & \left|\mathcal{I}\left(\mathcal{A}_{1}, \mathcal{A}_{2}\right)\right| .
\end{aligned}
$$

Case 3.2.4. $\mathcal{B}_{1}^{(2)}=\{(1,3),(2,4),(1,4)\}$ and $\mathcal{B}_{2}^{(2)}=\{(1,2),(3,4)\}$.
By Lemma 3.1 (ii), we have $\mathcal{S}_{13} \cup \mathcal{S}_{24} \cup \mathcal{S}_{14} \subset \mathcal{F}$ and $\mathcal{S}_{12} \cup \mathcal{S}_{34} \subset \mathcal{G}$. Let $\mathcal{F}^{\prime}=$ $\mathcal{F} \backslash\left(\mathcal{S}_{13} \cup \mathcal{S}_{24} \cup \mathcal{S}_{14}\right)$ and $\mathcal{G}^{\prime}=\mathcal{G} \backslash\left(\mathcal{S}_{12} \cup \mathcal{S}_{34}\right)$. Since $\mathcal{B}_{1}^{(2)}, \mathcal{G}^{\prime}$ are cross-intersecting, $G \cap[4]=\{1,4\}$ for all $G \in \mathcal{G}^{\prime}$. Similarly, $F \cap[4]=\{2,3\}$ for all $F \in \mathcal{F}^{\prime}$. Since $\mathcal{F}^{\prime}, \mathcal{G}^{\prime}$ are cross-intersecting, by (3) we have

$$
\left|\mathcal{F}_{23}^{\prime} \wedge \mathcal{G}_{14}^{\prime}\right| \leq \sum_{0 \leq i \leq k-3}\binom{n-5}{i}<2 \sum_{0 \leq i \leq k-3}\binom{n-6}{i}+\sum_{0 \leq i \leq k-4}\binom{n-6}{i}
$$

Note that $\mathcal{I}\left(\mathcal{F}_{23}^{\prime}, \mathcal{G} \backslash \mathcal{G}_{14}^{\prime}\right) \subset \mathcal{I}\left(\mathcal{S}_{13} \cup \mathcal{S}_{24}, \mathcal{S}_{12} \cup \mathcal{S}_{34}\right)$. Thus,

$$
|\mathcal{I}(\mathcal{F}, \mathcal{G})|=\left|\mathcal{I}\left(\mathcal{S}_{13} \cup \mathcal{S}_{24}, \mathcal{S}_{12} \cup \mathcal{S}_{34}\right)\right|+\left|\mathcal{F}_{23}^{\prime} \wedge \mathcal{G}_{14}^{\prime}\right| \leq\left|\mathcal{I}\left(\mathcal{A}_{1}, \mathcal{A}_{2}\right)\right| .
$$

## 4 Distinct intersections in a $t$-intersecting family

In this section, we determine the maximum number of distinct intersections in a $t$ intersecting family.

Since $\mathcal{F} \subset \tilde{\mathcal{F}}$ implies $\mathcal{I}(\mathcal{F}) \subset \mathcal{I}(\tilde{\mathcal{F}})$, we may always assume that $\mathcal{F}$ is saturated. Let $\mathcal{B}=\mathcal{B}_{t}(\mathcal{F})$ be the family of minimal (for containment) sets in $\mathcal{T}_{t}(\mathcal{F})$.
Lemma 4.1. Suppose that $\mathcal{F} \subset\binom{[n]}{k}$ is a saturated t-intersecting family. Then (i) and (ii) hold.
(i) $\mathcal{B}$ is a t-intersecting antichain,
(ii) $\mathcal{F}=\left\{H \in\binom{[n]}{k}: \exists B \in \mathcal{B}, B \subset H\right\}$.

Proof. (i) Clearly, $\mathcal{B}$ is an anti-chain. Suppose for contradiction that $B, B^{\prime} \in \mathcal{B}$ but $\left|B \cap B^{\prime}\right|<t$. If $|B|=\left|B^{\prime}\right|=k$, then $B, B^{\prime} \in \mathcal{F}$ as $\mathcal{F}$ is saturated, a contradiction. If $\left|B^{\prime}\right|<k$, then there exists $F^{\prime} \supset B^{\prime}$ such that $\left|F^{\prime}\right|=k$ and $\left|F^{\prime} \cap B\right|=\left|B^{\prime} \cap B\right|<t$. By definition $F^{\prime} \in \mathcal{T}_{t}(\mathcal{F})$. Since $\mathcal{F}$ is saturated, we see that $F^{\prime} \in \mathcal{F}$. But this contradicts the assumption that $B$ is a $t$-transversal. Since $\mathcal{F}$ is saturated, (ii) is immediate from the definition of $\mathcal{B}$.

Let $r(\mathcal{B})=\max \{|B|: B \in \mathcal{B}\}$ and $s(\mathcal{B})=\min \{|B|: B \in \mathcal{B}\}$. For any $\ell$ with $s(\mathcal{B}) \leq$ $\ell \leq r(\mathcal{B})$ define

$$
\mathcal{B}^{(\ell)}=\{B \in \mathcal{B}:|B|=\ell\} \text { and } \mathcal{B}^{(\leq \ell)}=\bigcup_{i=s(\mathcal{B})}^{\ell} \mathcal{B}^{(i)} .
$$

It is easy to see that $s\left(\mathcal{B}_{t}(\mathcal{F})\right)=\tau_{t}(\mathcal{F})$.
Lemma 4.2. Suppose that $\mathcal{F} \subset\binom{[n]}{k}$ is a saturated $t$-intersecting family and $\mathcal{B}=\mathcal{B}_{t}(\mathcal{F})$. If $s(\mathcal{B}) \geq t+1$ and $\tau_{t}\left(\mathcal{B}^{(\leq r)}\right) \geq t+1$, then

$$
\begin{equation*}
\sum_{r \leq \ell \leq k}\left(\binom{\ell}{t} \ell k^{\ell-t-1}\right)^{-1}\left|\mathcal{B}^{(\ell)}\right| \leq 1 \tag{22}
\end{equation*}
$$

Proof. For the proof we use a branching process. During the proof a sequence $S=$ $\left(x_{1}, x_{2}, \ldots, x_{\ell}\right)$ is an ordered sequence of distinct elements of $[n]$ and we use $\widehat{S}$ to denote the underlying unordered set $\left\{x_{1}, x_{2}, \ldots, x_{\ell}\right\}$. At the beginning, we assign weight 1 to the empty sequence $S_{\emptyset}$. At the first stage, we choose $B_{1} \in \mathcal{B}_{t}$ with $\left|B_{1}\right|=s(\mathcal{B}) \geq t+1$. For any $t$-subset $\left\{x_{1}, \ldots, x_{t}\right\} \subset B_{1}$, define one sequence $\left(x_{1}, \ldots, x_{t}\right)$ and assign the weight $\binom{s(\mathcal{B})}{t}^{-1}$ to it.

At the second stage, since $\tau_{t}\left(\mathcal{B}^{(\leq r)}\right) \geq t+1$, for each $t$-sequence $S=\left(x_{1}, \ldots, x_{t}\right)$ we may choose $B \in \mathcal{B}^{(\leq r)}$ such that $|\widehat{S} \cap B|<t$. Then we replace $S=\left(x_{1}, \ldots, x_{t}\right)$ by $|B \backslash \widehat{S}|$ $(t+1)$-sequences of the form $\left(x_{1}, \ldots, x_{t}, y\right)$ with $y \in B \backslash \widehat{S}$ and weight $\frac{w(S)}{|B \backslash \widehat{S}|}$.

In each subsequent stage, we pick a sequence $S=\left(x_{1}, \ldots, x_{p}\right)$ and denote its weight by $w(S)$. If $|\widehat{S} \cap B| \geq t$ for all $B \in \mathcal{B}$ then we do nothing. Otherwise we pick $B \in \mathcal{B}$ satisfying $|\widehat{S} \cap B|<t$ and replace $S$ by the $|B \backslash \widehat{S}|$ sequences $\left(x_{1}, \ldots, x_{p}, y\right)$ with $y \in B \backslash \widehat{S}$ and assign weight $\frac{w(S)}{|B \backslash \widehat{S}|}$ to each of them. clearly, the total weight is always 1.

We continue until $|\widehat{S} \cap B| \geq t$ for all sequences and all $B \in \mathcal{B}$. Since $[n]$ is finite, each sequence has length at most $n$ and eventually the process stops. Let $\mathcal{S}$ be the collection of sequences that survived in the end of the branching process and let $\mathcal{S}^{(\ell)}$ be the collection of sequences in $\mathcal{S}$ with length $\ell$.

Claim 2. To each $B \in \mathcal{B}^{(\ell)}$ with $\ell \geq r$ there is some sequence $S \in \mathcal{S}^{(\ell)}$ with $\widehat{S}=B$.

Proof. Let us suppose the contrary and let $S=\left(x_{1}, \ldots, x_{p}\right)$ be a sequence of maximal length that occurred at some stage of the branching process satisfying $\widehat{S} \varsubsetneqq B$. Since $\mathcal{B}$ is $t$-intersecting, $\left|B \cap B_{1}\right| \geq t$, implying that $p \geq t$. Since $\widehat{S}$ is a proper subset of $B$, there exists $F \in \mathcal{F}$ with $|\widehat{S} \cap F|<t$. In view of Lemma 4.1 (ii) we can find $B^{\prime} \in \mathcal{B}$ such that $\left|\widehat{S} \cap B^{\prime}\right|<t$. Thus at some point we picked $S$ and some $\tilde{B} \in \mathcal{B}$ with $|\widehat{S} \cap \tilde{B}|<t$. Since $\mathcal{B}$ is $t$-intersecting, $|B \cap \tilde{B}| \geq t$. Consequently, for each $y \in B \cap(\tilde{B} \backslash \widehat{S})$ the sequence $\left(x_{1}, \ldots, x_{p}, y\right)$ occurred in the branching process. This contradicts the maximality of $p$. Hence there is an $S$ at some stage satisfying $\widehat{S}=B$. Since $\mathcal{B}$ is $t$-intersecting, $\left|\widehat{S} \cap B^{\prime}\right| \geq t$ for all $B^{\prime} \in \mathcal{B}$. Thus $\widehat{S} \in \mathcal{S}$ and the claim holds.

By Claim 2, we see that $\left|\mathcal{B}^{(\ell)}\right| \leq\left|\mathcal{S}^{(\ell)}\right|$. Let $S=\left(x_{1}, \ldots, x_{\ell}\right) \in \mathcal{S}^{(\ell)}$ and let $S_{i}=\left(x_{1}, \ldots, x_{i}\right)$ for $i=1, \ldots, \ell$. At the first stage, $w\left(S_{t}\right)=1 /\binom{s(\mathcal{B})}{t}$. Assume that $B_{i}$ is the selected set when replacing $S_{i-1}$ in the branching process for $i=t+1, \ldots, \ell$. Clearly, $x_{i} \in B_{i}$, $B_{t+1} \in \mathcal{B}^{(\leq r)}$ and

$$
w(S)=\frac{1}{\binom{s(\mathcal{B})}{t}} \prod_{i=t+1}^{\ell} \frac{1}{\left|B_{i} \backslash \widehat{S_{i-1}}\right|}
$$

Note that $s(\mathcal{B}) \leq r \leq \ell,\left|B_{t+1} \backslash \widehat{S_{t}}\right| \leq \ell$ and $\left|B_{i} \backslash \widehat{S_{i-1}}\right| \leq k$ for $i \geq t+2$. It follows that

$$
w(S) \geq\left(\binom{\ell}{t} \ell k^{\ell-t-1}\right)^{-1}
$$

Thus,

$$
\sum_{r \leq \ell \leq k}\left(\binom{\ell}{t} \ell k^{\ell-t-1}\right)^{-1}\left|\mathcal{B}^{(\ell)}\right| \leq \sum_{r \leq \ell \leq k} \sum_{S \in \mathcal{S}^{(\ell)}} w(S) \sum_{S \in \mathcal{S}} w(S)=1
$$

Lemma 4.3. Suppose that $\tau_{t}\left(\mathcal{B}^{(t+1)} \geq t+1\right.$. Then $\mathcal{F}=\mathcal{A}(n, k, t)$.

Proof. Choose $B_{1}, B_{2} \in \mathcal{B}^{(t+1)}$ and assume by symmetry that $B_{i}=[t] \cup\{t+i\}$ for $i=1,2$. Since $\tau_{t}\left(\mathcal{B}^{(t+1)}\right) \geq t+1$, we may choose $B_{3} \in \mathcal{B}^{(t+1)}$ satisfying $[t] \nsubseteq B_{3}$. Now $\left|B_{2} \cap B_{i}\right| \geq t$ implies $\{t+1, t+2\} \subset B_{3}$. Using $\left|B_{3}\right|=t+1$, by symmetry we may assume that $B_{3}=[t+2] \backslash\{t\}$. Now take an arbitrary $F \in \mathcal{F}$. It is clear that $\left|F \cap B_{i}\right| \geq t$ can only hold for all $1 \leq i \leq 3$ if $|F \cap[t+2]| \geq t+1$. That is $\mathcal{F} \subset \mathcal{A}(n, k, t)$. Since $\mathcal{F}$ is saturated, $\mathcal{F}=\mathcal{A}(n, k, t)$.

Proof of Theorem 1.8. By (15) and (9), we have

$$
\begin{aligned}
\left|\mathcal{I}\left(\mathcal{S}_{[t]}\right)\right| & =\sum_{0 \leq i \leq k-t-1}\binom{n-t}{i} \\
& \stackrel{\text { (9) }}{\leq} \frac{n-t-2}{n-t-2 k} \sum_{0 \leq i \leq k-t-1}\binom{n-t-2}{i} \\
& <\binom{t+2}{t} \sum_{0 \leq i \leq k-t-1}\binom{n-t-2}{i} \\
& <|\mathcal{I}(\mathcal{A}(n, k, t))| .
\end{aligned}
$$

Thus, we may assume that $s=s(\mathcal{B}) \geq t+1$. Let us partition $\mathcal{F}$ into $\mathcal{F}^{(s)} \cup \ldots \cup \mathcal{F}^{(k)}$ where $F \in \mathcal{F}^{(\ell)}$ if $\max \{|B|: B \in \mathcal{B}, B \subset F\}=\ell$. Set

$$
\mathcal{I}_{\ell}=\left\{F \cap F^{\prime}: F \in \mathcal{F}^{(\ell)}, F^{\prime} \in \mathcal{F}^{(s)} \cup \ldots \cup \mathcal{F}^{(\ell)}\right\}
$$

Then

$$
|\mathcal{I}(\mathcal{F})| \leq \sum_{s \leq \ell \leq k}\left|\mathcal{I}_{\ell}\right|
$$

The point is that for $F \in \mathcal{F}^{(\ell)}$ and $B \subset F, B \in \mathcal{B}^{\ell}$ for an arbitrary $F^{\prime} \in \mathcal{F}$,

$$
F \cap F^{\prime}=\left(B \cap F^{\prime}\right) \cup\left((F \backslash B) \cap F^{\prime}\right)
$$

Note that $\left|B \cap F^{\prime}\right| \geq t$ and $\left|(F \backslash B) \cap F^{\prime}\right| \leq|F \backslash B|=k-\ell$. It follows that for $s \leq \ell \leq k$

$$
\begin{equation*}
\left|\mathcal{I}_{\ell}\right| \leq\left(\sum_{t \leq j \leq \ell}\binom{\ell}{j}\right)\left|\mathcal{B}^{(\ell)}\right| \sum_{0 \leq i \leq k-\ell}\binom{n-t}{i} \tag{23}
\end{equation*}
$$

Let $\alpha$ be the smallest integer such that $\tau_{t}\left(\mathcal{B}^{(\leq \alpha)}\right) \geq t+1$. The family $\mathcal{F}^{\prime}=\cup_{i=l}^{\alpha-1} \mathcal{F}^{(i)}$ is a trivial $t$-intersecting family. By (9), we have for $n \geq 5 k$

$$
\begin{align*}
\left|\bigcup_{i=s}^{\alpha-1} \mathcal{I}_{i}\right| \leq\left|\mathcal{I}\left(\mathcal{S}_{[t]}\right)\right| & =\sum_{0 \leq i \leq k-t-1}\binom{n-t}{i} \\
& \stackrel{\text { (9) }}{\leq} \frac{n-t-2}{n-t-2 k} \sum_{0 \leq i \leq k-t-1}\binom{n-t-2}{i} \\
& \leq 2 \sum_{0 \leq i \leq k-t-1}\binom{n-t-2}{i} . \tag{24}
\end{align*}
$$

If $\alpha=s=t+1$, then $\mathcal{B}^{(t+1)}$ is a $t$-intersecting $(t+1)$-uniform family with $t$-covering number $t+1$. By Lemma 4.3, $\mathcal{F}=\mathcal{A}(n, k, t)$ and there is nothing to prove. Thus we may assume that $\alpha \geq t+2$.

Define

$$
f(n, k, \ell)=\left(\sum_{t \leq j \leq \ell}\binom{\ell}{j}\right)\binom{\ell}{t} \ell k^{\ell-t-1} \sum_{0 \leq i \leq k-\ell}\binom{n-t}{i}
$$

and let

$$
\lambda_{\ell}=\left(\binom{\ell}{t} \ell k^{\ell-t-1}\right)^{-1}\left|\mathcal{B}^{(\ell)}\right|
$$

Then by (23)

$$
\begin{equation*}
\sum_{\alpha \leq \ell \leq k}\left|\mathcal{I}_{\ell}\right|=\sum_{\alpha \leq \ell \leq k} \lambda_{\ell} \cdot f(n, k, \ell) \tag{25}
\end{equation*}
$$

By (10) and (11), we have

$$
\begin{aligned}
\frac{f(n, k, \ell)}{f(n, k, \ell+1)} & =\frac{\sum_{t \leq j \leq \ell}\binom{\ell}{j}}{\sum_{t \leq j \leq \ell+1}\binom{\ell+1}{j}} \cdot \frac{\binom{\ell}{t} \ell k^{\ell-t-1}}{\binom{\ell+1}{t}(\ell+1) k^{\ell-t}} \cdot \frac{\sum_{0 \leq i \leq k-\ell}\binom{n-t}{i}}{\sum_{0 \leq i \leq k-\ell-1}\binom{n-t}{i}} \\
& \geq \frac{1}{2(t+1)} \cdot \frac{(\ell+1-t) \ell}{(\ell+1)^{2} k} \cdot \frac{n-t-k}{k} .
\end{aligned}
$$

By $\ell \geq t+1 \geq 3$, we have

$$
\frac{\ell+1-t}{\ell+1} \cdot \frac{\ell}{\ell+1} \geq \frac{2}{t+2} \cdot \frac{3}{4} \geq \frac{3}{2(t+2)}
$$

Then by $n \geq \frac{4}{3}(t+2)^{2} k^{2}$

$$
\frac{f(n, k, \ell)}{f(n, k, \ell+1)} \geq \frac{3(n-t-k)}{4(t+1)(t+2) k^{2}} \geq 1
$$

Hence $f(n, k, \ell)$ is decreasing as a function of $\ell$. Moreover, (22) implies $\sum_{\alpha \leq \ell \leq k} \lambda_{\ell} \leq 1$. From (25) we see

$$
\sum_{\alpha \leq \ell \leq k}\left|\mathcal{I}_{\ell}\right| \leq f(n, k, \alpha) \leq f(n, k, t+2)
$$

Therefore,

$$
\begin{aligned}
\sum_{\alpha \leq \ell \leq k}\left|\mathcal{I}_{\ell}\right| & \leq\left(\binom{t+2}{t}+\binom{t+2}{t+1}+\binom{t+2}{t+2}\right)\binom{t+2}{t}(t+2) k \sum_{0 \leq i \leq k-t-2}\binom{n-t}{i} \\
& \quad \frac{(10)}{\leq} \frac{(t+2)^{2}(t+1)\left(t^{2}+5 t+8\right) k}{4} \cdot \frac{k}{n-t-k} \sum_{0 \leq i \leq k-t-1}\binom{n-t}{i} \\
& \leq \frac{(9)}{\leq}(t+2)^{2}(t+1)(t+2)(t+4) k^{2}(n-t-2) \\
4(n-t-k)(n-t-2 k) & \sum_{0 \leq i \leq k-t-1}\binom{n-t-2}{i} .
\end{aligned}
$$

Note that $n \geq 5 k$ implies

$$
\frac{n-t-2}{n-t-2 k} \leq 2
$$

and $n \geq 3(t+2)^{3} k^{2}, t \geq 2$ imply

$$
\frac{(t+2)^{3}(t+1)(t+4) k^{2}}{4(n-t-k)} \leq \frac{1}{2}\left(\binom{t+2}{2}-2\right)
$$

It follows that

$$
\begin{equation*}
\sum_{\alpha \leq \ell \leq k}\left|\mathcal{I}_{\ell}\right| \leq\left(\binom{t+2}{2}-2\right) \sum_{0 \leq i \leq k-t-1}\binom{n-t-2}{i} \tag{26}
\end{equation*}
$$

By (24) and (26), we obtain that

$$
|\mathcal{I}(\mathcal{F})| \leq\left|\bigcup_{i=s}^{\alpha-1} \mathcal{I}_{i}\right|+\sum_{\alpha \leq \ell \leq k}\left|\mathcal{I}_{\ell}\right|<|\mathcal{I}(\mathcal{A}(n, k, t))|
$$

concluding the proof of the theorem.

## 5 Further problems and results

In their seminal paper [1] Erdős, Ko and Rado actually proved their main result for antichains. Namely, instead of considering $k$-graphs $\mathcal{F} \subset\binom{[n]}{k}$ they suppose that $\mathcal{F}$ is an antichain of rank $k$, that is $|F| \leq k$ for all $F \in \mathcal{F}$. The reason that this tendency has all but disappeared from recent research is that a $t$-intersecting antichain $\mathcal{F}$ of rank $k$ which is not $k$-uniform can always be replaced by a t-intersecting family $\tilde{\mathcal{F}} \subset\binom{[n]}{k}$ with $|\tilde{\mathcal{F}}|>|\mathcal{F}|$. The way to do is to apply an operation on antichains discovered already by Sperner [8].

For a family $\mathcal{A} \subset\binom{[n]}{a}$ define its shade $\sigma^{+}(\mathcal{A})$ by

$$
\sigma^{+}(\mathcal{A})=\left\{B \in\binom{[n]}{a+1}: \exists A \in \mathcal{A}, A \subset B\right\}
$$

Sperner [8] proved that for $a<n / 2,\left|\sigma^{+}(\mathcal{A})\right| \geq|\mathcal{A}|$ with strict inequality unless $a=\frac{n-1}{2}$ and $\mathcal{A}=\binom{[n]}{\frac{n-1}{2}}$. Let $\mathcal{F} \subset 2^{[n]}$ be a $t$-intersecting antichain of rank $k, n \geq 2 k-t$. Suppose that $a=\min \{|F|: F \in \mathcal{F}\}$ and $a<k$. Define

$$
\mathcal{F}^{(a)}=\{F \in \mathcal{F}:|\mathcal{F}|=a\} \text { and } \tilde{\mathcal{F}}=\left(F \backslash \mathcal{F}^{(a)}\right) \cup \sigma^{+}\left(\mathcal{F}^{(a)}\right)
$$

Then not only is $\tilde{\mathcal{F}}$ a $t$-intersecting antichain of $\operatorname{rank} k$ with $|\tilde{\mathcal{F}}|>|\mathcal{F}|$ but $\mathcal{I}(\tilde{\mathcal{F}}) \supset \mathcal{I}(\mathcal{F})$ can be checked easily as well. This shows that it was reasonable to restrict our attention to $k$-uniform families.

However there is a related, very natural problem.
Problem 5.1. Determine or estimate $\max |\mathcal{I}(\mathcal{A})|$ over all antichain $\mathcal{A} \subset 2^{[n]}$.
Example 5.2. Let $\ell \leq \frac{n}{2}$ and define $\mathcal{A}=\binom{[n]}{n-\ell}$. Clearly,

$$
\mathcal{I}(\mathcal{A})=\{B \subset[n]: n-2 \ell \leq|B|<n-\ell\} .
$$

Choosing $\ell=\lfloor n / 3\rfloor$, we have

$$
|\mathcal{I}(\mathcal{A})|=2^{n}-\sum_{0 \leq i \leq\left\lfloor\frac{n}{3}\right\rfloor}\binom{n}{i}-\sum_{0 \leq j \leq n-2\left\lfloor\frac{n}{3}\right\rfloor}\binom{n}{j} .
$$

Proposition 5.3. If $\mathcal{A} \subset 2^{[n]}$ is an antichain, then $|\mathcal{I}(\mathcal{A})|<2^{n}-\sqrt{2}^{n}$.
Proof. Note that

$$
|\mathcal{I}(\mathcal{A})| \leq\binom{|\mathcal{A}|}{2}
$$

Consequently, if $|\mathcal{A}| \leq \sqrt{2}^{n}$ then $|\mathcal{I}(\mathcal{A})|<2^{n} / 2<2^{n}-\sqrt{2}^{n}$. Thus we can assume $|\mathcal{A}|>\sqrt{2}^{n}$. Since $\mathcal{A} \cap \mathcal{I}(\mathcal{A})=\emptyset$, we have

$$
|\mathcal{I}(\mathcal{A})| \leq 2^{n}-|\mathcal{A}|<2^{n}-\sqrt{2}^{n}
$$

Two families $\mathcal{A}, \mathcal{B}$ are called cross-Sperner if $A \not \subset B$ and $B \not \subset A$ hold for all $A \in \mathcal{A}$, $B \in \mathcal{B}$. Set

$$
\mathcal{I}(\mathcal{A}, \mathcal{B})=\{A \cap B: A \in \mathcal{A}, B \in \mathcal{B}\}
$$

Define

$$
m(n)=\max \left\{|\mathcal{I}(\mathcal{A}, \mathcal{B})|: \mathcal{A}, \mathcal{B} \subset 2^{[n]} \text { are cross-Sperner }\right\}
$$

Example 5.4. Let $[n]=X \cup Y$ be a partition. Define

$$
\mathcal{A}=\{A \cup Y: A \subsetneq X\}, \mathcal{B}=\{X \cup B: B \subsetneq Y\}
$$

Then

$$
\mathcal{I}(\mathcal{A}, \mathcal{B})=\{A \cup B: A \subsetneq X, B \subsetneq Y\}
$$

and

$$
|\mathcal{I}(\mathcal{A}, \mathcal{B})|=2^{n}-2^{|X|}-2^{|Y|}+1
$$

Theorem 5.5. $m(n)=2^{n}-2 \cdot 2^{n / 2}+1$ holds for $n=2 d$ even.
Proof. The lower bound comes from the example with $|X|=\lfloor n / 2\rfloor,|Y|=\lceil n / 2\rceil$. Note that for $A, A^{\prime} \in \mathcal{A}, B, B^{\prime} \in \mathcal{B}$ the cross-Sperner property implies $A \not \subset A^{\prime} \cap B^{\prime}, B \not \subset A^{\prime} \cap B^{\prime}$. In particular,

$$
\mathcal{A} \cap \mathcal{I}(\mathcal{A}, \mathcal{B})=\emptyset=\mathcal{B} \cap \mathcal{I}(\mathcal{A}, \mathcal{B})
$$

Cross-Sperner property implies $\mathcal{A} \cap \mathcal{B}=\emptyset$ and $[n] \notin \mathcal{A} \cup \mathcal{B} \cup \mathcal{I}(\mathcal{A}, \mathcal{B})$. Thus

$$
|\mathcal{A}|+|\mathcal{B}|+|\mathcal{I}(\mathcal{A}, \mathcal{B})| \leq 2^{n}-1
$$

or equivalently

$$
\begin{equation*}
|\mathcal{I}(\mathcal{A}, \mathcal{B})| \leq 2^{n}-|\mathcal{A}|-|\mathcal{B}|-1 \tag{27}
\end{equation*}
$$

Obviously,

$$
\begin{equation*}
|\mathcal{I}(\mathcal{A}, \mathcal{B})| \leq|\mathcal{A}| \cdot|\mathcal{B}| \tag{28}
\end{equation*}
$$

Suppose that $n=2 d$ (even). If $|A|+|B| \geq 2\left(2^{d}-1\right)$, then (27) implies

$$
|\mathcal{I}(\mathcal{A}, \mathcal{B})| \leq 2^{n}-2 \cdot 2^{d}+1
$$

If $\frac{|A|+|B|}{2} \leq 2^{d}-1$ then the inequality between arithmetic and geometric mean yields via (28):

$$
|\mathcal{I}(\mathcal{A}, \mathcal{B})| \leq\left(2^{d}-1\right)^{2}=2^{n}-2 \cdot 2^{d}+1
$$

However the proof only gives $\mathcal{I}(\mathcal{A}, \mathcal{B}) \leq 2^{n}-2 \cdot 2^{n / 2}+1$ for $n=2 d+1$.
Problem 5.6. For $n=2 d+1$, does $m(n)=2^{n}-2^{d+1}-2^{d}+1$ hold?
