# SOME NEW CLASSES OF (ALMOST) PERFECT $c$-NONLINEAR PERMUTATIONS 

MOHIT PAL

#### Abstract

The concept of differential uniformity was recently extended to the $c$-differential uniformity. An interesting problem in this area is the construction of functions with low $c$ differential uniformity and a lot of research has been done in this direction in the recent past. Here, we present three classes of (almost) perfect $c$-nonlinear permutations over finite fields of even characteristic.

## 1. Introduction

Let $\mathbb{F}_{q^{n}}$ be the finite field with $q^{n}$ elements, where $q$ is a prime power and $n$ is a positive integer. We denote by $\mathbb{F}_{q^{n}}^{*}$, the multiplicative cyclic group of non-zero elements of $\mathbb{F}_{q^{n}}$. Let $f$ be a function from $\mathbb{F}_{q^{n}}$ to itself. Lagrange's interpolation formula allows us to write $f$ as a polynomial in $\mathbb{F}_{q^{n}}[X] /\left(X^{q^{n}}-X\right)$ uniquely. Thus, we shall use the term function and polynomial for $f$ interchangeably. A polynomial $f \in \mathbb{F}_{q^{n}}[X]$ is called a permutation polynomial if the associated mapping $c \mapsto f(c)$ permutes the elements of $\mathbb{F}_{q^{n}}$. Here we consider permutation polynomials of the shape $f(X)=\gamma X+\operatorname{Tr}_{q^{n} / q}\left(X^{k}\right)$, where $\operatorname{Tr}_{q^{n} / q}: \mathbb{F}_{q^{n}} \rightarrow \mathbb{F}_{q}$ is the trace map given by $\operatorname{Tr}_{q^{n} / q}(X)=\sum_{i=0}^{n-1} X^{q^{i}}$ and $\gamma \in \mathbb{F}_{q^{n}}^{*}$. These permutation polynomials are interesting because of their simple algebraic structure. Charpin and Kyureghyan [2] first studied the polynomials of the form $f$ and gave a complete characterization of permutation polynomials for $q=2$. In 2016, Kyureghyan and Zieve [10] studied permutation polynomials of the shape $X+\gamma \operatorname{Tr}_{q^{n} / q}\left(X^{k}\right)$ over $\mathbb{F}_{q^{n}}$ for odd $q$ and constructed several classes of permutation polynomials. Motivated by the results of [2, 10, Li et al. [12] studied polynomials of the form $\gamma X+\operatorname{Tr}_{q^{n} / q}\left(X^{k}\right)$ over finite fields of even characteristic. To avoid repetitive work from [2], the authors in [12] restricted themselves to the case $q>2$ and constructed fifteen new classes of permutation polynomials. For more details on permutation polynomials of the shape $\gamma X+\operatorname{Tr}_{q^{n} / q}\left(X^{k}\right)$, reader may refer to [2, 6, ,9, 10, 12, 16] and references therein.

Permutation polynomials have wide applications in the areas of mathematics and engineering such as coding theory [3, 11, cryptography [15, 19] and combinatorial designs [4]. In symmetric key cryptography, permutation polynomials are widely applied to the design of block ciphers, where they are used in the design of so-called substitution boxes. In fact, permutation polynomials must be choosen in a way so as S-box becomes immune to some of the known attacks against block ciphers. For instance, the differential attack introduced by Biham and Shamir [1 is one of the most powerful attacks on block ciphers. In 1993, Nyberg [18 introduced the notion of differential uniformity to quantify the immunity of a function against differential attacks. Recently, Ellingsen et al. 5] generalised the notion of differential uniformity and defined the $c$-differential uniformity of a function $f$ for any $c \in \mathbb{F}_{q^{n}}$. For any $a, c \in \mathbb{F}_{q^{n}}$, the $c$-derivative of $f$ in the direction of $a$ is given by ${ }_{c} D_{f}(a, X):=f(X+a)-c f(X)$ for all $X \in \mathbb{F}_{q^{n}}$. For any $a, b \in \mathbb{F}_{q^{n}}$, the $c$-Difference Distribution Table ( $c$-DDT) entry at

[^0]point $(a, b)$ of $f$ is given by ${ }_{c} \Delta_{f}(a, b):=\left|\left\{X \in \mathbb{F}_{q^{n}} \mid{ }_{c} D_{f}(a, X)=b\right\}\right|$. The $c$-differential uniformity of $f$ is defined as ${ }_{c} \Delta_{f}:=\max \left\{{ }_{c} \Delta_{f}(a, b) \mid a, b \in \mathbb{F}_{q^{n}}\right.$ and $a \neq 0$ when $\left.c=1\right\}$. When ${ }_{c} \Delta_{f}=1,2$, then the function $f$ is called perfect $c$-nonlinear ( $\mathrm{P} c \mathrm{~N}$ ) function and almost perfect $c$-nonlinear ( APcN ) function, respectively. When $c=1$, then the notions of $c$-DDT and $c$ differential uniformity coincide with the classical notions of DDT and differential uniformity, respectively.

Since the appearence of the notion of the $c$-differential uniformity, several functions having low $c$-differential uniformity have been constructed in the recent past. The most recent list of power maps along with their $c$-differential uniformity can be found in [13, Table 1], and the list of non-power maps with their $c$-differential uniformity is given in [13, Table 2] for $c \neq 1$. However, over finite fields of even characteristic, there are only few $\mathrm{P} c \mathrm{~N}$ and $\mathrm{AP} c \mathrm{~N}$ functions, see, e.g., [5, 7, 8, 17, 20. In this paper, we shall restrict ourselves to finite fields of even characteristic and study the $c$-differential uniformity of three classes of permutation polynomials of the shape $\gamma X+\operatorname{Tr}_{q^{n} / q}\left(X^{k}\right)$ over $\mathbb{F}_{q^{n}}$ for $c \in \mathbb{F}_{q^{n}} \backslash\{1\}$. The rationale behind excluding the case $c=1$ is the fact that in this case linear term outside the trace function vanishes and the varible $X$ remains only in the trace term. As a consequence, polynomials of the form $\gamma X+\operatorname{Tr}_{q^{n} / q}\left(X^{k}\right)$ will have very high differential uniformity.

The rest of the paper is organised as follows. In Section 2, we consider the $c$-differential uniformity of the permutation polynomial $f(X):=\gamma X+\operatorname{Tr}_{q^{2 n} / q}\left(X^{2^{i}(q+1)}\right)$, where $\gamma \in \mathbb{F}_{q^{2}}^{*}$, $q=2^{t}$ and $i, n, t>0$ are integers. We show that $f$ is $\mathrm{P} c \mathrm{~N}$ for all $c \in \mathbb{F}_{q^{2}} \backslash \mathbb{F}_{2}$ and if $\operatorname{gcd}(i, t)=1$ then ${ }_{c} \Delta_{f} \leq 2$ for all $c \in \mathbb{F}_{q^{2 n}} \backslash \mathbb{F}_{q^{2}}$. Since we are considering only permutation polynomials, and for $c=0$ every permutation polynomial is $\mathrm{P} c \mathrm{~N}$, we have excluded the trivial case $c=0$ in rest of the paper. In Section 3, we shall show that the permutation polynomial $g(X):=\gamma X+\operatorname{Tr}_{q^{2 n} / q}\left(X^{q^{2}+1}\right)$, where $\gamma \in \mathbb{F}_{q}^{*}, q=2^{t}$ and $n, t>0$ are integers, is $\mathrm{P} c \mathrm{~N}$ for all $c \in \mathbb{F}_{q^{2 n}} \backslash \mathbb{F}_{2}$. Section 4 is devoted to the $c$-differential uniformity of the permutation polynomial $h(X):=\gamma X+\operatorname{Tr}_{q^{2 n} / q}\left(X^{2^{i}\left(q^{2}+1\right)}\right)$, where $\gamma \in \mathbb{F}_{q^{2}}^{*}, q=2^{t}$ and $i, n, t>0$ are integers and either $n$ is even; or $n$ is odd and $\operatorname{Tr}_{q^{2} / q}\left(\left(\frac{1}{\gamma}\right)^{2^{i+1}}\right)^{\frac{q-1}{\operatorname{gcd}\left(2^{i+1}-1,2^{t}-1\right)}} \neq 1$. We show that $h$ is $\mathrm{P} c \mathrm{~N}$ for all $c \in \mathbb{F}_{q^{2}} \backslash \mathbb{F}_{2}$, and if $\operatorname{gcd}(i, t)=1$ then the $c$-differential uniformity of $h$ is $\leq 2$ for all $c \in \mathbb{F}_{q^{2 n}} \backslash \mathbb{F}_{q^{2}}$. Finally, we summarize the paper with some concluding remarks in Section [5,

## 2. The $c$-differential uniformity of the function $f$

In this section, we shall consider the $c$-differential uniformity of the function $f(X)=$ $\gamma X+\operatorname{Tr}_{q^{2 n} / q}\left(X^{2^{i}(q+1)}\right)$, where $\gamma \in \mathbb{F}_{q^{2}}^{*}, q=2^{t}$ and $i, n, t>0$ are integers. It has been proved in [12, Theorem 3.1] that $f$ is a permutation polynomial over $\mathbb{F}_{q^{2 n}}$. We first recall a lemma that will be used throughout this paper.
Lemma 2.1. [14] Let $q=p^{t}, i$ be a positive integer and $f(X)=X^{p^{i}}-\alpha X-\beta$ where $\alpha \in \mathbb{F}_{q}^{*}$ and $\beta \in \mathbb{F}_{q}$. Then, in the field $\mathbb{F}_{q}, f$ has either zero, one or $p^{d}$ roots where $d=\operatorname{gcd}(i, t)$.

The following theorem gives the $c$-differential uniformity of the function $f$ for all $c \in$ $\mathbb{F}_{q^{2 n}} \backslash \mathbb{F}_{2}$.
Theorem 2.2. Let $q=2^{t}$ and $f(X)=\gamma X+\operatorname{Tr}_{q^{2 n} / q}\left(X^{2^{i}(q+1)}\right)$, where $\gamma \in \mathbb{F}_{q^{2}}^{*}$ and $i, n, t>0$ are integers. Then
(i) $f$ is PcN over $\mathbb{F}_{q^{2 n}}$ for all $c \in \mathbb{F}_{q^{2}} \backslash \mathbb{F}_{2}$,
(ii) ${ }_{c} \Delta_{f} \leq 2$ for all $c \in \mathbb{F}_{q^{2 n}} \backslash \mathbb{F}_{q^{2}}$ when $\operatorname{gcd}(i, t)=1$.

Proof. Let $c \in \mathbb{F}_{q^{2 n}} \backslash \mathbb{F}_{2}$. Recall that, for any $(a, b) \in \mathbb{F}_{q^{2 n}} \times \mathbb{F}_{q^{2 n}}$, the $c$-DDT entry ${ }_{c} \Delta_{f}(a, b)$ is given by the number of solutions $X \in \mathbb{F}_{q^{2 n}}$ of the following equation.

$$
\begin{equation*}
f(X+a)+c f(X)=b \tag{2.1}
\end{equation*}
$$

It is easy to see that when $a=0$ then for each $b \in \mathbb{F}_{q^{2 n}}$, Equation (2.1) has a unique solution $X \in \mathbb{F}_{q^{2 n}}$. For $a \neq 0$, Equation (2.1) can be written as

$$
\begin{equation*}
\gamma X+\operatorname{Tr}_{q^{2 n} / q}\left(X^{2^{i}(q+1)}\right)+C \cdot \operatorname{Tr}_{q^{2 n} / q}\left(\left(X^{q} a+a^{q} X\right)^{2^{i}}\right)=B \tag{2.2}
\end{equation*}
$$

where $B=C\left(b+\gamma a+\operatorname{Tr}_{q^{2 n} / q}\left(a^{2^{i}(q+1)}\right)\right)$ and $C=\frac{1}{1+c}$. Notice that, when $a \in \mathbb{F}_{q}^{*}$, then the above equation reduces to

$$
B=\gamma X+\operatorname{Tr}_{q^{2 n} / q}\left(X^{2^{i}(q+1)}\right)+a^{2^{i}} C \cdot \operatorname{Tr}_{q^{2 n} / q}\left(\left(X^{2^{i}}\right)^{q}+X^{2^{i}}\right)=\gamma X+\operatorname{Tr}_{q^{2 n} / q}\left(X^{2^{i}(q+1)}\right),
$$

which has a unique solution for each $B \in \mathbb{F}_{q^{2 n}}$ (and hence for each $b \in \mathbb{F}_{q^{2 n}}$ ). Now, let $a \in \mathbb{F}_{q^{2 n}} \backslash \mathbb{F}_{q}$. Then, from Equation (2.2) we have

$$
\begin{equation*}
\gamma X+\operatorname{Tr}_{q^{2 n} / q}\left(X^{2^{i}(q+1)}\right)+C \cdot \operatorname{Tr}_{q^{2 n} / q}\left(\left(\left(X^{q^{2}}+X\right) a^{q}\right)^{2^{i}}\right)=B \tag{2.3}
\end{equation*}
$$

We shall now study the solutions of Equation (2.3), in three different cases, namely, $c \in \mathbb{F}_{q} \backslash \mathbb{F}_{2}$, $c \in \mathbb{F}_{q^{2}} \backslash \mathbb{F}_{q}$ and $c \in \mathbb{F}_{q^{2 n}} \backslash \mathbb{F}_{q^{2}}$, respectively.
Case 1 Let $c \in \mathbb{F}_{q} \backslash \mathbb{F}_{2}$. Now, let $u:=\operatorname{Tr}_{q^{2 n} / q}\left(X^{2^{i}(q+1)}\right)+C \cdot \operatorname{Tr}_{q^{2 n} / q}\left(\left(\left(X^{q^{2}}+X\right) a^{q}\right)^{2^{i}}\right)$. Then, from Equation (2.3), we have $X=\frac{u+B}{\gamma}$. Putting the value of $X$ into Equation (2.3), we have

$$
\begin{aligned}
u & =\frac{1}{\gamma^{2^{i}(q+1)}} \operatorname{Tr}_{q^{2 n} / q}\left(\left(u^{2}+\left(B^{q}+B\right) u+B^{q+1}\right)^{2^{i}}\right)+C B_{1} \\
& =\frac{1}{\gamma^{2^{i}(q+1)}} \operatorname{Tr}_{q^{2 n} / q}\left(B^{2^{i}(q+1)}\right)+C B_{1},
\end{aligned}
$$

where $B_{1}=\operatorname{Tr}_{q^{2 n} / q}\left(\left(\frac{\left(B^{q^{2}}+B\right) a^{q}}{\gamma}\right)^{2^{i}}\right)$ and the first equality holds as $u, \gamma^{q+1} \in \mathbb{F}_{q}$ and the second equality holds as $\operatorname{Tr}_{q^{2 n} / q}(1)=0$ and $\operatorname{Tr}_{q^{2 n} / q}\left(B^{q}+B\right)=0$. Thus, for $c \in \mathbb{F}_{q} \backslash \mathbb{F}_{2}$, Equation (2.3) has a unique solution for each $a \in \mathbb{F}_{q^{2 n}} \backslash \mathbb{F}_{q}$ and $b \in \mathbb{F}_{q^{2 n}}$.
Case 2 Let $c \in \mathbb{F}_{q^{2}} \backslash \mathbb{F}_{q}$. Let $u:=\operatorname{Tr}_{q^{2 n} / q}\left(X^{2^{i}(q+1)}\right)$ and $v:=\operatorname{Tr}_{q^{2 n} / q}\left(\left(\left(X^{q^{2}}+X\right) a^{q}\right)^{2^{i}}\right)$. Then, from Equation (2.3), we have $X=\frac{u+C v+B}{\gamma}$. Using the properties of the trace function, we shall now simplify $u$ and $v$. Consider

$$
\begin{aligned}
u & =\frac{1}{\gamma^{2^{i}(q+1)}} \operatorname{Tr}_{q^{2 n} / q}\left(\left(u^{2}+\left((B+C v)^{q}+B+C v\right) u+C^{q+1} v^{2}+\left(B^{q} C+B C^{q}\right) v+B^{q+1}\right)^{2^{i}}\right) \\
& =\frac{1}{\gamma^{2^{i}(q+1)}} \operatorname{Tr}_{q^{2 n} / q}\left(\left(\left(\left(B C^{q}\right)^{q}+B C^{q}\right) v+B^{q+1}\right)^{2^{i}}\right) \\
& =\frac{1}{\gamma^{2^{i}(q+1)}} \operatorname{Tr}_{q^{2 n} / q}\left(B^{2^{i}(q+1)}\right),
\end{aligned}
$$

where the first equality holds because $u, v \in \mathbb{F}_{q}$ and $C \in \mathbb{F}_{q^{2}}$ and the second equality holds because $C^{q+1} \in \mathbb{F}_{q}, \operatorname{Tr}_{q^{2 n} / q}\left((B+C v)^{q \cdot 2^{i}}\right)=\operatorname{Tr}_{q^{2 n} / q}\left((B+C v)^{2^{i}}\right)$ and the third equality holds
as $\operatorname{Tr}_{q^{2 n} / q}\left(\left(B C^{q}\right)^{q \cdot 2^{i}}\right)=\operatorname{Tr}_{q^{2 n} / q}\left(\left(B C^{q}\right)^{2^{i}}\right)$. Now consider $v$ which is given by

$$
v=\operatorname{Tr}_{q^{2 n} / q}\left(\left(\left(\frac{u+C v+B}{\gamma}\right)^{q^{2}}+\left(\frac{u+C v+B}{\gamma}\right)\right)^{2^{i}} a^{q \cdot 2^{i}}\right)=B_{1}
$$

where the last equality holds as $u, v \in \mathbb{F}_{q}$ and $C, \gamma \in \mathbb{F}_{q^{2}}$. Thus, $c \in \mathbb{F}_{q^{2}} \backslash \mathbb{F}_{q}$, Equation (2.3) has a unique solution for each $a \in \mathbb{F}_{q^{2 n}} \backslash \mathbb{F}_{q}$ and $b \in \mathbb{F}_{q^{2 n}}$.
Case 3 Let $c \in \mathbb{F}_{q^{2 n}} \backslash \mathbb{F}_{q^{2}}$. Again, let $u:=\operatorname{Tr}_{q^{2 n} / q}\left(X^{2^{i}(q+1)}\right), v:=\operatorname{Tr}_{q^{2 n} / q}\left(\left(\left(X^{q^{2}}+X\right) a^{q}\right)^{2^{i}}\right)$. Then, from Equation (2.3), we have

$$
\begin{equation*}
X=\frac{u+C v+B}{\gamma} . \tag{2.4}
\end{equation*}
$$

We shall now simplify $u$ and $v$. Consider $u$ which is given by

$$
\begin{aligned}
u & =\frac{1}{\gamma^{2^{i}(q+1)}} \operatorname{Tr}_{q^{2 n} / q}\left(\left(u^{2}+\left((B+C v)^{q}+B+C v\right) u+C^{q+1} v^{2}+\left(B C^{q}+B^{q} C\right) v+B^{q+1}\right)^{2^{i}}\right) \\
& =\frac{1}{\gamma^{2^{i}(q+1)}}\left(v^{2^{i+1}} \mathcal{C}+v^{2^{i}} \mathcal{B}+\operatorname{Tr}_{q^{2 n} / q}\left(B^{2^{i}(q+1)}\right)\right),
\end{aligned}
$$

where $\mathcal{B}=\operatorname{Tr}_{q^{2 n} / q}\left(\left(B C^{q}+B^{q} C\right)^{2^{i}}\right), \mathcal{C}=\operatorname{Tr}_{q^{2 n} / q}\left(C^{2^{i}(q+1)}\right)$ and the first equality holds because $u, v \in \mathbb{F}_{q}$, and last equality holds as $\operatorname{Tr}_{q^{2 n} / q}\left((B+C v)^{q \cdot 2^{i}}\right)=\operatorname{Tr}_{q^{2 n} / q}\left((B+C v)^{2^{i}}\right)$. Now consider $v$ which is given by

$$
v=\operatorname{Tr}_{q^{2 n} / q}\left(\left(\left(\frac{u+C v+B}{\gamma}\right)^{q^{2}}+\left(\frac{u+C v+B}{\gamma}\right)\right)^{2^{i}} a^{q \cdot 2^{i}}\right)=v^{2^{i}} C_{1}+B_{1},
$$

where $C_{1}=\operatorname{Tr}_{q^{2 n} / q}\left(\left(\frac{\left(C^{q^{2}}+C\right) a^{q}}{\gamma}\right)^{2^{i}}\right)$ and the last equality holds as $u, v \in \mathbb{F}_{q}$ and $\gamma \in \mathbb{F}_{q^{2}}$. When $C_{1}=0$, then $v=B_{1}$ and by putting the values of $u$ and $v$ in Equation (2.4), we get a unique solution

$$
X=\frac{1}{\gamma^{2^{i}(q+1)+1}}\left(\left(B_{1}\right)^{2^{i+1}} \mathcal{C}+\left(B_{1}\right)^{2^{i}} \mathcal{B}+\operatorname{Tr}_{q^{2 n} / q}\left(B^{2^{i}(q+1)}\right)\right)+\frac{\left(C B_{1}+B\right)}{\gamma}
$$

of Equation (2.3). In the event when $C_{1} \neq 0$, consider the equation

$$
v^{2^{i}}+C_{1}^{-1} v+B_{1} C_{1}^{-1}=0
$$

Since $\operatorname{gcd}(i, t)=1$, from Lemma 2.1 the above equation can have at most two solutions $v \in \mathbb{F}_{q}$. Thus, for $c \in \mathbb{F}_{q^{2 n}} \backslash \mathbb{F}_{q^{2}}$, Equation (2.3) can have at most two solutions for each $a \in \mathbb{F}_{q^{2 n}} \backslash \mathbb{F}_{q}$ and $b \in \mathbb{F}_{q^{2 n}}$. This completes the proof.

## 3. The $c$-Differential uniformity of the function $g$

In this section, we shall consider the $c$-differential uniformity of the function $g(X):=$ $\gamma X+\operatorname{Tr}_{q^{2 n} / q}\left(X^{q^{2}+1}\right)$, where $\gamma \in \mathbb{F}_{q}^{*}, q=2^{t}$ and $n, t>0$ are integers. In [12, Theorem 3.2], Li et al. proved that $g$ is a permutation polynomial over $\mathbb{F}_{q^{2 n}}$. The following theorem gives the $c$-differential uniformity of the function $g$ for all $c \in \mathbb{F}_{q^{2 n}} \backslash \mathbb{F}_{2}$.

Theorem 3.1. Let $q=2^{t}$ and $g(X)=\gamma X+\operatorname{Tr}_{q^{2 n} / q}\left(X^{q^{2}+1}\right)$, where $\gamma \in \mathbb{F}_{q}^{*}$ and $n, t>0$ are integers. Then $g$ is PcN over $\mathbb{F}_{q^{2 n}}$ for all $c \in \mathbb{F}_{q^{2 n}} \backslash \mathbb{F}_{2}$

Proof. Let $c \in \mathbb{F}_{q^{2 n}} \backslash \mathbb{F}_{2}$. For any $(a, b) \in \mathbb{F}_{q^{2 n}} \times \mathbb{F}_{q^{2 n}}$ the $c$-DDT entry ${ }_{c} \Delta_{g}(a, b)$ is given by the number of solutions $X \in \mathbb{F}_{q^{2 n}}$ of the following equation.

$$
\begin{equation*}
\gamma X+\operatorname{Tr}_{q^{2 n} / q}\left(X^{q^{2}+1}\right)+C \cdot \operatorname{Tr}_{q^{2 n} / q}\left(\left(X^{q^{2}} a+a^{q^{2}} X\right)\right)=B \tag{3.1}
\end{equation*}
$$

where $B=C\left(b+\gamma a+\operatorname{Tr}_{q^{2 n} / q}\left(a^{q^{2}+1}\right)\right)$ and $C=\frac{1}{1+c}$. When $a \in \mathbb{F}_{q}$, then the above equation reduces to $\gamma X+\operatorname{Tr}_{q^{2 n} / q}\left(X^{q^{2}+1}\right)=B$, which has a unique solution for each $B \in \mathbb{F}_{q^{2 n}}$. Now, let $a \in \mathbb{F}_{q^{2 n}} \backslash \mathbb{F}_{q}$ then Equation (3.1) can be rewritten as

$$
\begin{equation*}
\gamma X+\operatorname{Tr}_{q^{2 n} / q}\left(X^{q^{2}+1}\right)+C \cdot \operatorname{Tr}_{q^{2 n} / q}\left(\left(X^{q^{4}}+X\right) a^{q^{2}}\right)=B \tag{3.2}
\end{equation*}
$$

We shall split the analysis of the solutions of Equation (3.2) into three different cases, namely, $c \in \mathbb{F}_{q} \backslash \mathbb{F}_{2}, c \in \mathbb{F}_{q^{2}} \backslash \mathbb{F}_{q}$ and $c \in \mathbb{F}_{q^{2 n}} \backslash \mathbb{F}_{q^{2}}$, respectively.
Case 1 Let $c \in \mathbb{F}_{q} \backslash \mathbb{F}_{2}$. Now, let $u:=\operatorname{Tr}_{q^{2 n} / q}\left(X^{q^{2}+1}\right)+C \cdot \operatorname{Tr}_{q^{2 n} / q}\left(\left(X^{q^{4}}+X\right) a^{q^{2}}\right)$. Then, from Equation (3.2), we have $X=\frac{u+B}{\gamma}$. Putting the value of $X$ into Equation (3.2), we have

$$
\begin{aligned}
u & =\frac{1}{\gamma^{2}} \operatorname{Tr}_{q^{2 n} / q}\left(u^{2}+\left(B^{q^{2}}+B\right) u+B^{q^{2}+1}\right)+C \cdot \operatorname{Tr}_{q^{2 n} / q}\left(\left(\frac{B^{q^{4}}+B}{\gamma}\right) a^{q^{2}}\right) \\
& =\frac{1}{\gamma^{2}} \operatorname{Tr}_{q^{2 n} / q}\left(B^{q^{2}+1}\right)+C B_{1},
\end{aligned}
$$

where $B_{1}:=\frac{1}{\gamma} \operatorname{Tr}_{q^{2 n} / q}\left(\left(B^{q^{4}}+B\right) a^{q^{2}}\right)$ and equalities hold because $u, \gamma \in \mathbb{F}_{q}$. Thus, for $c \in \mathbb{F}_{q} \backslash \mathbb{F}_{2}$, Equation (3.2) has a unique solution for each $a \in \mathbb{F}_{q^{2 n}} \backslash \mathbb{F}_{q}$ and $b \in \mathbb{F}_{q^{2 n}}$.
Case 2 Let $c \in \mathbb{F}_{q^{2}} \backslash \mathbb{F}_{q}$. In this case, let $u:=\operatorname{Tr}_{q^{2 n} / q}\left(X^{\left(q^{2}+1\right)}\right)$ and $v:=\operatorname{Tr}_{q^{2 n} / q}\left(\left(X^{q^{4}}+X\right) a^{q^{2}}\right)$. Then, from Equation (3.2), we have $X=\frac{u+C v+B}{\gamma}$. Using properties of the trace function, we shall now simplify $u$ and $v$. Consider $u$ which is given by

$$
\begin{aligned}
u & =\frac{1}{\gamma^{2}} \operatorname{Tr}_{q^{2 n} / q}\left(u^{2}+(C v)^{2}+\left(B^{q^{2}}+B\right) u+\left((B C)^{q^{2}}+B C\right) v+B^{q^{2}+1}\right) \\
& =\frac{1}{\gamma^{2}}\left(v^{2} \operatorname{Tr}_{q^{2 n} / q}\left(C^{2}\right)+\operatorname{Tr}_{q^{2 n} / q}\left(B^{q^{2}+1}\right)\right),
\end{aligned}
$$

where equalities hold because $u, v, \gamma \in \mathbb{F}_{q}, \operatorname{Tr}_{q^{2 n} / q}\left(B^{q^{2}}+B\right)=0$ and $\operatorname{Tr}_{q^{2 n} / q}\left((B C)^{q^{2}}+B C\right)=$ 0 . Now consider $v$ which is given by

$$
v=\operatorname{Tr}_{q^{2 n} / q}\left(\left(\left(\frac{u+C v+B}{\gamma}\right)^{q^{4}}+\left(\frac{u+C v+B}{\gamma}\right)\right) a^{q^{2}}\right)=B_{1}
$$

where last equality holds as $u, v, \gamma \in \mathbb{F}_{q}$ and $C \in \mathbb{F}_{q^{2}}$. Thus, for $c \in \mathbb{F}_{q^{2}} \backslash \mathbb{F}_{q}$, Equation (3.2) has a unique solution for each $a \in \mathbb{F}_{q^{2 n}} \backslash \mathbb{F}_{q}$ and $b \in \mathbb{F}_{q^{2 n}}$.
Case 3 Let $c \in \mathbb{F}_{q^{2 n}} \backslash \mathbb{F}_{q^{2}}$. Again, let $u:=\operatorname{Tr}_{q^{2 n} / q}\left(X^{\left(q^{2}+1\right)}\right)$ and $v:=\operatorname{Tr}_{q^{2 n} / q}\left(\left(X^{q^{4}}+X\right) a^{q^{2}}\right)$. Then, from Equation (3.2), we have

$$
\begin{equation*}
X=\frac{u+C v+B}{\gamma} . \tag{3.3}
\end{equation*}
$$

Now, consider $u$ which is given by

$$
\begin{aligned}
u & =\frac{1}{\gamma^{2}} \operatorname{Tr}_{q^{2 n} / q}\left(u^{2}+\left((B+C v)^{q^{2}}+B+C v\right) u+C^{q^{2}+1} v^{2}+\left(B C^{q^{2}}+B^{q^{2}} C\right) v+B^{q^{2}+1}\right) \\
& =\frac{1}{\gamma^{2}}\left(v^{2} \mathcal{C}+v \mathcal{B}+\operatorname{Tr}_{q^{2 n} / q}\left(B^{q^{2}+1}\right)\right),
\end{aligned}
$$

where $\mathcal{B}=\operatorname{Tr}_{q^{2 n} / q}\left(B C^{q^{2}}+B^{q^{2}} C\right), \mathcal{C}=\operatorname{Tr}_{q^{2 n} / q}\left(C^{q^{2}+1}\right)$ and equalities hold because $u, v \in \mathbb{F}_{q}$ and $\operatorname{Tr}_{q^{2 n} / q}\left((B+C v)^{q^{2}}+B+C v\right)=0$. Now consider $v$ which is given by

$$
v=\operatorname{Tr}_{q^{2 n} / q}\left(\left(\left(\frac{u+C v+B}{\gamma}\right)^{q^{4}}+\left(\frac{u+C v+B}{\gamma}\right)\right) a^{q^{2}}\right)=v C_{1}+B_{1},
$$

where $C_{1}=\frac{1}{\gamma} \operatorname{Tr}_{q^{2 n} / q}\left(\left(C^{q^{4}}+C\right) a^{q^{2}}\right)$ and the last equality holds as $u, v, \gamma \in \mathbb{F}_{q}$. From above equation we get a unique solution for $v$. Thus, for $c \in \mathbb{F}_{q^{2 n}} \backslash \mathbb{F}_{q^{2}}$, Equation (3.2) has a unique solution for each $a \in \mathbb{F}_{q^{2 n}} \backslash \mathbb{F}_{q}$ and $b \in \mathbb{F}_{q^{2 n}}$. This completes the proof.

## 4. The $c$-differential uniformity of the function $h$

In this section, we shall consider the $c$-differential uniformity of a more general class of permutations than $g$. Let $h(X)=\gamma X+\operatorname{Tr}_{q^{2 n} / q}\left(X^{2^{i}\left(q^{2}+1\right)}\right)$, where $\gamma \in \mathbb{F}_{q^{2}}^{*}, q=2^{t}$ and $i, n, t>0$ are integers. It has been proved in [12, Theorem 3.3] that $h$ is a permutation polynomial over $\mathbb{F}_{q^{2 n}}$ if either $n$ is even; or $n$ is odd and $\operatorname{Tr}_{q^{2} / q}\left(\frac{1}{\gamma^{2^{i}+1}}\right)^{\frac{q-1}{\operatorname{gcd}\left(2^{i+1}-1,2^{t}-1\right)}} \neq 1$. The following theorem gives the $c$-differential uniformity of the function $h$ for all $c \in \mathbb{F}_{q^{2 n}} \backslash \mathbb{F}_{2}$.
Theorem 4.1. Let $q=2^{t}$ and $h(X)=\gamma X+\operatorname{Tr}_{q^{2 n} / q}\left(X^{2^{i}\left(q^{2}+1\right)}\right)$, where $\gamma \in \mathbb{F}_{q^{2}}^{*}, i, n, t>0$ are integers and either $n$ is even; or $n$ is odd and $\operatorname{Tr}_{q^{2} / q}\left(\frac{1}{\gamma^{2^{i}+1}}\right)^{\frac{q-1}{\operatorname{gcd}\left(2^{i+1}-1,2^{t}-1\right)}} \neq 1$. Then
(i) $h$ is PcN over $\mathbb{F}_{q^{2 n}}$ for all $c \in \mathbb{F}_{q^{2}} \backslash \mathbb{F}_{2}$,
(ii) ${ }_{c} \Delta_{h} \leq 2$ for all $c \in \mathbb{F}_{q^{2 n}} \backslash \mathbb{F}_{q^{2}}$ when $\operatorname{gcd}(i, t)=1$.

Proof. Let $c \in \mathbb{F}_{q^{2 n}} \backslash \mathbb{F}_{2}$. For any $(a, b) \in \mathbb{F}_{q^{2 n}} \times \mathbb{F}_{q^{2 n}}$ the $c$-DDT entry ${ }_{c} \Delta_{h}(a, b)$ is given by the number of solutions $X \in \mathbb{F}_{q^{2 n}}$ of the following equation.

$$
\begin{equation*}
\gamma X+\operatorname{Tr}_{q^{2 n} / q}\left(X^{2^{i}\left(q^{2}+1\right)}\right)+C \cdot \operatorname{Tr}_{q^{2 n} / q}\left(\left(X^{q^{2}} a+a^{q^{2}} X\right)^{2^{i}}\right)=B \tag{4.1}
\end{equation*}
$$

where $B=C\left(b+\gamma a+\operatorname{Tr}_{q^{2 n} / q}\left(a^{2^{i}\left(q^{2}+1\right)}\right)\right)$ and $C=\frac{1}{1+c}$. Notice that when $a \in \mathbb{F}_{q}$, Equation (4.1) reduces to $B=\gamma X+\operatorname{Tr}_{q^{2 n} / q}\left(X^{2^{i}\left(q^{2}+1\right)}\right)$, which has a unique solution for each $B \in \mathbb{F}_{q^{2 n}}$. Now, let $a \in \mathbb{F}_{q^{2 n}} \backslash \mathbb{F}_{q}$. Then, from Equation (4.1) we have

$$
\begin{equation*}
\gamma X+\operatorname{Tr}_{q^{2 n} / q}\left(X^{2^{i}\left(q^{2}+1\right)}\right)+C \cdot \operatorname{Tr}_{q^{2 n} / q}\left(\left(\left(X^{q^{4}}+X\right) a^{q^{2}}\right)^{2^{i}}\right)=B . \tag{4.2}
\end{equation*}
$$

Now we shall split the analysis of the solutions of Equation (4.2) into three different cases, namely, $c \in \mathbb{F}_{q} \backslash \mathbb{F}_{2}, c \in \mathbb{F}_{q^{2}} \backslash \mathbb{F}_{q}$ and $c \in \mathbb{F}_{q^{2 n}} \backslash \mathbb{F}_{q^{2}}$, respectively.
Case 1 Let $c \in \mathbb{F}_{q} \backslash \mathbb{F}_{2}$ and $u:=\operatorname{Tr}_{q^{2 n} / q}\left(X^{2^{i}\left(q^{2}+1\right)}\right)+C \cdot \operatorname{Tr}_{q^{2 n} / q}\left(\left(\left(X^{q^{4}}+X\right) a^{q^{2}}\right)^{2^{i}}\right)$. Then, from Equation (4.2), we have $X=\frac{u+B}{\gamma}$. Putting the value of $X$ into Equation (4.2), we
have

$$
\begin{aligned}
u & =\operatorname{Tr}_{q^{2 n} / q}\left(\left(\frac{u^{2}+\left(B^{q^{2}}+B\right) u+B^{q^{2}+1}}{\gamma^{2}}\right)^{2^{i}}\right)+C_{1} \\
& =\operatorname{Tr}_{q^{2} / q}\left(\operatorname{Tr}_{q^{2 n} / q^{2}}\left(\left(\frac{u^{2}+\left(B^{q^{2}}+B\right) u+B^{q^{2}+1}}{\gamma^{2}}\right)^{2^{i}}\right)\right)+C_{1} \\
& =\operatorname{Tr}_{q^{2} / q}\left(\left(\frac{u}{\gamma}\right)^{2^{i+1}} \operatorname{Tr}_{q^{2 n} / q^{2}(1)}\right)+\operatorname{Tr}_{q^{2 n} / q}\left(\left(\frac{B}{\gamma}\right)^{2^{i}\left(q^{2}+1\right)}\right)+C_{1} \\
& = \begin{cases}B_{1}+C_{1} & \text { when } n \text { is even } \\
u^{2^{2+1}} T_{1}+B_{1}+C_{1} & \text { when } n \text { is odd },\end{cases}
\end{aligned}
$$

where $B_{1}:=\operatorname{Tr}_{q^{2 n} / q}\left(\left(\frac{B}{\gamma}\right)^{2^{i}\left(q^{2}+1\right)}\right), C_{1}:=C \cdot \operatorname{Tr}_{q^{2 n} / q}\left(\left(\frac{\left(B^{q^{4}}+B\right) a^{q^{2}}}{\gamma}\right)^{2^{i}}\right)$ and $T_{1}:=$ $\operatorname{Tr}_{q^{2} / q}\left(\frac{1}{\gamma^{2^{i+1}}}\right)$. Notice that when $n$ is odd, $T_{1}^{\frac{q-1}{\operatorname{gcd}\left(2^{2+1}-1,2^{t}-1\right)}} \neq 1$ and hence we get only one solution $u \in \mathbb{F}_{q}$. Thus, for $c \in \mathbb{F}_{q} \backslash \mathbb{F}_{2}$, Equation (4.2) has a unique solution for each $a \in \mathbb{F}_{q^{2 n}} \backslash \mathbb{F}_{q}$ and $b \in \mathbb{F}_{q^{2 n}}$.
Case 2 Let $c \in \mathbb{F}_{q^{2}} \backslash \mathbb{F}_{q}$. Let $u:=\operatorname{Tr}_{q^{2 n} / q}\left(X^{2^{i}\left(q^{2}+1\right)}\right)$ and $v:=\operatorname{Tr}_{q^{2 n} / q}\left(\left(\left(X^{q^{4}}+X\right) a^{q^{2}}\right)^{2^{i}}\right)$. Then, from Equation (4.2), we have

$$
\begin{equation*}
X=\frac{u+C v+B}{\gamma} . \tag{4.3}
\end{equation*}
$$

Using the properties of the trace function, we shall now simplify $u$ and $v$. Consider $u$ which is given by

$$
\begin{aligned}
u & =\operatorname{Tr}_{q^{2 n} / q}\left(\left(\frac{u^{2}+\left(B^{q^{2}}+B\right) u+C^{2} v^{2}+\left((B C)^{q^{2}}+B C\right) v+B^{q^{2}+1}}{\gamma^{2}}\right)^{2^{i}}\right) \\
& =\operatorname{Tr}_{q^{2} / q}\left(\frac{1}{\gamma^{2^{i+1}}} \operatorname{Tr}_{q^{2 n} / q^{2}}\left(\left(u^{2}+\left(B^{q^{2}}+B\right) u+C^{2} v^{2}+\left((B C)^{q^{2}}+B C\right) v+B^{q^{2}+1}\right)^{2^{i}}\right)\right) \\
& =\operatorname{Tr}_{q^{2} / q}\left(\frac{1}{\gamma^{2^{i+1}}} \operatorname{Tr}_{q^{2 n} / q^{2}}\left(\left(u^{2}+C^{2} v^{2}+B^{q^{2}+1}\right)^{2^{i}}\right)\right) \\
& =\operatorname{Tr}_{q^{2} / q}\left(\frac{u^{2^{i+1}}}{\gamma^{2^{i+1}}} \operatorname{Tr}_{q^{2 n} / q^{2}}(1)+\frac{v^{2^{i+1}}}{\gamma^{2^{i+1}}} \operatorname{Tr}_{q^{2 n} / q^{2}}\left(C^{2^{i+1}}\right)+\frac{1}{\gamma^{2^{i+1}}} \operatorname{Tr}_{q^{2 n} / q^{2}}\left(B^{2^{i}\left(q^{2}+1\right)}\right)\right) \\
& = \begin{cases}v^{2^{i+1}} C_{2}+B_{1} \\
u^{2^{i+1}} T_{1}+v^{2^{2+1}} C_{2}+B_{1} & \text { when } n \text { is even } n \text { is odd, }\end{cases}
\end{aligned}
$$

where $C_{2}:=\operatorname{Tr}_{q^{2 n} / q}\left(\left(\frac{C}{\gamma}\right)^{2^{i+1}}\right)$. Again, since $T^{\frac{q-1}{\overline{\operatorname{gcd}\left(2^{i+1}-1,2^{t}-1\right)}}} \neq 1$ when $n$ is odd, for any fixed $v$, we get a unique solution $u \in \mathbb{F}_{q}$ of the above equation. Now consider $v$ which is given
by

$$
v=\operatorname{Tr}_{q^{2 n} / q}\left(\left(\left(\frac{u+C v+B}{\gamma}\right)^{q^{4}}+\left(\frac{u+C v+B}{\gamma}\right)\right)^{2^{i}} a^{q^{2} 2^{i}}\right)=\frac{C_{1}}{C}
$$

Now putting the values of $u, v$ into Equation (4.3), we get a unique solution $X \in \mathbb{F}_{q^{2 n}}$ of Equation (4.2). Thus, for $c \in \mathbb{F}_{q^{2}} \backslash \mathbb{F}_{q}$, Equation (4.2) has a unique solution for each $a \in \mathbb{F}_{q^{2 n}} \backslash \mathbb{F}_{q}$ and $b \in \mathbb{F}_{q^{2 n}}$.
Case 3 Let $c \in \mathbb{F}_{q^{2 n}} \backslash \mathbb{F}_{q^{2}}$. Again, in this case too, let $u:=\operatorname{Tr}_{q^{2 n} / q}\left(X^{2^{i}\left(q^{2}+1\right)}\right)$ and $v:=$ $\operatorname{Tr}_{q^{2 n} / q}\left(\left(\left(X^{q^{4}}+X\right) a^{q^{2}}\right)^{2^{i}}\right)$. Then, from Equation (4.2), we have $X=\frac{u+C v+B}{\gamma}$. Now consider $u$ which is given by

$$
\begin{align*}
u= & \operatorname{Tr}_{q^{2 n} / q}\left(\left(\frac{u^{2}+\left((B+C v)^{q^{2}}+B+C v\right) u+C^{q^{2}+1} v^{2}+\left(C^{q^{2}} B+C B^{q^{2}}\right) v+B^{q^{2}+1}}{\gamma^{2}}\right)^{2^{i}}\right)  \tag{4.4}\\
= & \operatorname{Tr}_{q^{2} / q}\left(\frac{1}{\gamma^{2^{i+1}}} \operatorname{Tr}_{q^{2 n} / q^{2}}\left(\left(u^{2}+C^{q^{2}+1} v^{2}+\left(C^{q^{2}} B+C B^{q^{2}}\right) v+B^{q^{2}+1}\right)^{2^{i}}\right)\right) \\
= & u^{2^{i+1}} \operatorname{Tr}_{q^{2} / q}\left(\frac{1}{\gamma^{2^{i+1}}} \operatorname{Tr}_{q^{2 n} / q^{2}}(1)\right)+v^{2^{i+1}} \operatorname{Tr}_{q^{2 n} / q}\left(\left(\frac{C}{\gamma}\right)^{2^{i}\left(q^{2}+1\right)}\right) \\
& +v^{2^{i}} \operatorname{Tr}_{q^{2 n} / q}\left(\left(\frac{C^{q^{2}} B+C B^{q^{2}}}{\gamma^{2}}\right)^{2^{i}}\right)+\operatorname{Tr}_{q^{2 n} / q}\left(\left(\frac{B}{\gamma}\right)^{2^{i}\left(q^{2}+1\right)}\right) \\
= & \begin{cases}v^{2^{i+1}} \mathcal{C}+v^{2^{i}} \mathcal{B}+B_{1} & \text { when } n \text { is even } \\
u^{2^{i+1}} T_{1}+v^{2^{i+1}} \mathcal{C}+v^{2^{i}} \mathcal{B}+B_{1} & \text { when } n \text { is odd, }\end{cases}
\end{align*}
$$

where $\mathcal{B}=\operatorname{Tr}_{q^{2 n} / q}\left(\left(\frac{B C^{q^{2}}+B^{q^{2}} C}{\gamma^{2}}\right)^{2^{i}}\right), \mathcal{C}=\operatorname{Tr}_{q^{2 n} / q}\left(\left(\frac{C}{\gamma}\right)^{2^{i}\left(q^{2}+1\right)}\right)$ and these equalities hold because $u, v \in \mathbb{F}_{q}, \gamma \in \mathbb{F}_{q^{2}}^{*}$ and $\operatorname{Tr}_{q^{2 n} / q}\left((B+C v)^{q^{2}}\right)=\operatorname{Tr}_{q^{2 n} / q}(B+C v)$. Now consider $v$ which is given by

$$
\begin{equation*}
v=\operatorname{Tr}_{q^{2 n} / q}\left(\left(\left(\frac{u+C v+B}{\gamma}\right)^{q^{4}}+\left(\frac{u+C v+B}{\gamma}\right)\right) a^{q^{2}}\right)=v^{2^{i}} C_{3}+\frac{C_{1}}{C} \tag{4.5}
\end{equation*}
$$

where $C_{3}=\operatorname{Tr}_{q^{2 n} / q}\left(\left(\frac{\left(C^{q^{4}}+C\right) a^{q^{2}}}{\gamma}\right)^{2^{i}}\right)$ and the second equality holds as $u, v \in \mathbb{F}_{q}$ and $\gamma \in \mathbb{F}_{q^{2}}^{*}$. Now, if $C_{3}=0$, then we have a unique solution $v \in \mathbb{F}_{q}$ of Equation (4.5). Thus, Equation (4.2) has a unique solution in this case. If $C_{3} \neq 0$, then Equation (4.5) can be rewritten as

$$
v^{2^{i}}+\frac{v}{C_{3}}+\frac{C_{1}}{C C_{3}}=0
$$

From Lemma 2.1, we know that if $\operatorname{gcd}(i, t)=1$, then the above equation can have at most two solutions $v \in \mathbb{F}_{q}$. Also, corresponding to each solution $v$ of Equation (4.5), we get a unique solution $u$ of Equation (4.4). Thus, for $c \in \mathbb{F}_{q^{2 n}} \backslash \mathbb{F}_{q^{2}}$, Equation (4.2) has at most two solutions for each $a \in \mathbb{F}_{q^{2 n}} \backslash \mathbb{F}_{q}$ and $b \in \mathbb{F}_{q^{2 n}}$. This completes the proof.

## 5. Conclusion

We have cosntructed three new classes of $\mathrm{P} c \mathrm{~N}$ permutations and two new classes of $\mathrm{AP} c \mathrm{~N}$ permutations for some specific values of $c$. Since there are only few PcN and $\mathrm{AP} c \mathrm{~N}$ permutations over finite fields of even characteristic, it would be an interesting problem to construct more such permutations.
