# Self-dual codes over $\mathbb{F}_{5}$ and $s$-extremal unimodular lattices 

Masaaki Harada*

August 9, 2022

#### Abstract

New $s$-extremal extremal unimodular lattices in dimensions 38, 40,42 and 44 are constructed from self-dual codes over $\mathbb{F}_{5}$ by Construction A. In the process of constructing these codes, we obtain a self-dual $[44,22,14]$ code over $\mathbb{F}_{5}$. In addition, the code implies a $[43,22,13]$ code over $\mathbb{F}_{5}$. These codes have larger minimum weights than the previously known [44,22] codes and [43,22] codes, respectively.

## 1 Introduction

A (linear) $[n, k]$ code $C$ over $\mathbb{F}_{5}$ is a $k$-dimensional subspace of $\mathbb{F}_{5}^{n}$, where $\mathbb{F}_{5}$ is the finite field of order 5. The dual code $C^{\perp}$ of $C$ is defined as $\left\{x \in \mathbb{F}_{5}^{n} \mid x \cdot y=\right.$ 0 for all $y \in C\}$, where $x \cdot y$ is the standard inner product. A code $C$ is called self-dual if $C=C^{\perp}$. Self-dual codes are one of the most interesting classes of codes. This interest is justified by many combinatorial objects and algebraic objects related to self-dual codes. Unimodular lattices are one of the objects related to self-dual codes. In addition, there are many similarities between self-dual codes and unimodular lattices (see [4). Construction A, which is the most important construction of unimodular lattices from self-dual codes, gives some similarities.

[^0]Extremal unimodular lattices are unimodular lattices meeting a certain upper bound on minimum norms, and $s$-extremal unimodular lattices are odd unimodular lattices meeting a certain upper bound on minimum norms of the shadows. In this paper, new $s$-extremal extremal unimodular lattices in dimensions $38,40,42$ and 44 are constructed from self-dual codes over $\mathbb{F}_{5}$ by Construction A. In the process of constructing the above self-dual codes, we obtain a self-dual $[44,22,14]$ code over $\mathbb{F}_{5}$. This code has larger minimum weight than the previously known self-dual $[44,22]$ codes. It is a fundamental problem to determine the largest minimum weight $d_{5}(n)$ among all self-dual $[n, n / 2]$ codes over $\mathbb{F}_{5}$ for a given $n$. Much work has been done concerning this fundamental problem (see e.g. [9], [10], [12], [14], [16], [17] and [23]). In addition, the new self-dual code implies a $[43,22,13]$ code over $\mathbb{F}_{5}$, which has larger minimum weight than the previously known [43, 22] codes.

This paper is organized as follows. In Section 2, we give some definitions, notations and basic results used in this paper. Two methods for constructing self-dual codes are given, namely, quasi-twisted codes and four-negacirculant codes. In Section 3, new $s$-extremal extremal unimodular lattices in dimension 44 are constructed from four-negacirculant self-dual codes over $\mathbb{F}_{5}$ by Construction A. In the process of constructing these codes, we obtain a self-dual $[44,22,14]$ code $C_{44}$ over $\mathbb{F}_{5}$. This code has larger minimum weight than the previously known self-dual codes. We emphasize that $C_{44}$ is the first example as not only self-dual [44, 22, 14] codes but also (linear) $[44,22,14]$ codes. In addition, $C_{44}$ implies a $[43,22,13]$ code over $\mathbb{F}_{5}$, which has larger minimum weight than the previously known $[43,22]$ codes. Section 3 also lists the current information on the largest minimum weight among self-dual [ $n, n / 2$ ] codes over $\mathbb{F}_{5}$ for $22 \leq n \leq 72$. In Section 4, new $s$-extremal extremal unimodular lattices in dimensions 38,40 and 42 are constructed from self-dual codes over $\mathbb{F}_{5}$ by Construction $A$. These self-dual codes are constructed as quasi-twisted codes or four-negacirculant codes. As a summary, we list the current information on the existence of non-isomorphic $s$-extremal unimodular lattices with minimum norm 4.

All computer calculations in this paper were done by programs in Magma [1].

## 2 Preliminaries

In this section, we give definitions, notations and basic results used in this paper.

### 2.1 Unimodular lattices

A (Euclidean) lattice $L \subset \mathbb{R}^{n}$ in dimension $n$ is unimodular if $L=L^{*}$, where the dual lattice $L^{*}$ of $L$ is defined as $\left\{x \in \mathbb{R}^{n} \mid x \cdot y \in \mathbb{Z}\right.$ for all $\left.y \in L\right\}$ under the standard inner product $x \cdot y$. A unimodular lattice $L$ is even if the norm $x \cdot x$ of every vector $x$ of $L$ is even, and odd otherwise. An even unimodular lattice in dimension $n$ exists if and only if $n$ is divisible by eight, while an odd unimodular lattice exists for every dimension. The minimum norm $\min (L)$ of a unimodular lattice $L$ is the smallest norm among all nonzero vectors of $L$. The kissing number of $L$ is the number of vectors of minimum norm in $L$. Two lattices $L$ and $L^{\prime}$ are isomorphic, denoted $L \cong L^{\prime}$, if there is an orthogonal matrix $A$ with $L^{\prime}=\{x A \mid x \in L\}$.

Let $L$ be an odd unimodular lattice in dimension $n$. The shadow $S(L)$ of $L$ is defined to be $S(L)=L_{0}^{*} \backslash L$, where $L_{0}$ denotes the even sublattice of L. Shadows of odd unimodular lattices appeared in [3] (see also [4, p. 440]), and shadows play an important role in the study of odd unimodular lattices. The theta series of an odd unimodular lattice $L$ and its shadow $S(L)$ are the formal power series $\theta_{L}(q)=\sum_{x \in L} q^{x \cdot x}$ and $\theta_{S(L)}(q)=\sum_{x \in S(L)} q^{x \cdot x}$, respectively. Conway and Sloane [3] showed that when the theta series of an odd unimodular lattice $L$ in dimension $n$ is written as:

$$
\begin{equation*}
\sum_{j=0}^{\lfloor n / 8\rfloor} a_{j} \theta_{3}(q)^{n-8 j} \Delta_{8}(q)^{j} \tag{1}
\end{equation*}
$$

the theta series of the shadow $S(L)$ is written as:

$$
\begin{equation*}
\sum_{j=0}^{\lfloor n / 8\rfloor} \frac{(-1)^{j}}{16^{j}} a_{j} \theta_{2}(q)^{n-8 j} \theta_{4}\left(q^{2}\right)^{8 j}, \tag{2}
\end{equation*}
$$

where $\Delta_{8}(q)=q \prod_{m=1}^{\infty}\left(1-q^{2 m-1}\right)^{8}\left(1-q^{4 m}\right)^{8}$, and $\theta_{2}(q), \theta_{3}(q), \theta_{4}(q)$ are the Jacobi theta series [4].

### 2.2 Extremal unimodular lattices and $s$-extremal unimodular lattices

By considering the theta series of odd unimodular lattices and their shadows, Rains and Sloane [25] showed that the minimum norm $\min (L)$ of an odd
unimodular lattice $L$ in dimension $n$ is bounded by

$$
\min (L) \leq \begin{cases}2\left\lfloor\frac{n}{24}\right\rfloor+2 & \text { if } n \neq 23  \tag{3}\\ 3 & \text { if } n=23\end{cases}
$$

A unimodular lattice meeting the bound (3) with equality is called extremal. In addition, it was shown in [8] that

$$
\begin{array}{rll}
4 \min (S(L)) & =15 & \text { if } n=23 \text { and } \min (L)=3,  \tag{4}\\
8 \min (L)+4 \min (S(L)) & \leq 8+n & \\
\text { otherwise, }
\end{array}
$$

where $\min (S(L))$ denotes the minimum norm of $S(L)$, that is, the smallest norm among all vectors of $S(L)$. An odd unimodular lattice meeting the bound (4) with equality is called $s$-extremal. If an $s$-extremal unimodular lattice $L$ in dimension $n$ having $\min (L)=4$ exists, then $n \in$ $\{32,36,37, \ldots, 47\}$ [8, p. 148].

### 2.3 Invariants $\operatorname{inv}(L)_{i}$

For a given unimodular lattice $L$ in dimension $n$ having $\min (L)=4$, let $L(4)$ denote the set of vectors of norm 4 in $L$. There is a subset $L(4)^{+}$of $L(4)$ such that

$$
L(4)=L(4)^{+} \cup L(4)^{-} \text {and } L(4)^{+} \cap L(4)^{-}=\emptyset
$$

where $L(4)^{-}=\left\{-x \mid x \in L(4)^{+}\right\}$. For a given unimodular lattice $L$ and a nonnegative integer $i$, we define

$$
\operatorname{inv}(L)_{i}=\left|\left\{(x, y) \in L(4)^{+} \times L(4)^{+} \mid x \cdot y \in\{i,-i\}\right\}\right|
$$

It is trivial that $\operatorname{inv}(L)_{i}=\operatorname{inv}\left(L^{\prime}\right)_{i}$ if $L \cong L^{\prime}$ for a nonnegative integer $i$.
Lemma 1. $\operatorname{inv}(L)_{3}=0, \operatorname{inv}(L)_{4}=\left|L^{+}(4)\right|$ and $\operatorname{inv}(L)_{0}+\operatorname{inv}(L)_{1}+\operatorname{inv}(L)_{2}=$ $\left|L^{+}(4)\right|^{2}-\left|L^{+}(4)\right|$.

Proof. Let $x$ and $y$ be vectors of $L(4)$. By considering $(x+y) \cdot(x+y)$ and $(x-y) \cdot(x-y)$, it follows that $-2 \leq x \cdot y \leq 2$ if $x \notin\{y,-y\}$, and it follows that $x \in\{y,-y\}$ if and only if $x \cdot y \in\{-4,4\}$. The last assertion is trivial.

Hence, it is sufficient to consider only $\operatorname{inv}(L)_{0}$ and $\operatorname{inv}(L)_{1}$.

### 2.4 Self-dual codes and Construction A

Let $\mathbb{F}_{5}$ be the finite field of order 5 . Throughout this paper, we take the elements of $\mathbb{F}_{5}$ to be either $0,1,2,3,4$ or $0, \pm 1, \pm 2$, using whichever form is more convenient. A (linear) $[n, k]$ code $C$ over $\mathbb{F}_{5}$ is a $k$-dimensional subspace of $\mathbb{F}_{5}^{n}$. All codes in this paper mean linear codes and we omit the term linear. The weight wt $(x)$ of a vector $x$ of $\mathbb{F}_{5}^{n}$ is the number of non-zero components of $x$. A vector of $C$ is called a codeword. The minimum non-zero weight of all codewords in $C$ is called the minimum weight of $C$. An $[n, k]$ code with minimum weight $d$ is called an $[n, k, d]$ code. The weight enumerator of $C$ is $\sum_{c \in C} y^{\mathrm{wt}(c)}$.

The dual code $C^{\perp}$ of an $[n, k]$ code $C$ over $\mathbb{F}_{5}$ is defined as

$$
C^{\perp}=\left\{x \in \mathbb{F}_{5}^{n} \mid x \cdot y=0 \text { for all } y \in C\right\}
$$

where $x \cdot y$ is the standard inner product. A code $C$ is called self-dual if $C=C^{\perp}$. If an $[n, k]$ code is self-dual, then it is trivial that $k=n / 2$. It is a fundamental problem to determine the largest minimum weight $d_{5}(n)$ among all self-dual $[n, n / 2]$ codes over $\mathbb{F}_{5}$ for a given $n$.

Let $C$ be a self-dual $[n, n / 2]$ code over $\mathbb{F}_{5}$. Then the following lattice

$$
A_{5}(C)=\frac{1}{\sqrt{5}}\left\{\left(x_{1}, \ldots, x_{n}\right) \in \mathbb{Z}^{n} \mid\left(x_{1}(\bmod 5), \ldots, x_{n}(\bmod 5)\right) \in C\right\}
$$

is a unimodular lattice in dimension $n$. This construction of lattices is well known as Construction A.

### 2.5 Self-dual codes constructed from negacirculant matrices

An $n \times n$ negacirculant matrix has the following form

$$
\left(\begin{array}{ccccc}
r_{0} & r_{1} & r_{2} & \cdots & r_{n-1} \\
-r_{n-1} & r_{0} & r_{1} & \cdots & r_{n-2} \\
-r_{n-2} & -r_{n-1} & r_{0} & \cdots & r_{n-3} \\
\vdots & \vdots & \vdots & & \vdots \\
-r_{1} & -r_{2} & -r_{3} & \cdots & r_{0}
\end{array}\right)
$$

Throughout this paper, let $I_{n}$ denote the identity matrix of order $n$ and let $A^{T}$ denote the transpose of a matrix $A$.

Let $A$ be an $n \times n$ negacirculant matrix. A $[2 n, n]$ code over $\mathbb{F}_{5}$ having the following generator matrix

$$
\left(\begin{array}{ll}
I_{n} & A \tag{5}
\end{array}\right)
$$

is called a quasi-twisted code or a double twistulant code. Let $A$ and $B$ be $n \times n$ negacirculant matrices. A $[4 n, 2 n]$ code over $\mathbb{F}_{5}$ having the following generator matrix

$$
\left(\begin{array}{ccc} 
& A & B  \tag{6}\\
I_{2 n} & -B^{T} & A^{T}
\end{array}\right)
$$

is called a four-negacirculant code. Many quasi-twisted self-dual codes and four-negacirculant self-dual codes with large minimum weights are known (see e.g. [16], [17, [21] and [22]).

## 3 New s-extremal extremal unimodular lattices in dimension 44 and new self-dual codes over $\mathbb{F}_{5}$

In this section, new $s$-extremal extremal unimodular lattices in dimension 44 are constructed from four-negacirculant self-dual codes over $\mathbb{F}_{5}$ by Construction A. In the process of constructing these codes, we obtain a self-dual $[44,22,14]$ code over $\mathbb{F}_{5}$. This code has larger minimum weight than the previously known [44, 22] codes. In addition, the new self-dual code implies a $[43,22,13]$ code over $\mathbb{F}_{5}$, which has larger minimum weight than the previously known [43, 22] codes.

### 3.1 New $s$-extremal extremal unimodular lattices in dimension 44

Let $L_{44}$ be an odd unimodular lattice in dimension 44 having minimum norm 4. By using (11) and (22), the possible theta series of $L_{44}$ and its shadow $S\left(L_{44}\right)$ are determined as follows:

$$
\begin{aligned}
\theta_{L_{44}}(q) & =1+(6600+16 \alpha) q^{4}+(811008-128 \alpha-65536 \beta) q^{5}+\cdots \text { and } \\
\theta_{S\left(L_{44}\right)}(q) & =\beta q+(\alpha-76 \beta) q^{3}+(1622016-52 \alpha+2806 \beta) q^{5}+\cdots,
\end{aligned}
$$

respectively, where $\alpha$ and $\beta$ are nonnegative integers [19]. It turns out that $L_{44}$ has kissing number 6600 if and only if $L_{44}$ is $s$-extremal. Two $s$-extremal extremal unimodular lattices in dimension 44 are previously known. More precisely, $A_{5}\left(C_{44}\right)$ in [19] and $A_{5}\left(C_{44,5}\left(D_{22}\right)\right)$ in [21] are the known lattices, and we denote the lattices by $L_{44,1}$ and $L_{44,2}$, respectively. We remark that the two lattices are constructed from some self-dual codes over $\mathbb{F}_{5}$ by Construction A.

We calculated by Magma the invariants $\operatorname{inv}(L)_{i}(i=0,1)$ given in Section 2.3 for $L=L_{44,1}$ and $L_{44,2}$, where the results are listed in Table [1 This was done using the Magma function ShortVectors. From the table, it holds that the two lattices $L_{44,1}$ and $L_{44,2}$ are non-isomorphic.

Table 1: $\operatorname{inv}(L)_{i}(i=0,1)$ for $L=L_{44,1}$ and $L_{44,2}$

| $L$ | $\operatorname{inv}(L)_{0}$ | $\operatorname{inv}(L)_{1}$ |
| :---: | :---: | :---: |
| $L_{44,1}$ | 7097112 | 3750384 |
| $L_{44,2}$ | 7089192 | 3760944 |

In order to construct new $s$-extremal extremal odd unimodular lattices, we tried to find four-negacirculant self-dual $[44,22]$ codes over $\mathbb{F}_{5}$. Then we found 50 codes $C_{44, i}$ satisfying the condition that $A_{5}\left(C_{44, i}\right)$ have minimum norm 4 and kissing number 6600 and the condition that

$$
\left|\left\{\left(\operatorname{inv}(L)_{0}, \operatorname{inv}(L)_{1}\right) \mid L \in \mathcal{L}\right\}\right|=52,
$$

where $\mathcal{L}=\left\{L_{44,1}, L_{44,2}\right\} \cup\left\{A_{5}\left(C_{44, i}\right) \mid i \in\{1,2, \ldots, 50\}\right\}$. The self-duality was verified by the Magma function IsSelfDual. The minimum norm and the kissing number were calculated by the Magma functions Minimum and KissingNumber, respectively. For $L=A_{5}\left(C_{44, i}\right)$, the results $\operatorname{inv}(L)_{j}(j=$ $0,1)$ are listed in Table 2. From Tables 1 and 2, we have the following:

Lemma 2. The 52 lattices $L_{44,1}, L_{44,2}$ and $A_{5}\left(C_{44, i}\right)(i=1,2, \ldots, 50)$ are non-isomorphic.

For the 50 codes $C_{44, i}$, the first rows $r_{A}\left(C_{44, i}\right)$ and $r_{B}\left(C_{44, i}\right)$ of the negacirculant matrices $A$ and $B$ in the generator matrices of form (6) are listed in Table 9 ,

For an odd unimodular lattice $L$, there are cosets $L_{1}, L_{2}, L_{3}$ of $L_{0}$ such that $L_{0}^{*}=L_{0} \cup L_{1} \cup L_{2} \cup L_{3}$, where $L=L_{0} \cup L_{2}$ and $S(L)=L_{1} \cup L_{3}$. Two

Table 2: $\operatorname{inv}(L)_{j}(j=0,1)$ for $L=A_{5}\left(C_{44, i}\right)$

| $i$ | $\operatorname{inv}(L)_{0}$ | $\operatorname{inv}(L)_{1}$ | $i$ | $\operatorname{inv}(L)_{0}$ | $\operatorname{inv}(L)_{1}$ | $i$ | $\operatorname{inv}(L)_{0}$ | $\operatorname{inv}(L)_{1}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | 7068600 | 3788400 | 18 | 7083252 | 3768864 | 35 | 7092756 | 3756192 |
| 2 | 7071372 | 3784704 | 19 | 7083648 | 3768336 | 36 | 7093152 | 3755664 |
| 3 | 7074144 | 3781008 | 20 | 7084440 | 3767280 | 37 | 7093548 | 3755136 |
| 4 | 7074540 | 3780480 | 21 | 7085232 | 3766224 | 38 | 7093944 | 3754608 |
| 5 | 7074936 | 3779952 | 22 | 7085628 | 3765696 | 39 | 7094340 | 3754080 |
| 6 | 7075332 | 3779424 | 23 | 7086420 | 3764640 | 40 | 7094736 | 3753552 |
| 7 | 7076520 | 3777840 | 24 | 7086816 | 3764112 | 41 | 7095132 | 3753024 |
| 8 | 7077312 | 3776784 | 25 | 7087212 | 3763584 | 42 | 7095528 | 3752496 |
| 9 | 7078104 | 3775728 | 26 | 7087608 | 3763056 | 43 | 7096320 | 3751440 |
| 10 | 7078500 | 3775200 | 27 | 7088004 | 3762528 | 44 | 7097904 | 3749328 |
| 11 | 7078896 | 3774672 | 28 | 7089588 | 3760416 | 45 | 7098300 | 3748800 |
| 12 | 7079292 | 3774144 | 29 | 7089984 | 3759888 | 46 | 7100676 | 3745632 |
| 13 | 7079688 | 3773616 | 30 | 7090380 | 3759360 | 47 | 7103448 | 3741936 |
| 14 | 7081272 | 3771504 | 31 | 7091172 | 3758304 | 48 | 7105824 | 3738768 |
| 15 | 7081668 | 3770976 | 32 | 7091568 | 3757776 | 49 | 7107012 | 3737184 |
| 16 | 7082460 | 3769920 | 33 | 7091964 | 3757248 | 50 | 7107804 | 3736128 |
| 17 | 7082856 | 3769392 | 34 | 7092360 | 3756720 |  |  |  |

lattices $L$ and $L^{\prime}$ are neighbors if both lattices contain a sublattice of index 2 in common. If $L$ is an odd unimodular lattice in dimension $n$ and $n$ is a multiple of four, then there are two unimodular lattices containing $L_{0}$, which are rather than $L$, namely, $L_{0} \cup L_{1}$ and $L_{0} \cup L_{3}$ (see [5]). Note that the two neighbors are even if $n$ is a multiple of eight. We denote the two unimodular neighbors by

$$
N_{1}(L)=L_{0} \cup L_{1} \text { and } N_{2}(L)=L_{0} \cup L_{3}
$$

Lemma 3. Let $L$ be an s-extremal extremal unimodular lattice in dimension 44. Then $N_{1}(L)$ and $N_{2}(L)$ are also s-extremal extremal unimodular lattices.

Proof. Since $L$ is an s-extremal extremal unimodular lattice in dimension 44, the minimum norm of the shadow $S(L)$ is 5 . Thus, $N_{1}(L)$ and $N_{2}(L)$ have minimum norm 4. In addition, the shadows of $N_{1}(L)$ and $N_{2}(L)$ are $L_{2} \cup L_{3}$ and $L_{2} \cup L_{1}$, respectively. Hence, $\min \left(S\left(N_{1}(L)\right)=\min \left(S\left(N_{2}(L)\right)=5\right.\right.$. The result follows.

By the above lemma, more $s$-extremal extremal unimodular lattices in dimension 44 are constructed as $N_{j}\left(L_{44,1}\right), N_{j}\left(L_{44,2}\right)$ and $N_{j}\left(A_{5}\left(C_{44, i}\right)\right)(i=$ $1,2, \ldots, 50)(j=1,2)$.

Lemma 4. Let $L$ and $L^{\prime}$ be s-extremal extremal unimodular lattices in dimension 44. If $\operatorname{inv}(L)_{0} \neq \operatorname{inv}\left(L^{\prime}\right)_{0}$ or $\operatorname{inv}(L)_{1} \neq \operatorname{inv}\left(L^{\prime}\right)_{1}$, then $L \neq N_{1}\left(L^{\prime}\right)$ and $L \neq N_{2}\left(L^{\prime}\right)$.

Proof. Since the minimum norm of the shadow of $L^{\prime}$ is 5 , the two sets of vectors of norm 4 in $L^{\prime}$ and $M$ are identical for $M=N_{1}\left(L^{\prime}\right)$ and $N_{2}\left(L^{\prime}\right)$. The result follows.

In addition, we verified that the three lattices $L, N_{1}(L)$ and $N_{2}(L)$ are non-isomorphic for each lattice $L=L_{44,1}, L_{44,2}$ and $A_{5}\left(C_{44, i}\right)(i=1,2, \ldots, 50)$. The neighbors $N_{1}(L)$ and $N_{2}(L)$ were constructed using the Magma functions EvenSublattice and Dual. In addition, the non-isomorphisms were verified by the Magma function IsIsomorphic. By Lemma 4, we have the following:

Proposition 5. There are at least 156 non-isomorphic s-extremal extremal unimodular lattices in dimension 44.

We stopped our search after finding the 50 self-dual codes $C_{44, i}$, which give 150 lattices $A_{5}\left(C_{44, i}\right), N_{1}\left(A_{5}\left(C_{44, i}\right)\right)$ and $N_{2}\left(A_{5}\left(C_{44, i}\right)\right)$. Our feeling is that the number of non-isomorphic $s$-extremal extremal unimodular lattices in dimension 44 might be even bigger.

### 3.2 A self-dual $[44,22,14]$ code over $\mathbb{F}_{5}$ and its related codes

We verified by Magma that $C_{44,50}$ has minimum weight $14, C_{44,29}$ has minimum weight 13 and $C_{44, i}(i=1,2, \ldots, 28,30, \ldots, 49)$ have minimum weight 12. The minimum weight was calculated by the MAGMA function MinimumWeight.

Proposition 6. There is a self-dual $[44,22,14]$ code over $\mathbb{F}_{5}$.
The code $C_{44,50}$ has generator matrix of form (6), where the negacirculant matrices $A$ and $B$ have the first rows

$$
(10033210404) \text { and }(12241413344)
$$

respectively. The first few terms of the weight enumerator of $C_{44,50}$ are given by

$$
1+12056 y^{14}+95920 y^{15}+807312 y^{16}+4677728 y^{17}+\cdots
$$

This was calculated by the Magma function NumberOfWord.
Let $d_{5}(n)$ denote the largest minimum weight among all self-dual $[n, n / 2]$ codes over $\mathbb{F}_{5}$. It was known that $13 \leq d_{5}(44) \leq 19$ [16, Table III]. Hence, $C_{44,50}$ improves the previously known lower bound on the largest minimum weight $d_{5}(44)$. As a summary, we list the current information on the largest minimum weight $d_{5}(n)$ in Table 3 along with references for $22 \leq n \leq 72$. The table updates [16, Table III].

Table 3: Largest minimum weights $d_{5}(n)$

| $n$ | $d_{5}(n)$ | References | $n$ | $d_{5}(n)$ | References |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 22 | $8-10$ | $[23$ | 48 | $14-20$ | $[6]$ |
| 24 | $9-10$ | $[23$ | 50 | $14-20$ | $[9$ |
| 26 | $9-11$ | $9]$ | 52 | $15-21$ | $[9$ |
| 28 | $10-12$ | $9]$ | 54 | $16-22$ | $[9]$ |
| 30 | $10-12$ | $[9$ | 56 | $16-23$ | $[9]$ |
| 32 | $11-13$ | $[17$ | 58 | $16-24$ | $[6]$ |
| 34 | $11-14$ | $9]$ | 60 | $18-24$ | $[15]$ |
| 36 | $12-15$ | $9]$ | 62 | $17-25$ | $[9$ |
| 38 | $12-16$ | 6 | 64 | $18-26$ | $[15$ |
| 40 | $13-17$ | $[6$ | 66 | $18-27$ | $[12$ |
| 42 | $13-18$ | $[16$ | 68 | $18-28$ | $[9]$ |
| 44 | $14-19$ | $C_{44,50}$ | 70 | $20-29$ | $[12$ |
| 46 | $14-20$ | $[6$ | 72 | $22-29$ | $[12$ |

It is a main problem in coding theory to determine the largest minimum weights $d_{q}(n, k)$ among all $[n, k]$ codes over a finite field of order $q$ for a given $(q, n, k)$. The current information on $d_{5}(n, k)$ can be found in [11]. For example, it was known that $12 \leq d_{5}(43,22) \leq 18$ and $13 \leq d_{5}(44,22) \leq 19$. We emphasize that $C_{44,50}$ is the first example as not only self-dual [44, 22, 14] codes but also (linear) $[44,22,14]$ codes. We verified that all punctured codes of $C_{44,50}$ are $[43,22,13]$ codes over $\mathbb{F}_{5}$. The punctured codes were constructed by the Magma functions PunctureCode.

Proposition 7. There is a $[43,22,13]$ code over $\mathbb{F}_{5}$.
The self-dual $[44,22,14]$ code $C_{44,50}$ and the punctured codes improve the previously known lower bounds on $d_{5}(43,22)$ and $d_{5}(44,22)$.

Corollary 8. $13 \leq d_{5}(43,22) \leq 18$ and $14 \leq d_{5}(44,22) \leq 19$.

## 4 Construction of $s$-extremal extremal unimodular lattices in dimensions 38,40 and 42

In this section, we construct new $s$-extremal extremal unimodular lattices in dimensions 38,40 and 42 from self-dual codes over $\mathbb{F}_{5}$ by Construction A. These self-dual codes are constructed as four-negacirculant self-dual codes or quasi-twisted self-dual codes.

### 4.1 New $s$-extremal extremal odd unimodular lattices in dimension 40

By using (11) and (24), the possible theta series of an extremal odd unimodular lattice $L_{40}$ in dimension 40 and its shadow $S\left(L_{40}\right)$ are determined as follows:

$$
\begin{aligned}
\theta_{L_{40}}(q) & =1+(19120+256 \alpha) q^{4}+(1376256-4096 \alpha) q^{5}+\cdots \text { and } \\
\theta_{S\left(L_{40}\right)}(q) & =\alpha q^{2}+(40960-56 \alpha) q^{4}+(87818240+1500 \alpha) q^{6}+\cdots
\end{aligned}
$$

respectively, where $\alpha$ is an even integer with $0 \leq \alpha \leq 80$ [2]. It is trivial that $L_{40}$ has kissing number 19120 if and only if $L_{40}$ is $s$-extremal. An $s$-extremal extremal odd unimodular lattice in dimension 40 was explicitly constructed in [2] and three non-isomorphic s-extremal extremal odd unimodular lattices were explicitly constructed in [21]. We calculated by Magma $\operatorname{inv}(L)_{i}(i=$ 0,1 ) for the four lattices, where the results are listed in Table 4.

Table 4: $\operatorname{inv}(L)_{i}(i=0,1)$ for the known lattices $L$ in [2] and [21]

| $L$ | $\operatorname{inv}(L)_{0}$ | $\operatorname{inv}(L)_{1}$ |
| :---: | :---: | :---: |
| $[2]$ | 56589480 | 34257920 |
| $A_{13}\left(C_{13,40}\right)$ in $[21]$ | 56644200 | 34184960 |
| $A_{9}\left(C_{9,40}\right)$ in $[21]$ | 56549160 | 34311680 |
| $A_{19}\left(C_{19,40}\right)$ in [21] | 56553480 | 34305920 |

In order to construct new $s$-extremal extremal odd unimodular lattices, we tried to find self-dual $[40,20]$ codes $C$ over $\mathbb{F}_{5}$ by considering four-negacirculant codes such that $A_{5}(C)$ have minimum norm 4 and kissing number 19120. Then we found 50 self-dual $[40,20]$ codes $C_{40, i}$ over $\mathbb{F}_{5}$ such that their lattices $A_{5}\left(C_{40, i}\right)$ are $s$-extremal extremal odd unimodular lattices and

$$
\mid\left\{\left(\operatorname{inv}(L)_{0}, \operatorname{inv}(L)_{1}\right)\left|L \in\left\{A_{5}\left(C_{40, i}\right) \mid i \in\{1,2, \ldots, 50\}\right\}\right|=50\right.
$$

The results $\operatorname{inv}\left(A_{5}\left(C_{40, i}\right)\right)_{j}(j=0,1)$ are listed in Table 5. From Tables 4 and 5, we have the following:

Proposition 9. There are at least 54 non-isomorphic s-extremal extremal odd unimodular lattices in dimension 40.

Table 5: $\operatorname{inv}(L)_{j}(j=0,1)$ for $L=A_{5}\left(C_{40, i}\right)$

| $i$ | $\operatorname{inv}(L)_{0}$ | $\operatorname{inv}(L)_{1}$ | $i$ | $\operatorname{inv}(L)_{0}$ | $\operatorname{inv}(L)_{1}$ | $i$ | $\operatorname{inv}(L)_{0}$ | $\operatorname{inv}(L)_{1}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | 56523240 | 34346240 | 18 | 56593800 | 34252160 | 35 | 56635560 | 34196480 |
| 2 | 56536200 | 34328960 | 19 | 56596680 | 34248320 | 36 | 56637000 | 34194560 |
| 3 | 56554920 | 34304000 | 20 | 56598120 | 34246400 | 37 | 56648520 | 34179200 |
| 4 | 56559240 | 34298240 | 21 | 56601000 | 34242560 | 38 | 56652840 | 34173440 |
| 5 | 56562120 | 34294400 | 22 | 56605320 | 34236800 | 39 | 56654280 | 34171520 |
| 6 | 56563560 | 34292480 | 23 | 56606760 | 34234880 | 40 | 56657160 | 34167680 |
| 7 | 56566440 | 34288640 | 24 | 56609640 | 34231040 | 41 | 56661480 | 34161920 |
| 8 | 56570760 | 34282880 | 25 | 56611080 | 34229120 | 42 | 56667240 | 34154240 |
| 9 | 56572200 | 34280960 | 26 | 56613960 | 34225280 | 43 | 56670120 | 34150400 |
| 10 | 56575080 | 34277120 | 27 | 56618280 | 34219520 | 44 | 56674440 | 34144640 |
| 11 | 56576520 | 34275200 | 28 | 56619720 | 34217600 | 45 | 56678760 | 34138880 |
| 12 | 56579400 | 34271360 | 29 | 56622600 | 34213760 | 46 | 56704680 | 34104320 |
| 13 | 56580840 | 34269440 | 30 | 56624040 | 34211840 | 47 | 56734920 | 34064000 |
| 14 | 56583720 | 34265600 | 31 | 56626920 | 34208000 | 48 | 56753640 | 34039040 |
| 15 | 56585160 | 34263680 | 32 | 56628360 | 34206080 | 49 | 56825640 | 33943040 |
| 16 | 56588040 | 34259840 | 33 | 56631240 | 34202240 | 50 | 56851560 | 33908480 |
| 17 | 56592360 | 34254080 | 34 | 56632680 | 34200320 |  |  |  |

For the 50 codes $C_{40, i}$, the first rows $r_{A}\left(C_{40, i}\right)$ and $r_{B}\left(C_{40, i}\right)$ of the negacirculant matrices $A$ and $B$ in the generator matrices of form (6) are listed in Table 10. We verified by Magma that the 50 codes $C_{40, i}$ have minimum weight 12. Although these codes have minimum weights less than $d_{5}(40)$, these codes are useful for constructing $s$-extremal extremal odd unimodular lattices.

We stopped our search after finding the new 50 lattices. Our feeling is that the number of non-isomorphic $s$-extremal extremal unimodular lattices in dimension 40 might be even bigger.

### 4.2 New $s$-extremal extremal odd unimodular lattices in dimension 38

Let $L_{38}$ be an extremal odd unimodular lattice in dimension 38. By using (1) and (2), one can determine the possible theta series $\theta_{L_{38}}(q)$ and $\theta_{S\left(L_{38}\right)}(q)$ as follows. Since the minimum norm of $L_{38}$ is 4 , we have that

$$
a_{0}=1, a_{1}=-76, a_{2}=1140 \text { and } a_{3}=-1520
$$

in (11). By considering the coefficient of $q^{\frac{3}{2}}$ in (2), $a_{4}$ is written as:

$$
a_{4}=2^{10} \alpha
$$

by using an integer $\alpha$. Hence, we have that

$$
\begin{aligned}
\theta_{L_{38}}(q) & =1+(29260+1024 \alpha) q^{4}+(1668352-20480 \alpha) q^{5}+\cdots \text { and } \\
\theta_{S\left(L_{38}\right)}(q) & =\alpha q^{\frac{3}{2}}+(6080-58 \alpha) q^{\frac{7}{2}}+(18471040+1615 \alpha) q^{\frac{11}{2}}+\cdots .
\end{aligned}
$$

It is trivial that $L_{38}$ has kissing number 29260 if and only if $L_{38}$ is s-extremal. An $s$-extremal extremal unimodular lattice in dimension 38 is previously known and this lattice is denoted by $G_{38}$ in [7]. We calculated by Magma

$$
\begin{equation*}
\operatorname{inv}\left(G_{38}\right)_{0}=129060350 \text { and } \operatorname{inv}\left(G_{38}\right)_{1}=83320320 \tag{7}
\end{equation*}
$$

For $n \equiv 2(\bmod 4)$, in order to construct new $s$-extremal extremal odd unimodular lattices in dimension $n$, we consider quasi-twisted self-dual [ $n, n / 2$ ] codes over $\mathbb{F}_{5}$. Then we found 15 self-dual $[38,19]$ codes $C_{38, i}$ over $\mathbb{F}_{5}$ such that $A_{5}\left(C_{38, i}\right)$ have minimum norm 4 and kissing number 29260. This means that $A_{5}\left(C_{38, i}\right)$ are $s$-extremal extremal odd unimodular lattices in dimension 38. For $L=A_{5}\left(C_{38, i}\right)$, we calculated by $\operatorname{Magma} \operatorname{inv}(L)_{j}(j=0,1)$, where the results are listed in Table 6. From (7) and the table, we know that

$$
\left(\operatorname{inv}\left(G_{38}\right)_{0}, \operatorname{inv}\left(G_{38}\right)_{1}\right)=\left(\operatorname { i n v } \left(A_{5}\left(C_{38,3}\right)_{0}, \operatorname{inv}\left(A_{5}\left(C_{38,3}\right)_{1}\right),\right.\right.
$$

however, we verified by Magma that these lattices are non-isomorphic. In addition, there are pairs $\left(i_{1}, i_{2}\right)$ such that

$$
\left(\operatorname{inv}\left(A_{5}\left(C_{38, i_{1}}\right)\right)_{0}, \operatorname{inv}\left(A_{5}\left(C_{38, i_{1}}\right)\right)_{1}\right)=\left(\operatorname{inv}\left(A_{5}\left(C_{38, i_{2}}\right)\right)_{0}, \operatorname{inv}\left(A_{5}\left(C_{38, i_{2}}\right)\right)_{1}\right)
$$

For the pairs, we verified by Magma that $A_{5}\left(C_{38, i_{1}}\right)$ and $A_{5}\left(C_{38, i_{2}}\right)$ are nonisomorphic. Therefore, we have the following:

Table 6: $r(C)$ and $\operatorname{inv}\left(A_{5}(C)\right)_{j}(j=0,1)$ for $C=C_{38, i}$

| $i$ | $r(C)$ | $\operatorname{inv}\left(A_{5}(C)\right)_{0}$ | $\operatorname{inv}\left(A_{5}(C)\right)_{1}$ |
| :---: | :---: | :---: | :---: |
| 1 | $(1,4,0,1,2,3,3,1,3,4,0,4,4,0,1,2,1,1,2)$ | 128961854 | 83451648 |

| 10 | $(1,0,3,2,2,2,3,2,0,1,3,3,3,0,4,2,1,4,3)$ | 129191678 | 83145216 |
| 11 | $(1,0,0,2,1,2,0,0,2,1,0,3,3,0,2,1,4,2,1)$ | 129224510 | 83101440 |
| 12 | $(1,0,3,3,3,0,2,1,1,3,2,4,1,3,1,3,3,4,1)$ | 129224510 | 83101440 |
| 13 | $(1,0,0,1,3,2,3,0,2,1,1,4,3,1,1,3,1,1,1)$ | 129257342 | 83057664 |
| 14 | $(1,0,1,4,4,4,4,1,2,0,3,3,4,2,2,0,4,1,3)$ | 129257342 | 83057664 |
| 15 | $(1,0,2,2,3,2,4,2,3,3,1,2,4,4,1,0,0,1,0)$ | 129257342 | 83057664 |

Proposition 10. There are at least 16 non-isomorphic s-extremal extremal odd unimodular lattices in dimension 38.

For the 15 codes $C_{38, i}$, the first rows $r\left(C_{38, i}\right)$ of the negacirculant matrices $A$ in the generator matrices of form (5) are listed in Table 6. We verified by Magma that the codes $C_{38, i}$ have minimum weight 10 if $i \in$ $\{1,3,4,5,8,9,12,13,15\}$ and the other codes have minimum weight 11. Although these codes have minimum weights less than $d_{5}(38)$, these codes are useful for constructing $s$-extremal extremal odd unimodular lattices.

### 4.3 New $s$-extremal extremal odd unimodular lattices in dimension 42

Let $L_{42}$ be an extremal odd unimodular lattice in dimension 42. By using (1) and (2), one can determine the possible theta series $\theta_{L_{42}}(q)$ and $\theta_{S\left(L_{42}\right)}(q)$ as follows. Since the minimum norm of $L_{42}$ is 4 , we have that

$$
a_{0}=1, a_{1}=-84, a_{2}=1596 \text { and } a_{3}=-4144
$$

in (11). By considering the coefficients of $q^{\frac{1}{2}}$ and $q^{\frac{5}{2}}$ in (2), $a_{4}$ and $a_{5}$ are written as:

$$
a_{4}=2^{6} \alpha \text { and } a_{5}=-2^{18} \beta,
$$

by using integers $\alpha$ and $\beta$. Hence, we have that

$$
\begin{aligned}
\theta_{L_{42}}(q) & =1+(11844+64 \alpha) q^{4}+(1080576-768 \alpha-262144 \beta) q^{5}+\cdots \text { and } \\
\theta_{S\left(L_{42}\right)}(q) & =\beta q^{\frac{1}{2}}+(\alpha-78 \beta) q^{\frac{5}{2}}+(265216-54 \alpha+2961 \beta) q^{\frac{9}{2}}+\cdots
\end{aligned}
$$

An $s$-extremal extremal unimodular lattice in dimension 42 is previously known and this lattice is denoted by $G_{42}$ in [7]. We calculated by Magma

$$
\operatorname{inv}\left(G_{42}\right)_{0}=22272390 \text { and } \operatorname{inv}\left(G_{42}\right)_{1}=12633936
$$

Lemma 11. Let $L_{42}$ be an extremal odd unimodular lattice in dimension 42. Then $L_{42}$ has kissing number 11844 if and only if $L_{42}$ is s-extremal.

Proof. It is sufficient to show that if $L_{42}$ has kissing number 11844 then $L_{42}$ is $s$-extremal. Suppose that $L_{42}$ has kissing number 11844. By considering the coefficients of $q^{4}$ in $\theta_{L_{42}}(q)$, we have $\alpha=0$. By considering the coefficients of $q^{\frac{1}{2}}$ and $q^{\frac{5}{2}}$ in $\theta_{S\left(L_{42}\right)}(q)$, we have $\beta=0$. The result follows.

By considering quasi-twisted codes, we found 30 self-dual [42,21] codes $C_{42, i}$ over $\mathbb{F}_{5}$ such that $A_{5}\left(C_{42, i}\right)$ have minimum norm 4 and kissing number 11844. This means that $A_{5}\left(C_{42, i}\right)$ are $s$-extremal extremal odd unimodular lattices in dimension 42. For $L=A_{5}\left(C_{42, i}\right)$, we calculated by Magma $\operatorname{inv}(L)_{j}$ $(j=0,1)$, where the results are listed in Table 7. There are pairs $\left(i_{1}, i_{2}\right)$ such that

$$
\left(\operatorname{inv}\left(A_{5}\left(C_{42, i_{1}}\right)\right)_{0}, \operatorname{inv}\left(A_{5}\left(C_{42, i_{1}}\right)\right)_{1}\right)=\left(\operatorname{inv}\left(A_{5}\left(C_{42, i_{2}}\right)\right)_{0}, \operatorname{inv}\left(A_{5}\left(C_{42, i_{2}}\right)\right)_{1}\right)
$$

For the pairs, we verified by Magma that $A_{5}\left(C_{42, i_{1}}\right)$ and $A_{5}\left(C_{42, i_{2}}\right)$ are nonisomorphic. Therefore, we have the following:

Proposition 12. There are at least 31 non-isomorphic s-extremal extremal odd unimodular lattices in dimension 42.

For the 30 codes $C_{42, i}$, the first rows $r\left(C_{42, i}\right)$ of the negacirculant matrices $A$ in the generator matrices of form (5) are listed in Table 7 . We verified by Magma that the codes $C_{42, i}$ have minimum weight 10 if $i \in$ $\{3,5,6,22,26,28,29\}$, the code $C_{42,19}$ have minimum weight 11 and the other codes have minimum weight 12. Although these codes have minimum weights less than $d_{5}(42)$, these codes are useful for constructing $s$-extremal extremal odd unimodular lattices.

Table 7: $r(C)$ and $\operatorname{inv}\left(A_{5}(C)\right)_{j}(j=0,1)$ for $C=C_{42, i}$

### 4.4 Summary of the existence of $s$-extremal unimodular lattices with minimum norm 4

In Section 3 and this section, we constructed 15, 50, 30 and 153 new nonisomorphic $s$-extremal extremal unimodular lattices in dimensions 38, 40, 42 and 44, respectively. As a summary, we list in Table 8 the current information on the number $N(n)$ of non-isomorphic $s$-extremal unimodular lattices $L$ in dimension $n$ with $\min (L)=4$. The table updates the table given in [8, p. 148] and Table 2 in [19].

Table 8: Existence of $s$-extremal unimodular lattices $L$ with $\min (L)=4$
