# LINEAR MAPS PRESERVING PRODUCTS EQUAL TO PRIMITIVE IDEMPOTENTS OF AN INCIDENCE ALGEBRA 

JORGE J. GARCÉS AND MYKOLA KHRYPCHENKO

#### Abstract

Let $A, B$ be algebras and $a \in A, b \in B$ a fixed pair of elements. We say that a map $\varphi: A \rightarrow B$ preserves products equal to $a$ and $b$ if for all $a_{1}, a_{2} \in A$ the equality $a_{1} a_{2}=a$ implies $\varphi\left(a_{1}\right) \varphi\left(a_{2}\right)=b$. In this paper we study bijective linear maps $\varphi: I(X, F) \rightarrow I(X, F)$ preserving products equal to primitive idempotents of $I(X, F)$, where $I(X, F)$ is the incidence algebra of a finite connected poset $X$ over a field $F$. We fully characterize the situation, when such a map $\varphi$ exists, and whenever it does, $\varphi$ is either an automorphism of $I(X, F)$ or the negative of an automorphism of $I(X, F)$.

## Introduction

There are several ways to generalize the notion of a homomorphism $\varphi: A \rightarrow B$ between two algebras. One of them deals with a generalization of the equality

$$
\begin{equation*}
\varphi\left(a_{1} a_{2}\right)=\varphi\left(a_{1}\right) \varphi\left(a_{2}\right) \tag{1}
\end{equation*}
$$

leading, for instance, to Jordan and Lie homomorphisms. The other one consists in a restriction of the set of pairs $\left(a_{1}, a_{2}\right)$ for which (1) holds. Perhaps, the most known generalizations in this direction are zero product preservers $\left(a_{1} a_{2}=0\right)$, orthogonality preservers $\left(a_{1} a_{2}=a_{2} a_{1}=0\right)$ and idempotent preservers $\left(a_{1}=a_{2} \in\right.$ $E(A))$. Inspired by the notion of a zero product preserver, Chebotar, Ke, Lee and Shiao [10] proposed to study maps that preserve "constant products", i.e. satisfying

$$
\begin{equation*}
a_{1} a_{2}=a_{3} a_{4} \Rightarrow \varphi\left(a_{1}\right) \varphi\left(a_{2}\right)=\varphi\left(a_{3}\right) \varphi\left(a_{4}\right) \tag{2}
\end{equation*}
$$

[^0]A variant of this property is the following:

$$
\begin{equation*}
a_{1} a_{2}=a \Rightarrow \varphi\left(a_{1}\right) \varphi\left(a_{2}\right)=b, \tag{3}
\end{equation*}
$$

where $a \in A$ and $b \in B$ are fixed. In this case we say that $\varphi$ preserves products equal to $a$ and $b$. If $a$ and $b$ are zero, we get a zero product preserver. If $a$ and $b$ are the identity elements, we get a map preserving the inverses.

Chebotar, Ke , Lee and Shiao [10] proved that a bijective additive map on a division ring satisfying (2) with $a_{1} a_{2}=a_{3} a_{4}$ being the identity element is either an automorphism multiplied by a central element or an anti-automorphism multiplied by a central element. This generalizes an old result [1] Theorem 1.15] on inverse preservers of division rings. Catalano (4) extended the above description by Chebotar, Ke , Lee and Shiao to the case, where $a_{1} a_{2}$ is an arbitrary invertible element of a division ring. Later, this was generalized in [7] to maps on the ring $M_{n}(D)$ of matrices (with usual or Jordan product) over a division ring $D$. The next natural question was to study maps that preserve products equal to non-invertible elements of $M_{n}(D)$. The case, where such products are rank-one idempotents of $M_{n}(\mathbb{C})$, was treated by Catalano in [5], and the corresponding maps were proved to be $\pm$ homomorphisms. Bijective maps on $M_{n}(\mathbb{C})$ preserving products equal to nilpotent matrices were later characterized in [6] by Catalano and Chang-Lee. Catalano and Julius [8] solved the problem, where the products are diagonalizable matrices over $\mathbb{C}$ with the same eigenvalues. Perhaps, the most general situation was considered in [9: one of the products is a matrix from $M_{n}(\mathbb{C})$ of rank at most $n-2$, or both products have the same rank $n-1$. The corresponding product preservers are again of the standard form, i.e. automorphisms multiplied by scalars. When $M_{n}(\mathbb{C})$ is equipped with the Lie bracket $[a, b]=a b-b a$, the description slightly differs, but still reminds the description of commutativity preservers (i.e. zero product preservers with respect to $[-,-]$ ), see [14, 15]. In the setting of $\mathrm{C}^{*}$-algebras the problem of studying linear mappings that are *-homomorphisms at a fixed point has been considered in 3].

Notice that the incidence algebra $I(X, F)$ of a finite poset $X$ over a field $F$ can be seen as a subalgebra of the algebra $T_{n}(F)$ of upper triangular matrices, where $n=|X|$. The primitive idempotents of $I(X, F)$ (which correspond to rank-one idempotent matrices from $\left.T_{n}(F)\right)$ were described in (17) and the automorphisms of $I(X, F)$ have been studied by various authors (see, for example, [19, 2, [12, 16]), so it is natural to ask whether the Catalano's result 5 holds for maps on incidence algebras. Under the assumption that $X$ is connected, we show in Theorem 3.17 that a bijective linear map $\varphi: I(X, F) \rightarrow I(X, F)$ preserving the products equal to fixed primitive idempotents does not always exist, and its existence depends on the existence of an automorphism $\lambda$ of $X$ mapping one fixed element $x \in X$ to another fixed element $y \in X$. If such $\lambda \in \operatorname{Aut}(X)$ exists, then $\varphi$ is either an automorphism of $I(X, F)$ or the negative of an automorphism of $I(X, F)$. Our result can be applied, in particular, to the upper triangular matrix algebra $T_{n}(F)$ (see Corollary 3.18).

## 1. Preliminaries

1.1. Rings and algebras. An element $a$ of a ring $R$ satisfying $a^{2}=a$ is called an idempotent. The set of idempotents of $R$ will be denoted by $E(R)$.

Two elements $a, b \in R$ are orthogonal if $a b=b a=0$. An idempotent $e \in E(R)$ is primitive if $e=e_{1}+e_{2}$ with $e_{1}, e_{2} \in E(R)$ orthogonal implies $e_{1}, e_{2} \in\{0, e\}$.
1.2. Posets. A poset is a pair $(X, \leq)$, where $X$ is a set and $\leq$ is a partial order (i.e., a reflexive, transitive and anti-symmetric binary relation) on $X$. All the posets in this article will be finite. The interval from $x$ to $y$ in a poset $X$ is the subset $[x, y]:=$ $\{z \in X \mid x \leq z \leq y\}$. A chain in $X$ is a non-empty subset $C \subseteq X$ such that for all $x, y \in C$ either $x \leq y$ or $y \leq x$. The length of a chain $C \subseteq X$ is defined to be $|C|-1$. The length of a non-empty poset $X$ is $l(X):=\max \{l(C) \mid C$ is a chain in $X\}$. We write $l(x, y)$ for $l([x, y])$. A walk in $X$ is a sequence $x_{0}, x_{1}, \ldots, x_{m}$ of elements of $X$, such that for all $i=0, \ldots, m-1$ either $x_{i} \leq x_{i+1}$ and $l\left(x_{i}, x_{i+1}\right)=1$ or $x_{i+1} \leq x_{i}$ and $l\left(x_{i+1}, x_{i}\right)=1$. A poset $X$ is connected if for all $x, y \in X$ there exists a walk $x=x_{0}, \ldots, x_{m}=y$.

Given a subset $A \subseteq X^{2}$, denote by $A_{\leq}\left(\right.$resp. $\left.A_{<}\right)$the set $\{(x, y) \in A \mid x \leq y\}$ (resp. $\{(x, y) \in A \mid x<y\}$ ).

A map $\lambda: X \rightarrow Y$ between two posets is order-preserving whenever $x \leq y \Rightarrow$ $\lambda(x) \leq \lambda(y)$ for all $x, y \in X$. An (order) automorphism of a finite poset $X$ is an order-preserving bijection of $X$,
1.3. Incidence algebras. The incidence algebra $I(X, F)$ of a finite poset $X$ over a field $F$ is the $F$-vector space with basis $\left\{e_{x y} \mid x \leq y\right\}$ (called the standard basis) and multiplication

$$
e_{x y} e_{u v}= \begin{cases}e_{x v}, & y=u \\ 0, & y \neq u\end{cases}
$$

For an element $f \in I(X, F)$ we write $f=\sum_{x \leq y} f(x, y) e_{x y}$, so that

$$
(f g)(x, y)=\sum_{x \leq z \leq y} f(x, z) g(z, y)
$$

The algebra $I(X, F)$ is associative and unital, where the identity element of $I(X, F)$ is $\delta:=\sum_{x \in X} e_{x x}$.

Given $f \in I(X, F)$, define $f_{D}=\sum_{x \in X} f(x, x) e_{x x}$ and $f_{U}=\sum_{x<y} f(x, y) e_{x y}$, so that $f=f_{D}+f_{U}$. An element $f \in I(X, F)$ is said to be diagonal whenever $f=f_{D}$. The diagonal elements form a commutative subalgebra of $I(X, F)$, denoted by $D(X, F)$. The elements $f$ with $f=f_{U}$ (equivalently, $f_{D}=0$ ) form an ideal which coincides with the Jacobson radical of $I(X, F)$, denoted $J(I(X, F))$ (see [18, Theorem 4.2.5]). The set $\mathcal{B}:=\left\{e_{x y} \mid x<y\right\}$ is clearly a basis of $J(I(X, F))$. Thus, $I(X, F)=D(X, F) \oplus J(I(X, F))$ as vector spaces. Invertible elements of $I(X, F)$ are exactly those $f \in I(X, F)$ such that $f(x, x) \in F^{*}$ for all $x \in X$ by [18, Theorem 1.2.3]. The center of $I(X, F)$ coincides with $\{r \delta \mid r \in F\}$ by [18, Corollary 1.3.15], provided that $X$ is connected. For any $Y \subseteq X$ the incidence algebra $I(Y, F)$ can be seen as a subspace of $I(X, F)$ closed under multiplication, where $Y$ is assumed to be endowed with the induced partial order. Observe that we avoid using the term "subalgebra", because the identity element of $I(Y, F)$ is different from that of $I(X, F)$ whenever $Y \neq X$.

We will write $e_{x}:=e_{x x}$ and, more generally, $e_{A}:=\sum_{a \in A} e_{a a}$ for $A \subseteq X$. Then $\left\{e_{x} \mid x \in X\right\}$ is a set of pairwise orthogonal primitive idempotents of $I(X, F)$ which

[^1]form a basis of $D(X, F)$. Observe that $I(X, F)$ also admits a basis formed by the idempotents $\left\{e_{x}\right\}_{x \in X} \sqcup\left\{e_{x}+e_{x y}\right\}_{x<y}$.

Recall from [19, 2, 16] the description of automorphisms of $I(X, F)$. Any order automorphism $\lambda$ of $X$ induces an automorphism $\hat{\lambda}$ of $I(X, F)$ by means of

$$
\begin{equation*}
\widehat{\lambda}\left(e_{x y}\right)=e_{\lambda(x) \lambda(y)} \tag{4}
\end{equation*}
$$

where $x \leq y$. Moreover, a map $\sigma: X_{\leq}^{2} \rightarrow F^{*}$ with

$$
\begin{equation*}
\sigma(x, y) \sigma(y, z)=\sigma(x, z) \tag{5}
\end{equation*}
$$

for all $x \leq y \leq z$ defines the multiplicative automorphism $M_{\sigma}$ of $I(X, F)$ acting as follows:

$$
\begin{equation*}
M_{\sigma}\left(e_{x y}\right)=\sigma(x, y) e_{x y} \tag{6}
\end{equation*}
$$

where $x \leq y$. Any automorphism of $I(X, F)$ is the composition of an inner automorphism of $I(X, F)$ and automorphisms $\hat{\lambda}$ and $M_{\sigma}$ described in (4) and (6).

## 2. Zero product preservers of $I(X, F)$

Recall that a map $\varphi: A \rightarrow B$ between two algebras preserves zero products (or is a zero product preserver) if $\varphi(a) \varphi(b)=0$ in $B$ whenever $a b=0$ in $A$. It turns out that the description of zero product preservers of $I(X, F)$ by their action on the natural basis will be useful in the following section.

Proposition 2.1. Let $X$ be finite and $\varphi: I(X, F) \rightarrow A$ a linear map, where $A$ is an algebra. Then $\varphi$ is a zero product preserver if and only if

$$
\begin{align*}
\varphi\left(e_{x y}\right) \varphi\left(e_{u v}\right) & =0 \text { for all } x \leq y \text { and } u \leq v \text { with } e_{x y} e_{u v}=0  \tag{7}\\
\varphi\left(e_{x}\right) \varphi\left(e_{x y}\right) & =\varphi\left(e_{x z}\right) \varphi\left(e_{z y}\right)=\varphi\left(e_{x y}\right) \varphi\left(e_{y}\right) \text { for all } x<z<y \tag{8}
\end{align*}
$$

Proof. Let $\varphi$ be a zero product preserver. Then (7) is immediate. Since $\left(e_{x}+\right.$ $\left.e_{x z}\right)\left(e_{z y}-e_{x y}\right)=0$ for all $x<z \leq y$, then using (7) we have

$$
\begin{aligned}
0 & =\varphi\left(e_{x}\right) \varphi\left(e_{z y}\right)-\varphi\left(e_{x}\right) \varphi\left(e_{x y}\right)+\varphi\left(e_{x z}\right) \varphi\left(e_{z y}\right)-\varphi\left(e_{x z}\right) \varphi\left(e_{x y}\right) \\
& =\varphi\left(e_{x z}\right) \varphi\left(e_{z y}\right)-\varphi\left(e_{x}\right) \varphi\left(e_{x y}\right)
\end{aligned}
$$

proving (8).
Conversely, assume (7) and (8). Take arbitrary $f, g \in I(X, F)$ and calculate

$$
\begin{aligned}
\varphi(f) \varphi(g) & =\sum_{x \leq y} \sum_{u \leq v} f(x, y) g(u, v) \varphi\left(e_{x y}\right) \varphi\left(e_{u v}\right)=\sum_{x \leq z \leq y} f(x, z) g(z, y) \varphi\left(e_{x z}\right) \varphi\left(e_{z y}\right) \\
& =\sum_{x \leq y}\left(\sum_{x \leq z \leq y} f(x, z) g(z, y)\right) \varphi\left(e_{x}\right) \varphi\left(e_{x y}\right)=\sum_{x \leq y}(f g)(x, y) \varphi\left(e_{x}\right) \varphi\left(e_{x y}\right)
\end{aligned}
$$

So, if $f g=0$, then $\varphi(f) \varphi(g)=0$.

## 3. Preservers of products equal to primitive idempotents of $I(X, F)$

Our goal is to study the bijective linear maps $\varphi: I(X, F) \rightarrow I(X, F)$ which preserve products equal to a fixed pair of primitive idempotents $\epsilon, \eta \in I(X, F)$, i.e. satisfying (3) with $a=\epsilon$ and $b=\eta$. By [17, Lemma 1] there exist $x, y \in X$
and inner automorphisms $\psi_{1}, \psi_{2}$ of $I(X, F)$, such that $\psi_{1}\left(e_{x}\right)=\epsilon$ and $\psi_{2}(\eta)=e_{y}$. Then, replacing $\varphi$ by $\psi_{2} \circ \varphi \circ \psi_{1}$, we may assume that $\varphi$ satisfies

$$
\begin{equation*}
f g=e_{x} \Rightarrow \varphi(f) \varphi(g)=e_{y} \tag{9}
\end{equation*}
$$

for all $f, g \in I(X, F)$.
We first list here easy consequences of (9) as in [5].
Lemma 3.1. The following equalities hold:
(i) $\varphi\left(e_{x}\right)^{2}=e_{y}$;
(ii) (a) $\varphi\left(e_{x}\right) \varphi\left(e_{u v}\right)=0$ for all $x \neq u \leq v$;
(b) $\varphi\left(e_{u v}\right) \varphi\left(e_{x}\right)=0$ for all $u \leq v \neq x$;
(iii) (a) $\varphi\left(e_{z}\right) \varphi\left(e_{u x}\right)=0$ for all $z \neq u \leq x$;
(b) $\varphi\left(e_{x v}\right) \varphi\left(e_{z}\right)=0$ for all $x \leq v \neq z$;
(iv) $\varphi\left(e_{u}\right) \varphi\left(e_{v}\right)=0$ for all $u \neq v$;
(v) (a) $\varphi\left(e_{u x}\right) \varphi\left(e_{x}\right)-\varphi\left(e_{u}\right) \varphi\left(e_{u x}\right)=r \varphi\left(e_{u x}\right)^{2}$ for all $u<x$ and $r \in F^{*}$;
(b) $\varphi\left(e_{x}\right) \varphi\left(e_{x v}\right)-\varphi\left(e_{x v}\right) \varphi\left(e_{v}\right)=r \varphi\left(e_{x v}\right)^{2}$ for all $v>x$ and $r \in F^{*}$;
(vi) (a) $\varphi\left(e_{u x}\right) \varphi\left(e_{z}\right)=0$ for all $u \leq x, z \notin\{u, x\}$;
(b) $\varphi\left(e_{z}\right) \varphi\left(e_{x v}\right)=0$ for all $x \leq v, z \notin\{x, v\}$.

Proof. (i) follows from $e_{x}^{2}=e_{x}$; (ii) follows from (i) and $e_{x}\left(e_{x}+e_{u v}\right)=e_{x}$ for $x \neq u \leq v$; (ii)b follows from (i) and $\left(e_{x}+e_{u v}\right) e_{x}=e_{x}$ for $u \leq v \neq x$.

It suffices to prove (iii) a for $u<x$, since $u=x$ is a particular case of (ii)b So, assume $u<x$ and write $\varphi\left(e_{x}\right) \varphi\left(e_{u x}\right)=0$ by (ii)a In particular, this proves (iii)a for $z=x$. Thus, take $z \neq x$. Then $\left(e_{x}+e_{z}\right)\left(e_{x}+e_{u x}\right)=e_{x}$. Combining this with $\varphi\left(e_{z}\right) \varphi\left(e_{x}\right)=0$ (by (ii)b and (i), we obtain (iii)a. Similarly, (iii)b follows from $\varphi\left(e_{x v}\right) \varphi\left(e_{x}\right)=0$ for $x<v,\left(e_{x}+e_{x v}\right)\left(e_{x}+e_{z}\right)=e_{x}$ for $z \neq x$ and (i),

If $x \in\{u, v\}$, then (iv) is a particular case of (ii) a or (ii)b. Otherwise, consider the product $\left(e_{x}+e_{u}\right)\left(e_{x}+e_{v}\right)=e_{x}$ and apply (i), (ii)a and (ii)b.

For (v)a write $\left(e_{x}+e_{u}+r e_{u x}\right)\left(e_{x}-r e_{u x}\right)=e_{x}$ and use (i), (ii)a and (ii)b Item (v)b is similar and follows from $\left(e_{x}-r e_{x v}\right)\left(e_{x}+e_{v}+r e_{x v}\right)=e_{x}$.

For (vi)a write $\left(e_{x}+e_{u}+e_{u x}\right)\left(e_{x}-e_{u x}+e_{z}\right)=e_{x}$ and use (ii)a (iv) and (v)a Analogously, (vi)b is a consequence of (ii)b, (iv) and (v)b.

Corollary 3.2. Let $z \in X \backslash\{y\}$.
(i) If $\varphi\left(e_{u}\right)(z, z)=0$ for some $u<x$, then $\varphi\left(e_{u x}\right)(z, z)=0$.
(ii) If $\varphi\left(e_{v}\right)(z, z)=0$ for some $v>x$, then $\varphi\left(e_{x v}\right)(z, z)=0$.

Proof. Let us prove (i). Using Lemma 3.1 (i) we have $\varphi\left(e_{x}\right)(z, z)^{2}=e_{y}(z, z)=0$, so $\varphi\left(e_{x}\right)(z, z)=0$. Therefore,

$$
r \varphi\left(e_{u x}\right)(z, z)^{2}=\varphi\left(e_{u x}\right)(z, z) \varphi\left(e_{x}\right)(z, z)-\varphi\left(e_{u}\right)(z, z) \varphi\left(e_{u x}\right)(z, z)=0
$$

by Lemma 3.1 (v)a, whence $\varphi\left(e_{u x}\right)(z, z)=0$. The proof of (ii) similarly follows from Lemma 3.1 (v)b.

From now on we view $I(X \backslash\{x\}, F)$ and $I(X \backslash\{y\}, F)$ as subspaces of $I(X, F)$ closed under multiplication. Their identity elements are $e_{X \backslash\{x\}}$ and $e_{X \backslash\{y\}}$, respectively.

Lemma 3.3. Let $f \in I(X, F)$. If $f^{2}=e_{y}$, then $f= \pm e_{y}+g$ for some $g \in$ $J(I(X \backslash\{y\}, F))$ with $g^{2}=0$

Proof. It immediately follows that $f_{D}= \pm e_{y}$. Now take $u<y$ and write

$$
\begin{aligned}
0 & =e_{y}(u, y)=f^{2}(u, y)=f(u, y) f(y, y)+\sum_{u<v<y} f(u, v) f(v, y) \\
& = \pm f(u, y)+\sum_{u<v<y} f(u, v) f(v, y)
\end{aligned}
$$

whence

$$
\begin{equation*}
f(u, y)=\mp \sum_{u<v<y} f(u, v) f(v, y) \tag{10}
\end{equation*}
$$

If $l(u, y)=1$, then there is no $v \in X$ with $u<v<y$, so the sum on the right-hand side of (10) vanishes, and $f(u, y)=0$. If $l(u, y)>1$, then $l(v, y)<l(u, y)$ for all $u<v<y$, so the obvious induction argument implies $f(u, y)=0$.

Similarly, for all $y<v$ one has

$$
\begin{aligned}
0 & =e_{y}(y, v)=f^{2}(y, v)=f(y, y) f(y, v)+\sum_{y<u<v} f(y, u) f(u, v) \\
& = \pm f(y, v)+\sum_{y<u<v} f(y, u) f(u, v)
\end{aligned}
$$

whence $f(y, v)=0$ by induction on $l(y, v)$.
Thus, $f= \pm e_{y}+g$, where $g=f_{U}$. Observe that $e_{y} g=\sum_{y<v} f(y, v) e_{y v}=0$ and $g e_{y}=\sum_{u<y} f(u, y) e_{u y}=0$. Therefore, $e_{y}=f^{2}=e_{y} \pm e_{y} g \pm g e_{y}+g^{2}=e_{y}+g^{2}$, whence $g^{2}=0$.

Corollary 3.4. We have $\varphi\left(e_{x}\right)= \pm e_{y}+g$ for some $g \in J(I(X \backslash\{y\}, F))$ with $g^{2}=0$.

Lemma 3.5. We have $\varphi(I(X \backslash\{x\}, F)) \subseteq I(X \backslash\{y\}, F)$. Moreover, $\varphi$ is a zero product preserver from $I(X \backslash\{x\}, F)$ to $I(X \backslash\{y\}, F)$.
Proof. Let $u, v \in X \backslash\{x\}, u \leq v$. Then $\varphi\left(e_{x}\right) \varphi\left(e_{u v}\right)=0$ by Lemma 3.1 (ii)a Multiplying this by $\varphi\left(e_{x}\right)$ on the left and using Lemma 3.1(i) we obtain $e_{y} \varphi\left(e_{u v}\right)=$ 0 . Similarly $\varphi\left(e_{u v}\right) e_{y}=0$ by (i) and (ii)b of Lemma 3.1. Therefore, $\varphi\left(e_{u v}\right)(a, y)=$ $\varphi\left(e_{u v}\right)(y, b)$ for all $a \leq y \leq b$. This proves the desired inclusion.

Now take $f, g \in I(X \backslash\{x\}, F)$ such that $f g=0$. It is easily seen that $\left(e_{x}+\right.$ $f)\left(e_{x}+g\right)=e_{x}$ in $I(X, F)$. Hence, $\left(\varphi\left(e_{x}\right)+\varphi(f)\right)\left(\varphi\left(e_{x}\right)+\varphi(g)\right)=e_{y}$ thanks to (9). The latter is equivalent to $\varphi(f) \varphi(g)=0$ by (i) (ii)a and (ii)b of Lemma 3.1.

Observe that $\operatorname{dim}(I(X \backslash\{x\}, F))=\mid(X \backslash\{x\})^{2} \leq$ and $\operatorname{dim}(I(X \backslash\{y\}, F))=$ $\left|(X \backslash\{y\})_{\leq}^{2}\right|$, so we have the following immediate consequence of Lemma 3.5,
Corollary 3.6. If $\left|(X \backslash\{x\})_{\leq}^{2}\right|>\left|(X \backslash\{y\})_{\leq}^{2}\right|$, then there is no bijective linear map $\varphi: I(X, F) \rightarrow I(X, F)$ satisfying (19).

Thus, in what follows we assume $\left|(X \backslash\{x\})_{\leq}^{2}\right| \leq\left|(X \backslash\{y\})_{\leq}^{2}\right|$.
Corollary 3.7. We have $\varphi(J(I(X \backslash\{x\}, F))) \subseteq J(I(X \backslash\{y\}, F))$.
Proof. Indeed, for any $u, v \in X \backslash\{x\}, u<v$, it follows from $e_{u v}^{2}=0$ and Lemma 3.5 that $\varphi\left(e_{u v}\right)^{2}=0$, so $\varphi\left(e_{u v}\right) \in J(I(X \backslash\{y\}, F))$.
Lemma 3.8. The element $\varphi\left(e_{X \backslash\{x\}}\right)$ is invertible in $I(X \backslash\{y\}, F)$.

Proof. For all $u \in X \backslash\{x\}$ denote $Z_{u}=\left\{z \in X \mid \varphi\left(e_{u}\right)(z, z) \neq 0\right\} \subseteq X \backslash\{y\}$. Observe that $Z_{u} \cap Z_{v}=\emptyset$ for $u \neq v$ thanks to Lemma 3.1 (iv) Since $e_{X \backslash\{x\}}=$ $\sum_{u \in X \backslash\{x\}} e_{u}$, we have

$$
Z:=\left\{z \in X \mid \varphi\left(e_{X \backslash\{x\}}\right)(z, z) \neq 0\right\}=\bigsqcup_{u \in X \backslash\{x\}} Z_{u} .
$$

Assume that $\varphi\left(e_{X \backslash\{x\}}\right) \notin I(X \backslash\{y\}, F)^{*}$. Then $Z \neq X \backslash\{y\}$, so there exists $z_{0} \in$ $X \backslash\{y\}$ such that $z_{0} \notin Z$. It follows that $\varphi\left(e_{u}\right)\left(z_{0}, z_{0}\right)=0$ for all $u \in X \backslash\{x\}$. By Corollary 3.2 we conclude that $\varphi\left(e_{u x}\right)\left(z_{0}, z_{0}\right)=0$ for all $u<x$ and $\varphi\left(e_{x v}\right)\left(z_{0}, z_{0}\right)=$ 0 for all $v>x$. Furthermore, $\varphi\left(e_{u v}\right)\left(z_{0}, z_{0}\right)=0$ for all $u, v \in X \backslash\{x\}, u<v$, by Corollary 3.7 Finally, $\varphi\left(e_{x}\right)\left(z_{0}, z_{0}\right)=0$ by Corollary 3.4. Thus, $\varphi(f)\left(z_{0}, z_{0}\right)=0$ for all $f \in I(X, F)$, a contradiction with $e_{z_{0}} \in \varphi(I(X, F))$.

Lemma 3.9. We have $\varphi\left(e_{x}\right)= \pm e_{y}$ and there exist a monomorphism $\psi: I(X \backslash$ $\{x\}, F) \rightarrow I(X \backslash\{y\}, F)$ and $c \in I(X \backslash\{y\}, F)^{*}$ such that $\varphi(f)=c \psi(f)$ for all $f \in I(X \backslash\{x\}, F)$.

Proof. Recall that $I(X \backslash\{x\}, F)$ has a basis formed by idempotents. Therefore, since $\varphi: I(X \backslash\{x\}, F) \rightarrow I(X \backslash\{y\}, F)$ preserves zero products by Lemma3.5 and $\varphi\left(e_{X \backslash\{x\}}\right)$ is invertible in $I(X \backslash\{y\}, F)$, it follows from [11, Theorem 2.6(vi)] that there are a homomorphism $\psi: I(X \backslash\{x\}, F) \rightarrow I(X \backslash\{y\}, F)$ and $c=\varphi\left(e_{X \backslash\{x\}}\right) \in$ $I(X \backslash\{y\}, F)^{*}$ such that $\varphi(f)=c \psi(f)$ for all $f \in I(X \backslash\{x\}, F)$. The homomorphism $\psi$ is injective, because $\varphi$ is injective and $c$ is invertible. Recall from Corollary 3.4 that $\varphi\left(e_{x}\right)= \pm e_{y}+g$, where $g \in I(X \backslash\{y\}, F)$. Now, $\varphi\left(e_{x}\right) c=\varphi\left(e_{x}\right) \varphi\left(e_{X \backslash\{x\}}\right)=0$ by Lemma 3.1 (iv). On the other hand, $\varphi\left(e_{x}\right) c= \pm e_{y} c+g c=g c$. Hence, $g c=0$. But $c$ is invertible in $I(X \backslash\{y\}, F)$, so $g=0$. Thus, $\varphi\left(e_{x}\right)= \pm e_{y}$.
Lemma 3.10. There exist $\beta \in I(X, F)^{*},\left\{\alpha_{z}\right\}_{z \in X} \subseteq F^{*}$ and a bijection $\lambda: X \rightarrow X$ with $\lambda(x)=y$ such that

$$
\begin{equation*}
\beta \varphi\left(e_{z}\right) \beta^{-1}=\alpha_{z} e_{\lambda(z)} \tag{11}
\end{equation*}
$$

for all $z \in X$. Moreover,

$$
\begin{equation*}
\beta e_{y} \beta^{-1}=e_{y} \tag{12}
\end{equation*}
$$

and $\alpha_{x}=1 \Leftrightarrow \varphi\left(e_{x}\right)=e_{y}, \alpha_{x}=-1 \Leftrightarrow \varphi\left(e_{x}\right)=-e_{y}$.
Proof. By Lemma 3.9 for any $z \in X \backslash\{x\}$ we have $\varphi\left(e_{z}\right)=c \psi\left(e_{z}\right)$, where $c \in$ $I(X \backslash\{y\}, F)^{*}$ and $\psi$ is a monomorphism $\psi: I(X \backslash\{x\}, F) \rightarrow I(X \backslash\{y\}, F)$. Since $\left\{\psi\left(e_{z}\right)\right\}_{z \in X \backslash\{x\}}$ is a set of orthogonal idempotents and $|X \backslash\{x\}|=|X \backslash\{y\}|$, there exists a bijection $\lambda^{\prime}: X \backslash\{x\} \rightarrow X \backslash\{y\}$ such that $\psi\left(e_{z}\right)_{D}=e_{\lambda^{\prime}(z)}$. Hence, by 13, Lemma 5.4] there is $\beta^{\prime} \in I(X \backslash\{y\}, F)^{*}$ such that $\beta^{\prime} \psi\left(e_{z}\right) \beta^{\prime-1}=e_{\lambda^{\prime}(z)}$ for all $z \in X \backslash\{x\}$. Then

$$
\begin{equation*}
\beta^{\prime} \varphi\left(e_{z}\right) \beta^{\prime-1}=\beta^{\prime} c \psi\left(e_{z}\right) \beta^{\prime-1}=\beta^{\prime} c \beta^{\prime-1} e_{\lambda^{\prime}(z)} . \tag{13}
\end{equation*}
$$

Denote $\gamma=\beta^{\prime} c \beta^{\prime-1} \in I(X \backslash\{y\}, F)^{*}$. Let $u<v$ in $X \backslash\{y\}$ and $a, b \in X \backslash\{x\}$ such that $\lambda^{\prime}(a)=u$ and $\lambda^{\prime}(b)=v$. Then it follows from Lemma 3.1 (iv) and (13) that

$$
0=\varphi\left(e_{a}\right) \varphi\left(e_{b}\right)=\gamma e_{u} \gamma e_{v}=\gamma \cdot \gamma(u, v) e_{u v}
$$

Since $\gamma$ is invertible in $I(X \backslash\{y\}, F)$, then $\gamma(u, v) e_{u v}=0$, whence $\gamma(u, v)=0$. Thus, $\gamma$ is diagonal and we define $\alpha_{z}=\gamma(z, z) \in F^{*}$ for all $z \in X \backslash\{x\}$, so that

$$
\begin{equation*}
\beta^{\prime} \varphi\left(e_{z}\right) \beta^{\prime-1}=\alpha_{z} e_{\lambda^{\prime}(z)} \tag{14}
\end{equation*}
$$

for such $z$.
We now extend $\lambda^{\prime}$ to a bijection $\lambda: X \rightarrow X$ by $\lambda(x)=y$ and define $\beta=e_{y}+\beta^{\prime}$,

$$
\alpha_{x}= \begin{cases}1, & \varphi\left(e_{x}\right)=e_{y} \\ -1, & \varphi\left(e_{x}\right)=-e_{y}\end{cases}
$$

Then $\beta \in I(X, F)^{*}$ and using (14) we obtain

$$
\beta \varphi\left(e_{z}\right) \beta^{-1}=\left(e_{y}+\beta^{\prime}\right) \varphi\left(e_{z}\right)\left(e_{y}+\beta^{\prime-1}\right)=\beta^{\prime} \varphi\left(e_{z}\right) \beta^{\prime-1}=\alpha_{z} e_{\lambda^{\prime}(z)}=\alpha_{z} e_{\lambda(z)}
$$

for all $z \in X \backslash\{x\}$ and

$$
\beta \varphi\left(e_{x}\right) \beta^{-1}=\left(e_{y}+\beta^{\prime}\right)\left( \pm e_{y}\right)\left(e_{y}+\beta^{\prime-1}\right)= \pm e_{y}=\alpha_{x} e_{\lambda(x)}
$$

So, (11) holds for all $z \in X$. Moreover,

$$
\beta e_{y} \beta^{-1}=\left(e_{y}+\beta^{\prime}\right) e_{y}\left(e_{y}+\beta^{\prime-1}\right)=e_{y}
$$

proving (12).
Observe from Lemma 3.10 and (9) and (11) that if $f g=e_{x}$ then

$$
\beta \varphi(f) \beta^{-1} \beta \varphi(g) \beta^{-1}=\beta \varphi(f) \varphi(g) \beta^{-1}=\beta e_{y} \beta^{-1}=e_{y}
$$

so, without loss of generality, we may assume that, for all $z \in X$,

$$
\begin{equation*}
\varphi\left(e_{z}\right)=\alpha_{z} e_{\lambda(z)} \tag{15}
\end{equation*}
$$

where $\alpha_{z} \in F^{*}, \alpha_{x}=1 \Leftrightarrow \varphi\left(e_{x}\right)=e_{y}, \alpha_{x}=-1 \Leftrightarrow \varphi\left(e_{x}\right)=-e_{y}$ and $\lambda: X \rightarrow X$ is a bijection with $\lambda(x)=y$.

Lemma 3.11. The bijection $\lambda$ is an automorphism of $X$.
Proof. Let $u, v \in X \backslash\{x\}$ with $u \leq v$. Then $e_{u}, e_{v}, e_{u v} \in I(X \backslash\{x\}, F)$. By Lemma 3.9 and (15)

$$
0 \neq \varphi\left(e_{u v}\right)=c \psi\left(e_{u v}\right)=c \psi\left(e_{u} e_{u v} e_{v}\right)=c \psi\left(e_{u}\right) \psi\left(e_{u v}\right) \psi\left(e_{v}\right)=c e_{\lambda(u)} \psi\left(e_{u v}\right) e_{\lambda(v)}
$$

whence $\lambda(u) \leq \lambda(v)$. So, $\left.\lambda\right|_{X \backslash\{x\}}$ is order-preserving.
Now let $u<x$. By Lemma 3.1 (iii)a and (15) for any $z \neq u$ we have

$$
0=\varphi\left(e_{z}\right) \varphi\left(e_{u x}\right)=\alpha_{z} e_{\lambda(z)} \varphi\left(e_{u x}\right)
$$

so $e_{\lambda(z)} \varphi\left(e_{u x}\right)=0$ for all $z \neq u$. It follows that

$$
\begin{equation*}
\varphi\left(e_{u x}\right)=\delta \cdot \varphi\left(e_{u x}\right)=\left(\sum_{z \in X} e_{\lambda(z)}\right) \varphi\left(e_{u x}\right)=e_{\lambda(u)} \varphi\left(e_{u x}\right) \tag{16}
\end{equation*}
$$

Now by (15) and (16) and Lemma 3.1 (v) a (with $r=1$ ) we have

$$
\begin{align*}
0 & =\varphi\left(e_{u x}\right) \alpha_{x} e_{\lambda(x)}-\alpha_{u} e_{\lambda(u)} \varphi\left(e_{u x}\right)-e_{\lambda(u)} \varphi\left(e_{u x}\right) e_{\lambda(u)} \varphi\left(e_{u x}\right) \\
& =e_{\lambda(u)} \varphi\left(e_{u x}\right) \alpha_{x} e_{\lambda(x)}-\alpha_{u} \varphi\left(e_{u x}\right)-\varphi\left(e_{u x}\right)(\lambda(u), \lambda(u)) e_{\lambda(u)} \varphi\left(e_{u x}\right) \\
& =\alpha_{x} e_{\lambda(u)} \varphi\left(e_{u x}\right) e_{\lambda(x)}-\left(\alpha_{u}+\varphi\left(e_{u x}\right)(\lambda(u), \lambda(u))\right) \varphi\left(e_{u x}\right) \tag{17}
\end{align*}
$$

On the other hand, by (15) and Lemma 3.1 (vi)a we have $\varphi\left(e_{u x}\right) e_{\lambda(z)}=0$ for all $z \notin\{u, x\}$, so combining this with (16) we get

$$
\begin{align*}
\varphi\left(e_{u x}\right) & =\varphi\left(e_{u x}\right) \cdot \delta=\varphi\left(e_{u x}\right) \cdot\left(\sum_{z \in X} e_{\lambda(z)}\right)=\varphi\left(e_{u x}\right) e_{\lambda(u)}+\varphi\left(e_{u x}\right) e_{\lambda(x)} \\
& =e_{\lambda(u)} \varphi\left(e_{u x}\right) e_{\lambda(u)}+e_{\lambda(u)} \varphi\left(e_{u x}\right) e_{\lambda(x)} \\
& =\varphi\left(e_{u x}\right)(\lambda(u), \lambda(u)) e_{\lambda(u)}+e_{\lambda(u)} \varphi\left(e_{u x}\right) e_{\lambda(x)} \tag{18}
\end{align*}
$$

Suppose that $e_{\lambda(u)} \varphi\left(e_{u x}\right) e_{\lambda(x)}=0$. Then thanks to (17) and $\varphi\left(e_{u x}\right) \neq 0$ we obtain $\varphi\left(e_{u x}\right)(\lambda(u), \lambda(u))=-\alpha_{u}$. Therefore, (15) and (18) give $\varphi\left(e_{u x}\right)=-\alpha_{u} e_{\lambda(u)}=$ $-\varphi\left(e_{u}\right)=\varphi\left(-e_{u}\right)$, whence $e_{u x}=-e_{u}$, a contradiction. Thus, $e_{\lambda(u)} \varphi\left(e_{u x}\right) e_{\lambda(x)} \neq 0$, i.e. $\lambda(u)<\lambda(x)$ and $\varphi\left(e_{u x}\right)(\lambda(u), \lambda(x)) \neq 0$.

Similarly one proves that $\lambda(x)<\lambda(v)$ for all $x<v$.
Thus, $\lambda$ is order-preserving. Since $X$ is finite, $\lambda^{-1}$ is also order-preserving. Thus, $\lambda$ is an automorphism of $X$.

Lemma 3.12. We have $\alpha_{u}=\alpha_{x}$ and

$$
\begin{equation*}
\varphi\left(e_{u x}\right)=\varphi\left(e_{u x}\right)(\lambda(u), \lambda(x)) e_{\lambda(u) \lambda(x)} \tag{19}
\end{equation*}
$$

for all $u<x$. Similarly, $\alpha_{v}=\alpha_{x}$ and

$$
\begin{equation*}
\varphi\left(e_{x v}\right)=\varphi\left(e_{x v}\right)(\lambda(x), \lambda(v)) e_{\lambda(x) \lambda(v)} \tag{20}
\end{equation*}
$$

for all $v>x$.
Proof. Substituting the right-hand side of (18) to (17), we obtain

$$
\begin{aligned}
0= & \left(\alpha_{x}-\alpha_{u}-\varphi\left(e_{u x}\right)(\lambda(u), \lambda(u))\right) \varphi\left(e_{u x}\right)(\lambda(u), \lambda(x)) e_{\lambda(u) \lambda(x)} \\
& -\left(\alpha_{u}+\varphi\left(e_{u x}\right)(\lambda(u), \lambda(u))\right) \varphi\left(e_{u x}\right)(\lambda(u), \lambda(u)) e_{\lambda(u)}
\end{aligned}
$$

If $\varphi\left(e_{u x}\right)(\lambda(u), \lambda(u)) \neq 0$, then $\alpha_{u}+\varphi\left(e_{u x}\right)(\lambda(u), \lambda(u))=0$, so $\varphi\left(e_{u x}\right)(\lambda(u), \lambda(x))=$ 0 , a contradiction with $e_{\lambda(u)} \varphi\left(e_{u x}\right) e_{\lambda(x)} \neq 0$ proved in Lemma 3.11. Consequently, $\varphi\left(e_{u x}\right)(\lambda(u), \lambda(u))=0$ and $\alpha_{u}=\alpha_{x}$. Then (19) follows from (18). The proof of $\alpha_{v}=\alpha_{x}$ and (20) for all $v>x$ is similar.

Corollary 3.13. We have $\varphi(J(I(X, F))=J(I(X, F))$.
Proof. Observe that $\varphi\left(e_{u x}\right), \varphi\left(e_{x v}\right) \in J(I(X, F))$ for all $u<x<v$ by Lemma 3.12 Together with Corollary 3.7 this results in $\varphi(J(I(X, F))) \subseteq J(I(X, F))$. Since $\varphi$ is injective, we have $\varphi(J(I(X, F)))=J(I(X, F))$.

Let $\hat{\lambda}$ be the automorphism of $I(X, F)$ induced by $\lambda$ as in (4). Replacing $\varphi$ by $(\widehat{\lambda})^{-1} \circ \varphi$, we may assume that $x=y$ and, for all $z \in X$,

$$
\begin{equation*}
\varphi\left(e_{z}\right)=\alpha_{z} e_{z} \tag{21}
\end{equation*}
$$

where $\alpha_{z} \in F^{*}$ with $\alpha_{x}=1 \Leftrightarrow \varphi\left(e_{x}\right)=e_{x}$ and $\alpha_{x}=-1 \Leftrightarrow \varphi\left(e_{x}\right)=-e_{x}$.
Lemma 3.14. For all $u<v$ in $X$ we have

$$
\begin{equation*}
\varphi\left(e_{u v}\right)=\sigma(u, v) e_{u v} \tag{22}
\end{equation*}
$$

for some $\sigma(u, v) \in F^{*}$.

Proof. It suffices to prove that $\varphi\left(e_{u v}\right)=e_{u} \varphi\left(e_{u v}\right)=\varphi\left(e_{u v}\right) e_{v}$ for all $u<v$, because in this case

$$
\varphi\left(e_{u v}\right)=e_{u} \varphi\left(e_{u v}\right)=e_{u} \varphi\left(e_{u v}\right) e_{v}=\varphi\left(e_{u v}\right)(u, v) e_{u v}
$$

so we define $\sigma(u, v)=\varphi\left(e_{u v}\right)(u, v) \in F^{*}$.
Case 1. $u, v \in X \backslash\{x\}$. Then $\varphi\left(e_{x}\right) \varphi\left(e_{u v}\right)=0$ by Lemma3.1(ii)a, which implies $e_{x} \varphi\left(e_{u v}\right)=0$ by (21). Similarly, $\varphi\left(e_{z}\right) \varphi\left(e_{u v}\right)=0$ for all $z \neq u, x$ by Lemma 3.5, so $e_{z} \varphi\left(e_{u v}\right)=0$ for all $z \neq u, x$. It follows that

$$
\varphi\left(e_{u v}\right)=\delta \cdot \varphi\left(e_{u v}\right)=\left(\sum_{z \in X} e_{z}\right) \varphi\left(e_{u v}\right)=e_{u} \varphi\left(e_{u v}\right)
$$

In a similar way one proves using Lemma 3.1 (ii)b, Lemma 3.5 and (21) that $\varphi\left(e_{u v}\right)=\varphi\left(e_{u v}\right) e_{v}$,

Case 2. $x=u<v$. Then $\varphi\left(e_{u v}\right) \varphi\left(e_{z}\right)=\varphi\left(e_{x v}\right) \varphi\left(e_{z}\right)=0$ for all $z \neq v$ by Lemma 3.1 (iii)b, whence $\varphi\left(e_{u v}\right) e_{z}=0$ for all $z \neq v$ in view of (21). Therefore,

$$
\begin{equation*}
\varphi\left(e_{u v}\right)=\varphi\left(e_{u v}\right) \cdot \delta=\varphi\left(e_{u v}\right) e_{v} \tag{23}
\end{equation*}
$$

Now, $\varphi\left(e_{z}\right) \varphi\left(e_{u v}\right)=\varphi\left(e_{z}\right) \varphi\left(e_{x v}\right)=0$ for $z \neq x, v$ by Lemma3.1 (vi)b, so $e_{z} \varphi\left(e_{u v}\right)=$ 0 for $z \neq u, v$ by (21). Consequently, using (23) and Corollary 3.13, we get

$$
\varphi\left(e_{u v}\right)=\delta \cdot \varphi\left(e_{u v}\right)=e_{u} \varphi\left(e_{u v}\right)+e_{v} \varphi\left(e_{u v}\right)=e_{u} \varphi\left(e_{u v}\right)+e_{v} \varphi\left(e_{u v}\right) e_{v}=e_{u} \varphi\left(e_{u v}\right)
$$

as needed.
Case 3. $u<v=x$. This case is similar to Case 2.
Lemma 3.15. Let $X$ be connected. Then $\varphi(\delta)= \pm \delta$.
Proof. Using (21) we write

$$
\varphi(\delta)=\sum_{z \in X} \varphi\left(e_{z}\right)=\sum_{z \in X} \alpha_{z} e_{z}
$$

It suffices to show that $\alpha_{z}=\alpha_{x}$ for all $z \in X$. We know by Lemma 3.12 that $\alpha_{u}=\alpha_{x}$ for all $u<x$ and $\alpha_{v}=\alpha_{x}$ for all $v>x$. Moreover, for all $u<v$, in view of Lemma 3.14 and (21) we obtain

$$
\alpha_{u} \varphi\left(e_{u v}\right)=\sigma(u, v) \alpha_{u} e_{u v}=\sigma(u, v) \alpha_{u} e_{u} \cdot e_{u v}=\sigma(u, v) \varphi\left(e_{u}\right) \cdot e_{u v}=\varphi\left(e_{u}\right) \varphi\left(e_{u v}\right)
$$

Similarly,

$$
\alpha_{v} \varphi\left(e_{u v}\right)=\sigma(u, v) \alpha_{v} e_{u v}=\sigma(u, v) e_{u v} \cdot \alpha_{v} e_{v}=\sigma(u, v) e_{u v} \varphi\left(e_{v}\right)=\varphi\left(e_{u v}\right) \varphi\left(e_{v}\right)
$$

However, $\varphi\left(e_{u}\right) \varphi\left(e_{u v}\right)=\varphi\left(e_{u v}\right) \varphi\left(e_{v}\right)$ for all $u<v$ from $X \backslash\{x\}$ by Lemma 3.5 and Proposition 2.1] Hence, $\alpha_{u}=\alpha_{v}$. Since $X$ is connected, we are done.

Replacing $\varphi$ by $-\varphi$, if necessary, we may assume that

$$
\begin{equation*}
\varphi(\delta)=\delta \tag{24}
\end{equation*}
$$

Then, for all $z \in X$, we have

$$
\begin{equation*}
\varphi\left(e_{z}\right)=e_{z} \tag{25}
\end{equation*}
$$

In particular, $c=\varphi\left(e_{X \backslash\{x\}}\right)=e_{X \backslash\{y\}}$, so $\varphi=\psi$ on $I(X \backslash\{x\}, F)$. We will now show that these conditions guarantee that $\varphi$ is a multiplicative automorphism (6) of $I(X, F)$.

Lemma 3.16. Let $X$ be connected. Then $\varphi$ is a multiplicative automorphism of $I(X, F)$.
Proof. Consider $\sigma: X_{<}^{2} \rightarrow F^{*}$ from Lemma 3.14 and extend it to $\sigma: X_{\leq}^{2} \rightarrow F^{*}$ by means of $\sigma(z, z)=1$ for all $z \in X$. Observe that (22) now holds for all $u \leq v$ thanks to (25). Thus, it only remains to prove that $\sigma$ satisfies (5). Take arbitrary $u \leq v \leq w$. We need to show that $\sigma(u, v) \sigma(v, w)=\sigma(u, w)$. Since $\sigma(z, z)=1$ for all $z \in X$, it suffices to assume $u<v<w$. Consider the following cases.

Case 1. $x \notin\{u, v, w\}$. Then $\sigma(u, v) \sigma(v, w)=\sigma(u, w)$ because $\varphi=\psi$ on $I(X \backslash$ $\{x\}, F)$ and $\psi\left(e_{u w}\right)=\psi\left(e_{u v}\right) \psi\left(e_{v w}\right)$.

Case 2. $x=u$. Since $\left(e_{x}+e_{x v}-e_{x w}\right)\left(\delta-e_{x v}+e_{v w}\right)=e_{x}$, by (22) and (24) we have

$$
\left(e_{x}+\sigma(x, v) e_{x v}-\sigma(x, w) e_{x w}\right)\left(\delta-\sigma(x, v) e_{x v}+\sigma(v, w) e_{v w}\right)=e_{x}
$$

which gives $\sigma(x, v) \sigma(v, w)=\sigma(x, w)$.
Case 3. $x=w$. This case is proved similarly to Case 2 using the product $\left(\delta-e_{v x}+e_{u v}\right)\left(e_{x}+e_{v x}-e_{u x}\right)=e_{x}$.

Case 4. $x=v$. The result follows by applying $\varphi$ to the product $\left(e_{x}+e_{u x}+\right.$ $\left.e_{x w}+e_{u w}-e_{u}\right)\left(\delta-e_{x w}+e_{u x}-e_{u}\right)=e_{x}$.

We can finally prove the main result of our work.
Theorem 3.17. Let $X$ be a finite connected poset and $x, y \in X$. Let $\epsilon, \eta \in I(X, F)$ be primitive idempotents such that $\epsilon_{D}=e_{x}$ and $\eta_{D}=e_{y}$. There exists a bijective linear map $\varphi: I(X, F) \rightarrow I(X, F)$ preserving products equal to $\epsilon$ and $\eta$ if and only if there exists an automorphism of $X$ mapping $x$ to $y$, in which case $\varphi$ is either an automorphism of $I(X, F)$ or the negative of an automorphism of $I(X, F)$.

Proof. Assume that $\varphi: I(X, F) \rightarrow I(X, F)$ preserves products equal to $\epsilon$ and $\eta$. By Lemmas 3.10 3.11 and 3.16, up to an inner automorphism, $\varphi$ is of the form $\pm \widehat{\lambda} \circ M_{\sigma}$, where $\lambda$ is an automorphism of $X$ with $\lambda(x)=y$ and $M_{\sigma}$ is a multiplicative automorphism of $I(X, F)$.

Conversely, if $\lambda$ is an automorphism of $X$ with $\lambda(x)=y$, then $\widehat{\lambda} \in \operatorname{Aut}(I(X, F))$ preserves products equal to $e_{x}$ and $e_{y}$. Composing $\widehat{\lambda}$ with appropriate inner automorphisms of $I(X, F)$, we get $\varphi \in \operatorname{Aut}(I(X, F))$ which preserves products equal to $\epsilon$ and $\eta$.

Corollary 3.18. Let $\epsilon, \eta \in T_{n}(F)$ be primitive idempotents. There exists a bijective linear map $\varphi: T_{n}(F) \rightarrow T_{n}(F)$ preserving products equal to $\epsilon$ and $\eta$ if and only if $\epsilon$ and $\eta$ have the same diagonal, in which case $\varphi$ is either an automorphism or the negative of an automorphism of $T_{n}(F)$.

Proof. For, $T_{n}(F) \cong I(X, F)$, where $X$ is a chain of length $n-1$. Then, $\epsilon$ and $\eta$, seen as elements of $I(X, F)$, have diagonals $e_{x}$ and $e_{y}$ for some $x, y \in X$. Since $\operatorname{Aut}(X)=\{\mathrm{id}\}$, the result follows.

[^0]:    2010 Mathematics Subject Classification. Primary: 16S50, 15A86; secondary: 17C27.
    Key words and phrases. Incidence algebra; product preserver; primitive idempotent.

[^1]:    ${ }^{1}$ For an infinite $X$ one should also require that the inverse bijection be order-preserving, which holds automatically in the finite case.
