# Extensions of locally analytic generalized parabolic Steinberg representations for $\mathrm{GL}_{n}$ 

Yiqin He *

#### Abstract

Let $L$ be a finite extension of $\mathbf{Q}_{p}$. In this paper, we study the locally $\mathbf{Q}_{p}$-analytic generalized parabolic Steinberg representations of $\mathrm{GL}_{n}(L)$ which are associated to a Zelevinsky-segment. We then compute the Ext-groups of them. They are related to the (parabolic) Breuil's simple $\mathcal{L}$-invariants, which arise in the automorphic side of a conjectured $p$-adic local Langlands correspondence.

## 1 Introduction

Let $L$ (resp. $E$ ) be a finite extension of $\mathbb{Q}_{p}$. Suppose that $E$ is sufficiently large containing all the embeddings $\Sigma_{L}:=\left\{\sigma: L \hookrightarrow \overline{\mathbb{Q}}_{p}\right\}$ of $L$ in $\overline{\mathbb{Q}}_{p}$.

In this paper, we study some locally $\mathbf{Q}_{p}$-analytic generalized parabolic Steinberg representations of $\mathrm{GL}_{n}(L)$ (constructed by locally $\mathbf{Q}_{p}$-analytic parabolic induction), which are given by a Zelevinskysegment. The heart of this paper is a computation of the Ext ${ }^{1}$-groups of them. They arise from the automorphic side of the $p$-adic local Langlands program, the so-called parabolic Breuil's simple $\mathcal{L}$-invariants in [24]. These results are previously only known when they are induced from a Borel subgroup.

In Borel case, Yiwen Ding [15, Section 2] computes the extension groups of certain locally $\mathbb{Q}_{p}$-analytic generalized (Borel) Steinberg representations of $\mathrm{GL}_{n}(L)$ over $E$. In general, let $\mathbf{G}$ be a connected reductive algebraic group over $L$. In [28], Sascha Orlik computes the extensions of smooth generalized (Borel) Steinberg representations of $\mathbf{G}(L)$, in the category of smooth $G$-representations with coefficients in a certain self-injective ring $R$. Moreover, if $\mathbf{G}$ is split, then Lennart Gehramnn [21] also computes the extensions of locally analytic generalized (Borel) Steinberg representations of $\mathbf{G}(L)$, which gives a slight generalization of the above result of Ding.

Our paper will provides a "parabolic" version of Ding's results. We sketch the main results of this paper as follows.

Let $\Delta_{n}$ be the set of simple roots of $\mathrm{GL}_{n}$ (with respect to the Borel subgroup $\mathbf{B}$ of upper triangular matrices), and we identify the set $\Delta_{n}$ with $\{1,2, \cdots, n-1\}$. Let $\mathbf{T}$ be the torus of diagonal matrices. Fix two integers $k$ and $r$ such that $n=k r$. We put $\Delta_{n}(k):=\{r, 2 r, \cdots,(k-1) r\} \subseteq \Delta_{n}$ and $\Delta_{n}^{k}:=\Delta_{n} \backslash \Delta_{n}(k)$. For a subset $I \subseteq \Delta_{n}(k)$, we denote by $\mathbf{P}_{I}^{\langle r\rangle}$ the parabolic subgroup of GL ${ }_{n}$ containing the Borel subgroup B such that $\Delta_{n}(k) \backslash I$ are precisely the simple roots of the unipotent radical of $\mathbf{P}_{I}^{\langle r\rangle}$. Let $\mathbf{L}_{I}^{\langle r\rangle}$ be the Levi subgroup of $\mathbf{P}_{I}^{\langle r\rangle}$ containing the group $\mathbf{T}$ such that $I \cup \Delta_{n}^{k}$ is equal to the set of simple roots of $\mathbf{L}_{I}^{\langle r\rangle}$. Let $\overline{\mathbf{P}}_{I}^{\langle r\rangle}$ be the parabolic subgroup opposite to $\mathbf{P}_{I}^{\langle r\rangle}$. In particular, we have

$$
\mathbf{L}^{\langle r\rangle}:=\mathbf{L}_{\emptyset}^{\langle r\rangle}=\left(\begin{array}{cccc}
\mathrm{GL}_{r} & 0 & \cdots & 0 \\
0 & \mathrm{GL}_{r} & \cdots & 0 \\
\vdots & \vdots & \ddots & 0 \\
0 & 0 & 0 & \mathrm{GL}_{r}
\end{array}\right) \subset \mathbf{P}^{\langle r\rangle}:=\mathbf{P}_{\emptyset}^{\langle r\rangle}=\left(\begin{array}{cccc}
\mathrm{GL}_{r} & * & \cdots & * \\
0 & \mathrm{GL}_{r} & \cdots & * \\
\vdots & \vdots & \ddots & * \\
0 & 0 & 0 & \mathrm{GL}_{r}
\end{array}\right)
$$

For simplicity, if $I=\{i r\}$ for some $1 \leq i \leq k-1$, we put $\mathbf{L}_{i r}^{\langle r\rangle}:=\mathbf{L}_{\{i r\}}^{\langle r\rangle}$ and $\overline{\mathbf{P}}_{i r}^{\langle r\rangle}:=\overline{\mathbf{P}}_{\{i r\}}^{\langle r\rangle}$.
Let $\pi$ be a fixed irreducible cuspidal representation of $\mathrm{GL}_{r}(L)$ over $E$. Following [1], we consider the

Zelevinsky-segment (see also Section 6.1, Definition 6.1 and Definition 6.2)

$$
\begin{equation*}
\Delta_{[k-1,0]}(\pi):=\pi|\operatorname{det}|_{L}^{r-1} \otimes_{E} \cdots \otimes_{E} \pi|\operatorname{det}|_{L} \otimes_{E} \pi \tag{1.1}
\end{equation*}
$$

which forms an irreducible cuspidal smooth representation of $\mathbf{L}^{\langle r\rangle}(L)$ over $E$.
In the sequel, we put $G:=\operatorname{GL}_{n}(L)$. Let $\underline{\lambda}$ be a dominant weight of $\left(\operatorname{Res}_{L / \mathbb{Q}_{p}} \mathrm{GL}_{n}\right) \times{ }_{\mathbb{Q}_{p}} E$ with respect to $\left(\operatorname{Res}_{L / \mathbb{Q}_{p}} \mathbf{B}\right) \times \times_{\mathbb{Q}_{p}} E$. Let $L(\underline{\lambda})$ be the unique irreducible $\mathbb{Q}_{p}$-algebraic representation of $G$ with the highest weight $\underline{\lambda}$. Consider the locally $\mathbb{Q}_{p}$-algebraic representation

$$
\begin{equation*}
i \overline{\mathbf{P}}^{\langle r\rangle}(\pi, \underline{\lambda}):=\left(\operatorname{Ind}_{\overline{\mathbf{P}}^{\langle r\rangle}(L)}^{G} \delta_{\overline{\mathbf{P}}^{\langle r\rangle}(L)}^{1 / 2} \Delta_{[r-1,0]}(\pi)\right)^{\infty} \otimes L(\underline{\lambda}) \tag{1.2}
\end{equation*}
$$

(by tensoring a normalized smooth parabolic induction with a $\mathbb{Q}_{p}$-algebraic representation of $G$ ), where $\delta_{\overline{\mathbf{P}}^{\langle r\rangle}(L)}$ is the modulus character of $\overline{\mathbf{P}}^{\langle r\rangle}(L)$.

In this paper, we first define (and study) the locally $\mathbb{Q}_{p}$-algebraic generalized (parabolic) Steinberg representations $\left\{v_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{\infty}(\pi, \underline{\lambda})\right\}_{I \subseteq \Delta_{n}(k)}$ associated to the Zelevinsky-segment $\Delta_{[k-1,0]}(\pi)$ and weight $\underline{\lambda}$, and show that they are precisely the Jordan-Hölder factors of $i \overline{\mathbf{P}}^{G}\langle r\rangle(\pi, \underline{\lambda})$ (1.2). In particular, $\mathrm{St}_{(r, k)}^{\infty}(\pi, \underline{\lambda}):=$ $v_{\overline{\mathbf{P}}_{\emptyset}^{\langle r\rangle}}^{\infty}(\pi, \underline{\lambda})\left(\right.$ resp., $\left.\mathrm{St}_{(r, k)}^{\infty}(\pi):=\mathrm{St}_{(r, k)}^{\infty}(\pi, \underline{0})\right)$ is the locally $\mathbb{Q}_{p}$-algebraic (resp., smooth) parabolic Steinberg representation. We add the terminology "parabolic" to distinguish from the usual (Borel) Steinberg representation induced from the Borel subgroup $\mathbf{B}(L)$. Recall that the Jordan-Hölder factors of $i \underline{\overline{\mathbf{P}}^{\langle r\rangle}}(\pi, \underline{0})$ are classified by the orientations of some graph in [1, Section 2.2, Theorem], we also compare our approach (or description) to that of the earlier work.

We then define the locally $\mathbb{Q}_{p}$-analytic analogy $\left\{v_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{\text {an }}(\pi, \underline{\lambda})\right\}_{I \subseteq \Delta_{n}(k)}$ (the so-called locally $\mathbb{Q}_{p}$-analytic generalized parabolic Steinberg representations associated to the Zelevinsky-segment $\Delta_{[k-1,0]}(\pi)$ and weight $\underline{\lambda})$ of $\left\{v_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{\infty}(\pi, \underline{\lambda})\right\}_{I \subseteq \Delta_{n}(k)}$. Denote by $\mathrm{St}_{(r, k)}^{\mathrm{an}}(\pi, \underline{\lambda}):=v_{\overline{\mathbf{P}}^{\langle r\rangle}}^{\mathrm{an}}(\pi, \underline{\lambda})$ the locally $\mathbb{Q}_{p}$-analytic parabolic Steinberg representation. The Orlik-Strauch constructions (see [30, Theorem]) on locally $\mathbb{Q}_{p}$-analytic representations give a way to determine the composition factors of $v_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{\text {an }}(\pi, \underline{\lambda})$. By generalizing the results in [29], we establish the locally $\mathbb{Q}_{p}$-analytic (resp., locally $\mathbb{Q}_{p}$-algebraic) Tits complexes (see Section 4.3), and compute the multiplicities of certain composition factors of $v_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{\text {an }}(\pi, \underline{\lambda})$ by following the route of [29]. We refer to Theorem 4.6 for more detailed and more precise statements.

The main result of this paper is to compute the Ext-groups of locally $\mathbb{Q}_{p}$-analytic generalized parabolic Steinberg representations. We prove

Theorem 1.1. (Theorem 5.19) For $\mathrm{ir} \in \Delta_{n}(k)$, there exists an isomorphism of $E$-vector spaces

$$
\begin{equation*}
\operatorname{Hom}\left(L^{\times}, E\right) \xrightarrow{\sim} \operatorname{Ext}_{G}^{1}\left(v_{\overline{\mathbf{P}}_{i r}^{\langle r\rangle}}^{\infty}(\pi, \underline{\lambda}), \operatorname{St}_{(r, k)}^{\mathrm{an}}(\pi, \underline{\lambda})\right) \tag{1.3}
\end{equation*}
$$

In particular, we have $\operatorname{dim}_{E} \operatorname{Ext}_{G}^{1}\left(v_{\overline{\mathbf{P}}_{i r}^{\langle r\rangle}}^{\infty}(\pi, \underline{\lambda}), \operatorname{St}_{(r, k)}^{\mathrm{an}}(\pi, \underline{\lambda})\right)=d_{L}+1$.
See Section 2.3 for a precise definition of the $\operatorname{Ext}_{G}^{1}$-group on locally $\mathbf{Q}_{p}$-analytic representations. Moreover, for $\psi \in \operatorname{Hom}\left(L^{\times}, E\right)$, we will give an explicit construction of the locally $\mathbb{Q}_{p}$-analytic representation $\widetilde{\Sigma}_{i}^{\langle r\rangle}(\pi, \underline{\lambda}, \psi)$, which is an extension of $v_{\overline{\mathbf{P}}_{i r}^{\langle r\rangle}}^{\infty}(\pi, \underline{\lambda})$ by $\operatorname{St}_{(r, k)}^{\mathrm{an}}(\pi, \underline{\lambda})$ attached to $\psi$ via (1.3).

For $i r \in \Delta_{n}(k)$, we next find a subrepresentation $\Sigma_{i}^{\langle r\rangle}(\pi, \underline{\lambda})$ of $\mathrm{St}_{(r, k)}^{\mathrm{an}}(\pi, \underline{\lambda})$ in Section 5.5 , such that we have a natural isomorphism (see Proposition 5.34) of $E$-vector spaces

$$
\begin{equation*}
\operatorname{Hom}\left(L^{\times}, E\right) \xrightarrow{\sim} \operatorname{Ext}_{G}^{1}\left(v_{\overline{\mathbf{P}}_{i r}^{\langle r\rangle}}^{\infty}(\pi, \underline{\lambda}), \Sigma_{i}^{\langle r\rangle}(\pi, \underline{\lambda})\right) \tag{1.4}
\end{equation*}
$$

The subrepresentation $\Sigma_{i}^{\langle r\rangle}(\pi, \underline{\lambda})$ has a simpler and more clear structure than $\mathrm{St}_{(r, k)}^{\text {an }}(\pi, \underline{\lambda})$. We show that the socle of $\Sigma_{i}^{\langle r\rangle}(\pi, \underline{\lambda})$ is $\operatorname{St}_{(r, k)}^{\infty}(\pi, \underline{\lambda})$ (the author does not know if the socle of $\mathrm{St}_{(r, k)}^{\mathrm{an}}(\pi, \underline{\lambda})$ is $\mathrm{St}_{(r, k)}^{\infty}(\pi, \underline{\lambda})$, which
is actually true for $(r, k)=(2,2))$. The proof needs the very strongly admissibility of locally $\mathbb{Q}_{p}$-algebraic parabolic generalized Steinberg representation, which cannot be deduced directly from the strategy of the proof of [15, Proposition 2.23]. We prove it by using global methods (more precisely, the Emerton's completed cohomology for the Shimura variety associated to certain division algebra). For any $\psi \in \operatorname{Hom}\left(L^{\times}, E\right)$, we denote by $\Sigma_{i}^{\langle r\rangle}(\pi, \underline{\lambda}, \psi)$ the extension of $v_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{\infty}(\pi, \underline{\lambda})$ by $\Sigma_{i}^{\langle r\rangle}(\pi, \underline{\lambda})$ attached to $\psi$ via (1.4), which is a subrepresentation of $\widetilde{\Sigma}_{i}^{\langle r\rangle}(\pi, \underline{\lambda}, \psi)$. Moreover, we can show that $\widetilde{\Sigma}_{i}^{\langle r\rangle}(\pi, \underline{\lambda}, \psi)$ actually comes from $\Sigma_{i}^{\langle r\rangle}(\pi, \underline{\lambda}, \psi)$ by pushing forward along the injection $\Sigma_{i}^{\langle r\rangle}(\pi, \underline{\lambda}) \hookrightarrow \mathrm{St}_{(r, k)}^{\mathrm{an}}(\pi, \underline{\lambda})$. In Remark 1.3, We describe how this theorem is related with the parabolic simple $\mathcal{L}$-invariants in $p$-adic local Langlands correspondence.

## Sketch of the proof of Theorem 1.1

The proof follows along the route of [15, Section 2.2]. To complete the computations, we need some technical calculations. We briefly explain the basic strategy and point out the difficulties.

For any subset $I \subseteq \Delta_{n}(k)$, it follows from [1, Proposition 2.10] that the smooth parabolic induction

$$
\left(\operatorname{Ind}_{\overline{\mathbf{P}}^{\langle r\rangle}(L) \cap \mathbf{L}_{I}^{\langle r\rangle}(L)}^{\langle r\rangle} \delta_{\overline{\mathbf{P}}^{\langle r\rangle}(L)}^{1 / 2} \Delta_{[r-1,0]}(\pi)\right)^{\infty}
$$

admits a unique irreducible subrepresentation $\pi_{I}$, which is a smooth representation of the Levi subgroup $\mathbf{L}_{I}^{\langle r\rangle}(L)$ over $E$. In particular, when $r=1$ (i.e., the Borel case), we see that $\pi_{I}$ is just the trivial representation of $\mathbf{L}_{I}^{\langle 1\rangle}(L)$ over $E$.

As a preliminary, we compute smooth extension groups between $\left\{v_{\overline{\mathbf{P}}_{I}^{\infty\rangle}}^{\infty}(\pi)\right\}_{I \subseteq \Delta_{n}(k)}$. See Appendix 6.4 for a collection of such results. The locally $\mathbb{Q}_{p}$-analytic (resp., locally $\mathbb{Q}_{p}$-algebraic) Tits complexes (see Section 4.3) show that locally $\mathbb{Q}_{p}$-analytic parabolic Steinberg representation is derived equivalent to a complex of (direct sum of) parabolically induced locally $\mathbb{Q}_{p}$-analytic (resp., locally $\mathbb{Q}_{p}$-algebraic) principal series. We reduce our problem (i.e., the computation of the extension group (1.3)) to the computation of some extension groups (see Lemma 5.9). Then by using some spectral sequences, Bruhat filtration (see Section 5.3), and dévissage arguments, the computations of extension groups (5.14) and (5.15) are reduced to calculations of $\operatorname{Ext}_{\mathbf{L}_{I}^{\langle r\rangle}(L)}^{i}\left(\pi_{I}, \pi_{I}\right)$ and $\operatorname{Ext}_{\mathbf{L}_{I}}^{i}{ }_{I}^{r\rangle}(L), Z_{n}=\eta\left(\pi_{I}, \pi_{I}\right)$, where $\operatorname{Ext}_{\mathbf{L}_{I}^{\langle r\rangle}(L), Z_{n}=\eta}^{i}\left(\pi_{I}, \pi_{I}\right)$ consists of extensions on which the center $Z_{n}$ of $G$ acts via certain character $\eta$.

In the Borel case, we have explicit expressions

$$
\operatorname{Ext}_{\mathbf{L}_{I}^{\langle 1\rangle}(L)}^{i}(1,1) \cong \mathrm{H}_{\mathrm{an}}^{i}\left(\mathbf{L}_{I}^{\langle 1\rangle}(L), E\right)\left(\operatorname{resp} . \operatorname{Ext}_{\mathbf{L}_{I}^{\langle 1\rangle}(L), Z_{n}=1}^{1}(1,1) \cong \mathrm{H}_{\mathrm{an}}^{i}\left(\mathbf{L}_{I}^{\langle 1\rangle}(L) / Z_{n}, E\right)\right)
$$

The reason that $r>1$ causes technical issues is that we cannot compute the (or determine the dimensions of) extension groups $\operatorname{Ext}_{\mathbf{L}_{I}}^{i}{ }_{I}^{r\rangle}(L),\left(\pi_{I}, \pi_{I}\right)$ and $\operatorname{Ext}_{\mathbf{L}_{I}^{i r\rangle}(L), Z=\eta}^{i}\left(\pi_{I}, \pi_{I}\right)$ explicitly, since the cuspidal smooth representation $\pi$ appears in a (parabolic) Zelevinsky-segment. Thus we cannot evaluate the right dimensions of Ext ${ }^{1}$-groups directly as in the discussion of [15, Corollary 2.16,Theorem 2.19]. But in Borel case, $\pi$ is the trivial representation, all these become trivial. We still are able to overcome this obstacle.

Firstly, the theory of types of Bushnell and Kutzko (more precisely, the semisimple Bushnell-Kutzko types for $\mathrm{GL}_{n}$, which classify the cuspidal smooth representations of $\mathrm{GL}_{n}$ over $\overline{\mathbf{Q}}_{p}$ or complex field $\mathbb{C}$ ) will give a way to compute smooth extension groups $\operatorname{Ext}_{\mathbf{L}_{I}^{〔 r\rangle}(L)}^{i, \infty}\left(\pi_{I}, \pi_{I}\right), \operatorname{Ext}_{\mathbf{L}_{I}^{\langle r\rangle}(L), Z=\eta}^{i, \infty}\left(\pi_{I}, \pi_{I}\right)$ explicitly (see Appendix, Lemma 6.6). Secondly, we point out that in general the locally analytic extension groups $\operatorname{Ext}_{\mathbf{L}_{I}^{i r\rangle}(L)}^{i}\left(\pi_{I}, \pi_{I}\right)$ and $\operatorname{Ext}_{\mathbf{L}_{I}^{\langle r\rangle}(L), Z=\eta}^{i}\left(\pi_{I}, \pi_{I}\right)$ are much harder to calculate than the smooth case. But we still have canonical morphisms

$$
\operatorname{Ext}_{\mathbf{L}_{I}^{\langle 1\rangle}(L)}^{1}(1,1) \rightarrow \operatorname{Ext}_{\mathbf{L}_{I}^{\langle r\rangle}(L)}^{1}\left(\pi_{I}, \pi_{I}\right), \operatorname{Ext}_{\mathbf{L}_{I}^{\langle 1\rangle}(L), Z_{n}=1}^{1}(1,1) \rightarrow \operatorname{Ext}_{\mathbf{L}_{I}^{\langle r\rangle}(L), Z=\eta}^{1}\left(\pi_{I}, \pi_{I}\right)
$$

The author does not know whether they are isomorphisms in general. In this paper, we compute explicitly the extension groups $\operatorname{Ext}_{\mathbf{L}_{I}^{\langle r\rangle}(L)}^{i}\left(\pi_{I}, \pi_{I}\right)$ and $\operatorname{Ext}_{\mathbf{L}_{I}^{\langle r\rangle}(L), Z_{n}=\eta}^{i}\left(\pi_{I}, \pi_{I}\right)$ for $i \in\{0,1\}$ and $I=\Delta_{n}(k), \Delta_{n}(k) \backslash\{j r\}$
(see Lemma 6.6 and Lemma 5.7). In these special cases, some spectral sequences degenerate (see Lemme 2.3 and the proof of Lemma 5.7, these spectral sequences link locally analytic extension groups to smooth extension groups. ), so that the above morphisms are isomorphisms.

Based on these results, we define and show the injectivity of the following morphism

$$
\begin{equation*}
\varrho_{\{i r\}, \emptyset}^{\sharp}: \operatorname{Hom}\left(\mathbf{Z}^{\langle r\rangle}(L), E\right) / \operatorname{Hom}\left(\mathbf{Z}_{i r}^{\langle r\rangle}(L), E\right) \longrightarrow \operatorname{Ext}_{G}^{1}\left(v_{\overline{\mathbf{P}}_{i r}^{\langle r\rangle}}^{G}(\pi, \underline{\lambda}), \operatorname{St}_{(r, k)}^{\mathrm{an}}(\pi, \underline{\lambda})\right) . \tag{1.5}
\end{equation*}
$$

This is the heart of Section 5.4. We next show that $\varrho_{\{i r\}, \emptyset}^{\sharp}$ is actually an isomorphism by comparing dimensions (this strategy is similar to the discussion of [15, Corollary 2.16,Theorem 2.19]). For general $J \subset I$ with $|I|=|J|+1$, the author does not know whether the above discussion is true for $\operatorname{Ext}_{G}^{1}\left(v_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{G}(\pi, \underline{\lambda}), v_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}}^{G}(\pi, \underline{\lambda})\right)$. Along the construction of the map $\varrho_{\{i r\}, \emptyset}^{\sharp}$, we will obtain an explicit description of locally $\mathbb{Q}_{p}$-analytic representation $\widetilde{\Sigma}_{i}^{\langle r\rangle}(\pi, \underline{\lambda}, \psi)$ (i.e., the extension of $v_{\overline{\mathbf{P}}_{i r}^{\langle r\rangle}}^{\infty}(\pi, \underline{\lambda})$ by $\mathrm{St}_{(r, k)}^{\text {an }}(\pi, \underline{\lambda})$ attached to $\psi$ via (1.3)).

Remark 1.2. Applying our results to $r=1$ and $\pi=|\operatorname{det}|_{L}^{\frac{1-n}{2}}$, our locally $\mathbb{Q}_{p}$-algebraic (resp., locally $\mathbb{Q}_{p}$-analytic) generalized parabolic Steinberg representations $\left\{v_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{\infty}(\pi)\right\}_{I \subseteq \Delta_{n}(k)}$ (resp., $\left.\left\{v_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{\text {an }}(\pi)\right\}_{I \subseteq \Delta_{n}(k)}\right)$ become the "classcial" locally $\mathbb{Q}_{p}$-algebraic generalized (Borel) Steinberg representations (resp., locally $\mathbb{Q}_{p}$ analytic generalized (Borel) Steinberg representations). In this case, our results are collapsed to Ding's results [15, Section 2]. For general reductive group, it may happen that no Borel subgroup exists (G may be not quasi-spilt). Motivated from the results of Lennart Gehramnn [21], we expect our (parabolic version) results can be generalized to connected reductive group $\mathbf{G}(L)$ (no longer split or quasi-split), this is the content of our future work.

Remark 1.3. (Parabolic simple $\mathcal{L}$-invariants) It would be more natural to put our locally $\mathbf{Q}_{p}$-analytic representations in the framework of p-adic Langlands program, which appear naturally in the automorphic side of p-adic Langlands program. In [24], the results in this paper are called (parabolic) Breuil's simple $\mathcal{L}$-invariants. In the work of author [24], for certain potentially semistable Galois representation $\rho_{L}$ of $\mathrm{Gal}_{L}$ which admits a non-critical special parabolization, we will define parabolic Fontaine-Mazur simple $\mathcal{L}$-invariants $\mathcal{L}\left(\rho_{L}\right)$ of $\rho_{L}$ by using cohomology of $(\varphi, \Gamma)$-modules over Robba ring, which encode some Galois information of an admissible Hodge filtration on some linear algebra data via Fontaine's theory. Then the locally $\mathbf{Q}_{p}$-analytic representation $\Sigma_{i}^{\langle r\rangle}(\alpha, \pi, \underline{\lambda}, V)$ (see the argument after (1.4)) will carry the Galois information $\mathcal{L}\left(\rho_{L}\right)$. Moreover, we use Bernstein eigenvarieties (developed by Breuil-Ding [13]) to establish some local-global compatibility results,i.e., the correspondence between these two parabolic simple $\mathcal{L}$-invariants can be realized in the p-adic completed cohomology of some Shimura varieties (especially, in the space of p-adic automorphic forms on certain definite unitary group). The above parabolic Fontaine-Mazur simple $\mathcal{L}$-invariants are extension parameters at simple roots. The next goal is to explore generalizations of Breuil's $\mathcal{L}$-invariants that conjecturally correspond to higher Fontaine-Mazur $\mathcal{L}$-invariants (or parabolic Fontaine-Mazur $\mathcal{L}$-invariants) at non-simple roots. See [8] (the locally analytic Ext ${ }^{1}$-conjecture) for general picture. See [40], [9] and [31]) for partial development.

Remark 1.4. A modification of the recent work of Zicheng Qian [32] may give a way to compute the higher Ext-groups $\operatorname{Ext}_{G}^{i}\left(v_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{\mathrm{an}}(\pi, \underline{\lambda}), v_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}}^{\mathrm{a}}(\pi, \underline{\lambda})\right)$ for general $J \subseteq I \subseteq \Delta_{n}(k)$. In this paper, the author prove certain decomposition for the space of locally analytic distributions to compute the $N$-homology and gives a locally analytic version of Bernstein-Zelevinsky geometric lemma. Inspired by these technical ingredients, we expect that this Ext-group only depends on $|J|-|I|$ and plays a crucial role in finding the counterpart of the parabolic Higher Fontaine-Mazur $\mathcal{L}$-invariants in the locally analytic representations of $G$. Since we only concern parabolic Fontaine-Mazur simple $\mathcal{L}$-invariants, Theorem 1.1 (or Theorem 5.19) is enough for our application.

## Acknowledgements

This is part of the author's PhD thesis in the School of Mathematical Sciences of Peking University. I would like to express my sincere gratitude to my advisor Yiwen Ding for introducing me to this subject,
for many helpful discussion and suggestions, and for his comments on earlier draft of this paper. This work is funded by the Natural Science Foundation of China [grant numbers 8200905010, 8200800065].

## 2 Preliminaries

### 2.1 General notation

Let $L$ (resp. $E$ ) be a finite extension of $\mathbb{Q}_{p}$ with $\mathcal{O}_{L}$ (resp. $\mathcal{O}_{E}$ ) as its ring of integers and $\varpi_{L}$ (resp. $\varpi_{E}$ ) a uniformizer. Suppose $E$ is sufficiently large, containing all the embeddings of $L$ in $\overline{\mathbb{Q}}_{p}$. Put $\Sigma_{L}:=\{\sigma$ : $\left.L \hookrightarrow \overline{\mathbb{Q}}_{p}\right\}=\{\sigma: L \hookrightarrow E\}$, the set of all the embeddings of $L$ in $\overline{\mathbb{Q}}_{p}$ (equivalently, in $E$ ). Let $k_{E}$ be the residue field of $E$. Let $\mathrm{val}_{L}(\cdot)$ (resp. val $l_{p}$ ) be the $p$-adic valuation on $\overline{\mathbb{Q}_{p}}$ normalized by sending uniformizers of $\mathcal{O}_{L}$ (resp. of $\left.\mathbb{Z}_{p}\right)$ to 1 . Let $d_{L}:=\left[L: \mathbb{Q}_{p}\right]=\left|\Sigma_{L}\right|$, let $e_{L}:=\operatorname{val} l_{L}\left(\varpi_{L}\right)$ and let $f_{L}:=d_{L} / e_{L}$. We have $q_{L}:=p^{f_{L}}=\left|\mathcal{O}_{L} / \varpi_{L}\right|$.

## General setting on Reductive groups and Lie algebras

For a Lie algebra $\mathfrak{h}$ over $L$, and $\sigma \in \Sigma_{L}$, let $\mathfrak{h}_{\sigma}:=\mathfrak{h} \otimes_{L, \sigma} E$ (which is a Lie algebra over $E$ ). For $J \subseteq \Sigma_{L}$, let $\mathfrak{h}_{J}:=\prod_{\sigma \in J} \mathfrak{g}_{\sigma}$. In particular, we have $\mathfrak{h}_{\Sigma_{L}} \cong \mathfrak{h} \otimes_{\mathbb{Q}_{p}} E$. The notation $U(\mathfrak{g})$ refers to the universal enveloping algebra of $\mathfrak{g}$ over $L$. Let $\mathbf{H}$ be an algebraic group over $L$, and $\mathfrak{h}$ be its Lie algebra over $L$. Let $\operatorname{Res}_{L / \mathbb{Q}_{p}} \mathbf{H}$ be the scalar restriction of $\mathbf{H}$ from $L$ to $\mathbb{Q}_{p}$. The Lie algebra of $\operatorname{Res}_{L / \mathbb{Q}_{p}} \mathbf{H}$ over $\mathbb{Q}_{p}$ can also be identified with $\mathfrak{h}$, where $\mathfrak{h}$ is regarded as a Lie algebra over $\mathbb{Q}_{p}$. We write $\mathbf{H}_{/ E}=\left(\operatorname{Res}_{L / \mathbb{Q}_{p}} \mathbf{H}\right) \times_{\mathbb{Q}_{p}} E$, which is an algebraic group over $E$. The Lie algebras of $\mathbf{H}_{/ E}$ over $E$ is $\mathfrak{h}_{\Sigma_{L}}$. Let $\mathbf{G}$ be a split connected reductive group over $L$, and $\mathfrak{g}$ be its Lie algebra over $L$. We fix a maximal split torus $\mathbf{T}$ and write $\mathbf{B}$ for a choice of Borel subgroup containing $\mathbf{T}$. We use $\mathbf{P}$ for the parabolic subgroup of $\mathbf{G}$ containing $\mathbf{B}$, and let $\mathbf{L}_{\mathbf{P}}$ be the Levi subgroup of $\mathbf{P}$ containing $\mathbf{T}$. Let $\mathbf{N}_{\mathbf{P}}$ be the unipotent radical of $\mathbf{P}$. Then $\mathbf{P}$ admits a Levi decomposition $\mathbf{P}=\mathbf{L}_{\mathbf{P}} \mathbf{N}_{\mathbf{P}}$. The Lie algebras (over $L$ ) of subgroups $\mathbf{T}, \mathbf{B}, \mathbf{P}, \mathbf{L}_{\mathbf{P}}, \mathbf{N}_{\mathbf{P}}$ are denoted by $\mathfrak{t}, \mathfrak{b}, \mathfrak{p}, \mathfrak{l}_{\mathbf{P}}, \mathfrak{n}_{\mathbf{P}}$ respectively.

Note that the group $\mathbf{G}_{/ E}$ is also a split-connected reductive group over $E$ with maximal split torus $\mathbf{T}_{/ E}$, Borel subgroup $\mathbf{B} / E$, parabolic subgroup $\mathbf{P}_{/ E}$, and $\mathbf{L}_{\mathbf{P} / E}$ is also the Levi subgroup of $\mathbf{L}_{\mathbf{P} / E}$ containing $\mathbf{T}_{/ E}$. The Lie algebras (over $E$ ) of reductive groups $\mathbf{G}_{/ E}, \mathbf{P}_{/ E}$, and $\mathbf{L}_{\mathbf{P} / E}$ are given by $\mathfrak{g}_{\Sigma_{L}}, \mathfrak{p}_{\Sigma_{L}}$ and $\mathfrak{l}_{\mathbf{P}, \Sigma_{L}}$.

## General linear group $\mathrm{GL}_{n}$ - I

Let $\mathrm{GL}_{n}$ be the general linear group over $L$. Let $\Delta_{n}$ be the set of simple roots of GL ${ }_{n}$ (with respect to the Borel subgroup $\mathbf{B}$ of upper triangular matrices). We identify the set $\Delta_{n}$ with $\{1, \cdots, n-1\}$ such that $i \in\{1, \cdots, n-1\}$ corresponds to the simple root $\alpha_{i}:\left(x_{1}, \cdots, x_{n}\right) \in \mathfrak{t} \mapsto x_{i}-x_{i+1}$, where $\mathfrak{t}$ denotes the $L$-Lie algebra of the torus $\mathbf{T}$ of diagonal matrices.

For a subset $I \subset \Delta_{n}$, we define an ordered partition $\underline{n}_{I}=\left(n_{1}, \cdots, n_{\left|\Delta_{n} \backslash I\right|+1}\right)$ of $n$ with $\Delta_{n} \backslash I=$ $\left\{n_{1}, n_{1}+n_{2}, \cdots, n_{1}+\cdots+n_{\left|\Delta_{n} \backslash I\right|+1}\right\}$. Let $\mathbf{P}_{I}$ be the parabolic subgroup of $\mathrm{GL}_{n}$ containing $\mathbf{B}$ such that $\Delta_{n} \backslash I$ are precisely the simple roots of the unipotent radical $\mathbf{N}_{I}$ of $\mathbf{P}_{I}$. Denote by $\mathbf{L}_{I}$ the unique Levi subgroup of $\mathbf{P}_{I}$ containing $\mathbf{T}$, then $\mathbf{L}_{I}$ is isomorphic to $\mathrm{GL}_{n_{1}} \times \cdots \mathrm{GL}_{n_{\left|\Delta_{n} \backslash I\right|+1}}$, and $I$ is equal to the set of simple roots of $\mathbf{L}_{I}$. Let $\Phi_{I}^{+} \subset \Phi_{I}$ be the set of positive roots and roots of $\mathbf{L}_{I}$ with respect to $\mathbf{T} \subset \mathbf{L}_{I} \cap \mathbf{B}$. In particular, we have $\mathbf{P}_{\Delta_{n}}=\mathrm{GL}_{n}, \mathbf{P}_{\emptyset}=\mathbf{B}$. Let $\overline{\mathbf{P}}_{I}$ be the parabolic subgroup opposite to $\mathbf{P}_{I}$. Let $\mathbf{N}_{I}$ (resp. $\overline{\mathbf{N}}_{I}$ ) be the nilpotent radical of $\mathbf{P}_{I}$ (resp. $\overline{\mathbf{P}}_{I}$ ), let $\mathbf{Z}_{I}$ be the center of $\mathbf{L}_{I}$ and let $\mathbf{D}_{I}$ be the derived subgroup of $\mathbf{L}_{I}$. Then we have a Levi decomposition $\mathbf{P}_{I}=\mathbf{L}_{I} \mathbf{N}_{I}$ (resp. $\overline{\mathbf{P}}_{I}=\mathbf{L}_{I} \overline{\mathbf{N}}_{I}$ ). Let $\mathbf{Z}_{n}$ be the center of $\mathrm{GL}_{n}$. Let $\mathfrak{g}, \mathfrak{p}_{I}, \mathfrak{n}_{I}, \mathfrak{l}_{I}, \overline{\mathfrak{l}}_{I}, \overline{\mathfrak{p}}_{I}, \overline{\mathfrak{n}}_{I}, \mathfrak{d}_{I}, \mathfrak{z}_{I}, \overline{\mathfrak{z}}_{I}$ and $\mathfrak{t}$ be the $L$-Lie algebras of $\mathrm{GL}_{n}, \mathbf{P}_{I}, \mathbf{N}_{I}, \mathbf{L}_{I}, \mathbf{L}_{I} / \mathbf{Z}_{n}, \overline{\mathbf{P}}_{I}$, $\overline{\mathbf{N}}_{I}, \mathbf{D}_{I}, \mathbf{Z}_{I}, \mathbf{Z}_{I} / \mathbf{Z}_{n}$ and $\mathbf{T}$ respectively.

Let $\underline{\lambda}:=\left(\lambda_{1, \sigma}, \cdots, \lambda_{n, \sigma}\right)_{\sigma \in \Sigma_{L}}$ be a weight of $\mathfrak{t}_{\Sigma_{L}}$. For $I \subseteq \Delta_{n}=\{1, \cdots, n-1\}$, we call that $\underline{\lambda}$ is $I$ dominant with respect to $\mathbf{B}_{/ E}$ (resp. with respect to $\overline{\mathbf{B}}{ }_{/ E}$ ) if $\lambda_{i, \sigma} \geq \lambda_{i+1, \sigma}\left(\right.$ resp. $\left.\lambda_{i, \sigma} \leq \lambda_{i+1, \sigma}\right)$ for all $i \in I$ and $\sigma \in \Sigma_{L}$. We denote by $X_{I}^{+}\left(\right.$resp. $\left.X_{I}^{-}\right)$the set of $I$-dominant integral weights of $\mathfrak{t}_{\Sigma_{L}}$ with respect to $\mathbf{B}_{/ E}$
(resp. with respect to $\overline{\mathbf{B}} / E$ ). Note that $\underline{\lambda} \in X_{I}^{+}$if and only if $-\underline{\lambda} \in X_{I}^{-}$. For $\underline{\lambda} \in X_{I}^{+}$, there exists a unique irreducible algebraic representation, denoted by $L(\underline{\lambda})_{I}$, of $\left(\mathbf{L}_{I}\right)_{/ E}$ with the highest weight $\underline{\lambda}$ with respect to $\left(\mathbf{L}_{I}\right)_{/ E} \cap \mathbf{B}_{/ E}$. We put $\bar{L}(-\underline{\lambda})_{I}:=\left(L(\underline{\lambda})_{I}\right)^{\vee}$, it is the irreducible algebraic representationof $\left(\mathbf{L}_{I}\right)_{/ E}$ with highest weight $-\underline{\lambda}$ with respect to $\left(\mathbf{L}_{I}\right)_{/ E} \cap \overline{\mathbf{B}} / E$. Denote $\chi_{\underline{\lambda}}:=L(\underline{\lambda})_{\emptyset}$. If $\underline{\lambda} \in X_{\Delta_{n}}^{+}$, let $L(\underline{\lambda}):=L(\underline{\lambda})_{\Delta_{n}}$. Note that if $I \subseteq J \subseteq \Delta_{n}$, and $\underline{\lambda} \in X_{J}^{+}$, then we have $L(\underline{\lambda})_{J}^{\mathbf{N}_{I}(L) \cap \mathbf{L}_{J}(L)} \cong L(\underline{\lambda})_{I}$ (see [15, Page 7997]).

We view the $L$-points of the above groups as locally $\mathbb{Q}_{p}$-analytic groups. Throughout this paper, we put $G:=\operatorname{GL}_{n}(L)$. A $\mathbb{Q}_{p}$-algebraic representation of $G$ over $E$ is the induced action of $G \subset \mathrm{GL}_{n / E}(E)$ on an algebraic representation of $\mathrm{GL}_{n / E}$. By abuse of notatio, we will use the same notation to denote $\mathbb{Q}_{p}$-algebraic representations induced from an algebraic representation of $\mathrm{GL}_{n / E}$.

Let $\underline{\lambda}$ be an integral weight, denoted by $M(\underline{\lambda}):=\mathrm{U}\left(\mathfrak{g}_{\Sigma_{L}}\right) \otimes_{\mathrm{U}\left(\mathfrak{b}_{\Sigma_{L}}\right)} \underline{\lambda}\left(\right.$ resp., $\left.\bar{M}(\underline{\lambda}):=\mathrm{U}\left(\mathfrak{g}_{\Sigma_{L}}\right) \otimes_{\mathrm{U}\left(\overline{\mathfrak{b}}_{\Sigma_{L}}\right)} \underline{\lambda}\right)$, the corresponding Verma module with respect to $\mathfrak{b}_{\Sigma_{L}}\left(\right.$ resp., $\overline{\mathfrak{b}}_{\Sigma_{L}}$ ). Let $L(\underline{\lambda})$ (resp., $\bar{L}(\underline{\lambda})$ ) be the unique simple quotient of $M(\underline{\lambda})$ (resp., of $\bar{M}(\underline{\lambda})$ ). Actually, when $\underline{\lambda} \in X_{\Delta_{n}}^{+}$(i.e., $-\underline{\lambda} \in X_{\Delta_{n}}^{-}$), $L(\underline{\lambda})$ is finitedimensional and isomorphic to the algebraic representation $L(\underline{\lambda})$ introduced above (hence there is no conflict of notation). We have $\bar{L}(-\underline{\lambda}) \cong L(\underline{\lambda})^{\vee}$. In general, for any subset $I$ of $\Delta_{n}$, and $\underline{\lambda} \in X_{I}^{+}$, we define the generalized parabolic Verma module $M_{I}(\underline{\lambda}):=\mathrm{U}\left(\mathfrak{g}_{\Sigma_{L}}\right) \otimes_{\mathrm{U}\left(\mathfrak{p}_{I, \Sigma_{L}}\right)} L(\underline{\lambda})_{I}\left(\right.$ resp. $\bar{M}_{I}(-\underline{\lambda}):=\mathrm{U}\left(\mathfrak{g}_{\Sigma_{L}}\right) \otimes_{\mathrm{U}\left(\bar{p}_{I, \Sigma_{L}}\right)}$ $\left.\bar{L}(-\underline{\lambda})_{I}\right)$ with respect to $\mathfrak{p}_{I, \Sigma_{L}}\left(\right.$ resp. $\left.\overline{\mathfrak{p}}_{I, \Sigma_{L}}\right)$. Let $\rho$ be the half of the sum of positive roots of $\mathrm{GL}_{n}$. We have a dot action $\cdot$ of $\mathscr{W}_{n, \Sigma_{L}}$ on the weight $\underline{\lambda}$ given by $w \cdot \underline{\lambda}=w(\underline{\lambda}+\rho)-\rho$. Denote by $\mathscr{W}_{n}\left(\cong S_{n}\right)$ the Weyl group of $\mathrm{GL}_{n}$, and denote by $s_{i}$ the simple reflection corresponding to $i \in \Delta_{n}$. For any $I \subset \Delta_{n}$, define $\mathscr{W}_{I}$ as the subgroup of $\mathscr{W}_{n}$ generated by simple reflections $s_{i}$ with $i \in I$. The Weyl group of $\mathbf{G}_{/ E}$ is $\mathscr{W}_{n, \Sigma_{L}}:=\Pi_{\sigma \in \Sigma_{L}} \mathscr{W}_{n, \sigma} \cong S_{n}^{d_{L}}$, where $\mathscr{W}_{n, \sigma} \cong \mathscr{W}_{n}$ is the $\sigma$-th factor of $\mathscr{W}_{n, \Sigma_{L}}$. For $i \in \Delta_{n}$ and $\sigma \in \Sigma_{L}$, let $s_{i, \sigma} \in \mathscr{W}_{n, \sigma}$ be the simple reflection corresponding to $i \in \Delta_{n}$.

For any $I \subset \Delta_{n}$, define $\mathscr{W}_{I, \sigma}$ to be the $\sigma$-copy of $\mathscr{W}_{I}$, i.e., to be the subgroup of $\mathscr{W}_{n, \sigma}$ generated by simple reflections $s_{i, \sigma}$ with $i \in I$. For $S \subseteq \Sigma_{L}$ and $I \subset \Delta_{n}$, we put $\mathscr{W}_{I, S}:=\prod_{\sigma \in S} \mathscr{W}_{I, \sigma}$. If $\underline{i}_{S}:=\left(i_{\sigma}\right)_{\sigma \in S} \in$ $\Delta_{n}^{|S|}$, we put $s_{\underline{i}_{S}}:=\prod_{\sigma \in S} s_{i_{\sigma}, \sigma}$. Let $I, J$ be subsets of $\Delta_{n}$. Recall that $\mathscr{W}_{I} \backslash \mathscr{W}_{n} / \mathscr{W}_{J}$ has a canonical set of representatives, which we will denote by $\left[\mathscr{W}_{I} \backslash \mathscr{W}_{n} / \mathscr{W}_{J}\right]:=\left[\mathscr{W}_{I} \backslash \mathscr{W}_{n} / \mathscr{W}_{J}\right]^{\mathrm{min}}$, given by taking in each double coset the elements of minimal length. When $J=\emptyset$, we put ${ }^{I} \mathscr{W}_{n}=\left[\mathscr{W}_{I} \backslash \mathscr{W}_{n} / \mathscr{W}_{\emptyset}\right]^{\min }=\left[\mathscr{W}_{I} \backslash \mathscr{W}_{n}\right]^{\min }$. For $S \subseteq \Sigma_{L}$ and $I \subset \Delta_{n}$, we put ${ }^{I} \mathscr{W}_{n, S}:=\prod_{\sigma \in S}{ }^{I} \mathscr{W}_{n, \sigma}$. Moreover, we have relative Bruhat decompositions

$$
\begin{equation*}
G=\coprod_{w \in\left[\mathscr{W}_{I} \backslash \mathscr{W}_{n} / \mathscr{W}_{J}\right]} \mathbf{P}_{I}(L) w \mathbf{P}_{J}(L)=\coprod_{w \in\left[\mathscr{W}_{I} \backslash \mathscr{W}_{n} / \mathscr{W}_{J}\right]} \overline{\mathbf{P}}_{I}(L) w \overline{\mathbf{P}}_{J}(L) . \tag{2.1}
\end{equation*}
$$

## General linear group $\mathrm{GL}_{n}$-II

In this paper, we will study some locally $\mathbb{Q}_{p}$-algebraic and locally $\mathbb{Q}_{p}$-analytic representations given by a Zelevinsky-segment. We list the basic notation in the theory of the Zelevinsky-segment.

Let $k, r$ be two integers such that $n=k r$. We put $\Delta_{n}(k):=\{r, 2 r, \cdots,(k-1) r\} \subseteq \Delta_{n}$ and $\Delta_{n}^{k}:=$ $\Delta_{n} \backslash \Delta_{n}(k)$. For a subset $I \subset \Delta_{n}(k)$, we put

$$
\begin{align*}
& \mathbf{L}_{I}^{\langle r\rangle}:=\mathbf{L}_{\Delta_{n}^{k} \cup I}, \mathbf{P}_{I}^{\langle r\rangle}:=\mathbf{P}_{\Delta_{n}^{k} \cup I}, \overline{\mathbf{P}}_{I}^{\langle r\rangle}:=\overline{\mathbf{P}}_{\Delta_{n}^{k} \cup I},  \tag{2.2}\\
& \mathbf{N}_{I}^{\langle r\rangle}:=\mathbf{N}_{\Delta_{n}^{k} \cup I}, \overline{\mathbf{N}}_{I}^{\langle r\rangle}:=\overline{\mathbf{N}}_{\Delta_{n}^{k} \cup I}, \mathbf{Z}_{I}^{\langle r\rangle}:=\mathbf{Z}_{\Delta_{n}^{k} \cup I}, \mathbf{D}_{I}^{\langle r\rangle}:=\mathbf{D}_{\Delta_{n}^{k} \cup I}
\end{align*}
$$

Let $\mathfrak{l}_{I}^{\langle r\rangle}, \overline{\mathfrak{l}}_{I}^{\langle r\rangle}, \mathfrak{p}_{I}^{\langle r\rangle}, \mathfrak{n}_{I}^{\langle r\rangle}, \overline{\mathfrak{p}}_{I}^{\langle r\rangle}, \overline{\mathfrak{n}}_{I}^{\langle r\rangle}, \mathfrak{d}_{I}^{\langle r\rangle}, \mathfrak{z}_{I}^{\langle r\rangle}, \overline{\mathfrak{z}}_{I}^{\langle r\rangle}$ be the $L$-Lie algebras of $\mathbf{L}_{I}^{\langle r\rangle}, \mathbf{L}_{I}^{\langle r\rangle} / \mathbf{Z}_{n}, \mathbf{P}_{I}^{\langle r\rangle}, \mathbf{N}_{I}^{\langle r\rangle}, \overline{\mathbf{P}}_{I}^{\langle r\rangle}$, $\overline{\mathbf{N}}_{I}^{\langle r\rangle}, \mathbf{D}_{I}^{\langle r\rangle}$ and $\mathbf{Z}_{I}^{\langle r\rangle}, \mathbf{Z}_{I}^{\langle r\rangle} / \mathbf{Z}_{n}$ respectively. Furthermore, for $\underline{\lambda} \in X_{\Delta_{n}^{k} \cup I}^{+}$, we put

$$
\begin{align*}
& L^{\langle r\rangle}(\underline{\lambda})_{I}:=L(\underline{\lambda})_{\Delta_{n}^{k} \cup I}, \bar{L}^{\langle r\rangle}(-\underline{\lambda})_{I}:=\bar{L}(-\underline{\lambda})_{\Delta_{n}^{k} \cup I}, \\
& M_{I}^{\langle r\rangle}(\underline{\lambda}):=M_{\Delta_{n}^{k} \cup I}(\underline{\lambda}), \bar{M}_{I}^{\langle r\rangle}(-\underline{\lambda}):=\bar{M}_{\Delta_{n}^{k} \cup I}(-\underline{\lambda}) . \tag{2.3}
\end{align*}
$$

Similarly, for a subset $S \subset \Sigma_{L}$, we put

$$
\begin{equation*}
\mathscr{W}_{I}^{\langle r\rangle}:=\mathscr{W}_{\Delta_{n}^{k} \cup I}, \mathscr{W}_{I, S}^{\langle r\rangle}:=\mathscr{W}_{\Delta_{n}^{k} \cup I, S}, \mathscr{W}_{n, S}^{\langle r\rangle}:={ }_{n}^{k} \cup I \mathscr{W}_{n, S} \tag{2.4}
\end{equation*}
$$

When $I=\emptyset$, we omit the subscripts $I$ in (2.2), (2.3) and (2.4). For example, we have

$$
\mathbf{L}^{\langle r\rangle}:=\left(\begin{array}{cccc}
\mathrm{GL}_{r} & 0 & \cdots & 0 \\
0 & \mathrm{GL}_{r} & \cdots & 0 \\
\vdots & \vdots & \ddots & 0 \\
0 & 0 & 0 & \mathrm{GL}_{r}
\end{array}\right) \subseteq \overline{\mathbf{P}}^{\langle r\rangle}:=\left(\begin{array}{cccc}
\mathrm{GL}_{r} & 0 & \cdots & 0 \\
* & \mathrm{GL}_{r} & \cdots & 0 \\
\vdots & \vdots & \ddots & 0 \\
* & * & \cdots & \mathrm{GL}_{r}
\end{array}\right)
$$

The parabolic subgroups of $\mathrm{GL}_{n}$ containing the parabolic subgroup $\overline{\mathbf{P}}^{\langle r\rangle}$ are $\left\{\overline{\mathbf{P}}_{I}^{\langle r\rangle}\right\}_{I \subseteq \Delta_{n}(k)}$.

## Characters

For a topological commutative group $M$, we use $\operatorname{Hom}(M, E)\left(\operatorname{resp} . \operatorname{Hom}_{\infty}(M, E)\right)$ to denote the $E$-space of continuous (resp. locally constant) additive $E$-valued characters on $M$. If $M$ is a totally disconnected group, then the terminology "locally constant" is often replaced by smooth. If $M$ is a locally $L$-analytic group, denote by $\operatorname{Hom}_{\sigma}(M, E)$ the $E$-vector space of locally $\sigma$-analytic characters on $M$ (i.e., the continuous characters which are locally $\sigma$-analytic $E$-valued functions on $M$ ). The local class field theory implies a bijection $\operatorname{Hom}\left(L^{\times}, E\right) \cong \operatorname{Hom}\left(\operatorname{Gal}_{L}, E\right)$. Let $\alpha \in E^{\times}$, denote by $\operatorname{unr}(\alpha)$ the unramified character of $L^{\times}$ sending uniformizers to $\alpha$.

## Representation theory

Let $\mathbf{G}$ be a split connected reductive group over $L$, and $\mathbf{P}$ a parabolic subgroup of $\mathbf{G}$. Let $G, P, N_{P}, L_{P}$ be the $L$-points of $\mathbf{G}, \mathbf{P}, \mathbf{N}_{\mathbf{P}}, \mathbf{L}_{\mathbf{P}}$, respectively. Let $\bar{P}$ be the parabolic subgroup opposite to $P$.

If $V$ is a continuous representation of $G$ over $E$, we denote by $V^{\text {an }}$ its locally $\mathbb{Q}_{p}$-analytic vectors. If $V$ is locally $\mathbb{Q}_{p}$-analytic representations of $G$, we denote by $V^{\text {sm }}$ (resp. $V^{\text {lalg }}$ ) the smooth (resp, locally $\mathbb{Q}_{p}$-algebraic) subrepresentation of $V$ consisting of its smooth (locally $\mathbb{Q}_{p}$-algebraic) vectors (see [18], [19] and [34] and for details).

For $w \in \mathscr{W}_{n}$, we identify $w$ with the corresponding permutation matrix. If $H$ is a closed subgroup of $G$ and $(\rho, V)$ is an abstract representation of $H$ on an $E$-vector space $V$, we put $H^{w}:=w^{-1} H w$ (resp., $\left.{ }^{w} H:=w H w^{-1}\right)$, and $\rho^{w}(h):=\rho\left(w h w^{-1}\right)$. Then $\left(\rho^{w}, V\right)$ forms an abstract representation of $H^{w}$ on the same $E$-vector space $V$.

Let $\pi_{P}$ be a continuous Banach representation of $P$ over $E$. We denote by

$$
\left(\operatorname{Ind}_{P}^{G} \pi_{P}\right)^{\mathcal{C}^{0}}:=\left\{f: G \rightarrow \pi_{P} \text { continuous : } f(p g)=p f(g), \forall p \in P\right\}
$$

the continuous parabolic induction of $G$. It becomes a continuous representation of $G$ over $E$ by endowing the left action of $G$ with the right translation on functions: $(g f)\left(g^{\prime}\right)=f\left(g^{\prime} g\right)$. Likewise, let $\pi_{P}$ be a locally $\mathbb{Q}_{p}$-analytic representation of $P$ on a locally convex $E$-vector space of compact type, denoted by

$$
\left(\operatorname{Ind}_{P}^{G} \pi_{P}\right)^{\mathbb{Q}_{p}-\text { an }}:=\left\{f: G \rightarrow \pi_{P} \text { locally } \mathbb{Q}_{p} \text {-analytic }: f(p g)=p f(g), \forall p \in P\right\}
$$

the locally $\mathbb{Q}_{p}$-analytic parabolic induction of $G$. It becomes a locally $\mathbb{Q}_{p}$-analytic representation of $G$ on a locally convex $E$-vector space of compact type (see e.g., [25, Rem. 5.4]), by endowing the same left action of $G$.

Let $\pi_{P}$ be a smooth representation of $P$ over $E$. We denote by

$$
i_{P}^{G} \pi_{P}:=\left(\operatorname{Ind}_{P}^{G} \pi_{P}\right)^{\infty}=\left\{f: G \rightarrow \pi_{P} \text { smooth }: f(p g)=p f(g), \forall p \in P\right\}
$$

the (un-normalized) smooth parabolic induction. It becomes a smooth representation of $G$ over $E$ by endowing the left action of $G$ with the right translation on functions. Let $(\pi, V)$ be a smooth representation of $G$ over $E$. We denote by $r_{P}^{G} V=V /\left\langle\pi(n) v-v: n \in N_{P}, v \in V\right\rangle$ the Jacquet module of the smooth
representation $(\pi, V)$ with respect to $P$. Then $r_{P}^{G} V$ becomes a smooth $L_{P}$-representations over $E$. Denote by $\delta_{P}$ the modulus character of $P$. Let $V$ (resp. $W$ ) be a smooth $G$-representation (resp. $L_{P}$-representation) over $E$, then we have

$$
\begin{equation*}
\operatorname{Hom}_{G}\left(V, i_{P}^{G} W\right) \xrightarrow{\sim} \operatorname{Hom}_{L_{P}}\left(r_{P}^{G} V, W\right) \tag{2.5}
\end{equation*}
$$

Moreover, if $V$ and $W$ are admissible, we have

$$
\begin{equation*}
\operatorname{Hom}_{G}\left(i \frac{G}{P} W, V\right) \xrightarrow{\sim} \operatorname{Hom}_{L_{P}}\left(W \otimes_{E} \delta_{P}, r_{P}^{G} V\right) \tag{2.6}
\end{equation*}
$$

Smooth parabolic induction is a special case of smooth compact induction. Let $H$ be a closed subgroup of $G$, and $\pi_{H}$ be a smooth representation of $H$ over $E$. Let

$$
\begin{align*}
& c-i_{H}^{G} \pi_{H}:=\left(\mathrm{c}-\operatorname{Ind}_{H}^{G} \pi_{H}\right)^{\infty} \\
& =\{f: G \rightarrow H \text { smooth }: \text { the support of } f \text { is compact modulo } H, f(p g)=p f(g), \forall p \in P\} \tag{2.7}
\end{align*}
$$

be the smooth compact induction (or smooth induction with compact support). It becomes a smooth representation of $G$ over $E$ by endowing the left action of $G$ with the right translation on functions.

### 2.2 Preliminaries on locally $\mathbb{Q}_{p}$-analytic representations

In this section, let $H$ be a strictly paracompact locally $L$-analytic group (where strictly paracompact means that any open covering of $H$ can be refined into a covering by pairwise disjoint open subsets).

Let $V$ be a Hausdorff convex $E$-vector space. Let $\mathcal{C}^{\mathbb{Q}_{p}-\text { an }}(H, V)$ be the locally convex $E$-vector spaces of locally $\mathbb{Q}_{p}$-analytic $V$-valued functions on $H$ ([35, Section 2, Page 447], see also [19, Definintion 2.1.25]). Let $\mathcal{D}^{\mathbb{Q}_{p}-\mathrm{an}}(H, E)$ be the strongly dual space of $\mathcal{C}^{\mathbb{Q}_{p}-\mathrm{an}}(H, E)$, which is called the locally convex $E$-algebra of $E$-valued distributions on $G$ (see [35, Proposition 2.3]). We have an embedding $E[G] \rightarrow \mathcal{D}^{\mathbb{Q}_{p}-a n}(H, E)$ by sending $h \in H$ to the delta function $\delta_{h}:=[f \mapsto f(h)]$, with $f \in \mathcal{C}^{\mathbb{Q}_{p}-\text { an }}(H, V)$. By [35, Lemma 3.1], $E[G]$ generates a dense subspace in $\mathcal{D}^{\mathbb{Q}_{p}-\text { an }}(H, E)$. Let $\mathfrak{h}$ be the $L$-Lie algebra of $H$, and let $U_{E}(\mathfrak{h})=U(\mathfrak{h}) \otimes_{L} E$ be the universal enveloping algebra of $\mathfrak{h}$ over $E$. For any $X \in \mathfrak{h}, f \in \mathcal{C}^{\mathbb{Q}_{p}-\text { an }}(H, E)$, and $h \in H$, we define

$$
(X \cdot f)(h)=\left.\frac{d}{d t} f(\exp (-t X) h)\right|_{t=0}
$$

Such an $\mathfrak{h}$-action extends $E$-linearly to an action of $U_{E}(\mathfrak{h})$ on $\mathcal{C}^{\mathbb{Q}_{p}-\text { an }}(H, E)$, which induces an injection $U_{E}(\mathfrak{h}) \hookrightarrow \mathcal{D}^{\mathbb{Q}_{p}-\mathrm{an}}(H, E)$.

Let $\mathcal{C}^{\infty}(H, E)$ denote the $E$-vector spaces of locally constant $E$-valued functions on $H$, and let $\mathcal{D}^{\infty}(H, E)$ denote its dual. The map $h \mapsto \delta_{h}$ induces in fact an injection $E[H] \hookrightarrow \mathcal{D}^{\infty}(H, E)$. Let $I(\mathfrak{h})$ be the closed two-sided ideal of $\mathcal{D}^{\mathbb{Q}_{p}-\mathrm{an}}(H, E)$ generated by $\mathfrak{h}$. One has $\mathcal{D}^{\infty}(H, E)=\mathcal{D}^{\mathbb{Q}_{p}-\mathrm{an}}(H, E) / I(\mathfrak{h})$ (see [38, Section 2] for more detailed and more precise statements).

We refer without comment to [19, Section 3.6] or [35, Section 3] for the definitions of locally $\mathbb{Q}_{p^{-}}$ analytic representations of $H$ over locally convex $E$-vector spaces. Let $Z^{\prime}$ be a locally $\mathbb{Q}_{p}$-analytic closed subgroup of the center $Z_{H}$ of $H$. Let $\chi^{\infty}$ (resp., $\chi$ ) be a fixed smooth character (resp., locally $\mathbb{Q}_{p}$-analytic character) of $Z^{\prime}$. We first list the following categories. Let $\boldsymbol{R e p}_{E}^{\infty}(H)\left(\operatorname{resp} . \boldsymbol{R e p}_{E}^{\infty}, \mathrm{ad}(H)\right)$ be category of smooth (resp. admissible smooth) representations of $H$ over $E$ with morphisms being all $H$-equivalent linear maps. Let $\boldsymbol{R e p}_{E, Z^{\prime}=\chi^{\infty}}^{\infty}(H)$ (resp. $\boldsymbol{\operatorname { R e p }}{ }_{E, Z^{\prime}=\chi^{\infty}}^{\infty, \text { ad }}(H)$ ) be the category of smooth (resp. admissible smooth) representations of $H$ over $E$ on which $Z^{\prime}$ acts via the character $\chi^{\infty}$. The morphisms are all $H$-equivariant linear maps. Denote by $\boldsymbol{R e p}_{E}(H)$ (resp. $\mathbf{R e p}_{E}^{\text {ad }}(H)$ ) the category of locally $\mathbb{Q}_{p}$-analytic representations of $H$ over barrelled locally convex Hausdorff $E$-vector spaces with morphisms being all continuous $H$-equivalent linear maps. Let $\boldsymbol{R e p}_{E, Z^{\prime}=\chi}(H)\left(\operatorname{resp} . \boldsymbol{R e p}_{E, Z^{\prime}=\chi}^{\text {ad }}(H)\right)$ be category of locally $\mathbb{Q}_{p^{-}}$ analytic representations of $H$ over barrelled locally convex Hausdorff $E$-vector space on which $Z^{\prime}$ acts via the character $\chi$. The morphisms are all continuous $H$-equivalent linear maps.

Let $\mathcal{M}(H)$ (resp., $\left.\mathcal{M}^{\infty}(H)\right)$ be the abelian category of (abstract) $\mathcal{D}^{\mathbb{Q}_{p}-\text { an }}(H, E)$-modules (resp., $\mathcal{D}^{\infty}(H, E)$ modules), and let $\mathcal{M}_{Z^{\prime}, \chi}(H)$ (resp., $\mathcal{M}_{Z^{\prime}, \chi}^{\infty}(H)$ ) be the full subcategory of $\mathcal{M}(H)$ (resp., $\mathcal{M}^{\infty}(H)$ ) of $\mathcal{D}^{\mathbb{Q}_{p}-\text { an }}(H, E)$-modules (resp., $\mathcal{D}^{\infty}(H, E)$ ) on which $Z^{\prime}$ acts by $\chi^{-1}$.

Let $V$ be a locally $\mathbb{Q}_{p}$-analytic representation of $H$, then the continuous dual $V^{\vee}$ is naturally equipped with a canonical $\mathcal{D}^{\mathbb{Q}_{p}-\mathrm{an}}(H, E)$-module structure given by the action $\delta_{g} \cdot w(v)=w\left(g^{-1} v\right)$ (this action is well-defined since $g \mapsto w\left(g^{-1} v\right)$ belongs to $\mathcal{C}^{\mathbb{Q}_{p}-\text { an }}(H, E)$, and gives a $\mathcal{D}^{\mathbb{Q}_{p}-\mathrm{an}}(H, E)$-module structure on $V^{\vee}$ by the density of $\left\{\delta_{h}\right\}_{h \in H}$ in $\left.\mathcal{D}^{\mathbb{Q}_{p}-a n}(H, E)\right)$. Suppose $V$ is a smooth representation of $H$ over $E$. In that case, the abstract dual $V^{\vee}$ of $V$ is a $\mathcal{D}^{\infty}(H, E)$-module (note that $V^{\vee}$ is also the continuous dual of $V$ if $V$ is equipped with the finest locally convex topology, and the $\mathcal{D}^{\infty}(H, E)$-action is given in the same way as locally $\mathbb{Q}_{p}$-analytic case). It follows from [36, Theorem 6.3] that the functor $V \mapsto V^{\vee}$ induces a fully faithful contravariant functor form $\operatorname{Rep}_{E}(H)$ to the abelian category $\mathcal{M}(H)$. Moreover, the functor $V \mapsto V^{\vee}$ also induces a fully faithful contravariant functor from $\operatorname{Rep}_{E}^{\infty}(H)$ to the abelian category $\mathcal{M}^{\infty}(H)$.

Recall that a locally $\mathbb{Q}_{p}$-analytic representation $V_{H}$ of $H$ over $E$ is called very strongly admissible (in the sense of [17, Definition 0.12]) if there exists a continuous admissible representation $B_{H}$ of $H$ on an $E$-Banach space and a continuous $E$-linear and $H$-equivalent injection $V_{H} \hookrightarrow B_{H}$.

### 2.3 Smooth and locally analytic extension groups

Recall that $\operatorname{Rep}_{E}^{\infty}(H)$ contains enough injectives and projectives, see [43] or [28, Section 3]. An explicit injective resolution of $V \in \operatorname{Rep}_{E}^{\infty}(H)$ is given by the Bruhat-Tits building $Y_{H}$ of $H$ (refer [5, Chapter X, 1.11. Lemma, 2.3 and 2.4. Theorem], but in this paper, we do not need the concrete form of $Y_{H}$ ). The Bruhat-Tits building $Y_{H}$ is a finite polysimplicial complex, with the decomposition

$$
Y_{H}=\coprod_{q} Y_{q}
$$

where $Y_{q}$ is the set of $q$-dimensional cells. Let $C_{E}^{q}\left(Y_{H}, V\right)^{\infty}$ be the space of finite smooth $q$-chains with $V$-coefficients. Then

$$
0 \rightarrow V \longrightarrow C_{E}^{1}\left(Y_{H}, V\right)^{\infty} \longrightarrow C_{E}^{2}\left(Y_{H}, V\right)^{\infty} \longrightarrow \cdots \longrightarrow C_{E}^{q}\left(Y_{H}, V\right)^{\infty} \longrightarrow \cdots
$$

is an injective resolution of $V$ by the complex of $V$-valued cochains on the Bruhat-Tits building $Y_{H}$. In particular, this injective resolution lies in the category $\boldsymbol{R e p}_{E}^{\infty}(H)$ (see [5, Chapter X, 2.4. Theorem]). Therefore, we can compute the Ext-groups $\operatorname{Ext}_{\operatorname{Rep}_{E}^{\infty}(H)}^{*}(V, W)$ for a given pair of smooth $H$-representations $V, W$ by choosing an injective resolution of $W$. By [15, Proposition 2.3], if $V, W \in \operatorname{Rep}_{E}^{\infty}(H)$ are admissible smooth representations of $H$. Then the functor $V \mapsto V^{\vee}$ induces natural bijections $\operatorname{Ext}_{\operatorname{Rep}_{E}^{r}(H)}^{r}(V, W) \cong$ $\operatorname{Ext}_{\mathcal{M}^{\infty}(H)}^{r}\left(W^{\vee}, V^{\vee}\right), \forall r \in \mathbb{Z}_{\geq 0}$. For $r \in \mathbb{Z}_{\geq 0}$, we put

$$
\operatorname{Ext}_{H}^{i, \infty}(V, W):=\operatorname{Ext}_{\operatorname{Rep}_{E}^{\infty}(H)}^{i}(V, W), H_{\infty}^{i}(H, V):=\operatorname{Ext}_{\operatorname{Rep}_{E}^{\infty}(H)}^{i}(1, V) .
$$

for simplicity. Let $Z^{\prime} \subseteq Z_{H}$ be a locally $\mathbb{Q}_{p}$-analytic closed subgroup of $Z_{H}$, and let $\chi^{\infty}$ be a smooth character of $Z^{\prime}$. If $V, W \in \operatorname{Rep}_{E, Z=\chi}^{\chi^{\infty}}(H)$, we put

$$
\operatorname{Ext}_{H, Z^{\prime}=\chi^{\infty}}^{i, \infty}(V, W):=\operatorname{Ext}_{\operatorname{Rep}_{E, Z^{\prime}=\chi^{\infty}}^{\infty}(H)}^{i}(V, W)
$$

for the $i$-th smooth extension group of $V, W$ on which $Z^{\prime}$ acts via $\chi^{\infty}$.
In this paper, we define extension groups of locally $\mathbb{Q}_{p}$-analytic representations in the category $\mathcal{M}(H)$ of all abstract $D^{\mathbb{Q}_{p}-\text { an }}(H, E)$-modules. Let $V, W$ be locally $\mathbb{Q}_{p}$-analytic representations of $H$ over $E$. As in [40, Définition 3.1], we put

$$
\begin{equation*}
\operatorname{Ext}_{H}^{r}(V, W):=\operatorname{Ext}_{\mathcal{M}(H)}^{r}\left(W^{\vee}, V^{\vee}\right), \operatorname{H}_{\mathrm{an}}^{r}(H, V)=\operatorname{Ext}_{H}^{r}(1, V), \tag{2.8}
\end{equation*}
$$

where $\operatorname{Ext}_{\mathcal{M}(H)}^{r}$ denotes the $r$-th extension group in the abelian category $\mathcal{M}(H)$. If $H^{\prime}$ is a closed locally $\mathbb{Q}_{p}$-analytic subgroup of $H$, we have a natural map

$$
\operatorname{Ext}_{H}^{r}(V, W) \rightarrow \operatorname{Ext}_{H^{\prime}}^{r}\left(\left.V\right|_{H^{\prime}},\left.W\right|_{H^{\prime}}\right)
$$

by restricting $V$ and $W$ on $H^{\prime}$. If furthermore $H^{\prime}$ is a normal subgroup of $H$, then $H / H^{\prime}$ is also a $\mathbb{Q}_{p}$-analytic subgroup. Since

$$
D^{\mathbb{Q}_{p}-\mathrm{an}}\left(H / H^{\prime}, E\right) \cong D^{\mathbb{Q}_{p}-\mathrm{an}}(H, E) \otimes_{D^{\mathbb{Q}_{p}-\mathrm{an}}\left(H^{\prime}, E\right)} E
$$

(see $\left[8\right.$, Section 5.1]), we deduce that $\mathrm{H}_{\mathrm{an}}^{r}\left(H^{\prime}, V\right)$ admits a $D^{\mathbb{Q}_{p}-\mathrm{an}}\left(H / H^{\prime}, E\right)$-modules structure. Similarly, let $\chi$ be a locally $\mathbb{Q}_{p}$-analytic character of $Z^{\prime}$. If $Z^{\prime}$ acts on both $V$ and $W$ via the character $\chi$, we put

$$
\operatorname{Ext}_{H, Z^{\prime}=\chi}^{r}(V, W):=\operatorname{Ext}_{\mathcal{M}_{Z^{\prime}, \chi}(H)}\left(W^{\vee}, V^{\vee}\right)
$$

where the latter denotes the $r$-th extension group in $\mathcal{M}_{Z^{\prime}, \chi}(H)$. When $Z^{\prime}=Z$, we denote $\operatorname{Ext}_{H, \chi}^{r}(V, W):=$ $\operatorname{Ext}_{H, Z=\chi}^{r}(V, W)$. If moreover $V$ and $W$ are admissible locally $\mathbb{Q}_{p}$-analytic representations of $H$ over $E$ (resp., admissible locally $\mathbb{Q}_{p}$-analytic representations of $H$ on which $Z^{\prime}$ acts via $\chi$ ), then [15, Lemma 2.2] implies that $\operatorname{Ext}_{H}^{1}(V, W)$ (resp., $\operatorname{Ext}_{H, Z^{\prime}=\chi}^{r}(V, W)$ ) consists of admissible locally $\mathbb{Q}_{p}$-analytic representations which are extensions of $V$ by $W$ (resp., which are extensions of $V$ by $W$ on which $Z^{\prime}$ acts via $\chi$ ).

Remark 2.1. Suppose that $Z^{\prime}$ is a locally $\mathbb{Q}_{p}$-analytic closed subgroup of $Z$ such that $H \cong H / Z^{\prime} \times Z^{\prime}$ as $\mathbb{Q}_{p}$-analytic manifolds. Let $\chi^{\infty}$ be a smooth character of $Z^{\prime}$ over $E$. If $\chi^{\infty}$ can be lifted to a smooth character of $H$, we have an equivalence of categories $\operatorname{Rep}_{E, Z^{\prime}=\chi^{\infty}}^{\infty}(H) \xrightarrow{\sim} \operatorname{Rep}_{E}^{\infty}\left(H / Z^{\prime}\right), V \mapsto V \otimes_{E}\left(\chi^{\infty}\right)^{-1}$. We also have an equivalence of categories $\mathcal{M}_{Z^{\prime}, \chi^{\infty}}^{\infty}(H) \stackrel{(\mathcal{M}}{ }{ }^{\infty}\left(H / Z^{\prime}\right)$. Let $V, W \in \operatorname{Rep}_{E, Z^{\prime}=\chi}^{\infty}(H)$ be admissible smooth representations of $H$, we have $\operatorname{Ext}_{\operatorname{Rep}_{Z^{\prime}=\chi^{\infty}}^{\infty}(H)}^{r}(V, W) \cong \operatorname{Ext}_{\mathcal{M}_{Z^{\prime}, \chi^{\infty}}^{\infty}(H)}^{r}\left(W^{\vee}, V^{\vee}\right), \forall r \in \mathbb{Z}_{\geq 0}$. For locally $\mathbf{Q}_{p}$-analytic case, if furthermore $H / Z^{\prime}$ is also strictly paracompact, we have a natural equivalence of categories between $\mathcal{M}_{Z^{\prime}, \chi}(H) \cong \mathcal{M}\left(H / Z^{\prime}\right)$. Therefore, we have $\operatorname{Ext}_{H, Z^{\prime}=\chi}^{r}(V, W) \cong \operatorname{Ext}_{H / Z^{\prime}}^{r}(V, W)$.

We still need two lemmas. By [42, Section 6], we have
Lemma 2.2. Let $V, W \in \operatorname{Rep}_{E}^{\infty}(H)$. Suppose there is an element $z \in Z_{H}$ such that $z$ acts on $V$ and $W$ by multiplication by two different scalars $z_{V} \neq z_{W}$. Then we have $\operatorname{Ext}_{H}^{\bullet, \infty}(V, W)=0$.

We end this section by recalling some spectral sequences which give relations between smooth extension groups and locally analytic extension groups. By [37, Page 306-307 (+)] and [25, (46)], we have

Lemma 2.3. For any $V \in \boldsymbol{\operatorname { R e p }}_{E}(H)$ and $W \in \boldsymbol{\operatorname { R e p }}_{E}^{\infty}(H)$, we have

$$
\begin{equation*}
\operatorname{Ext}_{\mathcal{M}^{\infty}(H)}^{r}\left(W^{\vee}, \mathrm{H}^{s}\left(\mathfrak{h}_{\Sigma_{L}}, V^{\vee}\right)\right) \Rightarrow \operatorname{Ext}_{H}^{r+s}(V, W) \tag{2.9}
\end{equation*}
$$

Furthermore, if $V \in \boldsymbol{R e p}_{E, Z^{\prime}=1}(H)$ and $W \in \boldsymbol{R e p}_{E, Z^{\prime}=1}^{\infty}(H)$, then we have

$$
\begin{equation*}
\operatorname{Ext}_{\mathcal{M}_{Z^{\prime}, 1}^{\infty}(H)}^{r}\left(W^{\vee}, H^{s}\left(\overline{\mathfrak{h}}_{\Sigma_{L}}, V^{\vee}\right)\right) \Rightarrow \operatorname{Ext}_{H, Z^{\prime}=1}^{r+s}(V, W) \tag{2.10}
\end{equation*}
$$

In particular, if $V \in \boldsymbol{\operatorname { R e p }}_{E}^{\infty}(H)$ (resp. $\boldsymbol{\operatorname { R e p }}_{E, Z^{\prime}=1}^{\infty}(H)$ ), we get an exact sequence

$$
\begin{align*}
& 0 \rightarrow \operatorname{Ext}_{H}^{1, \infty}(V, W) \rightarrow \operatorname{Ext}_{H}^{1}(V, W) \rightarrow \operatorname{Hom}_{H}\left(V, W \otimes_{E} \mathrm{H}_{1}\left(\mathfrak{h}_{\Sigma_{L}}, E\right)\right) \\
& \rightarrow \operatorname{Ext}_{H}^{2, \infty}(V, W) \rightarrow \operatorname{Ext}_{H}^{2}(V, W)  \tag{2.11}\\
& \left(\text { resp. } 0 \rightarrow \operatorname{Ext}_{H, Z^{\prime}=1}^{1, \infty}(V, W) \rightarrow \operatorname{Ext}_{H, Z^{\prime}=1}^{1}(V, W) \rightarrow \operatorname{Hom}_{H, Z^{\prime}=1}\left(V, W \otimes_{E} \mathrm{H}_{1}\left(\overline{\mathfrak{h}}_{\Sigma_{L}}, E\right)\right)\right.  \tag{2.12}\\
& \left.\rightarrow \operatorname{Ext}_{H, Z^{\prime}=1}^{2, \infty}(V, W) \rightarrow \operatorname{Ext}_{H, Z^{\prime}=1}^{2}(V, W)\right)
\end{align*}
$$

Note that $\mathrm{H}^{s}\left(\mathfrak{h}_{\Sigma_{L}}\right.$, -) (resp., $\left.\mathrm{H}_{s}\left(\mathfrak{h}_{\Sigma_{L}},-\right)\right)$ is r-th Lie algebraic cohomology (resp., homology) for $\mathfrak{h}_{\Sigma_{L}}$.

### 2.4 Künneth formula for smooth extension groups

Let $\mathbf{H}$ and $\mathbf{S}$ be two connected reductive groups over $L$. We put $H:=\mathbf{H}(L)$ (resp., $S:=\mathbf{S}(L)$ ) for its $L$ points, respectively. The following statement is well known. The proof follows along the line of [5, Chapter X, 6.1. Theorem].

Proposition 2.4. Let $V, W \in \operatorname{Rep}_{E}^{\infty}(G)$ and $V^{\prime}, W^{\prime} \in \operatorname{Rep}_{E}^{\infty}(S)$. Then

$$
\bigoplus_{p+q=m} \operatorname{Ext}_{H}^{p, \infty}(V, W) \otimes_{E} \operatorname{Ext}_{S}^{q, \infty}\left(V^{\prime}, W^{\prime}\right) \xrightarrow{\sim} \operatorname{Ext}_{H \times S}^{m, \infty}\left(V \otimes_{E} W, V^{\prime} \otimes_{E} W^{\prime}\right)
$$

Proof. The proof of [5, Chapter X, 6.1. Theorem] can be modified to our setting.
Remark 2.5. Let's remark that the Künneth formulas for locally $\mathbb{Q}_{p}$-analytic representations are more subtle.

## 3 Generalized parabolic (smooth) Steinberg representations

Before studying the locally $\mathbb{Q}_{p}$-analytic generalized parabolic Steinberg representations, we need some preparations on smooth generalized parabolic Steinberg representations of $G$. We study the generalized parabolic Steinberg representation attached to the Zelevinsky-segments (we recall the basic concepts of Zelevinsky-segments in Appendix Section 6.1). We add the terminology "parabolic" to distinguish from the usual (Borel) Steinberg representation induced from Borel subgroup $\mathbf{B}(L)$. To study parabolically induced representations (Section 3.2), and define (generalized) Bruhat filtration (see (5.7)), we review in Section 3.1 some properties of the representatives of the minimal length of certain double cosets in $\mathscr{W}_{n}$. In Section 3.2, we talk about (smooth) generalized parabolic Steinberg representations. We also describe the Jordan-Hölder factors of such parabolically induced representations. The Proof is contained in Appendix Section 6.3.

### 3.1 Double coset representatives

### 3.1.1 Double coset representatives-I

Let $I, J$ be subsets of $\Delta_{n}$, and let $\underline{n}_{I}=\left(n_{1}, \cdots, n_{l}\right)$ (resp., $\left.\underline{n}_{J}=\left(n_{1}^{\prime}, \cdots, n_{e}^{\prime}\right)\right)$ be the ordered partition of $n$ with respect to $I$ (resp., $J$ ) defined as in Section 2.1 "General linear group $\mathrm{GL}_{n}$ - I ", where $l=\left|\Delta_{n} \backslash I\right|+1$ (resp., $e=\left|\Delta_{n} \backslash J\right|+1$ ).

We recall that the element $w$ in $\left[\mathscr{W}_{I} \backslash \mathscr{W}_{n} / \mathscr{W}_{J}\right]$ is characterized by the properties $w J \subseteq \Phi_{\Delta_{n}}^{+}$and $w^{-1} I \subseteq$ $\Phi_{\Delta_{n}}^{+}$. More precisely, let $I_{1}, \cdots, I_{l}$ and $J_{1}, \cdots, J_{e}$ be the blocks of $\underline{n}_{I}$ and $\underline{n}_{J}^{\prime}$ respectively. Then by [1, (1.6)], the correspondence $w \mapsto B(w):=\left(\left|I_{i} \cap w\left(J_{j}\right)\right|\right)_{i, j}$ is the bijection of $\left[\mathscr{W}_{I} \backslash \mathscr{W}_{n} / \mathscr{W}_{J}\right]$ with the set $M_{I, J}$ of matrices $B=\left(b_{i j}\right)_{i, j}$ such that $b_{i, j} \in \mathbb{Z}_{\geq 0}$ and $\sum_{j=1}^{e} b_{i j}=n_{i}$ (resp. $\left.\sum_{i=1}^{l} b_{i j}=n_{j}^{\prime}\right)$ for any $1 \leq i \leq l$ (resp. $1 \leq j \leq e$ ). Equivalently, by $[4,(1.2)]$, we can identify $\left[\mathscr{W}_{I} \backslash \mathscr{W}_{n} / \mathscr{W}_{J}\right]$ with the set

$$
\begin{align*}
& \left\{w \in \mathscr{W}_{n} \mid w(x)<w(y) \text { if } x<y \text { and both } x \text { and } y \text { belong to the same block of } \underline{n}_{J}\right. \\
& \left.\quad w^{-1}(x)<w^{-1}(y) \text { if } x<y \text { and both } x \text { and } y \text { belong to the same block of } \underline{n}_{I}\right\} \tag{3.1}
\end{align*}
$$

As in [11, Theorem 2.7.4], for $w \in\left[\mathscr{W}_{I} \backslash \mathscr{W}_{n} / \mathscr{W}_{J}\right]$, we define $J \cap w^{-1} I:=\{j \in J: w(j)=i$ for some $i \in I\}$ (resp., $w J \cap I:=\{i \in I: w(j)=i$ for some $j \in J\}=w\left(J \cap w^{-1} I\right)$ ). Then [11, Theorem 2.7.4] asserts that $\mathscr{W}_{w J \cap I}=\mathscr{W}_{I} \cup w^{\mathscr{W}_{J}} w^{-1}$. Furthermore, by [11, Corollary 2.8.9], the Levi decomposition of $\mathbf{L}_{J}(L) \cap \overline{\mathbf{P}}_{I}(L)^{w}$ (resp., $\mathbf{L}_{I}(L) \cap{ }^{w} \overline{\mathbf{P}}_{J}(L)$ ) is given by (recall the notation $(-)^{w}$ and ${ }^{w}(-)$ of Section 2.1 "Representation theory")

$$
\begin{align*}
& \mathbf{L}_{J}(L) \cap \overline{\mathbf{P}}_{I}(L)^{w}=\mathbf{L}_{J}(L) \cap \mathbf{L}_{I}(L)^{w} \cdot\left(\mathbf{L}_{J}(L) \cap \overline{\mathbf{N}}_{I}(L)^{w}\right)=\mathbf{L}_{J \cap w^{-1} I}(L) \cdot\left(\mathbf{L}_{J}(L) \cap \overline{\mathbf{N}}_{I}(L)^{w}\right), \\
& \text { resp., } \mathbf{L}_{I}(L) \cap{ }^{w} \overline{\mathbf{P}}_{J}(L)=\mathbf{L}_{I}(L) \cap{ }^{w} \mathbf{L}_{J}(L) \cdot\left(\mathbf{L}_{I}(L) \cap{ }^{w} \overline{\mathbf{N}}_{J}(L)\right)=\mathbf{L}_{I \cap w J}(L) \cdot\left(\mathbf{L}_{I}(L) \cap{ }^{w} \overline{\mathbf{N}}_{J}(L)\right) . \tag{3.2}
\end{align*}
$$

### 3.1.2 Double coset representatives-II

We use the notation of Section 2.1 "General linear group GL ${ }_{n}$-II". This section aims to review some properties of the representatives of the minimal length of certain double cosets in $\mathscr{W}_{n}$, which are related
to the smooth parabolic induction associated with a Zelevinsky-segment (the contents of Definition 6.2 applied to $(m, s)=(r, k))$.

Let $I$ be a subset of $\Delta_{n}(k)$. We define an ordered partition $\underline{k}_{I}^{\langle r\rangle}:=\left(k_{1}, \cdots, k_{l_{I}}\right)$ of $k$ with $\Delta_{n}(k) \backslash I=$ $\left\{k_{1} r,\left(k_{1}+k_{2}\right) r, \cdots,\left(k_{1}+\cdots+k_{l_{I}}\right) r\right\}$ and $l_{I}:=k-|I|$. We call $\underline{k}_{I}^{\langle r\rangle}$ the ordered partition of integer $k$ associated with the $\mathbf{L}_{I}^{\langle r\rangle}(L)$. Then

$$
\mathbf{L}_{I}^{\langle r\rangle}(L)=\mathrm{GL}_{k_{1} r}(L) \times \cdots \times \mathrm{GL}_{k_{l_{I}} r}(L)
$$

Let $J$ be another subset of $\Delta_{n}(k)$. We put

$$
\begin{equation*}
\mathscr{W}\left(\mathbf{L}_{I}^{\langle r\rangle}, \mathbf{L}_{J}^{\langle r\rangle}\right):=\left\{w \in \mathscr{W}_{n}:\left(\mathbf{L}_{I}^{\langle r\rangle}\right)^{w}=\mathbf{L}_{J}^{\langle r\rangle}\right\} \cong\left\{w \in \mathscr{W}_{n}: w\left(\Phi_{J}\right)=\Phi_{I}\right\} \tag{3.3}
\end{equation*}
$$

We have a bijection $\mathscr{W}\left(\mathbf{L}^{\langle r\rangle}, \mathbf{L}^{\langle r\rangle}\right) / \mathscr{W}^{\langle r\rangle} \cong \mathscr{W}\left(\mathbf{L}^{\langle r\rangle}, \mathbf{L}^{\langle r\rangle}\right) \cap\left[\mathscr{W}^{\langle r\rangle} \backslash \mathscr{W}_{n} / \mathscr{W}^{\langle r\rangle}\right]$. Thus we see that the set $\mathscr{W}\left(\mathbf{L}^{\langle r\rangle}, \mathbf{L}^{\langle r\rangle}\right) / \mathscr{W}^{\langle r\rangle}$ has a canonical set of representatives, given by taking in each double coset the elements of minimal length. It is easy to see that $\mathscr{W}\left(\mathbf{L}^{\langle r\rangle}, \mathbf{L}^{\langle r\rangle}\right) / \mathscr{W}^{\langle r\rangle} \cong \mathscr{W}_{k}\left(\cong S_{k}\right)$. More precisely, we have

$$
\begin{equation*}
\mathscr{W}\left(\mathbf{L}^{\langle r\rangle}, \mathbf{L}^{\langle r\rangle}\right) / \mathscr{W}^{\langle r\rangle}=\left\{w^{\circ}: w^{\circ}(i r+l)=w(i) r+l, \forall 0 \leq i \leq k-1,1 \leq l \leq r, \text { for some } w \in \mathscr{W}_{k}\right\} \tag{3.4}
\end{equation*}
$$

In the sequel, we shall denote

$$
\mathscr{W}_{I, J}\left(\mathbf{L}^{\langle r\rangle}\right):=\mathscr{W}\left(\mathbf{L}^{\langle r\rangle}, \mathbf{L}^{\langle r\rangle}\right) \cap\left[\mathscr{W}_{I}^{\langle r\rangle} \backslash \mathscr{W}_{n} / \mathscr{W}_{J}^{\langle r\rangle}\right]
$$

for $I, J \subset \Delta_{n}(k)$. If $I=J=\emptyset$, we omit the subscripts $I$, $J$. In particular, $\mathscr{W}\left(\mathbf{L}^{\langle r\rangle}\right) \cong \mathscr{W}_{k}$.
The following lemma will be used frequently when we meet the irreducible cuspidal representation.
Lemma 3.1. Let $\pi^{\prime}$ be an irreducible cuspidal representation of $\mathbf{L}_{I}^{\langle r\rangle}(L)$ over $E$. For $w \in\left[\mathscr{W}_{I}^{\langle r\rangle} \backslash \mathscr{W}_{n} / \mathscr{W}^{\langle r\rangle}\right]$, one has $r_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}(L)^{w} \cap \mathbf{L}^{\langle r\rangle}(L)}^{\mathbf{L}^{\langle r\rangle}(L)} \pi^{\prime}=0$ unless $w \in \mathscr{W}_{I, \emptyset}\left(\mathbf{L}^{\langle r\rangle}\right)=\mathscr{W}\left(\mathbf{L}^{\langle r\rangle}, \mathbf{L}^{\langle r\rangle}\right) \cap\left[\mathscr{W}_{I}^{\langle r\rangle} \backslash \mathscr{W}_{n} / \mathscr{W}^{\langle r\rangle}\right]$.

Proof. Since $\pi^{\prime}$ is an irreducible supercuspidal representation of $\mathbf{L}_{I}^{\langle r\rangle}(L)$, we get that the smooth representation $r_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}(L)^{w} \cap \mathbf{L}^{\langle r\rangle}(L)}^{\langle r\rangle}(L)$ is zero unless $\overline{\mathbf{N}}_{J}^{\langle r\rangle}(L)^{w} \cap \mathbf{L}^{\langle r\rangle}(L)=1$, this is equivalent to $w\left(\Delta_{n}^{k}\right) \subseteq \Delta_{n}^{k} \cup J$ by [11, Corollary 2.8.8] (or see [12, Corollary 6.3.4] and its proof). We claim that $w\left(\Delta_{n}^{k}\right) \subseteq \Delta_{n}^{k}\left(\right.$ so $\left.w\left(\Delta_{n}^{k}\right)=\Delta_{n}^{k}\right)$, i.e., $w\left(\Delta_{n}^{k}\right) \cap J=\emptyset$. Let $\left\{j \in J: w\left(\Delta_{n}^{k}\right) \cap\{j\} \neq \emptyset\right\}=\left\{j_{1}<j_{2}<\cdots<j_{a}\right\}$. Then the condition $w\left(\Delta_{n}^{k}\right) \subseteq \Delta_{n}^{k} \cup J$ shows that for each $1 \leq i \leq a$, there exists an integer $1 \leq l_{i} \leq r-1$ such that $J_{i}:=\left\{\left(j_{i}-1\right) r+l_{i},\left(j_{i}-1\right) r+l_{i}+1, \cdots,\left(j_{i}-1\right) r+(r-1), j_{i} r, j_{i} r+1, \cdots, j_{i} r+l_{i}-1\right\} \subset w\left(\Delta_{n}^{k}\right)$, and $J_{i}^{\prime}:=\left\{\left(j_{i}+1\right) r+1, \cdots,\left(j_{i}+1\right) r+r-1,\left(j_{i}+2\right) r+1, \cdots,\left(j_{1+1}-2\right) r+1, \cdots,\left(j_{1+1}-2\right) r+r-1\right\} \subset w\left(\Delta_{n}^{k}\right)$. Put $j_{0}=0$ and $j_{a+1}=k+1$. Then

$$
\begin{align*}
\left|w\left(\Delta_{n}^{k}\right)\right| & =\left|J_{0}^{\prime}\right|+\sum_{i=1}^{a}\left(\left|J_{i}\right|+\left|J_{i}^{\prime}\right|\right) \\
& =\min \left\{0, j_{1}-2\right\} \cdot(r-1)+\sum_{i=1}^{a}\left(r-1+\min \left\{0, j_{i+1}-j_{i}-2\right\} \cdot(r-1)\right)  \tag{3.5}\\
& =\left(\min \left\{0, j_{1}-2\right\}+\sum_{i=1}^{a} \min \left\{1, j_{i+1}-j_{i}+1\right\}\right) \cdot(r-1)<\left|\Delta_{n}^{k}\right|=k(r-1)
\end{align*}
$$

if $a>0$. This is impossible. By the characterization of elements in $\left[\mathscr{W}_{I}^{\langle r\rangle} \backslash \mathscr{W}_{n} / \mathscr{W}\langle r\rangle\right]$, we see that $w \in$ $\mathscr{W}\left(\mathbf{L}^{\langle r\rangle}, \mathbf{L}^{\langle r\rangle}\right) \cap\left[\mathscr{W}_{I}^{\langle r\rangle} \backslash \mathscr{W}_{n} / \mathscr{W}^{\langle r\rangle}\right]$.
Remark 3.2. This lemma is vacuous if $r=1$. Moreover, by [11, Corollary 2.8.8] (or see [12, Corollary 6.3.4] and its proof), we see that the following statements are equivalent:

$$
\begin{align*}
\overline{\mathbf{P}}_{J}^{\langle r\rangle}(L) \cap \mathbf{L}_{I}^{\langle r\rangle}(L)^{w}=\mathbf{L}_{I}^{\langle r\rangle}(L)^{w} & \Longleftrightarrow \overline{\mathbf{N}}_{J}^{\langle r\rangle}(L) \cap \mathbf{L}_{I}^{\langle r\rangle}(L)^{w}=1 \Longleftrightarrow \mathbf{L}_{I}^{\langle r\rangle}(L)^{w} \subseteq \mathbf{L}_{J}^{\langle r\rangle}(L)  \tag{3.6}\\
& \Longleftrightarrow w^{-1}\left(\Delta_{n}^{k} \cup I\right) \subseteq \Delta_{n}^{k} \cup J,
\end{align*}
$$

by (3.2). If $w \in \mathscr{W}_{I, J}\left(\mathbf{L}^{\langle r\rangle}\right)=\mathscr{W}\left(\mathbf{L}^{\langle r\rangle}, \mathbf{L}^{\langle r\rangle}\right) \cap\left[\mathscr{W}_{I}^{\langle r\rangle} \backslash \mathscr{W}_{n} / \mathscr{W}_{J}^{\langle r\rangle}\right]$, we further have Levi decompositions:

$$
\begin{align*}
& \mathbf{L}_{J}^{\langle r\rangle}(L) \cap \overline{\mathbf{P}}_{I}^{\langle r\rangle}(L)^{w}=\mathbf{L}_{J \cap w^{-1} I}^{\langle r\rangle}(L) \cdot\left(\mathbf{L}_{J}^{\langle r\rangle}(L) \cap \overline{\mathbf{N}}_{I}^{\langle r\rangle}(L)^{w}\right),  \tag{3.7}\\
& \mathbf{L}_{I}^{\langle r\rangle}(L) \cap \overline{\mathbf{P}}_{J}^{\langle r\rangle}(L)=\mathbf{L}_{I \cap w J}^{\langle r\rangle}(L) \cdot\left(\mathbf{L}_{I}^{\langle r\rangle}(L) \cap{ }^{w} \overline{\mathbf{N}}_{J}^{\langle r\rangle}(L)\right) .
\end{align*}
$$

We use $\gamma_{I, J}^{w}$ to denote the modulus character of $\overline{\mathbf{P}}_{J}^{\langle r\rangle}(L) \cap \overline{\mathbf{P}}_{I}^{\langle r\rangle}(L)^{w} \operatorname{acting}$ on $\overline{\mathbf{N}}_{J}^{\langle r\rangle}(L) / \overline{\mathbf{N}}_{J}^{\langle r\rangle}(L) \cap \overline{\mathbf{P}}_{I}^{\langle r\rangle}(L)^{w}$.

We end this section by describing the modulus characters explicitly. Recall that $\underline{k}_{I}^{\langle r\rangle}$ is the ordered partition of integer $k$ associated with the $\mathbf{L}_{I}^{\langle r\rangle}(L)$. For $0 \leq i \leq l_{I}$, we put $s_{0}:=0$ and $s_{i}=\sum_{j=1}^{i} k_{j} r$. Explicitly, the modulus character $\delta_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}(L)}$ of $\overline{\mathbf{P}}_{I}^{\langle r\rangle}(L)$ is given by

$$
\delta_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}(L)}\left(\left(\begin{array}{cccc}
A_{1} & 0 & \cdots & 0 \\
* & A_{2} & \cdots & 0 \\
* & * & \ddots & 0 \\
* & * & * & A_{l}
\end{array}\right)\right)=\prod_{i=1}^{l} v_{k_{i} r}^{a_{i, I}}\left(A_{i}\right)
$$

where $a_{i, I}=r\left(-\sum_{j=i+1}^{l} k_{j}+\sum_{j=1}^{i-1} k_{j}\right)=r\left(2 s_{i-1}+k_{i}-k\right)$ (see [22, Defintion 14.3.6]). In particular, if $I=\emptyset$, then $a_{i, \emptyset}=r(2 i-1-k)$.

### 3.2 Definitions of the generalized parabolic Steinberg representations

Fix an irreducible cuspidal representation $\pi$ of $\mathrm{GL}_{r}(L)$ over $E$. Let $\Delta_{[k-1,0]}(\pi)$ be a Zelevinsky-segment over $E$ (we use the notation of Definition 6.2 applied to $(m, s)=(r, k)$ ). Put

$$
\begin{equation*}
\pi^{\langle r\rangle}:=\left(\otimes_{i=1}^{k} \pi(k-i)\right) \otimes_{E} \delta_{\overline{\mathbf{P}}^{\langle r\rangle}(L)}^{1 / 2}=\otimes_{i=1}^{k} \pi \otimes_{E} v_{r}^{-\frac{r}{2}(k-2 i+1)+k-i}, \pi(k-i):=\pi \otimes_{E} v_{r}^{k-i} \tag{3.8}
\end{equation*}
$$

This is an irreducible cuspidal smooth representation of $\mathbf{L}^{\langle r\rangle}(L)$ over $E$.
Definition 3.3. Let $I$ be a subset of $\Delta_{n}(k)$. We define $\pi_{I}$ to be the unique irreducible subrepresentation of $i_{\mathbf{P}^{\langle r\rangle}(L)}^{\mathbf{L}^{\langle r\rangle}(L) \cap \mathbf{L}_{I}^{\langle r\rangle}(L)} \pi^{\langle r\rangle}$. The existence of $\pi_{I}$ is a direct consequence of [1, 2.10. Proposition]. In particular, $\pi_{\emptyset}=\pi^{\langle r\rangle}$, and $\pi_{\Delta_{n}(k)}=\left\langle\Delta_{[k-1,0]}(\pi)\right\rangle$ (see the discussion after Appendix, Definition 6.1).

For $w \in \mathscr{W}\left(\mathbf{L}^{\langle r\rangle}\right)$, we put

$$
\begin{equation*}
w\left(\pi^{\langle r\rangle}\right):=\left(\otimes_{i=1}^{k} \pi \otimes_{E} v_{r}^{w(k-i)}\right) \otimes_{E} \delta_{\overline{\mathbf{P}}^{\langle r\rangle}(L)}^{1 / 2} \tag{3.9}
\end{equation*}
$$

The first goal is to compute $r_{\overline{\mathbf{P}}}{ }^{\langle r\rangle}{ }_{(L)} i \frac{G}{\mathbf{P}^{\langle r\rangle}(L)} \pi^{\langle r\rangle}$.
Lemma 3.4. We have isomorphism of smooth $\mathbf{L}^{\langle r\rangle}(L)$-representations:

$$
r_{\overline{\mathbf{P}}^{\langle r\rangle}(L)}^{G} i \overline{\mathbf{P}}^{\langle r\rangle}(L) \pi^{\langle r\rangle} \cong \bigoplus_{w \in \mathscr{W}\left(\mathbf{L}^{\langle r\rangle}\right)} w\left(\pi^{\langle r\rangle}\right)
$$

Remark 3.5. Indeed, this result is a direct consequence of [12, Proposition 6.4.1], but we include a proof for the reader's convenience.

Proof. The arguments in Section 3.1 and the Bernstein-Zelevinsky geometric lemma [4, 2.12. Geometrical LEMMA] shows that only elements in the subset $\mathscr{W}\left(\mathbf{L}^{\langle r\rangle}\right)$ appear in $r_{\overline{\mathbf{P}}}{ }^{\langle r\rangle}{ }_{(L)} i^{G} \overline{\mathbf{P}}^{\langle r\rangle}{ }_{(L)} \pi^{\langle r\rangle}$ instead of the whole
double coset $\left[\mathscr{W}^{\langle r\rangle} \backslash \mathscr{W}_{n} / \mathscr{W}^{\langle r\rangle}\right]$. In precise, by the Bernstein-Zelevinsky geometric lemma [4, 2.12. GEOMETRICAL LEMMA] and [12, Proposition 6.3.3], the semi-simplification of $r_{\overline{\mathbf{P}}}{ }^{\langle r\rangle}(L){ }^{i} \frac{G}{\mathbf{P}}{ }^{\langle r\rangle}(L) ~ \pi^{\langle r\rangle}$ is isomorphic to

$$
\begin{equation*}
\bigoplus_{w \in\left[\mathscr{W}^{\langle r\rangle} \backslash \mathscr{W}_{n} / \mathscr{W}\langle r\rangle\right]} i_{\mathbf{L}^{\langle r\rangle}(L) \cap \overline{\mathbf{P}}^{\langle r\rangle}(L)^{w}}^{\mathbf{L}^{\langle r\rangle}(L)} \gamma^{w} \otimes_{E}\left(r_{\overline{\mathbf{P}}^{\langle r\rangle}(L)^{w} \cap \mathbf{L}^{\langle r\rangle}(L)^{w}}^{\left.\mathbf{L}^{\langle\gamma\rangle}\left(\pi^{\langle r\rangle}\right)^{w}\right) .}\right. \tag{3.10}
\end{equation*}
$$

Recall that $\gamma^{w}$ is the modulus character of $\overline{\mathbf{P}}^{\langle r\rangle}(L) \cap \overline{\mathbf{P}}^{\langle r\rangle}(L)^{w}$ acting on $\overline{\mathbf{N}}^{\langle r\rangle}(L) / \overline{\mathbf{N}}^{\langle r\rangle}(L) \cap \overline{\mathbf{P}}^{\langle r\rangle}(L)^{w}$. Since $\pi^{\langle r\rangle}$ is an irreducible cuspidal representation of $\mathbf{L}^{\langle r\rangle}(L)$, we deduce by Lemma 3.1 that $w \in \mathscr{W}\left(\mathbf{L}^{\langle r\rangle}\right)$ is a necessary condition for the non-vanishing of the representation $r_{\overline{\mathbf{P}}^{\langle r\rangle}(L) \cap \mathbf{L}^{\langle r\rangle}(L)^{w}}^{\mathbf{L}^{\langle\gamma\rangle}\left(\pi^{\langle r\rangle}\right)^{w} \text {. In this case, by }}$ [12, Corollary 6.3.4 (b), Theorem 6.3.5], we have

$$
\begin{align*}
& \left(r_{\overline{\mathbf{P}}^{\langle r\rangle}(L)}^{G} i_{\overline{\mathbf{P}}^{\langle r\rangle}(L)}^{G} \pi^{\langle r\rangle}\right)^{\mathrm{ss}} \cong \bigoplus_{w \in \mathscr{W}\left(\mathbf{L}^{\langle r\rangle}\right)}\left(i_{\mathbf{L}^{\langle r\rangle}(L) \cap \overline{\mathbf{P}}^{\langle r\rangle}(L)^{w}}^{\langle r\rangle} \gamma^{w} \otimes_{E}\left(\otimes_{i=1}^{k} \pi \cdot v_{r}^{w(k-i)}\right)\right) \otimes \delta_{\overline{\mathbf{P}}^{\langle r\rangle}(L)}^{1 / 2}  \tag{3.11}\\
& \cong \bigoplus_{w \in \mathscr{W}\left(\mathbf{L}^{\langle r\rangle}\right)} w\left(\pi^{\langle r\rangle}\right) .
\end{align*}
$$

Note that all the central characters of $\left\{w\left(\pi^{\langle r\rangle}\right)\right\}_{w \in \mathscr{W}\left(\mathbf{L}^{\langle r\rangle}\right)}$ are pairwise different (since the central characters of $\left\{v_{r}^{k-i}\right\}_{1 \leq i \leq k}$ are pairwise different). Therefore, we deduce from Lemma 2.2 that

$$
\operatorname{Ext}_{G}^{1, \infty}\left(w\left(\pi^{\langle r\rangle}\right), w^{\prime}\left(\pi^{\langle r\rangle}\right)\right)=0
$$

for any pair of $w \neq w^{\prime} \in \mathscr{W}\left(\mathbf{L}^{\langle r\rangle}\right)$. It follows from (3.11) that $r_{\overline{\mathbf{P}}}{ }^{\langle r\rangle}(L) ~ i \frac{G}{\overline{\mathbf{P}}}{ }^{\langle r\rangle}{ }_{(L)} \pi^{\langle r\rangle}$ is actually semi-simple and hence is isomorphic to $\bigoplus_{w \in \mathscr{W}\left(\mathbf{L}^{\langle r\rangle}\right)} w\left(\pi^{\langle r\rangle}\right)$.

The following proposition plays a key role in proving the exactness of locally algebraic and locally analytic Tits complexes (see Section 4.3). The proof of Proposition 3.6 is elementary but tedious (for example, if $r=1$, this proposition is obvious). We prove it in Appendix 6.4. We suggest skipping the proof on the first reading.
Proposition 3.6. The family $\left\{\pi_{I}\right\}_{I \subset \Delta_{n}(k)}$ satisfying the following conditions $[\mathbf{A 1}],[\mathbf{A 2}]$.
[A1] For $J \subseteq I$, we have

$$
\begin{align*}
& \pi_{J}=r_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}(L) \cap \mathbf{L}_{I}^{\langle r\rangle}(L)}^{\mathbf{L}_{I}^{\langle r\rangle}(L)} \pi_{I}  \tag{3.12}\\
& \pi_{I} \hookrightarrow i_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}(L) \cap \mathbf{L}_{I}^{\langle r\rangle}(L)}^{\left\langle\mathbf{L}_{J}^{\langle \rangle}(L)\right.} \pi_{J} \text { and therefore } P_{I, J}: i i_{\mathbf{P}_{I}^{\langle r\rangle}(L)}^{G} \pi_{I} \hookrightarrow i \overline{\overline{\mathbf{P}}}_{J}^{\langle r\rangle}(L) \tag{3.13}
\end{align*} \pi_{J} .
$$

[A2] For any $I, J, I_{1}, \cdots, I_{m} \subseteq \Delta_{n}(k)$, we have

$$
\begin{align*}
& i \overline{\mathbf{P}}_{I}^{\langle r\rangle}(L)  \tag{3.14}\\
& \pi_{I} \cap i \underline{\mathbf{P}}_{J}^{\langle r\rangle}(L)  \tag{3.15}\\
& i \pi_{J}=i \overline{\mathbf{P}}_{I \cup J}^{\langle r\rangle} \pi_{I \cup J}^{G} \\
& \overline{\mathbf{P}}_{I}^{\langle r\rangle}(L) \\
& \pi_{I} \cap\left(\sum_{j=1}^{m} i i_{\overline{\mathbf{P}}_{I_{j}}^{\langle r\rangle}(L)}^{G} \pi_{I_{j}}\right)=\sum_{j=1}^{m} i i_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}(L)}^{G}\left(\pi_{I} \cap i_{\overline{\mathbf{P}}_{I_{j}}^{\langle r\rangle}(L)}^{G} \pi_{I_{j}}\right)
\end{align*}
$$

where the intersections are taken in $i_{\mathbf{P}^{\langle r\rangle}(L)}^{G} \pi^{\langle r\rangle}$, by (3.13).

## Definition 3.7. (Locally $\mathbb{Q}_{p}$-algebraic generalized parabolic Steinberg representations)

Let $\underline{\lambda} \in X_{\Delta_{n}}^{+}$, and let $I, J \subseteq \Delta_{n}(k)$. We put

$$
\begin{aligned}
& i \overline{\mathbf{P}}_{I}^{\langle r\rangle} \\
& u_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{\infty}(\pi, \underline{\lambda})=\left(i i_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}(L)}^{G} \pi_{I}\right) \otimes_{E} L(\underline{\lambda}) \\
& v_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{\infty}(\pi, \underline{\lambda}) i \overline{\mathbf{P}}_{J}^{\langle r\rangle} \\
&=i_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{G}(\pi, \underline{\lambda}) \\
&
\end{aligned}
$$

We put ${\underset{\overline{\mathbf{P}}}{I}}_{\langle r\rangle}^{\langle r}(\pi):=i{\underset{\overline{\mathbf{P}}}{I}}_{\langle r\rangle}(\pi, \underline{0}), v_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{\infty}(\pi):=v_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{\infty}(\pi, \underline{0})$. We call $\left\{v_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{\infty}(\pi, \underline{\lambda})\right\}_{I \subseteq \Delta_{n}(k)}\left(\operatorname{resp} .,\left\{v_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{\infty}(\pi)\right\}_{I \subseteq \Delta_{n}(k)}\right)$ the locally $\mathbb{Q}_{p}$-algebraic (resp., smooth) generalized parabolic Steinberg representations of $G$, associated to the Zelevinsky-segment $\Delta_{[k-1,0]}(\pi)$ and weight $\underline{\lambda}$. In particular, we have $v_{\overline{\mathbf{P}}_{\Delta_{n}(k)}^{\infty}}^{\infty}(\pi)=\pi_{\Delta_{n}(k)}$.

Furthermore, for $J \subset I \subseteq \Delta_{n}(k)$ and $\underline{\lambda} \in X_{\Delta_{n}^{k} \cup I}^{+}$. We put

$$
\begin{aligned}
& v_{J, I}^{\infty}(\pi)=i_{\overline{\mathbf{P}}^{\langle r\rangle}(L) \cap \mathbf{L}_{I}^{\langle r\rangle}(L)}^{\langle r\rangle} \pi_{I} / \sum_{J \subsetneq K \subseteq I} i_{\overline{\mathbf{P}}_{K}^{\langle r\rangle}(L) \cap \mathbf{L}_{I}^{\langle r\rangle}(L)}^{\langle r\rangle} \pi^{\langle r\rangle}, \\
& \left(\text { resp. }, v_{J, I}^{\infty}(\pi, \underline{\lambda})=v_{J, I}^{\infty}(\pi) \otimes_{E} L^{\langle r\rangle}(\underline{\lambda})_{I}\right) .
\end{aligned}
$$

They are smooth (resp., locally $\mathbb{Q}_{p}$-algebraic) generalized parabolic Steinberg representations of $\mathbf{L}_{I}^{\langle r\rangle}(L)$. We put $\mathrm{St}_{I}^{\infty}(\pi, \underline{\lambda}):=v_{\emptyset, I}^{\infty}(\pi, \underline{\lambda}), \mathrm{St}_{I}^{\infty}(\pi):=v_{\emptyset, I}^{\infty}(\pi, \underline{0})$.
Proposition 3.8. $\left\{v_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{\infty}(\pi)\right\}_{I \subseteq \Delta_{n}(k)}$ are precisely the Jordan-Hölder factors of the smooth representation $i \frac{G}{\overline{\mathbf{P}}^{\langle r\rangle}}(\pi)$ and $v_{\overline{\mathbf{P}}^{\langle r\rangle}}^{\infty}(\pi) \cong \mathrm{St}_{(r, k)}^{\infty}(\pi)$, where $\mathrm{St}_{(r, k)}^{\infty}(\pi)$ is the smooth parabolic Steinberg representation of $G$ (see Definition 6.2). Therefore, the Jordan-Hölder factors of the locally $\mathbb{Q}_{p}$-algebraic representation $i_{\overline{\mathbf{P}}^{\langle r\rangle}}(\pi, \underline{\lambda})$ are $\left\{v_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{\infty}(\pi, \underline{\lambda})\right\}_{I \subseteq \Delta_{n}(k)}$. In particular, we have $v_{\overline{\mathbf{P}}^{\langle r\rangle}}^{\infty}(\pi, \underline{\lambda}) \cong \operatorname{St}_{(r, k)}^{\infty}(\pi, \underline{\lambda}):=\operatorname{St}_{(r, k)}^{\infty}(\pi) \otimes_{E} L(\underline{\lambda})$.

We prove this Proposition in Appendix 6.3, Lemma 6.4.

## 4 Locally $\mathbb{Q}_{p}$-analytic generalized parabolic Steinberg representations

The main goal of this section is to study locally $\mathbb{Q}_{p}$-analytic generalized parabolic Steinberg representations. In Section 4.1, we recall the theory of Orlik-Strauch. In Section 4.2, we define locally $\mathbb{Q}_{p}$-analytic generalized parabolic Steinberg representations. In order to study the Jordan-Hölder factors of locally $\mathbb{Q}_{p}$-analytic generalized parabolic Steinberg representation, we first establish the locally $\mathbb{Q}_{p}$-algebraic and locally $\mathbb{Q}_{p}$-analytic Tits complexes in Section 4.3. In Section 4.4, we compute the multiplicities of certain composition factors of locally $\mathbb{Q}_{p}$-analytic parabolic Steinberg representations by following the route of [29].

### 4.1 Orlik-Strauch theory

In order to determine the composition factors of the above locally $\mathbb{Q}_{p}$-analytic representations, we apply the machinery constructing locally analytic representation $\mathcal{F}_{P}^{G}(-,-)$ (the Orlik-Strauch functor).

Let $\mathcal{O}_{\text {alg }}^{\bar{p}_{I}, \Sigma_{L}}$ be the Bernstein-Gelfand-Gelfand (BGG) category (see [7, Section 2]). Recall that if $\underline{\lambda} \in X_{I}^{+}$, then the generalized parabolic Verma module $\bar{M}_{I}(-\underline{\lambda})$ belongs to the BGG category $\mathcal{O}_{\text {alg }}^{\bar{p}_{I} \Sigma_{L}}$. Furthermore, by [2, Theorem 3.37], any irreducible constituents of $\bar{M}_{I}(-\underline{\lambda}) \in \mathcal{O}_{\text {alg }}^{\bar{p}_{I}, \Sigma_{L}}$ in $\mathcal{O}_{\text {alg }}^{\bar{p}_{I}, \Sigma_{L}}$ have the form $\bar{L}\left(-\underline{\lambda}^{\prime}\right)$ such that $\underline{\lambda}^{\prime}$ is strongly linked to $\underline{\lambda}$ and $\underline{\lambda}^{\prime} \in X_{I}^{+}$(see [2, Definition 3.31] for the notion of strongly linked). Let $I^{\prime}$ be a subset of $\Delta_{n}$ containing $I$, then $\mathcal{O}_{\text {alg }}^{\bar{p}_{I^{\prime}}, \Sigma_{L}}$ is a full subcategory of $\mathcal{O}_{\text {alg }}^{\bar{p}_{I}, \Sigma_{L}}$. Therefore, for any object $M \in \mathcal{O}_{\text {alg }}^{\overline{\mathfrak{p}}_{I}, \Sigma_{L}}$, there is a maximal subset $I^{\prime} \subseteq \Delta_{n}$ such that $M \in \mathcal{O}_{\text {alg }}^{\bar{p}_{I^{\prime}}, \Sigma_{L}}$. We call $\overline{\mathbf{P}}_{I^{\prime}}$ the maximal parabolic subgroup associated to $M$ (or say that $I^{\prime}$ is maximal for $M$ ).

We now recall the precise description of the Orlik-Strauch functor (see [30, Theorem]), see also [7, Section 2]. It has the form:

$$
\begin{aligned}
\mathcal{F}_{\overline{\mathbf{P}}_{I}}^{G}(-,-): \mathcal{O}_{\mathrm{alg}}^{\overline{\mathfrak{p}}_{I}, \Sigma_{L}} \times \operatorname{Rep}_{E}^{\infty, \mathrm{ad}}\left(\mathbf{L}_{I}(L)\right) & \longrightarrow \operatorname{Rep}_{E}(G), \\
\left(M, \pi_{I}\right) & \mapsto \mathcal{F}_{\overline{\mathbf{P}}_{I}}^{G}\left(M, \pi_{I}\right) .
\end{aligned}
$$

By [7, Theorem 2.3], or [30, The main theorem], this functor satisfies the following properties. $\mathcal{F}_{\overline{\mathbf{P}}_{I}}^{G}(-,-)$ is an exact bi-functor, which is contravariant (resp. covariant) in the first (resp. second) variable (see [30, Propositions 4.7 and 4.9]). If $M \in \mathcal{O}_{\text {alg }}^{\bar{p}_{I}, \Sigma_{L}}$ is simple, and $\overline{\mathbf{P}}_{I}$ is the maximal parabolic subgroup associated to $M$, then the representation $\mathcal{F}_{\overline{\mathbf{P}}_{I}}\left(M, \pi_{I}\right)$ is topologically irreducible for any admissible irreducible smooth representation $\pi_{I}$ of $\mathbf{L}_{I}(L)$. Let $I \subseteq J$ and let $M \in \mathcal{O}_{\text {alg }}^{\bar{p}_{J}, \Sigma_{L}} \subset \mathcal{O}_{\text {alg }}^{\bar{p}_{I}, \Sigma_{L}}$. Then for all $\pi_{I} \in \operatorname{Rep}_{E}^{\infty, \text { ad }}\left(\mathbf{L}_{I}(L)\right)$, we have an isomorphism of $G$-representations $\mathcal{F}_{\overline{\mathbf{P}}_{I}}^{G}\left(M, \pi_{I}\right) \cong \mathcal{F}_{\overline{\mathbf{P}}_{J}}^{G}\left(M, i_{\mathbf{L}_{J}(L) \cap \overline{\mathbf{P}}_{I}(L)}^{\mathbf{L}_{J}(L)} \pi_{I}\right)$.

### 4.2 Locally $\mathbb{Q}_{p}$-analytic generalized parabolic Steinberg representations

Let $\underline{\lambda} \in X_{\Delta_{n}}^{+}$, and let $I, J \subseteq \Delta_{n}(k)$. We put $\pi_{I}(\underline{\lambda}):=\pi_{I} \otimes_{E} L^{\langle r\rangle}(\underline{\lambda})_{I}$ and put

$$
\mathbb{I}_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{G}(\pi, \underline{\lambda})=\left(\operatorname{Ind}_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}(L)}^{G} \pi_{I}(\underline{\lambda})\right)^{\mathbb{Q}_{p}-\mathrm{an}}
$$

If $J \supsetneq I$, then by [30, The main theorem], we see that Proposition 3.6 (3.13) induces an injection

$$
\begin{align*}
& p_{J, I}^{\mathrm{an}}: \mathbb{I}_{\overline{\mathbf{P}}_{J}^{G}\langle r\rangle}^{G}(\pi, \underline{\lambda})=\mathcal{F}_{\overline{\mathbf{P}}_{J}^{\langle\langle \rangle}(L)}^{G(L)}\left(U\left(\mathfrak{g}_{\Sigma_{L}}\right) \otimes_{U\left(\overline{\boldsymbol{p}}_{J, \Sigma_{L}}\right)} \bar{L}^{\langle r\rangle}(-\underline{\lambda})_{J}, \pi_{J}\right) \\
& \xrightarrow{\mathcal{F}_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}(L)}^{G(L)}\left(q_{I, J}, \text { incl. }\right)} \mathcal{F}_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}(L)}^{G(L)}(U\left(\mathfrak{g}_{\Sigma_{L}}\right) \otimes \underbrace{}_{U\left(\overline{\mathfrak{p}}_{I, \Sigma_{L}}\right)} \bar{L}^{\langle r\rangle}(-\underline{\lambda})_{I}, i_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}(L) \cap \mathbf{L}_{J}^{\langle r\rangle}(L)}^{\langle r\rangle}(L) \pi_{I})  \tag{4.1}\\
& \cong \mathcal{F}_{\overline{\mathbf{P}}_{I}^{(r)}(L)}^{G(L)}\left(U\left(\mathfrak{g}_{\Sigma_{L}}\right) \otimes_{U\left(\overline{\mathfrak{F}}_{I, \Sigma_{L}}\right)} \bar{L}^{\langle r\rangle}(-\underline{\lambda})_{I}, \pi_{I}\right)=\mathbb{I}_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{G}(\pi, \underline{\lambda}),
\end{align*}
$$

where the map $q_{I, J}: \bar{M}_{I}(-\underline{\lambda})=U\left(\mathfrak{g}_{\Sigma_{L}}\right) \otimes_{U\left(\overline{\mathfrak{p}}_{I, \Sigma_{L}}\right)} \bar{L}^{\langle r\rangle}(-\underline{\lambda})_{I} \rightarrow \bar{M}_{J}(-\underline{\lambda})=U\left(\mathfrak{g}_{\Sigma_{L}}\right) \otimes_{U\left(\overline{\mathfrak{p}}_{J, \Sigma_{L}}\right)} \bar{L}^{\langle r\rangle}(-\underline{\lambda})_{J}$ is defined in the next section. Therefore, we put

$$
v_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{\mathrm{an}}(\pi, \underline{\lambda})=\mathbb{I}_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{G}(\pi, \underline{\lambda}) / \sum_{J \supsetneq I} \mathbb{I}_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}}^{G}(\pi, \underline{\lambda}) .
$$

We also put $\frac{\mathbb{I}_{\mathbf{P}_{I}}^{G}}{\langle r\rangle}(\pi):=\frac{\mathbb{T}}{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}(\pi, \underline{0}), v_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{\mathrm{an}}(\pi):=v_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{\mathrm{an}}(\pi, \underline{0})$.

## Definition 4.1. (Locally $\mathbb{Q}_{p}$-analytic generalized parabolic Steinberg representations)

For $\underline{\lambda} \in X_{\Delta_{n}}^{+}$, we call $\left\{v_{\overline{\mathbf{P}}_{I}^{\text {ar }}}^{\stackrel{\text { an }}{ }}(\pi, \underline{\lambda})\right\}_{I \subseteq \Delta_{n}(k)}$ the locally $\mathbb{Q}_{p}$-analytic generalized parabolic Steinberg representations associated to the Zelevinsky-segment $\Delta_{[k-1,0]}(\pi)$ and weight $\underline{\lambda}$. Put $\mathrm{St}_{(r, k)}^{\mathrm{an}}(\pi, \underline{\lambda}):=v_{\overline{\mathbf{P}}^{\langle r\rangle}}^{\mathrm{an}}(\pi, \lambda)$ and $\mathrm{St}_{(r, k)}^{\mathrm{an}}(\pi):=v_{\overline{\mathbf{P}}^{\langle r\rangle}}^{\mathrm{an}}(\pi, \underline{0})$, they are locally $\mathbb{Q}_{p}$-analytic parabolic Steinberg representations. Furthermore, for $J \subset I \subseteq \Delta_{n}(k)$ and $\underline{\lambda} \in X_{\Delta_{n}^{k} \cup I}^{+}$. We put

$$
\mathbb{I}_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}(L) \cap \mathbf{L}_{I}^{\langle r\rangle}(L)}^{\mathbf{L}_{I}^{\langle r\rangle}(L)}(\pi, \underline{\lambda}):=\left(\operatorname{Ind}_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}(L) \cap \mathbf{L}_{I}^{\langle r\rangle}(L)}^{\left\langle\mathbf{L}^{\langle r\rangle}(L)\right.} \pi_{I}(\underline{\lambda})\right)^{\mathbb{Q}_{p}-\mathrm{an}} .
$$

We put

They are locally $\mathbb{Q}_{p}$-analytic generalized parabolic Steinberg representations of $\mathbf{L}_{I}^{\langle r\rangle}(L)$. We put $\mathrm{St}_{I}^{\mathrm{an}}(\pi, \underline{\lambda}):=$ $v_{\emptyset, I}^{\mathrm{an}}(\pi, \underline{\lambda})$.

Example 4.2. (Borel case) When $r=1$, and $\pi=v_{1}^{\frac{1-n}{2}}$, we recover the locally $\mathbb{Q}_{p}$-analytic generalized (Borel) Steinberg representations defined in [15, Section 2.1.2]. More precisely, we have $v_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{\mathrm{an}}\left(v_{1}^{\frac{1-n}{2}}, \underline{\lambda}\right)=$ $v_{\overline{\mathbf{P}}_{I}}^{\mathrm{an}}(\underline{\lambda}), v_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{\infty}\left(v_{1}^{\frac{1-n}{2}}, \underline{\lambda}\right)=v_{\overline{\mathbf{P}}_{I}}^{\infty}(\underline{\lambda})$. In particular, we have $\mathrm{St}_{(1, n)}^{\mathrm{an}}\left(v_{1}^{\frac{1-n}{2}}, \underline{\lambda}\right)=\operatorname{St}_{n}^{\mathrm{an}}(\underline{\lambda}), \operatorname{St}_{(1, n)}^{\infty}\left(v_{1}^{\frac{1-n}{2}}, \underline{\lambda}\right)=$ $\mathrm{St}_{n}^{\infty}(\underline{\lambda})$, etc.

### 4.3 The locally $\mathbb{Q}_{p}$-algebraic and locally $\mathbb{Q}_{p}$-analytic Tits complexes

In this section, we will prove the exactness of the locally algebraic and locally analytic Tits complexes. They are used to compute the multiplicity of an irreducible constituent in the locally $\mathbb{Q}_{p}$-analytic generalized parabolic Steinberg representation $v_{\overline{\mathbf{P}}_{S}^{\langle r\rangle}}^{\text {an }}(\pi, \underline{\lambda})$ (see Section 4.4). In Section 4.4 and Section 5, we will use these complexes to compute some extension groups between certain locally $\mathbb{Q}_{p}$-analytic representations.

Keep the notation in Section 2.1 "General linear group $\mathrm{GL}_{n}-\mathrm{I}$ ". For $\sigma \in \Sigma_{L}$ and $w_{\sigma} \in \mathscr{W}_{n, \sigma}$, we let $I\left(w_{\sigma}\right)=\left\{i \in \Delta_{n} \mid l\left(s_{i, \sigma} w_{\sigma}\right)>l\left(w_{\sigma}\right)\right\}$, where $l(\bullet)$ is the length function. Let $\operatorname{supp}\left(w_{\sigma}\right)$ be the set of simple reflections appearing in one (and so in any) reduced expression of $w_{\sigma}$, Let $w=\left(w_{\sigma}\right)_{\sigma \in \Sigma_{L}} \in \mathscr{W}_{n, \Sigma_{L}} \cong$ $S_{n}^{d_{L}}$. We put

$$
I(w)=\bigcup_{\sigma \in \Sigma_{L}} I\left(w_{\sigma}\right), \operatorname{supp}(w)=\prod_{\sigma \in \Sigma_{L}} \operatorname{supp}\left(w_{\sigma}\right)
$$

By definition, we see that $w \in \mathscr{W}_{I, \Sigma_{L}}$ if and only if $\operatorname{supp}\left(w_{\sigma}\right) \subset I$ for all $\sigma \in \Sigma_{L}$.
Let $I$ be a subset of $\Delta_{n}$, and let $\underline{\lambda}=\left(\underline{\lambda}_{\sigma}\right)_{\sigma \in \Sigma_{L}} \in X_{I}^{+}$. We put

$$
\bar{M}_{I, \sigma}\left(-\underline{\lambda}_{\sigma}\right):=U\left(\mathfrak{g}_{\sigma}\right) \otimes_{U\left(\overline{\mathfrak{p}}_{I, \sigma}\right)} \bar{L}\left(-\underline{\lambda}_{\sigma}\right)_{I}, \bar{M}_{\sigma}\left(-\underline{\lambda}_{\sigma}\right):=\bar{M}_{\emptyset, \sigma}\left(-\underline{\lambda}_{\sigma}\right) .
$$

Then we have

$$
\bar{M}_{I}(-\underline{\lambda})=U\left(\mathfrak{g}_{\Sigma_{L}}\right) \otimes_{U\left(\overline{\mathfrak{p}}_{I, \Sigma_{L}}\right)} \bar{L}(-\underline{\lambda})_{I} \cong \bigotimes_{\sigma \in \Sigma_{L}} \bar{M}_{I, \sigma}\left(-\underline{\lambda}_{\sigma}\right) .
$$

For $\sigma \in \Sigma_{L}$, we write $\underline{\lambda}_{\sigma}:=\left(\lambda_{1, \sigma}, \cdots, \lambda_{n, \sigma}\right), \underline{\lambda}^{\sigma}:=\left(\lambda_{1, \sigma^{\prime}}, \cdots, \lambda_{n, \sigma^{\prime}}\right)_{\sigma^{\prime} \in \Sigma_{L} \backslash\{\sigma\}}$. Then for each $w_{\sigma} \in \mathscr{W}_{n, \sigma}$ and $\sigma \in \Sigma_{L}$, fix once and for all an embedding $i_{w_{\sigma}}: \bar{M}_{\sigma}\left(-w_{\sigma} \cdot \underline{\lambda}_{\sigma}\right) \hookrightarrow \bar{M}_{\sigma}\left(-\underline{\lambda}_{\sigma}\right)$. If $w_{\sigma}^{\prime} \geq w_{\sigma}$ (for the Bruhat order on $\left.\mathscr{W}_{n, \sigma}\right)$, we have a unique map $i_{w_{\sigma}^{\prime}, w_{\sigma}}: \bar{M}_{\sigma}\left(-w_{\sigma}^{\prime} \cdot \underline{\lambda}_{\sigma}\right) \rightarrow \bar{M}_{\sigma}\left(-w_{\sigma} \cdot \underline{\lambda}\right)$ such that $i_{w_{\sigma}^{\prime}}=i_{w_{\sigma^{\prime}, w_{\sigma}}} \circ i_{w_{\sigma}}$ ([29, Page 653]). By the argument in [27, Proposition 2.1] or [29, Section 2, Page 653], we have a surjective $\operatorname{map} q_{I}: \bar{M}(-\underline{\lambda}) \longrightarrow \bar{M}_{I}(-\underline{\lambda})$ and an exact sequence,

$$
\begin{equation*}
\bigoplus_{\substack{w \in \mathscr{W}_{I, \Sigma_{L}} \\ l(w)=1}} \bar{M}(-w \cdot \underline{\lambda}) \xrightarrow{\oplus_{w} \otimes_{\sigma \in \Sigma_{L}} i_{w_{\sigma}}} \bar{M}(-\underline{\lambda}) \longrightarrow \bar{M}_{I}(-\underline{\lambda}) \longrightarrow 0 \tag{4.2}
\end{equation*}
$$

If $I^{\prime} \subset I \subseteq \Delta_{n}$, then we obtain a transition map $q_{I^{\prime}, I}: \bar{M}_{I^{\prime}}(-\underline{\lambda}) \longrightarrow \bar{M}_{I}(-\underline{\lambda})$ such that $q_{I}=q_{I^{\prime}, I} \circ q_{I^{\prime}}$.
Let $\underline{\lambda} \in X_{\Delta_{n}}^{+}$be a dominant weight, recall that the $I$-parabolic BGG-resolution of $\bar{L}(-\underline{\lambda})[23$, Section 9.16, Theorem] is given by the exact sequence

$$
\begin{align*}
& 0 \rightarrow \bar{M}_{I}\left(-{ }^{I} w \cdot \underline{\lambda}\right) \rightarrow \bigoplus_{\substack{w \in \mathscr{W}_{n, \Sigma_{L}} \\
l(w)=l\left({ }^{I} w\right)-1}} \bar{M}_{I}(-w \cdot \underline{\lambda}) \rightarrow \cdots  \tag{4.3}\\
& \cdots \rightarrow \bigoplus_{\substack{w \in \mathscr{W}_{n} \mathscr{W}_{n, \Sigma_{L}} \\
l(w)=1}} \bar{M}_{I}(-w \cdot \underline{\lambda}) \rightarrow \bar{M}_{I}(-\underline{\lambda}) \rightarrow \bar{L}(-\underline{\lambda}) \rightarrow 0,
\end{align*}
$$

where ${ }^{I} w$ is the longest element in ${ }^{I} \mathscr{W}_{n, \Sigma_{L}}$. The differentials in (4.3) are specified in the end of $[29$, Section 2] in terms of some alternate sums of $\left\{i_{w_{\sigma}^{\prime}, w_{\sigma}}\right\}_{w_{\sigma}^{\prime}, w_{\sigma} \in \mathscr{W}_{n, \sigma}, \sigma \in \Sigma_{L}}$.

We use the notation of Section 2.1 "General linear group GL ${ }_{n}$-II". Let $I$ be a subset of $\Delta_{n}(k)$. In our setting, we apply (4.3) to get the following $I \cup \Delta_{n}^{k}$-parabolic BGG-resolution of $\bar{L}(-\underline{\lambda})$ :

$$
0 \rightarrow \bar{M}_{I}^{\langle r\rangle}\left(-I^{\left.I \cup \Delta_{n}^{k} w \cdot \underline{\lambda}\right) \rightarrow \bigoplus_{\substack{w \in \mathscr{W}^{\prime} \mathscr{W}_{n, \Sigma_{L}}^{\langle r\rangle} \\ l(w)=l\left({ }^{I} w\right)-1}} \bar{M}_{I}^{\langle r\rangle}(-w \cdot \underline{\lambda}) \rightarrow \cdots} \underset{\substack{w \in \mathscr{I}^{I} \mathscr{W}_{n, \Sigma_{L}}^{\langle r\rangle} \\ l(w)=1}}{ } \bar{M}_{I}^{\langle r\rangle}(-w \cdot \underline{\lambda}) \rightarrow \bar{M}_{I}^{\langle r\rangle}(-\underline{\lambda}) \rightarrow \bar{L}(-\underline{\lambda}) \rightarrow 0,\right.
$$

Applying the exact functor $\mathcal{F}_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}(L)}^{G}\left(-, \pi_{I}\right)$, we get the following exact sequence,

$$
\begin{align*}
& \mathcal{B}_{I}: 0 \leftarrow \mathbb{I}_{\mathbf{P}_{I}\langle r\rangle}^{G}\left(\pi,{ }^{I} w \cdot \underline{\lambda}\right) \leftarrow \bigoplus_{\substack{w \in \mathscr{L}^{I} \mathscr{W}_{n, 2}^{\langle r\rangle}, \Sigma_{L} \\
l(w)=l\left({ }^{T} w\right)-1}} \mathbb{I}_{\mathbf{P}_{I}}^{G}\langle r\rangle(\pi, w \cdot \underline{\lambda}) \leftarrow \cdots \\
& \cdots \leftarrow \bigoplus_{\substack{w \in^{I} \mathscr{W}_{n}^{\langle r\rangle}, l(w)=1}} \mathbb{I}_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{G}(\pi, w \cdot \underline{\lambda}) \leftarrow \mathbb{I}_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{G}(\pi, \underline{\lambda}) \leftarrow i i_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{G}(\pi, \underline{\lambda}) \leftarrow 0 . \tag{4.5}
\end{align*}
$$

We are going to prove the acyclicity of the locally $\mathbb{Q}_{p}$-algebraic (resp., locally $\mathbb{Q}_{p}$-analytic) Tits complexes. The locally $\mathbb{Q}_{p}$-analytic (resp., locally $\mathbb{Q}_{p}$-algebraic) Tits complexes show that locally $\mathbb{Q}_{p}$-analytic (resp., locally $\mathbb{Q}_{p}$-algebraic) generalized parabolic Steinberg representation is derived equivalent to a complex of (direct sum of) parabolically induced locally $\mathbb{Q}_{p}$-analytic (resp., locally $\mathbb{Q}_{p}$-algebraic) principal series.

For $0 \leq j \leq k-1-|I|$ and $\underline{\lambda} \in X_{\Delta_{n}}^{+}$, we define

$$
\begin{align*}
& C_{I, j}^{\infty}:=C_{I, j}^{\infty}(\pi, \underline{\lambda})=\bigoplus_{\substack{I \subseteq K \subseteq \Delta_{n}(k) \\
|K \backslash I|=r}} i{\underset{\overline{\mathbf{P}}}{K}}_{G\langle r\rangle}^{G r}(\pi, \underline{\lambda}),  \tag{4.6}\\
& C_{I, j}^{\mathrm{an}}:=C_{I, j}^{\mathrm{an}}(\pi, \underline{\lambda})=\bigoplus_{\substack{I \subseteq K \subseteq \Delta_{n}(k) \\
|K \backslash I|=r}} \frac{\mathbb{I}}{\mathbf{P}_{K}^{\langle r\rangle}}(\pi, \underline{\lambda}) .
\end{align*}
$$

The following proposition first gives the acyclicity of the locally $\mathbb{Q}_{p}$-algebraic Tits complexes. It follows from (3.14) and (3.15), together with the same combinatorial technique in [28, Propostion 11] (see also [33, Section 2, Proposition 6]).

Proposition 4.3. Let $I \subseteq \Delta_{n}(k)$ and $\underline{\lambda} \in X_{\Delta_{n}}^{+}$, we have a natural exact sequence of locally $\mathbb{Q}_{p}$-algebraic representations of $G$ :

$$
\begin{align*}
0 \rightarrow C_{I, k-1-|I|}^{\infty} \rightarrow C_{I, k-2-|I|}^{\infty} \rightarrow C_{I, k-3-|I|}^{\infty} \rightarrow & \cdots \rightarrow C_{I, 1}^{\infty} \\
& \rightarrow C_{I, 0}^{\infty}=i_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{G}(\pi, \underline{\lambda}) \rightarrow v_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{\infty}(\pi, \underline{\lambda}) \rightarrow 0 . \tag{4.7}
\end{align*}
$$

Here the differentials $d_{K^{\prime}, K}: i \underset{\overline{\mathbf{P}}_{K^{\prime}}^{\langle r\rangle}}{G}(\pi, \underline{\lambda}) \rightarrow i_{\overline{\mathbf{P}}_{K}^{\langle r\rangle}}^{G}(\pi, \underline{\lambda})$ are defined as follows. If $K \nsubseteq K^{\prime}, d_{K^{\prime}, K}=0$. If $K^{\prime}=\left\{k_{1} r<\cdots<k_{l} r\right\}$ and $K^{\prime}=K \cup\left\{k_{i} r\right\}$, we put $d_{K^{\prime}, K}=(-1)^{i} p_{K^{\prime}, K}$, where $p_{K^{\prime}, K}: i_{\overline{\mathbf{P}}_{K^{\prime}}^{\langle r\rangle}}^{G}(\pi, \underline{\lambda}) \hookrightarrow$ $i{\underset{\mathbf{P}}{K}}_{\langle r\rangle}(\pi, \underline{\lambda})$ is the injection defined in (3.13).

We also have a locally analytic analogy of the above situations. This is a generalization of [29, Theorem 4.2 ] and [15, Theorem 2.6]. We modify the proof of [29, Theorem 4.2] to our content.

Proposition 4.4. Let $I \subseteq \Delta_{n}(k)$ and $\underline{\lambda} \in X_{\Delta_{n}}^{+}$, we have a natural exact sequence of locally analytic representations of $G$ :

$$
\begin{align*}
0 \rightarrow C_{I, k-1-|I|}^{\mathrm{an}} \rightarrow C_{I, k-2-|I|}^{\mathrm{an}} \rightarrow C_{I, k-3-|I|}^{\mathrm{an}} \rightarrow & \cdots
\end{align*} \rightarrow C_{I, 1}^{\mathrm{an}} .
$$

Here the differentials $d_{K^{\prime}, K}: \mathbb{I}_{\overline{\mathbf{P}}_{K^{\prime}}}^{\langle r\rangle}(\pi, \underline{\lambda}) \rightarrow \mathbb{I}_{\overline{\mathbf{P}}_{K}^{\langle r\rangle}}^{G}(\pi, \underline{\lambda})$ are defined as follows. If $K \nsubseteq K^{\prime}, d_{K^{\prime}, K}=0$. If $K^{\prime}=\left\{k_{1} r<\cdots<k_{l} r\right\}$ and $K^{\prime}=K \cup\left\{k_{i} r\right\}$, we put $d_{K^{\prime}, K}=(-1)^{i} p_{K^{\prime}, K}^{\text {an }}$, where $p_{K^{\prime}, K}^{\text {an }}: \frac{\mathbb{K}_{\mathbf{P}_{K^{\prime}}}^{G r\rangle}}{}(\pi, \underline{\lambda}) \hookrightarrow$ $\mathbb{I}_{\overline{\mathbf{P}}_{K}^{G}}^{\langle r\rangle}(\pi, \underline{\lambda})$ is the injection defined in (4.1).

Proof. We prove (4.8) for $\underline{\lambda}=\underline{0}$ at first. By the same combinatorial technique in [28, Proposition 11] (see also [33, Section 2, Proposition 6]), it suffices to prove that

$$
\begin{align*}
& \mathbb{I}_{\overline{\mathbf{P}}_{I}^{G r\rangle}}^{G}(\pi) \cap \mathbb{I}_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}}^{G}(\pi)=\mathbb{I}_{\overline{\mathbf{P}}_{I \cup J}^{\langle r\rangle}}^{G}(\pi), \\
& \mathbb{I}_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{G}(\pi) \cap\left(\mathbb{I}_{\overline{\mathbf{P}}_{I_{1}}^{\langle r\rangle}}^{G}(\pi)+\cdots+\mathbb{I}_{\overline{\mathbf{P}}_{I_{m}}^{\langle r\rangle}}^{G}(\pi)\right)=\mathbb{I} \mathbb{I}_{\mathbf{P}_{I}^{\langle r\rangle}}^{G}(\pi) \cap \mathbb{I}_{\overline{\mathbf{P}}_{I_{1}}^{\langle r\rangle}}^{G}(\pi)+\cdots+\mathbb{I}_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{G}(\pi) \cap \mathbb{I}_{\overline{\mathbf{P}}_{I_{m}}^{\langle r\rangle}}^{G}(\pi) . \tag{4.9}
\end{align*}
$$

## Proof of the first identity of (4.9).

By the exactness of the induction functor $\operatorname{Ind}_{\overline{\mathbf{P}}_{I \cup J(L)}^{\langle r\rangle}(L)}^{G}$, it suffices to establish the identity $\left(\frac{\mathbb{I}_{\overline{\mathbf{P}}_{I}}^{\langle r\rangle}(L) \cap \mathbf{L}_{K}^{\langle r\rangle}(L)}{\langle r\rangle} \pi_{I}\right) \cap$ $\left(\mathbb{I}_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}(L) \cap \mathbf{L}_{K}^{\langle r\rangle}(L)}^{\langle r\rangle} \pi_{J}^{\langle L)}\right)=\pi_{I \cup J .}$. It is clear that the right-hand side is contained in the left-hand. Let $\mathcal{X}$ be a nonzero irreducible constituent of its cokernel. Then by [30, Theorem], we see that $\mathcal{X}$ has the
 $I \subseteq K \subseteq I \cup J$, and $M$ is an irreducible constituent of $i_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}(L) \cap \mathbf{L}_{K}^{\langle r\rangle}(L)}^{\langle r\rangle}(L) \pi_{I}$. On the other hand, $\mathcal{X}$ also has the form $\mathcal{F}_{\substack{\mathbf{L}_{I \cup J}^{\langle r\rangle}(L) \cap \overline{\mathbf{P}}_{K^{\prime}}^{\langle r\rangle}(L)}}^{\left\langle\mathbf{L}^{\langle r\rangle}(L)\right.}\left(\bar{L}^{\langle r\rangle}\left(-s^{\prime} \cdot \underline{0}\right)_{I \cup J}, M^{\prime}\right)$, where $s^{\prime} \in S_{n}^{\left|\Sigma_{L}\right|}$ satisfying $s \cdot \underline{0} \in X_{\Delta_{n}^{k} \cup K^{\prime}}^{+}$for some maximal $J \subseteq K^{\prime} \subseteq I \cup J$, and $M^{\prime}$ is an irreducible constituent of $i_{\overline{\mathbf{P}}_{J}^{\left\langle^{\prime}\right\rangle}(L) \cap \mathbf{L}_{K}^{\langle r\rangle}(L)}^{\mathbf{L}^{\langle r\rangle}(L)} \pi_{J}$. By [7, Corollary 2.7], we have $K=K^{\prime}, s=s^{\prime}$ and $M^{\prime} \cong M$. Therefore, we deduce that $s=s^{\prime} \in\left[\mathscr{W}_{K, \Sigma_{L}}^{\langle r\rangle} \backslash \mathscr{W}_{I \cup J, \Sigma_{L}}^{\langle r\rangle}\right] \cap\left[\mathscr{W}_{K^{\prime}, \Sigma_{L}}^{\langle r\rangle} \backslash \mathscr{W}_{I \cup J, \Sigma_{L}}^{\langle r\rangle}\right]=1$ since $K^{\prime} \cup K=I \cup J$ (since we have $I \subseteq K \subseteq I \cup J$ and $\left.J \subseteq K^{\prime} \subseteq I \cup J\right)$. In this case, we see that $M=M^{\prime}$ is an irreducible constituent of $\left(i_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}(L) \cap \mathbf{L}_{K}^{\langle r\rangle}(L)}^{\langle r\rangle}(L) \pi_{I}\right)$ and $\left(i_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}(L) \cap \mathbf{L}_{K}^{\langle r\rangle}(L)}^{\langle r\rangle} \pi_{J}\right)$. Then, by (3.14) and [4, Proposition $1.5(\mathrm{~b})]$, we deduce $M \cong M^{\prime}=\pi_{I \cup J}$. This proves the first identity.
Proof of the second identity of (4.9).
We prove the second identity by using induction on $m$. We deduce from the first identity that the right-
 and $\mathcal{W}=\mathbb{I}_{\overline{\mathbf{P}}_{I \cup I_{1}}}^{G r\rangle}(\pi)+\cdots+\mathbb{I}_{\overline{\mathbf{P}}_{I \cup I_{m-1}}^{G r\rangle}}^{\langle }(\pi)$. Then by induction, we have the following commutative diagram:

The result follows from the snake lemma.
For general $\underline{\lambda}$, we use the same route of the proof of [29, Theorem, 4.2]. The proof is by induction on the $\left|\Delta_{n}(k)\right|$. When $\left|\Delta_{n}(k)\right|=1$, the acyclicity of (4.8) is trivial. We assume that $\left|\Delta_{n}(k)\right|>1$. We denote

$$
\begin{equation*}
\mathbb{I}_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{G}[k]:=\bigoplus_{\substack{w \in^{I} \mathscr{W}_{n}^{\langle r\rangle} \\ l(w)=k}} \mathbb{I}_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{G}(\pi, w \cdot \underline{\lambda}), \text { and } \mathcal{I}_{I, d, l}:=\bigoplus_{\substack{I \subseteq K \subseteq \Delta_{n}(k) \\|K \backslash I|=d}} \mathbb{I} \mathbb{I}_{K}^{G}\langle\pi, \underline{\lambda})[l], \tag{4.11}
\end{equation*}
$$

for short (recall that $\mathcal{I}_{I, d, 0}=C_{I, d}^{a n}$ ). The complexes in (4.5), for various $I \subseteq K \subseteq \Delta_{n}(k)$, induce the
following double complex (note that the vertical sequences are given by (4.5), for various $I \subseteq K \subseteq \Delta_{n}(k)$ ):

where $t=l\left({ }^{I} w\right)-1$ and $i_{0}=\left|\Delta_{n}(k) \backslash I\right|$. To prove the commutativity of this diagram, the heart is to establish the following commutative diagram

$$
\begin{align*}
& \bar{M}_{K^{\prime}}^{\langle r\rangle}\left(-w^{\prime} \cdot \underline{\lambda}\right) \xrightarrow{q_{\Delta \Delta_{n}^{k} \cup K^{\prime}, \Delta_{n}^{k} \cup K}} \bar{M}_{K}^{\langle r\rangle}\left(-w^{\prime} \cdot \underline{\lambda}\right)  \tag{4.12}\\
& i_{w^{\prime}, w} \downarrow \\
& \bar{M}_{K}^{\langle r\rangle}(-w \cdot \underline{\lambda}) \xrightarrow{q_{\Delta n}^{k} \cup K^{\prime}, \Delta_{n}^{k} \cup K}{ }^{i_{w^{\prime}, w}} \\
& \bar{M}_{K^{\prime}}^{\langle r\rangle}(-w \cdot \underline{\lambda}),
\end{align*}
$$

for any $K^{\prime} \subset K \subseteq \Delta_{n}(k)$ with $\left|K^{\prime}\right|=|K|-1$. Note that $w^{\prime} \geq w$ and $l\left(w^{\prime}\right)=l(w)+1$, then there exists a $\sigma \in \Sigma_{L}$, such that $w_{\sigma^{\prime}}^{\prime}=w_{\sigma^{\prime}}$ for $\sigma^{\prime} \neq \sigma$ and $w_{\sigma}^{\prime} \geq w_{\sigma}$ with $l\left(w_{\sigma}^{\prime}\right)=l\left(w_{\sigma}\right)+1$. We can get the commutativity of (4.12) by applying the proof of a similar diagram in [29, Theorem 4.2, Page 662] to such $\sigma$-component of (4.12). Applying the functor $\mathcal{F}_{\overline{\mathbf{P}}_{K^{\prime}}^{\langle r\rangle}(L)}^{G}$ to (4.12), we have by [30, Theorem (iii)] a commutative diagram:

These commutative diagrams, for various $K^{\prime} \subset K \subseteq \Delta_{n}(k)$, imply the commutativity of the above double complex.

Now we establish (4.8). As in the proof of [29, Theorem 4.2, Page 663], it suffices to prove that each row of this double complex is exact except the second row and the rightmost column. The first row is exact
by Proposition 4.3. It remains to show the exactness of the following sequence

$$
\begin{equation*}
0 \rightarrow \mathbb{I}_{\overline{\mathbf{P}}_{I(w)}^{\langle r\rangle}}^{G}(\pi, w \cdot \underline{\lambda}) \rightarrow \cdots \rightarrow \bigoplus_{\substack{I \subseteq K \subseteq I(w) \\|K \backslash I|=1}} \mathbb{I}_{\overline{\mathbf{P}}_{K}^{\langle r\rangle}}^{G}(\pi, w \cdot \underline{\lambda}) \rightarrow \mathbb{I}_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{G}(\pi, w \cdot \underline{\lambda}) \rightarrow v_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{\text {an }}(\pi, w \cdot \underline{\lambda}) \rightarrow 0 \tag{4.13}
\end{equation*}
$$

for each $w \in{ }^{I} \mathscr{W}_{n, \Sigma_{L}}^{\langle r\rangle}$. Note that

Therefore, the exactness of induction functor $\operatorname{Ind}{\underset{\mathbf{P}}{I(w)}}_{G\langle r\rangle}^{\langle r|}$ implies that it suffices to establish the exactness of the sequence

$$
\begin{align*}
& 0 \rightarrow \mathbb{I}_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}(L) \cap \mathbf{L}_{I(w)}^{\langle r\rangle}(L)}^{\mathbf{L}_{I(w)}^{\langle r\rangle}(L)}(\pi, w \cdot \underline{\lambda}) \rightarrow \cdots \rightarrow \bigoplus_{I \subseteq K \subseteq I(w)}^{|K \backslash I|=1} \left\lvert\, \frac{\mathbb{P}_{I}^{\langle w)}(L) \cap \mathbf{L}_{I(w)}^{\langle r\rangle}(L)}{\mathbf{L}_{I}^{\langle r\rangle}(L)}(\pi, w \cdot \underline{\lambda})\right.  \tag{4.14}\\
& \rightarrow \underset{\mathbb{P}_{I}^{\langle r\rangle}(L) \cap \mathbf{L}_{I(w)}^{\langle r\rangle}(L)}{\stackrel{\mathbf{L}_{I(w)}^{\langle r\rangle}(L)}{\langle }}(\pi, w \cdot \underline{\lambda}) \rightarrow v_{I, I(w)}^{\mathrm{an}}(\pi, w \cdot \underline{\lambda}) \rightarrow 0 .
\end{align*}
$$

This can be done by induction on $I(w) \subsetneq \Delta_{n}(k)$ (since $\left|I(w) \backslash \Delta_{n}^{k}\right|<\left|\Delta_{n}(k)\right|$, we can apply the induction hypothesis). This completes the proof.

Remark 4.5. When $r=1$ and $\pi=v_{1}^{\frac{1-n}{2}}$, we recover the locally $\mathbb{Q}_{p}$-algebraic and locally $\mathbb{Q}_{p}$-analytic Tits complexes given in [15, Section 2.1.2].

### 4.4 The Jordan-Hölder series of locally $\mathbb{Q}_{p}$-analytic generalized parabolic Steinberg representation

Let $m\left(w^{\prime}: w\right):=\left[\bar{M}\left(-w^{\prime} \cdot \underline{0}\right): \bar{L}(-w \cdot \underline{0})\right]$ be the multiplicity of the simple highest weight module $\bar{L}(-w \cdot \underline{0})$ in the Verma module $\bar{M}\left(-w^{\prime} \cdot \underline{0}\right)$. By $\left[23\right.$, Section 5.2 , Corollary], we see that $m\left(w^{\prime}, w\right) \neq 0$ if and only if $w \geq w^{\prime}$. Let $\underline{\lambda} \in X_{\Delta_{n}}^{+}$be a dominant weight. We have $m\left(w^{\prime}, w\right)=\left[\bar{M}\left(-w^{\prime} \cdot \underline{\lambda}\right): \bar{L}(-w \cdot \underline{\lambda})\right]$ (one can use the fact that the translation functor $T_{w_{0} \cdot \underline{\underline{\lambda}}}^{w_{0}}($ see $[23$, section 7$])$ is exact and $T_{w_{0} \cdot \underline{\lambda}}^{w_{0} \cdot \underline{M}} \bar{M}\left(-w w_{0} \cdot \underline{0}\right)=\bar{M}\left(-w w_{0} \cdot \underline{\lambda}\right)$, and $\left.T_{w_{0}}^{w_{0} \cdot \underline{0}} \bar{L}\left(-w w_{0} \cdot \underline{0}\right)=\bar{L}\left(-w w_{0} \cdot \underline{\lambda}\right)\right)$. In particular, $\left[\bar{M}\left(-w^{\prime} \cdot \underline{\lambda}\right): \bar{L}(-w \cdot \underline{\lambda})\right] \neq 0$ if and only if $w \geq w^{\prime}$. The multiplicity $m\left(w^{\prime}, w\right)$ can be computed by Kazhdan-Lustzig polynomials.

Let $S$ be a fixed subset of $\Delta_{n}(k)$. Recall that $v_{\overline{\mathbf{P}}_{S}^{\langle\gamma\rangle}}^{\text {an }}(\pi, \underline{\lambda})$ is the locally $\mathbb{Q}_{p}$-analytic generalized parabolic Steinberg representation associated to $S$. By [30, The main theorem], we see that the representations $\mathcal{F}_{\overline{\mathbf{P}}_{I(w)}^{\langle r\rangle}}^{\langle }\left(\bar{L}(-w \cdot \underline{\lambda}), v_{J, I(w) \backslash \Delta_{n}^{k}}^{\infty}(\pi)\right)$ where $w \in \mathscr{W}_{n, \Sigma_{L}}$ is an element such that $w \cdot \underline{\lambda} \in X_{\Delta_{n}^{k} \cup S}^{+}$(hence $\Delta_{n}^{k} \cup S \subseteq$ $I(w))$ and $J$ is a subset of $I(w) \backslash \Delta_{n}^{k}$ are topologically irreducible. All the Jordan Hölder factors of $v_{\overline{\mathbf{P}}_{S}^{\langle r\rangle}}^{\text {an }}(\pi, \underline{\lambda})$ are obtained by this way. Denote by $m(w, J, S)$ the multiplicity of $\mathcal{F}_{\overline{\mathbf{P}}_{I(w)}^{G r\rangle}}^{\langle( }\left(\bar{L}(-w \cdot \underline{\lambda}), v_{J, I(w) \backslash \Delta_{n}^{k}}^{\infty}(\pi)\right)$ in the locally $\mathbb{Q}_{p}$-analytic generalized parabolic Steinberg representation $v_{\overline{\mathbf{P}}_{S}^{\langle r\rangle}}^{\text {an }}(\pi, \underline{\lambda})$.

The following proposition is a slight generalization of [29, Theorem 4.6].
Proposition 4.6. Let $w$ be an element in the Weyl group $\mathscr{W}_{n, \Sigma_{L}}$ such that $I(w)=\Delta_{n}^{k} \cup I$ for some subset $S \subset I \subset \Delta_{n}(k)$. Then for any subset $J \subset I$, the multiplicity $m(w, J, S)$ is given by

$$
\begin{equation*}
m(w, J, S)=\sum_{\substack{w^{\prime} \in \mathscr{W}_{n, \Sigma_{L}} \\ \operatorname{supp}\left(w^{\prime}\right) \backslash \Delta_{n}^{k}=J \backslash S}}(-1)^{l\left(w^{\prime}\right)+|J \backslash S|}\left[\bar{M}\left(-w^{\prime} \cdot \underline{\lambda}\right): \bar{L}(-w \cdot \underline{\lambda})\right] \tag{4.15}
\end{equation*}
$$

Proof. By the exact sequence (4.8) in the Proposition 4.4, we get the following formula for the multiplicity

$$
m(w, J, S)=\sum_{S \subseteq K \subseteq \Delta_{n}(k)}(-1)^{|K|}\left[\mathbb{I}_{\overline{\mathbf{P}}_{K}^{\langle r\rangle}}^{\langle }(\pi, \underline{\lambda}), \mathcal{F}_{\overline{\mathbf{P}}_{\tilde{I}}^{\langle r\rangle}}^{G}\left(\bar{L}(w \cdot \underline{\lambda}), v_{J, I}^{\infty}(\pi)\right)\right]
$$

By definition, we have

$$
\mathbb{I}_{\overline{\mathbf{P}}_{K}^{\langle r\rangle}}^{G}(\pi, \underline{\lambda}) \cong \mathcal{F}_{\overline{\mathbf{P}}_{K}^{\langle r\rangle}}^{G}\left(\bar{M}_{K}^{\langle r\rangle}(-\underline{\lambda}), \pi^{\langle r\rangle}\right) .
$$

The non-vanishing of the expression $\left[\frac{\mathbb{I}}{\underline{\mathbf{P}}}{ }_{K}^{\langle r\rangle}(\pi, \underline{\lambda}), \mathcal{F}_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{G}\left(\bar{L}(w \cdot \underline{\lambda}), v_{J, I}^{\infty}(\pi)\right)\right]$ implies that $K \subset I$ is a neces-
 $\operatorname{Ind}_{\overline{\mathbf{P}}_{K}^{\langle r\rangle}(L) \cap \mathbf{L}_{I}^{\langle r\rangle}(L)}^{\mathbf{L}_{I}^{\langle r\rangle}(L)} \pi^{\langle r\rangle}$ if and only if $K \subset J$. Therefore, by properties of the Orlik-Strauch functor (see Section 4.1) and [7, Corollary 2.7], we get that $\mathcal{F}_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{G}\left(\bar{L}(w \cdot \underline{\lambda}), v_{J, I}^{\infty}(\pi)\right)$ appears with multiplicity one in a Jordan-Hölder series of $\mathcal{F}_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{G}\left(\bar{L}(w \cdot \underline{\lambda}), \mathbb{I}_{\overline{\mathbf{P}}_{K}^{\langle r\rangle}(L) \cap \mathbf{L}_{I}^{\langle r\rangle}(L)}^{\langle r\rangle}(\pi, \underline{\lambda})\right)$. This shows that

$$
\left[\mathbb{I}_{\overline{\mathbf{P}}_{K}^{\langle r\rangle}}^{G}(\pi, \underline{\lambda}), \mathcal{F}_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{G}\left(\bar{L}(w \cdot \underline{\lambda}), v_{J, I}^{\infty}(\pi)\right)\right]=\left[\bar{M}_{K}^{\langle r\rangle}(-\underline{\lambda}): \bar{L}(-w \cdot \underline{\lambda})\right] .
$$

We now apply the character formula (see [23, Section 9.6, Proposition $]$ ) to $\bar{M}_{K}^{\langle r\rangle}(-\underline{\lambda})$, i.e.,

$$
\operatorname{ch} \bar{M}_{K}^{\langle r\rangle}(-\underline{\lambda})=\sum_{w^{\prime} \in \mathscr{W}_{\Delta_{n}^{k} \cup K, \Sigma_{L}}}(-1)^{l\left(w^{\prime}\right)} \operatorname{ch} \bar{M}\left(-w^{\prime} \cdot \underline{\lambda}\right) .
$$

We obtain

$$
\begin{align*}
& {\left[v_{\overline{\mathbf{P}}_{S}^{\langle r\rangle}}^{\mathrm{an}}(\pi, \underline{\lambda}): \mathcal{F}_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{G}\left(\bar{L}(-w \cdot \underline{\lambda}), v_{J, I}^{\infty}(\pi)\right)\right] } \\
= & \sum_{S \subseteq K \subseteq J}(-1)^{|K|}\left[\bar{M}_{K}^{\langle r\rangle}(-\underline{\lambda}): \bar{L}(-w \cdot \underline{\lambda})\right] \\
= & \sum_{S \subseteq K \subseteq J}(-1)^{|K|} \sum_{w^{\prime} \in \mathscr{W}_{\Delta_{n}^{k} \cup K, \Sigma_{L}}}(-1)^{l\left(w^{\prime}\right)}\left[\bar{M}\left(-w^{\prime} \cdot \underline{\lambda}\right): \bar{L}(-w \cdot \underline{\lambda})\right]  \tag{4.16}\\
= & \sum_{w^{\prime} \in \mathscr{W}_{n, \Sigma_{L}}}(-1)^{l\left(w^{\prime}\right)}\left[\bar{M}\left(-w^{\prime} \cdot \underline{\lambda}\right): \bar{L}(-w \cdot \underline{\lambda})\right] \sum_{\operatorname{supp}\left(w^{\prime}\right) \cup S \subseteq \Delta_{n}^{k} \cup K \subseteq \Delta_{n}^{k} \cup J}(-1)^{|K|} \\
= & \sum_{w^{\prime} \in \mathscr{W}_{n, \Sigma_{L}}}(-1)^{l\left(w^{\prime}\right)+|J \backslash S|}\left[\bar{M}\left(-w^{\prime} \cdot \underline{\lambda}\right): \bar{L}(-w \cdot \underline{\lambda})\right] . \\
& \operatorname{supp}\left(w^{\prime}\right) \backslash \Delta_{n}^{k}=J \backslash S
\end{align*}
$$

This completes the proof.
Example 4.7. Suppose $n=4$ and $(r, k)=(2,2)$ and $L=\mathbb{Q}_{p}$. By [20, Theorem 8.4 (iii)], the irreducible constituents of the generalized Verma module $\bar{M}^{\langle 2\rangle}(0)$ are $\left\{\bar{L}(0), \bar{L}\left(-s_{2} \cdot 0\right), \bar{L}\left(-s_{2} s_{3} s_{1} s_{2} \cdot 0\right)\right\}$. On the other hand, we have

$$
\begin{equation*}
\left\{w \in \mathscr{W}_{4}: I(w)=\Delta_{4}^{2}=\{1,3\}\right\}=\left\{1, s_{2}, s_{3} s_{2}, s_{1} s_{2}, s_{1} s_{3} s_{2}, s_{2} s_{3} s_{1} s_{2}\right\} \tag{4.17}
\end{equation*}
$$

Then Proposition 4.6 implies $m(w, \emptyset, \emptyset)=1$ for $w \in\left\{1, s_{2}, s_{2} s_{3} s_{1} s_{2}\right\}$ and $m(w, \emptyset, \emptyset)=0$ for $w \in$ $\left\{s_{3} s_{2}, s_{1} s_{2}, s_{1} s_{3} s_{2}\right\}$.

Remark 4.8. Let us remark that it is hard to determine if the multiplicity (4.15) is non-zero, due to the more complicated structure of the generalized (parabolic) Verma modules. Some questions arise in the parabolic Verma modules, which remain open except in some special cases. For a survey of this topic one can refer to [23]. Therefore, the description of composition factors of locally $\mathbb{Q}_{p}$-analytic generalized parabolic Steinberg representations are more subtle.

## 5 Extensions between locally analytic representations

This section gives the main result of this paper. We study the extension groups of certain locally $\mathbb{Q}_{p^{-}}$ analytic generalized parabolic Steinberg representations. In particular, we see that, for any $i r \in \Delta_{n}(k)$ and $\underline{\lambda} \in X_{\Delta_{n}}^{+}$, the extensions of $v_{\overline{\mathbf{P}}_{i r}^{\langle r\rangle}}^{\infty}(\pi, \underline{\lambda})$ by $\mathrm{St}_{(r, k)}^{\text {an }}(\pi, \underline{\lambda})$ can be parameterized by $\operatorname{Hom}\left(L^{\times}, E\right)$ (see Theorem 5.19).

Section 5.1 and Section 5.2 list some basic facts about smooth and locally analytic extension groups. As a Preliminary, we first compute smooth extensions between smooth generalized parabolic Steinberg representations in Appendix, Section 6.4. These results are not new, and we include proofs only for the reader's convenience. In Section 5.4, we prove the first main Theorem 5.19. The key technical ingredient is to show that the morphism (5.41) is an isomorphism. In Section 5.5, we study certain subrepresentations $\Sigma_{i}^{\langle r\rangle}(\pi, \underline{\lambda})$ and $\Sigma^{\langle r\rangle}(\pi, \underline{\lambda})(\operatorname{see}(5.54))$ of $\mathrm{St}_{(r, k)}^{\mathrm{an}}(\pi, \underline{\lambda})$. We further prove that $\operatorname{soc}_{G} \Sigma_{i}^{\langle r\rangle}(\pi, \underline{\lambda}) \cong \operatorname{soc}_{G} \Sigma^{\langle r\rangle}(\pi, \underline{\lambda}) \cong \mathrm{St}_{(r, k)}^{\infty}(\pi, \underline{\lambda})$ (it might be true that $\operatorname{soc}_{G} \mathrm{St}_{(r, k)}^{\mathrm{an}}(\pi, \underline{\lambda}) \cong \mathrm{St}_{(r, k)}^{\infty}(\pi, \underline{\lambda})$, but the author does not know how to prove it). We show that the extensions of $v_{\overline{\mathbf{P}}_{i r}^{\langle r\rangle}}^{\infty}(\pi, \underline{\lambda})$ by $\mathrm{St}_{(r, k)}^{\mathrm{an}}(\underline{\lambda})$ actually come by push-forward from the extensions of $v_{\overline{\mathbf{P}}_{i r}^{\langle r\rangle}}^{\infty}(\pi, \underline{\lambda})$ by $\Sigma_{i}^{\langle r\rangle}(\pi, \underline{\lambda})$ and $\Sigma^{\langle r\rangle}(\pi, \underline{\lambda})$.

### 5.1 Computation of $\mathrm{H}_{\infty}^{i}(-, E)$ and $\mathrm{H}_{\mathrm{an}}^{i}(-, E)$

For a uniformizer $\varpi_{L}$ one gets a character $\varepsilon_{L}: L^{\times} \rightarrow \mathcal{O}_{L}^{\times}$which is identity on $\mathcal{O}_{L}^{\times}$and sends $\varpi_{L}$ to 1 . Let $\psi_{\sigma, L}:=\sigma \circ \log \circ \varepsilon_{L}: L^{\times} \rightarrow E$ for $\sigma \in \Sigma_{L}$, and $\psi_{\mathrm{ur}}: L^{\times} \rightarrow E$ be the unramified character sending $p$ to 1 (thus sending $\varpi$ to $e^{-1}$ ). Then by [14, Lemma 1.14], $\left\{\psi_{\sigma, L}\right\}_{\sigma \in \Sigma_{L}}$ and $\psi_{\text {ur }}$ form a basis of $\operatorname{Hom}\left(L^{\times}, E\right)$. In particular, the $E$-dimension of $\operatorname{Hom}\left(L^{\times}, E\right)$ is $d_{L}+1$. In particular, $\operatorname{Hom}_{\infty}\left(L^{\times}, E\right)$ is the 1-dimensional subspace of $\operatorname{Hom}\left(L^{\times}, E\right)$ generated by $\psi_{\mathrm{ur}}$.

Let $X_{L}^{*}\left(\mathbf{L}_{I}\right)$ denote the group of $L$-algebraic characters of $\mathbf{L}_{I}$, and let $X_{E}^{*}\left(\mathbf{L}_{I}\right):=X_{L}^{*}\left(\mathbf{L}_{I}\right) \otimes_{\mathbb{Z}} E$. Recall that $\mathbf{Z}_{n}$ is the center of $\mathrm{GL}_{n}$. We put $Z_{n}=\mathbf{Z}_{n}(L)$. By [28, Proposition 9], we have

$$
\mathrm{H}_{\infty}^{i}\left(\mathbf{L}_{I}(L), E\right) \cong \bigwedge^{i} X_{E}^{*}\left(\mathbf{L}_{I}\right), \quad \mathrm{H}_{\infty}^{i}\left(\mathbf{L}_{I}(L) / Z_{n}, E\right) \cong \bigwedge^{i} X_{E}^{*}\left(\mathbf{L}_{I} / \mathbf{Z}_{n}\right)
$$

Let $I$ be a subset of $\Delta_{n}$. Recall that $\operatorname{Hom}\left(\mathbf{L}_{I}(L), E\right)$ (resp., $\left.\operatorname{Hom}_{\infty}\left(\mathbf{L}_{I}(L), E\right)\right)$ denote the set consisting of $E$-valued continuous additive characters (resp., smooth additive characters) of $\mathbf{L}_{I}(L)$. By applying Lemma 2.3 to the case $V=W=1$ and using $\left[28\right.$, Proposition 9], we get an injection $j_{I}: X_{E}^{*}\left(\mathbf{L}_{I}\right) \hookrightarrow \operatorname{Hom}\left(\mathbf{L}_{I}(L), E\right)$ with image $\operatorname{Hom}_{\infty}\left(\mathbf{L}_{I}(L), E\right)$. This injection is given as follows. For any $\alpha \in X_{L}^{*}\left(\mathbf{L}_{I}\right)$, it induces a homomorphism on the $L$-points $\alpha(L): \mathbf{L}_{I}(L) \rightarrow L^{\times}$. Then $j_{I}$ sends $\alpha$ to $|\alpha(L)|_{L}$.

By [40, (3.28), Corollary 3.14], we have

$$
\begin{gather*}
\mathrm{H}_{\mathrm{an}}^{i}\left(\mathbf{L}_{I}(L), E\right) \cong \bigoplus_{0 \leq t \leq i}\left(\left(\bigwedge^{t} \operatorname{Hom}\left(\mathbf{Z}_{I}(L), E\right)\right) \otimes_{E} \mathrm{H}^{i-t}\left(\mathfrak{d}_{I, \Sigma_{L}}, E\right)\right) \\
\mathrm{H}_{\mathrm{an}}^{i}\left(\mathbf{L}_{I}(L) / Z_{n}, E\right) \cong \bigoplus_{0 \leq t \leq i}\left(\left(\bigwedge^{t} \operatorname{Hom}\left(\mathbf{Z}_{I}(L) / Z_{n}, E\right)\right) \otimes_{E} \mathrm{H}^{i-t}\left(\overline{\mathfrak{d}}_{I, \Sigma_{L}}, E\right)\right) . \tag{5.1}
\end{gather*}
$$

Since $\mathfrak{d}_{I}$ is semi-simple, we have $\mathrm{H}^{r}\left(\mathfrak{d}_{I, \Sigma_{L}}, E\right)=0$ for $r=1,2$. In particular, we deduce natural isomorphisms

$$
\mathrm{H}_{\mathrm{an}}^{i}\left(\mathbf{L}_{I}(L), E\right) \cong \wedge^{i} \operatorname{Hom}\left(\mathbf{Z}_{I}(L), E\right), \mathrm{H}_{\mathrm{an}}^{i}\left(\mathbf{L}_{I}(L) / Z_{n}, E\right) \cong \wedge^{i} \operatorname{Hom}\left(\mathbf{Z}_{I}(L) / Z_{n}, E\right)
$$

for $i=1,2$. On the other hand, by [25, Corollary 8.10] (since $\mathbf{Z}_{I}$ is a torus, we apply it to the group
$\operatorname{Res}_{L / \mathbb{Q}_{p}} \mathbf{Z}_{I}$ ), one has

$$
\begin{align*}
& \mathrm{H}_{\mathrm{an}}^{i}\left(\mathbf{Z}_{I}(L), E\right) \cong \bigoplus_{t+s=i}\left(\bigwedge^{t} X_{E}^{*}\left(\mathbf{Z}_{I}\right)\right) \otimes_{E} \mathrm{H}^{s}\left(\mathfrak{z}_{I, \Sigma_{L}}, E\right) \\
& \mathrm{H}_{\mathrm{an}}^{i}\left(\mathbf{Z}_{I}(L) / Z_{n}, E\right) \cong \bigoplus_{t+s=i}\left(\bigwedge^{t} X_{E}^{*}\left(\mathbf{Z}_{I} / \mathbf{Z}_{n}\right)\right) \otimes_{E} \mathrm{H}^{s}\left(\overline{\mathfrak{z}}_{I, \Sigma_{L}}, E\right), \tag{5.2}
\end{align*}
$$

for all $i \in \mathbb{Z}_{\geq 0}$. Combining (5.1), (5.2) with the Künneth formula for Lie algebras (see [40, (3.24)]), we deduce other expressions of $\mathrm{H}_{\mathrm{an}}^{i}\left(\mathbf{Z}_{I}(L), E\right)$ and $\mathrm{H}_{\mathrm{an}}^{i}\left(\mathbf{Z}_{I}(L) / Z_{n}, E\right)$.

Lemma 5.1. For $I \subseteq \Delta_{n}$, we have

$$
\begin{gathered}
\mathrm{H}_{\mathrm{an}}^{i}\left(\mathbf{L}_{I}(L), E\right) \cong \bigoplus_{0 \leq t \leq i}\left(\bigwedge^{t} X_{E}^{*}\left(\mathbf{Z}_{I}\right)\right) \otimes_{E} \mathrm{H}^{i-t}\left(\mathfrak{l}_{I, \Sigma_{L}}, E\right), \\
\mathrm{H}_{\mathrm{an}}^{i}\left(\mathbf{L}_{I}(L) / Z_{n}, E\right) \cong \bigoplus_{0 \leq t \leq i}\left(\bigwedge^{t} X_{E}^{*}\left(\mathbf{Z}_{I} / \mathbf{Z}_{n}\right)\right) \otimes_{E} \mathrm{H}^{i-t}\left(\overline{\mathfrak{l}}_{I, \Sigma_{L}}, E\right) .
\end{gathered}
$$

### 5.2 More on smooth and locally analytic extension groups

The following lemma holds for any connected reductive algebraic group $\mathbf{G}$ over $L$.
Lemma 5.2. (Frobenius reciprocity, see [28, Lemma 8]). Let $\mathbf{P}$ be a parabolic subgroup of $\mathbf{G}$ with Levi factorization $\mathbf{P}=\mathbf{L}_{\mathbf{P}} \mathbf{N}_{\mathbf{P}}$. Let $\pi$ be a smooth representation of $\mathbf{G}(L)$ over $E$, and let $\sigma$ be a smooth representation of $\mathbf{L}_{\mathbf{P}}(L)$ over $E$. Then

$$
\operatorname{Ext}_{\mathbf{G}(L)}^{i, \infty}\left(\pi, i_{\mathbf{P}(L)}^{\mathbf{G}(L)} \sigma\right) \cong \operatorname{Ext}_{\mathbf{L}_{\mathbf{P}}(L)}^{i, \infty}\left(r_{\mathbf{P}(L)}^{\mathbf{G}(L)} \pi, \sigma\right) \text { for all } i \geq 0
$$

In particular, the Frobenius reciprocity for $i=0$ recovers adjunction property (2.5).
The next lemma lists some exact sequences arising from spectral sequences.
Lemma 5.3. Let $E$ be a biregular spectral sequence.
(a) Suppose $E_{2}^{p, q}=0$ when $p<0$, or $q<0$, or $0<q<m$. Then $E_{2}^{i, 2} \cong H^{i}$ for any $i<m$ and we have an exact sequence

$$
0 \rightarrow E_{2}^{m, 0} \rightarrow H^{m} \rightarrow E_{2}^{m-1,1} \rightarrow E_{2}^{m+1,0} \rightarrow H^{m+1}
$$

(b) Suppose $E_{2}^{p, q}=0$ for any $p \neq p_{1}, p_{2}$ and $p_{2}-p_{1}=1$, then we have a short exact sequence

$$
0 \rightarrow E_{2}^{p_{2}, m-p_{2}} \rightarrow H^{m} \rightarrow E_{2}^{p_{1}, m-p_{1}} \rightarrow 0
$$

(c) Suppose $E_{2}^{p, q}=0$ for any $q \neq q_{1}, q_{2}\left(q_{1}<q_{2}\right)$, then we have a long exact sequence

$$
\cdots \rightarrow E_{2}^{m-q_{1}, q_{1}} \rightarrow H^{m} \rightarrow E_{2}^{m-q_{2}, q_{2}} \rightarrow E_{2}^{m+1-q_{1}, q_{1}} \rightarrow H^{m+1} \rightarrow \cdots
$$

Remark 5.4. (Yoneda extensions) Let $\mathcal{C}$ be an abelian category with enough injectives, then we can define the extension groups $\operatorname{Ext}_{\mathcal{C}}^{i}(A, B)$ for all $r \geq 0$ and $A, B \in \mathcal{C}$, by choosing an injective resolution of $B$. On the other hand, a Yoneda $i$-extension of $A$ by $B$ is an exact sequence starting at $B$ and ending at A,

$$
X: 0 \rightarrow B \rightarrow X_{i} \rightarrow \cdots \rightarrow X_{1} \rightarrow A \rightarrow 0
$$

Two Yoneda i-extensions $X, Y$ are equivalent if there exists a commutative diagram:

The Yoneda $i$-extension group $\operatorname{Yext}^{i}(A, B)$ is given by the Yoneda $i$-extensions $A$ by $B$ modulo the above equivalence relation $\equiv$. By the arguments before [39, Corollary 0.2], there is a natural equivalence between the two bi-functors $\operatorname{Ext}_{\mathcal{C}}^{i}(A, B)$ and $\operatorname{Yext}_{\mathcal{C}}^{i}(A, B)$.

Let $\eta^{\infty}$ be a smooth character of $\mathbf{L}_{I}^{\langle r\rangle}(L)$ over $E$. Recall that the categories $\boldsymbol{R e p}_{E}^{\infty}\left(\mathbf{L}_{I}^{\langle r\rangle}(L)\right)$ and $\boldsymbol{R e p}_{E, Z_{n}=\eta^{\infty}}^{\infty}\left(\mathbf{L}_{I}^{\langle r\rangle}(L)\right)$ have enough injectives. For $V, W \in \boldsymbol{R e p}_{E, Z_{n}=\eta^{\infty}}^{\infty}\left(\mathbf{L}_{I}^{\langle r\rangle}(L)\right)$, there are then natural morphism

$$
\operatorname{Ext}_{\mathbf{L}_{I}^{\langle r\rangle}(L), Z_{n}=\eta^{\infty}}^{i, \infty}(V, W) \rightarrow \operatorname{Ext}_{\mathbf{L}_{I}^{\langle r\rangle}(L)}^{i, \infty}(V, W)
$$

induced by Yoneda $i$-extensions. In general, it is not clear whether these homomorphisms are injective or surjective. When $i=1$, this homomorphism is injective since a short exact sequence splits in the category $\boldsymbol{\operatorname { R e p }}_{E, Z_{n}=\eta^{\infty}}^{\infty}\left(\mathbf{L}_{I}^{\langle r\rangle}(L)\right)$ if and only if it splits in $\boldsymbol{\operatorname { R e p }}_{E}^{\infty}\left(\mathbf{L}_{I}^{\langle r\rangle}(L)\right)$.

Let $V, W, U, U^{\prime} \in \operatorname{Rep}_{E}^{\infty}\left(\mathbf{L}_{I}^{\langle r\rangle}(L)\right)$ (resp., $V^{\prime}, W^{\prime} \in \operatorname{Rep}_{E, Z_{n}=\eta^{\infty}}^{\infty}\left(\mathbf{L}_{I}^{\langle r\rangle}(L)\right)$ ). We assume that $Z_{n}$ acts on representation $U^{\prime}$ via a smooth character $\omega_{U^{\prime}}^{\infty}$. There are natural morphisms

$$
\begin{align*}
& \operatorname{Ext}_{\mathbf{L}_{I}^{i r\rangle}(L)}^{i, \infty}(V, W) \rightarrow \operatorname{Ext}_{\mathbf{L}_{I}^{\langle r\rangle}(L)}^{i, \infty}\left(V \otimes_{E} U, W \otimes_{E} U\right),  \tag{5.3}\\
& \text { resp., } \operatorname{Ext}_{\mathbf{L}_{I}^{\langle r\rangle}(L), Z_{n}=\eta^{\infty}}^{i, \infty}\left(V^{\prime}, W^{\prime}\right) \rightarrow \operatorname{Ext}_{\mathbf{L}_{I}^{\langle r\rangle}(L), Z_{n}=\eta^{\infty} \otimes_{E} \omega_{U^{\prime}}^{\infty}}^{i, \infty}\left(V^{\prime} \otimes_{E} U^{\prime}, W^{\prime} \otimes_{E} U^{\prime}\right),
\end{align*}
$$

induced by tensoring the Yoneda $i$-extensions in $\operatorname{Ext}_{\mathbf{L}_{I}^{i, \infty\rangle}(L)}^{\langle,}(V, W)\left(\right.$ resp., $\left.\operatorname{Ext}_{\mathbf{L}_{I}^{\langle r\rangle}(L), \eta}^{i, \infty}\left(V^{\prime}, W^{\prime}\right)\right)$ with $U$ (resp., $U^{\prime}$ ).

Let $\eta^{\infty}$ be a locally $\mathbb{Q}_{p}$-analytic character of $\mathbf{L}_{I}^{\langle r\rangle}(L)$ over $E$. Unlike the smooth case, it is not clear that the categories $\mathcal{M}(H)$ and $\mathcal{M}_{Z^{\prime}, \eta}(H)$ have enough injectives. Let $V, W \in \boldsymbol{R e p}_{E, Z_{n}=\eta}\left(\mathbf{L}_{I}^{\langle r\rangle}(L)\right)$ be locally $\mathbb{Q}_{p}$-analytic representations, we still have a natural morphism

$$
\operatorname{Ext}_{\mathbf{L}_{I}^{\langle r\rangle}(L), Z_{n}=\eta}^{i}\left(V^{\prime}, W^{\prime}\right) \rightarrow \operatorname{Ext}_{\mathbf{L}_{I}^{\langle r\rangle}(L)}^{i}\left(V^{\prime}, W^{\prime}\right), \forall V^{\prime}, W^{\prime} \in \operatorname{Rep}_{E, Z_{n}=\eta}\left(\mathbf{L}_{I}^{\langle r\rangle}(L)\right)
$$

by choosing a projective resolution of $V^{\prime}$ in the category $\mathcal{M}_{Z_{n}, \eta}\left(\mathbf{L}_{I}^{\langle r\rangle}(L)\right)$ (it remains a projective resolution of $V^{\prime}$ in the category $\mathcal{M}\left(\mathbf{L}_{I}^{\langle r\rangle}(L)\right)$ ). In general, it is not clear whether these homomorphisms are injective or surjective. If $i=1$ and $V, W$ are admissible, then by the argument after [15, Lemma 2.2] (or see the argument before Remark 2.1), this morphism is injective since a short exact sequence splits in $\mathcal{M}_{Z_{n}, \eta}\left(\mathbf{L}_{I}^{\langle r\rangle}(L)\right)$ if and only if it splits in $\mathcal{M}\left(\mathbf{L}_{I}^{\langle r\rangle}(L)\right)$.

Suppose that the $V, W, U, U^{\prime} \in \operatorname{Rep}_{E}\left(\mathbf{L}_{I}^{\langle r\rangle}(L)\right)$ (resp., $V^{\prime}, W^{\prime} \in \boldsymbol{R e p}_{E, Z_{n}=\eta}\left(\mathbf{L}_{I}^{\langle r\rangle}(L)\right)$ ) are admissible locally $\mathbb{Q}_{p}$-analytic representations over locally convex Hausdorff $E$-vector spaces of compact type. Assume that $Z_{n}$ acts on representation $U^{\prime}$ via character $\omega_{U^{\prime}}$. We have morphisms

$$
\begin{gather*}
\operatorname{Hom}_{\mathbf{L}_{I}^{\langle r\rangle}(L)}(V, W) \rightarrow \operatorname{Hom}_{\mathbf{L}_{I}^{\langle r\rangle}(L)}\left(V \widehat{\otimes}_{E} U, W \widehat{\otimes}_{E} U\right),  \tag{5.4}\\
\text { resp. }, \operatorname{Hom}_{\mathbf{L}_{I}^{\langle r\rangle}(L), Z_{n}=\eta}\left(V^{\prime}, W^{\prime}\right) \rightarrow \operatorname{Hom}_{\mathbf{L}_{I}^{\langle r\rangle}(L), Z_{n}=\eta \widehat{\otimes}_{E} \omega_{U^{\prime}}}\left(V^{\prime} \widehat{\otimes}_{E} U^{\prime}, W^{\prime} \widehat{\otimes}_{E} U^{\prime}\right)
\end{gather*}
$$

by sending $f \mapsto f \otimes_{E} \operatorname{id}_{U}$ (resp., $f \mapsto f \otimes_{E} \operatorname{id}_{U^{\prime}}$ ). If $U$ (resp., $U^{\prime}$ ) is a finite-dimensional locally $\mathbb{Q}_{p^{-}}$ analytic representation of $\mathbf{L}_{I}^{\langle r\rangle}(L)$, then by [19, Proposition 6.1.5], we get that $V \widehat{\otimes}_{E} U, W \widehat{\otimes}_{E} U$ (resp.,
$V^{\prime} \widehat{\otimes}_{E} U^{\prime}, W^{\prime} \widehat{\otimes}_{E} U^{\prime}$ ) are again admissible locally $\mathbb{Q}_{p}$-analytic representations of $\mathbf{L}_{I}^{\langle r\rangle}(L)$ (with the diagonal action). Therefore, we have the following morphisms:

$$
\begin{align*}
& \operatorname{Ext}_{\mathbf{L}_{I}^{\langle r\rangle}(L)}^{1}(V, W) \rightarrow \operatorname{Ext}_{\mathbf{L}_{I}^{\langle r\rangle}(L)}^{1}\left(V \widehat{\otimes}_{E} U, W \widehat{\otimes}_{E} U\right),  \tag{5.5}\\
& \text { resp., } \operatorname{Ext}_{\mathbf{L}_{I}^{\langle r\rangle}(L), Z_{n}=\eta}^{i}\left(V^{\prime}, W^{\prime}\right) \rightarrow \operatorname{Ext}_{\mathbf{L}_{I}^{\langle r\rangle}(L), Z_{n}=\eta \widehat{\otimes}_{E} \omega_{U^{\prime}}}^{1}\left(V^{\prime} \widehat{\otimes}_{E} U^{\prime}, W^{\prime} \widehat{\otimes}_{E} U^{\prime}\right) .
\end{align*}
$$

by tensoring $U$ (resp., $U^{\prime}$ ) with the 1-th extensions.
In (3.8), we define the irreducible cuspidal smooth representation $\pi^{\langle r\rangle}$ of $\mathbf{L}^{\langle r\rangle}(L)$ over $E$. Let $\omega_{\pi}$ be the central character of $\pi$. Then the central character of $\pi^{\langle r\rangle}$ is $\omega_{\pi}^{\langle r\rangle}:=\omega_{\pi} v_{r}^{k-1} \otimes_{E} \cdots \otimes_{E} \omega_{\pi}$. In particular, $Z_{n}$ acts on $\pi^{\langle r\rangle}$ via the character $\left.\omega_{\pi}^{\langle r\rangle}\right|_{Z_{n}}$. For any subset $I \subseteq \Delta_{n}(k)$, the center $Z_{n}$ also acts on representations $\pi_{I} \otimes_{E} L^{\langle r\rangle}(\underline{\lambda})_{I}, i_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{G}(\pi, \underline{\lambda})$ and $\mathbb{I}_{\overline{\mathbf{P}}_{I}^{G r\rangle}}^{G}(\pi, \underline{\lambda})$ via $\omega_{\pi}^{\langle r\rangle} \chi_{\underline{\lambda}}$. In the sequel, we put

$$
\begin{aligned}
& \operatorname{Ext}_{\mathbf{L}_{I}^{\langle r\rangle}(L), \omega_{\pi}^{\langle r\rangle}}^{i, \infty}(-,-):=\operatorname{Ext}_{\mathbf{L}_{I}^{\langle r\rangle}(L), Z_{n}=\omega_{\pi}^{\langle r\rangle}}^{i, \infty}(-,-), \\
& \operatorname{Ext}_{\mathbf{L}_{I}^{\langle r\rangle}(L), \eta}^{i}(-,-):=\operatorname{Ext}_{\mathbf{L}_{I}^{\langle r\rangle}(L), Z_{n}=\eta}^{i}(-,-), \text { for } \eta \in\left\{\omega_{\pi}^{\langle r\rangle}, \omega_{\pi}^{\langle r\rangle} \chi_{\underline{\lambda}}\right\},
\end{aligned}
$$

for all $i \in \mathbb{Z}_{\geq 0}$.

### 5.3 Bruhat filtrations

In this section, we talk about the Bruhat filtrations of parabolically induced representations and describe the associated graded representations.

Let $I, J$ be two subsets of $\Delta_{n}(k)$. Induced by the relative Bruhat decomposition

$$
\begin{equation*}
G=\coprod_{w \in\left[\mathscr{W}_{I} \backslash \mathscr{W}_{n} / \mathscr{W}_{J}\right]} \overline{\mathbf{P}}_{I}(L) w \overline{\mathbf{P}}_{J}(L), \tag{5.6}
\end{equation*}
$$

we define an increasing filtration $\mathcal{F}_{B}^{\bullet}$ on $i \frac{G}{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}(\pi)$ by $\overline{\mathbf{P}}_{J}^{\langle r\rangle}(L)$ invariant subspaces:

$$
\begin{equation*}
\mathcal{F}_{B}^{h} i \frac{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}{G}(\pi)=\left\{f \in i_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{G}(\pi), \operatorname{supp}(f) \in \bigcup_{\substack{w \in\left[\mathscr{W}_{I}^{\langle r\rangle} \backslash \mathscr{W}_{n} / \mathscr{W}_{J}^{\langle r\rangle}\right] \\ \lg (w) \leq h}} \overline{\mathbf{P}}_{I}^{\langle r\rangle}(L) \backslash \overline{\mathbf{P}}_{I}^{\langle r\rangle}(L) w \overline{\mathbf{P}}_{J}^{\langle r\rangle}(L)\right\}, \tag{5.7}
\end{equation*}
$$

for all $h \in \mathbb{Z}_{\geq 0}$. By [12, Proposition 6.3.1] (or a corollary of it), there are canonical isomorphisms

$$
\operatorname{gr}_{\mathcal{F}_{B}^{\bullet}}^{h}\left(i \overline{\overline{\mathbf{P}}}_{I}^{\langle r\rangle}(L) \mathrm{G}(\pi)\right) \cong \bigoplus_{\substack{w \in\left[\mathscr{W}_{I}^{\langle r\rangle} \backslash \mathscr{W}_{n} / \mathscr{W}_{J}^{\langle r\rangle}\right] \\ \lg (w)=h}} c-i \overline{\mathbf{P}}_{J}^{\langle r\rangle}(L) \overline{\mathbf{P}}_{J}^{\langle r\rangle}(L) \cap \overline{\mathbf{P}}_{I}^{\langle r\rangle}(L) w \pi_{I}^{w}
$$

of smooth $\overline{\mathbf{P}}_{J}^{\langle r\rangle}(L)$-representations for all $h \in \mathbb{Z}_{\geq 0}$, where $c-i \overline{\mathbf{P}}_{J}^{\langle r\rangle}(L) \quad \overline{\mathbf{P}}_{J}^{\langle\gamma\rangle}(L) \cap \overline{\mathbf{P}}_{I}^{\langle r\rangle}(L)^{w} \pi_{I}^{w}$ is the smooth induction with compact support. By [12, Proposition 6.3.3], we have isomorphism

$$
\begin{equation*}
r_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}(L)}^{G}\left(\operatorname{gr}_{\mathcal{F}_{B}^{\prime}}^{h}\left(i i_{\mathbf{P}_{I}^{\langle r\rangle}(L)}^{G}(\pi)\right)\right) \cong \bigoplus_{\substack{w \in\left[\mathscr{W}_{I}^{\langle r\rangle}\left\langle\mathscr{W}_{n} / \mathscr{W}_{J}^{\langle r\rangle}\right] \\ \lg (w)=h\right.}} i i_{\mathbf{L}_{J}^{\langle r\rangle}(L) \cap \overline{\mathbf{P}}_{I}^{\langle r\rangle}(L)^{w}}^{\left\langle\mathbf{L}_{I, ~}^{\langle r\rangle}(L)\right.}\left(\gamma_{I, J}^{w} \otimes_{E} r_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}(L) \cap \mathbf{L}_{I}^{\langle r\rangle}(L)^{w}}^{\mathbf{L}_{I}^{\langle r\rangle}(L)^{w}} \pi_{I}^{w}\right), \tag{5.8}
\end{equation*}
$$

of smooth $\mathbf{L}_{J}^{\langle r\rangle}(L)$-representations for all $h \in \mathbb{Z}_{\geq 0}$.
Lemma 5.5. For $w \in\left[\mathscr{W}_{I}^{\langle r\rangle} \backslash \mathscr{W}_{n} / \mathscr{W}_{J}^{\langle r\rangle}\right]$, the representation $r_{\overline{\mathbf{P}}_{J}^{\langle\gamma\rangle}(L) \cap \mathbf{L}_{I}^{\langle r\rangle}(L) w}^{\langle r\rangle} \pi_{I}^{w}$ is non-zero unless $w \in$ $\mathscr{W}_{I, J}\left(\mathbf{L}^{\langle r\rangle}\right)$.

Proof. For each $w \in\left[\mathscr{W}_{I}^{\langle r\rangle} \backslash \mathscr{W}_{n} / \mathscr{W}_{J}^{\langle r\rangle}\right] \subset\left[\mathscr{W}_{n} / \mathscr{W}_{J}^{\langle r\rangle}\right]$, we have injections
of smooth representations of $\mathbf{L}_{J}^{\langle r\rangle}(L)$. By [12, Corollary 6.3.4 (b), Theorem 6.3.5], we see that

$$
\begin{align*}
& \left(r_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}(L) \cap \mathbf{L}_{I}^{\langle r\rangle}(L)^{w}}^{\mathbf{L}^{\langle r\rangle} \overline{\mathbf{P}}^{i\langle )^{w}}(L)^{w} \cap \mathbf{L}_{I}^{\langle r\rangle}(L)^{w}} \pi^{\langle\langle \rangle}\right)^{\mathrm{SS}} \cong \\
& \bigoplus_{u \in\left[\mathscr{W}_{I \cap w J}^{\langle r\rangle} \backslash \mathscr{W}_{I}^{\langle r\rangle} / \mathscr{W}^{\langle r\rangle}\right]} i_{\left.\left(\mathbf{L}^{\langle r\rangle}(L) \cap \overline{\mathbf{P}}^{\langle r\rangle}(L)^{w}\right) \cap\left(\overline{\mathbf{P}}^{\langle r\rangle}(L) \cap \mathbf{L}_{I}^{\langle r\rangle}(L)\right)^{w u}\right)}^{i^{\langle r\rangle}(L) \cap \mathbf{L}^{\langle r\rangle}(L)^{w}}  \tag{5.10}\\
& \gamma_{I, J}^{w, u} \otimes_{E} r_{\left(\overline{\mathbf{P}}_{J}^{\langle r\rangle}(L) \cap \mathbf{L}_{I}^{\langle r\rangle}(L)^{w}\right) \cap \mathbf{L}^{\langle r\rangle}(L)^{w u}}^{\mathbf{L}^{\langle r\rangle}\left(L \pi^{w u}\right.}\left(\pi^{\langle r\rangle}\right)^{w u}
\end{align*}
$$

By [11, Corollary 2.8.8] (or see [12, Corollary 6.3.4] and its proof), we see that the smooth representation $r_{\left(\overline{\mathbf{P}}_{J}^{\langle r\rangle}(L) \cap \mathbf{L}_{I}^{\langle r\rangle}(L)^{w}\right) \cap \mathbf{L}^{\langle r\rangle}(L)^{w u}}^{\mathbf{L}^{\langle \rangle}\left(\pi^{\langle r\rangle}\right)^{w u} \text { is non-zero unless } u^{-1} w^{-1}\left(\Delta_{n}(k)\right) \subset\left(\Delta_{n}(k) \cup J\right) \cap w^{-1}\left(\Delta_{n}(k) \cup I\right) \subset ~}$ $\Delta_{n}(k) \cup J$. We deduce from Lemma 3.1 that $w u \in \mathscr{W}_{\emptyset, J}\left(\mathbf{L}^{\langle r\rangle}\right)$. Then we get that $u^{-1} w^{-1}\left(\Delta_{n}(k)\right)=\Delta_{n}(k)$ and $\Delta_{n}(k) \subset w^{-1}\left(\Delta_{n}(k) \cup I\right)$, we see that $w \in \mathscr{W}_{I, \emptyset}\left(\mathbf{L}^{\langle r\rangle}\right)$ by using Lemma 3.1 again. We thus have $w \in \mathscr{W}_{\emptyset, J}\left(\mathbf{L}^{\langle r\rangle}\right) \cap \mathscr{W}_{I, \emptyset}\left(\mathbf{L}^{\langle r\rangle}\right)=\mathscr{W}_{I, J}\left(\mathbf{L}^{\langle r\rangle}\right)$. This completes the proof.

### 5.4 Extensions between locally analytic representations-I

We study the extension groups of certain locally $\mathbb{Q}_{p}$-analytic generalized parabolic Steinberg representations. This section follows a technical modification of the route of [15, Section 2.2] and Section 6.4.

For any $J \subset \Delta_{n}(k)$, and $j \in \mathbb{Z}_{\geq 0}$, we put

$$
\mathcal{E}_{J}^{j}:=\operatorname{Ext}_{\mathbf{L}_{J}^{\langle r\rangle}(L)}^{i}\left(\pi_{J}, \pi_{J}\right), \text { and } \overline{\mathcal{E}}_{J}^{j}:=\operatorname{Ext}_{\mathbf{L}_{J}^{\langle r\rangle}(L), \omega_{\pi}^{\langle r\rangle}}^{i}\left(\pi_{J}, \pi_{J}\right)
$$

By Section 5.2, there are natural morphisms for $i \in\{0,1\}$

$$
\begin{equation*}
\iota_{J}^{i}: \mathrm{H}_{\mathrm{an}}^{i}\left(\mathbf{L}_{J}^{\langle r\rangle}(L), E\right) \rightarrow \mathcal{E}_{J}^{i},\left(\operatorname{resp} . \bar{\iota}_{J}^{i}: \mathrm{H}_{\mathrm{an}}^{i}\left(\mathbf{L}_{J}^{\langle r\rangle}(L) / \mathbf{Z}_{n}, E\right) \rightarrow \overline{\mathcal{E}}_{J}^{i}\right) \tag{5.11}
\end{equation*}
$$

More precisely, the map $\iota_{J}^{0}$ (resp., $\breve{\iota}_{J}^{0}$ ) is induced by tensoring

$$
\Psi_{0} \in \operatorname{Hom}_{\mathbf{L}_{J}^{\langle r\rangle}(L)}(1,1)\left(\text { resp. }, \Psi_{0} \in \operatorname{Hom}_{\mathbf{L}_{J}^{\langle r\rangle}(L), \omega_{\pi}^{\langle r\rangle}}(1,1)\right)
$$

with the identity homomorphism $\mathbf{1}_{\pi_{J}}: \pi_{J} \rightarrow \pi_{J}$. On the other hand, the map $\iota_{J}^{1}$ (resp., $\bar{\iota}_{J}^{1}$ ) is induced by mapping $\Psi \in \mathrm{H}_{\mathrm{an}}^{1}\left(\mathbf{L}_{J}^{\langle r\rangle}(L), E\right) \cong \operatorname{Hom}\left(\mathbf{Z}_{J}^{\langle r\rangle}(L), E\right)\left(\right.$ resp.,$\left.\Psi \in \mathrm{H}_{\mathrm{an}}^{1}\left(\mathbf{L}_{J}^{\langle r\rangle}(L) / \mathbf{Z}_{n}, E\right) \cong \operatorname{Hom}\left(\mathbf{Z}_{J}^{\langle r\rangle}(L) / \mathbf{Z}_{n}, E\right)\right)$ to an $E[\epsilon] / \epsilon^{2}$-valued representation

$$
\left[\pi_{J}(1+\Psi \epsilon)\right] \in \operatorname{Ext}_{\mathbf{L}_{J}^{\langle r\rangle}(L)}^{1}\left(\pi_{J}, \pi_{J}\right)\left(\text { resp. },\left[\pi_{J}(1+\Psi \epsilon)\right] \in \operatorname{Ext}_{\mathbf{L}_{J}^{\langle r\rangle}(L), \omega_{\pi}^{\langle r\rangle}}^{1}\left(\pi_{J}, \pi_{J}\right)\right)
$$

Lemma 5.6. For any $J \subset \Delta_{n}(k)$ and $i \in\{0,1\}$, the maps $\iota_{J}^{i}$ and $\bar{\iota}_{J}^{i}$ are injective.
Proof. The assertion for $i=0$ is clear. The natural injection $\mathbf{Z}_{J}^{\langle r\rangle}(L) \hookrightarrow \mathbf{L}_{J}^{\langle r\rangle}(L)$ induces a restriction map

$$
\begin{aligned}
c_{J}: \mathcal{E}_{J}^{i} \rightarrow \operatorname{Ext}_{\mathbf{Z}_{J}^{\langle r\rangle}(L)}^{1}\left(\omega_{\pi_{J}}, \omega_{\pi_{J}}\right) \cong \operatorname{Ext}_{\mathbf{Z}_{J}^{\langle r\rangle}(L)}^{1}(1,1) \\
\text { resp., } \quad \bar{c}_{J}: \overline{\mathcal{E}}_{J}^{i} \rightarrow \operatorname{Ext}_{\mathbf{Z}_{J}^{\langle r\rangle}(L), \omega_{\pi}^{\langle r\rangle}}^{1}\left(\omega_{\pi_{J}}, \omega_{\pi_{J}}\right) \cong \operatorname{Ext}_{\mathbf{Z}_{J}^{\langle r\rangle}(L) / \mathbf{Z}_{n}}^{1}(1,1)
\end{aligned}
$$

It is clear that the map $c_{J}$ (resp., $\bar{c}_{J}$ ) gives a section of $\iota_{J}^{1}$ (resp., $\bar{\iota}_{J}^{1}$ ). The results follow.

Lemma 5.7. For $J \in\left\{\Delta_{n}(k), \Delta_{k, j}\right\}$ and $i \in\{0,1\}$, we have the following isomorphisms of $E$-vector spaces:

$$
\begin{align*}
& \iota_{\Delta_{n}(k)}^{i}: \mathrm{H}_{\mathrm{an}}^{i}\left(\mathbf{L}_{\Delta_{n}(k)}^{\langle r\rangle}(L), E\right) \xrightarrow{\sim} \mathcal{E}_{\Delta_{n}(k)}^{i},  \tag{5.12}\\
& \bar{\iota}_{J}^{i}: \mathrm{H}_{\mathrm{an}}^{i}\left(\mathbf{L}_{J}^{\langle r\rangle}(L) / \mathbf{Z}_{n}, E\right) \xrightarrow{\sim} \overline{\mathcal{E}}_{J}^{i} .
\end{align*}
$$

Proof. By Lemma 2.3, we have spectral sequences

$$
\begin{align*}
E_{2, I}^{r, s} & =\operatorname{Ext}_{\mathcal{M}^{\infty}\left(\mathbf{L}_{J}^{\langle r\rangle}(L)\right)}^{r}\left(\pi_{J}^{\vee}, \mathrm{H}^{s}\left(\overline{\mathfrak{l}}_{J, \Sigma_{L}}, E\right) \otimes_{E} \pi_{J}^{\vee}\right) \Rightarrow \operatorname{Ext}_{\mathbf{L}_{J}^{\langle r\rangle}(L)}^{r+s}\left(\pi_{J}, \pi_{J}\right), \\
E_{2, I I}^{r, s} & =\operatorname{Ext}_{\mathcal{M}^{\infty}\left(\mathbf{L}_{J}^{\langle r\rangle}(L)\right), \omega_{\pi}^{\langle r\rangle}}^{r}\left(\left(\pi_{J} \otimes \omega_{\pi}^{-1}\right)^{\vee}, \mathrm{H}^{s}\left(\overline{\mathfrak{l}}_{J, \Sigma_{L}}, E\right) \otimes_{E}\left(\pi_{J} \otimes \omega_{\pi}^{-1}\right)^{\vee}\right)  \tag{5.13}\\
& \Rightarrow \operatorname{Ext}_{\mathbf{L}_{J}^{\langle r\rangle}(L), \omega_{\pi}^{\langle r\rangle}}^{r+s}\left(\pi_{J}, \pi_{J}\right) .
\end{align*}
$$

For any $J \in\left\{\Delta_{n}(k), \Delta_{k, j}\right\}$, it follows from Lemma 6.6 that the term $E_{2, I I}^{r, s}=0$ is zero unless $r \in$ $\{0,1\}$. Therefore, Lemma 5.3 (b) implies the following exact sequence

$$
0 \rightarrow X_{E}^{*}\left(\mathbf{L}_{J}^{\langle r\rangle} / \mathbf{Z}_{n}\right) \otimes_{E} \mathrm{H}^{i-1}\left(\overline{\mathfrak{l}}_{J, \Sigma_{L}}, E\right) \rightarrow \overline{\mathcal{E}}_{J}^{i} \rightarrow \mathrm{H}^{i}\left(\overline{\mathfrak{l}}_{J, \Sigma_{L}}, E\right) \rightarrow 0
$$

Then for each $i \in\{0,1\}$, we deduce the second isomorphism $\bar{\iota}_{J}^{i}$ in (5.12) from Lemma 5.1 and Lemma 5.6.
For $J=\Delta_{n}(k)$, the term $E_{2, I}^{r, s}=0$ is zero unless $r=0,1$ by Lemma 6.6. Therefore, the Lemma 5.3 (b) implies the following exact sequence

$$
0 \rightarrow X_{E}^{*}\left(\mathbf{L}_{\Delta_{n}(k)}^{\langle r\rangle}\right) \otimes_{E} \mathrm{H}^{i-1}\left(\mathfrak{l}_{\Delta_{n}(k), \Sigma_{L}}, E\right) \rightarrow \overline{\mathcal{E}}_{\Delta_{n}(k)}^{i} \rightarrow \mathrm{H}^{i}\left(\mathfrak{l}_{\Delta_{n}(k), \Sigma_{L}}, E\right) \rightarrow 0
$$

Then Lemma 5.1 and Lemma 5.6 show that the first map $\iota_{\Delta_{n}(k)}^{i}$ in (5.12) also induces an isomorphism for each $i \in\{0,1\}$.

Remark 5.8. In general, the higher extension groups $\mathcal{E}_{J}^{j}$ and $\overline{\mathcal{E}}_{J}^{j}$ are much harder to calculate than $\mathcal{S}_{I}^{i}$ and $\overline{\mathcal{S}}_{I}^{i}$. The Lemma 2.3 and the spectral sequence argument in Lemma 5.1 are of not help here.

Lemma 5.9. We have

$$
\operatorname{Ext}_{G}^{i}\left(i \overline{\mathbf{P}}_{I}^{G r\rangle}(\pi, \underline{\lambda}), \mathbb{I} \overline{\mathbf{P}}_{J}^{G}\langle r\rangle(\pi, \underline{\lambda})\right)= \begin{cases}\mathcal{E}_{J}^{i}, & J \subseteq I  \tag{5.14}\\ 0, & \text { otherwise }\end{cases}
$$

and

$$
\operatorname{Ext}_{G, \omega_{\pi}^{\langle r\rangle} \chi_{\underline{\underline{x}}}^{i}}\left(i \overline{\overline{\mathbf{P}}}_{I}^{\langle r\rangle}(\pi, \underline{\lambda}), \mathbb{I}_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}}^{G}(\pi, \underline{\lambda})\right)= \begin{cases}\overline{\mathcal{E}}_{J}^{i}, & J \subseteq I ;  \tag{5.15}\\ 0, & \text { otherwise. }\end{cases}
$$

Proof. We modify the proof of [15, Proposition 2.11] to our case. We prove (5.15) only and (5.14) follows by the same strategy. By [40, Corollary 4.9] (note that we need to check that $\mathrm{H}_{s}\left(\overline{\mathbf{N}}_{J}^{\langle r\rangle}(L), i \overline{\overline{\mathbf{P}}}_{I}^{\langle r\rangle}(\pi, \underline{\lambda})\right.$ ) satisfies the separated assumption of [40, Corollary 4.9]. This is true since $i \frac{G}{\mathbf{P}_{I}^{\langle r\rangle}}(\pi, \underline{\lambda})$ is locally $\mathbb{Q}_{p}$-algebraic), we have a spectral sequence

$$
\begin{equation*}
E_{2}^{r, s}=\operatorname{Ext}_{\mathbf{L}_{J}^{\langle r\rangle}(L), \omega_{\pi}^{\langle r\rangle} \chi_{\underline{\lambda}}}^{r}\left(\mathrm{H}_{s}\left(\overline{\mathbf{N}}_{J}^{\langle r\rangle}(L), i_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{G}(\pi, \underline{\lambda})\right), \pi_{J}(\underline{\lambda})\right) \Rightarrow \operatorname{Ext}_{G, \chi(\underline{\lambda})}^{r+s}\left(i_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{G}(\pi, \underline{\lambda}), \mathbb{I}_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}}^{G}(\pi, \underline{\lambda})\right) \tag{5.16}
\end{equation*}
$$

One has isomorphisms of locally $\mathbb{Q}_{p}$-algebraic representations of $\operatorname{Res}_{\mathbb{Q}_{p}}^{L} \mathbf{L}_{J}^{\langle r\rangle}(L)$,

$$
\begin{align*}
& \mathrm{H}_{s}\left(\overline{\mathbf{N}}_{J}^{\langle r\rangle}, i \overline{\overline{\mathbf{P}}}_{I}^{G r\rangle}\right. \\
&=r_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}}^{\langle r\rangle}\left(i \overline{\overline{\mathbf{P}}}_{I}^{G r\rangle}(\pi)\right) \otimes_{E}(\overbrace{\substack{w \in \mathscr{W}_{n}, \lg (w)=s \\
w \cdot \underline{\lambda} \in X_{\Delta_{n}^{k} \cup J}^{+}}} L^{\langle r\rangle}\left(i_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{G}(\pi)\right) \otimes_{E} \mathrm{H}_{s}\left(\overline{\mathfrak{n}}_{J, \Sigma_{L}}^{\langle r\rangle}, L(\underline{\lambda})\right)  \tag{5.17}\\
&
\end{align*}
$$

by [40, Theorem 4.10]. Therefore, by [40, Proposition $4.7(1)]$, only the terms $E_{2}^{r, s}$ with $s=0$ can be nonzero. Consequently, for all $r \geq 0$, we have

$$
\begin{aligned}
& \operatorname{Ext}_{G, \omega_{\pi}^{\langle r\rangle} \chi_{\underline{\lambda}}}\left(i_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{G}(\pi, \underline{\lambda}), \mathbb{I}_{\overline{\mathbf{P}}_{J}^{G r\rangle}}^{G}(\pi, \underline{\lambda})\right) \\
& =\operatorname{Ext}_{\mathbf{L}_{J}^{\langle r\rangle}(L), \omega_{\pi}^{\langle r\rangle} \chi_{\underline{\boldsymbol{\lambda}}}}^{r}\left(r_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}}^{G}\left(i_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{G}(\pi)\right) \otimes_{E} L^{\langle r\rangle}(\underline{\lambda})_{J}, \pi_{J}\left(\underline{\lambda}_{J}\right)\right) \\
& =\operatorname{Ext}_{\mathbf{L}_{J}^{\langle r\rangle}(L), \omega_{\pi}^{\langle r\rangle}}^{r}\left(r_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}}^{G}\left(i \frac{G}{\mathbf{P}_{I}^{\langle r\rangle}}(\pi)\right), \pi_{J} \otimes_{E} \operatorname{End}_{E}\left(L^{\langle r\rangle}(\underline{\lambda})_{J}\right)\right), \\
& =\operatorname{Ext}_{\mathbf{L}_{J}^{\langle r\rangle}(L), \omega_{\pi}^{\langle r\rangle}}\left(r_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}}^{G}\left(i_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{G}(\pi)\right), \pi_{J}\right),
\end{aligned}
$$

where the last isomorphism follows from the fact that the algebraic representation $\operatorname{End}_{E}\left(L(\underline{\lambda})_{J}\right)$ is semisimple, in which the trivial representation has multiplicity 1. By Lemma 2.3, we have a spectral sequence

$$
\operatorname{Ext}_{\mathcal{M}_{Z, \chi}^{\infty}\left(\mathbf{L}_{J}^{\langle r\rangle}(L)\right)}^{r}\left(\pi_{J}^{\vee}, \mathrm{H}^{s}\left(\overline{\check{l}}_{J, \Sigma_{L}}^{\langle r\rangle}, E\right) \otimes_{E}\left(r_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}}^{G}\left(i \overline{\overline{\mathbf{P}}}_{I}^{\langle r\rangle}(\pi)\right)\right)^{\vee}\right) \Rightarrow \operatorname{Ext}_{\mathbf{L}_{J}^{\langle\langle \rangle}(L), \omega_{\pi}^{r r\rangle}}^{\langle+s}\left(r_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}}^{G}\left(i i_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{G}(\pi), \pi_{J}\right)\right.
$$

We recall the Bruhat filtration $\mathcal{F}_{B}^{\bullet}(5.7)$ on $i \frac{G}{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}(\pi)$. It satisfies

$$
r_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}(L)}^{G}\left(\operatorname{gr}_{\mathcal{F}_{B}}^{k}\left(i_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{G}(\pi)\right)\right) \cong \bigoplus_{\substack{w \in\left[\mathscr{W}_{I}^{\langle r\rangle} \backslash \mathscr{W}_{n} / \mathscr{W}_{J}^{\langle r\rangle}\right] \\ \lg (w)=k}} i_{\mathbf{L}_{J}^{\langle r\rangle}(L) \cap \overline{\mathbf{P}}_{I}^{\langle r\rangle}(L)^{w}}^{\mathbf{L}_{J}^{\langle r\rangle}(L)}\left(\gamma_{I, J}^{w} \otimes_{E} r_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}(L) \cap \mathbf{L}_{I}^{\langle r\rangle}(L)^{w}}^{\mathbf{L}_{I}^{\langle r\rangle}(L)^{w}} \pi_{I}^{w}\right)
$$

for each $k \geq 0$. We are going to show that

$$
\operatorname{Ext}_{\mathbf{L}_{J}^{\langle r\rangle}(L)(L), \omega_{\pi}^{\langle r\rangle}}^{r}\left(i_{\mathbf{L}_{J}^{\langle r\rangle}(L) \cap \overline{\mathbf{P}}_{I}^{\langle r\rangle}(L)^{w}}^{\left\langle\mathbf{L}^{\langle r\rangle}(L)\right.}\left(\gamma_{I, J}^{w} \otimes_{E} r_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}(L) \cap \mathbf{L}_{I}^{\langle r\rangle}(L)^{w}}^{\left\langle\mathbf{L}_{I}^{\langle r\rangle}(L)^{w}\right.} \pi_{I}^{w}\right), \pi_{J}\right)=0
$$

for any element $1 \neq w \in\left[\mathscr{W}_{I}^{\langle r\rangle} \backslash \mathscr{W}_{n} / \mathscr{W}_{J}^{\langle r\rangle}\right]$ or $J \nsubseteq I$. This is a direct consequence of the following spectral sequence (see Lemma 2.3)

$$
\begin{aligned}
& \operatorname{Ext}_{\mathcal{M}_{Z, \omega}^{\infty}}^{r}\left(\mathbf{L}_{J}^{\langle r\rangle}(L)\right)\left(\pi_{J}^{\vee, \infty}, \mathrm{H}^{s}\left(\overline{\mathfrak{l}}_{J, \Sigma_{L}}^{\langle r\rangle}, E\right) \otimes_{E}\left(i_{\mathbf{L}_{J}^{\langle r\rangle}(L) \cap \overline{\mathbf{P}}_{I}^{\langle r\rangle}(L)^{w}}^{\langle r\rangle}\left(\gamma_{I, J}^{w} \otimes_{E} r_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}(L) \cap \mathbf{L}_{I}^{\langle r\rangle}(L)^{w}}^{\mathbf{L}_{I}^{\langle r\rangle}(L)^{w}} \pi_{I}^{w}\right)\right)^{\vee}\right) \\
& \Rightarrow \operatorname{Ext}_{\mathbf{L}_{J}^{\langle r\rangle}(L), \omega_{\pi}^{\langle r\rangle}}^{r+s} i_{\mathbf{L}_{J}^{\langle r\rangle}(L) \cap \overline{\mathbf{P}}_{I}^{\langle r\rangle}(L)^{w}}^{\langle r\rangle} \gamma_{I, J}^{w} r_{\mathbf{P}_{J}^{\langle r\rangle}(L)^{w}}^{\left\langle\mathbf{L}^{\langle r\rangle}\right.}(L) \\
& \mathbf{L}_{I}^{\langle r\rangle}(L)^{w} \\
&\left.\pi_{I}^{w}, \pi_{J}\right),
\end{aligned}
$$

and (5.20). It suffices to show that

$$
\left.\operatorname{Ext}_{\mathbf{L}_{J}^{\langle\gamma\rangle}(L), \omega_{\pi}^{\langle r\rangle}}^{i, \infty}\left(\begin{array}{l}
i_{J}^{\mathbf{L}_{J}^{\langle r\rangle}(L)}(L) \cap \overline{\mathbf{P}}_{I}^{\langle r\rangle}(L)^{w} \tag{5.18}
\end{array} \gamma_{I, J}^{w} \otimes_{E} r_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}(L) \cap \mathbf{L}_{I}^{\langle r\rangle}(L)^{w}}^{\mathbf{L}_{I}^{\langle r\rangle}(L)^{w}} \pi_{I}^{w}\right), \pi_{J}\right)=0
$$

for $J \nsubseteq I$ or $w \neq 1$. By Lemma 5.5, we can assume that $w \in \mathscr{W}_{I, J}\left(\mathbf{L}^{\langle r\rangle}\right)$. In this case, we see that

$$
\begin{align*}
& \cong \operatorname{Ext}_{\mathbf{L}_{J}^{\langle r\rangle}(L), \omega_{\pi}^{\langle r\rangle}}^{i, \infty}\left(\pi_{J}^{\sim}, i_{\mathbf{L}_{J}^{\langle r\rangle}(L) \cap \overline{\mathbf{P}}_{I}^{\langle r\rangle}(L)^{w}}^{\mathbf{L}^{\langle r\rangle}(L)}\left(\gamma_{I, J}^{w} \otimes_{E} r_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}(L) \cap \mathbf{L}_{I}^{\langle r\rangle}(L)^{w}}^{\mathbf{L}_{I}^{\langle r\rangle}(L)^{w}} \pi_{I}^{w}\right)^{\sim} \delta_{\mathbf{L}_{J}^{\langle r\rangle}(L) \cap \overline{\mathbf{P}}_{I}^{\langle r\rangle}(L)^{w}}\right) \tag{5.19}
\end{align*}
$$

$$
\begin{aligned}
& =: \operatorname{Ext}_{\mathbf{L}_{J \cap w-1}(L)}^{i, \infty}(L), \omega_{\pi}^{\langle r\rangle}(A, B),
\end{aligned}
$$

where the first isomorphism follows from [28, Lemma 14] (note that $W^{\sim}$ denotes the smooth dual of $W$, if $W$ is a smooth representation), and the second isomorphism follows from Lemma 5.2. If $J \nsubseteq I$ or $w \neq 1$, by the Proof of [28, Proposition 15, especially (2) and (3), \& Lemma 16], there exists an element
$z \in \mathbf{Z}_{J \cap w^{-1} I}^{\langle r\rangle}(L)$ such that $\left(\gamma_{I, J}^{w}\right)^{\vee}(z) \delta_{\mathbf{L}_{J}^{\langle r\rangle}(L) \cap \overline{\mathbf{P}}_{I}^{(r)}(L)^{w}}(z) \neq 1$. Therefore, we deduce from (3.7) that $z$ acts on $B$ (resp, $A$ ) by multiplication by scalar

$$
z_{B}:=\left(\pi_{J \cap w^{-1} I} \otimes_{E} \gamma_{I, J}^{w}\right)^{\sim}(z) \delta_{\mathbf{L}_{J}^{\langle r\rangle}(L) \cap \overline{\mathbf{F}}_{I}^{\langle r\rangle}(L)^{w}}(z),\left(\text { resp. } z_{A}:=\left(\pi_{J \cap w^{-1} I}\right)^{\sim}(z)\right) .
$$

Since $z_{A} \neq z_{B}$, we deduce from Lemma 2.2 that
for $J \nsubseteq I$ or $w \neq 1$. If $J \nsubseteq I$, we deduce by dévissage that $\operatorname{Ext}_{G}^{i}\left(i \frac{G}{\mathbf{P}_{I}^{(r)}}(\pi, \underline{\lambda}), \frac{\mathbb{I}_{\mathbf{P}}^{G}}{(\langle r\rangle}(\pi, \underline{\lambda})\right)=0$. If $J \subseteq I$, we have

$$
\begin{aligned}
& \left.=\operatorname{Ext}_{\mathbf{L}_{J}^{r\langle \rangle}(L), \omega_{\pi}^{\langle r\rangle}}^{r} \stackrel{\left(r_{\overline{\mathbf{P}}}^{I}\right.}{\mathbf{L}_{J}^{\langle r\rangle}(L)}(L) \cap \mathbf{L}_{J}^{\langle r\rangle}(L), \pi_{J}, \pi_{J}\right)=\operatorname{Ext}_{\mathbf{L}_{J}^{\langle r\rangle}(L), \omega_{\pi}^{\langle r\rangle}}^{r}\left(\pi_{J}, \pi_{J}\right) .
\end{aligned}
$$

This completes the proof of (5.15).
As a corollary of Lemma 5.9, we have
Corollary 5.10. We have

$$
\begin{gather*}
\operatorname{Ext}_{G}^{i}\left(v_{\overline{\mathbf{P}}_{I}^{(r\rangle}}^{\infty}(\pi, \underline{\lambda}), \mathbb{I}_{\overline{\mathbf{P}}_{J}^{(r)}}^{G}(\pi, \underline{\lambda})\right)= \begin{cases}\mathcal{E}_{J}^{i-\left|\Delta_{n}(k) \backslash I\right|}, & I \cup J=\Delta_{n}(k) ; \\
0, & \text { otherwise. } .\end{cases}  \tag{5.21}\\
\operatorname{Ext}_{{ }_{G}, \omega_{\pi}^{\langle r)} \chi_{\underline{X}}}\left(v_{\overline{\mathbf{P}}_{I}^{(r)}}^{\infty}(\pi, \underline{\lambda}), \mathbb{I}_{\mathbf{P}}^{\mathbf{P}_{J}^{(r)}}(\pi, \underline{\lambda})\right)= \begin{cases}\overline{\mathcal{E}}_{J}^{i-\left|\Delta_{n}(k) \backslash I\right|}, & I \cup J=\Delta_{n}(k) ; \\
0, & \text { otherwise. } .\end{cases} \tag{5.22}
\end{gather*}
$$

Proof. We prove (5.22) only, and (5.21) follows by the same arguments. We apply the acyclic complex in Proposition 4.3 to the locally $\mathbb{Q}_{p}$-algebraic representation $v_{\overline{\mathbf{P}}_{I}^{(r)}}^{\infty}(\pi, \underline{\lambda})$, i.e.,

$$
\left[C_{I, k-1-|I|}^{\infty} \longrightarrow C_{I, k-2-|I|}^{\infty} \longrightarrow \cdots \longrightarrow C_{I, 0}^{\infty}\right] \text {, with } C_{I, l}^{\infty}=\underset{\substack{I \subseteq K \subseteq \Delta_{n}(k) \\|K \backslash I|=l}}{ } i \frac{G}{\mathbf{P}_{K}^{(r)}}(\pi, \underline{\lambda}) .
$$

We recall the discussion after [40, Proposition 5.4] briefly. By [25, (25)], we have a resolution $\left(C^{\text {an }}\left(G^{q+1}, C_{T, l}^{\infty}\right)\right)_{q \geq 0}$ for each term $C_{I, l}^{\infty}$. Then we form a double complex $\left(C^{q, l}\right)_{q, l}$ with $C^{q, l}:=C^{\text {an }}\left(G^{q+1}, C_{I,-l}^{\infty}\right)$. Then the extension group in this corollary is equal to the cohomology of the total complex associated to the $\left(\operatorname{Hom}_{G}\left(C^{q, l}, \frac{\mathbb{T}_{\mathbf{P}_{J}^{(i\rangle}}^{G}}{}(\pi, \underline{\lambda})\right)\right)_{q, l}$, which leads to a spectral sequence

$$
E_{1}^{s, r}=\operatorname{Ext}_{G, \omega_{\pi}^{\langle r\rangle}}^{r} \chi_{\underline{\boldsymbol{\lambda}}}\left(\bigoplus_{\substack{I \subseteq K \subseteq \Delta_{n}(k) \\|K \backslash I|=s}} i \frac{G}{\mathbf{P}_{K}^{\langle r\rangle}}(\pi, \underline{\lambda}), \mathbb{I}_{\overline{\mathbf{P}}_{J}^{(r)}}^{G}(\pi, \underline{\lambda})\right) \Rightarrow \operatorname{Ext}_{G, \omega_{\pi}^{\langle r\rangle} \chi_{\underline{\boldsymbol{\lambda}}}}^{r+s}\left(v_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{\infty}(\pi, \underline{\lambda}), \mathbb{I}_{\mathbf{P}_{J}^{(r)}}^{G}(\pi, \underline{\lambda})\right)
$$

By (5.15), for any $r \in \mathbb{Z}_{\geq 0}$, the $r$-th row of the $E_{1}$-page of the spectral sequence is given by

$$
\begin{array}{cccccc}
E_{1}^{|I \cup J|-|I|, r} \\
\|_{\mathcal{E}_{J}^{i}}^{\|} & \longrightarrow & E_{1}^{|I \cup J|-|I|+1, r} & \longrightarrow & \cdots & \cdots \\
& \bigoplus_{\substack{I \cup J K K \\
|K \backslash(I \cup J)|=1}}^{\|} \overline{\mathcal{E}}_{J}^{i} & \longrightarrow & \cdots & \longrightarrow & E_{1}^{n-1-|I|, r} \\
& \longrightarrow & \overline{\mathcal{E}}_{J}^{i}
\end{array}
$$

If $I \cup J \neq \Delta_{n}(k)$, the above sequence is a constant coefficient system on the standard simplex associated to $I \cup J$, which is exact. This implies that $\operatorname{Ext}_{G, \omega_{\pi}^{r r\rangle} \chi_{\underline{\chi}}}\left(v_{\overline{\mathbf{P}}_{I}^{(r)}}^{\infty}(\pi, \underline{\lambda}), \underline{\mathbb{I}} \frac{G}{\mathbf{P}_{J}^{(r\rangle}}(\pi, \underline{\lambda})\right)=0$ for all $r \in \mathbb{Z}_{\geq 0}$. On the
other hand, if $I \cup J=\Delta_{n}(k)$, all the elements of the $E_{1}$-page vanish except the elements on the $\left|\Delta_{n}(k) \backslash I\right|$-th column, and hence

$$
\overline{\mathcal{E}}_{J}^{i} \cong \operatorname{Ext}_{G, \omega_{\pi}^{\langle r\rangle} \chi_{\underline{\lambda}}}^{r}\left(i i_{\overline{\mathbf{P}}_{\Delta_{n}(k)}^{G r\rangle}}^{G}(\pi, \underline{\lambda}), \mathbb{I}_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}}^{G}(\pi, \underline{\lambda})\right) \cong \operatorname{Ext}_{G, \omega_{\pi}^{\langle r\rangle} \chi_{\underline{\lambda}}}^{r+\left|\Delta_{n}(k) \backslash I\right|}\left(v_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{\infty}(\pi, \underline{\lambda}), \mathbb{I}_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}}^{G}(\pi, \underline{\lambda})\right)
$$

This completes the proof.
We now give an explicit description for the Ext ${ }^{1}$-groups in the Lemma 5.9. Let $J \subseteq I \subseteq \Delta_{n}(k)$ be subsets of $\Delta_{n}(k)$. Let $\widetilde{\pi}_{J}$ be a locally $\mathbb{Q}_{p}$-analytic representation of $\mathbf{L}_{J}^{\langle r\rangle}(L)$ over $E$, which is a locally $\mathbb{Q}_{p}$-analytic extension of $\pi_{J}$ by $\pi_{J}$. It gives a cohomology class $\left[\widetilde{\pi}_{J}\right] \in \mathcal{E}_{J}^{1}$. Thus, the locally $\mathbb{Q}_{p}$-analytic parabolic induction $\left(\operatorname{Ind} \overline{\mathbf{P}}_{J}^{G}\left\langle(L) \quad \tilde{\pi}_{J} \otimes_{E} L^{\langle r\rangle}(\underline{\lambda})_{J}\right)^{\mathbb{Q}_{p}-\text { an }}\right.$ lies in an exact sequence

$$
\begin{equation*}
0 \longrightarrow \mathbb{I}_{\mathbf{P}_{J}^{\langle r\rangle}}^{G}(\pi, \underline{\lambda}) \longrightarrow\left(\operatorname{Ind} \overline{\overline{\mathbf{P}}}_{J}^{G\langle \rangle}(L), \widetilde{\pi}_{J} \otimes_{E} L(\underline{\lambda})_{J}\right)^{\mathbb{Q}_{p}-\mathrm{an}} \xrightarrow{\mathrm{pr}} \mathbb{I}_{\mathbf{P}_{J}^{\langle r\rangle}}^{G}(\pi, \underline{\lambda}) \longrightarrow 0 \tag{5.23}
\end{equation*}
$$

Pullback (5.23) via a natural injection

$$
i \frac{G}{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}(\pi, \underline{\lambda}) \longleftrightarrow \mathbb{I}_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{G}(\pi, \underline{\lambda}) \longleftrightarrow \mathbb{I}_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}}^{G}(\pi, \underline{\lambda}),
$$

gives a locally $\mathbb{Q}_{p}$-analytic representation $\mathscr{E}_{I}^{J}\left(\pi, \underline{\lambda}, \widetilde{\pi}_{J}\right)^{+}$, which is an extension of $i \frac{G}{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}(\pi, \underline{\lambda})$ by $\mathbb{I}_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}}^{\langle }(\pi, \underline{\lambda})$. It gives a cohomology class $\left[\mathscr{E}_{I}^{J}\left(\pi, \underline{\lambda}, \widetilde{\pi}_{J}\right)^{+}\right] \in \operatorname{Ext}{ }_{G}^{1}\left(i \frac{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}{G}(\pi, \underline{\lambda}), \mathbb{I}_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}}^{G}(\pi, \underline{\lambda})\right)$. By the argument in Section 5.1, we have $\mathrm{H}_{\mathrm{an}}^{1}\left(\mathbf{L}_{I}^{\langle r\rangle}(L), E\right) \cong \operatorname{Hom}\left(\mathbf{Z}_{I}^{\langle r\rangle}(L), E\right)$ (and the same for $J$ ). Then the natural injection $\mathbf{L}_{J}^{\langle r\rangle}(L) \hookrightarrow$ $\mathbf{L}_{I}^{\langle r\rangle}(L)$ induces a natural morphism

$$
\mathrm{H}_{\mathrm{an}}^{1}\left(\mathbf{L}_{I}^{\langle r\rangle}(L), E\right) \cong \operatorname{Hom}\left(\mathbf{Z}_{I}^{\langle r\rangle}(L), E\right) \rightarrow \mathrm{H}_{\mathrm{an}}^{1}\left(\mathbf{L}_{J}^{\langle r\rangle}(L), E\right) \cong \operatorname{Hom}\left(\mathbf{Z}_{J}^{\langle r\rangle}(L), E\right)
$$

In particular, we will view $\operatorname{Hom}\left(\mathbf{Z}_{I}^{\langle r\rangle}(L), E\right)$ as a subspace of $\operatorname{Hom}\left(\mathbf{Z}_{J}^{\langle r\rangle}(L), E\right)$. Let

$$
\Psi \in \mathrm{H}_{\mathrm{an}}^{1}\left(\mathbf{L}_{J}^{\langle r\rangle}(L), E\right) \cong \operatorname{Hom}\left(\mathbf{Z}_{J}^{\langle r\rangle}(L), E\right)
$$

which induces an extension $\iota_{J}(\Psi)$ of $\pi_{J}$ of $\mathbf{L}_{J}^{\langle r\rangle}(L)$ :

$$
\iota_{J}(\Psi)(a)=\pi_{J}(a) \otimes_{E}\left(\begin{array}{cc}
1 & \Psi(a) \\
0 & 1
\end{array}\right), \forall a \in \mathbf{L}_{J}^{\langle r\rangle}(L)
$$

We may identify $\iota_{J}(\Psi)$ with the $E[\epsilon] / \epsilon^{2}$-valued representation $\pi_{J}(1+\Psi \epsilon)$. We put

$$
\mathscr{E}_{I}^{J}(\pi, \underline{\lambda}, \Psi)^{+}:=\mathscr{E}_{I}^{J}\left(\pi, \underline{\lambda}, \iota_{J}(\Psi)\right)^{+}
$$

Applying and modifying the proof of [15, Lemma 2.13, Remark 2.18] to our case, we can show that
Lemma 5.11. The representation $\left[\mathscr{E}_{I}\left(\pi, \underline{\lambda}, \widetilde{\pi}_{J}\right)^{+}\right]$is mapped (up to nonzero scalars) to $\widetilde{\pi}_{J} \in \mathcal{E}_{J}^{1}$ via the isomorphism in (5.14).

Proof. By the discussion in [40, Section 4.4,(4.32)], we see that the isomorphism (5.14) factors though the following composition,

$$
\begin{align*}
& \operatorname{Ext}_{G}^{1}\left(i \stackrel{\overline{\mathbf{P}}}{I}_{\langle r\rangle}(\pi, \underline{\lambda}), \mathbb{I}_{\mathbf{P}_{J}^{\langle r\rangle}}^{G}(\pi, \underline{\lambda})\right) \\
\xrightarrow{\sim} & \operatorname{Ext}_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}(L)}^{1}\left(i \overline{\mathbf{P}}_{I}^{\langle r\rangle}(L)\right.  \tag{5.24}\\
\sim & \left.(\pi, \underline{\lambda}))\left.\right|_{\mathbf{P}_{J}^{\langle r\rangle}(L)}, \pi_{J}(\underline{\lambda})\right) \\
\xrightarrow{\sim} & \operatorname{Ext}_{\mathbf{L}_{J}^{\langle r\rangle}(L)}^{1}\left(r_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}(L)}^{G}\left(i i_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}(L)}^{G}(\pi, \underline{\lambda})\right), \pi_{J}\right) \\
\xrightarrow{\sim} & \operatorname{Ext}_{\mathbf{L}_{J}^{\langle r\rangle}(L)}\left(\pi_{J}(\underline{\lambda}), \pi_{J}(\underline{\lambda})\right),
\end{align*}
$$

where the first map sends $V$ to the push-forward of $V$ to the push-forward of $\left.V\right|_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}(L)}$ via the natural evaluation map $\mathbb{I}_{\mathbf{P}_{J}^{G r\rangle}}^{G}(\pi, \underline{\lambda}) \rightarrow \pi_{J}(\underline{\lambda}), f \mapsto f(1)$, the second map is inverse of the map induced by the natural projection $\left.i_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}(L)}^{G}(\pi, \underline{\lambda})\right)\left.\right|_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}(L)} \rightarrow r_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}(L)}^{G}\left(i \overline{\overline{\mathbf{P}}}_{I}^{G r\rangle}(L), \underline{\lambda}\right)$, and the third map is induced by the injection $\left.\pi_{J}(\underline{\lambda}) \hookrightarrow r_{\overline{\mathbf{P}}_{J}^{G r\rangle}(L)}^{G}\left(i \overline{\mathbf{P}}_{I}^{\langle r\rangle}(L), \underline{\lambda}\right)\right)$. Note that composition 5.24 is also the edge morphism given by the spectral sequence (5.16).

We next show that $\left[\mathscr{E}_{I}^{J}\left(\pi, \underline{\lambda}, \widetilde{\pi}_{J}\right)^{+}\right]$is mapped to $\widetilde{\pi}_{J}$ via (5.24). Similar to the discussion in $[15$, Lemma 2.13], we can show that the following composition

$$
\left.\left.\begin{array}{rl} 
& \operatorname{Ext}_{\mathbf{L}_{J}^{\langle r\rangle}(L)}^{1}\left(\pi_{J}(\underline{\lambda}), \pi_{J}(\underline{\lambda})\right) \\
\rightarrow & \operatorname{Ext}_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}(L)}^{1}\left(\mathbb{I} \overline{\mathbf{P}}_{I}^{G r\rangle}(L)\right.  \tag{5.25}\\
\rightarrow & \left.\left.\operatorname{Ext}_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}(L)}^{1}(\pi, \underline{\lambda})\right)\left.\right|_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}(L)}, \pi_{J}(\underline{\lambda})\right) \\
\overline{\mathbf{P}}_{I}^{\langle r\rangle}(L)
\end{array}(\pi, \underline{\lambda})\right)\left.\right|_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}(L)}, \pi_{J}(\underline{\lambda})\right)
$$

is the inverse of the composition of the last two maps in (5.24). By the construction of $\left[\mathscr{E}_{I}^{J}\left(\pi, \underline{\lambda}, \widetilde{\pi}_{J}\right)^{+}\right]$, we see that the representation $\left[\mathscr{E}_{I}^{J}\left(\pi, \underline{\lambda}, \widetilde{\pi}_{J}\right)^{+}\right]$is just the image of $\widetilde{\pi}_{J}$ via the above composition and the inverse of the first isomorphism in (5.24). The lemma follows.

Furthermore, the injection $\mathbb{T}_{\overline{\mathbf{P}}_{I}^{G}}^{\langle r\rangle}(\pi, \underline{\lambda}) \longleftrightarrow \mathbb{I}_{\overline{\mathbf{P}}_{J}^{G}}^{\langle r\rangle}(\pi, \underline{\lambda})$ induces a map

$$
\operatorname{Ext}_{G}^{1}\left(i \overline{\overline{\mathbf{P}}}_{I}^{G r\rangle}(\pi, \underline{\lambda}), \mathbb{I}_{\overline{\mathbf{P}}_{I}^{G r\rangle}}^{G}(\pi, \underline{\lambda})\right) \rightarrow \operatorname{Ext}_{G}^{1}\left(i \overline{\overline{\mathbf{P}}}_{I}^{G}{ }^{\langle r\rangle}(\pi, \underline{\lambda}), \mathbb{I}_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}}^{\langle }(\pi, \underline{\lambda})\right)
$$

By the isomorphism (5.14), we get a map $\mathcal{E}_{I} \rightarrow \mathcal{E}_{J}$. We now describe this map explicitly. By [40, Corollary 4.9], we have a spectral sequence

$$
\begin{equation*}
\left.E_{2}^{r, s}=\operatorname{Ext}_{\mathbf{L}_{J}^{\langle r\rangle}(L)}^{r}\left(\mathrm{H}_{s}\left(\overline{\mathbf{N}}_{J}^{\langle r\rangle}(L) \cap \mathbf{L}_{I}^{\langle r\rangle}(L), \pi_{I}(\underline{\lambda})\right), \pi_{J}(\underline{\lambda})\right) \Rightarrow \operatorname{Ext}_{\mathbf{L}_{I}^{\langle r\rangle}(L)}^{r+s}\left(\pi_{I}(\underline{\lambda}), \mathbb{L}_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}(L) \cap \mathbf{L}_{I}^{\langle r\rangle}(L)}^{\langle r\rangle}(\pi), \underline{\lambda}\right)\right) . \tag{5.26}
\end{equation*}
$$

One has isomorphisms of locally algebraic representations of $\operatorname{Res}_{\mathbb{Q}_{p}}^{L} \mathbf{L}_{J}^{\langle r\rangle}(L)$,

$$
\begin{align*}
\mathrm{H}_{s}\left(\overline{\mathbf{N}}_{J}^{\langle r\rangle}(L) \cap \mathbf{L}_{I}^{\langle r\rangle}(L), \pi_{I}(\underline{\lambda})\right) & =r_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{G} \pi_{I} \otimes_{E} \mathrm{H}_{s}\left(\overline{\mathfrak{n}}_{I, \Sigma_{L}}^{\langle r\rangle}, L(\underline{\lambda})\right) \\
& =\pi_{J} \otimes_{E}\left(\bigoplus_{\substack{w \in \mathscr{W}_{n}, \lg (w)=s \\
w \cdot \underline{\lambda}^{\prime} \in X_{\Delta_{n}^{k} \cup J}^{+}}} L^{\langle r\rangle}(w \cdot \underline{\lambda})_{J}\right) \tag{5.27}
\end{align*}
$$

by [40, Theorem 4.10]. This implies

$$
\begin{equation*}
\operatorname{Ext}_{\mathbf{L}_{J}^{r\langle\gamma}(L)}^{r}\left(\pi_{J}(\underline{\lambda}),(\underline{\lambda})\right) \cong \operatorname{Ext}_{\mathbf{L}_{I}^{\langle r\rangle}(L)}^{r+s}\left(\pi_{I}(\underline{\lambda}), \mathbb{I}_{\mathbf{P}_{I}^{\langle r\rangle}(L) \cap \mathbf{L}_{I}^{\langle r\rangle}(L)}^{\langle r\rangle}(\pi, \underline{\lambda})\right) \tag{5.28}
\end{equation*}
$$

Therefore, we have the following compositions of morphisms:

$$
\begin{align*}
\mathcal{E}_{I}^{1} & \rightarrow \operatorname{Ext}_{\mathbf{L}_{I}^{\langle r\rangle}(L)}^{1}\left(\pi_{I}(\underline{\lambda}), i_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}(L) \cap \mathbf{L}_{I}^{\langle r\rangle}(L)}^{\langle r\rangle}(\pi, \underline{\lambda})\right) \\
& \rightarrow \operatorname{Ext}_{\mathbf{L}_{I}^{\langle r\rangle}(L)}^{1}\left(\pi_{I}(\underline{\lambda}), \mathbb{I}_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}(L)}^{L_{J}^{\langle\nu\rangle} \cap \mathbf{L}_{I}^{\langle r\rangle}(L)}(\pi, \underline{\lambda})\right) \\
& \xrightarrow{\sim} \operatorname{Ext}_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}(L) \cap \mathbf{L}_{I}^{\langle r\rangle}(L)}^{1}\left(\left.\left(\pi_{I}(\underline{\lambda})\right)\right|_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}(L) \cap \mathbf{L}_{I}^{\langle r\rangle}(L)}, \pi_{J}(\underline{\lambda})\right)  \tag{5.29}\\
& \xrightarrow{\sim} \operatorname{Ext}_{\mathbf{L}_{J}^{\langle r\rangle}(L)}^{1}\left(r_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}(L) \cap \mathbf{L}_{I}^{\langle r\rangle}(L)}^{\langle r)}\left(\pi_{I}\right) \otimes_{E} L^{\langle r\rangle}(\underline{\lambda})_{J}, \pi_{J}(\underline{\lambda})\right) \\
& \xrightarrow{\sim} \mathcal{E}_{J}^{1},
\end{align*}
$$

where the first map is induced by the injection $\pi_{I}(\underline{\lambda}) \hookrightarrow i_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}(L) \cap \mathbf{L}_{I}^{\langle r\rangle}(L)}^{\langle r\rangle}(\pi, \underline{\lambda})$, the second map is induced by the injection $i_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}(L) \cap \mathbf{L}_{I}^{\langle r\rangle}(L)}^{\langle r\rangle}(\pi, \underline{\lambda}) \hookrightarrow \frac{\mathbb{I}_{I}^{\langle r\rangle}(L)}{\overline{\mathbf{P}}_{J}^{\langle r\rangle}(L) \cap \mathbf{L}_{I}^{\langle r\rangle}(L)}(\pi, \underline{\lambda})$, and the third map sends $V$ to the push-forward of $\left.V\right|_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}(L) \cap \mathbf{L}_{I}^{\langle r\rangle}(L)}$ via the natural evaluation map $\frac{\mathbb{L}_{I}^{\langle r\rangle}(L)}{\overline{\mathbf{P}}_{J}^{\langle r\rangle}(L) \cap \mathbf{L}_{I}^{\langle r\rangle}(L)}(\pi, \underline{\lambda}) \rightarrow \pi_{J}(\underline{\lambda}), f \mapsto$ $f(1)$. The fourth map is the inverse of the map induced by the natural projection $\left.\left(\pi_{I}(\underline{\lambda})\right)\right|_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}(L) \cap \mathbf{L}_{I}^{\langle r\rangle}(L)} \rightarrow$ $r_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}(L) \cap \mathbf{L}_{I}^{\langle r\rangle}(L)}^{\mathbf{L}_{I}^{\langle r\rangle}(L)} \pi_{I} \otimes_{E} L^{\langle r\rangle}(\underline{\lambda})_{J}$. The last map is induced by the isomorphism (see Proposition 3.6, (3.12)) $\pi_{J} \xrightarrow{\sim} r_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}(L) \cap \mathbf{L}_{I}^{\langle r\rangle}(L)}^{\mathbf{L}^{\langle r\rangle}(L)}\left(\pi_{I}\right) \otimes_{E} L^{\langle r\rangle}(\underline{\lambda})_{J}$. Using a parallel discussion in (5.24), we see that the last three maps in (5.29) are isomorphisms (where we use the isomorphism (5.28)). We denote the map (5.29) by $\varrho_{I, J}$. In a similar way, we can construct an explicit map $\bar{\varrho}_{I, J}: \overline{\mathcal{E}}_{I}^{1} \rightarrow \overline{\mathcal{E}}_{J}^{1}$ which is induced by

The natural injection $\mathbf{L}_{J}^{\langle r\rangle}(L) \hookrightarrow \mathbf{L}_{I}^{\langle r\rangle}(L)$ induces a natural morphism $\mathrm{H}_{\mathrm{an}}^{1}\left(\mathbf{L}_{I}^{\langle r\rangle}(L), E\right) \rightarrow \mathrm{H}_{\mathrm{an}}^{1}\left(\mathbf{L}_{J}^{\langle r\rangle}(L), E\right)$, which induces a morphism $\operatorname{Hom}\left(\mathbf{Z}_{I}^{\langle r\rangle}(L), E\right) \rightarrow \operatorname{Hom}\left(\mathbf{Z}_{J}^{\langle r\rangle}(L), E\right)$. This morphism is also induced by the morphism composition

$$
\mathbf{Z}_{J}^{\langle r\rangle}(L) \hookrightarrow \mathbf{L}_{J}^{\langle r\rangle}(L) \hookrightarrow \mathbf{L}_{I}^{\langle r\rangle}(L) \xrightarrow{\operatorname{det}} \mathbf{Z}_{I}^{\langle r\rangle}(L)
$$

By the construction of $\varrho_{I, J}$ in (5.29), we deduce:
Lemma 5.12. The following diagram is commutative:

where the top morphism is induced by the natural injection $\mathbf{L}_{J}^{\langle r\rangle}(L) \hookrightarrow \mathbf{L}_{I}^{\langle r\rangle}(L)$.
Lemma 5.13. Suppose that $J \subseteq I$, the following diagram is commutative:

$$
\begin{aligned}
& \operatorname{Ext}_{G}^{1}\left(i_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{G}(\pi, \underline{\lambda}), \mathbb{I}_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{G}(\pi, \underline{\lambda})\right) \longrightarrow \operatorname{Ext}_{G}^{1}\left(i i_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{G}(\pi, \underline{\lambda}), \mathbb{I}_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}}^{G}(\pi, \underline{\lambda})\right) \\
&(5.14) \mid \sim \\
& \mathcal{E}_{I}^{1}(5.14) \mid \sim \\
& \varrho_{I, J} \sim \\
& \mathcal{E}_{J}^{1}
\end{aligned}
$$

A similar result holds for $\bar{\varrho}_{I, J}$.

Proof. Firstly, we write

$$
\begin{align*}
& \operatorname{Ext}_{I}^{r}:=\operatorname{Ext}_{\mathbf{L}_{I}^{\langle r\rangle}(L)}^{r}\left(\text { resp., } \operatorname{Ext}_{J}^{r}:=\operatorname{Ext}_{\mathbf{L}_{J}^{\langle r\rangle}(L)}^{1}\right), \\
& i_{I} \pi_{I}^{\lambda}:=i_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{G}(\pi, \underline{\lambda})\left(\text { resp. }, i_{J} \pi \frac{\lambda}{J}:=i_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}}^{G}(\pi, \underline{\lambda})\right), \\
& \mathbb{I}_{I} \pi_{I}^{\lambda}:=\mathbb{I}_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{\langle }(\pi, \underline{\lambda})\left(\text { resp. }, \mathbb{I}_{J} \pi \frac{\lambda}{J}:=\mathbb{I}_{\overline{\mathbf{P}}_{J}^{G}}^{\langle r\rangle}(\pi, \underline{\lambda})\right),  \tag{5.30}\\
& \pi_{I}^{\lambda}:=\pi_{I}(\underline{\lambda})\left(\text { resp., } \pi_{J}^{\lambda}:=\pi_{J}(\underline{\lambda})\right) \text {, } \\
& \text { and } \mathbb{I}_{J}^{I}\left(\pi \frac{\lambda}{J}\right):=\mathbb{I}_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}(L) \cap \mathbf{L}_{I}^{\langle r\rangle}(L)}^{\langle r\rangle}(\pi, \underline{\lambda})
\end{align*}
$$

for simplicity.

Considering the following commutative diagram:

$$
\begin{aligned}
& \begin{array}{l}
\left.\operatorname{Ext}_{G}^{1}\left(i_{I} \pi_{\frac{\lambda}{I}}, \mathbb{I}_{I} \pi \frac{\lambda}{I}\right) \longrightarrow \operatorname{Ext}_{G}^{1}\left(i_{I} \pi \frac{\lambda}{I}, \mathbb{I}_{J} \pi \frac{\lambda}{J}\right) \longrightarrow\left(a^{\prime}\right) \right\rvert\,
\end{array} \\
& \operatorname{Ext}_{I}^{1}\left(r_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}(L)}^{G}\left(i_{I} \pi \frac{\lambda}{I}\right), \pi \frac{\lambda}{I}\right) \xrightarrow{\left(e^{\prime}\right)} \operatorname{Ext}_{I}^{1}\left(r_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}(L)}^{G}\left(i_{I} \pi \frac{\lambda}{I}\right), \mathbb{I}_{J}^{I}\left(\pi \frac{\lambda}{J}\right)\right) \xrightarrow[\left(d^{\prime}\right), \simeq]{ } \operatorname{Ext}_{J}^{1}\left(r_{\overline{\mathbf{P}}_{J}^{G r\rangle}(L)}\left(i_{I} \pi \frac{\lambda}{I}, \pi \frac{\lambda}{J}\right)\right. \\
& (c), \simeq \downarrow \quad\left(c^{\prime}\right) \downarrow \quad\left(c^{\prime \prime}\right) \downarrow \\
& \operatorname{Ext}_{I}^{1}\left(\pi \frac{\lambda}{I}, \pi \frac{\lambda}{I}\right) \longrightarrow \operatorname{Ext}_{I}^{1}\left(\pi_{I}^{\prime \prime}, \mathbb{I}_{J}^{I}\left(\pi \frac{\lambda}{J}\right)\right) \xrightarrow{\left(d^{\prime \prime}\right), \simeq} \operatorname{Ext}_{J}^{1}\left(\pi \frac{\lambda}{J}, \pi \frac{\lambda}{J}\right),
\end{aligned}
$$

The maps (a), ( $\left.a^{\prime \prime}\right),\left(d^{\prime}\right)$ are edge morphisms of spectral sequence (and an easy variation of it) in (5.16), and the map $\left(d^{\prime \prime}\right)$ is edge morphism of spectral sequence (5.26). The map $(e)$ is induced by the injection $\mathbb{I}_{I} \pi_{I}^{\lambda} \hookrightarrow$ $\mathbb{I}_{J} \pi \frac{\lambda}{J}$. The maps $\left(e^{\prime}\right)$ and $\left(e^{\prime \prime}\right)$ are induced by the injection $\pi_{I}^{\lambda} \hookrightarrow \mathbb{I}_{J}^{I}\left(\pi \frac{\lambda}{J}\right)$. The maps $(c)$ and $\left(c^{\prime}\right)$ are induced by the injection $\pi \frac{\lambda}{I} \hookrightarrow r_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}(L)}^{G}\left(i_{I} \pi \frac{\lambda}{I}\right)$, and the map $\left(c^{\prime \prime}\right)$ is induced by the injection $\pi \frac{\lambda}{J} \hookrightarrow r_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}(L)}^{G}\left(i_{I} \pi \frac{\lambda}{I}\right)$. The maps $(b),\left(b^{\prime \prime}\right)$ are given by the composition of first and second isomorphisms in (5.24). The map $\left(a^{\prime}\right)$ is the edge morphism of the spectral sequence $E_{2}^{r, s}=\operatorname{Ext}_{I}^{r}\left(\mathrm{H}_{s}\left(\overline{\mathbf{N}}_{I}^{\langle r\rangle}(L), i_{I} \pi_{I}^{\lambda}\right), \mathbb{I}_{J}^{I}\left(\pi \frac{\lambda}{J}\right)\right) \Rightarrow \operatorname{Ext}_{G}^{r+s}\left(i_{I} \pi \frac{\lambda}{I}, \mathbb{I}_{J} \pi \frac{\lambda}{J}\right)$. It is clear that all the four blocks of the above diagram are commutative. In this case, we see that ( $a^{\prime}$ ) is also an isomorphism. Note that $\varrho_{I, J}$ is the composition of $\left(e^{\prime \prime}\right)$ and the isomorphism $\left(d^{\prime \prime}\right)$. The result follows by an easy diagram chasing.

Remark 5.14. Note that all the above description also hold for smooth case, i.e., we are working with the smooth extension group $\operatorname{Ext}_{G}^{1, \infty}\left(i i_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{G}(\pi, \underline{\lambda}), i{\underset{\mathbf{P}}{J}}_{\langle }^{\langle r\rangle}(\pi, \underline{\lambda})\right) \xrightarrow{\sim} \mathcal{S}_{J}^{1}$ instead of the $\left.\operatorname{Ext}_{G}^{1}\left(i \underline{\overline{\mathbf{P}}}_{I}^{G}\langle r\rangle, \underline{\lambda}\right), \mathbb{I}_{\mathbb{P}_{J}^{G}}^{\langle r\rangle}(\pi, \underline{\lambda})\right) \xrightarrow{\sim}$ $\mathcal{E}_{J}^{1}$. Moreover, the injection $i \underset{\overline{\mathbf{P}}_{J}^{\langle r\rangle}}{G}(\pi, \underline{\lambda}) \hookrightarrow \mathbb{I}_{\overline{\mathbf{P}}_{J}^{G}\langle r\rangle}^{G}(\pi, \underline{\lambda})$ induces an injection

$$
\operatorname{Ext}_{G}^{1}\left(i i_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{G}(\pi, \underline{\lambda}), i_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}}^{G}(\pi, \underline{\lambda})\right) \hookrightarrow \operatorname{Ext}_{G}^{1}\left(i i_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{G}(\pi, \underline{\lambda}), \mathbb{I}_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}}^{G}(\pi, \underline{\lambda})\right)
$$

by an easy dévissage (using $\operatorname{Hom}_{G}\left(i \overline{\mathbf{P}}_{I}^{\langle r\rangle}(\pi, \underline{\lambda}), \mathbb{I}_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}}(\pi, \underline{\lambda}) / i \overline{\mathbf{P}}_{J}^{\langle r\rangle}(\pi, \underline{\lambda})\right)=0$ ). Using Lemma 2.3 (2.11), Lemma 6.7 and the explicit description for $\mathrm{Ext}^{1}$, we get the following commutative diagram:

$$
\begin{gathered}
\operatorname{Ext}_{G}^{1, \infty}\left(i \frac{G}{\mathbf{P}_{I}^{\langle r\rangle}}(\pi, \underline{\lambda}), i_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}}^{G}(\pi, \underline{\lambda})\right) \hookrightarrow \operatorname{Ext}_{G}^{1}\left(i i_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{G}(\pi, \underline{\lambda}), \mathbb{I}_{\overline{\mathbf{P}}_{J}^{G r\rangle}}^{G}(\pi, \underline{\lambda})\right) \\
\downarrow \sim \\
\perp_{E}^{*}\left(\mathbf{L}_{I}^{\langle r\rangle}\right) \cong \operatorname{Hom}_{\infty}\left(\mathbf{L}_{I}^{\langle r\rangle}(L), E\right) \longleftrightarrow \operatorname{Hom}\left(\mathbf{L}_{I}^{\langle r\rangle}(L), E\right),
\end{gathered}
$$

where the top injection is induced by

$$
\begin{equation*}
\operatorname{Ext}_{G}^{1, \infty}\left(i i_{\mathbf{P}_{I}^{\langle r\rangle}}^{G}(\pi, \underline{\lambda}), i \overline{\overline{\mathbf{P}}}_{J}^{G r\rangle}(\pi, \underline{\lambda})\right) \hookrightarrow \operatorname{Ext}_{G}^{1}\left(i i_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{G}(\pi, \underline{\lambda}), i_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}}^{G}(\pi, \underline{\lambda})\right) \hookrightarrow \operatorname{Ext}_{G}^{1}\left(i{\underset{\overline{\mathbf{P}}}{I}}_{\langle r\rangle}^{\langle }(\pi, \underline{\lambda}), \mathbb{I}_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}}^{G}(\pi, \underline{\lambda})\right) \tag{5.31}
\end{equation*}
$$

In particular, we see that $\mathscr{E}_{I}^{J}(\underline{\lambda}, \Psi)^{+}$comes from a locally algebraic extension of $i_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{G}(\pi, \underline{\lambda})$ by $i_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}}^{\infty}(\pi, \underline{\lambda})$ if and only if $\Psi \in X_{E}^{*}\left(\mathbf{L}_{I}^{\langle r\rangle}\right)$.

We push forward (5.23) along surjection $\mathbb{I}_{\overline{\mathbf{P}}_{J}^{G r\rangle}}^{G}(\pi, \underline{\lambda}) \rightarrow v_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}}^{\text {an }}(\pi, \underline{\lambda})$ and then pullback via natural injections

$$
i \frac{G}{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}(\pi, \underline{\lambda}) \longleftrightarrow \mathbb{I}_{\overline{\mathbf{P}}_{I}\langle r\rangle}^{\langle }(\pi, \underline{\lambda}) \longleftrightarrow \mathbb{I}_{\overline{\mathbf{P}}_{J}^{G}}^{\langle r\rangle}(\pi, \underline{\lambda}),
$$

we get a locally $\mathbb{Q}_{p}$-analytic representation $\mathscr{E}_{I}^{J}\left(\pi, \underline{\lambda}, \widetilde{\pi}_{J}\right)^{0}$, which is an extension of $i \frac{G}{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}(\pi, \underline{\lambda})$ by $v_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}}^{\text {an }}(\pi, \underline{\lambda})$. It gives a cohomology class $\left[\mathscr{E}_{I}^{J}\left(\pi, \underline{\lambda}, \tilde{\pi}_{J}\right)^{0}\right] \in \operatorname{Ext}_{G}^{1}\left(i_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{G}(\pi, \underline{\lambda}), v_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}}^{\text {an }}(\pi, \underline{\lambda})\right)$.

Let $\widetilde{\pi}_{I}$ be an locally analytic representation of $\mathbf{L}_{I}^{\langle r\rangle}(L)$ over $E$, which is a locally analytic extension of $\pi_{I}$ by $\pi_{I}$. It gives a cohomology class $\left[\widetilde{\pi}_{I}\right] \in \mathcal{E}_{I}^{1}$. Then the locally $\mathbb{Q}_{p}$-analytic parabolic induction $\left(\operatorname{Ind}_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}(L)}^{G} \tilde{\pi}_{I} \otimes_{E} L^{\langle r\rangle}(\underline{\lambda})_{I}\right)^{\mathbb{Q}_{p}-\text { an }}$ lies in the following exact sequence

$$
\begin{equation*}
0 \longrightarrow \mathbb{I}_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{G}(\pi, \underline{\lambda}) \longrightarrow\left(\operatorname{Ind}_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}(L)}^{G} \tilde{\pi}_{I} \otimes_{E} L(\underline{\lambda})_{I}\right)^{\mathbb{Q}_{p}-\mathrm{an}} \xrightarrow{\operatorname{pr}} \mathbb{I}_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{G}(\pi, \underline{\lambda}) \longrightarrow 0 \tag{5.32}
\end{equation*}
$$

We push forward (5.32) along natural injections $\underline{\underline{\bar{P}}}_{I}^{G r\rangle}(\pi, \underline{\lambda}) \longleftrightarrow \mathbb{I}_{\overline{\mathbf{P}}_{J}^{G}}^{\langle r\rangle}(\pi, \underline{\lambda})$ and then pullback via natural injections $i_{\mathbf{P}_{I}^{\langle r\rangle}}^{G}(\pi, \underline{\lambda}) \longleftrightarrow \underset{\mathbb{I}_{\mathbf{P}_{I}}^{G}}{\langle r\rangle}(\underline{\lambda})$, we reconstruct $\mathscr{E}_{I}^{J}\left(\pi, \underline{\lambda}, \varrho_{I, J}\left(\left[\widetilde{\pi}_{I}\right]\right)\right)^{+}$by Lemma 5.11 and Lemma 5.13. Furthermore, we pushforward (5.32) along the natural morphism

$$
\mathbb{I}_{\mathbf{P}_{I}^{\langle r\rangle}}^{G}(\pi, \underline{\lambda}) \longleftrightarrow \mathbb{I}_{\overline{\mathbf{P}}_{J}}^{G}{ }_{j}^{r\rangle}(\pi, \underline{\lambda}) \rightarrow v_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}}^{\mathrm{an}}(\pi, \underline{\lambda})
$$

and then pullback via natural injections $i \frac{G}{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}(\pi, \underline{\lambda}) \longleftrightarrow \mathbb{I}_{\overline{\mathbf{P}}_{I}}^{G}{ }_{I}^{\langle r\rangle}(\underline{\lambda})$, we may reconstruct the representation $\mathscr{E}_{I}^{J}\left(\pi, \underline{\lambda}, \varrho_{I, J}\left(\left[\widetilde{\pi}_{I}\right]\right)\right)^{0}$ by Lemma 5.11 and Lemma 5.13 . But by definition it is zero. Therefore, we get a homomorphism

$$
\begin{equation*}
\left.\varrho_{I, J}^{0}: \mathcal{E}_{J}^{1} / \varrho_{I, J}\left(\mathcal{E}_{I}^{1}\right) \longrightarrow \operatorname{Ext}_{G}^{1}\left(i \stackrel{\underline{\mathbf{P}}}{I}_{G}^{G}\right\rangle(\pi, \underline{\lambda}), v_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}}^{\mathrm{an}}(\pi, \underline{\lambda})\right) . \tag{5.33}
\end{equation*}
$$

The remainder of this section is devoted to showing

$$
\operatorname{Hom}\left(L^{\times}, E\right) \xrightarrow{\sim} \operatorname{Ext}_{G}^{1}\left(v_{\overline{\mathbf{P}}_{i r}^{\langle r\rangle}}^{\infty}(\pi, \underline{\lambda}), \operatorname{St}_{(r, k)}^{\mathrm{an}}(\pi, \underline{\lambda})\right)
$$

This is the main result of this paper.
We begin with a more general situation. Let $J \subseteq I \subseteq \Delta_{n}(k)$ be subsets of $\Delta_{n}(k)$ such that $|I|=$ $|J|+1$. Suppose that $I=J \cup\{v r\}$ for some $1 \leq v \leq k-1$. We are going to construct an injection (see (5.39))

$$
\varrho_{I, J}^{\sharp}: \operatorname{Hom}\left(\mathbf{Z}_{J}^{\langle r\rangle}(L), E\right) / \operatorname{Hom}\left(\mathbf{Z}_{I}^{\langle r\rangle}(L), E\right) \longrightarrow \operatorname{Ext}_{G}^{1}\left(v_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{\infty}(\pi, \underline{\lambda}), v_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}}^{\mathrm{an}}(\pi, \underline{\lambda})\right)
$$

We see that the first term is isomorphic to $\operatorname{Hom}\left(L^{\times}, E\right)$. We will show that this injection is an isomorphism when $J=\emptyset$ and $I=\{i r\}$ for some $1 \leq i \leq k-1$ by comparing dimensions (see Theorem 5.19). Then we get the desired result.

We first have the following proposition.
Proposition 5.15. (a) We have an isomorphism of E-vector spaces

$$
\left.\operatorname{Ext}_{G, \omega_{\pi}^{\langle r\rangle} \chi_{\underline{\lambda}}}^{1}\left(i \frac{G}{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}(\pi, \underline{\lambda}), v_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}}^{\mathrm{an}}(\pi, \underline{\lambda})\right) \xrightarrow{\sim} \operatorname{Ext}_{G}^{1}\left(i \overline{\overline{\mathbf{P}}}_{I}^{G}\langle r\rangle, \underline{\lambda}\right), v_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}}^{\mathrm{an}}(\pi, \underline{\lambda})\right) .
$$

(b) The map $\varrho_{I, J}: \mathcal{E}_{I}^{1} \rightarrow \mathcal{E}_{J}^{1}$ is injective. We further have an exact sequence:

$$
0 \rightarrow \mathcal{E}_{J}^{1} / \varrho_{I, J}\left(\mathcal{E}_{I}^{1}\right) \rightarrow \operatorname{Ext}_{G}^{1}\left(i \stackrel{\overline{\mathbf{P}}}{I}_{G}^{\langle r\rangle}(\pi, \underline{\lambda}), v_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}}^{\mathrm{an}}(\pi, \underline{\lambda})\right) \rightarrow \operatorname{ker}\left(\mathcal{E}_{I}^{2} \rightarrow \mathcal{E}_{J}^{2}\right) \rightarrow 0
$$

In particular, we may view $\mathcal{E}_{I}^{1}$ as a subspace of $\mathcal{E}_{J}^{1}$.
(c) The map $\bar{\varrho}_{I, J}: \overline{\mathcal{E}}_{I}^{1} \rightarrow \overline{\mathcal{E}}_{J}^{1}$ is injective. We further have an exact sequence:

$$
0 \rightarrow \overline{\mathcal{E}}_{J}^{1} / \bar{\varrho}_{I, J}\left(\overline{\mathcal{E}}_{I}^{1}\right) \rightarrow \operatorname{Ext}_{G, \omega_{\pi}^{\langle r\rangle} \chi_{\underline{\lambda}}}^{1}\left(i_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{G}(\pi, \underline{\lambda}), v_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}}^{\mathrm{an}}(\pi, \underline{\lambda})\right) \rightarrow \operatorname{ker}\left(\overline{\mathcal{E}}_{I}^{2} \rightarrow \overline{\mathcal{E}}_{J}^{2}\right) \rightarrow 0
$$

In particular, we will view $\overline{\mathcal{E}}_{I}^{1}$ as a subspace of $\overline{\mathcal{E}}_{J}^{1}$ via the map $\varrho_{I, J}$ with no further mention.

Proof. Since $\operatorname{Hom}_{G}\left(i_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{G}(\pi, \underline{\lambda}), v_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}}^{\mathrm{an}}(\pi, \underline{\lambda})\right)=0$, we deduce Part (a) from [9, Lemma 3.1] or [32, Lemma 3.2 . We apply the acyclic complex in Proposition 4.4, i.e.,

$$
\begin{equation*}
0 \rightarrow C_{J, k-1}^{\mathrm{an}} \rightarrow C_{J, k-2}^{\mathrm{an}} \rightarrow C_{J, k-3}^{\mathrm{an}} \rightarrow \cdots \rightarrow C_{J, 1}^{\infty} \rightarrow C_{J, 0}^{\mathrm{an}}=\mathbb{I}_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}}^{\mathrm{an}}(\pi, \underline{\lambda}) \tag{5.34}
\end{equation*}
$$

to representation $v_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}}^{\text {an }}(\pi, \underline{\lambda})$, where $C_{J, j}^{\text {an }}=\bigoplus_{\substack{\subseteq K \subseteq \Delta_{n}(k) \\|K \backslash J|=j}} \frac{\mathbb{I}_{\mathbf{P}_{K}^{\prime r\rangle}}^{G}}{\langle r|}(\pi, \underline{\lambda})$. As in the proof of Corollary 5.10 , we get a spectral sequence

By (5.14), only the 0 -th and $(-1)$-th columns of the $E_{1}$-page of (5.35) can have non-zero terms. The 1-th row is

$$
\begin{array}{ccc}
\overline{\mathcal{E}}_{I}^{1} & \longrightarrow & \overline{\mathcal{E}}_{J}^{1} \\
\| & \longrightarrow \\
\operatorname{Ext}_{G, \omega_{\pi}^{\langle r\rangle} \chi_{\underline{\lambda}}}^{1}\left(i \overline{\mathbf{P}}_{I}^{\langle r\rangle}(\pi, \underline{\lambda}), \mathbb{I}_{\overline{\mathbf{P}}_{I}^{G r\rangle}}^{G}(\pi, \underline{\lambda})\right) & \longrightarrow & \operatorname{Ext}_{G, \omega_{\pi}^{\langle r\rangle} \chi_{\underline{\lambda}}}^{1}\left(i \overline{\mathbf{P}}_{I}^{G r\rangle}(\pi, \underline{\lambda}), \mathbb{I}_{\mathbf{P}_{J}^{\langle r\rangle}}^{G}(\pi, \underline{\lambda})\right) \\
E_{1}^{-1,1} & \xrightarrow{d_{1}^{-1,1}} & E_{1}^{0,1}
\end{array}
$$

The 2-th row is given by

Therefore, by Lemma 5.3, we obtain the following exact sequences

$$
\begin{aligned}
& 0 \rightarrow E_{2}^{0,0} \rightarrow \operatorname{Ext}_{G, \omega_{\pi}^{\langle r\rangle} \chi_{\underline{\lambda}}}^{0}\left(i \overline{\mathbf{P}}_{I}^{\langle r\rangle}(\pi, \underline{\lambda}), v_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}}^{\mathrm{an}}(\pi, \underline{\lambda})\right) \rightarrow \operatorname{ker}\left(\overline{\mathcal{E}}_{I}^{1} \rightarrow \overline{\mathcal{E}}_{J}^{1}\right) \rightarrow 0, \\
& 0 \rightarrow \overline{\mathcal{E}}_{J}^{1} / \overline{\mathcal{E}}_{I}^{1} \rightarrow \operatorname{Ext}_{G, \omega_{\pi}^{\langle r\rangle} \chi_{\underline{\lambda}}}^{1}\left(i \frac{G}{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}(\pi, \underline{\lambda}), v_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}}^{\mathrm{an}}(\pi, \underline{\lambda})\right) \rightarrow \operatorname{ker}\left(\overline{\mathcal{E}}_{I}^{2} \rightarrow \overline{\mathcal{E}}_{J}^{2}\right) \rightarrow 0 .
\end{aligned}
$$

These prove Part (c). Part (b) follows by the same argument.
Remark 5.16. It is difficult to describe the morphisms $\mathcal{E}_{I}^{2} \rightarrow \mathcal{E}_{J}^{2}$ and $\overline{\mathcal{E}}_{I}^{2} \rightarrow \overline{\mathcal{E}}_{J}^{2}$ explicitly. Therefore, we cannot explain the terms $\operatorname{ker}\left(\mathcal{E}_{I}^{2} \rightarrow \mathcal{E}_{J}^{2}\right)$ and $\operatorname{ker}\left(\overline{\mathcal{E}}_{I}^{2} \rightarrow \overline{\mathcal{E}}_{J}^{2}\right)$. Moreover, we will see below that certain subspaces of $\mathcal{E}_{J}^{1} / \varrho_{I, J}\left(\mathcal{E}_{I}^{1}\right)$ or $\overline{\mathcal{E}}_{J}^{1} / \bar{\varrho}_{I, J}\left(\overline{\mathcal{E}}_{I}^{1}\right)$ are easy to control, which are enough for our computation.

By Lemma 5.12 and Lemma 5.6, the injections $\iota_{I}^{1}$ and $\iota_{J}^{1}$ induce a map

$$
\iota_{J, I}^{1}: \operatorname{Hom}\left(\mathbf{Z}_{J}^{\langle r\rangle}(L), E\right) / \operatorname{Hom}\left(\mathbf{Z}_{I}^{\langle r\rangle}(L), E\right) \rightarrow \mathcal{E}_{J}^{1} / \varrho_{I, J}\left(\mathcal{E}_{I}^{1}\right)
$$

Consider the composition:

$$
\begin{equation*}
\varrho_{I, J}^{1}:=\varrho_{I, J}^{0} \circ \iota_{J, I}^{1}: \operatorname{Hom}\left(\mathbf{Z}_{J}^{\langle r\rangle}(L), E\right) / \operatorname{Hom}\left(\mathbf{Z}_{I}^{\langle r\rangle}(L), E\right) \longrightarrow \operatorname{Ext}_{G}^{1}\left(i_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{G}(\pi, \underline{\lambda}), v_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}}^{\mathrm{a}}(\pi, \underline{\lambda})\right) . \tag{5.36}
\end{equation*}
$$

More precisely, let $\psi \in \operatorname{Hom}\left(\mathbf{Z}_{J}^{\langle r\rangle}(L), E\right) / \operatorname{Hom}\left(\mathbf{Z}_{I}^{\langle r\rangle}(L), E\right)$ and let $\Psi$ be a lifting of $\psi$ to $\operatorname{Hom}\left(\mathbf{Z}_{J}^{\langle r\rangle}(L), E\right)$. Then $\varrho_{I, J}^{0}(\psi)=\left[\mathscr{E}_{I}^{J}\left(\pi, \underline{\lambda}, \iota_{J}(\Psi)\right)^{0}\right]$ (it is clear that $\varrho_{I, J}^{0}(\psi)$ is independent of the choice of lifting $\left.\Psi\right)$.

Lemma 5.17. The maps $\iota_{J, I}^{1}$ and $\varrho_{I, J}^{1}$ are injective.
Proof. By Lemma 5.15 (b), it suffices to show that $\iota_{J, I}^{1}$ is injective. By Lemma 5.15 (b), we will view $\operatorname{Hom}\left(\mathbf{Z}_{J}^{\langle r\rangle}(L), E\right), \operatorname{Hom}\left(\mathbf{Z}_{I}^{\langle r\rangle}(L), E\right)$ and $\mathcal{E}_{I}^{1}$ as subspaces of $\mathcal{E}_{J}^{1}$. It suffices to prove that $\operatorname{Hom}\left(\mathbf{Z}_{I}^{\langle r\rangle}(L), E\right)=$
$\varrho_{I, J}\left(\mathcal{E}_{I}^{1}\right) \cap \operatorname{Hom}\left(\mathbf{Z}_{J}^{\langle r\rangle}(L), E\right)$. By the definition of $\varrho_{I, J}$ in (5.29), we have a commutative diagram:

where the morphism $c_{I}^{\prime}$ (resp., $c_{I}^{\prime \prime}$ ) is induced by the natural injection $\mathbf{Z}_{J}^{\langle r\rangle}(L) \hookrightarrow \mathbf{L}_{I}^{\langle r\rangle}(L)$ (resp., $\mathbf{Z}_{I}^{\langle r\rangle}(L) \hookrightarrow$ $\mathbf{Z}_{J}^{\langle r\rangle}(L)$ ) and the morphism $c_{I}$ (resp., $c_{J}$ ) is induced by the natural injection $\mathbf{Z}_{I}^{\langle r\rangle}(L) \hookrightarrow \mathbf{L}_{I}^{\langle r\rangle}(L)$ (resp., $\left.\mathbf{Z}_{J}^{\langle\gamma\rangle}(L) \hookrightarrow \mathbf{L}_{J}^{\langle r\rangle}(L)\right)$. Using the above commutative diagram, we see that if $\Psi \in \varrho_{I, J}\left(\mathcal{E}_{I}^{1}\right) \cap \operatorname{Hom}\left(\mathbf{Z}_{J}^{\langle\gamma\rangle}(L), E\right)$, then $c_{J}\left(\left[\pi_{J}(\Psi)\right]\right)$ comes from an element

$$
\left[\left.\tilde{\pi}_{I}\right|_{\mathbf{Z}_{J}^{(r)}(L)}\right] \in \operatorname{Ext}_{\mathbf{z}_{J}^{\langle\gamma\rangle}(L)}^{1}\left(\left.\pi_{I}\right|_{\mathbf{Z}_{J}^{(r)}(L)},\left.\pi_{I}\right|_{\mathbf{Z}_{J}^{(r)}(L)}\right) .
$$

Let $\Psi^{\prime}:=c_{I}^{\prime \prime}\left(\left[\left.\tilde{\pi}_{I}\right|_{\mathbf{Z}_{J}^{\langle r\rangle}(L)}\right]\right) \in \operatorname{Ext}_{\mathbf{Z}_{I}^{(r\rangle}(L)}^{1}\left(\omega_{\pi_{I}}, \omega_{\pi_{I}}\right)$. By the injectivity of $\varrho_{I, J}$, and the proof of Lemma 5.6, we deduce that $\varrho_{I, J}$ sends $\omega_{\pi_{I}}^{-1} \otimes_{E} \Psi^{\prime} \in \operatorname{Hom}\left(\mathbf{Z}_{I}^{\langle r\rangle}(L), E\right)$ to $\Psi$. This completes the proof.

Consider the exact sequence

$$
0 \longrightarrow u_{\overline{\mathbf{P}}_{I}^{(r)}}^{\infty}(\pi, \underline{\lambda}) \longrightarrow i \frac{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}{G}(\pi, \underline{\lambda}) \longrightarrow v_{\overline{\mathbf{P}}_{I}^{(r)}}^{\infty}(\pi, \underline{\lambda}) \longrightarrow 0,
$$

which induces a long exact sequence

$$
\begin{align*}
& 0 \longrightarrow \operatorname{Hom}_{G}\left(v_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{\infty}(\pi, \underline{\lambda}), v_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}}^{\mathrm{an}}(\pi, \underline{\lambda})\right) \longrightarrow \operatorname{Hom}_{G}\left(i \dot{\overline{\mathbf{P}}}_{I}^{\langle\langle \rangle}(\pi, \underline{\lambda}), v_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}}^{\mathrm{a}}(\pi, \underline{\lambda})\right) \\
& \longrightarrow \operatorname{Hom}_{G}\left(u_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{\infty}(\pi, \underline{\lambda}), v \overline{\overline{\mathbf{P}}}_{j^{(r)}}^{\mathrm{an}}(\pi, \underline{\lambda})\right) \longrightarrow \operatorname{Ext}_{G}^{1}\left(v_{\overline{\mathbf{P}}_{I}^{(r)}}^{\infty}(\pi, \underline{\lambda}), v_{\overline{\mathbf{P}}_{J}^{\left.()^{\prime}\right\rangle}}^{\mathrm{an}}(\pi, \underline{\lambda})\right)  \tag{5.37}\\
& \longrightarrow \operatorname{Ext}_{G}^{1}\left(\frac{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}{G}(\pi, \underline{\lambda}), v_{\overline{\mathbf{P}}_{J}^{(r)}}^{\mathrm{an}}(\pi, \underline{\lambda})\right) \longrightarrow \operatorname{Ext}_{G}^{1}\left(u_{\overline{\mathbf{P}}_{I}^{(r)}}^{\infty}(\pi, \underline{\lambda}), v_{\overline{\mathbf{P}}_{J}^{(r)}}^{\mathrm{an}}(\pi, \underline{\lambda})\right) \text {. }
\end{align*}
$$

Since $\operatorname{Hom}_{G}\left(u_{\left.\overline{\mathbf{P}}_{I}^{(r\rangle}\right\rangle}^{\infty}(\pi, \underline{\lambda}), v_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}}^{\mathrm{a}}(\pi, \underline{\lambda})\right)=0$ (this is a direct consequence of the calculation of Jordan-Hölder factors of locally $\mathbb{Q}_{p}$-analytic generalized parabolic Steinberg representation, see Section 4.4), we get an injection

$$
\begin{equation*}
\operatorname{Ext}_{G}^{1}\left(v_{\overline{\mathbf{F}}_{I}^{\langle r\rangle}}^{\infty}(\pi, \underline{\lambda}), v_{\overline{\mathbf{F}}_{J}^{(r\rangle}}^{\mathrm{an}}(\pi, \underline{\lambda})\right) \hookrightarrow \operatorname{Ext}_{G}^{1}\left(i_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{G}(\pi, \underline{\lambda}), v_{\overline{\mathbf{P}}_{J}^{(r)}}^{\mathrm{an}}(\pi, \underline{\lambda})\right) . \tag{5.38}
\end{equation*}
$$

Proposition 5.18. The injection

$$
\varrho_{I, J}^{1}: \operatorname{Hom}\left(\mathbf{Z}_{J}^{\langle r\rangle}(L), E\right) / \operatorname{Hom}\left(\mathbf{Z}_{I}^{\langle r\rangle}(L), E\right) \longrightarrow \operatorname{Ext}_{G}^{1}\left(i_{\mathbf{P}_{I}^{r r\rangle}}^{G}(\pi, \underline{\lambda}), v_{\overline{\mathbf{P}}_{J}^{(r\rangle}}^{\text {an }}(\pi, \underline{\lambda})\right)
$$

factors through the injection (5.38). We put

$$
\begin{equation*}
\varrho_{I, J}^{\sharp}: \operatorname{Hom}\left(\mathbf{Z}_{J}^{\langle r\rangle}(L), E\right) / \operatorname{Hom}\left(\mathbf{Z}_{I}^{\langle r\rangle}(L), E\right) \longrightarrow \operatorname{Ext}_{G}^{1}\left(v_{\overline{\mathbf{F}}_{I}^{\langle r\rangle}}^{\infty}(\pi, \underline{\lambda}), v_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}}^{\mathrm{an}}(\pi, \underline{\lambda})\right) \tag{5.39}
\end{equation*}
$$

the resulting homomorphism.

Proof. Let $\widetilde{w}_{\overline{\mathbf{P}}_{I}^{(r)}}^{\infty}(\pi, \underline{\lambda})$ be the kernel of the surjection $\bigoplus_{q r \in \Delta_{n}(k) \backslash I} i \frac{\overline{\mathbf{P}}_{I \cup\{q r\}}^{(r)}}{i}(\pi, \underline{\lambda}) \rightarrow u_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{\infty}(\pi, \underline{\lambda})$. We then consider the exact sequence

$$
0 \rightarrow \widetilde{w}_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{\infty}(\pi, \underline{\lambda}) \rightarrow \bigoplus_{q r \in \Delta_{n}(k)} i \frac{\overline{\mathbf{P}}_{I \cup\{q r\}}^{\langle r\rangle}}{(\pi, \underline{\lambda}) \rightarrow u_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{\infty}(\pi, \underline{\lambda}) \rightarrow 0 . . . .}
$$

Since $\operatorname{Hom}_{G}\left(\widetilde{w}_{\overline{\mathbf{P}}_{I}^{(r)}}^{\infty}(\pi, \underline{\lambda}), v_{\overline{\mathbf{P}}_{J}^{\left\langle{ }^{(r\rangle}\right.}}^{\mathrm{an}}(\pi, \underline{\lambda})\right)=0$, we deduce from the long exact sequence of extension groups that the natural map

$$
\begin{equation*}
\operatorname{Ext}_{G}^{1}\left(u_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{\infty}(\pi, \underline{\lambda}), v_{\overline{\mathbf{P}}_{J}^{(r)}}^{\text {an }}(\pi, \underline{\lambda})\right) \hookrightarrow \bigoplus_{q r \in \Delta_{n}(k) \backslash I} \operatorname{Ext}_{G}^{1}\left(i \overline{\overline{\mathbf{P}}}_{I \backslash \backslash q\}\}}^{G}(\pi, \underline{\lambda}), v_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}}^{\text {an }}(\pi, \underline{\lambda})\right) \tag{5.40}
\end{equation*}
$$

is injective. For $\Psi \in \operatorname{Hom}\left(\mathbf{Z}_{J}^{\langle r\rangle}(L), E\right)$, the long exact sequence (5.37) implies that $\left[\mathscr{E}_{I}^{J}(\pi, \underline{\lambda}, \Psi)^{0}\right]$ falls into $\operatorname{Ext}_{G}^{1}\left(v_{\overline{\mathbf{P}}_{I}^{\langle\gamma\rangle}}^{\infty}(\pi, \underline{\lambda}), v_{\overline{\mathbf{P}}_{J}^{\langle\gamma\rangle}}^{\text {an }}(\pi, \underline{\lambda})\right)$ if and only if its image in $\operatorname{Ext}_{G}^{1}\left(u_{\overline{\mathbf{P}}_{I}^{\langle\gamma\rangle}}^{\infty}(\pi, \underline{\lambda}), v_{\overline{\mathbf{P}}_{J}^{\langle \rangle\rangle}}^{\text {an }}(\pi, \underline{\lambda})\right)$ is trivial. Therefore, by the long exact sequence (5.37) and the injection (5.40), it suffices to prove that the image of any
 trivial. Note that the natural inclusion induces an isomorphism

$$
\operatorname{Hom}\left(\mathbf{Z}_{J \cup\{q r\}}^{\langle \rangle}(L), E\right) / \operatorname{Hom}\left(\mathbf{Z}_{I \cup\{q r\}}^{\langle r\rangle}(L), E\right) \xrightarrow{\sim} \operatorname{Hom}\left(\mathbf{Z}_{J}^{\langle r\rangle}(L), E\right) / \operatorname{Hom}\left(\mathbf{Z}_{I}^{\langle r\rangle}(L), E\right),
$$

we can choose an element $\Psi_{q r} \in \operatorname{Hom}\left(\mathbf{Z}_{J \cup\{q r\}}^{\langle r\rangle}(L), E\right)$ such that its image $\Psi_{q r}$ in the group

$$
\operatorname{Hom}\left(\mathbf{Z}_{J}^{\langle \rangle\rangle}(L), E\right) / \operatorname{Hom}\left(\mathbf{Z}_{I}^{\langle r\rangle}(L), E\right)
$$

agrees with $\bar{\Psi}$. Then the extension class $\left[\mathscr{E}_{I}^{J}\left(\pi, \underline{\lambda}, \Psi_{q r}\right)^{0}\right]$ agrees with $\left[\mathscr{E}_{I}^{J}(\pi, \underline{\lambda}, \Psi)^{0}\right]$ by (5.36). The pullback of $\left[\mathscr{E}_{I}^{J}\left(\pi, \underline{\lambda}, \Psi_{q r}\right)^{0}\right]$ along the inclusion $i \overline{\mathbf{P}}_{I \cup\{q r\}}^{(i r)}(\pi, \underline{\lambda}) \hookrightarrow i i_{\overline{\mathbf{P}}_{I}^{(r\rangle}}^{G}(\pi, \underline{\lambda})$ is equal to the pullback of $\left[\mathscr{E}_{J \cup\{q r\}}^{J}\left(\pi, \underline{\lambda}, \Psi_{q r}\right)^{0}\right]$ along the inclusion $i{\underset{\mathbf{F}}{I \cup\{q r\}}}_{(\langle r)}^{G}(\pi, \underline{\lambda}) \hookrightarrow i \dot{\mathbf{P}}_{J \cup\{q r\}}^{G\langle \rangle}(\pi, \underline{\lambda})$. But the latter extension is split by the discussion before (5.33). This completes the proof.

We are ready to prove the first main theorem.
Theorem 5.19. Let ir $\in \Delta_{n}(k)$, we have isomorphisms of $E$-vector spaces

$$
\operatorname{Hom}\left(\mathbf{Z}_{\Delta_{k, i}}^{\langle r\rangle}(L) / \mathbf{Z}_{n}, E\right) \xrightarrow{\sim} \operatorname{Ext}_{G, \omega_{\pi}^{\langle r\rangle} \chi_{\underline{\chi}}}^{1}\left(v_{\overline{\mathbf{P}}_{i r}^{(r)}}^{\infty}(\pi, \underline{\lambda}), \operatorname{St}_{(r, k)}^{\mathrm{an}}(\underline{\lambda})\right) \xrightarrow{\sim} \operatorname{Ext}_{G}^{1}\left(v_{\overline{\mathbf{F}}_{i r}^{(r)}}^{\infty}(\pi, \underline{\lambda}), \mathrm{St}_{(r, k)}^{\mathrm{ar}}(\pi, \underline{\lambda})\right) .
$$

In particular, we have $\operatorname{dim}_{E} \operatorname{Ext}_{G}^{1}\left(v_{\overline{\mathbf{P}}_{I}^{(r)}}^{\infty}(\pi, \underline{\lambda}), \operatorname{St}_{(r, k)}^{\mathrm{an}}(\pi, \underline{\lambda})\right)=d_{L}+1$. Furthermore, the homomorphism

$$
\begin{equation*}
\varrho_{\{i r\}, \emptyset}^{\sharp}: \operatorname{Hom}\left(\mathbf{Z}^{\langle r\rangle}(L), E\right) / \operatorname{Hom}\left(\mathbf{Z}_{i r}^{\langle r\rangle}(L), E\right) \longrightarrow \operatorname{Ext}_{G}^{1}\left(v_{\overline{\mathbf{F}}_{i r}^{\langle r}}^{\infty}(\pi, \underline{\lambda}), \operatorname{St}_{(r, k)}^{\mathrm{an}}(\pi, \underline{\lambda})\right) \tag{5.41}
\end{equation*}
$$

is an isomorphism.
Proof. Since $\operatorname{Hom}_{G}\left(v_{\overline{\mathbf{P}}_{i r}^{(r)}}^{\infty}(\pi, \underline{\lambda}), \operatorname{St}_{(r, k)}^{\text {an }}(\pi, \underline{\lambda})\right)=0$, the second isomorphism follows from [9, Lemma 3.1] or [31, Lemma 3.2]. We apply the exact sequence in Proposition 4.4,

$$
\begin{equation*}
0 \rightarrow C_{\emptyset, k-1}^{\mathrm{an}} \rightarrow C_{\emptyset, k-2}^{\mathrm{an}} \rightarrow C_{\emptyset, k-3}^{\mathrm{an}} \rightarrow \cdots \rightarrow C_{\emptyset, 1}^{\mathrm{an}} \rightarrow C_{\emptyset, 0}^{\mathrm{an}}=\mathbb{I} \frac{G}{\mathbf{P}}(\pi, \underline{\lambda}) \tag{5.42}
\end{equation*}
$$

to the locally analytic representation $\operatorname{St}_{(r, k)}^{\mathrm{an}}(\pi, \underline{\lambda})$. As in the proof of Corollary 5.10 , we deduce a spectral sequence

$$
\begin{equation*}
E_{1}^{-s, r}=\bigoplus_{\substack{K \subseteq \Delta_{n}(k) \\|K|=s}} \operatorname{Ext}_{G, \omega_{\pi}^{\langle r\rangle} \chi_{\underline{\boldsymbol{\lambda}}}}^{r}\left(v_{\mathbf{F}_{i r}^{(r)}}^{\infty}(\pi, \underline{\lambda}), \mathbb{I}_{\mathbf{P}_{K}^{(r\rangle}}^{(r)}(\pi, \underline{\lambda})\right) \Rightarrow \operatorname{Ext}_{G, \omega_{\pi}^{\langle r\rangle} \chi_{\underline{\boldsymbol{u}}}^{r-s}}\left(v_{\overline{\mathbf{F}}_{i r}^{\langle r\rangle}}^{\infty}(\pi, \underline{\lambda}), \mathrm{St}_{(r, k)}^{\mathrm{ar}}(\pi, \underline{\lambda})\right) \tag{5.43}
\end{equation*}
$$

By Proposition 5.10, Lemma 5.7, only the objects in the $(1-k)$-th and $(2-k)$-th columns of the $E_{1}$-page can be non-zero, where the $(k-1)$-th row is given by

$$
\begin{array}{ccc}
\mathrm{H}_{\mathrm{an}}^{1}\left(\mathbf{L}_{\Delta_{n}(k)}^{\langle r\rangle}(L) / Z_{n}, E\right) & \longrightarrow & \operatorname{Hom}\left(\mathbf{Z}_{\Delta_{k, i}}^{\langle r\rangle}(L) / Z_{n}, E\right) \\
\| & \xrightarrow{\longrightarrow} \\
E_{1}^{1-k, k-1} & \xrightarrow[1]{d_{1}^{1-k, k-1}} & E_{1}^{2-k, k-1}
\end{array}
$$

and the $k$-th row is given by

$$
\begin{array}{ccc}
\mathrm{H}_{\mathrm{an}}^{2}\left(\mathbf{L}_{\Delta_{n}(k)}^{\langle r\rangle}(L) / Z_{n}, E\right) & \longrightarrow & \overline{\mathcal{E}}_{\Delta_{k, i}}^{2} \\
\| & & \| \\
E_{1}^{1-k, k} & \xrightarrow{d_{1}^{1-k, k}} & E_{1}^{2-k, k}
\end{array}
$$

Since $\mathfrak{s l}_{n, \Sigma_{L}}$ is semisimple, $\mathrm{H}_{\mathrm{an}}^{i}\left(\mathbf{L}_{\Delta_{n}(k)}^{\langle r\rangle}(L) / Z_{n}, E\right) \cong \mathrm{H}^{i}\left(\mathfrak{s l} l_{n, \Sigma_{L}}, E\right)=0$ for $i=1,2$. By Lemma 5.3, we deduce

$$
E_{2}^{2-k, k-1}=E_{\infty}^{2-k, k-1}=F^{k-1} H^{1} / F^{k} H^{1}=\operatorname{Ext}_{G, \omega_{\pi}^{\langle r\rangle} \chi_{\underline{\lambda}}}^{1}\left(v_{\overline{\mathbf{P}}_{i r}^{\langle r\rangle}}^{\infty}(\pi, \underline{\lambda}), \operatorname{St}_{(r, k)}^{\mathrm{an}}(\pi, \underline{\lambda})\right) .
$$

The first isomorphism follows. Note that we also have an isomorphism

$$
\operatorname{Hom}\left(L^{\times}, E\right) \xrightarrow{\sim} \operatorname{Hom}\left(\mathbf{Z}_{\Delta_{k, i}}^{\langle r\rangle}(L) / Z_{n}, E\right),
$$

which is an $E$-vector space of dimension $d_{L}+1$. At last, by applying Proposition 5.18 to the case $J=\emptyset$ and $I=\{i r\}$, we get an injection $\varrho_{\{i r\}, \emptyset}^{\sharp}$, which in fact is an isomorphism since both of these two $E$-vector spaces are $d_{L}+1$-dimensional by Proposition 5.19. This completes the proof.

Remark 5.20. when $J=\emptyset$ and $I=\{i r\}$, we have an isomorphism

$$
\begin{align*}
\iota_{i r}: \operatorname{Hom}\left(L^{\times}, E\right) & \xrightarrow{\sim} \operatorname{Hom}\left(\mathbf{Z}^{\langle r\rangle}(L), E\right) / \operatorname{Hom}\left(\mathbf{Z}_{i r}^{\langle r\rangle}(L), E\right),  \tag{5.44}\\
\psi & \mapsto\left[\left(a_{1} I_{r}, \cdots, a_{k} I_{r}\right) \mapsto \psi\left(a_{i} / a_{i+1}\right)\right],
\end{align*}
$$

Then the composition $\varrho_{\{i r\}, \emptyset}^{\sharp} \circ \iota_{i r}$ gives the desired isomorphism

$$
\begin{equation*}
\operatorname{Hom}\left(L^{\times}, E\right) \longrightarrow \operatorname{Ext}_{G}^{1}\left(v_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{G}(\pi, \underline{\lambda}), v_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}}^{\mathrm{an}}(\pi, \underline{\lambda})\right) \tag{5.45}
\end{equation*}
$$

Remark 5.21. We describe explicitly the isomorphism $\varrho_{\{i r\}, \emptyset}^{1}$ in Theorem 5.19. For $\psi \in \operatorname{Hom}\left(L^{\times}, E\right)$,
 Theorem 5.19, we see that the injection (5.38)

$$
\operatorname{Ext}_{G}^{1}\left(v_{\overline{\mathbf{P}}_{i r}^{\langle r\rangle}}^{\infty}\left(\pi, \underline{\lambda}, \operatorname{St}_{(r, k)}^{\mathrm{an}}(\pi, \underline{\lambda})\right) \hookrightarrow \operatorname{Ext}_{G}^{1}\left(i_{\overline{\mathbf{P}}_{i r}^{\langle r\rangle}}^{G}(\pi, \underline{\lambda}), \operatorname{St}_{(r, k)}^{\mathrm{an}}(\pi, \underline{\lambda})\right)\right.
$$

is actually an isomorphism. Then the pull back of $\mathscr{E}_{\{i r\}}^{\emptyset}\left(\pi, \underline{\lambda}, \iota_{\nu}(\psi)\right)^{0}$ via the natural injection $u_{\overline{\mathbf{P}}_{i r}^{\langle r\rangle}}^{\infty}(\pi, \underline{\lambda}) \rightarrow$ $i \underset{\mathbf{P}_{i r}^{\langle r\rangle}}{G}(\pi, \underline{\lambda})$ is split (as an extension of $u_{\overline{\mathbf{P}}_{i r}^{\langle r\rangle}}^{\infty}(\pi, \underline{\lambda})$ by $\mathrm{St}_{(r, k)}^{\mathrm{an}}(\pi, \underline{\lambda})$ ). Quotient it by $u_{\overline{\mathbf{P}}_{i r}^{\langle r\rangle}}^{\infty}(\pi, \underline{\lambda})$, we deduce $\widetilde{\Sigma}_{i}^{\langle r\rangle}(\pi, \underline{\lambda}, \psi)$, which is an extension of $v_{\overline{\mathbf{P}}_{i r}^{\langle r\rangle}}^{\infty}(\pi, \underline{\lambda})$ by $\mathrm{St}_{(r, k)}^{\mathrm{an}}(\pi, \underline{\lambda})$. We therefore get that $\left[\widetilde{\Sigma}_{i}^{\langle r\rangle}(\pi, \underline{\lambda}, \psi)\right]$ is the extension class associated with $\psi$ via $\varrho_{\{i r\}, \emptyset}$. Note that $\widetilde{\Sigma}_{i}^{\langle r\rangle}(\pi, \underline{\lambda}, \psi)$ comes from a locally algebraic extension of $v_{\overline{\mathbf{P}}_{i r}^{(r\rangle}}^{G}(\pi, \underline{\lambda})$ by $\mathrm{St}_{(r, k)}^{\infty}(\underline{\lambda})$ if and only if $\psi \in \operatorname{Hom}_{\infty}\left(L^{\times}, E\right)$.

Remark 5.22. A modification of the recent work of Zicheng Qian [32] may give a way to compute the higher Ext-groups $\operatorname{Ext}_{G}^{i}\left(v_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{\mathrm{an}}(\pi, \underline{\lambda}), v_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}}^{\mathrm{an}}(\pi, \underline{\lambda})\right)$ for general $J \subseteq I \subseteq \Delta_{n}(k)$.

### 5.5 Extensions between locally analytic representations-II

This section follows along the line of $\left[15\right.$, Section 2.3]. Let $\underline{\lambda} \in X_{\Delta_{n}}^{+}$, and let $I \subseteq \Delta_{n}(k)$. Recall the locally $\mathbb{Q}_{p}$-analytic (resp., locally $\mathbb{Q}_{p}$-algebraic, resp., smooth) generalized Steinberg representations $\mathrm{St}_{I}^{\text {an }}(\pi, \underline{\lambda})$ (resp., $\mathrm{St}_{I}^{\infty}(\pi, \underline{\lambda})$, resp., $\left.\mathrm{St}_{I}^{\infty}(\pi)\right)$ of $\mathbf{L}_{I}^{\langle r\rangle}(L)$ defined in Definition 4.1 (resp., Definition 3.7). In this section, we study certain subrepresentations of $\operatorname{St}_{(r, k)}^{\text {an }}(\pi, \underline{\lambda})$, and compute the extensions of $v_{\overline{\mathbf{P}}_{i r}^{\langle r\rangle}}^{\infty}(\pi, \underline{\lambda})$ by such representations. These subrepresentations have more clear structure than $\mathrm{St}_{(r, k)}^{\mathrm{an}}(\pi, \underline{\lambda})$.

By the transitivity of parabolic inductions, we have isomorphisms

$$
\begin{aligned}
& \left(\operatorname{Ind}_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}(L)}^{G} \mathrm{St}_{I}^{\infty}(\pi)\right)^{\infty} \otimes_{E} L(\underline{\lambda})=i \overline{\mathbf{P}}^{G r\rangle}(\pi, \underline{\lambda}) / \sum_{\emptyset \neq J \subseteq I} i \overline{\mathbf{P}}_{J}^{G}(\pi, \underline{\lambda}), \\
& \left(\operatorname{Ind}_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}(L)}^{G} \mathrm{St}_{I}^{\mathrm{an}}(\pi, \underline{\lambda})\right)^{\mathbb{Q}_{p}-\mathrm{an}}=\mathbb{I}_{\overline{\mathbf{P}}^{\langle r\rangle}}^{G}(\pi, \underline{\lambda}) / \sum_{\emptyset \neq J \subseteq I} \mathbb{I}_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}}(\pi, \underline{\lambda}) .
\end{aligned}
$$

Consider the following composition

$$
\begin{equation*}
\tau_{I}:\left(\operatorname{Ind}_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}(L)}^{G} \mathrm{St}_{I}^{\infty}(\pi, \underline{\lambda})\right)^{\mathbb{Q}_{p}-\mathrm{an}} \longleftrightarrow\left(\operatorname{Ind}_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}(L)}^{G} \operatorname{St}_{I}^{\mathrm{an}}(\pi, \underline{\lambda})\right)^{\mathbb{Q}_{p}-\mathrm{an}} \longrightarrow \mathrm{St}_{(r, k)}^{\mathrm{an}}(\pi, \underline{\lambda}) \tag{5.46}
\end{equation*}
$$

Let $\widetilde{\Sigma}_{\Delta_{n}(k) \backslash I}^{\langle r\rangle}(\pi, \underline{\lambda})$ be its image. When $I=\Delta_{k, i}$, we denote $\widetilde{\Sigma}_{i}^{\langle r\rangle}(\pi, \underline{\lambda}):=\widetilde{\Sigma}_{\{i r\}}^{\langle r\rangle}(\pi, \underline{\lambda})$.
Lemma 5.23. Let ir $\in \Delta_{n}(k)$. We have the following commutative diagram with all the rows exact,

Proof. By [30, Theorem], the locally $\mathbb{Q}_{p}$-algebraic subrepresentation of

$$
\left(\operatorname{Ind}_{\overline{\mathbf{P}}_{\Delta_{k, i}}^{\langle r\rangle}(L)} \mathrm{St}_{\Delta_{k, i}}^{\infty}(\pi, \underline{\lambda})\right)^{\mathbb{Q}_{p}-\mathrm{an}} \cong \mathcal{F}_{\overline{\mathbf{P}}^{\langle r\rangle}(L)}^{G}\left(\bar{M}^{\langle r\rangle}(-\underline{\lambda}), \pi^{\langle r\rangle}\right)
$$

is $\left(\operatorname{Ind}_{\overline{\mathbf{P}}_{\Delta_{k, i}}^{\langle r\rangle}(L)} \mathrm{St}_{\Delta_{k, i}}^{\infty}(\pi)\right)^{\infty} \otimes_{E} L(\underline{\lambda})$. By (3.14) and (3.15), this locally $\mathbb{Q}_{p}$-algebraic subrepresentation is an extension of $\operatorname{St}_{(r, k)}^{\infty}(\pi, \underline{\lambda})$ by $v_{\overline{\mathbf{P}}_{i r}^{\langle r\rangle}}^{\infty}(\pi, \underline{\lambda})$. The first row is exact. In a similar way, we deduce from (4.9) the exactness of the third row. It remains to prove that the second row is exact. By the exactness of the first row, we see that the composition $\tau_{i r}$ factors through

$$
\begin{equation*}
\tau_{i r}^{\prime}:\left(\operatorname{Ind}_{\overline{\mathbf{P}}_{\Delta_{k, i}}^{G r\rangle}(L)}^{G} \mathrm{St}_{\Delta_{k, i}}^{\infty}(\pi, \underline{\lambda})\right)^{\mathbb{Q}_{p}-\mathrm{an}} / v_{\overline{\mathbf{P}}_{i r}^{\langle r\rangle}}^{\infty}(\pi, \underline{\lambda}) \longrightarrow \operatorname{St}_{(r, k)}^{\mathrm{an}}(\pi, \underline{\lambda}) . \tag{5.47}
\end{equation*}
$$

It suffices to show that $\tau_{i r}^{\prime}$ is still injective. The restriction of $\tau_{i r}^{\prime}$ on its locally $\mathbb{Q}_{p}$-algebraic vectors is injective. Suppose that $\tau_{i r}^{\prime}$ is not injective. Let $V$ be an irreducible constituent of $\operatorname{ker}\left(\tau_{i r}^{\prime}\right)$, then $V$ has the form (since $V$ is not locally algebraic)

$$
\begin{equation*}
\mathcal{F}_{\overline{\mathbf{P}}_{\Delta_{k, i}}^{\langle r\rangle}(L)}^{G}\left(\bar{L}(-s \cdot \underline{\lambda}), \mathrm{St}_{\Delta_{k, i}}^{\infty}(\pi)\right), \tag{5.48}
\end{equation*}
$$

with $s \cdot \underline{\lambda} \in X_{\Delta_{n}^{k} \cup \Delta_{k, i}}^{+}$. Note that the kernel of (5.47) is also a subquotient of $\sum_{\emptyset \neq I \subseteq \Delta_{n}(k)} \frac{\mathbb{I}}{\underline{\mathbf{P}}}{ }_{I}^{\langle r\rangle}(\pi, \underline{\lambda})$, so $V$ is an irreducible constituent of

$$
\mathbb{I}_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{G}(\pi, \underline{\lambda}) \cong \mathcal{F}_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}(L)}^{G}\left(\bar{M}_{I}^{\langle r\rangle}(-\underline{\lambda}), \pi_{I}\right)
$$

for some $\emptyset \neq I \subseteq \Delta_{n}(k)$. If (5.48) appears as an irreducible subquotient of $\frac{\mathbb{P}_{\overline{\mathbf{P}}}^{I}}{\langle r\rangle}(\pi, \underline{\lambda})$, then we see that $I$ is a subset of $\Delta_{k, i}$ and $\mathrm{St}_{\Delta_{k, i}}^{\infty}(\pi)$ is also an irreducible subquotient of $i_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}(L) \cap \mathbf{L}_{\Delta_{k, i}}^{\langle r\rangle}(L)}^{\mathbf{L}_{\Delta_{k}}^{\langle \rangle}(L)} \pi_{I}$ by [30, Theorem]. This is impossible by the definition of $\mathrm{St}_{\Delta_{k, i}}^{\infty}(\pi)$. The result follows.
Lemma 5.24. The injections $\widetilde{\Sigma}_{i}^{\langle r\rangle}(\pi, \underline{\lambda}) \hookrightarrow \operatorname{St}_{(r, k)}^{\mathrm{an}}(\pi, \underline{\lambda})$ for all ir $\in \Delta_{n}(k)$ induce an injection of $G$ representations:

$$
\widetilde{\Sigma}^{\langle r\rangle}(\pi, \underline{\lambda}):=\bigoplus_{\operatorname{St}_{(r, k)}^{\infty}(\pi, \underline{\lambda})}^{i \in \Delta_{n}(k)} \widetilde{\Sigma}_{i}^{\langle r\rangle}(\pi, \underline{\lambda}) \longleftrightarrow \operatorname{St}_{(r, k)}^{\mathrm{an}}(\pi, \underline{\lambda})
$$

Proof. It suffices to prove that any irreducible constituent of $\widetilde{\Sigma}_{i}^{\langle r\rangle}(\pi, \underline{\lambda})$ that is not locally algebraic, i.e., is of the form

$$
\mathcal{V}=\mathcal{F}_{\overline{\mathbf{P}}_{\Delta_{k, i}}^{\langle r\rangle}}^{G}\left(\bar{L}(-s \cdot \underline{\lambda}), \mathrm{St}_{\Delta_{k, i}}^{\infty}(\pi)\right)
$$

with $s \cdot \underline{\lambda} \in X_{\Delta_{n}^{k} \cup \Delta_{k, i}}^{+}$, cannot appear as an irreducible constituent of $\widetilde{\Sigma}_{j}^{\langle r\rangle}(\pi, \underline{\lambda})$ for $j \neq i$. This is a direct consequence of [8, Corollary 2.7]. The lemma follows.

We next compute the socle of $\widetilde{\Sigma}_{i}^{\langle r\rangle}(\pi, \underline{\lambda})$, by modifying the proof of [15, Proposition 2.23$]$ to our case, but we need some preliminaries.

In our case, the very strongly admissibility of locally $\mathbb{Q}_{p}$-algebraic parabolic generalized Steinberg representation cannot be deduced directly from the strategy of the proof of [15, Proposition 2.23]. We prove it by using global methods (more precisely, the Emerton's completed cohomology).

Lemma 5.25. The locally $\mathbb{Q}_{p}$-algebraic parabolic generalized Steinberg representations $\mathrm{St}_{I}^{\infty}(\pi)$ of $\mathbf{L}_{I}^{\langle r\rangle}(L)$ is very strongly admissible.

Proof.
Step 1. We write $\mathbf{L}_{I}^{\langle r\rangle}(L)=\mathrm{GL}_{k_{1} r}(L) \times \cdots \times \mathrm{GL}_{k_{l} r}(L)$, where $\underline{k}_{I}^{\langle r\rangle}:=\left(k_{1}, \cdots, k_{k-|I|}\right)$ is the ordered partition of integer $k$ associated with the $\mathbf{L}_{I}^{\langle r\rangle}(L)$. We thus have an isomorphism $\operatorname{St}_{I}^{\infty}(\pi, \underline{\lambda}) \cong V_{1} \otimes_{E} \cdots \otimes_{E} V_{l}$ of smooth representations of $\mathbf{L}_{I}^{\langle r\rangle}(L)$, where $V_{i}$ is also a locally algebraic parabolic Steinberg representation of $\mathrm{GL}_{k_{i} r}(L)$ for each $1 \leq i \leq l$. By definition, it suffices to show that there is a continuous $G$-equivariant $E$-linear injection $\mathrm{St}_{I}^{\infty}(\pi) \rightarrow W$, where $W$ is an admissible continuous representation of $\mathbf{L}_{I}^{\langle r\rangle}(L)$ on an $E$-Banach space (see [19, Proposition-Definition 6.2.3] for admissible continuous representation). By [10, Lemma A.3], it suffices to prove that each $V_{i}$ (as a smooth representation of $\mathrm{GL}_{k_{i} r}(L)$ over $E$ ) is very strongly admissible. Therefore, we can assume that $I=\Delta_{n}(k)$. Fix an isomorphism $\iota: \overline{\mathbb{Q}}_{p} \xrightarrow{\sim} \mathbb{C}$. In this case, by the discussion after [41, Definition 3], $\mathrm{St}_{I}^{\infty}(\pi)$ is an irreducible essentially discrete series representation of $G$ over $E$, in the terminology of [41, Definition 3], i.e., $\iota\left(\mathrm{St}_{I}^{\infty}(\pi)\right)$ is an irreducible essentially discrete series representation of $G$ over $\iota(E) \subset \mathbb{C}$. By definition, there exists a smooth character $\eta: G \rightarrow E^{\times}$(by enlarging $E$ if necessary), such that $\iota\left(\operatorname{St}_{(r, k)}^{\infty}(\pi) \otimes_{E} \eta\right)$ is (unitary) discrete series representation of $G$ over $\iota(E) \subset \mathbb{C}$. Put $\mathcal{W}:=\operatorname{St}_{(r, k)}^{\infty}(\pi) \otimes_{E} \eta$. Let $\omega_{\mathcal{W}}$ be the central character of $\mathcal{W}$.
Step 2. We remark first that there exists a number field $F$, a finite place $w$ of $F$ satisfying the completion $F_{w}$ of $F$ at $w$ is isomorphic to our local field $L$. Let $D$ be a division algebra of dimension $n^{2}$ and center over $F$. Suppose that $D$ is ramified at a set $S_{D}$ of places disjoint from $w$. Let $S_{\infty}$ be the set of infinite places of $F$, we further suppose that $D$ is ramified at the set $S_{\infty}$. Let $\mathbb{G}_{D, \mathbb{Q}}=\operatorname{Res}_{F / \mathbb{Q}} D^{\times}$be the scalar restriction of the algebraic group associated to the division algebra $D$. Then $\mathbb{G}_{D, \mathbb{Q}}^{\text {ad }}$ is a semisimple anisotropic $\mathbb{Q}$-group. By
[41, Corollary 3, Lemma 4], we see that there is a classical algebraic automorphic representation $\Pi$ of $\mathbb{G}_{D, \mathbb{Q}}^{\text {ad }}$ such that the local factor $\Pi_{w} \cong \iota\left(\mathcal{W} \otimes_{E} \omega_{\mathcal{W}}^{-1}\right)$ and $\Pi_{\infty}=1$ (trivial algebraic representation). In [41], this result is proved by a simplified form of the Selberg trace formula. By enlarging $E$ if necessary, we may realize $\iota^{-1}(\Pi)$ over $E$.
Step 3. Let $W$ be a finite-dimensional algebraic representation of $\mathbb{G}_{D, \mathbb{Q}}^{\text {ad }}$ over $E$, and $K^{w} \subset \mathbb{G}_{D, \mathbb{Q}}^{\text {ad }}\left(\mathbb{A}_{f}^{w}\right)$ be a tame level such that $\left(\Pi^{w}\right)^{K^{w}} \neq 0$. Let $W_{0}$ be an $\mathcal{O}_{E}$-lattice of $W$, and denote by $\mathcal{S}_{W_{0}}$ the set (ordered by inclusions) of open compact subgroups of $\mathbb{G}_{D, \mathbb{Q}}^{\text {ad }}\left(\mathbb{A}_{f}^{w}\right)\left(\mathbb{Q}_{p}\right) \cong \mathrm{PGL}_{n}\left(F_{w}\right)$ which stabilize $W_{0}$. Then we can associate to $W_{0}$ (resp., $W_{0} / \varpi_{E}^{s}$ ) a local system $\mathcal{V}_{W_{0}}$ (resp., $\mathcal{V}_{W_{0} / \varpi_{E}^{s}}$ ) of $\mathcal{O}_{E}$-modules over $Y_{K_{w} K^{w}}:=$ $\mathbb{G}_{D, \mathbb{Q}}^{\mathrm{ad}}(\mathbb{Q}) \backslash \mathbb{G}_{D, \mathbb{Q}}^{\mathrm{ad}}(\mathbb{A}) / A_{\infty}^{\circ} K_{\infty}^{\circ} K_{w} K^{w}$. We recall that the Emerton's completed cohomology (see [16])

$$
\widetilde{H}^{i}\left(K^{w}, W_{0}\right):={\underset{s}{s}}_{\lim _{K_{w} \in \mathcal{S}}}^{\lim _{W_{0}}} H^{i}\left(Y_{K_{w} K^{w}}, \mathcal{V}_{W_{0} / \varpi_{E}^{s}}\right) .
$$

Then $\widetilde{H}^{i}\left(K^{\mathfrak{p}}, W_{0}\right)_{E}:=\widetilde{H}^{i}\left(K^{\mathfrak{p}}, W_{0}\right) \otimes_{\mathcal{O}_{E}} E$ gives an admissible Banach representation of $\mathbb{G}_{D}^{\text {ad }}\left(F_{w}\right)=$ $\mathrm{PGL}_{n}\left(F_{w}\right)$ over $E$. Let $\widehat{\Pi}$ be the classical $p$-adic automorphic representation of $\mathbb{G}_{D, \mathbb{Q}}^{\text {ad }}\left(\mathbf{A}_{f}\right)$ over $E$ attached to the automorphic form $\iota^{-1}(\Pi)$ constructed in Step 2 (see [16, Definition 3.1.5]), then we have an injection

$$
\left(W^{\vee} \otimes \Pi_{w}\right) \otimes\left(\Pi^{w}\right)^{K^{w}} \hookrightarrow \widetilde{H}^{0}\left(K^{w}, W\right)
$$

by [16, Corollary 2.2.25, Proposition 3.2.2]. A choice of non-zero vector $v \in\left(\Pi^{w}\right)^{K^{w}}$ then gives rise to an injection $\mathcal{W} \otimes_{E} \omega_{\mathcal{W}}^{-1}=W^{\vee} \otimes \Pi_{w} \hookrightarrow \widetilde{H}^{0}\left(K^{w}, W\right)$ of representation of $\mathrm{PGL}_{n}\left(F_{w}\right)=\mathrm{PGL}_{n}(L)$ over $E$. We finish the proof by twisting the character $\eta^{-1} \omega_{\mathcal{W}}$.

The socle of $\widetilde{\Sigma}_{i}^{\langle r\rangle}(\pi, \underline{\lambda})$ is given by the following proposition.
Proposition 5.26. We have $\operatorname{soc}_{G}\left(\widetilde{\Sigma}_{i}^{\langle r\rangle}(\pi, \underline{\lambda})\right) \cong \operatorname{St}_{(r, k)}^{\infty}(\pi, \underline{\lambda})$.
Proof. We have

$$
\begin{align*}
& \operatorname{soc}_{G}\left(\operatorname{Ind} \overline{\mathbf{P}}_{\Delta_{k, i}}^{G}(L)\right. \\
\cong & \left.\operatorname{Soc}_{G} \mathcal{F}_{\overline{\mathbf{P}}_{k, i}}^{G}(\pi, \underline{\lambda})\right)^{\mathbb{Q}_{p}-\mathrm{an}} \\
& \operatorname{soc}_{G}\left(\bar{L}_{k, i}^{G}(-\underline{\lambda}), \operatorname{St}_{\Delta_{k, i}}^{\infty}(\pi)\right) \cong(\pi, \underline{\lambda}) / \sum_{\emptyset \neq J \subseteq \Delta_{k, i}} i \overline{\mathcal{P}}_{G}^{G}\left(\bar{L}(-\underline{\lambda}), \operatorname{soc}_{G}\left(i i_{\overline{\mathbf{P}}_{\Delta_{k, i}}^{G r\rangle}}^{G}(\pi)\right.\right.  \tag{5.49}\\
\cong & \left.\left.\mathrm{St}_{\Delta_{k, i}}^{\infty}(\pi)\right)\right) \\
\cong & v_{\overline{\mathbf{P}}_{i r}^{\langle r\rangle}}^{\infty}(\pi, \underline{\lambda})
\end{align*}
$$

where the first and second isomorphisms follow from [7, Corollary 2.5], and the last isomorphism follows from Lemma 6.8. Suppose that there exists an irreducible constituent $W$ of $\widetilde{\Sigma}_{i}^{\langle r\rangle}(\pi, \underline{\lambda}) / \operatorname{St}_{(r, k)}^{\infty}(\pi, \underline{\lambda})$ such that $W \hookrightarrow \operatorname{soc}_{G}\left(\widetilde{\Sigma}_{i}^{\langle r\rangle}(\pi, \underline{\lambda})\right)$. We see that the pull-back $V$ of $\left(\operatorname{Ind}_{\overline{\mathbf{P}}_{\Delta_{k, i}}^{\langle r\rangle}(L)} \operatorname{St}_{\Delta_{k, i}}^{\infty}(\pi, \underline{\lambda})\right)^{\mathbb{Q}_{p}-\text { an }}$ via this injection gives an extension of $W$ by $v_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{\infty}(\pi, \underline{\lambda})$, i.e., such $V$ lies in the following commutative diagram:

By (5.49), the first row of this diagram is non-split. Similar to the proof of Lemma 5.23, $W$ has the form $\mathcal{F}_{\overline{\mathbf{P}}_{\Delta_{k, i}}^{\langle r\rangle}}^{G}\left(\bar{L}(-s \cdot \underline{\lambda}), \operatorname{St}_{\Delta_{k, i}}^{\infty}(\pi)\right)$ with $s \in S_{n}^{\left|\Sigma_{L}\right|}$ satisfying $s \cdot \underline{\lambda} \in X_{\Delta_{n}^{k} \cup \Delta_{k, i}}^{+}$.

Claim. $V$ is very strongly admissible, i.e., there is a continuous $G$-equivariant $E$-linear injection $V \rightarrow W$, where $W$ is an admissible continuous representation of $G$ on an $E$-Banach space (see [19, PropositionDefinition 6.2.3] for admissible continuous representation). Indeed, by [17, Proposition 2.1.2] and $V \hookrightarrow$ $\left(\operatorname{Ind} \underline{\mathbf{P}}_{\Delta_{k, i}}^{\langle r\rangle}(L) \mathrm{St}_{\Delta_{k, i}}^{\infty}(\pi, \underline{\lambda})\right)^{\mathbb{Q}_{p}-\text { an }}$, it suffices to show that $\mathrm{St}_{\Delta_{k, i}}^{\infty}(\pi, \underline{\lambda})$ is very strongly admissible. Since an admissible Banach representation tensoring with a finite-dimensional $\mathbb{Q}_{p}$-algebraic representation of $\mathbf{L}_{\Delta_{k, i}}^{\langle r\rangle}(L)$ is still an admissible Banach representation, it remains to show that $\mathrm{St}_{\Delta_{k, i}}^{\infty}(\pi)$ is very strongly admissible. This fact is proved in Lemma 5.25. We are going to prove that $V$ is split by using the same strategy of [15, Lemma 2.4]. Indeed, this result follows by an easy variation of the proof of [15, Lemma 2.24]. We briefly indicate below the changes. Only Part $(e)$ of the proof of [15, Lemma 2.4] need some more modification. In our case, we need to show that

$$
\begin{equation*}
\operatorname{Hom}_{\mathbf{L}_{\Delta_{k, i}}^{\langle r\rangle,+}}\left(\operatorname{St}_{\Delta_{k, i}}^{\infty}(\pi) \otimes_{E} \delta_{\overline{\mathbf{P}}_{\Delta_{k, i}(L)}^{\langle r\rangle}} \otimes_{E} L^{\langle r\rangle}(\mu)_{\Delta_{k, i}}, \mathrm{H}_{\mathrm{an}}^{1}\left(\mathbf{N}_{0}(L), v_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{\infty}(\pi, \underline{\lambda})\right)\right)=0 \tag{5.50}
\end{equation*}
$$

where $\mathbf{N}_{0}(L)$ is a compact open subgroup of $\mathbf{N}_{\Delta_{k, i}}^{\langle r\rangle}$, and $\mathbf{L}_{\Delta_{k, i}}^{\langle r\rangle,+}:=\left\{z \in \mathbf{L}_{\Delta_{k, i}}^{\langle r\rangle}: z \mathbf{N}_{0}(L) z^{-1} \subset \mathbf{N}_{0}(L)\right\}$. If this vector space is non-zero, then the same argument after $[15,(55)]$ and the adjunction property (2.6)) implies $\operatorname{Hom}_{G}\left(\left(\operatorname{Ind}_{\overline{\mathbf{P}}_{\Delta_{k, i}}^{\langle r\rangle}(L)}^{G} \mathrm{St}_{\Delta_{k, i}}^{\infty}\right)^{\infty}, v_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{\infty}(\pi)\right) \neq 0$. Then we deduce $\operatorname{Hom}_{G}\left(i \overline{\mathbf{P}}^{G}\langle r\rangle(\pi), v_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{\infty}(\pi)\right) \neq 0$. This is impossible by Lemma 6.7. The proposition follows.

Recall that $\underline{\lambda}:=\left(\lambda_{1, \sigma}, \cdots, \lambda_{n, \sigma}\right)_{\sigma \in \Sigma_{L}}$. Let $\sigma \in \Sigma_{L}$, we put

$$
\underline{\lambda}_{\sigma}:=\left(\lambda_{1, \sigma}, \cdots, \lambda_{n, \sigma}\right), \underline{\lambda}^{\sigma}:=\left(\lambda_{1, \sigma^{\prime}}, \cdots, \lambda_{n, \sigma^{\prime}}\right)_{\sigma^{\prime} \in \Sigma_{L} \backslash\{\sigma\}}
$$

Let $\operatorname{ir} \in \Delta_{n}(k)$. We put $\operatorname{St}_{\Delta_{k, i}}^{\infty}\left(\pi, \underline{\lambda}_{\sigma}\right) \cong \operatorname{St}_{\Delta_{k, i}}^{\infty}(\pi) \otimes_{E} L^{\langle r\rangle}\left(\underline{\lambda}_{\sigma}\right)_{\Delta_{k, i}}$, which is a locally $\sigma$-analytic representation of $\mathbf{L}_{\Delta_{k, i}}^{\langle r\rangle}(L)$. Consider the locally $\sigma$-analytic parabolic induction

$$
\left(\operatorname{Ind}_{\overline{\mathbf{P}}_{\Delta_{k, i}}^{\langle r\rangle}(L)}^{G} \mathrm{St}_{\Delta_{k, i}}^{\infty}\left(\pi, \underline{\lambda}_{\sigma}\right)\right)^{\sigma-\mathrm{an}}
$$

By [30, the main theorem] and [15, Lemma 2.7, Lemma 2.10], we have

$$
\begin{align*}
& \left(\operatorname{Ind}_{\overline{\mathbf{P}}_{\Delta_{k, i}}^{\langle r\rangle}(L)}^{G} \operatorname{St}_{\Delta_{k, i}}^{\infty}(\pi)\right)^{\infty} \otimes_{E} L(\underline{\lambda}) \longleftrightarrow\left(\operatorname{Ind}_{\overline{\mathbf{P}}_{\Delta_{k, i}}^{\langle r\rangle}(L)}^{G} \mathrm{St}_{\Delta_{k, i}}^{\infty}\left(\pi, \underline{\lambda}_{\sigma}\right)\right)^{\sigma-\mathrm{an}} \otimes_{E} L\left(\underline{\lambda}^{\sigma}\right) \\
\longleftrightarrow & \left(\operatorname{Ind}_{\overline{\mathbf{P}}_{\Delta_{k, i}}^{G}\langle L\rangle}^{G r\rangle} \mathrm{St}_{\Delta_{k, i}}^{\infty}(\pi, \underline{\lambda})\right)^{\mathbb{Q}_{p}-\mathrm{an}} \longrightarrow \mathrm{St}_{(r, k)}^{\text {an }}(\pi, \underline{\lambda}) . \tag{5.51}
\end{align*}
$$

Denote by

$$
\begin{equation*}
\widetilde{\Sigma}_{i, \sigma}^{\langle r\rangle}(\pi, \underline{\lambda}):=\left(\left(\operatorname{Ind}_{\overline{\mathbf{P}}_{\Delta_{k, i}}^{\langle r\rangle}(L)}^{G} \operatorname{St}_{\Delta_{k, i}}^{\infty}\left(\pi, \underline{\lambda}_{\sigma}\right)\right)^{\sigma-\mathrm{an}} \otimes_{E} L\left(\underline{\lambda}^{\sigma}\right) / v_{\overline{\mathbf{P}}_{i r}^{\langle r\rangle}}^{\infty}(\pi, \underline{\lambda}) \hookrightarrow \widetilde{\Sigma}_{i}^{\langle r\rangle}(\pi, \underline{\lambda})\right. \tag{5.52}
\end{equation*}
$$

We put

$$
C_{i, \sigma}:=\mathcal{F}_{\overline{\mathbf{P}}_{\Delta_{k, i}}^{G r\rangle}}^{G}\left(\bar{L}\left(-\underline{\lambda}^{\sigma}\right) \otimes_{E} \bar{L}\left(-s_{i r, \sigma} \cdot \underline{\lambda}_{\sigma}\right), \operatorname{St}_{\Delta_{k, i}}^{\infty}(\pi)\right),
$$

which is an irreducible subrepresentation of $\widetilde{\Sigma}_{i, \sigma}^{\langle r\rangle}(\pi, \underline{\lambda}) / \mathrm{St}_{(r, k)}^{\infty}(\pi, \underline{\lambda})$. By Proposition 4.6 (applied to $J=$ $S=\emptyset), C_{i, \sigma}$ appears as an irreducible constituent in $\operatorname{St}_{(r, k)}^{\mathrm{an}}(\pi, \underline{\lambda})$ with nonzero multiplicity

$$
\begin{equation*}
\left[\mathrm{St}_{(r, k)}^{\mathrm{an}}(\pi, \underline{\lambda}): C_{i, \sigma}\right]=\sum_{\substack{w^{\prime} \in \mathscr{W}_{n} \\ \operatorname{supp}\left(w^{\prime}\right)=\emptyset}}(-1)^{l\left(w^{\prime}\right)}\left[\bar{M}\left(-w^{\prime} \cdot \underline{\lambda}\right): \bar{L}\left(-\underline{\lambda}^{\sigma}\right) \otimes_{E} \bar{L}\left(-s_{i r, \sigma} \cdot \underline{\lambda}_{\sigma}\right)\right]=1 \tag{5.53}
\end{equation*}
$$

We are going to define certain subrepresentations of $\mathrm{St}_{(r, k)}^{\mathrm{an}}(\pi, \underline{\lambda})$.

## Definition 5.27.

(1) Denote by $\Sigma_{i, \sigma}^{\langle r\rangle}(\pi, \underline{\lambda})$ the extension of $C_{i, \sigma}$ by $\operatorname{St}_{(r, k)}^{\infty}(\pi, \underline{\lambda})$ appearing as a subrepresentation of $\widetilde{\Sigma}_{i, \sigma}^{\langle r\rangle}(\pi, \underline{\lambda})$.
(2) Put

$$
\begin{align*}
& \Sigma_{i}^{\langle r\rangle}(\pi, \underline{\lambda}):=\bigoplus_{\operatorname{St}_{(r, k)}^{\infty}(\pi, \bar{\lambda})}^{\sigma \in \Sigma_{L}} \Sigma_{i, \sigma}^{\langle r\rangle}(\pi, \underline{\lambda}) \hookrightarrow \widetilde{\Sigma}_{i}^{\langle r\rangle}(\pi, \underline{\lambda}), \\
& \Sigma^{\langle r\rangle}(\pi, \underline{\lambda}):=\bigoplus_{\operatorname{St}_{(r, k)}^{\infty}(\pi, \underline{\lambda})}^{i r \in \Delta_{n}(k)} \Sigma_{i}^{\langle r\rangle}(\pi, \underline{\lambda}) \hookrightarrow \widetilde{\Sigma}^{\langle r\rangle}(\pi, \underline{\lambda}) \subseteq \operatorname{St}_{(r, k)}^{\mathrm{an}}(\pi, \underline{\lambda}) . \tag{5.54}
\end{align*}
$$

By definition, $\Sigma_{i}^{\langle r\rangle}(\pi, \underline{\lambda})$ is an extension of $\bigoplus_{\sigma \in \Sigma_{L}} C_{i, \sigma}$ by $\operatorname{St}_{(r, k)}^{\infty}(\pi, \underline{\lambda})$.
Proposition 5.28. For any $V \in\left\{\widetilde{\Sigma}_{i, \sigma}^{\langle r\rangle}(\pi, \underline{\lambda}), \Sigma_{i}^{\langle r\rangle}(\pi, \underline{\lambda}), \Sigma^{\langle r\rangle}(\pi, \underline{\lambda})\right\}$, we have $\operatorname{soc}_{G} V=\operatorname{St}_{(r, k)}^{\infty}(\pi, \underline{\lambda})$.
Proof. For each $V \in\left\{\widetilde{\Sigma}_{i, \sigma}^{\langle r\rangle}(\pi, \underline{\lambda}), \Sigma_{i}^{\langle r\rangle}(\pi, \underline{\lambda})\right\}$, the result follows from Proposition 5.26. By [8, Corollary 2.7], the irreducible constituents $\left\{C_{i, \sigma}\right\}_{i r \in \Delta_{n}(k), \sigma \in \Sigma_{L}}$ are all distinct, hence we have $\operatorname{soc}_{G} \Sigma_{i}^{\langle r\rangle}(\pi, \underline{\lambda}) \cong$ $\operatorname{St}_{(r, k)}^{\infty}(\pi, \underline{\lambda})$.
Proposition 5.29. Let $i r, j r \in \Delta_{n}(k)$ and let $\sigma \in \Sigma_{L}$, the following natural morphisms are isomorphisms

$$
\begin{aligned}
& \operatorname{Ext}_{G}^{1}\left(v_{\mathbf{F}_{\dot{i r}}^{\langle r\rangle}}^{\infty}(\pi, \underline{\lambda}), \Sigma^{\langle r\rangle}(\pi, \underline{\lambda})\right) \xrightarrow{\sim} \quad \operatorname{Ext}_{G}^{1}\left(v_{\overline{\mathbf{P}}_{i r}^{\langle r\rangle}}^{\infty}(\pi, \underline{\lambda}), \mathrm{St}_{(r, k)}^{\mathrm{an}}(\pi, \underline{\lambda})\right), \\
& \operatorname{Ext}_{G}^{1}\left(v_{\overline{\mathbf{P}}_{i r}^{(r\rangle}}^{\infty}(\pi, \underline{\lambda}), \Sigma_{j}^{\langle r\rangle}(\pi, \underline{\lambda})\right) \xrightarrow{\sim} \operatorname{Ext}_{G}^{1}\left(v_{\overline{\mathbf{P}}_{i r}^{(r)}}^{\infty}(\pi, \underline{\lambda}), \widetilde{\Sigma}_{j}^{\langle r\rangle}(\pi, \underline{\lambda})\right), \\
& \operatorname{Ext}_{G}^{1}\left(v_{\overline{\mathbf{P}}_{i r}^{\langle r}}^{\infty}(\pi, \underline{\lambda}), \Sigma_{j, \sigma}^{\langle r\rangle}(\pi, \underline{\lambda})\right) \xrightarrow{\sim} \operatorname{Ext}_{G}^{1}\left(v_{\overline{\mathbf{P}}_{i r}^{\langle r}}^{\infty}(\pi, \underline{\lambda}), \widetilde{\Sigma}_{j, \sigma}^{\langle r\rangle}(\pi, \underline{\lambda})\right) \text {. }
\end{aligned}
$$

Proof. By Proposition 4.6, the irreducible constituent of $\mathrm{St}_{(r, k)}^{\mathrm{an}}(\pi, \underline{\lambda}) / \Sigma^{\langle r\rangle}(\pi, \underline{\boldsymbol{\lambda}})$ (resp., $\widetilde{\Sigma}_{j}^{\langle r\rangle}(\pi, \underline{\lambda}) / \Sigma_{j}^{\langle r\rangle}(\pi, \underline{\lambda})$, resp., $\left.\widetilde{\Sigma}_{j, \sigma}^{\langle r\rangle}(\pi, \underline{\lambda}) / \Sigma_{j, \sigma}^{\langle r\rangle}(\pi, \underline{\lambda})\right)$ has the form $\mathcal{F}_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}}^{G}(\bar{L}(-s \cdot \underline{\lambda}), W)$ with $\lg (s)>1$. Therefore, all the isomorphisms follow from [15, Lemma 2.26] and an easy dévissage argument.

Remark 5.30. Note that $\bar{M}_{\Delta_{k, i}}^{\langle \rangle}(-\underline{\lambda})$ admits a natural increasing filtration Fil ${ }^{\bullet} \bar{M}_{\Delta_{k, i}}^{\langle\gamma}(-\underline{\lambda})$ in BGG category $\mathcal{O}_{\text {alg }}^{\overline{\mathrm{p}}_{\Delta k, i}^{(r)}}$ such that
where $m_{\Delta_{k, i}, w}(\underline{\lambda}):=\left[\bar{M}_{\Delta_{k, i}}^{r\rangle}(-\underline{\lambda}): \bar{L}(-w \cdot \underline{\lambda})\right]$ (note that this multiplicity may be greater than one). By [30, Theorem], it induces an increasing filtration $\operatorname{Fil}^{\bullet} \widetilde{\Sigma}_{i}^{\langle r\rangle}(\pi, \underline{\lambda})$ on $\widetilde{\Sigma}_{i}^{\langle r\rangle}(\pi, \underline{\lambda})$. Then $\Sigma_{j}^{\langle r\rangle}(\pi, \underline{\lambda})$ lies in $\operatorname{Fil}^{1} \widetilde{\Sigma}_{i}^{\langle r\rangle}(\pi, \underline{\lambda})$.

We will see below that only the part $\Sigma_{i}^{\langle r\rangle}(\pi, \underline{\lambda})$ of $\mathrm{St}_{(r, k)}^{\text {an }}(\pi, \underline{\lambda})$ contributes non-split extensions in the $\operatorname{Ext}_{G}^{1}\left(v_{\overline{\mathbf{F}}_{i r}^{(r)}}^{\infty}(\pi, \underline{\lambda}), \mathrm{St}_{(r, k)}^{\mathrm{an}}(\pi, \underline{\lambda})\right)$. Similar to the proof of [15, Lemma 2.28], we have
Lemma 5.31. Let $i r, j r \in \Delta_{n}(k)$, then for any $\sigma \in \Sigma_{L}$, we have
(1) $\operatorname{dim}_{E} \operatorname{Ext}_{G}^{1}\left(v_{\overline{\mathbf{P}}_{i r}^{\langle r\rangle}}^{\infty}(\pi, \underline{\lambda}),\left(\operatorname{Ind}_{\underset{\mathbf{P}_{\Delta_{k, j}}}{G}}^{\langle\gamma\rangle} L^{\langle r\rangle}\left(s_{j, \sigma} \cdot \underline{\lambda}\right)_{\Delta_{k, j}} \otimes_{E} \operatorname{St}_{\Delta_{k, j}}^{\infty}(\pi)\right)^{\mathbb{Q}_{p}-\mathrm{an}}\right)= \begin{cases}1, & i=j ; \\ 0, & i \neq j \text {; }\end{cases}$
(2) $\operatorname{dim}_{E} \operatorname{Ext}_{G}^{1}\left(v_{\overline{\mathbf{P}}_{i r}^{\langle r\rangle}}^{\infty}(\pi, \underline{\lambda}), C_{j, \sigma}\right)= \begin{cases}1, & i=j ; \\ 0, & i \neq j \text {; }\end{cases}$

Denote by $\Pi_{1}^{i, \sigma} \in \operatorname{Ext}_{G}^{1}\left(v_{\overline{\mathbf{P}}_{i r}^{(r)}}^{\infty}(\pi, \underline{\lambda}), C_{i, \sigma}\right)$ the unique nonsplit element.

Remark 5.32. For each $1 \leq i \leq k-1$, we expect that the unique non-split element $\Pi_{1}^{i, \sigma}$ is a subrepresentation of the conjectural representations in [8, (EXT)].

Lemma 5.33. Let $i r, j r \in \Delta_{n}(k)$.
(1) If $i \neq j$, then the following natural morphism is an isomorphism:

$$
\operatorname{Ext}_{G}^{1}\left(v_{\overline{\mathbf{P}}_{i r}^{\langle r\rangle}}^{\infty}(\pi, \underline{\lambda}), \operatorname{St}_{(r, k)}^{\infty}(\pi, \underline{\lambda})\right) \xrightarrow{\sim} \operatorname{Ext}_{G}^{1}\left(v_{\overline{\mathbf{P}}_{i r}^{\langle r\rangle}}^{\infty}(\pi, \underline{\lambda}), \Sigma_{j}^{\langle r\rangle}(\pi, \underline{\lambda})\right) .
$$

(2) The following natural morphism is an isomorphism:

$$
\operatorname{Ext}_{G}^{1}\left(v_{\overline{\mathbf{P}}_{i r}^{\langle r\rangle}}^{\infty}(\pi, \underline{\lambda}), \Sigma_{i}^{\langle r\rangle}(\pi, \underline{\lambda})\right) \xrightarrow{\sim} \operatorname{Ext}_{G}^{1}\left(v_{\overline{\mathbf{P}}_{i r}^{\langle r\rangle}}^{\infty}(\pi, \underline{\lambda}), \Sigma^{\langle r\rangle}(\pi, \underline{\lambda})\right) .
$$

(3) For $\sigma \in \Sigma_{L}, \operatorname{dim}_{E} \operatorname{Ext}_{G}^{1}\left(v_{\overline{\mathbf{P}}_{i r}^{\langle r\rangle}}^{\infty}(\pi, \underline{\lambda}), \Sigma_{i, \sigma}^{\langle r\rangle}(\pi, \underline{\lambda})\right)=2$.

Proof. The lemma follows by an easy variation of the proof of [15, Lemma 2.29]. The "[31,Theorem 1]" (resp., "[Lemma $2.28(2)] "$ ) in the proof of [15, Lemma 2.29] has to be replaced by Proposition 6.9 (resp., Lemma 5.31 (2)).

Finally, we have:
Proposition 5.34. Let ir $\in \Delta_{n}(k)$ and $\sigma \in \Sigma_{L}$, we have isomorphisms

$$
\begin{align*}
& \operatorname{Hom}\left(\mathbf{Z}^{\langle r\rangle}(L), E\right) / \operatorname{Hom}\left(\mathbf{Z}_{i r}^{\langle r\rangle}(L), E\right) \xrightarrow{\sim} \operatorname{Ext}_{G}^{1}\left(v_{\overline{\mathbf{P}}_{i r}^{\langle r\rangle}}^{\infty}(\pi, \underline{\lambda}), \Sigma_{i}^{\langle r\rangle}(\pi, \underline{\lambda})\right),  \tag{5.55}\\
& \operatorname{Hom}_{\sigma}\left(\mathbf{Z}^{\langle r\rangle}(L) / \mathbf{Z}_{i r}^{\langle r\rangle}(L), E\right) \xrightarrow{\sim} \operatorname{Ext}_{G}^{1}\left(v_{\overline{\mathbf{P}}_{i r}^{\langle r\rangle}}^{\infty}(\pi, \underline{\lambda}), \Sigma_{i, \sigma}^{\langle r\rangle}(\pi, \underline{\lambda})\right) .
\end{align*}
$$

Proof. The first assertion follows from Theorem (5.19), Proposition 5.29, Lemma 5.33 (2). The second follows from an easy variation of the proof of [15, Proposition 2.30].

### 5.6 Collection of locally $\mathbb{Q}_{p}$-analytic representations

In Remark 5.21, we obtain a locally $\mathbb{Q}_{p}$-analytic representation $\widetilde{\Sigma}_{i}^{\langle r\rangle}(\pi, \underline{\lambda}, \psi)$, which is an extension of $v_{\overline{\mathbf{P}}_{i r}^{\langle r\rangle}}^{\infty}(\pi, \underline{\lambda})$ by $\operatorname{St}_{(r, k)}^{\text {an }}(\pi, \underline{\lambda})$. Let $i r \in \Delta_{n}(k)$, and $\psi \in \operatorname{Hom}\left(L^{\times}, E\right) \cong \operatorname{Hom}\left(\mathbf{Z}^{\langle r\rangle}(L), E\right) / \operatorname{Hom}\left(\mathbf{Z}_{i r}^{\langle r\rangle}(L), E\right)$. We denote by $\Sigma_{i}^{\langle r\rangle}(\pi, \underline{\lambda}, \psi)$ the extension of $v_{\overline{\mathbf{P}}_{i r}^{\langle r\rangle}}^{\infty}(\pi, \underline{\lambda})$ by $\Sigma_{i}^{\langle r\rangle}(\pi, \underline{\lambda})$ attached to $\psi$ via (5.55), which is thus a subrepresentation of $\widetilde{\Sigma}_{i r}^{\langle r\rangle}(\pi, \underline{\lambda}, \psi)$. Let $\left[\widetilde{\Sigma}_{i}^{\langle r\rangle}(\pi, \underline{\lambda}, \psi)\right] \in \operatorname{Ext}_{G}^{1}\left(v_{\overline{\mathbf{P}}_{i r}^{\langle r\rangle}}^{\infty}(\pi, \underline{\lambda}), \operatorname{St}_{(r, k)}^{\mathrm{an}}(\underline{\lambda})\right)$ be the extension class associated with $\widetilde{\Sigma}_{i}^{\langle r\rangle}(\pi, \underline{\lambda}, \psi)$. By (5.19), Proposition 5.29 and Lemma 5.33 (2), we see that $\left[\widetilde{\Sigma}_{i}^{\langle r\rangle}(\pi, \underline{\lambda}, \psi)\right]$ actually comes by pushing-forward from $\left[\Sigma_{i}^{\langle r\rangle}(\pi, \underline{\lambda}, \psi)\right]$ via an injection $\Sigma_{i}^{\langle r\rangle}(\pi, \underline{\lambda}) \hookrightarrow \operatorname{St}_{(r, k)}^{\text {an }}(\pi, \underline{\lambda})$. If $\psi \in$ $\operatorname{Hom}_{\sigma}\left(L^{\times}, E\right)$ for some $\sigma \in \Sigma_{L}$, then $\Sigma_{i}^{\langle r\rangle}(\pi, \underline{\lambda}, \psi)$ is isomorphic to the push-forward of an extension, denoted by $\Sigma_{i, \sigma}^{\langle r\rangle}(\pi, \underline{\lambda}, \psi)$, of $v_{\overline{\mathbf{P}}_{i r}^{\langle r\rangle}}^{\infty}(\underline{\lambda})$ by $\Sigma_{i, \sigma}^{\langle r\rangle}(\pi, \underline{\lambda})$. It is clear that $\left[\Sigma_{i, \sigma}^{\langle r\rangle}(\pi, \underline{\lambda}, \psi)\right]$ is isomorphic to the extension attached to $\psi$ via (5.55).

## 6 Appendix: smooth extensions of generalized parabolic Steinberg representations

### 6.1 Bernstein-Zelevinsky theory

We now recall some details of the Bernstein-Zelevinsky theory, following [4] and [1]. Although several of our references work over $\mathbb{C}$, the various results over $\mathbb{C}$ are transferred to our content over $\overline{\mathbb{Q}}_{p}$ if we choose (and
fix) an isomorphism $\iota: \overline{\mathbb{Q}}_{p} \xrightarrow{\sim} \mathbb{C}$. Bernstein-Zelevinsky classifies the irreducible smooth representations of $G=\mathrm{GL}_{n}(L)$ on $\overline{\mathbb{Q}}_{p}$-vector spaces in terms of Zelevinsky-segments.

Let $\underline{\alpha}=\left(n_{1}, n_{2}, \cdots, n_{s}\right)$ be an ordered partition of $n$. We put

$$
\mathrm{GL}_{\underline{\alpha}}:=\left(\begin{array}{cccc}
\mathrm{GL}_{n_{1}} & 0 & \cdots & 0 \\
0 & \mathrm{GL}_{n_{2}} & \cdots & 0 \\
\vdots & \vdots & \ddots & 0 \\
0 & 0 & 0 & \mathrm{GL}_{n_{s}}
\end{array}\right) \subseteq \mathbf{P}_{\underline{\alpha}}:=\left(\begin{array}{cccc}
\mathrm{GL}_{n_{1}} & * & \cdots & * \\
0 & \mathrm{GL}_{n_{r}} & \cdots & * \\
\vdots & \vdots & \ddots & * \\
0 & 0 & \cdots & \mathrm{GL}_{n_{s}}
\end{array}\right)
$$

For each $1 \leq i \leq s$, let $\pi_{i}$ be a smooth representation of $\mathrm{GL}_{n_{i}}(L)$ over $\overline{\mathbb{Q}}_{p}$. Then $\pi_{1} \otimes \cdots \otimes \pi_{s}$ is naturally a smooth representation of $\mathrm{GL}_{\underline{\alpha}}$ over $\overline{\mathbb{Q}}_{p}$ and thus of $\mathbf{P}_{\underline{\alpha}}$ (where the tensor products are taken over $\overline{\mathbb{Q}}_{p}$ ). Put

$$
\begin{equation*}
\pi_{1} \times \cdots \times \pi_{s}:=i_{\mathbf{P}_{\underline{\alpha}}(L)}^{G}\left(\delta_{\mathbf{P}_{\underline{\alpha}}(L)}^{1 / 2} \pi_{1} \otimes \cdots \otimes \pi_{s}\right) \tag{6.1}
\end{equation*}
$$

where $\delta_{\mathbf{P}_{\underline{\alpha}}(L)}$ is the modulus character of $\mathbf{P}_{\underline{\alpha}}(L)$. If all the representations $\pi_{1}, \cdots, \pi_{s}$ are irreducible cuspidal, then $\left[1,2.2,2.3\right.$. Corollary] showed that the Jordan Hölder factors $\mathbf{J H}\left(\pi_{1} \times \cdots \times \pi_{s}\right)$ of $\pi_{1} \times \cdots \times \pi_{s}$ are classified by the orientations of some graph. The length of the Jordan Hölder series of $\pi_{1} \times \cdots \times \pi_{s}$ is $2^{l}$, where $l$ is the number of the pairs of the form $\left\{\pi, \pi \otimes|\operatorname{det}|_{L}\right\} \subseteq\left\{\pi_{1}, \cdots, \pi_{s}\right\}$. Recall that any smooth irreducible representation of $G$ is necessarily a sub-representation of some $\pi_{1} \times \cdots \times \pi_{s}$, for some choices of an ordered partition $\underline{\alpha}$ and some multiset of irreducible cuspidal representations $\left\{\pi_{1}, \cdots, \pi_{s}\right\}$. This multiset is called the cuspidal support of $\pi$.

Let $\pi$ be a smooth representation of $\mathrm{GL}_{m}(L)$ over $\overline{\mathbb{Q}}_{p}$. For $l \in \mathbb{Z}$, we put $\pi(l):=\pi \otimes_{\overline{\mathbb{Q}}_{p}} v_{m}^{l}$, where $v_{m}=|\operatorname{det}|_{L}: \mathrm{GL}_{m}(L) \rightarrow E^{\times} \subset \overline{\mathbb{Q}}_{p}$.
Definition 6.1. A Zelevinsky-segment is a non-empty set of irreducible cuspidal representations of $\mathrm{GL}_{m}(L)$ of the form $\Delta=[\pi, \pi(1), \cdots, \pi(s-1)]$ for some integers $m$ and $s$. We put $l(\Delta)=m s$.

By [1, 2.10. Proposition], $\pi \times \cdots \times \pi(s-1)$ admits a unique irreducible subrepresentation $\langle\Delta\rangle$ and a unique irreducible quotient $\langle\Delta\rangle^{t}$ (in the terminology of [1, 3.1, 9.1]). By [1], every irreducible smooth representation of $G$ can be constructed by a sequence of Zelevinsky-segments.

## Definition 6.2. (Smooth parabolic Steinberg representation)

Since the parabolic subgroups that we use are the opposite of those that appeared in [1], the Zelevinskysegment is arranged in descending order in our content. More precisely, let $s \geq s^{\prime}$ be two integers, and let $\pi$ be an irreducible cuspidal representation of $\mathrm{GL}_{m}(L)$ over $E$. We put the Zelevinsky-segment

$$
\Delta_{\left[s, s^{\prime}\right]}(\pi):=\left[\pi(s), \cdots, \pi\left(s^{\prime}\right)\right]=\Delta_{\left[s-s^{\prime}, 0\right]}\left(\pi\left(s^{\prime}\right)\right)
$$

In this case, $\pi(s-1) \times \cdots \times \pi:=i \overline{\mathbf{P}}_{(m, m, \cdots, m)(L)}\left(\delta_{\overline{\mathbf{P}}_{(m, m, \cdots, m)}(L)}^{1 / 2} \pi(s-1) \otimes_{E} \cdots \otimes_{E} \pi\right)$ admits a unique irreducible generic quotient $\left\langle\Delta_{[s-1,0]}(\pi)\right\rangle^{t}$. In this paper, we call it the (smooth) parabolic Steinberg representation of $\mathrm{GL}_{m s}(L)$ over $E$ (with respect to the Zelevinsky-segment $\Delta_{[s-1,0]}(\pi)$ ). In the sequel, we may rewrite it as $\mathrm{St}_{(m, s)}^{\infty}(\pi)$.

### 6.2 Proof of Proposition 3.6

Proof. By the transitivity of parabolic induction, we see that $\pi_{I}$ is a subrepresentation of $i_{\mathbf{P}_{J}^{\langle r\rangle}(L) \cap \mathbf{L}_{I}^{\langle r\rangle}(L)}^{\langle\langle \rangle} \pi_{J}$ since $\pi_{I}$ is the unique irreducible subrepresentation of $i_{\overline{\mathbf{P}}^{\langle r\rangle}(L)}^{\langle r\rangle} \pi^{\langle r\rangle}$. This proves (3.13).
Proof of (3.12). By definition and [4, 1.5. Proposition (b)], $\pi_{I}$ is the unique irreducible subrepresentation of

$$
\begin{aligned}
& i_{\overline{\mathbf{P}}^{\langle r\rangle}(L) \cap \mathbf{L}_{I}^{\langle r\rangle}(L)}^{\mathbf{L}^{\langle r\rangle}(L)} \pi^{\langle r\rangle} \\
= & \otimes_{i=1}^{l} i_{\overline{\mathbf{P}}^{\langle r\rangle}(L) \cap \mathrm{GL}_{k_{i} r}(L)} \delta_{\overline{\mathbf{P}}^{\langle r\rangle}(L) \cap \mathrm{GL}_{k_{i} r}(L)}^{1 / 2} \Delta_{\left[k_{i}-1,0\right]}\left(\pi \otimes_{E} v_{r}^{-\frac{r}{2}\left(k-2 s_{i-1}-k_{i}\right)+k-s_{i}}\right),
\end{aligned}
$$

where we identify $\mathrm{GL}_{k_{i} r}(L)$ (resp., $\overline{\mathbf{P}}^{\langle r\rangle}(L) \cap \mathrm{GL}_{k_{i} r}(L)$ ) with the subgroup $1 \times \cdots \times \mathrm{GL}_{k_{i} r}(L) \times \cdots \times 1$ of $\mathbf{L}_{I}^{\langle r\rangle}(L) \subset G$ (resp., $\left.\left(1 \times \cdots \times \mathrm{GL}_{k_{i} r}(L) \times \cdots \times 1\right) \cap \overline{\mathbf{P}}^{\langle r\rangle}(L)\right)$. This implies that

$$
\begin{equation*}
\pi_{I}=\otimes_{i=1}^{l}\left\langle\Delta_{\left[k_{i}-1,0\right]}\left(\pi \otimes_{E} v_{r}^{-\frac{r}{2}\left(k-2 s_{i-1}-k_{i}\right)+k-s_{i}}\right)\right\rangle \tag{6.2}
\end{equation*}
$$

Therefore, by [4, Proposition 1.5 (a)], we deduce

$$
\begin{equation*}
r_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}(L) \cap \mathbf{L}_{I}^{\langle r\rangle}(L)}^{\mathbf{L}^{\langle r\rangle}(L)} \pi_{I}=\otimes_{i=1}^{l} r_{\mathrm{GL}_{k_{i} r}(L) \cap \overline{\mathbf{P}}_{J}^{\langle r\rangle}(L)}^{\mathrm{GL}_{k_{i} r}(L)}\left\langle\Delta_{\left[k_{i}-1,0\right]}\left(\pi \otimes_{E} v_{r}^{-\frac{r}{2}\left(k-2 s_{i-1}-k_{i}\right)+k-s_{i}}\right)\right\rangle, \tag{6.3}
\end{equation*}
$$

where we identify $\left.\overline{\mathbf{P}}_{J}^{\langle r\rangle}(L) \cap \mathrm{GL}_{k_{i} r}(L)\right)$ with the subgroup $\left.\left(1 \times \cdots \times \mathrm{GL}_{k_{i} r}(L) \times \cdots \times 1\right) \cap \overline{\mathbf{P}}_{J}^{\langle r\rangle}(L)\right)$. Let $\underline{k}_{J}^{\langle r\rangle}$ be the ordered partition of integer $k$ associated with the $\mathbf{L}_{J}^{\langle r\rangle}(L)$. Since $J \subseteq I$, we can write $\underline{k}_{J}^{\langle r\rangle}$ as $\underline{k}_{J}^{\langle r\rangle}=\left(\underline{k_{1}}, \cdots, \underline{k_{l}}\right)$, where $\underline{k_{i}}=\left(k_{i, 1}, \cdots, k_{i, l_{i}}\right)$ is an ordered partition of integer $k_{i}$ for each $1 \leq i \leq l$. For $0 \leq t \leq \overline{l_{i}}$, we put $s_{i, 0}^{\prime}=0$ and $s_{i, t}^{\prime}=\sum_{j=1}^{t} k_{i, j} r$. Similar to (6.2), we have the following

$$
\begin{equation*}
\pi_{J}=\otimes_{i=1}^{l} \otimes_{j=1}^{l_{i}}\left\langle\Delta_{\left[k_{i, j}-1,0\right]}\left(\pi \otimes_{E} v_{r}^{-\frac{r}{2}\left(k-2\left(s_{i-1}+s_{i, j-1}^{\prime}\right)-k_{i, j}\right)+k-s_{i-1}-s_{i, j}^{\prime}}\right)\right\rangle \tag{6.4}
\end{equation*}
$$

By applying [1, 3.4. Proposition] step by step, we have

$$
\begin{align*}
& r_{\mathrm{GL}_{k_{i} r}(L) \cap \overline{\mathbf{P}}_{J}^{\langle r\rangle}(L)}^{\mathrm{GL}_{k^{r}}(L)}\left\langle\Delta_{\left[k_{i}-1,0\right]}\left(\pi \otimes_{E} v_{r}^{-\frac{r}{2}\left(k-2 s_{i-1}-k_{i}\right)+k-s_{i}}\right)\right\rangle \\
= & \otimes_{j=1}^{l_{i}}\left\langle\Delta_{\left[k_{i}-1-s_{i, j-1}^{\prime}, k_{i}-1-s_{i, j}^{\prime}\right]}\left(\pi \otimes_{E} v_{r}^{-\frac{r}{2}\left(k-2 s_{i-1}-k_{i}\right)+k-s_{i}}\right)\right\rangle \otimes_{E} v_{k_{i, j} r}^{-\frac{r}{2}\left(k_{i}-2 s_{i, j-1}^{\prime}-k_{i, j}\right)},  \tag{6.5}\\
= & \otimes_{j=1}^{l_{i}}\left\langle\Delta_{\left[k_{i, j}-1,0\right]}\left(\pi \otimes_{E} v_{r}^{-\frac{r}{2}\left(k-2\left(s_{i-1}+s_{i, j-1}^{\prime}\right)-k_{i, j}\right)+k-s_{i-1}-s_{i, j}^{\prime}}\right)\right\rangle .
\end{align*}
$$

Now (3.12) follows by comparing (6.3), (6.4) and (6.5).
 to prove that $\mathcal{V}=0$.
Claim. $r_{\overline{\mathbf{P}}^{\langle r\rangle}(L)}^{G} \mathcal{V}=0$. Admitting this claim, if $\mathcal{V}$ admits at least one nonzero irreducible subquotient $\mathcal{V}^{\prime}$, then $r_{\overline{\mathbf{P}}^{\langle r\rangle}(L)}^{G} \mathcal{V}^{\prime}=0$ by the exactness of $r_{\overline{\mathbf{P}}^{\langle r\rangle}(L)}^{G}$. But this would lead to a contradiction to Lemma 6.3 below.
Proof of claim. Note that
by (3.13). After replacing $I, J$ by $I \backslash I \cap J, J$, we can assume that $I \cap J=\emptyset$. By the transitivity of parabolic inductions, it suffices to prove that

$$
\begin{equation*}
\left(i_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}(L) \cap \mathbf{L}_{I \cup J}^{\langle r\rangle}(L)}^{\langle r\rangle} \pi_{I}^{\langle r\rangle}(L) \cap\left(i_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}(L) \cap \mathbf{L}_{I \cup J}^{\langle r\rangle}(L)}^{\mathbf{L}_{J}^{\langle r\rangle}(L)} \pi_{J}\right)=\pi_{I \cup J} .\right. \tag{6.6}
\end{equation*}
$$

 $i{\underset{\mathbf{P}}{I \cup J}(L)}_{\langle r\rangle}^{G} \pi_{I \cup J}$ are subrepresentations of $i \frac{G}{\mathbf{P}^{\langle r\rangle}(L)} \pi^{\langle r\rangle}$, we have

$$
\begin{align*}
& r_{\overline{\mathbf{P}}^{\langle r\rangle}(L)}^{G} i_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}(L)}^{G} \pi_{I}=\left(r_{\overline{\mathbf{P}}^{\langle r\rangle}(L)}^{G} i_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}(L)} \pi_{I}\right)^{\mathrm{ss}} \\
& =\bigoplus_{w \in\left[\mathscr{W}_{I}^{\langle r\rangle} \backslash \mathscr{W}_{n} / \mathscr{W}\langle r\rangle\right]} i_{\mathbf{L}^{\langle r\rangle}(L) \cap \overline{\mathbf{P}}_{I}^{\langle r\rangle}(L)^{w}}^{\langle r\rangle}\left(\gamma_{I, \emptyset}^{w} \otimes_{E} r_{\overline{\mathbf{P}}^{\langle r\rangle}(L) \cap \mathbf{L}_{I}^{\langle r\rangle}(L)^{w}}^{\langle r\rangle} \pi_{I}^{w}\right),  \tag{6.7}\\
& r_{\overline{\mathbf{P}}^{\langle r\rangle}(L)}^{G} i_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}(L)}^{G} \pi_{J}=\left(r_{\overline{\mathbf{P}}^{\langle r\rangle}(L)}^{G} i_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}(L)}^{G} \pi_{J}\right)^{\mathrm{ss}} \\
& =\bigoplus_{u \in\left[\mathscr{W}_{J}^{\langle r\rangle} \backslash \mathscr{W}_{n} / \mathscr{W}^{\langle r\rangle}\right]} i_{\mathbf{L}^{\langle r\rangle}(L) \cap \overline{\mathbf{P}}_{J}(L)^{w}}^{\mathbf{L}^{\langle r\rangle}(L)}\left(\gamma_{I, \emptyset}^{u} \otimes_{E} r_{\overline{\mathbf{P}}^{\langle r\rangle}(L) \cap \mathbf{L}_{J}^{\langle r\rangle}(L)^{u}}^{\mathbf{L}_{L^{\langle r\rangle}}} \pi_{J}^{u}\right), \tag{6.8}
\end{align*}
$$

where the first equality in (6.7) (resp., (6.8)) follows from the semi-simplicity of the smooth representation $r_{\overline{\mathbf{P}}}{ }^{\langle r\rangle}(L){ }^{i} \overline{\mathbf{P}}^{\langle r\rangle}(L){ }^{\langle r\rangle}$. By (3.11), we see that an irreducible constitute $w^{\prime}\left(\pi^{\langle r\rangle}\right)$ (for some $w^{\prime} \in$
 $w \in\left[\mathscr{W}_{I}^{\langle r\rangle} \backslash \mathscr{W}_{n} / \mathscr{W}^{\langle r\rangle}\right]$ if and only if

$$
\begin{aligned}
0 \neq & \operatorname{Hom}_{\mathbf{L}^{\langle r\rangle}(L)}\left(w^{\prime}\left(\pi^{\langle r\rangle}\right), i_{\mathbf{L}^{\langle r\rangle}(L) \cap}^{\mathbf{L}^{\langle r\rangle}(L)} \overline{\mathbf{P}}_{J}(L)^{w}\right. \\
& \left.\left.\cong \gamma_{I, \emptyset}^{w} \otimes_{E} r_{\overline{\mathbf{P}}^{\langle r\rangle}(L) \cap \mathbf{L}_{I}^{\langle r\rangle}(L)^{w}}^{\mathbf{L}_{r}^{\langle r\rangle}(L)^{w}} \pi_{I}^{w}\right)\right) \\
& \cong \operatorname{Hom}_{\mathbf{L}^{\langle r\rangle}(L) \cap \mathbf{L}_{I}^{\langle r\rangle}(L)^{w}}\left(r_{\mathbf{L}^{\langle r\rangle}(L) \cap \overline{\mathbf{P}}_{I}^{\langle r\rangle}(L)^{w}}^{\mathbf{L}^{\langle r\rangle}(L)} w^{\prime}\left(\pi^{\langle r\rangle}\right), \gamma_{I, \emptyset}^{w} \otimes_{E} r_{\overline{\mathbf{P}}^{\langle r\rangle}(L) \cap \mathbf{L}_{I}^{\langle r\rangle}(L)^{w}}^{\langle r\rangle} \pi_{I}^{w}\right) .
\end{aligned}
$$

where the second isomorphism follows from the adjunction formula (2.5). Therefore, by the supercuspidality of $w^{\prime}\left(\pi^{\langle r\rangle}\right)$ and Lemma 3.1, we see that $w \in \mathscr{W}_{I, \emptyset}\left(\mathbf{L}^{\langle r\rangle}\right)$. Then, we deduce from (3.12) and the proof of [12, Corollary 6.3.4 (b), i.e., the computation of $\delta$-factors] that

$$
0 \neq \operatorname{Hom}_{\mathbf{L}^{\langle r\rangle}(L)}\left(w^{\prime}\left(\pi^{\langle r\rangle}\right), \gamma_{I, \emptyset}^{w} \otimes_{E} r_{\overline{\mathbf{P}}^{\langle r\rangle}(L) \cap \mathbf{L}_{I}^{\langle r\rangle}(L)^{u}}^{\langle\langle \rangle} \pi_{I}^{w}\right) \cong \operatorname{Hom}_{\mathbf{L}^{\langle r\rangle}(L)}\left(w^{-1} w^{\prime}\left(\pi^{\langle r\rangle}\right), r_{\overline{\mathbf{P}}^{\langle r\rangle}(L) \cap \mathbf{L}_{I}^{\langle r\rangle}(L)}^{\mathbf{L}_{I}^{\langle r\rangle}(L)} \pi_{I}\right)
$$

This implies that $w^{\prime}=w$. The same argument holds for $J$. Thus, if $w^{\prime}\left(\pi^{\langle r\rangle}\right)$ appears as an irreducible constitute of $\left(r_{\overline{\mathbf{P}}^{\langle r\rangle}(L)}^{G} i_{\overline{\mathbf{P}}}^{\underline{G}}{ }_{I}^{r r\rangle}(L) \pi_{I}\right) \cap\left(r_{\overline{\mathbf{P}}^{\langle r\rangle}(L)}^{G} i_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}(L)}^{G} \pi_{J}\right)$, then $w^{\prime} \in \mathscr{W}_{I, \emptyset}\left(\mathbf{L}^{\langle r\rangle}\right) \cap \mathscr{W}_{J, \emptyset}\left(\mathbf{L}^{\langle r\rangle}\right)=1$ (under the assumption $\left.I \cup J=\Delta_{n}(k)\right)$. We then conclude that

$$
\left(r_{\overline{\mathbf{P}}^{\langle r\rangle}(L)}^{G} i_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}(L)}^{G} \pi_{I}\right) \cap\left(r_{\overline{\mathbf{P}}^{\langle r\rangle}(L)}^{G} i_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}(L)}^{G} \pi_{J}\right)=\pi^{\langle r\rangle}=r_{\overline{\mathbf{P}}^{\langle r\rangle}(L)}^{G} \pi_{\Delta_{n}(k)}
$$

The claim follows.

 are subrepresentations of the semi-simple representation $r_{\overline{\mathbf{P}}}{ }^{\langle r\rangle}{ }_{(L)} i^{G} \overline{\mathbf{P}}^{\langle r\rangle}{ }_{(L)} \pi^{\langle r\rangle}$, which shows that all the sums are direct. Therefore, we get that $r_{\overline{\mathbf{P}}}{ }^{\langle r\rangle}{ }_{(L)} \mathcal{V}^{\prime}=0$. By Lemma 6.3, we deduce $\mathcal{V}^{\prime}=0$. This completes the proof.

Lemma 6.3. Let $\mathcal{V}$ be a non-zero irreducible subquotient of $i \frac{G}{\mathbf{P}^{\langle r\rangle}(L)} \pi^{\langle r\rangle}$, then $r_{\overline{\mathbf{P}}^{\langle r\rangle}(L)}^{G} \mathcal{V} \neq 0$.
Proof. If $r_{\overline{\mathbf{P}}^{\langle r\rangle}(L)}^{G} \mathcal{V}=0$, we can choose $\emptyset \neq I \subset \Delta_{n}(k)$ such that $r_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}(L)}^{G} \mathcal{V}$ is non-zero and quasi-cuspidal (i.e., for any $J \subsetneq I$, we have $r_{\overline{\mathbf{P}}_{J}^{\langle\gamma\rangle}(L)}^{G} \mathcal{V}=0$, see also [1, 1.10]). Let $\mathcal{W}$ be an irreducible subquotient of $r_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}(L)}^{G} \mathcal{V}$. Then $\mathcal{W}$ is cuspidal. Note that

$$
\left(r_{\overline{\mathbf{P}}_{I}^{\langle\langle \rangle}(L)}^{G} i i_{\overline{\mathbf{P}}^{\langle r\rangle}(L)}^{G} \pi^{\langle r\rangle}\right)^{\mathrm{ss}}=\bigoplus_{w \in\left[\mathscr{W}\langle r\rangle \backslash \mathscr{W}_{n} / \mathscr{W}_{I}^{\langle r\rangle}\right]} i_{\mathbf{L}_{I}^{\langle r\rangle}(L) \cap \overline{\mathbf{P}}(L)^{w}}^{\langle r\rangle}\left(\gamma_{\emptyset, I}^{w} \otimes_{E} r_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}(L) \cap \mathbf{L}^{\langle r\rangle}(L)^{w}}^{\mathbf{L}^{\langle r\rangle}(L)^{w}}\left(\pi^{\langle r\rangle}\right)^{w}\right) .
$$

It follows from the cuspidality of $\left(\pi^{\langle r\rangle}\right)^{w}$ that $\overline{\mathbf{P}}_{I}^{\langle r\rangle}(L) \cap \mathbf{L}^{\langle r\rangle}(L)^{w}=\mathbf{L}^{\langle r\rangle}(L)^{w}$. By Lemma 3.1, we deduce $w \in \mathscr{W}_{\emptyset, I}\left(\mathbf{L}^{\langle r\rangle}\right)$. Therefore, there exists an element $w \in \mathscr{W}_{\emptyset, I}\left(\mathbf{L}^{\langle r\rangle}\right)$ such that $\mathcal{W}$ is an irreducible subquotient of $i_{\mathbf{L}_{I}^{\langle r\rangle}(L) \cap \overline{\mathbf{P}}(L)^{w}}^{\mathbf{L}^{\langle r\rangle}(L)}\left(\gamma_{\emptyset, I}^{w} \otimes_{E} r_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}(L) \cap \mathbf{L}^{\langle r\rangle}(L)^{w}}^{\mathbf{L}^{\langle r\rangle}(L)^{w}}\left(\pi^{\langle r\rangle}\right)^{w}\right)$. Therefore, for such $w$ we have

$$
\begin{aligned}
& 0 \neq \operatorname{Hom}_{\mathbf{L}_{I}^{\langle r\rangle}(L)}\left(\mathcal{W}, i_{\mathbf{L}_{I}^{\langle r\rangle}(L) \cap \overline{\mathbf{P}}(L)^{w}}^{\langle r\rangle}\left(\gamma_{\emptyset, I}^{w} \otimes_{E}\left(\pi^{\langle r\rangle}\right)^{w}\right)\right) \\
&=\operatorname{Hom}_{\mathbf{L}^{\langle r\rangle}(L)^{w}}\left(r_{\mathbf{L}_{I}^{\langle r\rangle}(L) \cap \overline{\mathbf{P}}^{\langle r\rangle}(L)^{w}}^{\mathbf{L}_{I}^{\langle r\rangle}(L)} \mathcal{W}, \gamma_{\emptyset, I}^{w} \otimes_{E}\left(\pi^{\langle r\rangle}\right)^{w}\right) .
\end{aligned}
$$

This leads to a contradiction to the cuspidality of $\mathcal{W}$.

### 6.3 Jordan-Hölder factors of parabolically induced representations

The main goal of this section is to determine the Jordan-Hölder factors $\mathbf{J H}\left(i{ }_{\overline{\mathbf{P}}}{ }^{G r\rangle}{ }_{(L)}(\pi)\right)$ of $i_{\mathbf{P}^{\langle r\rangle}(L)}(\pi)$. Recall that the parabolic Steinberg representation $\mathrm{St}_{(r, k)}^{\infty}(\pi)$ is the unique irreducible generic quotient of $i_{\mathbf{P}^{\langle r\rangle}(L)}^{G}(\pi)$.

Let $\Sigma$ be the root system of $\mathrm{GL}_{n}$, then $\Sigma$ is the hyperplane $\left\{x=\left(x_{1}, \cdots, x_{n}\right) \in \mathbb{R}^{n}: x_{1}+\cdots+x_{n}=\right.$ $0\}$. Let us identify the root $\epsilon_{i}:\left(x_{1}, \cdots, x_{n}\right) \in \mathfrak{t} \mapsto x_{i}$ to the coordinate $x \mapsto x_{i}$ for $i=1, \cdots, n$. Then each root $\alpha \in \Phi$ induces an $\mathbb{R}$-linear form on $\Sigma$. The Weyl group $\mathscr{W}_{n}$ act on $\Sigma$ by $w \cdot x \mapsto\left(x_{w^{-1}(1)}, \cdots, x_{w^{-1}(n)}\right)$. Let $C=\left\{x \in \Sigma: \alpha_{i}(x)>0, i=1, \cdots, n-1\right\}$ be the standard Weyl chamber. Let $I^{\prime}$ be a subset of $\Delta_{n}$, then for any $w \in \mathscr{W}_{n}$, we have $w\left(\Phi^{+}\right) \cap \Delta_{n}=I^{\prime}$ if and only if $w(C)$ is contained in the set $C_{I}=\left\{x \in V: \alpha_{i}(x)>\right.$ $\left.0, \forall i \in I^{\prime}, \alpha_{i}(x)<0, \forall i \in \Delta_{n} \backslash I^{\prime}\right\}$. Let $w_{\Delta_{n} \backslash I^{\prime}}$ be the longest element of $\mathscr{W}_{\Delta_{n} \backslash I^{\prime}}$. Then we have $w_{\Delta_{n} \backslash I^{\prime}}^{2}=1$, $w_{\Delta_{n} \backslash I^{\prime}}\left(\Delta_{n} \backslash I^{\prime}\right) \subset-\left(\Delta_{n} \backslash I^{\prime}\right), w_{\Delta_{n} \backslash I^{\prime}}\left(I^{\prime}\right) \subset \Phi^{+}$, and $w_{\Delta_{n} \backslash I^{\prime}}\left(\Phi^{+}\right) \cap \Delta_{n}=I^{\prime}$.

Recall that $\left[1\right.$, Section 2] gives a bijection between $\mathbf{J H}\left(i \overline{\mathbf{P}}^{\underline{G}\rangle}(\pi)\right)$ and orientations of some graph $\Gamma_{\pi}$. The

$$
\begin{equation*}
\stackrel{\pi(k)}{\bullet} \tag{6.9}
\end{equation*}
$$

An orientation of $\Gamma_{\pi}$ is given by choosing a direction on each edge. Let $\mathcal{O}\left(\Gamma_{\pi}\right)$ be the set of all orientations on $\Gamma_{\pi}$. We can construct a map $\Theta: \mathscr{W}\left(\mathbf{L}^{\langle r\rangle}\right) \rightarrow \mathcal{O}\left(\Gamma_{\pi}\right)$ as follows. The edge ${ }^{\pi(k-i)}-\stackrel{\pi(k-i-1)}{\bullet}$ is oriented by the form $\stackrel{\pi(k-i)}{\bullet}{ }^{\pi(k-i-1)}$ if and only if $w(i r)<w((i+1) r)$, where $i r,(i+1) r \in I$ are viewed as simple roots. For a subset $I \subset \Delta_{n}(k)$ and each $w \in \mathscr{W}\left(\mathbf{L}^{\langle r\rangle}\right)$, we see that $w\left(\Phi^{+}\right) \cap \Delta_{n}=I \cup \Delta_{n}^{k}$ if and only if $w\left(\Phi^{+}\right) \cap \Delta_{n}(k)=I$, since $w$ fixes simple roots in $\Delta_{n}^{k}$. Let $\vec{\Gamma}_{\pi}(I)$ be the orientation of $\Gamma_{\pi}$ defined by $\pi(k-i) \rightarrow \pi(k-i-1)$ if and only if ir $\in I$. By definition, we see that $\Theta^{-1}\left(\overrightarrow{\Gamma_{\pi}}(I)\right)=\left\{w \in \mathscr{W}\left(\mathbf{L}^{\langle r\rangle}\right)\right.$ : $\left.w^{-1}\left(\Phi^{+}\right) \cap \Delta_{n}(k)=I\right\}$. By identifying the set $\Delta_{n}(k)$ with the simple roots of $\mathscr{W}\left(\mathbf{L}^{\langle r\rangle}\right) \cong \mathscr{W}_{k}$, we let $w_{\Delta_{n}(k) \backslash I}^{\langle r\rangle}$ be the longest element of $\mathscr{W}\left(\mathbf{L}^{\langle r\rangle}\right)_{\Delta_{n}(k) \backslash I}$ (i.e., the subgroup of $\mathscr{W}\left(\mathbf{L}^{\langle r\rangle}\right)$ generated by simple reflections which belong to $\left.\Delta_{n}(k) \backslash I\right)$. By definition, we see that $\left(w_{\Delta_{n}(k) \backslash I}^{\langle r\rangle}\right)^{2}=1, w_{\Delta_{n}(k) \backslash I}^{\langle r\rangle}(I) \in \mathscr{W}_{\emptyset, I}\left(\mathbf{L}^{\langle r\rangle}\right)$ and $w_{\Delta_{n}(k) \backslash I}^{\langle r\rangle} \in \Theta^{-1}\left(\overrightarrow{\Gamma_{\pi}}(I)\right)$.

For each $w \in \mathscr{W}\left(\mathbf{L}^{\langle r\rangle}\right) \cong S_{k}$, we let $y_{w}^{\infty}(\pi)$ (resp., $z_{w}^{\infty}(\pi)$ ) be the unique irreducible quotient (resp., subrepresentation) of $i \frac{G}{\overline{\mathbf{P}}}{ }^{\langle r\rangle}(L) ~ w\left(\pi^{\langle r\rangle}\right)$ (see [1, 2.10. Proposition]), where $w\left(\pi^{\langle r\rangle}\right)=\left(\otimes_{i=1}^{k} \pi \otimes_{E} v_{r}^{w(k-i)}\right) \otimes_{E}$ $\delta_{\overline{\mathbf{P}}}{ }^{\langle r\rangle}(L)$. Let $\Sigma_{0}$ be a system of representatives of the classes in $\mathscr{W}\left(\mathbf{L}^{\langle r\rangle}\right)$ for the equivalence relation

$$
w \sim w^{\prime} \text { if and only if } i_{\overline{\mathbf{P}}^{\langle r\rangle}(L)}^{G} w\left(\pi^{\langle r\rangle}\right) \cong i_{\overline{\mathbf{P}}^{\langle r\rangle}(L)}^{G} w^{\prime}\left(\pi^{\langle r\rangle}\right)
$$

Then [1, 2.11. Corollary] show that the following conditions are equivalent:

- $w \sim w^{\prime}$,
- $w^{-1}\left(\Phi^{+}\right) \cap \Delta_{n}(k)=w^{\prime-1}\left(\Phi^{+}\right) \cap \Delta_{n}(k)$,
- $z_{w}^{\infty}(\pi) \cong z_{w^{\prime}}^{\infty}(\pi)$,
- $y_{w}^{\infty}(\pi) \cong y_{w^{\prime}}^{\infty}(\pi)$.

Together with the Frobenius reciprocity and the semi-simplicity of $r \overline{\mathbf{P}}^{G}{ }^{\langle r\rangle}{ }_{(L)} i^{G} \overline{\mathbf{P}}^{\langle r\rangle}{ }_{(L)} \pi^{\langle r\rangle}$, the above equivalent conditions imply that

$$
\begin{equation*}
r_{\overline{\mathbf{P}}^{\langle r\rangle}(L)}^{G} z_{w}^{\infty}(\pi)=\bigoplus_{w \sim w^{\prime}} w^{\prime}\left(\pi^{\langle r\rangle}\right) \tag{6.10}
\end{equation*}
$$

These also show that the system $\Sigma_{0}$ of representatives can be chosen by $\left\{w_{\Delta_{n}(k) \backslash I}^{\langle r\rangle}\right\}_{I \subseteq \Delta_{n}(k)}$. We put $z_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{\infty}(\pi):=z_{w_{\Delta_{n}(k) \backslash I}^{\langle r\rangle}}^{\infty}(\pi)$. By [1, Section 2] or [6, Page 628-629], we see that

$$
\mathbf{J H}\left(i_{\mathbf{P}^{\langle r\rangle}}^{G}(\pi)\right)=\left\{z_{\mathbf{P}_{I}^{\langle r\rangle}}^{\infty}(\pi)\right\}_{I \subseteq \Delta_{n}(k)} .
$$

The following lemma compares our construction in Definition 3.7 with the Zelevinsky classification (i.e., [1, Section 2]) of $\mathbf{J H}\left(i_{\mathbf{P}^{\langle r\rangle}}^{G}(\pi)\right)$. The proof follows along the route of [26, Theorem (8.1.2), Lemma (8.1.3) and Lemma (8.1.4)].

Lemma 6.4. We have
(1) $i_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{G}(\pi)$ has a composition series whose successive quotients are the $v_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}}(\pi)$ with $J \supseteq I$, each occurring with multiplicity one.
(2) $u_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{G}(\pi)$ has a composition series whose successive quotients are the $v_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}}^{\infty}(\pi)$ with $J \nsupseteq I$, each occurring with multiplicity one.
(3) The composition series constructed in parts (1) and (2) are indeed Jordon-Hölder series. In particular, for each $I \subset \Delta_{n}(k), v_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{\infty}(\pi)$ is irreducible, and $v_{\overline{\mathbf{P}}^{\langle r\rangle}}^{\infty}(\pi)=\mathrm{St}_{(r, k)}^{\infty}(\pi)$.
(4) For any $I \subseteq \Delta_{n}, v_{\overline{\mathbf{P}}_{I}^{(r\rangle}}^{\infty}(\pi)$ is isomorphic to $z_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{\infty}(\pi)$. In particular, for any $I^{\prime}, I^{\prime \prime} \subseteq \Delta_{n}(k)$, the representations $v_{\overline{\mathbf{P}}_{I^{\prime}}^{\langle r\rangle}}^{\infty}(\pi)$ and $v_{\overline{\mathbf{P}}_{I^{\prime \prime}}^{\langle r\rangle}}^{\infty}(\pi)$ are isomorphic if and only if $I^{\prime}=I^{\prime \prime}$.

Proof. Proof of (1). An easy induction shows that there exists a numbering $I=J_{0}, J_{1}, \cdots, J_{N}=\Delta_{n}(k)$ of the set $\{J \mid J \subseteq I\}$ such that $J_{n} \subseteq J_{m}$ then $n \leq m$. Now define

$$
F^{l}=\sum_{j=l}^{N} i \overline{\overline{\mathbf{P}}}_{J_{j}}^{G r\rangle}(\pi) .
$$

Then we have a filtration $0=F^{N+1} \subset F^{N} \subset \cdots \subset F^{0}=i \frac{G}{\mathbf{P}_{I}^{\langle r\rangle}}(\pi)$ such that, for each $l=0, \cdots, N$, we have

$$
F^{l} / F^{l+1}=\sum_{j=l}^{N} i \frac{G}{\mathbf{P}_{J_{j}}^{\langle r\rangle}}(\pi) / \sum_{j=l+1}^{N} i i_{\overline{\mathbf{P}}_{J_{j}}}^{\langle r\rangle}(\pi)=i_{\overline{\mathbf{P}}_{J_{l}}^{\langle r\rangle}}^{G}(\pi) / \sum_{j=l+1}^{N}\left(i \frac{\overline{\mathbf{P}}_{J_{j}}^{\langle r\rangle}}{G}(\pi) \cap i_{\overline{\mathbf{P}}_{J_{l}}^{\langle r\rangle}}^{G}(\pi)\right) \cong v_{\overline{\mathbf{P}}_{J_{l}}^{\langle r\rangle}}^{\infty}(\pi) .
$$

The second equality and the third isomorphism follow from [A2] in Proposition 3.6.
Proof of (2). This is a direct consequence of (1) and the exact sequence

$$
0 \longrightarrow u_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{G}(\pi) \longrightarrow i_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{G}(\pi) \longrightarrow v_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{\infty}(\pi) \longrightarrow 0
$$

Proof of (3). We claim that $i_{\mathbf{P}^{\langle r\rangle}}^{G}(\pi)$ has a Jordon-Hölder series whose successive quotients are $v_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}}^{\infty}(\pi)$ with $J \subseteq \Delta_{n}(k)$, each occurring multiplicity one. By ([1, 2.3. Corollary $]$ ), a Jordon-Hölder series for $i{\underset{\mathbf{P}}{ }{ }^{G}\langle r\rangle}{ }^{\text {j }}(\pi)$ has length $2^{k-1}$. This shows that the composition series constructed in part (1) is indeed a Jordon-Hölder series. By the uniquely of the irreducible quotient of $i \frac{G}{\overline{\mathbf{P}}}{ }^{\langle r\rangle}(\pi)$, we get $v_{\overline{\mathbf{P}}^{\langle r\rangle}}^{\infty}(\pi)=\operatorname{St}_{(r, k)}^{\infty}(\pi)$.
Proof of (4). The above discussion implies that there exists a bijection $\beta$ from $\left\{I \subseteq \Delta_{n}(k)\right\}$ onto itself such that $v_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{\infty}(\pi) \cong z_{\overline{\mathbf{P}}_{\beta(I)}^{\langle r\rangle}}^{\infty}(\pi)$ for any $I \subseteq \Delta_{n}(k)$. In fact, we will prove that $\beta(I)=I$ by induction on $\left|\Delta_{n}(k) \backslash I\right|$. It is clear that $\beta\left(\Delta_{n}(k)\right)=\Delta_{n}(k)$. Let $I \subseteq \Delta_{n}(k)$ with $\left|\Delta_{n}(k) \backslash I\right|>0$ and let us assume that $\beta(J)=J$ for any $\left|\Delta_{n}(k) \backslash J\right|<\left|\Delta_{n}(k) \backslash I\right|$. For these $J$, we thus have

$$
\begin{equation*}
r_{\overline{\mathbf{P}}^{\langle r\rangle}(L)}^{G} v_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}}^{\infty}(\pi)=\bigoplus_{w \sim w^{\prime}} w^{\prime}\left(\pi^{\langle r\rangle}\right) \tag{6.11}
\end{equation*}
$$

by (6.10). Note that $w_{\Delta_{n}(k) \backslash I}^{\langle r\rangle} \in \mathscr{W}_{\emptyset, I}\left(\mathbf{L}^{\langle r\rangle}\right)$. By the same arguments as in the discussion after (6.7) and (6.10), we deduce that $w_{\Delta_{n}(k) \backslash I}^{\langle r\rangle}\left(\pi^{\langle r\rangle}\right)$ appears in the semi-simplification of $r_{\overline{\mathbf{P}}^{\langle r\rangle}(L)}^{G} i_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}(L)}^{G} \pi_{I}$ (up to isomorphism). But by the induction hypothesis, Part (1) and (6.11), we see that $w_{\Delta_{n}(k) \backslash I}^{\langle r\rangle}\left(\pi^{\langle r\rangle}\right)$ cannot be isomorphic to a subquotient of $r_{\overline{\mathbf{P}}^{\langle r\rangle}(L)}^{G} v_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}}^{\infty}(\pi)$ for $J \supsetneq I$. Hence $w_{\Delta_{n}(k) \backslash I}^{\langle r\rangle}\left(\pi^{\langle r\rangle}\right)$ is isomorphic to a subquotient of $r_{\overline{\mathbf{P}}^{\langle r\rangle}(L)}^{G} v_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{\infty}(\pi)=r_{\overline{\mathbf{P}}^{\langle r\rangle}(L)}^{G} z_{\overline{\mathbf{P}}_{\beta(I)}^{\langle r\rangle}}^{\infty}(\pi)$. We thus have $w_{\Delta_{n}(k) \backslash I}^{\langle r\rangle} \sim w_{\Delta_{n}(k) \backslash \beta(I)}^{\langle r\rangle}$, i.e., $\beta(I)=$ $w_{\Delta_{n}(k) \backslash \beta(I)}^{\langle r\rangle}\left(\Phi^{+}\right) \cap \Delta_{n}(k)=w_{\Delta_{n}(k) \backslash(I)}^{\langle r\rangle}\left(\Phi^{+}\right) \cap \Delta_{n}(k)=I$. We complete the proof of part (4). By definition of equivalence relation, we see that $z_{\mathbf{P}_{I^{\prime}}^{\langle r\rangle}}^{\infty}(\pi)$ and $z_{\overline{\mathbf{P}}_{I^{\prime \prime}}^{\langle r\rangle}}^{\infty}(\pi)$ are isomorphic if and only if $I^{\prime}=I^{\prime \prime}$. Therefore, we get that $v_{\overline{\mathbf{P}}_{I^{\prime}}^{\langle r\rangle}}^{\infty}(\pi)$ and $v_{\overline{\mathbf{P}}}^{I^{\prime \prime}}\left\langle\underset{\langle r\rangle}{\infty}(\pi)\right.$ are isomorphic if and only if $I^{\prime}=I^{\prime \prime}$. This completes the proof.

### 6.4 Smooth extensions of generalized parabolic Steinberg representations

This section follows a technical modification of the route of [28]. In this paper, the author compute the higher Ext-groups between smooth generalized (Borel) Steinberg representations via some spectral sequences arising from the so-called smooth Tits complex. This method can be adapted to our parabolic case, where the smooth Tits complexes in [28] are replaced by the results in Section 4.3. In parabolic case, we meet some cuspidal objects, these cause difficulty in the computations. Therefore, the theory of semi-simple types by Bushnell and Kutzko [3] is the cornerstone of the computation.

Many results in this section are not new. Indeed, in [28, Corollary 18], Sascha Orlik computed the smooth extension groups $\operatorname{Ext}_{G, \omega_{\pi}^{\langle r\rangle}}^{i, \infty}\left(v_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{\infty}(\pi), v_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}}^{\infty}(\pi)\right)$ for general $I, J$. The proof uses the Zelevinski classification and the theory of semi-simple types by Bushnell and Kutzko [3]. Indeed, the semisimple Bushnell-Kutzko types for $\mathrm{GL}_{n}$, which classify the cuspidal smooth representations of $\mathrm{GL}_{n}$ over $\overline{\mathbf{Q}}_{p}$ (or complex field $\mathbb{C}$ ), play a central role in its proof. But in Borel case, all these become trivial. In this section, we avoid using this theory for several reasons.

- We only need Ext ${ }^{1}$-groups for some special case (see Proposition 6.9). We can achieve this by a easy argument of spectral sequences.
- The semisimple Bushnell-Kutzko types requires the introduction of many concepts, discussions and statements, which are deviated from our central goals and themes.

Therefore, we use instead the modified treatment of Orlik's approach on Borel case [28]. The computations (Section 5.4) on extension groups of locally $\mathbf{Q}_{p}$-analytic generalized (parabolic) Steinberg representations also follows this route, but in the setting of locally analytic representation.

Let $I \subset \Delta_{n}(k)$ and let $\underline{k}_{I}^{\langle r\rangle}=\left(k_{1}, \cdots, k_{l_{I}}\right)$ be the ordered partition of integer $k$ associated with the $\mathbf{L}_{I}^{\langle r\rangle}(L)$. Then $\mathbf{L}_{I}^{\langle r\rangle}(L)=\mathrm{GL}_{k_{1} r}(L) \times \cdots \times \mathrm{GL}_{k_{l_{I}} r}(L)$. For $i \in \mathbb{Z}_{\geq 0}$, we put

$$
\mathcal{S}_{I}^{i}:=\operatorname{Ext}_{\mathbf{L}_{I}^{\langle r\rangle}(L)}^{i, \infty}\left(\pi_{I}, \pi_{I}\right), \text { and } \overline{\mathcal{S}}_{I}^{i}:=\operatorname{Ext}_{\mathbf{L}_{I}^{r i\rangle}(L), \omega_{\pi}^{\langle r\rangle}}^{i, \infty}\left(\pi_{I}, \pi_{I}\right)
$$

The cuspidal representation $\pi$ cause difficulty in the computation of $\mathcal{S}_{I}^{i}$ and $\overline{\mathcal{S}}_{I}^{i}$. But there are natural morphisms

$$
\begin{gather*}
\kappa_{I}^{i}: \bigwedge^{i} X_{E}^{*}\left(\mathbf{L}_{I}^{\langle r\rangle}\right) \cong \operatorname{Ext}_{\mathbf{L}_{I}^{\langle r\rangle}(L)}^{i, \infty}(1,1) \rightarrow \mathcal{S}_{I}^{i} \\
\text { resp. } \bar{\kappa}_{I}^{i}: \bigwedge^{i} X_{E}^{*}\left(\mathbf{L}_{I}^{\langle r\rangle} / \mathbf{Z}_{n}\right) \cong \operatorname{Ext}_{\mathbf{L}_{I}^{\langle r\rangle}(L), Z_{n}=1}^{i, \infty}(1,1) \rightarrow \overline{\mathcal{S}}_{I}^{i} \tag{6.12}
\end{gather*}
$$

induced by the Yoneda $i$-extensions (see (5.3)).
Lemma 6.5. For any $I \subset \Delta_{n}(k)$, the maps $\kappa_{I}^{1}$ and $\bar{\kappa}_{I}^{1}$ are injective. In particular, we have $\operatorname{dim}_{E} \mathcal{S}_{I}^{1} \geq$ $\operatorname{dim}_{E} X_{E}^{*}\left(\mathbf{L}_{I}^{\langle r\rangle}\right)$ and $\operatorname{dim}_{E} \overline{\mathcal{S}}_{I}^{1} \geq \operatorname{dim}_{E} X_{E}^{*}\left(\mathbf{L}_{I}^{\langle r\rangle} / \mathbf{Z}_{n}\right)$.

Proof. The injection $\mathbf{Z}_{I}^{\langle r\rangle}(L) \hookrightarrow \mathbf{L}_{I}^{\langle r\rangle}(L)$ induces a map $\mathcal{S}_{I}^{i} \rightarrow \operatorname{Ext}_{\mathbf{Z}_{I}^{\langle r\rangle}(L)}^{1, \infty}\left(\omega_{\pi_{I}}, \omega_{\pi_{I}}\right) \cong \operatorname{Ext}_{\mathbf{Z}_{I}^{\langle r\rangle}(L)}^{1}(1,1)$ (resp., $\left.\overline{\mathcal{S}}_{I}^{i} \rightarrow \operatorname{Ext}_{\mathbf{Z}_{I}^{\langle r\rangle}(L), \omega_{\pi}^{\langle r\rangle}}^{1, \infty}\left(\omega_{\pi_{I}}, \omega_{\pi_{J}}\right) \cong \operatorname{Ext}_{\mathbf{Z}_{I}^{\langle r\rangle}(L), Z_{n}=1}^{1, \infty}(1,1)\right)$, where $\omega_{\pi_{I}}$ is the central character of $\pi_{I}$. It is clear that this map gives a section of $\kappa_{I}^{1}$ (resp., $\bar{\kappa}_{I}^{1}$ ). The results follow.

For any $1 \leq j \leq k-1$, denote by $\Delta_{k, j}$ the set $\Delta_{n}(k) \backslash\{j r\}$. We establish the following lemma (crucially using the theory of types of Bushnell and Kutzko [3]).

Lemma 6.6. We have
(a) $\mathcal{S}_{\Delta_{n}(k)}^{i}=\operatorname{Ext}_{G, \omega_{\pi}^{\langle r\rangle}}^{i, \infty}\left(\pi_{\Delta_{n}(k)}, \pi_{\Delta_{n}(k)}\right)=\bigwedge^{i} X_{E}^{*}\left(\mathbf{G}_{n} / \mathbf{Z}_{n}\right)$.
(b) $\overline{\mathcal{S}}_{\Delta_{n}(k)}^{i}=\operatorname{Ext}_{G}^{i, \infty}\left(\pi_{\Delta_{n}(k)}, \pi_{\Delta_{n}(k)}\right)=\bigwedge^{i} X_{E}^{*}\left(\mathbf{G}_{n}\right)$.
(c) $\mathcal{S}_{I}^{i}=\operatorname{Ext}_{\mathbf{L}_{I}^{\langle r\rangle}(L)}^{i, \infty}\left(\pi_{I}, \pi_{I}\right)=\bigwedge^{i} X_{E}^{*}\left(\mathbf{L}_{I}^{\langle r\rangle}\right)$.

These isomorphisms are induced by the morphisms in (6.12) respectively.

Proof. Part (b) is a direct consequence of [28, Corollary 18] with $I=J=\Delta_{n}(k)$ (by enlarging $E$ if necessary). The proof of [28, Corollary 18] makes use of the theory of types of Bushnell and Kutzko [3]. By applying [28, Lemma 5] to our situation, we get a spectral sequence (see [28, Proof of Corollary 2] for a similar spectral sequence),

$$
\begin{gathered}
E_{2}^{r, s}=\operatorname{Ext}_{G / Z_{n}}^{r, \infty}\left(\mathrm{H}_{s}\left(Z_{n}, \pi_{\Delta_{n}(k)} \otimes_{E}\left(\omega_{\pi}^{\langle r\rangle}\right)^{-1}\right), \pi_{\Delta_{n}(k)} \otimes_{E}\left(\omega_{\pi}^{\langle r\rangle}\right)^{-1}\right) \\
\Rightarrow \operatorname{Ext}_{G}^{r+s, \infty}\left(\pi_{\Delta_{n}(k)}, \pi_{\Delta_{n}(k)}\right)
\end{gathered}
$$

Note that $\mathrm{H}_{\infty}^{*}\left(Z_{n}, E\right)=\Lambda^{*} \operatorname{Hom}\left(Z_{n} /{ }^{0} Z_{n}, E\right) \cong \Lambda^{*} E$, we get

$$
\begin{aligned}
\mathrm{H}_{s}\left(Z_{n}, \pi_{\Delta_{n}(k)} \otimes_{E}\left(\omega_{\pi}^{\langle r\rangle}\right)^{-1}\right) & =\mathrm{H}_{\infty}^{s}\left(Z_{n}, E\right)^{\vee} \otimes_{E} \pi_{\Delta_{n}(k)} \otimes_{E}\left(\omega_{\pi}^{\langle r\rangle}\right)^{-1} \\
& \cong \begin{cases}\pi_{\Delta_{n}(k)} \otimes_{E}\left(\omega_{\pi}^{\langle r\rangle}\right)^{-1}, & s=0,1 \\
0, & \text { otherwise }\end{cases}
\end{aligned}
$$

Therefore, Lemma 5.3 (c) gives a long exact sequence

$$
\cdots \rightarrow E_{2}^{i, 0} \rightarrow \operatorname{Ext}_{G}^{i, \infty}\left(\pi_{\Delta_{n}(k)}, \pi_{\Delta_{n}(k)}\right) \rightarrow E_{2}^{i-1,1} \rightarrow E_{2}^{i+1,0} \rightarrow \operatorname{Ext}_{G}^{i+1, \infty}\left(\pi_{\Delta_{n}(k)}, \pi_{\Delta_{n}(k)}\right) \rightarrow \cdots
$$

At first, we have $\operatorname{Ext}_{G, \omega_{\pi}^{\langle r\rangle}}^{0, \infty}\left(\pi_{\Delta_{n}(k)}, \pi_{\Delta_{n}(k)}\right) \cong E_{2}^{0,0} \cong E$. Since $\operatorname{Ext}_{G}^{i, \infty}\left(\pi_{\Delta_{n}(k)}, \pi_{\Delta_{n}(k)}\right)=0$ for all $i \geq 2$, we see that $\overline{\mathcal{S}}_{\Delta_{n}(k)}^{2}=\overline{\mathcal{S}}_{\Delta_{n}(k)}^{4}=\cdots$ and $\overline{\mathcal{S}}_{\Delta_{n}(k)}^{1}=\overline{\mathcal{S}}_{\Delta_{n}(k)}^{3}=\cdots$. By [5, Chapter X, Theorem 2.4], we see that $\overline{\mathcal{S}}_{\Delta_{n}(k)}^{l}$ is zero for all $l$ large enough. We deduce that $\overline{\mathcal{S}}_{\Delta_{k, j}}^{l}=0$ for all $l \geq 1$. We prove Part ( $a$ ). To prove Part (c), we write $\mathbf{L}_{I}^{\langle r\rangle}(L)=\mathrm{GL}_{k_{1} r}(L) \times \mathrm{GL}_{k_{2} r}(L) \times \cdots \times \mathrm{GL}_{k_{l-1} r}(L) \times \mathrm{GL}_{k_{l} r}(L)$ for some ordered partition $\underline{k}_{I}=\left(k_{1}, \cdots, k_{t}, \cdots, k_{l}\right)$ of $k$. Then by (6.2), we have

$$
\begin{equation*}
\pi_{I}=\otimes_{i=1}^{l}\left\langle\Delta_{i}\right\rangle, \Delta_{i}:=\Delta_{\left[k_{i}-1,0\right]}\left(\pi \cdot v_{r}^{-\frac{r}{2}\left(k-2 s_{i-1}-k_{i}\right)+k-s_{i}}\right) \tag{6.13}
\end{equation*}
$$

Then by Part (b) and Proposition 2.4 (Künneth formula for smooth extension groups), we have

$$
\operatorname{Ext}_{\mathbf{L}_{I}^{\langle\langle \rangle}(L)}^{*, \infty}\left(\pi_{I}, \pi_{I}\right)=\bigotimes_{i=1}^{l} \operatorname{Ext}_{\mathrm{GL}_{k_{i} r}(L)}^{*, \infty}\left(\left\langle\Delta_{i}\right\rangle,\left\langle\Delta_{i}\right\rangle\right)=\bigotimes_{i=1}^{l}\left(\bigwedge^{*} X_{E}^{*}\left(\mathrm{GL}_{k_{i} r}\right)\right)=\bigwedge^{*} X_{E}^{*}\left(\mathbf{L}_{I}^{\langle r\rangle}\right)
$$

It remains to prove Part $(d)$. Similarly, we have the following spectral sequence,

$$
\begin{aligned}
& E_{2}^{r, s}=\operatorname{Ext}_{\mathbf{L}_{\Delta_{k, j}}^{r, \infty}(L) / \mathbf{z}_{n}}^{r, \infty}\left(\mathrm{H}_{s}\left(Z_{n}, \pi_{\Delta_{k, j}} \otimes_{E}\left(\omega_{\pi}^{\langle r\rangle}\right)^{-1}\right), \pi_{\Delta_{k, j}} \otimes_{E}\left(\omega_{\pi}^{\langle r\rangle}\right)^{-1}\right) \\
& \Rightarrow \operatorname{Ext}_{\mathbf{L}_{\Delta_{k, j}}^{\langle r+}(L)}^{r+s, \infty}\left(\pi_{\Delta_{k, j}}, \pi_{\Delta_{k, j}}\right)
\end{aligned}
$$

Note that $E_{2}^{r, s}$ is zero unless $s \in\{0,1\}$ and $E_{2}^{r, 0} \cong E_{2}^{r, 1} \cong \overline{\mathcal{S}}_{\Delta_{k, j}}^{r}$ for all $r \geq 0$. Therefore, Lemma 5.3 (c) gives a long exact sequence

$$
\cdots \rightarrow E_{2}^{i, 0} \rightarrow \operatorname{Ext}_{\mathbf{L}_{\Delta_{k, j}}^{\langle r\rangle}(L)}^{i, \infty}\left(\pi_{\Delta_{k, j}}, \pi_{\Delta_{k, j}}\right) \rightarrow E_{2}^{i-1,1} \rightarrow E_{2}^{i+1,0} \rightarrow \operatorname{Ext}_{\mathbf{L}_{\Delta_{k, j}}^{\langle r\rangle}(L)}^{i+1, \infty}\left(\pi_{\Delta_{k, j}}, \pi_{\Delta_{k, j}}\right) \cdots
$$

 $\overline{\mathcal{S}}_{\Delta_{k, j}}^{5}=\cdots$. Since $\overline{\mathcal{S}}_{\Delta_{k, j}}^{l}$ is zero for all $l$ large enough, we deduce that $\overline{\mathcal{S}}_{\Delta_{k, j}}^{l}=0$ for all $l \geq 2$. Then we get a long exact sequence

$$
0 \rightarrow \overline{\mathcal{S}}_{\Delta_{k, j}}^{0} \rightarrow E \rightarrow E_{2}^{-1,1} \rightarrow \overline{\mathcal{S}}_{\Delta_{k, j}}^{1} \rightarrow E \oplus E \rightarrow \overline{\mathcal{S}}_{\Delta_{k, j}}^{0} \rightarrow \overline{\mathcal{S}}_{\Delta_{k, j}}^{2} \rightarrow E \rightarrow \overline{\mathcal{S}}_{\Delta_{k, j}}^{1} \rightarrow \overline{\mathcal{S}}_{\Delta_{k, j}}^{3}=0
$$

This implies $\overline{\mathcal{S}}_{\Delta_{k, j}}^{0} \cong E$, and $\overline{\mathcal{S}}_{\Delta_{k, j}}^{1} \cong E$. By Lemma 6.5 , we get $(d)$.
We are ready to compute the smooth Extensions between smooth generalized parabolic Steinberg representations. The following contents follow along the lines of [28]. If $W$ is a smooth representation, then we let $W^{\sim}$ be its smooth dual.

Lemma 6.7. We have

$$
\operatorname{Ext}_{G}^{i, \infty}\left(i{\underset{\mathbf{P}}{I}}_{G\langle \rangle}^{G}(\pi), i \overline{\mathbf{P}}_{J}^{G r\rangle}(\pi)\right)= \begin{cases}\mathcal{S}_{J}^{i}, & J \subseteq I  \tag{6.14}\\ 0, & \text { otherwise }\end{cases}
$$

and

$$
\operatorname{Ext}_{G, \omega_{\pi}^{i r\rangle}}^{i, \infty}\left(i \overline{\mathbf{P}}_{I}^{\langle r\rangle}(\pi), i \overline{\mathbf{P}}_{J}^{\langle r\rangle}(\pi)\right)= \begin{cases}\overline{\mathcal{S}}_{J}^{i}, & J \subseteq I  \tag{6.15}\\ 0, & \text { otherwise }\end{cases}
$$

Proof. We prove (6.15) at first, and (6.14) follows by the same strategy. By Lemma 5.2, we have for all $r \geq 0$ the isomorphisms

$$
\operatorname{Ext}_{G, \omega_{\pi}^{\langle r\rangle}}^{i, \infty}\left(i \frac{G}{\mathbf{P}_{I}^{\langle r\rangle}}(\pi), i \frac{G}{\mathbf{P}_{J}^{\langle r\rangle}}(\pi)\right)=\operatorname{Ext}_{\mathbf{L}_{J}^{\langle r\rangle}(L), \omega_{\pi}^{\langle r\rangle}}^{i, \infty}\left(r_{\mathbf{P}_{J}^{\langle r\rangle}}^{G} i \frac{G}{\mathbf{P}_{I}^{\langle r\rangle}}(\pi), \pi_{J}\right)
$$

Restrict the proof of Lemma 5.9 to smooth case. Recall the Bruhat filtration $\mathcal{F}_{B}^{\bullet}$ on $i \overline{\mathbf{P}}_{I}^{G r\rangle}(\pi)$ (see (5.7)) and the vanishing result of (5.18). If $J \subsetneq I$, we deduce by dévissage (see the graded pieces (5.8) for all $h \in \mathbb{Z}_{\geq 0}$ ) that $\operatorname{Ext}_{G, \omega_{\pi}^{\langle r\rangle}}^{i, \infty}\left(i \overline{\mathbf{P}}_{I}^{G r\rangle}(\pi), i \frac{G}{\mathbf{P}_{J}^{\langle r\rangle}}(\pi)\right)=0$ for all $i \geq 0$. If $J \subseteq I$, we have for all $i \geq 0$ the isomorphisms

$$
\begin{aligned}
\operatorname{Ext}_{\mathbf{L}_{J}^{\langle i\rangle}(L), \omega_{\pi}^{\langle r\rangle}}^{i, \infty}\left(r_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}(L)}^{G} i i_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}(L)}^{G}(\pi), \pi_{J}\right) & \cong \operatorname{Ext}_{\mathbf{L}_{J}^{\langle r\rangle}(L), \omega_{\pi}^{\langle r\rangle}}^{i, \infty}\left(r_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}(L)}^{G}\left(\mathcal{F}_{B}^{0} i_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}(L)}^{G}(\pi)\right), \pi_{J}\right) \\
& =\operatorname{Ext}_{\mathbf{L}_{J}^{\langle r\rangle}(L), \omega_{\pi}^{\langle r\rangle}}^{i, \infty}\left(r_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}(L)}^{\langle r\rangle}(L)\right. \\
& =\operatorname{Ext}_{\mathbf{L}_{J}^{\langle r\rangle}(L)}^{i, \infty} \pi_{J}^{\langle r\rangle}(L), \omega_{J}^{\langle r\rangle}\left(\pi_{J}\right) \\
& \left.\pi_{J}\right)
\end{aligned}
$$

This completes the proof.

The following proposition follows from the same arguments as in the proof of [28, Proposition 17], where the acyclic complex in the proof of [28, Proposition 11] is replaced by our exact sequence (4.7) in Proposition 4.3.

Proposition 6.8. We have

$$
\operatorname{Ext}_{G}^{i, \infty}\left(v_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{G}(\pi), i_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}}^{G}(\pi)\right)= \begin{cases}\mathcal{S}_{J}^{i-\left|\Delta_{n}(k) \backslash I\right|}, & I \cup J=\Delta_{n}(k)  \tag{6.16}\\ 0, & \text { otherwise }\end{cases}
$$

and

$$
\operatorname{Ext}_{G, \omega_{\pi}^{\langle r\rangle}}^{i, \infty}\left(v_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{G}(\pi), i_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}}^{G}(\pi)\right)= \begin{cases}\overline{\mathcal{S}}_{J}^{i-\left|\Delta_{n}(k) \backslash I\right|}, & I \cup J=\Delta_{n}(k)  \tag{6.17}\\ 0, & \text { otherwise }\end{cases}
$$

We now compute the smooth Ext ${ }^{i}$-groups of smooth generalized parabolic Steinberg representations.
Proposition 6.9. Let $J \subseteq I$ be subsets of $\Delta_{n}(k)$ such that $|I|=|J|+1$. Assume that $I=J \cup\{v r\}$ for some $1 \leq v \leq k-1$. We have

$$
\begin{equation*}
X_{E}^{*}\left(\mathbf{L}_{\Delta_{k, v}}^{\langle r\rangle} / \mathbf{Z}_{n}\right) \xrightarrow{\sim} \operatorname{Ext}_{G, \omega_{\pi}^{\langle r\rangle}}^{1, \infty}\left(v_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{\infty}(\pi), v_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}}^{\infty}(\pi)\right) \xrightarrow{\sim} \operatorname{Ext}_{G}^{1, \infty}\left(v_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{\infty}(\pi), v_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}}^{\infty}(\pi)\right) . \tag{6.18}
\end{equation*}
$$

and $\operatorname{Ext}_{G}^{i, \infty}\left(v_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{\infty}(\pi), v_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}}^{\infty}(\pi)\right)=0$ for all $i \neq 1$.
Proof. Using the fact $\operatorname{Hom}_{G}\left(v_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}}^{\infty}(\pi), v_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{\infty}(\pi)\right)=0$ (see Lemma 6.4 (4)), we deduce the second isomorphism of (6.18) from [9, Lemma 3.1] or [31, Lemma 3.2]. We apply the acyclic complex of Proposition 4.3, i.e.,

$$
\begin{equation*}
0 \rightarrow C_{J, k-1}^{\infty} \rightarrow C_{J, k-2}^{\infty} \rightarrow C_{J, k-3}^{\infty} \rightarrow \cdots \rightarrow C_{J, 1}^{\infty} \rightarrow C_{J, 0}^{\infty}=i_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}}^{\infty}(\pi) \rightarrow v_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}}^{\infty}(\pi) \rightarrow 0 \tag{6.19}
\end{equation*}
$$

to the representation $v_{\overline{\mathbf{P}}}^{J}{ }_{J}^{\langle r\rangle}(\pi)$. By the same arguments as [28, Page 626, proof of Theorem 1], we first choose a projective resolution of $v_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{\infty}(\pi)$ (recall that $\operatorname{Rep}_{E}^{\infty}(G)$ has enough projectives, see the beginning of [28, Section 3] or Section 2.3). Then we get a double complex such that its associated spectral sequence converges:

$$
\begin{equation*}
E_{1}^{-s, r}=\bigoplus_{\substack{J \subseteq K \subseteq \Delta_{n}(k) \\|K \backslash J|=s}} \operatorname{Ext}_{G, \omega_{\pi}^{\langle r\rangle}}^{r, \infty}\left(v_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{\infty}(\pi), i i_{\overline{\mathbf{P}}_{K}^{\langle r\rangle}}^{G}(\pi)\right) \Rightarrow \operatorname{Ext}_{G, \omega_{\pi}^{\langle r\rangle}}^{r-s, \infty}\left(v_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{\infty}(\pi), v_{\overline{\mathbf{P}}_{J}^{\langle r\rangle}}^{\infty}(\pi)\right) . \tag{6.20}
\end{equation*}
$$

By Proposition 6.8, we see that $S:=J \cup\left(\Delta_{n}(k) \backslash I\right)=\Delta_{k, v}$ is the minimal subset $S$ of $\Delta_{n}(k)$ containing $J$ with $\operatorname{Ext}_{G, \omega_{\pi}^{\langle r\rangle}}^{r, \infty}\left(v_{\overline{\mathbf{P}}_{I}^{\langle r\rangle}}^{\infty}(\pi), i \overline{\overline{\mathbf{P}}}_{K}^{G r\rangle}(\pi)\right) \neq 0$. Hence, the $h$-th row of the $E_{1}$-page of the above spectral sequence is given by

$$
\begin{align*}
& 0 \longrightarrow \overline{\mathcal{S}}_{\Delta_{n}(k)}^{h-\left|\Delta_{n}(k) \backslash I\right|} \longrightarrow \bigoplus_{\substack{S \subseteq K \subseteq \Delta_{n}(k) \\
\left|\Delta_{n}(k) \backslash K\right|=1}} \overline{\mathcal{S}}_{K}^{h-\left|\Delta_{n}(k) \backslash I\right|} \longrightarrow \cdots \\
& \longrightarrow \bigoplus_{\substack{S \subseteq K \subseteq \Delta_{n}(k) \\
|K \backslash S|=1}} \overline{\mathcal{S}}_{K}^{h-\left|\Delta_{n}(k) \backslash I\right|} \longrightarrow \overline{\mathcal{S}}_{S}^{h-\left|\Delta_{n}(k) \backslash I\right|} \longrightarrow 0 . \tag{6.21}
\end{align*}
$$

Only the objects in the $-(k-1-|J|)$-th and $-(k-2-|J|)$-th columns of the $E_{1}$-page can be non-zero. By Lemma 6.6 , the $\left|\Delta_{n}(k) \backslash I\right|+1$-th row is given by

$$
\begin{array}{ccc}
X_{E}^{*}\left(\mathbf{L}_{\Delta_{n}(k)}^{\langle r\rangle} / \mathbf{Z}_{n}\right) & \longrightarrow & X_{E}^{*}\left(\mathbf{L}_{\Delta_{k, v}}^{\langle r\rangle} / \mathbf{Z}_{n}\right) \\
E_{1}^{-(k-1-|J|),\left|\Delta_{n}(k) \backslash I\right|+1} & \xrightarrow{d_{1}^{-(k-1-|J|),\left|\Delta_{n}(k) \backslash I\right|+1}} & E_{1}^{-(k-2-|J|),\left|\Delta_{n}(k) \backslash I\right|+1}
\end{array} .
$$

For $d \geq 2$, the $\left|\Delta_{n}(k) \backslash I\right|+d$-th row is given by

$$
\begin{array}{ccc}
\bigwedge^{d} X_{E}^{*}\left(\mathbf{L}_{\Delta_{n}(k)}^{\langle r\rangle} / \mathbf{Z}_{n}\right) & \longrightarrow & \bigwedge^{d} X_{E}^{*}\left(\mathbf{L}_{\Delta k, v}^{\langle r\rangle} / \mathbf{Z}_{n}\right) \\
E_{1}^{-(k-1-|J|),\left|\Delta_{n}(k) \backslash I\right|+d} & \xrightarrow{d_{1}^{-(k-1-|J|),\left|\Delta_{n}(k) \backslash I\right|+2}} & E_{1}^{-(k-2-|J|),\left|\Delta_{n}(k) \backslash I\right|+d}
\end{array} .
$$

Note that $X_{E}^{*}\left(\mathbf{L}_{\Delta_{n}(k)}^{\langle r\rangle} / \mathbf{Z}_{n}\right)=0$ and $\bigwedge^{d} X_{E}^{*}\left(\mathbf{L}_{\Delta_{k, i}}^{\langle r\rangle} / \mathbf{Z}_{n}\right)$ for all $d \geq 2$. We thus have

$$
\begin{aligned}
& E_{2}^{-(k-2-|J|),\left|\Delta_{n}(k) \backslash I\right|+1}=E_{1}^{-(k-2-|J|),\left|\Delta_{n}(k) \backslash I\right|+1} / \operatorname{Im}\left(d_{1}^{-(k-1-|J|),\left|\Delta_{n}(k) \backslash I\right|+1}\right)=X_{E}^{*}\left(\mathbf{L}_{\Delta_{k, v}}^{\langle r\rangle} / \mathbf{Z}_{n}\right), \\
& E_{2}^{-(k-2-|J|),\left|\Delta_{n}(k) \backslash I\right|+d}=E_{2}^{-(k-1-|J|),\left|\Delta_{n}(k) \backslash I\right|+1}=E_{2}^{-(k-1-|J|),\left|\Delta_{n}(k) \backslash I\right|+d}=0,
\end{aligned}
$$

for all $d \geq 2$. The results follow from Lemma 5.3 (b).
