#### Abstract

This paper is concerned with the qualitative properties of the positive ground state solutions to the nonlocal Choquard type equation on a ball $B_{R}$. First, we prove the radial symmetry of the

[^0]positive ground state solutions by using Talenti's inequality. Next we develop Newton's Theorem and then resort to the contraction mapping principle to establish the uniqueness of the positive ground state solutions. Finally, by constructing cut-off functions and applying energy comparison method, we show the convergence of the positive ground state solutions as $R \rightarrow \infty$. Our results generalize and improve the existing ones in the literature.

Key words Nonlocal equation; Ground state solution; Uniqueness; Symmetry; Newton's theorem.

## 1 Introduction

The interesting stationary Choquard equation in the whole space $\mathbb{R}^{N}$ with $N \geq 3$,

$$
\begin{equation*}
-\Delta u+u=\left(\int_{\mathbb{R}^{N}} \frac{|u(y)|^{2}}{|x-y|^{N-2}} d y\right) u, \text { in } \mathbb{R}^{N} \tag{1.1}
\end{equation*}
$$

which is usually called Schrödinger-Newton equation, has several physical origins. When $N=3$, the nonlocal problem (1.1) becomes the classical stationary Choquard-Pekar equation

$$
\begin{equation*}
-\Delta u+u=\left(\int_{\mathbb{R}^{3}} \frac{|u(y)|^{2}}{|x-y|} d y\right) u, \text { in } \mathbb{R}^{3} . \tag{1.2}
\end{equation*}
$$

Equation (1.2) first appeared at least as early as in 1954, in a work by Pekar describing the quantum mechanics of polaron at rest. In 1976, Choquard used (1.2) to model an electron trapped in its own hole, in a certain approximation to Hartree-Fock theory of one-component plasma [9]. This equation also arises in many interesting situations related to the quantum theory of large systems of nonrelativistic bosonic atoms and molecules, see [11]. In mathematical contents, the existence and qualitative properties of solutions for (1.1) have been studied widely and intensively in the literature. See [2, 5, 7, $9,12,14]$ and references therein for the existence of ground state solutions, multiple solutions and nodal solutions to (1.1). About the qualitative properties such as regularity, symmetry, uniqueness and decay of nontrivial solutions of (1.1), we can refer to [3, 14-19] for instance.

As we know, by rescaling, 1.1) is equivalent to

$$
\left\{\begin{array}{l}
-\Delta u+u=w u, \text { in } \mathbb{R}^{N}  \tag{1.3}\\
-\Delta w=|u|^{2}, \text { in } \mathbb{R}^{N}
\end{array}\right.
$$

Let $B_{R} \subset \mathbb{R}^{N}$ be an open ball domain with radius $R>0$ centered at the origin. Then the Dirichlet problem of (1.3) on $B_{R}$ is

$$
\left\{\begin{array}{l}
-\Delta u+u=w u \text { in } B_{R}  \tag{1.4}\\
-\Delta w=|u|^{2} \text { in } B_{R} \\
w=u=0 \text { in } \partial B_{R}
\end{array}\right.
$$

By using Green's function, (1.4) can be rewritten as the following Choquard type equation on a ball

$$
\begin{equation*}
-\Delta u+u=\left(\int_{B_{R}} G(x, y)\left|u^{2}(y)\right| d y\right) u, \quad x \in B_{R} \tag{1.5}
\end{equation*}
$$

We point out that

$$
G(x, y)=\frac{1}{|y-x|^{N-2}}-\frac{1}{\left(\frac{|x|}{R}|y-\tilde{x}|\right)^{N-2}},\left(x, y \in B_{R} \text { with } x \neq y\right)
$$

where $\tilde{x}=\frac{R^{2} x}{|x|^{2}}$ is the dual point of $x$ with respect to $\partial B_{R}$. Clearly, $G(x, y)>0, G(x, y)=G(y, x)$ for $x, y \in B_{R}$ and $x \neq y$.

If a function $u$ is said to be a ground state solution of (1.1) (or (1.5)), if $u$ solves (1.1) (or (1.5)) and minimizes the energy functional associated with (1.1) (or (1.5)) among all possible nontrivial solutions. In the whole space $\mathbb{R}^{N}$, Moroz and Van Schaftingen [14] obtained the regularity, radial symmetry and asymptotic behavior of positive ground state solutions of the Choquard equation (1.1). This combined with the uniqueness of positive radial solutions of (1.1) (see [17]), implies that the positive ground state solutions of (1.1) are uniquely determined, up to translations. On a ball $B_{R}$, Wang and Yi [18] proposed that the positive ground state solutions of (1.5) may be only axially symmetric by using its separability property. When $N=3$, Feliciangeli and Seiringer [4] proved the radial symmetry and uniqueness of positive solutions with a prescribed $L^{2}-$ norm for the Choquard type equation (1.5). Motivated by the above work, one natural question is to ask whether the positive ground state solution of (1.5) on a ball $B_{R}$ is radially symmetric and unique when $N \geq 3$. We know that for the classical local elliptic equations

$$
\begin{equation*}
-\Delta u+u=u^{p} \text { in } B_{R}, \tag{1.6}
\end{equation*}
$$

with $p>1$, Gidas, Ni and Nirenberg [6] showed us that all the positive ground state solution are radially symmetric on a ball $B_{R}$. Later, Kwong [8] established the uniqueness of the positive, radially symmetric solution to (1.6). This yields that the positive ground state solution to (1.6) is unique. For more results on the uniqueness for the general local elliptic equations, we can refer to [1,13] and references therein. However, compared with the problem on the uniqueness for the local elliptic equations, the appearance of convolution term makes the nonlocal Choquard equations extremely difficult to handle. In order to obtain our main results, we first prove the radial symmetry of all the positive ground state solutions of (1.5). Then we resolve the convolution term by developing Newton's Theorem, which allows us to shift the uniqueness study to the ordinary differential equation. Finally, we investigate the asymptotic behavior of the unique positive ground state solution of (1.5).

The remainder of this paper is organized as follows. In Section 2, some notations and preliminary results are presented. Section 3 is devoted to the proof of the radial symmetry of all the positive ground state solutions to (1.5) with $N \geq 3$ by using Talenti's inequality. In Section 4, we develop Newton's

Theorem and then take advantage of the contraction mapping principle to establish the uniqueness of the positive ground state solutions to (1.5) when $N=3,4,5,6$. In Section 5, by constructing cutoff functions and applying energy comparison method, we show that the unique positive ground state solution of (1.5) converges to the unique positive ground state solution of (1.1) as $R \rightarrow \infty$.

## 2 Preliminaries

In this section, some notations are collected as follows.
$\bullet$ Let $N \in \mathbb{N}$ and $H^{1}\left(\mathbb{R}^{N}\right)$ is the Sobolev space with standard norm $\|u\|=\left(\int_{\mathbb{R}^{N}}|\nabla u|^{2}+|u|^{2}\right)^{\frac{1}{2}}$. We can identify $u \in H_{0}^{1}(\Omega)$ with its extensions to $\mathbb{R}^{N}$ obtained by setting $u=0$ in $\mathbb{R}^{N} \backslash \Omega$.

- The dual space of $H^{1}\left(\mathbb{R}^{N}\right)$ is denoted by $H^{-1}\left(\mathbb{R}^{N}\right)$.
- Let $\langle\cdot, \cdot\rangle$ be the duality pairing between $H^{1}\left(\mathbb{R}^{N}\right)$ and $H^{-1}\left(\mathbb{R}^{N}\right)$.
- Let $\mathbb{S}_{r, x}^{N-1}$ be the sphere with radius $r>0$ centered at the point $x$ in $\mathbb{R}^{N}$. $\left|\mathbb{S}_{r, x}^{N-1}\right|$ denotes its $N-1$ dimensional area. For simplicity, $\mathbb{S}^{N-1}$ and $\left|\mathbb{S}^{N-1}\right|$ denote the sphere of unit radius centered at the origin and its $N$ dimensional area, respectively.
- For $1 \leq s<\infty, L^{s}(\Omega)$ denotes the Lebesgue space with the norm $\|u\|_{L^{s}(\Omega)}=\left(\int_{\Omega}|u|^{s} d x\right)^{\frac{1}{s}}$.
- $C$ may represent different positive constants.

As usual, for $N \geq 3$, the corresponding energy functional $I_{R}: H_{0}^{1}\left(B_{R}\right) \rightarrow \mathbb{R}$ associated to (1.5) is

$$
\begin{equation*}
I_{R}(u)=\frac{1}{2} \int_{B_{R}}\left(|\nabla u|^{2}+|u|^{2}\right) d x-\frac{1}{4} \int_{B_{R}} \int_{B_{R}} G(x, y)|u(y)|^{2}|u(x)|^{2} d x d y, \tag{2.1}
\end{equation*}
$$

due to the symmetry and positivity of $G(x, y)$ for $x, y \in B_{R}$ and $x \neq y$. It is easy to check that $I_{R}$ is $C^{1}$-functional and its Gateaux derivative is given by

$$
\left\langle I_{R}^{\prime}(u), v\right\rangle=\int_{B_{R}}(\nabla u \nabla v+u v) d x-\int_{B_{R}} \int_{B_{R}} G(x, y)|u(y)|^{2} u(x) v(x) d x d y
$$

for any $v \in H_{0}^{1}\left(B_{R}\right)$. Recall that the critical points of $I_{R}$ are solutions of 1.5 in the weak sense. Let

$$
c_{R}:=\inf _{u \in \mathcal{N}_{R}} I_{R}(u),
$$

where the Nehari manifold

$$
\mathcal{N}_{R}=\left\{u \in H_{0}^{1}\left(B_{R}\right) \backslash\{0\}:\left\langle I_{R}^{\prime}(u), u\right\rangle=0\right\} .
$$

For the sake of convenience,

$$
\mathbb{D}(u):=\int_{B_{R}} \int_{B_{R}} G(x, y)|u(y)|^{2}|u(x)|^{2} d x d y
$$

The proof of the following properties of the Nehari manifold $\mathcal{N}_{R}$ is standard and hence is omitted here.

Lemma 2.1. The following statements are true:
(i) $0 \notin \partial \mathcal{N}_{R}$ and $c_{R}>0$;
(ii) For any $u \in H_{0}^{1}\left(B_{R}\right) \backslash\{0\}$, there exists a unique $t_{u} \in(0, \infty)$ such that $t_{u} u \in \mathcal{N}_{R}$ and $t_{u}=\left(\frac{\|\left. u\right|^{2}}{\mathbb{D}(u)}\right)^{\frac{1}{2}}$. Furthermore,

$$
\begin{equation*}
I_{R}\left(t_{u} u\right)=\sup _{t>0} I_{R}(t u)=\frac{1}{4} \frac{\|u\|^{4}}{\mathbb{D}(u)} ; \tag{2.2}
\end{equation*}
$$

(iii) $c_{R}=\inf _{u \in \mathcal{N}_{R}} I_{R}(u)=\inf _{u \in H_{0}^{1}\left(B_{R}\right) \backslash\{0\}} \sup _{t>0} I_{R}(t u)$.

By using standard Nehari manifold method, we can obtain the existence of ground state solutions of (1.5) in $H_{0}^{1}\left(B_{R}\right)$ (see [18]). In the following parts, we always assume that $\phi_{R} \in H_{0}^{1}\left(B_{R}\right)$ is a ground state solution of (1.5).

## 3 Positivity and symmetry

In this section, we shall prove the positivity and radial symmetry of ground state solutions of (1.5). In order to achieve it, we need the following Talenti's inequality.

Lemma 3.1. (see [4. Theorem 2.4]) Let $0 \leq f \in L^{2}\left(B_{R}\right)$, and let $u, v \in H_{0}^{1}\left(B_{R}\right)$ solve

$$
\left\{\begin{array}{l}
-\Delta u=f, x \in B_{R} \\
u=0, x \in \partial B_{R}
\end{array}\right.
$$

and

$$
\left\{\begin{array}{l}
-\Delta v=f^{*}, x \in B_{R} \\
v=0, x \in \partial B_{R}
\end{array}\right.
$$

Then $u^{*} \leq v$ a.e. in $B_{R}$. If additionally, $u^{*}\left(x_{0}\right)=v\left(x_{0}\right)$ for some $x_{0}$ with $\left|x_{0}\right|=t \in(0, R)$, then $u(x)=v(x)$ and $f(x)=f^{*}(x)$ for all $x$ with $t \leq|x| \leq R$. Here $u^{*}$ and $f^{*}$ are the symmetric decreasing rearrangement of $u$ and $f$, respectively.

Based on Lemma 3.1, we can obtain the following result.
Proposition 3.1. $\phi_{R} \in C^{2}\left(B_{R}\right) \bigcap H_{0}^{1}\left(B_{R}\right)$ is strictly positive, radially symmetric and decreasing.
Proof. Since $|\nabla| \phi_{R} \|^{2}=\left|\nabla\left(\phi_{R}^{2}\right)^{\frac{1}{2}}\right|^{2}$, direct calculations imply that $I_{R}\left(\phi_{R}\right)=I_{R}\left(\left|\phi_{R}\right|\right)$. This combined with Euler-Lagrange multiplication principle and the definition of ground state solution, yields that $\left|\phi_{R}\right|$ is also a ground state solution of (1.5). Furthermore, applying the standard elliptic regularity estimates and the strong maximum principle, we deduce that $\phi_{R}$ belongs to $C^{2}\left(B_{R}\right)$, and either $\phi_{R}>$ or $\phi_{R}<0$ in
$B_{R}$. Without loss of generality, we can assume that $\phi_{R}>0$ in $B_{R}$. Let $\phi_{R}^{*}$ be the symmetric decreasing rearrangement of $\phi_{R}$.

Define $u(x)=\int_{B_{R}} G(x, y)\left|\phi_{R}\right|^{2} d y, v(x)=\int_{B_{R}} G(x, y)\left|\phi_{R}^{*}\right|^{2} d y$. According to Lemma 3.1, we deduce that $u^{*} \leq v$. Then, by using symmetric rearrangement inequalities, we have

$$
\begin{equation*}
\int_{B_{R}}\left|\nabla \phi_{R}^{*}\right|^{2} d x \leq \int_{B_{R}}\left|\nabla \phi_{R}\right|^{2} d x, \int_{B_{R}}\left|\phi_{R}^{*}\right|^{2} d x=\int_{B_{R}}\left|\phi_{R}\right|^{2} d x \tag{3.1}
\end{equation*}
$$

and

$$
\begin{align*}
\int_{B_{R}} \int_{B_{R}} G(x, y)\left|\phi_{R}^{*}(y)\right|^{2}\left|\phi_{R}^{*}(x)\right|^{2} d x d y & =\int_{B_{R}} v(x)\left|\phi_{R}^{*}(x)\right|^{2} d x \\
& \geq \int_{B_{R}} u^{*}(x)\left|\phi_{R}^{*}(x)\right|^{2} d x  \tag{3.2}\\
& \geq \int_{B_{R}} u(x)\left|\phi_{R}(x)\right|^{2} d x \\
& =\int_{B_{R}} \int_{B_{R}} G(x, y)\left|\phi_{R}(y)\right|^{2}\left|\phi_{R}(x)\right|^{2} d x d y
\end{align*}
$$

This combined with (3.2), implies that $I_{R}\left(\phi_{R}\right) \geq I_{R}\left(\phi_{R}^{*}\right)$.
In what follows, we shall show that $\phi_{R}^{*}$ is a positive ground state solution of 1.5). In fact, let $F(u)=\left\langle I_{R}^{\prime}(u), u\right\rangle$. Then we have $F\left(\phi_{R}^{*}\right) \leq F\left(\phi_{R}\right)=0$. We claim that $F\left(\phi_{R}^{*}\right)=0$, otherwise, $F\left(\phi_{R}^{*}\right)<0$. This and Lemma 2.1 show that there exists $t_{\phi_{R}^{*}} \in(0,1)$ such that $t_{\phi_{R}^{*}} \phi_{R}^{*} \in \mathcal{N}_{R}$, and

$$
c_{R} \leq I_{R}\left(t_{\phi_{R}^{*}} \phi_{R}^{*}\right)=\frac{1}{4} \frac{\left\|\phi_{R}^{*}\right\|^{4}}{\mathbb{D}\left(\phi_{R}^{*}\right)}<\frac{1}{4} \frac{\left\|\phi_{R}\right\|^{4}}{\mathbb{D}\left(\phi_{R}\right)}=I_{R}\left(\phi_{R}\right)=c_{R}
$$

This is a contradiction. Thus the claim holds, that is $\phi_{R}^{*} \in \mathcal{N}_{R}$. So $I_{R}\left(\phi_{R}\right) \leq I_{R}\left(\phi_{R}^{*}\right)$. By (3.1), we deduce that $I_{R}\left(\phi_{R}\right)=I_{R}\left(\phi_{R}^{*}\right)=c_{R}$. This combined with (3.2), implies that

$$
\int_{B_{R}} v(x)\left|\phi_{R}^{*}(x)\right|^{2} d x=\int_{B_{R}} u^{*}(x)\left|\phi_{R}^{*}(x)\right|^{2} d x .
$$

Since $v \geq u^{*}$, we conclude that $v=u^{*}$ on $B_{R}$. Thus, by Lemma 3.1, $u=v$ and then $\phi_{R}=\phi_{R}^{*}$, which shows that $\phi_{R}$ is strictly positive, radially symmetric decreasing. The proof is completed.

Therefore, we immediately obtain the following symmetry result.
Theorem 3.1. Assume that $N \geq 3$. Then all the positive ground state solutions of (1.5) are radially symmetric and decreasing.

## 4 Uniqueness

Based on the radial symmetry of the positive ground state solution of (1.5) in Section 3, we shall prove its uniqueness in this section. First, we shall develop the Newton's Theorem by listing the following two lemmas whose proofs are similar as [10, Theorem 9.7] with some necessary modifications.

Lemma 4.1. Let $N \geq 3$ and

$$
J(r, x)=\left|\mathbb{S}^{N-1}\right|^{-1} \int_{\mathbb{S}^{N-1}}|r z-x|^{2-N} d z
$$

with $x \in \mathbb{R}^{N}$. Then $J(r, x)=\min \left\{r^{2-N},|x|^{2-N}\right\}$.
Proof. First we see that $J(r, x)$ is radial with respect to $x$. Define $g(x)=|x|^{2-N}$. Then $g$ is a harmonic function if $x \neq 0$. Note that

$$
J(r, x)=\left|\mathbb{S}_{r,-x}^{N-1}\right|^{-1} \int_{\mathbb{S}_{r,-x}^{N-1}}|y|^{2-N} d y
$$

If $r<|x|$, we see that $|y|^{2-N}$ is a harmonic function in $B_{r,-x}^{N-1}$, where $B_{r,-x}^{N-1}$ is an open ball domain with radius $r>0$ centered at the point $-x$. Thus

$$
\begin{equation*}
J(r, x)=g(-x)=|x|^{2-N} \tag{4.1}
\end{equation*}
$$

If $r>|x|$, we have

$$
\begin{align*}
J(r, x) & =\left|\mathbb{S}^{N-1}\right|^{-1} \int_{\mathbb{S}^{N-1}}\left[\left|\mathbb{S}^{N-1}\right|^{-1} \int_{\mathbb{S}^{N-1}}|r z-x|^{2-N} d z\right] d \xi \\
& =\left|\mathbb{S}^{N-1}\right|^{-1} \int_{\mathbb{S}^{N-1}}\left[\left|\mathbb{S}^{N-1}\right|^{-1} \int_{\mathbb{S}^{N-1}}|r z-|x| \xi|^{2-N} d z\right] d \xi \\
& =\left|\mathbb{S}^{N-1}\right|^{-1} \int_{\mathbb{S}^{N-1}}\left[\left|\mathbb{S}^{N-1}\right|^{-1} \int_{\mathbb{S}^{N-1}}|r z-|x| \xi|^{2-N} d \xi\right] d z  \tag{4.2}\\
& =\left|\mathbb{S}^{N-1}\right|^{-1} \int_{\mathbb{S}^{N-1}} r^{2-N} d z \\
& =r^{2-N} .
\end{align*}
$$

It suffices to prove that when $r=|x|$, the conclusion holds. Indeed, we claim that when $|x|=r$,

$$
\lim _{\tilde{\varepsilon} \rightarrow 0} \int_{\mathbb{S}_{r_{-}^{N-x}}^{N-x} \cap B_{\bar{\varepsilon}}}|y|^{2-N} d y=0
$$

Here $B_{\tilde{\varepsilon}} \subset \mathbb{R}^{N}$ is an open ball domain with radius $\tilde{\varepsilon}>0$ centered at the origin. Indeed, by direct calculations, we can deduce that

$$
\mathbb{S}_{r,-x}^{N-1} \bigcap \partial B_{\varepsilon}=\left\{\frac{\varepsilon^{2}}{2 r^{2}} x+x^{\perp}: x^{\perp} \in(\operatorname{span}\{x\})^{\perp} \text { and }\left|x^{\perp}\right|^{2}=\varepsilon^{2}-\frac{\varepsilon^{4}}{4 r^{2}}\right\},\left(0<\varepsilon<\frac{r}{2}\right)
$$

where $x^{\perp}$ is a orthogonal vector of $x$. Then

$$
\begin{aligned}
\lim _{\tilde{\varepsilon} \rightarrow 0} \int_{\mathbb{S}_{r,-x}^{N-1} \cap B_{\tilde{\varepsilon}}}|y|^{2-N} d y & =\lim _{\tilde{\varepsilon} \rightarrow 0} \int_{0}^{\tilde{\varepsilon}} \frac{1}{|\varepsilon|^{N-2}}\left|\mathbb{S}^{N-2} \| \varepsilon^{2}-\frac{\varepsilon^{4}}{4 r^{2}}\right|^{\frac{N-2}{2}} d \varepsilon \\
& =\lim _{\tilde{\varepsilon} \rightarrow 0} \int_{0}^{\tilde{\varepsilon}}\left|\mathbb{S}^{N-2} \| \frac{4 r^{2}-\varepsilon^{2}}{4 r^{2}}\right|^{\frac{N-2}{2}} d \varepsilon \\
& =0 .
\end{aligned}
$$

So the claim holds and $J(r, x)$ is well defined in $x \in \mathbb{R}^{N}$. Furthermore, $J(r, x)$ is continuous with respect to $x$. So we obtain $J(r, x)=r^{2-N}$. This together with (4.1) and (4.2), yields the proof.

Lemma 4.2. Assume that $\varphi \in H_{0}^{1}\left(B_{R}\right)$ is a positive radial function. Then for any $x \in B_{R}$,

$$
\begin{align*}
V_{\varphi}(x) & :=\int_{B_{R}} \frac{|\varphi(y)|^{2}}{|y-x|^{N-2}} d y-\int_{B_{R}} \frac{|\varphi(y)|^{2}}{\left|\frac{|y|}{R} x-\frac{R}{|y|} y\right|^{N-2}} d y  \tag{4.3}\\
& =\int_{|y| \leq|x|}\left(|x|^{2-N}-|y|^{2-N}\right)|\varphi(y)|^{2} d y+\int_{B_{R}}|y|^{2-N}|\varphi(y)|^{2} d y-R^{2-N} \int_{B_{R}}|\varphi(y)|^{2} d y .
\end{align*}
$$

Proof. Let

$$
P(x):=\int_{B_{R}} \frac{|\varphi(y)|^{2}}{|y-x|^{N-2}} d y, \text { for all } x \in B_{R} .
$$

Then $p$ is a radial function, that is, $P(x)=P(|x| z)$ for all $z \in \mathbb{S}^{N-1}$. By using Lemma 4.1, we have

$$
\begin{align*}
P(x) & =\left|\mathbb{S}^{N-1}\right|^{-1} \int_{\mathbb{S}^{N-1}} P(x) d z \\
& =\left|\mathbb{S}^{N-1}\right|^{-1} \int_{\mathbb{S}^{N-1}} P(|x| z) d z \\
& =\left|\mathbb{S}^{N-1}\right|^{-1} \int_{\mathbb{S}^{N-1}}\left[\int_{B_{R}} \frac{|\varphi(y)|^{2}}{|y-|x| z|^{N-2}} d y\right] d z  \tag{4.4}\\
& =\int_{B_{R}}\left[\left|\mathbb{S}^{N-1}\right|^{-1} \int_{\mathbb{S}^{N-1}}| | x|z-y|^{2-N} d z\right]|\varphi(y)|^{2} d y \\
& =|x|^{2-N} \int_{|y \leq|x|}|\varphi(y)|^{2} d y+\int_{|y|>|x|}|y|^{2-N}|\varphi(y)|^{2} d y \\
& =\int_{|y| \leq|x|}\left(|x|^{2-N}-|y|^{2-N}\right)|\varphi(y)|^{2} d y+\int_{B_{R}}|y|^{2-N}|\varphi(y)|^{2} d y
\end{align*}
$$

Observe that

$$
\begin{equation*}
W(x):=\int_{B_{R}} \frac{|\varphi(y)|^{2}}{\left|\frac{y y}{R} x-\frac{R}{|y|} y\right|^{N-2}} d y=\int_{B_{R}} \frac{\left(\frac{R}{|y|}\right)^{N-2}|\varphi(y)|^{2}}{\left|x-\frac{R^{2}}{|y|^{2}} y\right|^{N-2}} d y \text {, for all } x \in B_{R} . \tag{4.5}
\end{equation*}
$$

Clearly, $W(x)$ is radial in $B_{R}$ and $W(x)=W(|x| z)$ with $z \in \mathbb{S}^{N-1}$. Then

$$
\begin{align*}
W(x) & =\left|\mathbb{S}^{N-1}\right|^{-1} \int_{\mathbb{S}^{N-1}} W(|x| z) d z \\
& =\left|\mathbb{S}^{N-1}\right|^{-1} \int_{\mathbb{S}^{N-1}}\left[\int_{B_{R}} \frac{\left(\frac{R}{|y|}\right)^{N-2}|\varphi(y)|^{2}}{| | x\left|z-\frac{R^{2}}{|y|} y\right|^{N-2}} d y\right] d z  \tag{4.6}\\
& =\int_{B_{R}}\left[\left|\mathbb{S}^{N-1}\right|^{-1} \int_{\mathbb{S}^{N-1}} \frac{\left(\frac{R}{|y|}\right)^{N-2}|\varphi(y)|^{2}}{| | x\left|z-\frac{R^{2}}{|y|^{2}} y\right|^{N-2}} d z\right] d y .
\end{align*}
$$

According to Lemma 4.1 again, we may conclude that

$$
\left|\mathbb{S}^{N-1}\right|^{-1} \int_{\mathbb{S}^{N-1}}| | x\left|z-\frac{R^{2}}{|y|^{2}} y\right|^{2-N} d z=\left\{\begin{array}{l}
\left(\frac{R^{2}}{|y|}\right)^{2-N}, \text { if }|y| \leq \frac{R^{2}}{|x|}, \\
|x|^{2-N}, \text { if }|y|>\frac{R^{2}}{|x|} .
\end{array}\right.
$$

This combined with (4.6), yields that for any $x \in B_{R}$, there holds that $|y| \leq \frac{R^{2}}{|x|}$. Hence,

$$
\begin{align*}
W(x) & =\int_{|x| \leq \frac{R^{2}}{\mid y 2^{2}}|y|}\left(\frac{R^{2}}{|y|^{2}}|y|\right)^{2-N}\left(\frac{R}{|y|}\right)^{N-2}|\varphi(y)|^{2} d y+\int_{|x|>\frac{R^{2}}{\mid x 2^{2}}|y|}|x|^{2-N}\left(\frac{R}{|y|}\right)^{N-2}|\varphi(y)|^{2} d y \\
& =\int_{|x| \leq \frac{R^{2}}{W \mid}}\left(\frac{R^{2}}{|y|}\right)^{2-N}\left(\frac{R}{|y|}\right)^{N-2}|\varphi(y)|^{2} d y+\int_{|x|>\frac{R^{2}}{|y|}}|x|^{2-N}\left(\frac{R}{|y|}\right)^{N-2}|\varphi(y)|^{2} d y  \tag{4.7}\\
& =R^{2-N} \int_{B_{R}}|\varphi(y)|^{2} d y .
\end{align*}
$$

Thus the conclusion follows from (4.4) and (4.7).
In the sequel, we always assume that $\varphi \in C^{2}\left(B_{R}\right) \bigcap H_{0}^{1}\left(B_{R}\right)$ is a positive radial solution of (1.5). Let

$$
\begin{equation*}
U_{\varphi}(x):=\int_{|y| \leq x \mid}\left(|y|^{2-N}-|x|^{2-N}\right)|\varphi(y)|^{2} d y, \text { for all } x \in B_{R} . \tag{4.8}
\end{equation*}
$$

By applying Lemma 4.2, the nonlocal problem (1.5) becomes

$$
\begin{equation*}
\left(-\Delta+U_{\varphi}(x)\right) \varphi(x)=\left(\int_{B_{R}}|y|^{2-N}|\varphi(y)|^{2} d y-R^{2-N} \int_{B_{R}}|\varphi(y)|^{2} d y-1\right) \varphi(x) . \tag{4.9}
\end{equation*}
$$

We denote by

$$
\begin{align*}
\lambda(\varphi) & =\int_{B_{R}}|y|^{2-N}|\varphi(y)|^{2} d y-R^{2-N} \int_{B_{R}}|\varphi(y)|^{2} d y-1 \\
& =\int_{0}^{R}\left|\mathbb{S}^{N-1}\right| s|\varphi(s)|^{2} d s-R^{2-N} \int_{B_{R}}|\varphi(y)|^{2} d y-1 . \tag{4.10}
\end{align*}
$$

Clearly, $\lambda(\varphi) \in(0, \infty)$ follows from (4.8) and (4.9). Furthermore, we have
Lemma 4.3. $U_{\varphi}(x)$ is radially symmetric and bounded.

Proof. By (4.8) and the radial symmetry of $\varphi$, we have

$$
U_{\varphi}(x)=\int_{0}^{r}\left|\mathbb{S}^{N-1}\right| s^{N-1}\left(s^{2-N}-r^{2-N}\right)|\varphi(s)|^{2} d s
$$

This yields the proof.
Let $R^{*}:=\sqrt{\lambda(\varphi)} R$. The following lemma illustrates that every radial solution of 4.9) can obey the following canonical form

$$
\begin{equation*}
\left(-\Delta+U_{\phi}(x)\right) \phi(x)=\phi(x), \phi \in H_{0}^{1}\left(B_{R^{*}}\right) \tag{4.11}
\end{equation*}
$$

after a suitable scaling. This is critical in the proof of the uniqueness of positive radial solutions of (1.5).

Lemma 4.4. Let $\varphi_{\lambda}(x)=\frac{1}{\lambda} \varphi\left(\frac{x}{\sqrt{\lambda}}\right)$ with $\lambda=\lambda(\varphi)$. Then $\varphi_{\lambda}(x)$ satisfies 4.11).
Proof. Notice that $\varphi(x)=\lambda \varphi_{\lambda}(\sqrt{\lambda} x)$. Then

$$
-\lambda^{2} \Delta \varphi_{\lambda}(z)+\left(\int_{\left|z_{1}\right| \leq|z|} \lambda^{3} \lambda^{\frac{N-2}{2}}\left(\left|z_{1}\right|^{2-N}-|z|^{2-N}\right)\left|\varphi_{\lambda}\left(z_{1}\right)\right|^{2} \lambda^{\frac{-N}{2}} d z_{1}\right) \varphi_{\lambda}(z)=\lambda^{2} \varphi_{\lambda}(z)
$$

where $z=\sqrt{\lambda} x$. Therefore,

$$
\left(-\Delta+U_{\varphi_{\lambda}}(z)\right) \varphi_{\lambda}(z)=\varphi_{\lambda}(z) .
$$

This completes our proof.
In the following part, we shall first investigate the uniqueness of positive radial solutions of (4.11), which yields that the uniqueness of positive radial solutions of (1.5) due to Lemma 4.4. Assume that $\phi \in C^{2}\left(B_{R^{*}}\right) \bigcap H_{0}^{1}\left(B_{R^{*}}\right)$ is a positive radial solution of (4.11).

Define a new functional $A_{\phi}: H_{0}^{1}\left(B_{R^{*}}\right) \rightarrow \mathbb{R}$ by

$$
\begin{equation*}
A_{\phi}(\psi)=\int_{B_{R^{*}}}|\nabla \psi(x)|^{2} d x+\int_{B_{R^{*}}} U_{\phi}(x)|\psi(x)|^{2} d x \tag{4.12}
\end{equation*}
$$

We shall consider the following minimizing problem

$$
\Gamma_{\phi}=\inf \left\{A_{\phi}(\psi) \mid \psi \in H_{0}^{1}\left(B_{R^{*}}\right),\|\psi\|_{L^{2}\left(B_{R^{*}}\right)}=1\right\}
$$

Then we have the following lemma.
Lemma 4.5. $\Gamma_{\phi}$ can be achieved by a nonnegative radial function $\hat{\psi} \in H_{0}^{1}\left(B_{R^{*}}\right)$ and $\Gamma_{\phi}=1$.

Proof. It is easy to see that $\Gamma_{\phi} \geq 0$. For any fixed $\psi \in H_{0}^{1}\left(B_{R^{*}}\right)$, we denote the symmetric decreasing rearrangement of $\psi$ by $\psi^{*}$. In view of Lemma 4.3. we assume that $U_{\phi}^{\infty}:=\lim _{|x| \rightarrow R} U_{\phi}(x)$. Then by using symmetric rearrangement inequalities(see [9]), there holds that $\|\nabla \psi\|_{L^{2}\left(B_{R^{*}}\right)} \geq\left\|\nabla \psi^{*}\right\|_{L^{2}\left(B_{R^{*}}\right)},\|\psi\|_{L^{2}\left(B_{R^{*}}\right)}=$ $\left\|\psi^{*}\right\|_{L^{2}\left(B_{R^{*}}\right)}$ and

$$
\begin{align*}
\int_{B_{R^{*}}} U_{\phi}(x)|\psi(x)|^{2} d x & =\int_{B_{R^{*}}} U_{\phi}^{\infty}|\psi(x)|^{2} d x-\int_{B_{R^{*}}}\left(U_{\phi}^{\infty}-U_{\phi}(x)\right)|\psi(x)|^{2} d x  \tag{4.13}\\
& \geq \int_{B_{R^{*}}} U_{\phi}(x)\left|\psi^{*}(x)\right|^{2} d x
\end{align*}
$$

From the above, we can assume that there exists a sequence of nonnegative radially symmetric decreasing functions $\left\{\psi_{n}\right\}_{n \geq 1}$ satisfying $A_{\phi}\left(\psi_{n}\right) \rightarrow \Gamma_{\phi}$ and $\left\|\psi_{n}\right\|_{L^{2}\left(B_{R^{*}}\right)}=1$. Since $\left\|\nabla \psi_{n}\right\|_{L^{2}\left(B_{R^{*}}\right)}$ is bounded, up to a subsequence, there exists a nonnegative radial symmetric decreasing function $\hat{\psi} \in H_{0}^{1}\left(B_{R^{*}}\right)$ such that $\psi_{n} \rightharpoonup \hat{\psi}$ weakly in $H_{0}^{1}\left(B_{R^{*}}\right)$ and $\psi_{n} \rightarrow \hat{\psi}$ strongly in $L^{2}\left(B_{R^{*}}\right)$. Thus $\|\hat{\psi}\|_{L^{2}\left(B_{R^{*}}\right)}=1$. Moreover, by weak lower semicontinuity of the norm and Fatou's Lemma, we have $\liminf _{n \rightarrow \infty}\left\|\nabla \psi_{n}\right\|_{2} \geq\|\nabla \hat{\psi}\|_{2}$ and

$$
\liminf _{n \rightarrow \infty} \int_{B_{R^{*}}} U_{\phi}(x)\left|\psi_{n}(x)\right|^{2} d x \geq \int_{B_{R^{*}}} U_{\phi}(x)|\hat{\psi}(x)|^{2} d x
$$

which shows that $A_{\phi}(\hat{\psi}) \leq \Gamma_{\phi}$. This combined with the fact that $\|\hat{\psi}\|_{L^{2}\left(B_{R^{*}}\right)}=1$, implies that $\Gamma_{\phi}$ can be achieved by $\hat{\psi}$.

Next, it suffices to prove $\Gamma_{\phi}=1$. By using Lagrange multiplier principle, there exists a real number $\theta$ such that

$$
\begin{equation*}
\left(-\Delta+U_{\phi}(x)\right) \hat{\psi}=\theta \hat{\psi} \tag{4.14}
\end{equation*}
$$

It is easy to check that $\theta=\Gamma_{\phi}$. Multiplying (4.11) and (4.14) by $\hat{\psi}$ and $\phi$, respectively, and integrating by part, we deduce that $\Gamma_{\phi}=1$. This completes our proof.

In similar spirit of [17, Lemma 3.3], we obtain the following lemma.
Lemma 4.6. The positive radial solution of (4.11) is unique.
Proof. We shall argue it by contradiction. Let $\phi_{1}$ and $\phi_{2} \in C^{2}\left(B_{R^{*}}\right) \bigcap H_{0}^{1}\left(B_{R^{*}}\right)$ be two different positive radial solutions of (4.11). Then $A_{\phi_{i}}\left(\phi_{i}\right)=\left\|\phi_{i}\right\|_{2}^{2}$, and $\phi_{i}$ satisfies the following ordinary differential equation with second order

$$
\begin{equation*}
\phi^{\prime \prime}(r)+\frac{N-1}{r} \phi^{\prime}(r)=\left(U_{\phi}(r)-1\right) \phi(r), \tag{4.15}
\end{equation*}
$$

where $i=1,2$. Set $\psi:=\phi_{1}-\phi_{2} \not \equiv 0$. Then $\psi$ is also a radial function. There are three cases to occur.
Case 1. Either $\psi(r) \geq 0$ for all $r \in\left[0, R^{*}\right)$ or $\psi(r) \leq 0$ for all $r \in\left[0, R^{*}\right)$.
Without loss of generality, we assume $\psi(r) \geq 0$ for all $r \in\left[0, R^{*}\right)$. For any $\varphi \in H_{0}^{1}\left(B_{R^{*}}\right)$, there holds

$$
\begin{equation*}
A_{\phi}(\varphi) \geq\|\varphi\|_{L^{2}\left(B_{R^{*}}\right)}^{2} \tag{4.16}
\end{equation*}
$$

due to Lemma 4.5. This combine with Lemma 4.3, yields that

$$
\left\|\phi_{1}\right\|_{L^{2}\left(B_{R^{*}}\right)}^{2} \leq A_{\phi_{2}}\left(\phi_{1}\right)=A_{\phi_{1}}\left(\phi_{1}\right)+\int_{B_{R}}\left(U_{\phi_{2}}-U_{\phi_{1}}\right)\left|\phi_{1}(x)\right|^{2}<\left\|\phi_{1}\right\|_{L^{2}\left(B_{R^{*}}\right)}^{2},
$$

a contradiction. This case will not happen.
Case 2. There is $R_{1} \in\left(0, R^{*}\right)$ such that $\psi\left(R_{1}\right)=0$, and either $\psi \supsetneqq 0$ in $\left[0, R_{1}\right]$ or $\psi \supsetneqq 0$ in $\left[0, R_{1}\right]$. Without loss of generality, we assume $\psi\left(R_{1}\right)=0$ and $\psi \supsetneqq 0$ in [ $0, R_{1}$ ]. Define

$$
\tilde{\psi}(x)=\left\{\begin{array}{l}
\psi(x),|x| \leq R_{1}, \\
0,|x| \in\left(R_{1}, R^{*}\right) .
\end{array}\right.
$$

Since $\phi_{1}$ and $\phi_{2}$ satisfy (4.11), then

$$
\left[-\Delta+\frac{1}{2}\left(U_{\phi_{1}}+U_{\phi_{2}}\right)\right] \tilde{\psi}=\tilde{\psi}-\frac{U_{\phi_{1}}-U_{\phi_{2}}}{2}\left(\phi_{1}+\phi_{2}\right),|x| \leq R_{1} .
$$

Multiplying this by $\tilde{\psi}$ and integrating by part, we have

$$
\frac{1}{2} A_{\phi_{1}}(\tilde{\psi})+\frac{1}{2} A_{\phi_{2}}(\tilde{\psi})=\|\tilde{\psi}\|_{2}^{2}-\int_{B_{R^{*}}} \frac{U_{\phi_{1}}-U_{\phi_{2}}}{2}\left(\phi_{1}+\phi_{2}\right) \tilde{\psi} d x<\|\tilde{\psi}\|_{2}^{2},
$$

which leads to a contradiction with 4.15). This case does not hold.
Case 3. There exists $R_{2} \in\left[0, R^{*}\right)$ such that $\psi \equiv 0$ in $\left[0, R_{2}\right]$, and for any $\varepsilon>0, \psi$ changes sign in $\left(R_{2}, R_{2}+\varepsilon\right)$.

Notice that $\phi_{1}\left(R_{2}\right)=\phi_{2}\left(R_{2}\right), \phi_{1}^{\prime}\left(R_{2}\right)=\phi_{2}^{\prime}\left(R_{2}\right)$. Applying the variation of constants formula to (4.15), we obtain

$$
\begin{equation*}
\phi_{1}(r)-\phi_{2}(r)=T\left(r, \phi_{1}\right)-T\left(r, \phi_{2}\right) \tag{4.17}
\end{equation*}
$$

where

$$
\begin{equation*}
T\left(r, \phi_{i}\right)=\int_{R_{2}}^{r} \frac{s}{N-2}\left(U_{\phi_{i}}(s)-1\right) \phi_{i}(s) d s+\frac{\int_{R_{2}}^{r} \frac{s}{}_{N-2}^{N-2}\left(1-U_{\phi_{i}}(s)\right) \phi_{i}(s) d s}{r^{N-2}} \tag{4.18}
\end{equation*}
$$

with $i=1,2$. For any $r \in\left(R_{2}, R_{2}+\varepsilon\right)$, we obtain the following two estimates.

$$
\begin{align*}
U_{\phi_{i}}(r) & =\int_{0}^{r}\left|\mathbb{S}^{N-1}\right| s^{N-1}\left(s^{2-N}-r^{2-N}\right)\left|\phi_{i}(s)\right|^{2} d s  \tag{4.19}\\
& \leq C r^{2},
\end{align*}
$$

and

$$
\begin{align*}
\left|U_{\phi_{1}}(r)-U_{\phi_{2}}(r)\right| & \leq \int_{0}^{r}\left|\mathbb{S}^{N-1}\right| s^{N-1}\left(s^{2-N}-r^{2-N}\right)\left|\phi_{1}(s)-\phi_{2}(s) \| \phi_{1}(s)+\phi_{2}(s)\right| d s \\
& =\int_{R_{2}}^{r}\left|\mathbb{S}^{N-1}\right| s^{N-1}\left(s^{2-N}-r^{2-N}\right)\left|\phi_{1}(s)-\phi_{2}(s) \| \phi_{1}(s)+\phi_{2}(s)\right| d s  \tag{4.20}\\
& \leq C \sup _{s \in\left(R_{2}, R_{2}+\varepsilon\right)}\left|\phi_{1}(s)-\phi_{2}(s)\right| r^{2} .
\end{align*}
$$

Then for any $r \in\left(R_{2}, R_{2}+\varepsilon\right)$ with $\varepsilon$ sufficiently small, we conclude from (4.18), (4.19) and (4.20) that there exists $0<C_{\varepsilon}<\frac{1}{2}$ small enough such that

$$
\begin{align*}
\left|\phi_{1}(r)-\phi_{2}(r)\right| & \leq\left|\int_{R_{2}}^{r} \frac{s}{N-2}\left[U_{\phi_{1}}(s)\left(\phi_{1}(s)-\phi_{2}(s)\right)+\left(U_{\phi_{1}}(s)-U_{\phi_{2}}(s)\right) \phi_{2}(s)+\left(\phi_{2}(s)-\phi_{1}(s)\right)\right] d s\right| \\
& +\frac{1}{r^{N-2}}\left|\int_{R_{2}}^{r} \frac{s^{N-1}}{N-2}\left[\left(\phi_{1}(s)-\phi_{2}(s)\right)+U_{\phi_{2}}(s)\left(\phi_{2}(s)-\phi_{1}(s)\right)+\left(U_{\phi_{2}}(s)-U_{\phi_{1}}(s)\right) \phi_{1}(s)\right] d s\right| \\
& \leq C_{\varepsilon} \sup _{s \in\left(R_{2}, R_{2}+\varepsilon\right)}\left|\phi_{1}(s)-\phi_{2}(s)\right| \tag{4.21}
\end{align*}
$$

This implies a contradiction with $\psi \not \equiv 0$ in $r \in\left(R_{2}, R_{2}+\varepsilon\right)$. This case is not true.
From the above arguments, we have $\phi_{1} \equiv \phi_{2}$. The proof is completed.
Now we are ready to prove the uniqueness of positive ground state solutions of (1.5).
Theorem 4.1. Assume that $N=3,4,5,6$. Then the positive ground state solution of (1.5) is uniquely determined.

Proof. We shall argue by contradiction. Suppose on the contrary that $\varphi_{1}$ and $\varphi_{2} \in H_{0}^{1}\left(B_{R}\right) \cap C^{2}\left(B_{R}\right)$ are two distinct positive ground state solutions of (1.5). In view of (4.9) and (4.10), we shall finish the proof by distinguishing two cases: $\lambda\left(\varphi_{1}\right)=\lambda\left(\varphi_{2}\right)$ (the first case) $\lambda\left(\varphi_{1}\right) \neq \lambda\left(\varphi_{2}\right)$ (the second case).

The first Case. Since $\lambda\left(\varphi_{1}\right)=\lambda\left(\varphi_{2}\right)$, by applying Lemma 4.4, there exist two distinct positive radial solutions $\phi_{1}$ and $\phi_{2} \in H_{0}^{1}\left(B_{\sqrt{\lambda\left(\varphi_{1}\right) R}}\right) \cap C^{2}\left(B_{\sqrt{\lambda\left(\varphi_{1}\right) R}}\right)$ of (4.11). This implies a contradiction with Lemma 4.6. The first case will not happen.

The second Case. Note that $\lambda\left(\varphi_{1}\right) \neq \lambda\left(\varphi_{2}\right)$. Without loss of generality, we assume that $\lambda\left(\varphi_{1}\right)>$ $\lambda\left(\varphi_{2}\right)$. Let $\tilde{\lambda}=\frac{\lambda\left(\varphi_{1}\right)}{\lambda\left(\varphi_{2}\right)}$ and $\tilde{\varphi}_{2}(x)=\frac{1}{\lambda} \varphi_{2}\left(\frac{x}{\sqrt{\lambda}}\right)$ with $x \in B_{\sqrt{\lambda} R}$. Then a direct calculation yields that $\tilde{\varphi}_{2}$ satisfies the following equation

$$
\begin{equation*}
\left(-\Delta+U_{\tilde{\varphi}_{2}}\right) \tilde{\varphi}_{2}(x)=\lambda\left(\varphi_{1}\right) \tilde{\varphi}_{2}(x), x \in B_{\sqrt{\lambda} R} \tag{4.22}
\end{equation*}
$$

This together with 4.9), shows that both $\varphi_{1}$ and $\tilde{\varphi}_{2}$ satisfy

$$
\begin{equation*}
\left(-\Delta+U_{\varphi}\right) \varphi(x)=\lambda\left(\varphi_{1}\right) \varphi(x), x \in B_{R} \tag{4.23}
\end{equation*}
$$

i.e.

$$
\begin{equation*}
\varphi^{\prime \prime}(r)+\frac{N-1}{r} \varphi^{\prime}(r)=\left(U_{\varphi}(r)-\lambda\left(\varphi_{1}\right)\right) \varphi(r) \tag{4.24}
\end{equation*}
$$

Note that $\varphi_{1}^{\prime}(0)=\tilde{\varphi}_{2}^{\prime}(0)=0$. If $\varphi_{1}(0)>\tilde{\varphi}_{2}(0)$, by integrating 4.24, we obtain

$$
\int_{0}^{r}\left[s^{N-1} \varphi_{1}^{\prime \prime}(s) \tilde{\varphi}_{2}(s)+(N-1) s^{N-2} \varphi_{1}^{\prime}(s) \tilde{\varphi}_{2}(s)\right] d s=\int_{0}^{r} s^{N-1}\left(U_{\varphi_{1}}(s)-\lambda\left(\varphi_{1}\right)\right) \varphi_{1}(s) \tilde{\varphi}_{2}(s) d s
$$

So using the fact $\varphi_{1}^{\prime}(0)=\tilde{\varphi}_{2}^{\prime}(0)=0$, there holds that

$$
r^{N-1} \varphi_{1}^{\prime}(r) \tilde{\varphi}_{2}(r)-\int_{0}^{r} s^{N-1} \varphi_{1}^{\prime}(s) \tilde{\varphi}_{2}^{\prime}(s) d s=\int_{0}^{r} s^{N-1}\left(U_{\varphi_{1}}(s)-\lambda\left(\varphi_{1}\right)\right) \varphi_{1}(s) \tilde{\varphi}_{2}(s) d s
$$

Similar arguments can lead to

$$
r^{N-1} \tilde{\varphi}_{2}^{\prime}(r) \varphi_{1}(r) \int_{0}^{r} s^{N-1} \varphi_{1}^{\prime}(s) \tilde{\varphi}_{2}^{\prime}(s) d s=\int_{0}^{r} s^{N-1}\left(U_{\tilde{\varphi}_{2}}(s)-\lambda\left(\varphi_{1}\right)\right) \varphi_{1}(s) \tilde{\varphi}_{2}(s) d s
$$

Thus

$$
\begin{equation*}
\left(\frac{\varphi_{1}(r)}{\tilde{\varphi}_{2}(r)}\right)^{\prime}=\frac{1}{r^{N-1} \tilde{\varphi}_{2}^{2}(r)} \int_{0}^{r} s^{N-1}\left(U_{\varphi_{1}}(s)-U_{\tilde{\varphi}_{2}}(s)\right) \varphi_{1}(s) \tilde{\varphi}_{2}(s) d s \tag{4.25}
\end{equation*}
$$

Since $\varphi_{1}(0)>\tilde{\varphi}_{2}(0)$, this implies that $\varphi_{1}(r)>\tilde{\varphi}_{2}(r)$ on $[0, t)$ with small $t>0$. Notice that $\left(\frac{\varphi_{1}(r)}{\tilde{\varphi}_{2}(r)}\right)^{\prime}>0$ on $[0, t)$, which can yields that $\varphi_{1}(r)>\tilde{\varphi}_{2}(r)$ on $B_{R}$. This leads to a contradiction with the definition of $\tilde{\varphi}_{2}$.

If $\varphi_{1}(0)<\tilde{\varphi}_{2}(0)$, by using (4.25), we obtain $\varphi_{1}(r)<\tilde{\varphi}_{2}(r)$ on $B_{R}$. Since $\varphi_{1}$ and $\varphi_{2}$ are two positive ground state solutions of (4.9), so

$$
\begin{equation*}
I_{R}\left(\varphi_{1}\right)=\frac{1}{4} \int_{B_{R}} \int_{B_{R}} G(x, y)\left|\varphi_{1}(y)\right|^{2}\left|\varphi_{1}(x)\right|^{2} d x d y=\frac{1}{4} \int_{B_{R}} \int_{B_{R}} G(x, y)\left|\varphi_{2}(y)\right|^{2}\left|\varphi_{2}(x)\right|^{2} d x d y=I_{R}\left(\varphi_{2}\right) \tag{4.26}
\end{equation*}
$$

According to Lemma 4.2, since $\tilde{\lambda}>1$, we conclude that when $N=3,4,5,6$, there holds

$$
\begin{align*}
& \int_{B_{R}} \int_{B_{R}} G(x, y)\left|\varphi_{1}(y)\right|^{2}\left|\varphi_{1}(x)\right|^{2} d x d y \\
& <\int_{B_{R}}^{B_{B_{R}}} \int_{B_{R}} G(x, y)\left|\tilde{\varphi}_{2}(y)\right|^{2}\left|\tilde{\varphi}_{2}(x)\right|^{2} d x d y \\
& =\int_{B_{R}}^{B_{R}} \int_{B_{R}}^{B_{R}} \frac{\left|\tilde{\varphi}_{2}(y)\right|^{2}\left|\tilde{\varphi}_{2}(x)\right|^{2}}{|y-x|^{N-2}} d x d y-R^{2-N} \int_{B_{R}} \int_{B_{R}}\left|\tilde{\varphi}_{2}(y)\right|^{2}\left|\tilde{\varphi}_{2}(x)\right|^{2} d x d y \\
& =\tilde{\lambda}^{\frac{N}{2}-3} \int_{B_{\frac{R}{\sqrt{\lambda}}}} \int_{B_{\frac{R}{\sqrt{\lambda}}}} \frac{\left|\varphi_{2}(y)\right|^{2}\left|\varphi_{2}(x)\right|^{2}}{|y-x|^{N-2}} d x d y-\tilde{\lambda}^{N-4} R^{2-N} \int_{B_{\frac{R}{\sqrt{\lambda}}}} \int_{B_{\frac{R}{\sqrt{\lambda}}}}\left|\varphi_{2}(y)\right|^{2}\left|\varphi_{2}(x)\right|^{2} d x d y  \tag{4.27}\\
& =\int_{B_{\frac{R}{\sqrt{\lambda}}}^{\sqrt{\lambda}}} \int_{B_{\frac{R}{\sqrt{\lambda}}}} \frac{\left|\varphi_{2}(y)\right|^{2}\left|\varphi_{2}(x)\right|^{2}}{|y-x|^{N-2}} d x d y-R^{2-N} \int_{B_{\frac{R}{\sqrt{\lambda}}}} \int_{B_{\frac{R}{\sqrt{\lambda}}}}\left|\varphi_{2}(y)\right|^{2}\left|\varphi_{2}(x)\right|^{2} d x d y \\
& <\int_{B_{R}}^{\sqrt{\lambda}} \int_{B_{R}}^{\sqrt{\lambda}} G(x, y)\left|\varphi_{2}(y)\right|^{2}\left|\varphi_{2}(x)\right|^{2} d x d y .
\end{align*}
$$

This implies a contradiction with (4.26).
If $\varphi_{1}(0)=\tilde{\varphi}_{2}(0)$, by applying similar arguments as Case 3 in Lemma 4.6, we deduce from (4.24) that there exists $\delta_{1}>0$ small enough and $0<C_{\delta_{1}}<\frac{1}{2}$ such that

$$
\begin{align*}
\left|\varphi_{1}(r)-\tilde{\varphi}_{2}(r)\right| & \leq\left|\int_{0}^{r} \frac{s}{N-2}\left[U_{\varphi_{1}}(s)\left(\varphi_{1}(s)-\tilde{\varphi}_{2}(s)\right)+\left(U_{\varphi_{1}}(s)-U_{\tilde{\varphi}_{2}}(s)\right) \tilde{\varphi}_{2}(s)+\lambda\left(\varphi_{1}\right)\left(\tilde{\varphi}_{2}(s)-\varphi_{1}(s)\right)\right] d s\right| \\
& +\frac{1}{r^{N-2}}\left|\int_{0}^{r} \frac{s^{N-1}}{N-2}\left[\lambda\left(\varphi_{1}\right)\left(\varphi_{1}(s)-\tilde{\varphi}_{2}(s)\right)+U_{\tilde{\varphi}_{2}}(s)\left(\tilde{\varphi}_{2}(s)-\varphi_{1}(s)\right)+\left(U_{\tilde{\varphi}_{2}}(s)-U_{\varphi_{1}}(s)\right) \varphi_{1}(s)\right] d s\right| \\
& \leq C_{\delta_{1}} \sup _{s \in\left(0,0+\delta_{1}\right)}\left|\varphi_{1}(s)-\tilde{\varphi}_{2}(s)\right| . \tag{4.28}
\end{align*}
$$

Thus, $\varphi_{1}(r)=\tilde{\varphi}_{2}(r)$ on $\left[0, \delta_{1}\right]$. By applying the iteration arguments with starting point $\delta_{1}$, we can finally obtain that that $\varphi_{1}(r)=\tilde{\varphi}_{2}(r)$ on $B_{R}$. This implies a contradiction with the definition of $\tilde{\varphi}_{2}$. From the above arguments, we see that the second case is not valid.

Therefore, we complete the proof.

## 5 Convergence

In this section, we shall show the convergence of the unique positive ground state solution $\phi_{R}$ of (1.5) as $R \rightarrow \infty$.

First, consider the following Choquard equation in full space $\mathbb{R}^{N}$

$$
\begin{equation*}
-\Delta u+u=\left(\int_{\mathbb{R}^{N}} \frac{\left|u^{2}(y)\right|}{|x-y|^{N-2}} d y\right) u, \quad x \in \mathbb{R}^{N} . \tag{5.1}
\end{equation*}
$$

The corresponding energy functional $I_{\infty}: H^{1}\left(\mathbb{R}^{N}\right) \rightarrow \mathbb{R}$ associated to (5.1) is

$$
\begin{equation*}
I_{\infty}(u)=\frac{1}{2} \int_{\mathbb{R}^{N}}\left(|\nabla u|^{2}+|u|^{2}\right) d x-\frac{1}{4} \int_{\mathbb{R}^{N}} \int_{\mathbb{R}^{N}} \frac{|u(y)|^{2}|u(x)|^{2}}{|x-y|^{N-2}} d x d y, \tag{5.2}
\end{equation*}
$$

Let $\mathcal{N}_{\infty}=\left\{u \in H^{1}\left(\mathbb{R}^{N}\right) \backslash\{0\}:\left\langle I_{\infty}^{\prime}(u), u\right\rangle=0\right\}$ and $c_{\infty}=\inf _{u \in \mathcal{N}_{\infty}} I_{\infty}(u)$. As we know, $c_{\infty}$ can be achieved by a unique positive radial solution $\phi_{\infty}$ of (5.2) (see [17]). Notice that $c_{R}=I_{R}\left(\phi_{R}\right)$. Then we have the following lemma.

Proposition 5.1. There holds $\lim _{R \rightarrow \infty} c_{R}=c_{\infty}$.
Proof. We first prove that $c_{R} \geq c_{\infty}$. Indeed, by similar arguments as in Lemma 2.1, there exists a unique $t_{R}>0$ such that $t_{R} \phi_{R} \in \mathcal{N}_{\infty}$. Since $\left\langle I_{R}^{\prime}\left(\phi_{R}\right), \phi_{R}\right\rangle=0$, we see that $\left\langle I_{\infty}^{\prime}\left(\phi_{R}\right), \phi_{R}\right\rangle<0$, which implies that $t_{R} \in(0,1)$. Hence

$$
c_{\infty} \leq I_{\infty}\left(t_{R} \phi_{R}\right)=\frac{1}{4} t_{R}^{2}\left\|\phi_{R}\right\|^{2} \leq \frac{1}{4}\left\|\phi_{R}\right\|^{2}=I_{R}\left(\phi_{R}\right)=c_{R} .
$$

On the other hand, we show $\lim _{R \rightarrow \infty} c_{R} \leq c_{\infty}$. Let $\eta_{R} \in C^{\infty}\left(\mathbb{R}^{N}\right)$ be a radial function such that $\eta_{R}=1$ in $B_{\frac{R}{2}}, \eta_{R} \in(0,1)$ in $B_{R} \backslash B_{\frac{R}{2}}, \eta_{R}=0$ in $\mathbb{R}^{N} \backslash B_{R}$ and $\left|\nabla \eta_{R}\right| \leq \frac{2}{R}$. Define $\Psi_{R}=\eta_{R} \phi_{\infty}$. In fact, by standard arguments, we can deduce that $\Psi_{R} \rightarrow \phi_{\infty}$ in $H^{1}\left(\mathbb{R}^{N}\right)$ as $R \rightarrow \infty$. In addition, by using Lemma 4.2,

$$
\begin{align*}
\lim _{R \rightarrow \infty} \int_{B_{R}} \int_{B_{R}} G(x, y)\left|\Psi_{R}(y)\right|^{2}\left|\Psi_{R}(x)\right|^{2} d x d y & =\lim _{R \rightarrow \infty}\left[\int_{B_{R}} \int_{B_{R}}|x-y|^{2-N}\left|\Psi_{R}(y)\right|^{2}\left|\Psi_{R}(x)\right|^{2} d x d y+R^{2-N}| | \Psi_{R} \|_{L^{2}}^{4}\right] \\
& =\int_{\mathbb{R}^{N}} \int_{\mathbb{R}^{N}}|x-y|^{2-N}\left|\phi_{\infty}(y)\right|^{2}\left|\phi_{\infty}(x)\right|^{2} d x d y:=\mathbb{E}\left(\phi_{\infty}\right) . \tag{5.3}
\end{align*}
$$

Then $\lim _{R \rightarrow \infty} I_{R}\left(\Psi_{R}\right)=I_{\infty}\left(\phi_{\infty}\right)=c_{\infty}$. By using Lemma 2.1, there exists a unique $s_{R}>0$ such that $s_{R} \Psi_{R} \in$ $\mathcal{N}_{R}$. Moreover, since $\phi_{\infty} \in \mathcal{N}_{\infty}$, we obtain

$$
s_{R}=\left(\frac{\left\|\Psi_{R}\right\|^{2}}{\mathbb{D}\left(\Psi_{R}\right)}\right)^{\frac{1}{2}} \rightarrow\left(\frac{\left\|\phi_{\infty}\right\|^{2}}{\mathbb{E}\left(\phi_{\infty}\right)}\right)^{\frac{1}{2}}=1
$$

as $R \rightarrow \infty$. Thus

$$
\lim _{R \rightarrow \infty} c_{R} \leq \lim _{R \rightarrow \infty} I_{R}\left(s_{R} \Psi_{R}\right)=\lim _{R \rightarrow \infty} I_{R}\left(\Psi_{R}\right)=I_{\infty}\left(\phi_{\infty}\right)=c_{\infty}
$$

Therefore $c_{R} \rightarrow c_{\infty}$ as $R \rightarrow \infty$.
Theorem 5.1. Assume that $N=3,4,5,6$. Then the positive ground state solution of (1.5) converges to the unique positive ground state solution of (1.1) as $R \rightarrow \infty$.

Proof. It suffices to prove that $\phi_{R} \rightarrow \phi_{\infty}$ in $H^{1}\left(\mathbb{R}^{N}\right)$ as $R \rightarrow \infty$. Since $c_{R} \rightarrow c_{\infty}$ as $R \rightarrow \infty$, we conclude that $\left\{\phi_{R}\right\}$ is uniformly bounded with respect to $R$. Then there exists a nonnegative radially symmetric decreasing function $\psi \in H^{1}\left(\mathbb{R}^{N}\right)$ such that $\phi_{R} \rightharpoonup \psi$ weakly in $H^{1}\left(\mathbb{R}^{N}\right)$ and $\phi_{R} \rightarrow \psi$ strongly in $L^{s}\left(\mathbb{R}^{N}\right)$ with $s \in(2,6)$ due to the radial symmetry of $\phi_{R}$. In view of (5.3),

$$
0 \neq \lim _{R \rightarrow \infty} \int_{B_{R}} \int_{B_{R}} G(x, y)\left|\phi_{R}(y)\right|^{2}\left|\phi_{R}(x)\right|^{2} d x d y=\int_{\mathbb{R}^{N}} \int_{\mathbb{R}^{N}}|x-y|^{2-N}|\psi(y)|^{2}|\psi(x)|^{2} d x d y
$$

Then we have $\psi \neq 0$. Furthermore, for any $v \in C_{0}^{\infty}\left(\mathbb{R}^{N}\right)$,

$$
0=\lim _{R \rightarrow \infty}\left\langle I_{R}^{\prime}\left(\phi_{R}\right), v\right\rangle=\left\langle I_{\infty}^{\prime}(\psi), v\right\rangle .
$$

The uniqueness of the positive radial solution of (5.1) yields that $\psi=\phi_{\infty}$. This combined with the fact that $\lim _{R \rightarrow \infty} c_{R}=c_{\infty}$, implies that $\phi_{R} \rightarrow \phi_{\infty}$ strongly in $H^{1}\left(\mathbb{R}^{N}\right)$ as $R \rightarrow \infty$. The proof is completed.
