# ON AN ANALOGUE OF THE HUREWICZ THEOREM FOR MEAN DIMENSION 

MASAKI TSUKAMOTO

#### Abstract

The Hurewicz theorem is a fundamental result in classical dimension theory concerning continuous maps which lower topological dimension. We study whether or not its analogue holds for mean dimension of dynamical systems. Our first main result shows that an analogue of the Hurewicz theorem does not hold for mean dimension in general. Our second main result shows that it holds true if a base system has zero mean dimension.

## 1. Introduction

1.1. Background and basic definitions. The Hurewicz theorem is one of the fundamental results in the classical topological dimension theory. For a compact metrizable space $X$ we denote its topological dimension (Lebesgue covering dimension) by $\operatorname{dim} X$. Let $f: X \rightarrow Y$ be a continuous map between compact metrizable spaces. Then the Hurewicz theorem [HW41, p. 91, Theorem VI 7] states that

$$
\operatorname{dim} X \leq \operatorname{dim} Y+\sup _{y \in Y} \operatorname{dim} f^{-1}(y) .
$$

The purpose of this paper is to study an analogue of this theorem for mean dimension of dynamical systems.

Mean dimension is a dynamical version of topological dimension introduced by Gromov [Gro99]. It quantifies how many parameters per iterate we need for describing orbits of a dynamical system. It has applications to several problems in topological dynamics [LW00, Lin99, MT19, GT20].

We need to prepare some definitions before rigorously stating our problem. Throughout of this paper we assume that "simplicial complex" means a finite simplicial complex (namely, the number of its simplices is finite). Let $(X, d)$ be a metric space and $Y$ a topological space. A continuous map $f: X \rightarrow Y$ is called an $\varepsilon$-embedding if we have $\operatorname{Diam} f^{-1}(y)<\varepsilon$ for all $y \in Y$. We define the $\varepsilon$-width $\operatorname{dimension}_{\operatorname{Widim}_{\varepsilon}(X, d)}$ as the minimum integer $n \geq 0$ such that there exist an $n$-dimensional simplicial complex $P$ and

[^0]an $\varepsilon$-embedding $f: X \rightarrow P$. If $X$ is compact then its topological dimension is defined by
$$
\operatorname{dim} X=\lim _{\varepsilon \rightarrow 0} \operatorname{Widim}_{\varepsilon}(X, d) .
$$

A pair $(X, T)$ is called a dynamical system if $X$ is a compact metrizable space and $T: X \rightarrow X$ is a homeomorphism. Let $(X, T)$ be a dynamical system with a metric $d$ on $X$. For each natural number $N$ we define a metric $d_{N}$ on $X$ by

$$
d_{N}(x, y)=\max _{0 \leq n<N} d\left(T^{n} x, T^{n} y\right)
$$

We define the mean dimension of $(X, T)$ by

$$
\operatorname{mdim}(X, T)=\lim _{\varepsilon \rightarrow 0}\left(\lim _{N \rightarrow \infty} \frac{\operatorname{Widim}_{\varepsilon}\left(X, d_{N}\right)}{N}\right) .
$$

The value of $\operatorname{mim}(X, T)$ is independent of the choice of a metric $d$, and it provides a topological invariant of $(X, T)$.

Let $A$ be a (not necessarily invariant) closed subset of $X$. We define the upper and lower mean dimensions of $A$ by

$$
\begin{aligned}
& \overline{\operatorname{mdim}}(A, T)=\lim _{\varepsilon \rightarrow 0}\left(\limsup _{N \rightarrow \infty} \frac{\operatorname{Widim}_{\varepsilon}\left(A, d_{N}\right)}{N}\right), \\
& \underline{\operatorname{mdim}}(A, T)=\lim _{\varepsilon \rightarrow 0}\left(\liminf _{N \rightarrow \infty} \frac{\operatorname{Widim}_{\varepsilon}\left(A, d_{N}\right)}{N}\right)
\end{aligned}
$$

These are also independent of the choice of $d$.
Let $(X, T)$ and $(Y, S)$ be dynamical systems. A map $\pi: X \rightarrow Y$ is called a factor map between dynamical systems if $\pi$ is a continuous surjection satisfying $\pi \circ T=S \circ \pi$. We often denote it by $\pi:(X, T) \rightarrow(Y, S)$ for clarifying the underlying dynamics.

Let $\pi:(X, T) \rightarrow(Y, S)$ be a factor map between dynamical systems. We would like to study the mean dimension of fibers of $\pi$. For this purpose we define the relative mean dimension of $\pi:(X, T) \rightarrow(Y, S)$ by

$$
\operatorname{mdim}(\pi, T)=\lim _{\varepsilon \rightarrow 0}\left(\lim _{N \rightarrow \infty} \frac{\sup _{y \in Y} \operatorname{Widim}_{\varepsilon}\left(\pi^{-1}(y), d_{N}\right)}{N}\right)
$$

It is easy to check that the quantity $\sup _{y \in Y} \operatorname{Widim}_{\varepsilon}\left(\pi^{-1}(y), d_{N}\right)$ is sub-additive in $N$ and monotone in $\varepsilon$. So the above limits exist.

The next proposition clarifies the meaning of this definition.
Proposition 1.1. Let $\pi:(X, T) \rightarrow(Y, S)$ be a factor map between dynamical systems. Then

$$
\operatorname{mdim}(\pi, T)=\sup _{y \in Y} \overline{\operatorname{mdim}}\left(\pi^{-1}(y), T\right)=\sup _{y \in Y} \underline{\operatorname{mdim}}\left(\pi^{-1}(y), T\right)
$$

So we can say that the relative mean dimension $\operatorname{mdim}(\pi, T)$ properly measures the mean dimension of fibers of $\pi$.

Now we formally state the main problem we study in the paper:

Problem 1.2. Let $\pi:(X, T) \rightarrow(Y, S)$ be a factor map between dynamical systems. Does the following inequality hold true?

$$
\operatorname{mdim}(X, T) \leq \operatorname{mdim}(Y, S)+\operatorname{mdim}(\pi, T)
$$

This problem was originally posed by the author in [Tsu08, Problem 4.8] more than ten years ago. He encountered it when he studied mean dimension of certain dynamical systems coming from geometric analysis. At that time he spent a lot of time trying to prove the inequality ( $1 \cdot 1$ ), but he did not succeed. He could only prove an inequality much weaker than (1.1) under a rather artificial assumption [Tsu08, Theorem 4.6].

Recently Liang [Lia21] revisited this problem from a new angle. He proved, among other things, that the inequality $(1 \cdot 1)$ holds true in the category of algebraic actions ${ }^{1}$ [Lia21, Corollary 2.18]. See also [LL18, Corollary 6.1] for a closely related result.

We will give both (partially) positive and negative answers to Problem 1.2 below.
1.2. Main results. Our first main result shows a negative answer to Problem 1.2 in a rather strong sense:

Theorem 1.3. For any positive number $\delta$ there exists a factor map between dynamical systems

$$
\pi:(X, T) \rightarrow(Y, S)
$$

satisfying

$$
\operatorname{mdim}(X, T)=1, \quad \operatorname{mdim}(Y, S)<\delta, \quad \operatorname{mdim}(\pi, T)=0
$$

In particular, letting $\delta<1$, this shows that the inequality

$$
\operatorname{mdim}(X, T) \leq \operatorname{mdim}(Y, S)+\operatorname{mdim}(\pi, T)
$$

does not hold in general.
Remark 1.4. In the above statement, we consider the condition $\operatorname{mdim}(X, T)=1$. This is just for simplicity, and indeed we can make mdim $(X, T)$ arbitrary large as follows: Let $n$ be a natural number and $\delta$ a positive number. By Theorem 1.3 there exists a factor map $\pi:(X, T) \rightarrow(Y, S)$ satisfying

$$
\operatorname{mdim}(X, T)=1, \quad \operatorname{mdim}(Y, S)<\frac{\delta}{n}, \quad \operatorname{mdim}(\pi, T)=0
$$

Then it is easy to check that the factor map $\pi:\left(X, T^{n}\right) \rightarrow\left(Y, S^{n}\right)$ satisfies

$$
\operatorname{mdim}\left(X, T^{n}\right)=n, \quad \operatorname{mdim}\left(Y, S^{n}\right)<\delta, \quad \operatorname{mdim}\left(\pi, T^{n}\right)=0
$$

Furthermore we can even prove that for any positive number $\delta$ there exists a factor map $\pi^{\prime}:\left(X^{\prime}, T^{\prime}\right) \rightarrow\left(Y^{\prime}, S^{\prime}\right)$ satisfying

$$
\operatorname{mdim}\left(X^{\prime}, T^{\prime}\right)=\infty, \quad \operatorname{mdim}\left(Y^{\prime}, S^{\prime}\right)<\delta, \quad \operatorname{mdim}\left(\pi^{\prime}, T^{\prime}\right)=0
$$

[^1]See Remarks 3.10 and 3.11 in $\S 3.2$ for further discussions.
Some readers might wonder whether one can even require $\operatorname{mdim}(Y, S)=0$ instead of $\operatorname{mdim}(Y, S)<\delta$ in the statement of Theorem 1.3. However this turns out to be impossible. This is our second main result:

Theorem 1.5. Let $\pi:(X, T) \rightarrow(Y, S)$ be a factor map between dynamical systems. If $\operatorname{mdim}(Y, S)=0$ then

$$
\operatorname{mdim}(X, T)=\operatorname{mdim}(\pi, T)
$$

Namely, an analogue of the Hurewicz theorem holds true if the base system $(Y, S)$ has zero mean dimension. This provides a partially positive answer to Problem 1.2.

The proof of Theorem 1.3 is based on a result of Gromov [Gro88] and its variations developed in $\S 3.1$ below. A main ingredient of the proof of Theorem 1.5 is LindenstraussWeiss' theory of small boundary property.

Acknowledgment. I would like to deeply thank Tom Meyerovitch. The conversation with him revived my interest in Problem 1.2. We discussed the problem together. He generously declined to be a coauthor of this paper. But his influence is visible in several places of the paper. In particular I came up with Remark 3.11 thanks to his suggestion.

## 2. Proof of Proposition 1.1

2.1. Preparations on $\varepsilon$-width dimension. Here we prepare some simple results on $\varepsilon$-width dimension. Let $(X, d)$ and $\left(Y, d^{\prime}\right)$ be metric spaces. We consider its product

$$
(X, d) \times\left(Y, d^{\prime}\right)=\left(X \times Y, d \times d^{\prime}\right)
$$

where $d \times d^{\prime}$ is a metric on $X \times Y$ defined by

$$
d \times d^{\prime}\left(\left(x_{1}, y_{1}\right),\left(x_{2}, y_{2}\right)\right)=\max \left(d\left(x_{1}, x_{2}\right), d^{\prime}\left(y_{1}, y_{2}\right)\right)
$$

Lemma 2.1. For any $\varepsilon>0$ we have

$$
\operatorname{Widim}_{\varepsilon}\left(X \times Y, d \times d^{\prime}\right) \leq \operatorname{Widim}_{\varepsilon}(X, d)+\operatorname{Widim}_{\varepsilon}\left(Y, d^{\prime}\right)
$$

Proof. If $f:(X, d) \rightarrow K$ and $g:\left(Y, d^{\prime}\right) \rightarrow L$ are both $\varepsilon$-embeddings then $f \times g$ : $\left(X \times Y, d \times d^{\prime}\right) \rightarrow K \times L$ is also an $\varepsilon$-embedding.
We say that a map $f: X \rightarrow Y$ is distance non-decreasing if for every $x_{1}, x_{2} \in X$ we have

$$
d\left(x_{1}, x_{2}\right) \leq d^{\prime}\left(f\left(x_{1}\right), f\left(x_{2}\right)\right)
$$

Lemma 2.2. If there exists a distance non-decreasing continuous map $f: X \rightarrow Y$ then for any $\varepsilon>0$

$$
\operatorname{Widim}_{\varepsilon}(X, d) \leq \operatorname{Widim}_{\varepsilon}\left(Y, d^{\prime}\right)
$$

Proof. If $g: Y \rightarrow K$ is an $\varepsilon$-embedding then $g \circ f: X \rightarrow K$ is also.
2.2. Proof of Proposition 1.1. Let $\pi:(X, T) \rightarrow(Y, S)$ be a factor map between dynamical systems. Here we prove Proposition 1.1. It is obvious from the definitions that

$$
\sup _{y \in Y} \underline{\operatorname{mdim}}\left(\pi^{-1}(y), T\right) \leq \sup _{y \in Y} \overline{\operatorname{mdim}}\left(\pi^{-1}(y), T\right) \leq \operatorname{mdim}(\pi, T) .
$$

So it is enough to prove

$$
\operatorname{mdim}(\pi, T) \leq \sup _{y \in Y} \underline{\operatorname{mdim}}\left(\pi^{-1}(y), T\right)
$$

Take any positive number $a$ with

$$
\sup _{y \in Y} \underline{\operatorname{mdim}}\left(\pi^{-1}(y), T\right)<a .
$$

We will show $\operatorname{mdim}(\pi, T) \leq a$.
Let $\varepsilon$ be any positive number. For every $y \in Y$ there exists $N_{y}>0$ satisfying $\operatorname{Widim}_{\varepsilon}\left(\pi^{-1}(y), d_{N_{y}}\right)<a N_{y}$.

Claim 2.3. We can find an open neighborhood $U_{y}$ of $\pi^{-1}(y)$ satisfying $\operatorname{Widim}_{\varepsilon}\left(U_{y}, d_{N_{y}}\right)<$ $a N_{y}$.

Proof. Take an $\varepsilon$-embedding $f: \pi^{-1}(y) \rightarrow K$ with a simplicial complex $K$ of dimension smaller than $a N_{y}$. Since a simplicial complex is ANR (absolute neighborhood retract), we can find an open neighborhood $U_{y}$ of $\pi^{-1}(y)$ and extend $f$ to a continuous map $f: U_{y} \rightarrow K$. If we choose $U_{y}$ sufficiently small, then $f: U_{y} \rightarrow K$ is also an $\varepsilon$-embedding and we have $\operatorname{Widim}_{\varepsilon}\left(U_{y}, d_{N_{y}}\right)<a N_{y}$.

There exists an open neighborhood $V_{y}$ of $y$ satisfying $\pi^{-1}\left(V_{y}\right) \subset U_{y}$. Then we have $\operatorname{Widim}_{\varepsilon}\left(\pi^{-1}\left(V_{y}\right), d_{N_{y}}\right)<a N_{y}$.

Since $Y$ is compact, we can find an open cover $Y=V_{1} \cup V_{2} \cup \cdots \cup V_{m}$ and natural numbers $N_{1}, N_{2}, \ldots, N_{m}$ satisfying $\operatorname{Widim}_{\varepsilon}\left(\pi^{-1}\left(V_{i}\right), d_{N_{i}}\right)<a N_{i}$ for all $1 \leq i \leq m$. Set

$$
\bar{N}:=\max _{1 \leq i \leq m} N_{i}
$$

Claim 2.4. For every $y \in Y$ and natural number $N$ we have

$$
\operatorname{Widim}_{\varepsilon}\left(\pi^{-1}(y), d_{N}\right)<a(N+\bar{N})
$$

Proof. We choose a sequence $i_{1}, i_{2}, \ldots, i_{k}$ such that

$$
\begin{gathered}
y \in V_{i_{1}}, \quad S^{N_{i_{1}}} y \in V_{i_{2}}, \quad S^{N_{i_{1}}+N_{i_{2}}} y \in V_{i_{3}}, \quad \cdots \quad, S^{N_{i_{1}}+N_{i_{2}}+\cdots+N_{i_{k-1}}} y \in V_{i_{k}}, \\
N_{i_{1}}+N_{i_{2}}+\cdots+N_{i_{k-1}}<N \leq N_{i_{1}}+N_{i_{2}}+\cdots+N_{i_{k}} .
\end{gathered}
$$

Consider a map

$$
f:\left(\pi^{-1}(y), d_{N}\right) \rightarrow\left(\pi^{-1}\left(V_{i_{1}}\right), d_{N_{i_{1}}}\right) \times\left(\pi^{-1}\left(V_{i_{2}}\right), d_{N_{i_{2}}}\right) \times \cdots \times\left(\pi^{-1}\left(V_{i_{k}}\right), d_{N_{i_{k}}}\right),
$$

defined by $f(x)=\left(x, T^{N_{i_{1}}} x, T^{N_{i_{1}}+N_{i_{2}}} x, \ldots, T^{N_{i_{1}}+N_{i_{2}}+\cdots+N_{i_{k-1}}} x\right)$. This is a distance nondecreasing continuous map. Hence by Lemmas 2.1 and 2.2 we have

$$
\begin{aligned}
\operatorname{Widim}_{\varepsilon}\left(\pi^{-1}(y), d_{N}\right) & \leq \sum_{j=1}^{k} \operatorname{Widim}_{\varepsilon}\left(\pi^{-1}\left(V_{i_{j}}\right), d_{N_{i_{j}}}\right) \\
& <a \sum_{j=1}^{k} N_{i_{j}}<a(N+\bar{N})
\end{aligned}
$$

Thus we have

$$
\sup _{y \in Y} \operatorname{Widim}_{\varepsilon}\left(\pi^{-1}(y), d_{N}\right) \leq a(N+\bar{N})
$$

Hence

$$
\lim _{N \rightarrow \infty} \frac{\sup _{y \in Y} \operatorname{Widim}_{\varepsilon}\left(\pi^{-1}(y), d_{N}\right)}{N} \leq a
$$

Since $\varepsilon>0$ is arbitrary, we have

$$
\operatorname{mdim}(\pi, T)=\lim _{\varepsilon \rightarrow 0}\left(\lim _{N \rightarrow \infty} \frac{\sup _{y \in Y} \operatorname{Widim}_{\varepsilon}\left(\pi^{-1}(y), d_{N}\right)}{N}\right) \leq a
$$

This proves Proposition 1.1.

## 3. Proof of Theorem 1.3

3.1. Variations of Gromov's lemma. Gromov proved the following statement in [Gro88, p.107, ( $\mathrm{H}_{1}^{\prime \prime}$ ) Example]. This shows that a direct analogue of the Hurewicz theorem does not hold for $\varepsilon$-width dimension.

Lemma 3.1 (Gromov 1988). Let $(X, d)$ be a $(2 n+1)$-dimensional compact Riemannian manifold. For any positive number $\varepsilon$ there exists a smooth map $f: X \rightarrow[0,1]$ such that for every $t \in[0,1]$ we have

$$
\operatorname{Widim}_{\varepsilon}\left(f^{-1}(t), d\right) \leq n
$$

The purpose of this subsection is to develop some variations of this lemma. The main results are Lemma 3.4 and Corollary 3.5 below. We do not explain the proof of Lemma 3.1 itself because we will provide a full proof of a more detailed version below. Our argument follows Gromov's idea.

We need to prepare some basic terminologies of simplicial complex. (Recall that we always assume that a simplicial complex has only finitely many simplices.) For a simplicial complex $K$ we denote by $V(K)$ the set of vertices of $K$.

Definition 3.2. Let $K$ be a simplicial complex and $L \subset K$ a subcomplex. $L$ is said to be a full subcomplex of $K$ if for every simplex $\Delta \subset K$ with $V(\Delta) \subset L$ we have $\Delta \subset L$.

There is a one-to-one correspondence between full subcomplexes of $K$ and a subset of $V(K)$. For a subset $A \subset V(K)$ we denote by $K(A)$ the (unique) full subcomplex of $K$ satisfying $V(K(A))=A$. If $A=\emptyset$ (empty set), then $K(A)=\emptyset$.

For a vertex $v \in K$ we define the $\operatorname{star} \operatorname{St}(v)$ by

$$
\operatorname{St}(v)=\bigcup\{\operatorname{Int}(\Delta) \mid \Delta \text { is a simplex of } K \text { with } v \in \Delta\}
$$

where $\operatorname{Int}(\Delta)$ is the interior of $\Delta$ defined by (letting $\left.V(\Delta)=\left\{p_{0}, p_{1}, \ldots, p_{n}\right\}\right)$

$$
\operatorname{Int}(\Delta)=\left\{\sum_{i=0}^{n} t_{i} p_{i} \mid t_{0}+t_{1}+\cdots+t_{n}=1, t_{i}>0(\forall 0 \leq i \leq n)\right\}
$$

When $\Delta=\{v\}$ (just one point) then its interior is $\{v\}$. So in particular $\operatorname{St}(v)$ contains $v$. Indeed it is easy to check that $\operatorname{St}(v)$ is an open neighborhood of $v$. So the stars $\operatorname{St}(v)$ $(v \in V(K))$ form an open covering of $K$.

Let $m$ be a natural number. We denote the standard basis of $\mathbb{R}^{m}$ by $e_{1}, e_{2}, \ldots, e_{m}$. We define the standard $(m-1)$-dimensional simplex $\Delta^{m-1} \subset \mathbb{R}^{m}$ by

$$
\boldsymbol{\Delta}^{m-1}=\left\{\sum_{i=1}^{m} t_{i} e_{i} \mid t_{1}+t_{2}+\cdots+t_{m}=1, t_{i} \geq 0(\forall 1 \leq i \leq m)\right\}
$$

The following lemma is our first variation of Gromov's lemma.
Lemma 3.3. Let $K$ be a simplicial complex with a metric $d$. Let $\varepsilon$ be a positive number satisfying

$$
\max _{v \in V(K)} \operatorname{Diam} \operatorname{St}(v)<\varepsilon
$$

Let $m$ be a natural number. Suppose we are given a partition

$$
V(K)=A_{1} \cup A_{2} \cup \cdots \cup A_{m} \quad(\text { disjoint union }) .
$$

Then there exists a simplicial map $f: K \rightarrow \boldsymbol{\Delta}^{m-1}$ such that for every $p \in \boldsymbol{\Delta}^{m-1}$ we have

$$
\operatorname{Widim}_{\varepsilon}\left(f^{-1}(p), d\right) \leq \max _{1 \leq i \leq m} \operatorname{dim} K\left(A_{i}\right) .
$$

Here $K\left(A_{i}\right)$ is the full subcomplex of $K$ corresponding to $A_{i}$.
Proof. We define a simplicial map $f: K \rightarrow \boldsymbol{\Delta}^{m-1}$ by the condition $f\left(A_{i}\right)=\left\{e_{i}\right\}$ and extending it linearly. Namely, if $x \in K$ has the form

$$
x=\sum_{i=1}^{m}\left(\sum_{u \in A_{i}} x_{u} u\right)
$$

where $x_{u}$ are nonnegative numbers with $\sum_{i=1}^{m} \sum_{u \in A_{i}} x_{u}=1$, we define

$$
f(x)=\sum_{i=1}^{m}\left(\sum_{u \in A_{i}} x_{u}\right) e_{i} .
$$

Let $p=\sum_{i=1}^{m} t_{i} e_{i} \in \boldsymbol{\Delta}^{m-1}$. We assume, say, $t_{1}>0$. (Other cases can be treated similarly.) If $x=\sum_{i=1}^{m}\left(\sum_{u \in A_{i}} x_{u} u\right) \in f^{-1}(p)$ then

$$
f(x)=\sum_{i=1}^{m}\left(\sum_{u \in A_{i}} x_{u}\right) e_{i}=\sum_{i=1}^{m} t_{i} e_{i}
$$

and hence

$$
\sum_{u \in A_{1}} x_{u}=t_{1}>0
$$

We define a map $g: f^{-1}(p) \rightarrow K\left(A_{1}\right)$ by

$$
g(x)=\frac{\sum_{u \in A_{1}} x_{u} u}{\sum_{u \in A_{1}} x_{u}}
$$

Every fiber of $g$ is contained in some star $\operatorname{St}(v)$ of $v \in A_{1}$. So its diameter is smaller than $\varepsilon$. Hence $g$ is an $\varepsilon$-embedding. Therefore

$$
\operatorname{Widim}_{\varepsilon}\left(f^{-1}(p), d\right) \leq \operatorname{dim} K\left(A_{1}\right)
$$

We need to recall the terminologies on barycentric subdivision. Let $K$ be a simplicial complex. For each simplex $\Delta \subset K$ we denote the barycenter of $\Delta$ by bc( $\Delta$ ). (Namely, if $V(\Delta)=\left\{p_{0}, p_{1}, \ldots, p_{n}\right\}$ then $\left.\operatorname{bc}(\Delta)=\left(p_{0}+p_{1}+\cdots+p_{n}\right) /(n+1).\right)$

We define the barycentric subdivision $K^{\prime}$ of $K$ by the following two conditions.

- $V\left(K^{\prime}\right):=\{\mathrm{bc}(\Delta) \mid \Delta \subset K$ : simplex $\}$.
- If $\Delta_{0} \subset \Delta_{1} \subset \cdots \subset \Delta_{n}$ is a flag of mutually distinct simplices of $K$ then $\mathrm{bc}\left(\Delta_{0}\right), \mathrm{bc}\left(\Delta_{1}\right), \ldots, \mathrm{bc}\left(\Delta_{n}\right)$ form an $n$-simplex in $K^{\prime}$.
As a topological space, $K^{\prime}$ is naturally identified with $K$. See Figure 1.

Figure 1. The 2-simplex (left) and its barycentric subdivision (right).
The next lemma is our second variation of Gromov's lemma.
Lemma 3.4. Let $K$ be a simplicial complex with a metric $d$. Let $\varepsilon$ be a positive number and $m$ a natural number. After subdividing $K$ sufficiently fine, we can find a simplicial map $f: K \rightarrow \boldsymbol{\Delta}^{m-1}$ such that for every point $p \in \boldsymbol{\Delta}^{m-1}$

$$
\operatorname{Widim}_{\varepsilon}\left(f^{-1}(p), d\right) \leq \frac{\operatorname{dim} K}{m}
$$

Proof. By subdividing $K$ sufficiently fine, we can assume that

$$
\max _{v \in V(K)} \operatorname{Diam} \operatorname{St}(v)<\varepsilon
$$

Let $K^{\prime}$ be the barycentric subdivision of $K$. Then for each simplex $\Delta \subset K$ we have a vertex $\mathrm{bc}(\Delta)$ of $K^{\prime}$. We define a partition $V\left(K^{\prime}\right)=A_{1} \cup A_{2} \cup \cdots \cup A_{m}$ (disjoint union) by
$A_{1}=\left\{\mathrm{bc}(\Delta) \mid \Delta\right.$ is a simplex of $K$ with $\left.\operatorname{dim} \Delta \leq \frac{\operatorname{dim} K}{m}\right\}$,
$A_{i}=\left\{\operatorname{bc}(\Delta) \mid \Delta\right.$ is a simplex of $K$ with $\left.\frac{(i-1) \operatorname{dim} K}{m}<\operatorname{dim} \Delta \leq \frac{i \operatorname{dim} K}{m}\right\}, \quad(2 \leq i \leq m)$.
Consider the full subcomplexes $K^{\prime}\left(A_{i}\right)(1 \leq i \leq m)$ corresponding to $A_{i}$. Every simplex of $K^{\prime}\left(A_{1}\right)$ corresponds to a flag $\Delta_{0} \subset \Delta_{1} \subset \cdots \subset \Delta_{n}$ of distinct simplices of $K$ of dimension $\leq \frac{\operatorname{dim} K}{m}$. The length of such a flag is at most $\frac{\operatorname{dim} K}{m}+1$. So we have

$$
\operatorname{dim} K^{\prime}\left(A_{1}\right) \leq \frac{\operatorname{dim} K}{m}
$$

Similarly

$$
\operatorname{dim} K^{\prime}\left(A_{i}\right)<\frac{\operatorname{dim} K}{m}, \quad(2 \leq i \leq m)
$$

Figure 2 shows the case that $K$ is two dimensional and $m=2$.

- : $V\left(K^{\prime}\left(A_{1}\right)\right)$
* : $K^{\prime}\left(A_{2}\right)$

Figure 2. This shows the construction in the case that $K$ is two dimensional and $m=2$. The left is a two-dimensional simplicial complex $K$. The right is $K^{\prime}\left(A_{1}\right)$ and $K^{\prime}\left(A_{2}\right) . K^{\prime}\left(A_{1}\right)$ is the one-dimensional skeleton of $K$ (more precisely, $K^{\prime}\left(A_{1}\right)$ is the barycentric subdivision of the onedimensional skeleton of $K)$. The vertices of $K^{\prime}\left(A_{1}\right)$ is depicted as dots. $K^{\prime}\left(A_{2}\right)$ consists of five points depicted as $*$, which are the barycenters of two-dimensional simplices of $K$. So $K^{\prime}\left(A_{1}\right)$ is one dimensional and $K^{\prime}\left(A_{2}\right)$ is zero dimensional.

Then by Lemma 3.3 we can find a simplicial map $f: K^{\prime} \rightarrow \boldsymbol{\Delta}^{m-1}$ such that for every point $p \in \boldsymbol{\Delta}^{m-1}$ we have

$$
\operatorname{Widim}_{\varepsilon}\left(f^{-1}(p), d\right) \leq \max _{1 \leq i \leq m} \operatorname{dim} K^{\prime}\left(A_{i}\right) \leq \frac{\operatorname{dim} K}{m}
$$

The following corollary is a crucial ingredient of the proof of Theorem 1.3 in the next subsection.

Corollary 3.5. Let $K$ be a simplicial complex with a metric d. For any positive number $\varepsilon$ and any natural number $m$ there exists a continuous map $F: K \rightarrow[0,1]^{m-1}$ such that for every point $p \in[0,1]^{m-1}$ we have

$$
\operatorname{Widim}_{\varepsilon}\left(F^{-1}(p), d\right) \leq \frac{\operatorname{dim} K}{m}
$$

Proof. The $(m-1)$ dimensional cube $[0,1]^{m-1}$ is homeomorphic to the $(m-1)$ dimensional simplex $\boldsymbol{\Delta}^{m-1}$. So the statement follows from Lemma 3.4.

Remark 3.6. The factor of $\frac{1}{m}$ in the statements of Lemma 3.4 and Corollary 3.5 is optimal, according to [Gro88, p.107, Corollaries $\left.\left(\mathrm{H}_{1}^{\prime}\right)\right]$. It says that if $f: X \rightarrow[0,1]^{m-1}$ is a continuous map from a compact metric space $(X, d)$ then for any $\varepsilon>0$

$$
\sup _{p \in[0,1]^{m-1}} \operatorname{Widim}_{\varepsilon}\left(f^{-1}(p), d\right) \geq \frac{\operatorname{Widim}_{\varepsilon}(X, d)-m+1}{m} .
$$

Remark 3.7. Lemma 3.4 and Corollary 3.5 show a rather counter-intuitive phenomena. The following example illustrates its significance: Let $K$ be a simplicial complex of

$$
\operatorname{dim} K=1000,000 \quad \text { (one million). }
$$

Let $m=1001$. From Corollary 3.5, for any positive number $\varepsilon$, there exists a continuous map $F: K \rightarrow[0,1]^{1000}$ such that for all $p \in[0,1]^{1000}$

$$
\operatorname{Widim}_{\varepsilon}\left(F^{-1}(p), d\right)<1000
$$

Hence every fiber of $F$ looks like a space whose dimension is smaller than 1000 (up to distortion bounded by $\varepsilon$ ). The range of $F$ is also 1000 dimensional. However the total space $K$ has dimension one million!
3.2. Proof of Theorem 1.3. The purpose of this subsection is to prove Theorem 1.3.

Consider the two-sided infinite product of copies of the unit interval $[0,1]$ :

$$
[0,1]^{\mathbb{Z}}=\cdots \times[0,1] \times[0,1] \times[0,1] \times \cdots
$$

We define a metric $\rho$ on $[0,1]^{\mathbb{Z}}$ by

$$
\rho\left(\left(x_{n}\right)_{n \in \mathbb{Z}},\left(y_{n}\right)_{n \in \mathbb{Z}}\right)=\sum_{n \in \mathbb{Z}} 2^{-|n|}\left|x_{n}-y_{n}\right| .
$$

We define the shift map $\sigma:[0,1]^{\mathbb{Z}} \rightarrow[0,1]^{\mathbb{Z}}$ by

$$
\sigma\left(\left(x_{n}\right)_{n \in \mathbb{Z}}\right)=\left(x_{n+1}\right)_{n \in \mathbb{Z}} .
$$

The pair $\left([0,1]^{\mathbb{Z}}, \sigma\right)$ is a dynamical system.
Let $(Z, R)$ be a zero dimensional free minimal dynamical system. Here "zero dimensional" means that $Z$ is totally disconnected, "free" means that it has no periodic point, and "minimal" means that every orbit is dense in $Z$. (Indeed, the following argument works well without the minimality assumption. But we assume it for simplicity of the explanation.) It is a standard fact that such a dynamical system exists. For example, we can construct it as a subshift of $\left(\{0,1\}^{\mathbb{Z}}\right.$, shift $)$. We take a metric $\rho^{\prime}$ on $Z$.

We define a dynamical system $(X, T)$ as the product of $\left([0,1]^{\mathbb{Z}}, \sigma\right)$ and $(Z, R)$ :

$$
(X, T):=\left([0,1]^{\mathbb{Z}} \times Z, \sigma \times R\right)
$$

We define a metric $d$ on $X=[0,1]^{\mathbb{Z}} \times Z$ by

$$
d\left((x, z),\left(x^{\prime}, z^{\prime}\right)\right)=\max \left(\rho\left(x, x^{\prime}\right), \rho^{\prime}\left(z, z^{\prime}\right)\right)
$$

The mean dimension of $(X, T)$ is one:

$$
\operatorname{mdim}(X, T)=1
$$

Throughout this subsection we fix $(X, T)=\left([0,1]^{\mathbb{Z}} \times Z, \sigma \times R\right)$ and construct factor maps from this $(X, T)$.

The next proposition is a preliminary version of Theorem 1.3.
Proposition 3.8. For any positive numbers $\varepsilon$ and $\delta$ there exist a dynamical system $(Y, S)$ and a factor map $\pi:(X, T) \rightarrow(Y, S)$ such that

$$
\operatorname{mdim}(Y, S)<\delta, \quad \lim _{N \rightarrow \infty} \frac{\sup _{y \in Y} \operatorname{Widim}_{\varepsilon}\left(\pi^{-1}(y), d_{N}\right)}{N}<\delta
$$

Proof. We prepare ingredients of the construction:

- Fix a natural number $m$ with $\frac{1}{m}<\delta$.
- Fix a natural number $L>m$ with $\frac{m}{L}<\frac{\delta}{2}$.
- Since $(Z, R)$ is free and zero dimensional, we can take a non-empty clopen set $U \subset Z$ satisfying $U \cap R^{-n} U=\emptyset$ for all $1 \leq n \leq L$. Here "clopen" means that $U$ is both closed and open. Since $(Z, R)$ is minimal, there exists a natural number $L^{\prime}>L$ satisfying

$$
Z=\bigcup_{n=1}^{L^{\prime}-1} R^{-n} U
$$

- For $z \in Z$ we set $E(z)=\left\{n \in \mathbb{Z} \mid R^{n} z \in U\right\}$. For any two distinct points $a, b \in E(z)$ we have $|b-a|>L$. Moreover for any $a \in E(z)$ there exists $b \in E(z)$ satisfying $a+L<b<a+L^{\prime}$.
- For each natural number $n$, we apply Corollary 3.5 to the $n$-dimensional cube $[0,1]^{n}$. Then we find a continuous map $F_{n}:[0,1]^{n} \rightarrow[0,1]^{m-1}$ such that for every point $p \in[0,1]^{m-1}$ we have

$$
\operatorname{Widim}_{\varepsilon / 4}\left(F_{n}^{-1}(p),\|\cdot\|_{\infty}\right) \leq \frac{n}{m}(<\delta n) .
$$

Here a metric on $[0,1]^{n}$ is given by the $\ell^{\infty}$-norm $\|x\|_{\infty}=\max _{1 \leq i \leq n}\left|x_{i}\right|$.

- For $n \geq m$ we define $G_{n}:[0,1]^{n} \rightarrow[0,1]^{n}$ by

$$
G_{n}(x)=(F_{n}(x), \underbrace{0,0, \ldots, 0,0}_{n-m+1}) .
$$

Notice that if $n$ is large then the proportion of non-zero entries of $G_{n}(x)$ is very small. For every point $p \in[0,1]^{n}$ we have

$$
\operatorname{Widim}_{\varepsilon / 4}\left(G_{n}^{-1}(p),\|\cdot\|_{\infty}\right) \leq \frac{n}{m}(<\delta n)
$$

We will construct an equivariant continuous map $f:(X, T) \rightarrow\left([0,1]^{\mathbb{Z}}, \sigma\right)$ by using the above data. For a point $x=\left(x_{n}\right)_{n \in \mathbb{Z}} \in[0,1]^{\mathbb{Z}}$ and integers $a<b$, we denote

$$
\left.x\right|_{[a, b)}:=\left(x_{a}, x_{a+1}, x_{a+2}, \ldots, x_{b-1}\right) .
$$

Let $(x, z) \in[0,1]^{\mathbb{Z}} \times Z=X$. Take any point $a \in E(z)$ and set $b:=\min (E(z) \cap(a, \infty))$. We have $L<b-a<L^{\prime}$. We define

$$
\left.f(x, z)\right|_{[a, b)}:=G_{b-a}\left(\left.x\right|_{[a, b)}\right) \in[0,1]^{b-a} .
$$

We consider this for every $a \in E(z)$. Then we have defined $f(x, z) \in[0,1]^{\mathbb{Z}}$. The map $f$ is equivariant and continuous. (The continuity follows from the clopenness of $U$.) We define $\pi: X \rightarrow[0,1]^{\mathbb{Z}} \times Z$ by

$$
\pi(x, z)=(f(x, z), z)
$$

We set $Y=\pi(X)$, which becomes a dynamical system under the map $S:=\sigma \times R$. We will show that a factor map $\pi:(X, T) \rightarrow(Y, S)$ satisfies the statement.

First we estimate the mean dimension of $(Y, S)$. Let $(x, z) \in[0,1]^{\mathbb{Z}} \times Z$ and let $N$ be a natural number. Denote

$$
[0, N) \cap E(z)=\left\{a_{1}<a_{2}<a_{3}<\cdots<a_{k}\right\}
$$

Since $a_{i+1}-a_{i}>L$, we have $k-1<\frac{N}{L}$. Set

$$
a_{0}:=\max (E(z) \cap(-\infty, 0)), \quad a_{k+1}:=\min (E(z) \cap[N, \infty))
$$

Then we have

$$
[0, N) \subset \bigcup_{i=0}^{k}\left[a_{i}, a_{i+1}\right)=\left[a_{0}, a_{k+1}\right)
$$

For $0 \leq i \leq k$

$$
\left.f(x, z)\right|_{\left[a_{i}, a_{i+1}\right)}=G_{a_{i+1}-a_{i}}\left(\left.x\right|_{\left[a_{i}, a_{i+1}\right)}\right) .
$$

The number of its non-zero entries is at most $m-1$. Therefore
The number of non-zero entries of $\left.f(x, z)\right|_{[0, N)} \leq(k+1)(m-1)$

$$
\begin{aligned}
& <\left(\frac{N}{L}+2\right)(m-1) \\
& <\frac{\delta N}{2}+2 m \text { by } \frac{m}{L}<\frac{\delta}{2}
\end{aligned}
$$

Denote by $\Pi_{N}:[0,1]^{\mathbb{Z}} \rightarrow[0,1]^{N}$ the projection to the $0,1,2, \ldots,(N-1)$-th coordinates. Then $\Pi_{N}(f(X))$ is contained in

$$
\left\{\left(y_{0}, y_{1}, \ldots, y_{N-1}\right) \mid y_{n}=0 \text { except for at most } \frac{\delta N}{2}+2 m \text { entries }\right\} .
$$

whose dimension is at most $\frac{\delta N}{2}+2 m$. This implies that

$$
\operatorname{mdim}(f(X), \sigma) \leq \lim _{N \rightarrow \infty}\left(\frac{\delta N}{2}+2 m\right) / N=\frac{\delta}{2}<\delta
$$

Since $Z$ is zero dimensional, we have

$$
\operatorname{mdim}(Y, S)=\operatorname{mdim}(f(X), \sigma)<\delta
$$

Next we study the fibers of $\pi$. Fix $M>0$ with $\sum_{|n| \geq M} 2^{-|n|}<\frac{\varepsilon}{2}$. Let $y=(p, z) \in Y$ with $p \in[0,1]^{\mathbb{Z}}$ and $z \in Z$. Let $N$ be a natural number. Denote

$$
(-M, N+M) \cap E(z)=\left\{a_{1}<a_{2}<\cdots<a_{k}\right\}
$$

and set

$$
a_{0}:=\max (E(z) \cap(-\infty,-M]), \quad a_{k+1}:=\min (E(z) \cap[N+M, \infty))
$$

Then we have

$$
(-M, N+M) \subset \bigcup_{i=0}^{k}\left[a_{i}, a_{i+1}\right)=\left[a_{0}, a_{k+1}\right)
$$

Since $a_{i+1}-a_{i}<L^{\prime}$, we have $a_{k+1}-a_{0}<N+2 M+2 L^{\prime}$. For any $0 \leq i \leq k$ and $(x, z) \in \pi^{-1}(y)$ we have

$$
\left.f(x, z)\right|_{\left[a_{i}, a_{i+1}\right)}=G_{a_{i+1}-a_{i}}\left(\left.x\right|_{\left[a_{i}, a_{i+1}\right)}\right)=\left.p\right|_{\left[a_{i}, a_{i+1}\right)} .
$$

We define a projection $\Pi_{\left[a_{0}, a_{k+1}\right)}:[0,1]^{\mathbb{Z}} \times Z \rightarrow[0,1]^{a_{k+1}-a_{0}}$ by

$$
\Pi_{\left[a_{0}, a_{k+1}\right)}\left(\left(x_{n}\right)_{n \in \mathbb{Z}}, z\right)=\left(x_{n}\right)_{n \in\left[a_{0}, a_{k+1}\right)} .
$$

Then

$$
\Pi_{\left[a_{0}, a_{k+1}\right)}\left(\pi^{-1}(y)\right) \subset G_{a_{1}-a_{0}}^{-1}\left(\left.p\right|_{\left[a_{0}, a_{1}\right)}\right) \times G_{a_{2}-a_{1}}^{-1}\left(\left.p\right|_{\left[a_{1}, a_{2}\right)}\right) \times \cdots \times G_{a_{k+1}-a_{k}}^{-1}\left(\left.p\right|_{\left[a_{k}, a_{k+1}\right)}\right) .
$$

It follows that
$\operatorname{Widim}_{\varepsilon}\left(\pi^{-1}(y), d_{N}\right) \leq \operatorname{Widim}_{\varepsilon / 4}\left(\Pi_{\left[a 0, a_{k+1}\right)}\left(\pi^{-1}(y)\right),\|\cdot\|_{\infty}\right) \quad$ by the definition of the metric $d$

$$
\begin{aligned}
& \leq \sum_{i=0}^{k} \operatorname{Widim}_{\varepsilon / 2}\left(G_{a_{i+1}-a_{i}}^{-1}\left(\left.p\right|_{\left[a_{i}, a_{i+1}\right)}\right),\|\cdot\|_{\infty}\right) \\
& \leq \sum_{i=0}^{k} \frac{a_{i+1}-a_{i}}{m} \\
& =\frac{a_{k+1}-a_{0}}{m}<\frac{N+2 M+2 L^{\prime}}{m}
\end{aligned}
$$

This holds for every $y \in Y$. So we get

$$
\sup _{y \in Y} \operatorname{Widim}_{\varepsilon}\left(\pi^{-1}(y), d_{N}\right)<\frac{N+2 M+2 L^{\prime}}{m} .
$$

Notice that $M$ and $L^{\prime}$ are independent of $N$. Thus we conclude

$$
\lim _{N \rightarrow \infty} \frac{\sup _{y \in Y} \operatorname{Widim}_{\varepsilon}\left(\pi^{-1}(y), d_{N}\right)}{N} \leq \frac{1}{m}<\delta .
$$

Now we are ready to prove Theorem 1.3.
Theorem 3.9. For any positive number $\delta$ there exists a dynamical system $(Y, S)$ and a factor map $\pi:(X, T) \rightarrow(Y, S)$ such that

$$
\operatorname{mdim}(Y, S)<\delta, \quad \operatorname{mdim}(\pi, T)=0
$$

Recall that the dynamical system $(X, T)=\left([0,1]^{\mathbb{Z}} \times Z, \sigma \times R\right)$ has mean dimension one. So Theorem 1.3 follows from this theorem.

Proof. For each natural number $n$ we apply Proposition 3.8 to $\varepsilon=\frac{1}{n}$ and $\frac{\delta}{2^{n}}$. Then we find a factor map $\pi_{n}:(X, T) \rightarrow\left(Y_{n}, S_{n}\right)$ such that

$$
\operatorname{mdim}\left(Y_{n}, S_{n}\right)<\frac{\delta}{2^{n}}, \quad \lim _{N \rightarrow \infty} \frac{\sup _{y \in Y_{n}} \operatorname{Widim}_{1 / n}\left(\pi_{n}^{-1}(y), d_{N}\right)}{N}<\frac{\delta}{2^{n}}
$$

Define

$$
\pi:=\pi_{1} \times \pi_{2} \times \pi_{3} \times \cdots: X \rightarrow Y_{1} \times Y_{2} \times Y_{3} \times \cdots, \quad x \mapsto\left(\pi_{1}(x), \pi_{2}(x), \pi_{3}(x), \ldots\right)
$$

Set $Y=\pi(X) \subset Y_{1} \times Y_{2} \times Y_{3} \times \cdots$ with a map $S:=S_{1} \times S_{2} \times S_{3} \times \cdots$. The pair $(Y, S)$ is a dynamical system. We show that the factor map $\pi:(X, T) \rightarrow(Y, S)$ satisfies the statement.

The mean dimension of $(Y, S)$ is bounded by

$$
\operatorname{mdim}(Y, S) \leq \sum_{n=1}^{\infty} \operatorname{mdim}\left(Y_{n}, S_{n}\right)<\sum_{n=1}^{\infty} \frac{\delta}{2^{n}}=\delta
$$

Let $y=\left(y_{1}, y_{2}, y_{3}, \ldots\right) \in Y\left(y_{n} \in Y_{n}\right)$. We have

$$
\pi^{-1}(y)=\bigcap_{n=1}^{\infty} \pi_{n}^{-1}\left(y_{n}\right) .
$$

Then for any natural numbers $n$ and $N$

$$
\operatorname{Widim}_{1 / n}\left(\pi^{-1}(y), d_{N}\right) \leq \operatorname{Widim}_{1 / n}\left(\pi_{n}^{-1}\left(y_{n}\right), d_{N}\right) .
$$

Hence

$$
\lim _{N \rightarrow \infty} \frac{\sup _{y \in Y} \operatorname{Widim}_{1 / n}\left(\pi^{-1}(y), d_{N}\right)}{N} \leq \lim _{N \rightarrow \infty} \frac{\sup _{y_{n} \in Y_{n}} \operatorname{Widim}_{1 / n}\left(\pi_{n}^{-1}\left(y_{n}\right), d_{N}\right)}{N}<\frac{\delta}{2^{n}}
$$

Letting $n \rightarrow \infty$, we get $\operatorname{mdim}(\pi, T)=0$.
Remark 3.10. Let $\delta$ be a positive number. For each natural number $n$ we apply Theorem 3.9 to $\frac{\delta}{2^{n}}$. Then there exists a factor map $\pi_{n}:(X, T) \rightarrow\left(Y_{n}, S_{n}\right)$ such that

$$
\operatorname{mdim}\left(Y_{n}, S_{n}\right)<\frac{\delta}{2^{n}}, \quad \operatorname{mdim}\left(\pi_{n}, T\right)=0
$$

We set

$$
\left(X^{\prime}, T^{\prime}\right):=(X, T) \times(X, T) \times(X, T) \times \cdots, \quad\left(Y^{\prime}, S^{\prime}\right):=\left(Y_{1}, S_{1}\right) \times\left(Y_{2}, S_{2}\right) \times\left(Y_{3}, S_{3}\right) \times \cdots .
$$

We define a factor map $\pi^{\prime}:\left(X^{\prime}, T^{\prime}\right) \rightarrow\left(Y^{\prime}, S^{\prime}\right)$ by

$$
\pi^{\prime}\left(x_{1}, x_{2}, x_{3}, \ldots\right)=\left(\pi_{1}\left(x_{1}\right), \pi_{2}\left(x_{2}\right), \pi_{3}\left(x_{3}\right), \ldots\right)
$$

Then it is easy to check that

$$
\operatorname{mdim}\left(X^{\prime}, T^{\prime}\right)=\infty, \quad \operatorname{mdim}\left(Y^{\prime}, S^{\prime}\right)<\delta, \quad \operatorname{mdim}\left(\pi^{\prime}, T^{\prime}\right)=0
$$

See Remark 1.4 in $\S 1.2$.
Remark 3.11. The dynamical system $\left(X^{\prime}, T^{\prime}\right)$ constructed in the above remark is a rather "universal" one. It has the form

$$
\left(X^{\prime}, T^{\prime}\right)=\left(\left([0,1]^{\mathbb{N}}\right)^{\mathbb{Z}}, \text { shift }\right) \times\left(Z^{\prime}, S^{\prime}\right)
$$

where $\left(Z^{\prime}, S^{\prime}\right)$ is a zero dimensional dynamical system given by

$$
\left(Z^{\prime}, S^{\prime}\right)=(Z, S) \times(Z, S) \times(Z, S) \times \cdots
$$

It is easy to see that every dynamical system embeds in $\left(\left([0,1]^{\mathbb{N}}\right)^{\mathbb{Z}}\right.$, shift $)$. Hence, given an arbitrary dynamical system $(\mathcal{X}, \mathcal{T})$, we can embed $(\mathcal{X}, \mathcal{T}) \times\left(Z^{\prime}, S^{\prime}\right)$ in $\left(X^{\prime}, T^{\prime}\right)$. Therefore, for any positive number $\delta$, there exists a factor map

$$
\Pi:\left(\mathcal{X} \times Z^{\prime}, \mathcal{T} \times S^{\prime}\right) \rightarrow(\mathcal{Y}, \mathcal{S})
$$

satisfying

$$
\operatorname{mdim}(\mathcal{Y}, \mathcal{S})<\delta, \quad \operatorname{mdim}(\Pi, \mathcal{T})=0
$$

Notice that

$$
\operatorname{mdim}\left(\mathcal{X} \times Z^{\prime}, \mathcal{T} \times S^{\prime}\right)=\operatorname{mdim}(\mathcal{X}, \mathcal{T})
$$

can be an arbitrary nonnegative number. Thus we can say that the construction of this section shows an universal phenomena.

## 4. Proof of Theorem 1.5

4.1. Preliminaries on relative mean dimension. Here we prepare some simple facts on the relative mean dimension.

Lemma 4.1. Let $\pi_{i}:\left(X_{i}, T_{i}\right) \rightarrow\left(Y_{i}, S_{i}\right)(i=1,2)$ be two factor maps between dynamical systems. We consider their product:

$$
\pi_{1} \times \pi_{2}:\left(X_{1} \times X_{2}, T_{1} \times T_{2}\right) \rightarrow\left(Y_{1} \times Y_{2}, S_{1} \times S_{2}\right)
$$

For this factor map we have

$$
\begin{aligned}
& \operatorname{mdim}\left(\pi_{1} \times \pi_{2}, T_{1} \times T_{2}\right) \leq \operatorname{mdim}\left(\pi_{1}, T_{1}\right)+\operatorname{mdim}\left(\pi_{2}, T_{2}\right) \\
& \operatorname{mdim}\left(\pi_{1} \times \pi_{2}, T_{1} \times T_{2}\right) \geq \max \left(\operatorname{mdim}\left(\pi_{1}, T_{1}\right), \operatorname{mdim}\left(\pi_{2}, T_{2}\right)\right)
\end{aligned}
$$

Proof. Let $d$ and $d^{\prime}$ be metrics on $X_{1}$ and $X_{2}$ respectively. The product space $X \times X^{\prime}$ has a metric $d \times d^{\prime}$. (See §2.1.)

Let $\left(y_{1}, y_{2}\right) \in Y_{1} \times Y_{2}$. For every natural number $N$ we have

$$
\left(\left(\pi_{1} \times \pi_{2}\right)^{-1}\left(y_{1}, y_{2}\right),\left(d \times d^{\prime}\right)_{N}\right)=\left(\pi_{1}^{-1}\left(y_{1}\right), d_{N}\right) \times\left(\pi_{2}^{-1}\left(y_{2}\right), d_{N}^{\prime}\right)
$$

By Lemma 2.1, for $\varepsilon>0$
$\operatorname{Widim}_{\varepsilon}\left(\left(\pi_{1} \times \pi_{2}\right)^{-1}\left(y_{1}, y_{2}\right),\left(d \times d^{\prime}\right)_{N}\right) \leq \operatorname{Widim}_{\varepsilon}\left(\pi_{1}^{-1}\left(y_{1}\right), d_{N}\right)+\operatorname{Widim}_{\varepsilon}\left(\pi_{2}^{-1}\left(y_{2}\right), d_{N}^{\prime}\right)$.
Thus we have the first inequality.
Fix $p \in \pi_{2}^{-1}\left(y_{2}\right)$. The map

$$
\left(\pi_{1}^{-1}\left(y_{1}\right), d_{N}\right) \rightarrow\left(\left(\pi_{1} \times \pi_{2}\right)^{-1}\left(y_{1}, y_{2}\right),\left(d \times d^{\prime}\right)_{N}\right), \quad x \mapsto(x, p),
$$

is an isometric embedding. Hence

$$
\operatorname{Widim}_{\varepsilon}\left(\pi_{1}^{-1}\left(y_{1}\right), d_{N}\right) \leq \operatorname{Widim}_{\varepsilon}\left(\left(\pi_{1} \times \pi_{2}\right)^{-1}\left(y_{1}, y_{2}\right),\left(d \times d^{\prime}\right)_{N}\right)
$$

Similarly
$\operatorname{Widim}_{\varepsilon}\left(\pi_{2}^{-1}\left(y_{2}\right), d_{N}\right) \leq \operatorname{Widim}_{\varepsilon}\left(\left(\pi_{1} \times \pi_{2}\right)^{-1}\left(y_{1}, y_{2}\right),\left(d \times d^{\prime}\right)_{N}\right)$.
Then we get the second inequality.
Corollary 4.2. Let $\pi:(X, T) \rightarrow(Y, S)$ be a factor map between dynamical systems, and let $(Z, R)$ a dynamical system. We consider

$$
\pi \times \operatorname{Id}:(X \times Z, T \times R) \rightarrow(Y \times Z, S \times R), \quad(x, z) \mapsto(\pi(x), z)
$$

Then we have

$$
\operatorname{mdim}(\pi \times \operatorname{Id}, T \times R)=\operatorname{mdim}(\pi, T)
$$

Proof. The trivial factor map

$$
\text { Id }:(Z, R) \rightarrow(Z, R)
$$

has zero relative mean dimension. So the corollary follows from Lemma 4.1.
4.2. Small boundary property. Here we review the theory of small boundary property introduced by Lindenstrauss-Weiss [LW00]. Let $(X, T)$ be a dynamical system. For a subset $A \subset X$ we define the orbit capacity of $A$ by

$$
\operatorname{ocap}(A)=\lim _{N \rightarrow \infty} \frac{1}{N} \sup _{x \in X} \sum_{n=0}^{N-1} 1_{A}\left(T^{n} x\right)
$$

The quantity $\sup _{x \in X} \sum_{n=0}^{N-1} 1_{A}\left(T^{n} x\right)$ is sub-additive in $N$. So we have

$$
\operatorname{ocap}(A)=\inf _{N \geq 1} \frac{1}{N} \sup _{x \in X} \sum_{n=0}^{N-1} 1_{A}\left(T^{n} x\right) .
$$

It is easy to see that $\operatorname{ocap}(A \cup B) \leq \operatorname{ocap}(A)+\operatorname{ocap}(B)$. In particular, if ocap $(A)=$ $\operatorname{ocap}(B)=0$ then $\operatorname{ocap}(A \cup B)=0$.

The next lemma was proved in [Lin99, Lemma 6.3].
Lemma 4.3. Let $E \subset X$ be a closed subset. For any positive number $\delta$ there exists an open neighborhood $U$ of $E$ satisfying

$$
\operatorname{ocap}(U)<\operatorname{ocap}(E)+\varepsilon .
$$

Proof. This follows from the formula (4•1).
We say that a dynamical system $(X, T)$ has the small boundary property if for every point $x \in X$ and for every open neighborhood $U$ of $x$ there exists an open set $V$ such that

$$
x \in V \subset U, \quad \operatorname{ocap}(\partial V)=0
$$

Here $\partial V$ is the boundary of $V$, namely $\partial V:=\bar{V} \backslash V$. The small boundary property is a dynamical version of totally disconnectedness.

Lindenstrauss-Weiss [LW00, Theorem 5.4] proved that if a dynamical system has the small boundary property then its mean dimension is zero. Lindenstrauss [Lin99, Theorem 6.2 ] proved a partial converse of this statement as follows. This will be crucial in the next subsection.

Theorem 4.4 (Lindenstrauss 1999). If $(X, T)$ is an extension of a free minimal system and $\operatorname{mim}(X, T)=0$ then $(X, T)$ has the small boundary property.

Here the assumption that " $(X, T)$ is an extension of a free minimal system" means that there exists a factor map $\pi:(X, T) \rightarrow(Y, S)$ such that $(Y, S)$ is a free minimal dynamical system.

Lemma 4.5. Let $(Y, S)$ be a dynamical system having the small boundary property. Let $\delta$ be a positive number. For any open covering $Y=V_{1} \cup V_{2} \cup \cdots \cup V_{m}$ there exist compact subsets $E_{i} \subset V_{i}(1 \leq i \leq m)$ such that

- $E_{i} \cap E_{j}=\emptyset$ for $i \neq j$.
- $\operatorname{ocap}\left(Y \backslash\left(E_{1} \cup \cdots \cup E_{m}\right)\right)<\delta$.

Proof. By the small boundary property there exist open sets $W_{i}(1 \leq i \leq m)$ such that $\overline{W_{i}} \subset V_{i}, \operatorname{ocap}\left(\partial W_{i}\right)=0$ and $Y=W_{1} \cup W_{2} \cup \cdots \cup W_{m}$. By Lemma 4.3 there exist open sets $U_{i} \supset \partial W_{i}$ with $\operatorname{ocap}\left(U_{i}\right)<\frac{\delta}{m}$ for $1 \leq i \leq m$. Then $\overline{W_{i}} \cup U_{i}=W_{i} \cup U_{i}$ is an open set. We set

$$
\begin{aligned}
& E_{1}:=\overline{W_{1}}, \quad E_{2}:=\overline{W_{2}} \backslash\left(\overline{W_{1}} \cup U_{1}\right), \quad E_{3}:=\overline{W_{3}} \backslash\left(\overline{W_{1}} \cup U_{1} \cup \overline{W_{2}} \cup U_{2}\right), \quad \ldots, \\
& E_{m}:=\overline{W_{m}} \backslash\left(\overline{W_{1}} \cup U_{1} \cup \overline{W_{2}} \cup U_{2} \cup \cdots \cup \overline{W_{m-1}} \cup U_{m-1}\right) .
\end{aligned}
$$

$E_{i}$ are compact and

$$
Y \backslash\left(E_{1} \cup \cdots \cup E_{m}\right) \subset U_{1} \cup U_{2} \cup \cdots \cup U_{m}
$$

Then

$$
\operatorname{ocap}\left(Y \backslash\left(E_{1} \cup \cdots \cup E_{m}\right)\right) \leq \sum_{i=1}^{m} \operatorname{ocap}\left(U_{i}\right)<\delta
$$

4.3. Proof of Theorem 1.5. In this subsection we first prove an analogue of the Hurewicz theorem for mean dimension in the case that the base system has the small boundary property. Next we prove it in the case that the base system has zero mean dimension.

Before stating the proposition, we prepare terminologies on cone. This will be used in the proof. Let $K$ be a topological space. We define the cone $C(K)$ by

$$
C(K)=[0,1] \times K / \sim,
$$

where $(0, x) \sim(0, y)$ for any $x, y \in K$. For $0 \leq t \leq 1$ and $x \in X$, the equivalence class of $(t, x)$ is denoted by $t x$. The point $0 x$ is called the vertex of the cone $C(K)$ and often denoted by $*$.

When $K$ is a simplicial complex, the cone $C(K)$ naturally admits a structure of a simplicial complex. Its dimension is $\operatorname{dim} K+1$.

Let $K_{1}, \ldots, K_{m}$ be topological spaces and let $C\left(K_{1}\right), \ldots, C\left(K_{m}\right)$ their cones. We denote by $*_{i}$ the vertex of the cone $C\left(K_{i}\right)$. Let $C\left(K_{1}\right) \cup C\left(K_{2}\right) \cup \cdots \cup C\left(K_{m}\right)$ be the disjoint union of $C\left(K_{1}\right), \ldots, C\left(K_{m}\right)$. We define

$$
C\left(K_{1}\right) \cup_{*} C\left(K_{2}\right) \cup_{*} \cdots \cup_{*} C\left(K_{m}\right)=C\left(K_{1}\right) \cup C\left(K_{2}\right) \cup \cdots \cup C\left(K_{m}\right) / \sim
$$

where $*_{i} \sim *_{j}$ for all $i, j$. Namely we glue $C\left(K_{1}\right), \ldots, C\left(K_{m}\right)$ at their vertices, and the resulting space is denoted by $C\left(K_{1}\right) \cup_{*} C\left(K_{2}\right) \cup_{*} \cdots \cup_{*} C\left(K_{m}\right)$. The shared vertex (i.e. the equivalence class of $*_{i}$ ) is denoted by $*$. See Figure 3.

When $K_{1}, \ldots, K_{m}$ are simplicial complexes then $C\left(K_{1}\right) \cup_{*} \cdots \cup_{*} C\left(K_{m}\right)$ is also a simplicial complex and its dimension is the maximum of $\operatorname{dim} K_{i}+1(1 \leq i \leq m)$.

Figure 3. The left is the cone $C(K)$ with the vertex *. The right is $C\left(K_{1}\right) \cup_{*} C\left(K_{2}\right) \cup_{*} C\left(K_{3}\right)$ with the vertex $*$. Three cones are glued at their vertices.

Proposition 4.6. Let $\pi:(X, T) \rightarrow(Y, S)$ be a factor map between dynamical systems. If $(Y, S)$ has the small boundary property then

$$
\operatorname{mdim}(X, T)=\operatorname{mdim}(\pi, T)
$$

Proof. $\operatorname{mdim}(\pi, T) \leq \operatorname{mdim}(X, T)$ is obvious from the definition. Let $a$ be any positive number with $\operatorname{mdim}(\pi, T)<a$. We will prove $\operatorname{mdim}(X, T) \leq a$.
We take a metric $d$ on $X$. Let $\varepsilon$ be any positive number. We can take a natural number $N$ such that

$$
\sup _{y \in Y} \operatorname{Widim}_{\varepsilon}\left(\pi^{-1}(y), d_{N}\right)+1<a N .
$$

As in Claim 2.3 in $\S 2.2$, for each $y \in Y$ there exists an open neighborhood $U_{y}$ of $\pi^{-1}(y)$ satisfying

$$
\operatorname{Widim}_{\varepsilon}\left(U_{y}, d_{N}\right)+1<a N .
$$

There exists an open neighborhood $V_{y}$ of $y$ with $\pi^{-1}\left(V_{y}\right) \subset U_{y}$.
Since $Y$ is compact, we can find an open covering $Y=V_{1} \cup V_{2} \cup \cdots \cup V_{m}$ such that for all $1 \leq i \leq m$

$$
\operatorname{Widim}_{\varepsilon}\left(\pi^{-1}\left(V_{i}\right), d_{N}\right)+1<a N
$$

Let $\delta$ be any positive number. By applying Lemma 4.5 to an open cover $Y=V_{1} \cup \cdots \cup V_{m}$, we find compact subsets $E_{i} \subset V_{i}(1 \leq i \leq m)$ such that

$$
E_{i} \cap E_{j}=\emptyset \quad(i \neq j), \quad \text { ocap }\left(Y \backslash\left(E_{1} \cup \cdots \cup E_{m}\right)\right)<\delta
$$

We take open sets $W_{i}(1 \leq i \leq m)$ satisfying

$$
E_{i} \subset W_{i} \subset V_{i}, \quad W_{i} \cap W_{j}=\emptyset \quad(i \neq j)
$$

We also take a continuous function $\rho: Y \rightarrow[0,1]$ such that $\rho=1$ on $E_{1} \cup E_{2} \cup \cdots \cup E_{m}$ and supp $\rho \subset W_{1} \cup W_{2} \cup \cdots \cup W_{m}$. See Figure 4 .

Figure 4. The continuous function $\rho$.

For each $1 \leq i \leq m$ we take an $\varepsilon$-embedding $f_{i}:\left(\pi^{-1}\left(V_{i}\right), d_{N}\right) \rightarrow K_{i}$ such that $K_{i}$ is a simplicial complex of dimension smaller than $a N-1$. Let $C\left(K_{i}\right)$ be the cone over $K_{i}$. We set

$$
K^{\prime}:=C\left(K_{1}\right) \cup_{*} C\left(K_{2}\right) \cup_{*} \cdots \cup_{*} C\left(K_{m}\right) .
$$

This is a simplicial complex of dimension smaller than $a N$. We define a continuous map $f^{\prime}: X \rightarrow K^{\prime}$ as follows: If $x \in \pi^{-1}\left(W_{i}\right)(1 \leq i \leq m)$ then we set

$$
f^{\prime}(x)=\rho(\pi(x)) f_{i}(x) \in C\left(K_{i}\right) \subset K^{\prime}
$$

If $x \notin \pi^{-1}\left(W_{1}\right) \cup \pi^{-1}\left(W_{2}\right) \cup \cdots \cup \pi^{-1}\left(W_{m}\right)$ then we set $f^{\prime}(x)=*$.
We take an $\varepsilon$-embedding $g:\left(X, d_{N}\right) \rightarrow L$ such that $L$ is a simplicial complex of $\operatorname{dimension} \operatorname{Widim}_{\varepsilon}\left(X, d_{N}\right)<\infty$. Let $L^{\prime}:=C(L)$ be the cone over $L$. We have $\operatorname{dim} L^{\prime}=$ $\operatorname{Widim}_{\varepsilon}\left(X, d_{N}\right)+1$. We define a continuous map $g^{\prime}: X \rightarrow L^{\prime}$ by

$$
g^{\prime}(x)=(1-\rho(\pi(x))) g(x) .
$$

For $n \geq 1$ we define $F_{n}: X \rightarrow\left(K^{\prime} \times L^{\prime}\right)^{n}$ by

$$
F_{n}(x)=\left(f^{\prime}(x), g^{\prime}(x), f^{\prime}\left(T^{N} x\right), g^{\prime}\left(T^{N} x\right), \ldots, f^{\prime}\left(T^{(n-1) N} x\right), g^{\prime}\left(T^{(n-1) N} x\right)\right)
$$

Claim 4.7. $F_{n}$ is an $\varepsilon$-embedding with respect to the metric $d_{n N}$.
Proof. It is enough to prove that

$$
f^{\prime} \times g^{\prime}: X \rightarrow K^{\prime} \times L^{\prime}, \quad x \mapsto\left(f^{\prime}(x), g^{\prime}(x)\right)
$$

is an $\varepsilon$-embedding with respect to the metric $d_{N}$.
Suppose $\left(f^{\prime}(x), g^{\prime}(x)\right)=\left(f^{\prime}\left(x^{\prime}\right), g^{\prime}\left(x^{\prime}\right)\right)$ for $x, x^{\prime} \in X$. Then we have $\rho(\pi(x))=\rho\left(\pi\left(x^{\prime}\right)\right)$. If this common value is zero then $g(x)=g\left(x^{\prime}\right)$ and hence we have $d_{N}\left(x, x^{\prime}\right)<\varepsilon$. If the value is positive then there exists $1 \leq i \leq m$ such that $x, x^{\prime} \in \pi^{-1}\left(W_{i}\right)$ and $f_{i}(x)=f_{i}\left(x^{\prime}\right)$. Then $d_{N}\left(x, x^{\prime}\right)<\varepsilon$.

Claim 4.8. If $n$ is sufficiently large then for all $x \in X$

$$
\left|\left\{0 \leq k<n \mid g^{\prime}\left(T^{k N} x\right) \neq *\right\}\right|<\delta n N .
$$

Therefore the image of $F_{n}$ is contained in a simplicial complex of dimension smaller than $n \operatorname{dim} K^{\prime}+\delta n N \operatorname{dim} L^{\prime}$.

Proof. Let $x \in X$ and set $y=\pi(x)$. The condition $g^{\prime}\left(T^{k N} x\right) \neq *$ is equivalent to $\rho\left(S^{k N} y\right)<1$. The latter condition implies $S^{k N} y \in Y \backslash\left(E_{1} \cup \cdots \cup E_{m}\right)$. Then

$$
\begin{aligned}
\left|\left\{0 \leq k<n \mid g^{\prime}\left(T^{k N} x\right) \neq *\right\}\right| & \leq \sum_{k=0}^{n-1} 1_{Y \backslash\left(E_{1} \cup \cdots \cup E_{m}\right)}\left(S^{k N} y\right) \\
& \leq \sum_{k=0}^{n N-1} 1_{Y \backslash\left(E_{1} \cup \ldots \cup E_{m}\right)}\left(S^{k} y\right) \\
& <\delta n N \text { by ocap }\left(Y \backslash\left(E_{1} \cup \cdots \cup E_{m}\right)\right)<\delta
\end{aligned}
$$

for all sufficiently large $n$ (uniformly in $x \in X$ ).
By Claims 4.7 and 4.8, for sufficiently large $n$

$$
\begin{aligned}
\operatorname{Widim}_{\varepsilon}\left(X, d_{n N}\right) & <n \operatorname{dim} K^{\prime}+\delta n N \operatorname{dim} L^{\prime} \\
& <a n N+\delta n N\left(\operatorname{Widim}_{\varepsilon}\left(X, d_{N}\right)+1\right)
\end{aligned}
$$

Then

$$
\lim _{n \rightarrow \infty} \frac{\operatorname{Widim}_{\varepsilon}\left(X, d_{n N}\right)}{n N} \leq a+\delta\left(\operatorname{Widim}_{\varepsilon}\left(X, d_{N}\right)+1\right)
$$

Here $\delta$ is independent of $\varepsilon, N$. So we can let $\delta \rightarrow 0$ and get

$$
\lim _{n \rightarrow \infty} \frac{\operatorname{Widim}_{\varepsilon}\left(X, d_{n}\right)}{n} \leq a
$$

Letting $\varepsilon \rightarrow 0$, we conclude

$$
\operatorname{mdim}(X, T) \leq a
$$

Now we are ready to prove Theorem 1.5. We write the statement again.
Theorem 4.9 (= Theorem 1.5). Let $\pi:(X, T) \rightarrow(Y, S)$ be a factor map between dynamical systems. If $\operatorname{mdim}(Y, S)=0$ then

$$
\operatorname{mdim}(X, T)=\operatorname{mdim}(\pi, T)
$$

Proof. Let $(Z, R)$ be a zero dimensional free minimal dynamical system. We consider

$$
\pi \times \operatorname{Id}:(X \times Z, T \times R) \rightarrow(Y \times Z, S \times R)
$$

The system $(Y \times Z, S \times R)$ has a free minimal factor $(Z, R)$ and its mean dimension is zero:

$$
\operatorname{mdim}(Y \times Z, S \times R)=\operatorname{mdim}(Y, S)=0 \quad \text { since } \operatorname{dim} Z=0
$$

By the Lindenstrauss Theorem (Theorem 4.4), the system $(Y \times Z, S \times R)$ has the small boundary property.

Now we can apply Proposition 4.6 to the above factor map (4.2) and get

$$
\operatorname{mdim}(X \times Z, T \times R)=\operatorname{mdim}(\pi \times \operatorname{Id}, T \times R) .
$$

We have

$$
\begin{aligned}
& \operatorname{mdim}(X \times Z, T \times R)=\operatorname{mdim}(X, T) \quad \text { since } \operatorname{dim} Z=0, \\
& \operatorname{mdim}(\pi \times \operatorname{Id}, T \times R)=\operatorname{mdim}(\pi, T) \quad \text { by Corollary 4.2. }
\end{aligned}
$$

Therefore we conclude $\operatorname{mdim}(X, T)=\operatorname{mdim}(\pi, T)$.
