# Identities for the $k$-generalized Fibonacci sequence with negative indices and its zero-multiplicity 

Jonathan García * Carlos A. Gómez ${ }^{\dagger}$ Florian Luca ${ }^{\ddagger}$

November 2, 2022

#### Abstract

In this paper, we prove identities for members of the $k$-generalized Fibonacci sequence with negative indices and we apply these identities to deduce an exact formula for its zero-multiplicity.

Key words and phrases: $k$-generalized Fibonacci sequence, zero-multiplicity of linear recurrences.

Mathematics Subject Classification 2020: 11B39, 11J86

## 1 Introduction

One of the most famous and curious numerical sequence, due to the large number of properties and relationships with other areas [8], is the Fibonacci sequence, denoted by $\mathbf{F}:=\left(F_{n}\right)_{n \geq 0}$. Its initial values are $F_{0}=0, F_{1}=1$ and obeys the recurrence $F_{n}=F_{n-1}+F_{n-2}$ for all $n \geq 2$. This sequence has been generalized in many ways, some by preserving the initial conditions, and others by preserving the recurrence relation. In general, a sequence $\left(u_{n}\right)_{n \in \mathbb{Z}} \subseteq \mathbb{C}$ is a linear recurrence sequence of order $k \in \mathbb{Z}^{+}$if it satisfies the recurrence relation $u_{n+k}=a_{1} u_{n+k-1}+a_{2} u_{n+k-2}+\cdots+a_{k} u_{n}$ for all $n \geq 0$ with coefficients $a_{1}, \ldots, a_{k} \in \mathbb{C}$ and $a_{k} \neq 0$. We assume that $k$ is minimal with the above property. Such a sequence $\left(u_{n}\right)_{n \in \mathbb{Z}}$ has an associated characteristic

[^0]polynomial given by $\Psi_{k}(z)=z^{k}-a_{1} z^{k-1}-\cdots-a_{k}$. Let $\alpha_{1}, \ldots, \alpha_{s} \in \mathbb{C}$ be the distinct roots of $\Psi_{k}(z)$. From the theory of linear recurrence sequences (see [10, Theorem C.1]) there are polynomials $p_{1}(z), p_{2}(z), \ldots, p_{s}(z)$ in $\mathbb{C}[z]$, uniquely determined by the initial values $u_{0}, \ldots, u_{k-1}$, such that the formula $u_{n}=p_{1}(n) \alpha_{1}^{n}+p_{2}(n) \alpha_{2}^{n}+\cdots+p_{s}(n) \alpha_{s}^{n}$ holds for all $n \in \mathbb{Z}$. Studying certain arithmetic properties of members of linear recurrence sequences $\left(u_{n}\right)$ can be performed with methods from the theory of exponential Diophantine equations by using the above expression for $u_{n}$.

In this paper, we present some identities for the members of the $k$ generalized Fibonacci sequence with negative indices. The $k$-generalized Fibonacci sequence $F^{(k)}$ is the linear recurrence sequence of order $k$ with initial values $F_{-i}^{(k)}=0$ for $i=0,1, \ldots, k-2$ and $F_{1}^{(k)}=1$, where each subsequent term is the sum of the $k$ previous ones $F_{n}^{(k)}=F_{n-1}^{(k)}+F_{n-2}^{(k)}+\cdots+F_{n-k}^{(k)}$, for all $n, k \geq 2$. This sequence can be extended to all integer indices $n$. Since $F_{n}^{(k)}>0$ for $n>0$, all zeros of $\mathbf{F}^{(k)}$ correspond to non-positive indices $n$. We denote $H^{(k)}:=\left(H_{n}^{(k)}\right)_{n \geq 0}$, where $H_{n}^{(k)}=F_{-n}^{(k)}$. This sequence obeys the recurrence relation

$$
\begin{equation*}
H_{n}^{(k)}=H_{n-k}^{(k)}-H_{n-(k-1)}^{(k)}-\cdots-H_{n-1}^{(k)} \quad \text { for all } \quad n \geq k \tag{1}
\end{equation*}
$$

with initial values $H_{i}^{(k)}=0$ for $0 \leq i \leq k-2$ and $H_{k-1}^{(k)}=1$.
In this paper, we find identities for members of $H^{(k)}$ and apply them to deduce an exact formula for the zero-multiplicity of $H^{(k)}$.

## 2 The main results

### 2.1 Identities for $H^{(k)}$

Our identities are similars to the given by Ferguson [3], Gabai [4] or Cooper and Howard [1] for the $k$-generalized Fibonacci sequence with positive indices.

Theorem 1. For all $k \geq 2$, the sequence $H^{(k)}$ satisfies
(i) For all $0 \leq m \leq r \leq k-2$, we have $H_{m k+r}^{(k)}=0$.
(ii) For all $m \in[1, k-1]$, we have $H_{m k-1}^{(k)}=2^{m-1}$.
(iii) For all $0 \leq r<m \leq k-1$,

$$
H_{m k+r}^{(k)}=(-1)^{r+1}\left[\binom{m-1}{r}+\binom{m}{r+1}\right] 2^{m-r-2}
$$

(iv) For all $r \in[-1, k-2]$ and $m \geq k-1$,

$$
H_{m k+r}^{(k)}=\sum_{i=0}^{l}(-1)^{i k+r+1}\left[\binom{m-i-1}{i k+r}+\binom{m-i}{i k+r+1}\right] 2^{m-i(k+1)-r-2}
$$

where $l=m-1$ if $k=2$, and $l=\lfloor m /(k-1)\rfloor$ if $k>2$.

### 2.2 Zero-multiplicity for $H^{(k)}$

One of the classical problems in the theory of linear recurrence sequences is the Skolem problem: Given the linear recurrence sequence $\mathbf{u}:=\left(u_{n}\right)_{n \in \mathbb{Z}}$, one want to find $\mathcal{Z}(\mathbf{u})=\left\{n \in \mathbb{Z}: u_{n}=0\right\}$. The cardinality of $\mathcal{Z}(\mathbf{u})$ (when this is finite) is called the zero-multiplicity of $\mathbf{u}$. There is no known algorithm to find $\mathcal{Z}(\mathbf{u})$ in general. One of the more important results here is due to Skolem [11, 10]: If the coefficients $a_{1}, \ldots, a_{k}$ of the linear recurrence sequence $\mathbf{u}$ are rational, then the set $\mathcal{Z}(\mathbf{u})$ is a union of finitely many arithmetical progressions together with a finite set. Hagedorn [7] showed that if the roots of $\Psi_{k}(z)$ are real then $\# \mathcal{Z}(\mathbf{u}) \leq 2 k-3$.

Our current research is motived by our previous work [5]. There we obtained that

$$
\begin{equation*}
\mathcal{A}:=\bigcup_{m=0}^{k-2}[m(k+1),(m+1) k-2] \subseteq \mathcal{Z}\left(H^{(k)}\right) \tag{2}
\end{equation*}
$$

Thus, $\# \mathcal{Z}\left(H^{(k)}\right) \geq k(k-1) / 2$. Furthermore, we checked that

$$
\# \mathcal{Z}\left(H^{(2)}\right)=1, \# \mathcal{Z}\left(H^{(3)}\right)=4 \quad \text { and } \quad \# \mathcal{Z}\left(H^{(k)}\right)=k(k-1) / 2
$$

for $k \in[4,500]$.
Based on the above results, we proposed in [5] the following conjecture.
Conjecture 1. The zero-multiplicity $\# \mathcal{Z}\left(H^{(k)}\right)$ of the $k$-generalized Fibonacci sequence with non-positive indices $H^{(k)}$ for $k \geq 4$ is the $(k-1)$ st triangular number; i.e.

$$
\# \mathcal{Z}\left(H^{(k)}\right)=k(k-1) / 2 .
$$

Recently, relating the 2-adic valuation of $F^{(k)}$ with the Diophantine equation $H_{n}^{(k)}=0$, Young [12] showed that for all $k>500$,

$$
\# \mathcal{Z}\left(H^{(k)}\right) \leq k(k+1) / 2+\lfloor k / 2\rfloor .
$$

In this paper, we confirm the above conjecture. As a consequence of this, we get that $\mathcal{Z}\left(\mathbf{F}^{(\mathbf{k})}\right)$ is exactly $\mathcal{A}$.

## 3 Preliminary results

To simplify the notation, from now on we denote $H_{n}^{(k)}:=H_{n}$, where $k$ is fixed. From the recurrence relation (1), it is easy to see that

$$
\begin{align*}
H_{n} & =2 H_{n-k}-\left(H_{n-k}+H_{n-(k-1)}+\cdots+H_{n-2}+H_{n-1}\right) \\
& =2 H_{n-k}-H_{n-k-1} \quad \text { for all } n \geq k+1 . \tag{3}
\end{align*}
$$

The containment (2) is a direct consequence of the initial values of $H_{n}$ and the identity (3). Indeed, inductively we see that $H_{n}=0$ for all $0 \leq n \leq k-2$. Further

$$
H_{n}=2 H_{n-k}-H_{n-k-1}=0 \quad \text { for all } \quad m(k+1) \leq n \leq m k+(k-2)
$$

with $1 \leq m \leq k-2$. Moreover, the length of these intervals is given by the decreasing quantity

$$
m k+(k-2)-m(k+1)=k-(m+2)
$$

which becomes 0 at $m=k-2$.
So far, we have only summarized what we obtained in [5]. This is fundamental for what follows, since we note that the sequence $H_{n}$ can be represented as lists matrices, starting with a rectangular matrix of size $(k-$ $1) \times(k+1)$ and continuing with square matrices of size $k \times k$. Then, we observed interesting patterns in $H_{n}$ that we were able to formulate and prove.

We start by ordering the first $k^{2}-1$ elements of the sequence $H_{n}$ in matrix form $\left(H_{(i-1)(k+1)+(j-1)}\right)_{i j}$ with $1 \leq i \leq k-1$ and $1 \leq j \leq k+1$. This is

$$
\left(\begin{array}{lllll}
\mathbf{H}_{\mathbf{0}} & \cdots & \mathbf{H}_{\mathbf{k}-\mathbf{2}} & H_{k-1} & H_{k} \\
\mathbf{H}_{(\mathbf{k}+\mathbf{1})+\mathbf{0}} & \cdots & H_{(k+1)+k-2} & H_{(k+1)+k-1} & H_{(k+1)+k} \\
\mathbf{H}_{\mathbf{2}(\mathbf{k}+\mathbf{1})+\mathbf{0}} & \cdots & H_{2(k+1)+k-2} & H_{2(k+1)+k-1} & H_{2(k+1)+k} \\
\vdots & \ddots & \vdots & \vdots & \vdots \\
\mathbf{H}_{(\mathbf{k}-\mathbf{2})(\mathbf{k}+\mathbf{1})+\mathbf{0}} & \cdots & H_{(k-2)(k+1)+k-2} & H_{(k-2)(k+1)+k-1} & H_{(k-2)(k+1)+k}
\end{array}\right)
$$

and we notice that the "upper triangular" part, which is in bold, is composed of zeros. We can also write this matrix as

$$
\left(\begin{array}{lllllll}
0 & 0 & \cdots & 0 & 0 & H_{k-1} & H_{k}  \tag{4}\\
0 & 0 & \cdots & 0 & H_{2 k-1} & H_{2 k} & H_{2 k+1} \\
0 & 0 & \cdots & H_{3 k-1} & H_{3 k} & H_{3 k+1} & H_{3 k+2} \\
\vdots & \vdots & \ddots & \vdots & \vdots & \vdots & \vdots \\
0 & H_{(k-1) k-1} & \cdots & H_{(k-1) k+k-5} & H_{(k-1) k+k-4} & H_{(k-1) k+k-3} & H_{(k-1) k+k-2}
\end{array}\right),
$$

and we observe the following behavior in the non-zero diagonals.

## Lemma 1.

(a) For all $m \in[1, k-1]$, we have $H_{m k-1}=2^{m-1}$.
(b) For all $m \in[1, k-1]$, we have $H_{m k}=-(m+1) 2^{m-2}$.
(c) For all $1 \leq r<m \leq k-1$,

$$
H_{m k+r}=-\sum_{j=r}^{m-1} 2^{m-1-j} H_{j k+r-1}
$$

Proof. To show that the items of this lemma are fulfilled, we proceed by induction on $m$, taking into account that the upper bound for $m$ is $k-1 \geq 1$.
(a) If $m=1$, given the initial values, we have $H_{k-1}=1=2^{0}$. Suppose that $H_{(m-1) k-1}=2^{m-2}$ for $m \in[2, k-1]$. Then, using identity (3), it follows that

$$
H_{m k-1}=2 H_{(m-1) k-1}-H_{(m-1) k-2}=2^{m-1},
$$

since $0 \leq m-2 \leq k-3$ and therefore $H_{((m-2)+1) k-2}=0$ (see (2)).
(b) When $m=1$, we have

$$
H_{k}=H_{0}-H_{1}-\cdots-H_{k-1}=-1=-2 \times 2^{-1}
$$

Assume $H_{(m-1) k}=-m 2^{m-3}$ and we obtain from identity (3) and item (a), that

$$
H_{m k}=2 H_{(m-1) k}-H_{(m-1) k-1}=-m 2^{m-2}-2^{m-2}=-(m+1) 2^{m-2}
$$

(c) Assume $m=r+1$. We have by identity (3) that

$$
H_{(r+1) k+r}=2 H_{r k+r}-H_{r k+r-1}=-H_{r k+r-1}=-\sum_{j=r}^{r} 2^{r-j} H_{j k+r-1}
$$

because $H_{r k+r}=H_{r(k+1)}=0$ with $1 \leq r \leq k-2$ (see (2)). We take

$$
H_{(m-1) k+r}=-\sum_{j=r}^{m-2} 2^{m-2-j} H_{j k+r-1}
$$

as the inductive hypothesis. Then

$$
\begin{aligned}
H_{m k+r} & =2 H_{(m-1) k+r}-H_{(m-1) k+r-1} \\
& =-\left(\sum_{j=r}^{m-2} 2^{m-1-j} H_{j k+r-1}\right)-H_{(m-1) k+r-1} \\
& =-\sum_{j=r}^{m-1} 2^{m-1-j} H_{j k+r-1} .
\end{aligned}
$$

Matrix (4) is the first element of the list of matrices that we use to organize all the elements of $H_{n}$, as we mentioned before. It is rectangular of size $(k-1) \times(k+1)$. The matrix that follows is of size $k \times k$ and includes all the non-zero elements of the last row of matrix (4), this is

$$
\left(\begin{array}{llll}
H_{\left(k^{2}-k-1\right)+0} & H_{\left(k^{2}-k-1\right)+1} & \cdots & H_{\left(k^{2}-k-1\right)+k-1}  \tag{5}\\
H_{\left(k^{2}-k-1\right)+k} & H_{\left(k^{2}-k-1\right)+k+1} & \cdots & H_{\left(k^{2}-k-1\right)+k+(k-1)} \\
\vdots & \vdots & \ddots & \vdots \\
H_{\left(k^{2}-k-1\right)+(k-1) k} & H_{\left(k^{2}-k-1\right)+(k-1) k+1} & \cdots & H_{\left(k^{2}-k-1\right)+(k-1) k+(k-1)}
\end{array}\right) .
$$

In general, all square matrices after matrix (4) form the sequence $\left\{M_{b}\right\}_{b \in \mathbb{Z}^{+}}$, where

$$
M_{b}:=\left(\begin{array}{cccc}
H_{\left(b k^{2}-b k-1\right)+0} & H_{\left(b k^{2}-b k-1\right)+1} & \cdots & H_{\left(b k^{2}-b k-1\right)+k-1} \\
H_{\left(b k^{2}-b k-1\right)+k} & H_{\left(b k^{2}-b k-1\right)+k+1} & \cdots & H_{\left(b k^{2}-b k-1\right)+k+(k-1)} \\
\vdots & \vdots & \ddots & \vdots \\
H_{\left(b k^{2}-b k-1\right)+(k-1) k} & H_{\left(b k^{2}-b k-1\right)+(k-1) k+1} & \cdots & H_{\left(b k^{2}-b k-1\right)+(k-1) k+(k-1)}
\end{array}\right) .
$$

Furthermore, by calling $M_{0}$ the matrix (4), we have arrived at

$$
\left(H_{n}^{(k)}\right)_{n \geq 0}=\bigcup_{b \geq 0}\left\{h: h \text { is an entry of } M_{b}\right\} .
$$

From now on, we simplify the notation by setting

$$
H_{b, j k+r}:=H_{\left(b k^{2}-b k-1\right)+j k+r} \quad \text { for all } b \geq 0
$$

Note that matrix (5) is exactly $M_{1}$. In fact, these matrices satisfy that their first row is exactly the last row of the immediately preceding matrix. Indeed,

$$
\begin{equation*}
H_{b, r}=H_{b-1,(k-1) k+r} \quad \text { for all } 0 \leq r \leq k-1 \quad \text { and } \quad b \geq 1 . \tag{6}
\end{equation*}
$$

Also,

$$
\begin{equation*}
H_{b,-1}=H_{b-1,(k-2) k+(k-1)} \quad \text { for all } b \geq 1 \tag{7}
\end{equation*}
$$

and in particular, by containment (2),

$$
H_{1,-1}=H_{0,(k-2) k+(k-1)}=H_{(k-2)(k+1)}=0 .
$$

Moreover, we observe that identity (3) is still satisfied with this notation

$$
\begin{equation*}
H_{b, n}=2 H_{b, n-k}-H_{b, n-k-1} \tag{8}
\end{equation*}
$$

for all $b \geq 1$ and $n \geq 2$, or for $b=0$ and $n \geq k+2$.
Next, we find the following patterns in all entries below the main diagonal of $M_{b}$ with $b \geq 1$.

Lemma 2. Let $b \geq 1$, then
(I) $H_{b, j k}= \begin{cases}2 H_{b, 0}-H_{b-1,(k-2) k+(k-1)}, & \text { if } j=1, \\ 2^{j-1} H_{b, k}-\sum_{i=0}^{j-2} 2^{j-i-2} H_{b,(i+1) k-1}, & \text { if } 2 \leq j \leq k-1 .\end{cases}$
(II) For all $r, j \in[1, k-1]$, it holds that

$$
H_{b, j k+r}=2^{j-1} H_{b, k+r}-\sum_{i=1}^{j-1} 2^{j-1-i} H_{b, i k+r-1}
$$

(III) Let $r, j \in[0, k-1]$ be fixed. Then

$$
H_{b, j k+r}=\sum_{i=0}^{t}(-1)^{i}\binom{t}{i} 2^{t-i} H_{b,(j-t) k+r-i},
$$

for all $t \in\left[0,\left\lfloor\frac{b k^{2}-b k-1+j k+r}{k+1}\right]\right]$.
Proof. We consider each item separately.
( $I$ ) The case $j=1$, follows from identities (77) and (8). Let $2 \leq j \leq k-1$. We argue by induction on $j$. If $j=2$, item ( $I$ ) is immediate by identity (8). Suppose it is satisfied for $j-1$; i.e.,

$$
\begin{equation*}
H_{b,(j-1) k}=2^{j-2} H_{b, k}-\sum_{i=0}^{j-3} 2^{j-i-3} H_{b,(i+1) k-1} . \tag{9}
\end{equation*}
$$

Then, by (8) and (9),

$$
\begin{aligned}
H_{b, j k} & =2 H_{b,(j-1) k}-H_{b,(j-1) k-1} \\
& =\left(2^{j-1} H_{b, k}-\sum_{i=0}^{j-3} 2^{j-i-2} H_{b,(i+1) k-1}\right)-H_{b,(j-1) k-1} \\
& =2^{j-1} H_{b, k}-\sum_{i=0}^{j-2} 2^{j-i-2} H_{b,(i+1) k-1}
\end{aligned}
$$

and thus we conclude item $(I)$ for $j$.
(II) If $j=1$, the identity is trivial. For $j \geq 2$, we apply recursively, $j-1$ times, identity (8) on $H_{b, j k+r}$. That is,

$$
\begin{aligned}
H_{b, j k+r} & =2 H_{b,(j-1) k+r}-H_{b,(j-1) k+r-1} \\
& =2^{2} H_{b,(j-2) k+r}-2 H_{b,(j-2) k+r-1}-H_{b,(j-1) k+r-1} \\
& =2^{3} H_{b,(j-3) k+r}-2^{2} H_{b,(j-3) k+r-1}-2 H_{b,(j-2) k+r-1}-H_{b,(j-1) k+r-1}
\end{aligned}
$$

$$
=2^{j-1} H_{b,(j-(j-1)) k+r}-2^{j-2} H_{b,(j-(j-1)) k+r-1}-\cdots-H_{b,(j-1) k+r-1} .
$$

(III) We proceed by induction on $t$. If $t=0$, the identity is trivial. Suppose it is satisfied for $t-1 \geq 0$; i.e.,

$$
H_{b, j k+r}=\sum_{i=0}^{t-1}(-1)^{i}\binom{t-1}{i} 2^{t-i-1} H_{b,(j-t+1) k+r-i} .
$$

Then, by the inductive hypothesis and identity (8), it follows that

$$
\begin{aligned}
& H_{b, j k+r}=\sum_{i=0}^{t-1}(-1)^{i}\binom{t-1}{i} 2^{t-i-1}\left(2 H_{b,(j-t) k+r-i}-H_{b,(j-t) k+r-i-1}\right) \\
& =(-1)^{0}\binom{t-1}{0} 2^{t} H_{b,(j-t) k+r}+\sum_{i=1}^{t-1}(-1)^{i}\binom{t-1}{i} 2^{t-i} H_{b,(j-t) k+r-i} \\
& \\
& +\sum_{i=1}^{t}(-1)^{i}\binom{t-1}{i-1} 2^{t-i} H_{b,(j-t) k+r-i} \\
& =2^{t} H_{b,(j-t) k+r}+\sum_{i=1}^{t-1}(-1)^{i}\left(\binom{t-1}{i}+\binom{t-1}{i-1}\right) 2^{t-i} H_{b,(j-t) k+r-i} \\
& \\
& \quad+(-1)^{t}\binom{t-1}{t-1} 2^{t-t} H_{b,(j-t) k+r-t} \\
& =2^{t} H_{b,(j-t) k+r}+\sum_{i=1}^{t-1}(-1)^{i}\binom{t}{i} 2^{t-i} H_{b,(j-t) k+r-i}+(-1)^{t} H_{b,(j-t) k+r-t} \\
& =\sum_{i=0}^{t}(-1)^{i}\binom{t}{i} 2^{t-i} H_{b,(j-t) k+r-i}
\end{aligned}
$$

and the identity is satisfied for $t$. We must assume that $t \leq\left\lfloor\frac{b k^{2}-b k-1+j k+r}{k+1}\right\rfloor$, because in this case

$$
b k^{2}-b k-1+(j-t) k+r-i \geq b k^{2}-b k-1+(j-t) k+r-t \geq 0
$$

for all $0 \leq i \leq t$. Therefore, $H_{b,(j-t) k+r-i}$ is well defined for all $0 \leq i \leq t$.
This completes the proof of this lemma.
The above lemmas will allow us, in Section 4, to characterize all entries of the matrices $M_{b}$ and therefore all elements of $H_{n}$. For this purpose we introduce the following notation:

$$
\begin{equation*}
\psi(v, w):=\binom{v}{w}+\binom{v+1}{w+1} \tag{10}
\end{equation*}
$$

Note that

$$
\begin{equation*}
\psi(v,-1)=1 \text { for all } v \neq-1 \text { and } \psi(v, w)=0 \text { for all } w>v \geq 0 \tag{11}
\end{equation*}
$$

We prove the following properties of $\psi(v, w)$.
Lemma 3. The funtion $\psi$ satisfies:
(1) $\psi(v, w)+\psi(v, w+1)=\psi(v+1, w+1)$.
(2) $\sum_{i=0}^{n} \psi(v+i, v)=\psi(v+n+1, v+1)$.
(3) $\sum_{i=-1}^{n} \psi(v+i, i)=\psi(v+n+1, n)$.
(4) $\sum_{i=w}^{v} \psi(i-1, w-1)=\psi(v, w)$.
(5) $\sum_{i=0}^{w}\binom{u}{i} \psi(v, w-i-1)=\psi(u+v, w-1)$.

Proof. To show that all items are satisfied, we use basic properties of binomial coefficients. Item (1) is immediate.
(2) We know that

$$
\sum_{i=0}^{n} \psi(v+i, v)=\sum_{i=v}^{v+n}\binom{i}{v}+\sum_{i=v+1}^{v+n+1}\binom{i}{v+1}=\psi(v+n+1, v+1)
$$

(3) It is clear that

$$
\begin{aligned}
\sum_{i=-1}^{n} \psi(v+i, i) & =\sum_{i=0}^{n}\binom{v+i}{i}+\sum_{i=-1}^{n}\binom{v+i+1}{i+1} \\
& =\sum_{i=v}^{v+n}\binom{i}{v}+\sum_{i=v}^{v+n+1}\binom{i}{v} \\
& =\psi(v+n+1, n) .
\end{aligned}
$$

(4) We have

$$
\sum_{i=w}^{v} \psi(i-1, w-1)=\sum_{i=w-1}^{v-1}\binom{i}{w-1}+\sum_{i=w}^{v}\binom{i}{w}=\psi(v, w) .
$$

(5) We obtain

$$
\begin{aligned}
\sum_{i=0}^{w}\binom{u}{i} \psi(v, w-i-1) & =\sum_{i=0}^{w-1}\binom{u}{i}\binom{v}{w-i-1}+\sum_{i=0}^{w}\binom{u}{i}\binom{v+1}{w-i} \\
& =\psi(u+v, w-1)
\end{aligned}
$$

## 4 Proof of Theorem 1

For items ( $i$ ) and (ii), see containment (2) and Lemma 11, item (a), respectively. The remaining items are shown below.

### 4.1 Item (iii)

With notation (10), we must prove that

$$
\begin{equation*}
H_{m k+r}=(-1)^{r+1} \psi(m-1, r) 2^{m-r-2} \quad \text { for all } \quad 0 \leq r<m \leq k-1 \tag{12}
\end{equation*}
$$

For this, we apply induction on $r$. If $r=0$, by Lemma 1, item (b), we get that identity (12) is satisfied. Indeed,

$$
H_{m k}=-(m+1) 2^{m-2}=(-1)^{1} \psi(m-1,0) 2^{m-2} \quad \text { for all } \quad 1 \leq m \leq k-1
$$

We assume by the inductive hypothesis that identity (12) is satisfied for $r-1$ and therefore $0 \leq r-1<m \leq k-1$; i.e.,

$$
H_{m k+r-1}=(-1)^{r} \psi(m-1, r-1) 2^{m-r-1} \quad \text { for all } \quad r \leq m \leq k-1
$$

In particular,

$$
\begin{equation*}
H_{j k+r-1}=(-1)^{r} \psi(j-1, r-1) 2^{j-r-1} \quad \text { for all } \quad r \leq j \leq m-1 \tag{13}
\end{equation*}
$$

Then, by Lemma 1, item (c), Lemma 3, item (4) and identity (13), we obtain

$$
\begin{aligned}
H_{m k+r} & =-\sum_{j=r}^{m-1} 2^{m-1-j}\left((-1)^{r} \psi(j-1, r-1) 2^{j-r-1}\right) \\
& =(-1)^{r+1}\left(\sum_{j=r}^{m-1} \psi(j-1, r-1)\right) 2^{m-r-2} \\
& =(-1)^{r+1} \psi(m-1, r) 2^{m-r-2} \quad \text { for all } \quad 1 \leq r<m \leq k-1
\end{aligned}
$$

This completes the proof of item (iii).

### 4.2 Item (iv)

### 4.2.1 Case $k=2$ :

Here we must prove that for all $m \geq 1$,

$$
H_{2 m+r}= \begin{cases}\sum_{i=0}^{m-1} \psi(m-i-1,2 i-1) 2^{m-3 i-1}, & \text { if } r=-1,  \tag{14}\\ -\sum_{i=0}^{m-1} \psi(m-i-1,2 i) 2^{m-3 i-2}, & \text { if } r=0 .\end{cases}
$$

For this we proceed by induction on $m$. Suppose that identity (14) is satisfied up to $m-1 \geq 2$ (the cases $m=1$ and $m=2$ are easily verified). Then using (3), (11), Lemma 3 and the fact that $\psi(0,2 m-2)=\psi(0,2 m-3)=0$ (since $m \geq 2$ ), we obtain

$$
\begin{aligned}
& H_{2 m-1}=2 H_{2(m-1)-1}-H_{2(m-2)} \\
& =\sum_{i=0}^{m-2} \psi(m-i-2,2 i-1) 2^{m-3 i-1}+\sum_{i=0}^{m-3} \psi(m-i-3,2 i) 2^{m-3 i-4} \\
& =\psi(m-2,-1) 2^{m-1}+\sum_{i=1}^{m-2}(\psi(m-i-2,2 i-1)+\psi(m-i-2,2 i-2)) 2^{m-3 i-1} \\
& =\psi(m-1,-1) 2^{m-1}+\sum_{i=1}^{m-2} \psi(m-i-1,2 i-1) 2^{m-3 i-1}+\psi(0,2 m-3) 2^{-2(m-1)} \\
& =\sum_{i=0}^{m-1} \psi(m-i-1,2 i-1) 2^{m-3 i-1}
\end{aligned}
$$

and

$$
\begin{aligned}
& H_{2 m}=2 H_{2(m-1)}-H_{2(m-1)-1} \\
& =-\sum_{i=0}^{m-2} \psi(m-i-2,2 i) 2^{m-3 i-2}-\sum_{i=0}^{m-2} \psi(m-i-2,2 i-1) 2^{m-3 i-2} \\
& =-\psi(0,2 m-2) 2^{-2 m+1}-\sum_{i=0}^{m-2}(\psi(m-i-2,2 i)+\psi(m-i-2,2 i-1)) 2^{m-3 i-2} \\
& =-\sum_{i=0}^{m-1} \psi(m-i-1,2 i) 2^{m-3 i-2}
\end{aligned}
$$

### 4.2.2 Case $k>2$ :

To treat this case, we present the following two lemmas.
Lemma 4. For all $k>2$ and $j, r \in[0, k-1]$, it holds that

$$
\begin{align*}
H_{1, j k+r} & =(-1)^{r} 2^{k+j-r-2} \psi(k+j-2, r-1) \\
& +(-1)^{k+r} 2^{j-r-3} \psi(k+j-3, k+r-1) \tag{15}
\end{align*}
$$

Proof. We apply double induction on $j, r \in[0, k-1]$.
(A) Let $j=r=0$. Since $k>2$, by observation (11), it follows that

$$
\psi(k-2,-1)=1 \quad \text { and } \quad \psi(k-3, k-1)=0
$$

Then, using item (ii), we obtain

$$
H_{1,0}=H_{(k-1) k-1}=2^{k-2}=2^{k-2} \psi(k-2,-1)+(-1)^{k} 2^{-3} \psi(k-3, k-1)
$$

fulfilling identity (15).
(B) Let $j=0$ and $r \in[1, k-1]$. Then, by item (iii), we get that

$$
H_{1, r}=H_{k(k-1)+r-1}=(-1)^{r} \psi(k-2, r-1) 2^{k-r-2}
$$

and by observation (11) it follows that

$$
\begin{align*}
H_{1, r} & =(-1)^{r} 2^{k-r-2} \psi(k-2, r-1)  \tag{16}\\
& =(-1)^{r} 2^{k-r-2} \psi(k-2, r-1)+(-1)^{k+r} 2^{-r-3} \psi(k-3, k+r-1)
\end{align*}
$$

Thus, identity (15) is satisfied.
(C) Let $r=0$ and $j \in[1, k-1]$. If $j=1$, by Lemma 2, item ( $I$ ) and observation (11), we have that identity (15) is satisfied. In fact,

$$
\begin{align*}
H_{1, k} & =2 H_{1,0}-H_{0,(k-2) k+(k-1)}=2 H_{1,0}=2^{k-1}  \tag{17}\\
& =2^{k-1} \psi(k-1,-1)+(-1)^{k} 2^{-2} \psi(k-2, k-1) .
\end{align*}
$$

If $j \in[2, k-1]$, we note that by Lemma 2, item $(I)$, combined with item $(I I I) *$ of this same Lemma and items $(A),(B)$ above, we get

$$
\begin{align*}
H_{1, j k} & =2^{j-1} H_{1, k}-\sum_{i=0}^{j-2} 2^{j-i-2} H_{1, i k+k-1} \\
& =2^{j-1} H_{1, k}+\sum_{i=0}^{j-2}\left(\sum_{\ell=0}^{i}(-1)^{\ell+1}\binom{i}{\ell} 2^{j-2-\ell} H_{1, k-1-\ell}\right) \\
& =2^{j-1} H_{1, k}+\left(\sum_{\ell=0}^{j-2}(-1)^{\ell+1}\left(\sum_{i=\ell}^{j-2}\binom{i}{\ell}\right) 2^{j-2-\ell} H_{1, k-1-\ell}\right) \\
& =2^{j-1} H_{1, k}+\left(\sum_{\ell=0}^{j-2}(-1)^{\ell+1}\binom{j-1}{\ell+1} 2^{j-2-\ell} H_{1, k-1-\ell}\right) \\
& =2^{j-1} H_{1, k}+(-1)^{k} 2^{j-3}\left(\sum_{\ell=1}^{j-1}\binom{j-1}{\ell} \psi(k-2, k-1-\ell)\right) . \tag{18}
\end{align*}
$$

In addition,

$$
\begin{equation*}
\psi(k-2, k-1)=0 \quad \text { and } \quad\binom{j-1}{\ell}=0 \quad \text { for } \quad j \leq \ell \leq k \tag{19}
\end{equation*}
$$

Then, by identities (17), (18), (19), observation (11) and Lemma 3 (item 5), we obtain

$$
\begin{aligned}
H_{1, j k} & =2^{k+j-2}+(-1)^{k} 2^{j-3}\left(\sum_{\ell=0}^{k}\binom{j-1}{\ell} \psi(k-2, k-\ell-1)\right) \\
& =2^{k+j-2} \psi(k+j-2,-1)+(-1)^{k} 2^{j-3} \psi(k+j-3, k-1)
\end{aligned}
$$

Thus, identity (15) is satisfied.
$(D)$ Let $r \in[1, k-1]$ be fixed and assume as inductive hypothesis that identity (15) is satisfied up to $j-1 \geq 0$. Then replacing $r$ by $r-1$ in the inductive hypothesis, we have

$$
\begin{aligned}
H_{1, i k+r-1} & =(-1)^{r-1} 2^{k+i-r-1} \psi(k+i-2, r-2) \\
& +(-1)^{k+r-1} 2^{i-r-2} \psi(k+i-3, k+r-2)
\end{aligned}
$$

for all $1 \leq i \leq j-1$ and $r-1 \in[0, k-2]$ fixed $\dagger$. In particular, this also implies (see (11)) that

$$
\begin{aligned}
H_{1, k+r} & =(-1)^{r} 2^{k-r-1} \psi(k-1, r-1)+(-1)^{k+r} 2^{-r-2} \psi(k-2, k+r-1) \\
& =(-1)^{r} 2^{k-r-1} \psi(k-1, r-1)
\end{aligned}
$$

[^1]for $r \in[1, k-1]$ fixed. Thus, by the above two identities and Lemma 2, item (II), we get
\[

$$
\begin{align*}
& H_{b, j k+r}= 2^{j-1} H_{b, k+r}-\sum_{i=1}^{j-1} 2^{j-1-i} H_{b, i k+r-1} \\
&=(-1)^{r} 2^{k+j-r-2} \psi(k-1, r-1) \\
& \quad+(-1)^{r} 2^{k+j-r-2} \sum_{i=1}^{j-1} \psi(k+i-2, r-2) \\
& \quad+(-1)^{k+r} 2^{j-r-3} \sum_{i=1}^{j-1} \psi(k+i-3, k+r-2) \tag{20}
\end{align*}
$$
\]

for all $r, j \in[1, k-1]$, with $r$ fixed. We note that using the identity (1) of Lemma 3, it follows that

$$
\begin{align*}
& \psi(k-1, r-1)+\sum_{i=1}^{j-1} \psi(k+i-2, r-2) \\
& =\psi(k, r-1)+\sum_{i=2}^{j-1} \psi(k+i-2, r-2) \\
& =\psi(k+1, r-1)+\sum_{i=3}^{j-1} \psi(k+i-2, r-2) \\
& \vdots \\
& =\psi(k+j-3, r-1)+\sum_{i=j-1}^{j-1} \psi(k+i-2, r-2) \\
& =\psi(k+j-2, r-1) \tag{21}
\end{align*}
$$

Furthermore, by observation (11),

$$
\begin{equation*}
\psi(k+i-3, k+r-2)=0 \quad \text { for } \quad i<r+1 . \tag{22}
\end{equation*}
$$

Then, by the identities (20), (21), (22) and Lemma 3, item (2), we obtain

$$
\begin{aligned}
H_{b, j k+r} & =(-1)^{r} 2^{k+j-r-2}\left(\psi(k-1, r-1)+\sum_{i=1}^{j-1} \psi(k+i-2, r-2)\right) \\
& +(-1)^{k+r} 2^{j-r-3} \sum_{i=1}^{j-1} \psi(k+i-3, k+r-2) \\
& =(-1)^{r} 2^{k+j-r-2} \psi(k+j-2, r-1) \\
& +(-1)^{k+r} 2^{j-r-3} \psi(k+j-3, k+r-1)
\end{aligned}
$$

Therefore, identity (15) is satisfied.
(E) We fix $j \in[1, k-1]$ and take as inductive hypothesis the identity (15) for $r-1 \geq 0$. In items $(A),(C)$ and $(D)$ above, we proved that identity (15) is satisfied on $H_{i k+r-1}$, for fixed $r-1 \geq 0$ and all $i \in[0, k-1]$. Then

$$
\begin{aligned}
H_{1, i k+r-1} & =(-1)^{r-1} 2^{k+i-r-1} \psi(k+i-2, r-2) \\
& +(-1)^{k+r-1} 2^{i-r-2} \psi(k+i-3, k+r-2)
\end{aligned}
$$

holds for all $0 \leq i \leq j-1$. Thus, by the above identity, identity (16) and Lemma 2, item (II), it follows that

$$
\begin{align*}
H_{1, j k+r} & =2^{j} H_{1, r}-\sum_{i=0}^{j-1} 2^{j-1-i} H_{1, i k+r-1} \\
& =(-1)^{r} 2^{k+j-r-2} \psi(k-2, r-1)+(-1)^{r} 2^{k+j-r-2} \sum_{i=0}^{j-1} \psi(k+i-2, r-2) \\
& +(-1)^{k+r} 2^{j-r-3} \sum_{i=0}^{j-1} \psi(k+i-3, k+r-2) \tag{23}
\end{align*}
$$

holds for all $r, j \in[1, k-1]$, with $j$ fixed. Now, by identity (1) of Lemma 3 and identity (21), we deduce that

$$
\begin{align*}
& \psi(k-2, r-1)+\sum_{i=0}^{j-1} \psi(k+i-2, r-2) \\
& =\psi(k-1, r-1)+\sum_{i=1}^{j-1} \psi(k+i-2, r-2)=\psi(k+j-2, r-1) \tag{24}
\end{align*}
$$

Therefore, identities (22), (23), (24) and Lemma 3, item (2), lead us to

$$
\begin{aligned}
H_{1, j k+r} & =(-1)^{r} 2^{k+j-r-2} \psi(k+j-2, r-1) \\
& +(-1)^{k+r} 2^{j-r-3} \sum_{i=r+1}^{j-1} \psi(k+i-3, k+r-2) \\
& =(-1)^{r} 2^{k+j-r-2} \psi(k+j-2, r-1) \\
& +(-1)^{k+r} 2^{j-r-3} \sum_{i=0}^{j-r-2} \psi(k+r-2+i, k+r-2) \\
& =(-1)^{r} 2^{k+j-r-2} \psi(k+j-2, r-1) \\
& +(-1)^{k+r} 2^{j-r-3} \psi(k+j-3, k+r-1),
\end{aligned}
$$

thus satisfying identity (15).
Finally, items $(A),(B),(C),(D)$ and $(E)$ above prove the lemma.
The following result generalizes the previous one.

Lemma 5. For all $k>2 ; j, r \in[0, k-1]$ and $b \in \mathbb{Z}^{+}$, it holds that

$$
\begin{equation*}
H_{b, j k+r}=\sum_{i=0}^{b}(-1)^{i k+r} 2^{(b-i) k+j-r-b-i-1} \psi(b k+j-b-i-1, i k+r-1) \tag{25}
\end{equation*}
$$

Proof. Here, we proceed by induction in $b$. The case $b=1$ follows from Lemma 4. We state as inductive hypothesis that

$$
\begin{equation*}
H_{b-1, j k+r}=\sum_{i=0}^{b-1}(-1)^{i k+r} 2^{(b-i-1) k+j-r-b-i} \psi((b-1) k+j-b-i, i k+r-1), \tag{26}
\end{equation*}
$$

for $b-1 \geq 1, k>2$ and $j, r \in[0, k-1]$. Next, we consider the following cases.
$\left(A^{\prime}\right)$ Let $j \leq r$. Then, by Lemma 2 (item $I I I$ ) with $t=j$ and the identities (26), (16), we have that

$$
\begin{align*}
& H_{b, j k+r}=\sum_{\ell=0}^{j}(-1)^{\ell}\binom{j}{\ell} 2^{j-\ell} H_{b-1,(k-1) k+r-\ell} \\
& =\sum_{i=0}^{b-1}(-1)^{i k+r} 2^{(b-i) k+j-r-b-i-1} \sum_{\ell=0}^{j}\binom{j}{\ell} \psi(b k-b-i-1, i k+r-\ell-1) . \tag{27}
\end{align*}
$$

We note that $j \leq r<i k+r$ for all $i \geq 0$, and

$$
\begin{equation*}
\binom{j}{\ell}=0 \quad \text { for } j+1 \leq \ell \leq i k+r . \tag{28}
\end{equation*}
$$

We use the identities (27), (28) and Lemma 3, item (5), to obtain

$$
\begin{align*}
H_{b, j k+r} & =\sum_{i=0}^{b-1}(-1)^{i k+r} 2^{(b-i) k+j-r-b-i-1} \sum_{\ell=0}^{i k+r}\binom{j}{\ell} \psi(b k-b-i-1, i k+r-\ell-1) \\
& =\sum_{i=0}^{b-1}(-1)^{i k+r} 2^{(b-i) k+j-r-b-i-1} \psi(b k+j-b-i-1, i k+r-1) \tag{29}
\end{align*}
$$

In fact, $b(k-2)+j-1<b k+r-1$ and therefore (see (11))

$$
\psi(b(k-2)+j-1, b k+r-1)=0 .
$$

So, the sum in identity (29) can be extended to $b$, fulfilling identity (25) in this case.
$\left(B^{\prime}\right)$ Let $r<j$. Here, we proceed by induction on $r$.

- For $r=0$, we apply induction on $j>0$. If $j=1$, by the identities (6),
(7) and (26) we obtain that

$$
\begin{aligned}
H_{b, k} & =2 H_{b, 0}-H_{b,-1}=2 H_{b-1,(k-1) k}-H_{b-1,(k-2) k+(k-1)} \\
& =\sum_{i=0}^{b-1}(-1)^{i k} 2^{(b-i) k-b-i} \psi(b k-b-i-1, i k-1) \\
& -\sum_{i=0}^{b-1}(-1)^{i k+k-1} 2^{(b-i-1) k-b-i-1} \psi(b k-b-i-2, i k+k-2) .
\end{aligned}
$$

In addition,

$$
\begin{array}{r}
\psi(b k-b-b-1, b k-1)=0, \\
\psi(b k-b-1,-1)=\psi(b k-b,-1)=1
\end{array}
$$

(see (11)) and by Lemma 3, item (1) we obtain

$$
\begin{align*}
& H_{b, k}=\sum_{i=0}^{b-1}(-1)^{i k} 2^{(b-i) k-b-i} \psi(b k-b-i-1, i k-1) \\
& +\sum_{i=1}^{b}(-1)^{i k} 2^{(b-i) k-b-i} \psi(b k-b-i-1, i k-2) \\
& =2^{b k-b} \psi(b k-b-1,-1) \\
& +\sum_{i=1}^{b}(-1)^{i k} 2^{(b-i) k-b-i}(\psi(b k-b-i-1, i k-1)+\psi(b k-b-i-1, i k-2)) \\
& =\sum_{i=0}^{b}(-1)^{i k} 2^{(b-i) k-b-i} \psi(b k-b-i, i k-1) \tag{30}
\end{align*}
$$

satisfying identity (25).

- Now, we assume that identity (25) is satisfied for $j-1$, when $r=0$. We obtain that

$$
\begin{align*}
& H_{b, j k}=2 H_{b,(j-1) k}-H_{b,(j-1) k-1}=2 H_{b,(j-1) k}-H_{b,(j-2) k+k-1} \\
& =-H_{b,(j-2) k+k-1}+\sum_{i=0}^{b}(-1)^{i k} 2^{(b-i) k+j-b-i-1} \psi(b k+j-b-i-2, i k-1) . \tag{31}
\end{align*}
$$

We also note that $j-2<k-1$, so item $\left(A^{\prime}\right)$ above implies that

$$
\begin{equation*}
H_{b,(j-2) k+k-1}=\sum_{i=0}^{b}(-1)^{i k+k-1} 2^{(b-i-1) k+j-b-i-2} \psi(b k+j-b-i-3, i k+k-2) . \tag{32}
\end{equation*}
$$

Then, since

$$
\begin{array}{r}
\psi(b k+j-2 b-3, b k+k-2)=0 \\
\psi(b k+j-b-2,-1)=\psi(b k+j-b-1,-1)=1
\end{array}
$$

(see (11)), we use identities (31), (32) and Lemma 3, item (1) to obtain

$$
\begin{aligned}
H_{b, j k} & =2^{b k+j-b-1} \psi(b k+j-b-2,-1) \\
& +\sum_{i=1}^{b}(-1)^{i k} 2^{(b-i) k+j-b-i-1} \psi(b k+j-b-i-2, i k-2) \\
& +\sum_{i=1}^{b}(-1)^{i k} 2^{(b-i) k+j-b-i-1} \psi(b k+j-b-i-2, i k-1) \\
& =\sum_{i=0}^{b}(-1)^{i k} 2^{(b-i) k+j-b-i-1} \psi(b k+j-b-i-1, i k-1) .
\end{aligned}
$$

Therefore identity (25) holds in this case. This concludes the induction on $j$ when $r=0$. Thus, the base case of induction on $r$ is done.

- Let $j=r+1$. Item $\left(A^{\prime}\right)$ above implies that

$$
\begin{equation*}
H_{b, k+\ell}=\sum_{i=0}^{b}(-1)^{i k+\ell} 2^{(b-i) k-\ell-b-i} \psi(b k-b-i, i k+\ell-1) \tag{33}
\end{equation*}
$$

for $1 \leq \ell \leq r$. By Lemma 2, item (III) with $t=r$, and the identities (30), (33), we obtain

$$
\begin{align*}
H_{b,(r+1) k+r} & =\sum_{\ell=0}^{r}(-1)^{r-\ell}\binom{r}{r-\ell} 2^{\ell} H_{b, k+\ell} \\
& =\sum_{\ell=0}^{r}\binom{r}{\ell}\left(\sum_{i=0}^{b}(-1)^{i k+r} 2^{(b-i) k-b-i} \psi(b k-b-i, i k+\ell-1)\right) \\
& =\sum_{i=0}^{b}(-1)^{i k+r} 2^{(b-i) k-b-i} \sum_{\ell=0}^{r}\binom{r}{r-\ell} \psi(b k-b-i, i k+r-\ell-1) . \tag{34}
\end{align*}
$$

Furthermore, $r \leq i k+r$ for $i \geq 0$ and

$$
\begin{equation*}
\binom{r}{r-\ell}=\binom{r}{\ell}=0, \quad \text { for } \quad r+1 \leq \ell \leq i k+r \quad \text { when } \quad i \geq 1 \tag{35}
\end{equation*}
$$

Then, by identities (34), (35) and Lemma 3, item (5), we arrive at

$$
\begin{aligned}
H_{b,(r+1) k+r} & =\sum_{i=0}^{b}(-1)^{i k+r} 2^{(b-i) k-b-i} \sum_{\ell=0}^{i k+r}\binom{r}{\ell} \psi(b k-b-i, i k+r-\ell-1) \\
& =\sum_{i=0}^{b}(-1)^{i k+r} 2^{(b-i) k-b-i} \psi(b k-b-i+r, i k+r-1) .
\end{aligned}
$$

The above identity verifies identity (25) in this case, and we finish the base step of induction on $j$ and on $r$.

- We assume by the inductive hypothesis that identity (25) is fulfilled for $r-1$ and up to $j-1$; i.e.,

$$
\begin{equation*}
H_{b, \ell k+r-1}=\sum_{i=0}^{b}(-1)^{i k+r-1} 2^{(b-i) k+\ell-r-b-i} \psi(b k+\ell-b-i-1, i k+r-2) \tag{36}
\end{equation*}
$$

for $r \leq \ell \leq j-1$. Also, by item $\left(A^{\prime}\right)$ above, we obtain that identity (36) holds for $0 \leq \ell \leq r-1$. In fact, it implies that

$$
H_{b, r}=\sum_{i=0}^{b}(-1)^{i k+r} 2^{(b-i) k-r-b-i-1} \psi(b k-b-i-1, i k+r-1) .
$$

Then, by Lemma 2, item (II) and identity (36), we arrive at

$$
\begin{align*}
H_{b, j k+r} & =2^{j} H_{b, r}-\sum_{\ell=0}^{j-1} 2^{j-1-\ell} H_{b, \ell k+r-1} \\
& =\sum_{i=0}^{b}(-1)^{i k+r} 2^{(b-i) k+j-r-b-i-1} \psi(b k-b-i-1, i k+r-1) \\
& +\sum_{i=0}^{b}(-1)^{i k+r} 2^{(b-i) k+j-r-b-i-1} \sum_{\ell=0}^{j-1} \psi(b k+\ell-b-i-1, i k+r-2) \tag{37}
\end{align*}
$$

for all $r, j \in[1, k-1]^{\text {I }}$. We observe, by Lemma (3), item (1), that

$$
\begin{align*}
& \psi(b k-b-i-1, i k+r-1)+\sum_{\ell=0}^{j-1} \psi(b k+\ell-b-i-1, i k+r-2) \\
& =\psi(b k-b-i, i k+r-1)+\sum_{\ell=1}^{j-1} \psi(b k+\ell-b-i-1, i k+r-2) \\
& =\psi(b k-b-i+1, i k+r-1)+\sum_{\ell=2}^{j-1} \psi(b k+\ell-b-i-1, i k+r-2) \\
& \vdots \\
& =\psi(b k-b-i+j-2, i k+r-1)+\psi(b k+j-b-i-2, i k+r-2) \\
& =\psi(b k-b-i+j-1, i k+r-1) . \tag{38}
\end{align*}
$$

[^2]Then, by the identities (37) and (38), we obtain

$$
\begin{aligned}
H_{b, j k+r} & =\sum_{i=0}^{b}(-1)^{i k+r} 2^{(b-i) k+j-r-b-i-1}(\psi(b k-b-i-1, i k+r-1) \\
& \left.+\sum_{\ell=0}^{j-1} \psi(b k+\ell-b-i-1, i k+r-2)\right) \\
& =\sum_{i=0}^{b}(-1)^{i k+r} 2^{(b-i) k+j-r-b-i-1} \psi(b k-b-i+j-1, i k+r-1)
\end{aligned}
$$

and identity (25) is satisfied. This finishes the induction on both $j$ and $r$ thus completing the proof of this lemma.

Now we return to the proof of item (iv). Replacing $b(k-1)+j$ by $m$ and $r-1$ by $r$ in Lemma 5, we obtain that

$$
\begin{align*}
H_{m k+r} & =H_{(b(k-1)+j) k+r}=H_{b, j k+r+1}  \tag{39}\\
& =\sum_{i=0}^{b}(-1)^{i k+r+1} \psi(m-i-1, i k+r) 2^{m-i(k+1)-r-2}, \tag{40}
\end{align*}
$$

for all $k>2, j \in[0, k-1], r \in[-1, k-2]$ and $b \in \mathbb{Z}^{+}$. By identity (6), we have

$$
H_{b, r+1}=H_{b-1,(k-1) k+r+1} \quad \text { for all } \quad-1 \leq r \leq k-2 \quad \text { and } \quad b \in \mathbb{Z}^{+}
$$

so we can assume that $j \in[0, k-1$ ) (in order not to repeat elements of the sequence in (39)). Then

$$
\frac{m}{k-1}-1<\frac{m-j}{k-1} \leq \frac{m}{k-1} \quad \text { for } \quad k-1>1
$$

therefore $\left\lfloor\frac{m}{k-1}\right\rfloor-1<b \leq\left\lfloor\frac{m}{k-1}\right\rfloor$ and $b=\left\lfloor\frac{m}{k-1}\right\rfloor$. In conclusion, item (iv) follows from replacing $b$ by $\left\lfloor\frac{m}{k-1}\right\rfloor$ in identity (40) ${ }^{8}$.

This completes the proof of Theorem 1.

## 5 Proof of Conjecture 1

We distinguish two cases according to the parity of $k$. Furthermore, since item $(i)$ of Theorem 1 determines the set of zeros of $H^{(k)}$ in (2) and items (ii)-(iii) don't provide zeros for $H^{(k)}$, we can assume that $m \geq k-1$.

[^3]
### 5.1 Case $k$ even

In this case, by item (iv) in Theorem 1, we get that for all $r \in[-1, k-2]$ and $m \geq k-1$,

$$
H_{m k+r}=(-1)^{r+1} \sum_{i=0}^{l}\left[\binom{m-i-1}{i k+r}+\binom{m-i}{i k+r+1}\right] 2^{m-i(k+1)-r-2}
$$

where $l=m-1$ if $k=2$, and $l=\lfloor m /(k-1)\rfloor$ if $k>2$. So, for $n=m k+r \geq$ $k^{2}-k-1$, we have $H_{n}<0$ if $n$ is even, while $H_{n}>0$ if $n$ is odd, given that $n$ and $r$ have same parity because $k$ is even.

Thus, item $(i)$ of Theorem 1 implies that in this case the zero-multiplicity of $H^{(k)}$ is exactly $k(k-1) / 2$, confirming Conjecture 1 in this case.

### 5.2 Case $k$ odd

Since we verified in our previous work [5] that $\# \mathcal{Z}\left(H^{(k)}\right)=k(k-1) / 2$ for $k \in[4,500]$, we will assume that $H_{n}=0$, for $n=m k+r$, with $m \geq k-1, r \in$ [ $-1, k-2$ ] and $k>500$ odd.

### 5.2.1 A lower bound for $n$ in terms of $k$

By item (iv) of Theorem 1 , we have after simplifying a factor of $2^{m-r-2}$, that

$$
\begin{equation*}
\sum_{i=0}^{l}(-1)^{i} \psi(m-i-1, i k+r) 2^{-i(k+1)}=0, \quad \text { for } \quad l=\lfloor m /(k-1)\rfloor \tag{41}
\end{equation*}
$$

We note that in the sum of equation (41), the term for $i=0$ is non-zero since $r \leq k-2<k-1 \leq m$, which implies that $r \leq m-1$ and therefore $\psi(m-1, r) \neq 0$. If the case $i=0$ were the only for which $\psi(m-i-1, i k+r)$ is non-zero, we would have that equation (41) has no solution and our problem of zero multiplicity for the odd $k$ case would be solved. So, we must assume that at least two terms of the above sum (the first with $i=0$ and the second with $i$ odd) are non-zero.

Next, we take $l^{\prime}$ to be the largest index $i>0$ for which the $i$-th term of the sum in equation (41) is non-zero and see that equation (41) takes the form

$$
\sum_{i=0}^{l^{\prime}}(-1)^{i} \psi(m-i-1, i k+r) 2^{-i(k+1)}=0, \quad \text { for } 0<l^{\prime} \leq\lfloor m /(k-1)\rfloor
$$

where $\psi\left(m-l^{\prime}-1, l^{\prime} k+r\right)$ is non-zero.
Separating the case $i=l^{\prime}$, we get

$$
\psi\left(m-l^{\prime}-1, l^{\prime} k+r\right)=2^{k+1} \sum_{i=0}^{l^{\prime}-1}(-1)^{l^{\prime}+i} \psi(m-i-1, i k+r) 2^{\left(l^{\prime}-i-1\right)(k+1)}
$$

with $l^{\prime}-i-1 \geq 0$ for all $i=0, \ldots, l^{\prime}-1$. Hence,

$$
2^{k+1} \mid \psi\left(m-l^{\prime}-1, l^{\prime} k+r\right), \quad \text { where } \quad l^{\prime} \leq\lfloor m /(k-1)\rfloor .
$$

Now,

$$
\psi(v, w)=\binom{v}{w}+\binom{v+1}{w+1}=\binom{v}{w}\left(1+\frac{v+1}{w+1}\right) .
$$

Kummer [9] proved that $\left.\nu_{2}\binom{v}{w}\right)$ equals the number of carries when adding $w$ with $v-w$ in base 2 . Here, for a nonzero integer $m, \nu_{2}(m)$ is the exponent of 2 in the factorization of $m$. In particular,

$$
\nu_{2}\left(\binom{v}{w}\right) \leq \frac{\log v}{\log 2}+1 .
$$

Hence,

$$
\begin{aligned}
\nu_{2}(\psi(v, w)) \leq \nu_{2}\left(\binom{v}{w}\right)+\nu_{2}(v+w+2) & \leq \frac{\log v}{\log 2}+1+\frac{\log (v+w+2)}{\log 2} \\
& \leq \frac{2 \log v}{\log 2}+2
\end{aligned}
$$

where for the last inequality we used the fact that we may assume that $w \leq v-2$ (indeed, if $w=v$, then $\psi(v, w)=2$, so the above bound holds while if $w=v-1$, then $\psi(v, w)=2 v+1$ is odd so the above bound again holds). Since

$$
2^{k+1} \mid \psi(v, w), \quad \text { for } \quad(v, w)=\left(m-l^{\prime}-1, l^{\prime} k+r\right)
$$

we get $\nu_{2}(\psi(v, w)) \geq k+1$. Hence,

$$
k+1 \leq \frac{2 \log v}{\log 2}+2, \quad \text { therefore } \quad v \geq 2^{(k-1) / 2}
$$

Since $m-l^{\prime}-1 \leq n$, we get that

$$
\begin{equation*}
2^{(k-1) / 2} \leq n \tag{42}
\end{equation*}
$$

### 5.2.2 An upper bound for $n$ in terms of $k$

We now review the preliminary work [5] on zero-multiplicity of $H^{(k)}$, to obtain a better upper bound for $n$ on $k$, which we then combine with the above lower bound (42). In [5], we used a Binet-type formula of $H_{n}$, namely

$$
H_{n}=f_{k}\left(\alpha_{1}\right) \alpha_{1}^{-(n+1)}+\cdots+f_{k}\left(\alpha_{k-1}\right) \alpha_{k-1}^{-(n+1)}+f_{k}\left(\alpha_{k}\right) \alpha_{k}^{-(n+1)}
$$

where $\alpha_{1}, \ldots, \alpha_{k-1}, \alpha_{k}$ are all the roots of the characteristic polynomial of $F^{(k)}$, with $\alpha_{1}>1$ being the only real root and the remaining $k-1$ roots lie inside the unit disk. Furthermore,
$\alpha_{1}>\left|\alpha_{2}\right| \geq \cdots \geq\left|\alpha_{k-1}\right| \geq\left|\alpha_{k}\right| \quad$ and $\quad f_{k}(z):=(z-1) /(2+(k+1)(z-2))$.

Thus, if $H_{n}=0$, then

$$
\begin{align*}
|\Lambda|:=\left|1+\left(\frac{f_{k}\left(\alpha_{k-1}\right)}{f_{k}\left(\alpha_{k}\right)}\right)\left(\frac{\alpha_{k}}{\alpha_{k-1}}\right)^{n+1}\right| & =\sum_{i=1}^{k-2}\left|\frac{f_{k}\left(\alpha_{i}\right)}{f_{k}\left(\alpha_{k}\right)}\right|\left|\frac{1}{\alpha_{i} / \alpha_{k}}\right|^{n+1} \\
& <\frac{3(k-2) /(k-1)}{\left|\alpha_{k-2} / \alpha_{k}\right|^{n+1}}\left|\frac{1}{f_{k}\left(\alpha_{k}\right)}\right|  \tag{43}\\
& <\frac{13 k(3 k+1)}{\left|\alpha_{k-2} / \alpha_{k}\right|^{n+1}} .
\end{align*}
$$

Using an argument involving lower bounds for nonzero linear forms in logarithms of complex algebraic numbers, we found

$$
\begin{equation*}
|\Lambda|>\exp \left(-5 \cdot 10^{13} \times k^{7} \log (n+1)(\log k)^{2}\right) \tag{44}
\end{equation*}
$$

The following result will be fundamental to combine inequalities (43) and (44), in order to find a better upper bound for $n$ on $k$ that one given in [5]. The next lemma is Theorem 1 in [6] and represents an improvement over the analogous inequality in [2].

Lemma 6. The inequality

$$
\frac{\left|\alpha_{i}\right|}{\left|\alpha_{j}\right|}>1+\frac{1}{10 k^{9.6}(\pi / e)^{k}} \quad \text { holds for all } \quad 1 \leq i<j \leq(k-1) / 2
$$

and all $k \geq 4$.
Hence, by inequalities (43), (44) and Lemma 6

$$
\begin{equation*}
n<3 \cdot 10^{14} k^{17.6}(\log k)^{3}(\pi / e)^{k} . \tag{45}
\end{equation*}
$$

### 5.2.3 Absolute bounds for $n, k$ and final conclusion

Combining (42) and (45), we get

$$
\left(\frac{\sqrt{2}}{(\pi / e)}\right)^{k}<3 \sqrt{2} \cdot 10^{14} k^{17.6}(\log k)^{3}
$$

showing that $k \leq 790$.
By (43) and (44), we have

$$
\begin{equation*}
5 \cdot 10^{13} \times k^{7} \log (n+1)(\log k)^{2}>\log \left|\frac{f_{k}\left(\alpha_{k}\right)}{3}\right|+(n+1) \log \left|\frac{\alpha_{k-2}}{\alpha_{k}}\right| \tag{46}
\end{equation*}
$$

Thus, using the fact that $k \in[501,789]$, we obtain computationally an upper bound on $n$ in each case:

$$
\text { If } H_{n}=0 \text { and } k \in[501,789] \text {, then } n \in 2.5 \cdot 10^{45} .
$$

Returning to inequality (42), we have $2^{(k-1) / 2}<n<2.5 \cdot 10^{45}$ which leads to $k \leq 517$. Finally, we return once again to (46) where now we get $n<3.5 \cdot 10^{43}$ for all odd $k \in[501,517]$. Then, by (42), we conclude that $k<500$, contradicting our initial assumption about $k$.

This completes the proof of Conjecture 1 for the case of $k$ odd.
