# Solution to a problem of Katona on counting cliques of weighted graphs 

Peter Borg* Carl Feghali ${ }^{\dagger}$ Rémi Pellerin ${ }^{\ddagger}$

#### Abstract

A subset $I$ of the vertex set $V(G)$ of a graph $G$ is called a $k$-clique independent set of $G$ if no $k$ vertices in $I$ form a $k$-clique of $G$. An independent set is a 2 -clique independent set. Let $\pi_{k}(G)$ denote the number of $k$-cliques of $G$. For a function $w: V(G) \rightarrow\{0,1,2, \ldots\}$, let $G(w)$ be the graph obtained from $G$ by replacing each vertex $v$ by a $w(v)$-clique $K^{v}$ and making each vertex of $K^{u}$ adjacent to each vertex of $K^{v}$ for each edge $\{u, v\}$ of $G$. For an integer $m \geq 1$, consider any $w$ with $\sum_{v \in V(G)} w(v)=m$. For $U \subseteq V(G)$, we say that $w$ is uniform on $U$ if $w(v)=0$ for each $v \in V(G) \backslash U$ and, for each $u \in U, w(u)=\lfloor m /|U|\rfloor$ or $w(u)=\lceil m /|U|\rceil$. Katona asked if $\pi_{k}(G(w))$ is smallest when $w$ is uniform on a largest $k$-clique independent set of $G$. He placed particular emphasis on the Sperner graph $B_{n}$, given by $V\left(B_{n}\right)=$ $\{X: X \subseteq\{1, \ldots, n\}\}$ and $E\left(B_{n}\right)=\left\{\{X, Y\}: X \subsetneq Y \in V\left(B_{n}\right)\right\}$. He provided an affirmative answer for $k=2$ (and any $G$ ). We determine graphs for which the answer is negative for every $k \geq 3$. These include $B_{n}$ for $n \geq 2$. Generalizing Sperner's Theorem and a recent result of Qian, Engel and Xu, we show that $\pi_{k}\left(B_{n}(w)\right)$ is smallest when $w$ is uniform on a largest independent set of $B_{n}$. We also show that the same holds for complete multipartite graphs and chordal graphs. We show that this is not true of every graph, using a deep result of Bohman on triangle-free graphs.

## 1 Introduction

Let $\mathbb{N}$ denote set of positive integers, and let $\mathbb{N}_{0}$ denote $\{0\} \cup \mathbb{N}$. For $n \in \mathbb{N}_{0}$, let $[n]$ denote the $n$-set $\{i \in \mathbb{N}: i \leq n\}$ (note that $[0]=\varnothing$ ). For a set $X$, let $2^{X}$ denote the power set of $X(\{A: A \subseteq X\})$ and, for $k \in \mathbb{N}_{0}$, let $\binom{X}{k}$ denote $\left\{A \in 2^{X}:|A|=k\right\}$.

A family $\mathcal{A}$ of sets is called an antichain or a Sperner family if $A \nsubseteq B$ for every $A, B \in \mathcal{A}$ with $A \neq B$. A cornerstone in extremal set theory is Sperner's Theorem [12], which bounds the size of an antichain.

[^0]Theorem 1 (Sperner's Theorem [12]). If $\mathcal{A} \subseteq 2^{[n]}$ and $\mathcal{A}$ is an antichain, then

$$
|\mathcal{A}| \leq\binom{ n}{\left\lceil\frac{n}{2}\right\rceil} .
$$

There have been many generalizations, extensions and variants of Theorem 1; see, for example, [4, 5, 6, 9]. Of particular relevance to this paper is a generalization due to Qian, Engel and Xu [11] in which repetition of sets is allowed. A multifamily is a pair $(\mathcal{F}, q)$ such that $\mathcal{F}$ is a family and $q$ is a function with domain $\mathcal{F}$ and codomain $\mathbb{N}_{0}$. A multifamily can be viewed as a family $\mathcal{F}$ such that, for each $F \in \mathcal{F}, F$ appears $q(F)$ times. Let

$$
\theta(\mathcal{F}, q)=\sum_{F \in \mathcal{F}}\binom{q(F)}{2}+\sum_{F, F^{\prime} \in \mathcal{F}: F \subseteq F^{\prime}} q(F) q\left(F^{\prime}\right)
$$

Theorem 2 (Qian, Engel and Xu [11]). For any $n \geq 1$ and $m \geq 1$, the minimum of $\theta(\mathcal{F}, q)$ over all multifamilies $(\mathcal{F}, q)$ with $\mathcal{F} \subseteq 2^{[n]}$ and $\sum_{F \in \mathcal{F}} q(F)=m$ is attained if $\mathcal{F} \in\left\{\binom{[n]}{[n / 2\rfloor},\binom{[n]}{[n / 2\rceil}\right\}$ and $q(F) \in\{\lfloor m /|\mathcal{F}|\rfloor,\lceil m /|\mathcal{F}|\rceil\}$ for each $F \in \mathcal{F}$.

Qian, Engel and Xu actually proved that the result holds for the quantity $\theta(\mathcal{F}, q)+\sum_{F \in \mathcal{F}}\binom{q(F)}{2}$ rather than $\theta(\mathcal{F}, q)$ [11, Theorem 1.1], but Theorem 2 follows from this and Theorem [1.

Recently, Katona [8] obtained a far-reaching generalization of Theorem 2, To be able to state his result, we require a number of definitions.

As usual, we denote the vertex set and the edge set of a graph $G$ by $V(G)$ and $E(G)$, respectively. We take any graph $G$ to be simple, that is, $G=(V(G), E(G))$ with $E(G) \subseteq$ $\binom{V(G)}{2}$. We may represent any edge $\{u, v\}$ by uv. The open neighbourhood $N_{G}(v)$ of a vertex $v$ of $G$ is the set of neighbours of $v$, that is, $N_{G}(v)=\{u \in V(G): u v \in E(G)\}$. The closed neighbourhood $N_{G}[v]$ of $v$ is the set $N_{G}(v) \cup\{v\}$. For $X \subseteq V(G), G[X]$ denotes the subgraph of $G$ induced by $X$, that is, $G[X]=\left(X, E(G) \cap\binom{X}{2}\right)$.

For a graph $G$ and a (weight) function $w: V(G) \rightarrow \mathbb{N}_{0}$, let $G(w)$ be the graph obtained from $G$ by replacing each vertex $v$ by a $w(v)$-clique $K^{v}$ and making each vertex of $K^{u}$ adjacent to each vertex of $K^{v}$ for each edge $u v$ of $G$. More formally, $G(w)$ is given by

$$
V(G(w))=\{(v, i): v \in V(G), i \in[w(v)]\}
$$

and

$$
E(G(w))=\bigcup_{v \in V(G)}\binom{\{(v, i): i \in[w(v)]\}}{2} \cup \bigcup_{u v \in E(G)}\{(u, i)(v, j): i \in[w(u)], j \in[w(v)]\}
$$

We call $w$ an $m$-weighting of $G$, where $m=\sum_{v \in V(G)} w(v)$. For $k \geq 1$, let $\mathcal{K}_{k}(G)$ denote the set of vertex sets of $k$-cliques ( $k$-vertex complete subgraphs) of $G$, and let $\pi_{k}(G)$ denote
the number of $k$-cliques of $G$. Thus, $\pi_{k}(G)=\left|\mathcal{K}_{k}(G)\right|$. Observe that the number of edges of $G(w)$ is

$$
\pi_{2}(G(w))=\sum_{v \in V(G)}\binom{w(v)}{2}+\sum_{u v \in E(G)} w(u) w(v)
$$

and for any $k \geq 1$,

$$
\pi_{k}(G(w))=\sum_{i=1}^{k} \sum_{\substack{\left\{v_{1}, \ldots, v_{i}\right\} \in \mathcal{K}_{i}(G)}} \sum_{\substack{k_{1}+\cdots+k_{i}=k \\ k_{1}, \ldots, k_{i} \geq 1}} \prod_{j=1}^{i}\binom{w\left(v_{j}\right)}{k_{j}} .
$$

Given an $m$-weighting $w$ of $G$ and a subset $U$ of $V(G)$, we say that $w$ is uniform on $U$ if $w(v)=0$ for each $v \in V(G) \backslash U$ and, for each $u \in U, w(u)=\lfloor m /|U|\rfloor$ or $w(u)=\lceil m /|U|\rceil$. If $U$ is an independent set of $G$ (that is, $u v \notin E(G)$ for every $u, v \in U$ ) of maximum size and $w$ is uniform on $U$, then, as in [8], $w$ is said to be uniform- $\alpha$.

For $n \geq 1$, let $B_{n}$ be the Sperner graph given by $V\left(B_{n}\right)=2^{[n]}$ and $E(G)=\{X Y: X \subsetneq$ $\left.Y \in 2^{[n]}\right\}$. Note that Sperner's Theorem gives us the size of a largest independent set of $B_{n}$. Theorem [2 may thus be restated as follows.

Theorem 3. If $n \geq 1, m \geq 1, w$ and $w^{\prime}$ are $m$-weightings of $B_{n}$, and $w^{\prime}$ is uniform- $\alpha$, then $\pi_{2}\left(B_{n}\left(w^{\prime}\right)\right) \leq \pi_{2}\left(B_{n}(w)\right)$.

Rather surprisingly, Katona showed that Theorem 3 can be generalized to arbitrary graphs.
Theorem 4 (Katona [8]). If $m \geq 1, w$ and $w^{\prime}$ are $m$-weightings of a graph $G$, and $w^{\prime}$ is uniform- $\alpha$, then $\pi_{2}\left(G\left(w^{\prime}\right)\right) \leq \pi_{2}(G(w))$.
He then asked the general question below. For a graph $G$ and $k \geq 1$, we call a subset $I$ of $V(G)$ a $k$-clique independent set of $G$ if no $k$-element subset of $I$ is a member of $\mathcal{K}_{k}(G)$ (that is, $\binom{I}{k} \cap \mathcal{K}_{k}(G)=\varnothing$ ). Let the size of a largest $k$-clique independent set of $G$ be denoted by $\alpha_{k}(G)$ and called the $k$-clique independence number of $G$.
Problem 1 ([8, Problem 3]). Is it true that if $m \geq 1, k \geq 2, w$ and $w^{\prime}$ are $m$-weightings of a graph $G$, and $w^{\prime}$ is uniform on a largest $k$-clique independent set of $G$, then $\pi_{k}\left(G\left(w^{\prime}\right)\right) \leq$ $\pi_{k}(G(w))$ ?

Theorem 4 provides a positive answer to Problem 1 for $k=2$. Unfortunately, if $k \geq 3$, one cannot hope for a positive answer to Problem 1, as shown in the following counterexample and in Section 4 (see Remarks 1 and 2).

Counterexample 1. Let $G$ be the 3 -vertex path ( $\{a, b, c\},\{a b, b c\}$ ), let $k \geq 3$, let $w^{\prime}$ be the $3 k$-weighting of $G$ that is uniform on $V(G)$, and let $w$ be the $3 k$-weighting of $G$ defined by $w(a)=w^{\prime}(a)+w^{\prime}(b), w(b)=0$, and $w(c)=w^{\prime}(c)$. Note that $V(G)$ is the largest $k$-clique independent set of $G$. We have

$$
\pi_{k}\left(G\left(w^{\prime}\right)\right)=\binom{w^{\prime}(a)+w^{\prime}(b)}{k}+\binom{w^{\prime}(b)+w^{\prime}(c)}{k}-\binom{w^{\prime}(b)}{k}=2\binom{2 k}{k}-\binom{k}{k}
$$

$$
\pi_{k}(G(w))=\binom{w^{\prime}(a)+w^{\prime}(b)}{k}+\binom{w^{\prime}(c)}{k}=\binom{2 k}{k}+\binom{k}{k}
$$

and hence $\pi_{k}(G(w))<\pi_{k}\left(G\left(w^{\prime}\right)\right)$.
As our primary contribution, we completely address Problem 1 for Sperner graphs, thereby answering another question of Katona [8, Problem 3].

Theorem 5. If $n \geq 1, m \geq 1, k \geq 2, w$ and $w^{\prime}$ are $m$-weightings of $B_{n}$, and $w^{\prime}$ is uniform on $\binom{[n]}{[n / 2\rceil}$, then $\pi_{k}\left(B_{n}\left(w^{\prime}\right)\right) \leq \pi_{k}\left(B_{n}(w)\right)$.

Theorem [5 generalizes the inequalities in Theorems 1 and 3. Indeed, let $\mathcal{A} \subseteq 2^{[n]}$ such that $\mathcal{A}$ is an antichain. Let $w_{1}$ and $w_{2}$ be $\left(\binom{n}{\lceil n / 2\rceil}+1\right)$-weightings of $B_{n}$ such that $w_{1}$ is uniform on $\mathcal{A}$ and $w_{2}$ is uniform on $\binom{[n]}{[n / 2\rceil}$. Note that $\pi_{2}\left(B_{n}\left(w_{2}\right)\right)=1$. Thus, by Theorem 5, $\pi_{2}\left(B_{n}\left(w_{1}\right)\right) \geq 1$. The inequality in Theorem 1 follows. Now, by Theorem 1 , $w^{\prime}$ is uniform- $\alpha$. By Theorem 5 for $k=2$, Theorem 3 follows.

Remark 1. In [8, Problem 3], Katona placed particular emphasis on solving Problem 1 for $G=B_{n}$. Theorem 5 already tells us how to minimize $\pi_{k}\left(B_{n}(w)\right)$. In Section 4, we show that, furthermore, the answer to Problem 1 for $G=B_{n}$ is negative if $n \geq 2, k \geq 3$, and $m \geq k \alpha_{k}\left(B_{n}\right)$.

We also address Problem 1 for complete multipartite graphs and chordal graphs.
If $I_{1}, \ldots, I_{r}$ are pairwise disjoint non-empty sets and $G$ is the graph with $V(G)=\bigcup_{i=1}^{r} I_{i}$ and $E(G)=\bigcup_{\{i, j\} \in\binom{[r]}{2}}\left\{x y: x \in I_{i}, y \in I_{j}\right\}$, then $G$ is called a complete multipartite graph, and $I_{1}, \ldots, I_{r}$ are called the maximal partite sets of $G$.

Theorem 6. If $m \geq 1, k \geq 2, w$ and $w^{\prime}$ are $m$-weightings of a complete multipartite graph $G$, and $w^{\prime}$ is uniform- $\alpha$, then $\pi_{k}\left(G\left(w^{\prime}\right)\right) \leq \pi_{k}(G(w))$.

Remark 2. In Section 4, we show that, furthermore, if $G$ is a complete multipartite graph with a maximal partite set $I$ that is larger than the others, $k \geq 3$, and $m \geq k \alpha_{k}(G)$, then the answer to Problem 1 is negative. Note that Counterexample 1 is the special case where the maximal partite sets of $G$ are $\{a, c\}$ and $\{b\}$.

Let $\mathcal{K}(G)$ denote the set of vertex sets of cliques of $G$; that is, $\mathcal{K}(G)=\bigcup_{k=1}^{|V(G)|} \mathcal{K}_{k}(G)$. A graph $G$ is said to be chordal if for some sequence $v_{1}, \ldots, v_{n}$ such that $V(G)=\left\{v_{1}, \ldots, v_{n}\right\}$ and $n=|V(G)|, N_{G}\left[v_{i}\right] \backslash\left\{v_{j}: j \in[i-1]\right\} \in \mathcal{K}(G)$ for each $i \in[n]$.

Theorem 7. If $m \geq 1, k \geq 2, w$ and $w^{\prime}$ are m-weightings of a chordal graph $G$, and $w^{\prime}$ is uniform- $\alpha$, then $\pi_{k}\left(G\left(w^{\prime}\right)\right) \leq \pi_{k}(G(w))$.

In view of Theorems 5-7, one may wonder whether the minimum of $\pi_{k}(G(w))$ is always attained when $w$ is uniform $-\alpha$. We show this to be false for $k=3$, using a result on triangle-free graphs (graphs containing no 3-clique) due to Bohman [2].

Theorem 8. There exist a graph $G$, a positive integer $m$, and an $m$-weighting $w$ of $G$ such that $\pi_{3}(G(w))<\pi_{3}\left(G\left(w^{\prime}\right)\right)$ for every uniform- $\alpha$ m-weighting $w^{\prime}$ of $G$.

We propose the following conjecture.
Conjecture 1. If $m \geq 1, k \geq 2$, and $G$ is a graph, then for some $k$-clique independent set I of $G$ and some $m$-weighting $w^{\prime}$ of $G$ that is uniform on $I, \pi_{k}\left(G\left(w^{\prime}\right)\right) \leq \pi_{k}(G(w))$ for any $m$-weighting $w$ of $G$.

The paper is organized as follows. Section 2 contains basic tools that are used in the proofs of Theorems 5-7. In Section 3, we establish a general weight shifting lemma from which Theorems 57 follow, and we prove Theorems 6 and 7. In Section 4, we prove our main results, given by Theorems 5 and 8 and the claims in Remarks 1 and 2 ,

## 2 Basic lemmas

The following known fact is very useful, and we prove it for completeness.
Lemma 1. If $n \geq 1, m \geq 1, k \geq 2, w$ and $w^{\prime}$ are $m$-weightings of an $n$-vertex graph $G$ with no edges, and $w^{\prime}$ is uniform- $\alpha$, then $\pi_{k}\left(G\left(w^{\prime}\right)\right) \leq \pi_{k}(G(w))$.

Remark 3. Let $k, G$, and $w^{\prime}$ be as in Lemma 1. Thus, $w^{\prime}(v) \in\{\lfloor m / n\rfloor,\lceil m / n\rceil\}$ for each $v \in V(G)$. By the division algorithm, $m=\lfloor m / n\rfloor n+r$ for some $r \in\{0\} \cup[n-1]$. If $r=0$, then $\lfloor m / n\rfloor=m / n=\lceil m / n\rceil$. Suppose $r \neq 0$. Then, $m / n>\lfloor m / n\rfloor=\lceil m / n\rceil-1$. Since $\sum_{v \in V(G)} w^{\prime}(v)=m$, we obtain $\left|\left\{v \in V(G): w^{\prime}(v)=\lfloor m / n\rfloor\right\}\right|=n-r$ and $\mid\{v \in$ $\left.V(G): w^{\prime}(v)=\lceil m / n\rceil\right\} \mid=r$. Therefore, if $w_{1}$ and $w_{2}$ are uniform- $\alpha$ m-weightings of $G$, then $\pi_{k}\left(G\left(w_{1}\right)\right)=\pi_{k}\left(G\left(w_{2}\right)\right)$.

Proof of Lemma 1. Let $v_{1}, v_{2} \in V(G)$ such that $w\left(v_{1}\right)=\min \{w(v): v \in V(G)\}$ and $w\left(v_{2}\right)=\max \{w(v): v \in V(G)\}$. Since $\sum_{v \in V(G)} w(v)=m$, we have $w\left(v_{1}\right) \leq m / n$ and $w\left(v_{2}\right) \geq m / n$. Since $w(v) \in \mathbb{N}_{0}$ for each $v \in V(G), w\left(v_{1}\right) \leq\lfloor m / n\rfloor$ and $w\left(v_{2}\right) \geq\lceil m / n\rceil$. If $w\left(v_{1}\right)=\lfloor m / n\rfloor$ and $w\left(v_{2}\right)=\lceil m / n\rceil$, then $w$ is uniform- $\alpha$, so $\pi_{k}\left(G\left(w^{\prime}\right)\right)=\pi_{k}(G(w))$ by Remark 3. Suppose $w\left(v_{1}\right) \neq\lfloor m / n\rfloor$ or $w\left(v_{2}\right) \neq\lceil m / n\rceil$. Then, $w\left(v_{1}\right) \leq\lfloor m / n\rfloor-1$ or $w\left(v_{2}\right) \geq\lceil m / n\rceil+1$.

Suppose $w\left(v_{1}\right) \leq\lfloor m / n\rfloor-1$. Let $w_{1}$ be the $m$-weighting of $G$ such that $w_{1}\left(v_{1}\right)=$ $w\left(v_{1}\right)+1, w_{1}\left(v_{2}\right)=w\left(v_{2}\right)-1$, and $w_{1}(v)=w(v)$ for each $v \in V(G) \backslash\left\{v_{1}, v_{2}\right\}$. We have

$$
\begin{align*}
\pi_{k}(G(w))-\pi_{k}\left(G\left(w_{1}\right)\right) & =\binom{w\left(v_{2}\right)}{k}-\binom{w\left(v_{2}\right)-1}{k}+\binom{w\left(v_{1}\right)}{k}-\binom{w\left(v_{1}\right)+1}{k} \\
& =\binom{w\left(v_{2}\right)-1}{k-1}-\binom{w\left(v_{1}\right)}{k-1} \geq 0 \tag{1}
\end{align*}
$$

as $w\left(v_{2}\right)-1 \geq w\left(v_{1}\right)$ and $k-1 \geq 1$. Thus, $\pi_{k}(G(w)) \geq \pi_{k}\left(G\left(w_{1}\right)\right)$. We apply this procedure until we obtain an $m$-weighting $w_{p}$ of $G$ such that $\min \left\{w_{p}(v): v \in V(G)\right\}=$
$\lfloor m / n\rfloor$. We have $\pi_{k}(G(w)) \geq \pi_{k}\left(G\left(w_{p}\right)\right)$. Let $v_{p, 1}, v_{p, 2} \in V(G)$ such that $w_{p}\left(v_{p, 1}\right)=\lfloor m / n\rfloor$ and $w_{p}\left(v_{p, 2}\right)=\max \left\{w_{p}(v): v \in V(G)\right\}$. If $w_{p}\left(v_{p, 2}\right)=\lceil m / n\rceil$, then $w_{p}$ is uniform- $\alpha$, so $\pi_{k}\left(G\left(w^{\prime}\right)\right)=\pi_{k}\left(G\left(w_{p}\right)\right)$ by Remark 3. Suppose $w_{p}\left(v_{p, 2}\right) \neq\lceil m / n\rceil$. Since $w_{p}\left(v_{p, 2}\right) \geq\lceil m / n\rceil$, we obtain $w_{p}\left(v_{p, 2}\right) \geq\lceil m / n\rceil+1$. Since $\sum_{v \in V(G)} w_{p}(v)=m, m / n>\lfloor m / n\rfloor=w_{p}(u)$ for some $u \in V(G) \backslash\left\{v_{p, 1}\right\}$. Let $w_{p+1}$ be the $m$-weighting of $G$ such that $w_{p+1}(u)=w_{p}(u)+1$, $w_{p+1}\left(v_{p, 2}\right)=w_{p}\left(v_{p, 2}\right)-1$, and $w_{p+1}(v)=w_{p}(v)$ for each $v \in V(G) \backslash\left\{u, v_{p, 2}\right\}$. As in (1), we obtain $\pi_{k}\left(G\left(w_{p}\right)\right) \geq \pi_{k}\left(G\left(w_{p+1}\right)\right)$. We apply this procedure until we obtain an $m$ weighting $w_{q}$ of $G$ such that $\max \left\{w_{q}(v): v \in V(G)\right\}=\lceil m / n\rceil$. Since $w_{q}\left(v_{p, 1}\right)=\lfloor m / n\rfloor=$ $\min \left\{w_{q}(v): v \in V(G)\right\}, w_{q}$ is uniform- $\alpha$, so $\pi_{k}\left(G\left(w^{\prime}\right)\right)=\pi_{k}\left(G\left(w_{q}\right)\right)$ by Remark 3,

If $w\left(v_{2}\right) \geq\lceil m / n\rceil+1$, then $\pi_{k}\left(G\left(w^{\prime}\right)\right) \leq \pi_{k}(G(w))$ by a similar argument.
Lemma 2. If $n \geq 1, m \geq 1, k \geq 2, w$ and $w^{\prime}$ are $m$-weightings of an $n$-vertex graph $G$, $I$ and $I^{\prime}$ are independent sets of $G$ with $|I| \leq\left|I^{\prime}\right|, w(v)=0$ for each $v \in V(G) \backslash I$, and $w^{\prime}$ is uniform on $I^{\prime}$, then $\pi_{k}\left(G\left(w^{\prime}\right)\right) \leq \pi_{k}(G(w))$.

Proof. Let $u_{1}, \ldots, u_{r}$ be the distinct vertices in $I$. Let $v_{1}, \ldots, v_{s}$ be the distinct vertices in $I^{\prime}$. Then, $r \leq s$. Let $H=G\left[I^{\prime}\right]$. Let $w_{H}$ be the $m$-weighting of $H$ such that $w_{H}\left(v_{i}\right)=w\left(u_{i}\right)$ for each $i \in[r]$ and $w_{H}\left(v_{j}\right)=0$ for each $j \in[s] \backslash[r]$. Let $w_{H}^{\prime}$ be the uniform- $\alpha$ m-weighting of $H$ such that $w_{H}^{\prime}\left(v_{i}\right)=w^{\prime}\left(v_{i}\right)$ for each $i \in[s]$. By Lemma 1, $\pi_{k}\left(H\left(w_{H}^{\prime}\right)\right) \leq \pi_{k}\left(H\left(w_{H}\right)\right)$. Since $\pi_{k}\left(H\left(w_{H}^{\prime}\right)\right)=\pi_{k}\left(G\left(w^{\prime}\right)\right)$ and $\pi_{k}\left(H\left(w_{H}\right)\right)=\pi_{k}(G(w))$, the result follows.

## 3 A weight shifting lemma

In the proof of Theorem 4, Katona defined the following weight shifting operation along an edge. For a graph $G$, an $m$-weighting $w$ of $G$, and an edge $a b$ of $G$, let $w_{a b}$ be the $m$-weighting of $G$ given by

$$
w_{a b}(v)= \begin{cases}0 & \text { if } v=a \\ w(b)+w(a) & \text { if } v=b \\ w(v) & \text { otherwise }\end{cases}
$$

for each $v \in V(G)$. It was proved in [8] that $\pi_{2}\left(G\left(w_{a b}\right)\right) \leq \pi_{2}(G(w))$ or $\pi_{2}\left(G\left(w_{b a}\right)\right) \leq$ $\pi_{2}(G(w))$. Thus, by applying the weight shift operation repeatedly, one arrives at an $m$-weighting $w^{\prime}$ of $G$ such that $\pi_{2}\left(G\left(w^{\prime}\right)\right) \leq \pi_{2}(G(w))$ and $w^{\prime}$ is non-zero only on an independent set. Theorem 4 follows from this.

Remark 4. Unfortunately, for $k \geq 3$, Katona's shifting technique does not always decrease $\pi_{k}(G(w))$ or leave it unchanged. For instance, for $k=3$, consider the illustration in Figure [1. If we start with the $m$-weighting in Figure (1), then each shift produces a larger number of triangles, as demonstrated in Figures (b) and (c).

In view of the remark above, new ideas would therefore be needed to address Problem 1 Still, instead of shifting along one edge at a time, is shifting simultaneously along many edges at a time conceivable? In our main lemma, we show that this is indeed the case, provided a number of conditions are satisfied.

Figure 1: A weight shift along an edge

Lemma 3. If $m \geq 1, k \geq 2, w$ is an m-weighting of a graph $G, A=\left\{a_{1}, \ldots, a_{r}\right\}$ and $B=\left\{b_{1}, \ldots, b_{r}\right\}$ are disjoint $r$-element subsets of $V(G)$ such that

1. $a_{i} b_{i} \in E(G)$ for each $i \in[r]$,
2. $B$ is an independent set of $G$, and
3. $N_{G}\left(b_{i}\right) \backslash(A \cup\{v \in V(G): w(v)=0\}) \subseteq N_{G}\left(a_{i}\right)$ for each $i \in[r]$,
and $w^{\prime}$ is the $m$-weighting of $G$ given by

$$
w^{\prime}(v)= \begin{cases}0 & \text { if } v \in A \\ w\left(b_{i}\right)+w\left(a_{i}\right) & \text { if } v=b_{i} \text { for some } i \in[r], \\ w(v) & \text { otherwise }\end{cases}
$$

for each $v \in V(G)$, then $\pi_{k}\left(G\left(w^{\prime}\right)\right) \leq \pi_{k}(G(w))$.
Proof. Our strategy is to associate a unique $k$-clique of $G(w)$ to each $k$-clique of $G\left(w^{\prime}\right)$. More precisely, we construct an injective function from $\mathcal{K}_{k}\left(G\left(w^{\prime}\right)\right)$ to $\mathcal{K}_{k}(G(w))$. This gives us $\pi_{k}\left(G\left(w^{\prime}\right)\right) \leq \pi_{k}(G(w))$.

Let $\phi: V\left(G\left(w^{\prime}\right)\right) \rightarrow V(G(w))$ such that, for each $(v, i) \in V\left(G\left(w^{\prime}\right)\right)$,

$$
\phi((v, i))= \begin{cases}\left(a_{j}, i-w\left(b_{j}\right)\right) & \text { if } v=b_{j} \text { and } i \in\left[w\left(b_{j}\right)+w\left(a_{j}\right)\right] \backslash\left[w\left(b_{j}\right)\right] \\ (v, i) & \text { otherwise }\end{cases}
$$

Note that $\phi$ is bijective. We may abbreviate $\phi((v, i))$ to $\phi(v, i)$.
Consider any $X \in \mathcal{K}_{k}\left(G\left(w^{\prime}\right)\right)$. Thus, $G\left(w^{\prime}\right)[X]$ is a $k$-clique of $G\left(w^{\prime}\right)$. Let $\left(v_{1}, y_{1}\right), \ldots$, $\left(v_{k}, y_{k}\right)$ be the vertices in $X$. Let $\phi(X)$ denote $\left\{\phi\left(v_{1}, y_{1}\right), \ldots, \phi\left(v_{k}, y_{k}\right)\right\}$. Since $\phi$ is injective, $|\phi(X)|=k$. We show that $\phi(X) \in \mathcal{K}_{k}(G(w))$, that is, $\phi\left(v_{i}, y_{i}\right) \phi\left(v_{j}, y_{j}\right) \in E(G(w))$ for every $i, j \in[k]$ with $i \neq j$. If $\phi\left(v_{i}, y_{i}\right)=\left(v_{i}, y_{i}\right)$ and $\phi\left(v_{j}, y_{j}\right)=\left(v_{j}, y_{j}\right)$, then $y_{i} \in\left[w\left(v_{i}\right)\right]$, $y_{j} \in\left[w\left(v_{j}\right)\right]$, and, since $\left(v_{i}, y_{i}\right)\left(v_{j}, y_{j}\right) \in E\left(G\left(w^{\prime}\right)\right)\left(\right.$ as $\left.\left(v_{i}, y_{i}\right),\left(v_{j}, y_{j}\right) \in X \in \mathcal{K}_{k}\left(G\left(w^{\prime}\right)\right)\right)$, $\phi\left(v_{i}, y_{i}\right) \phi\left(v_{j}, y_{j}\right) \in E(G(w))$. Suppose $\phi\left(v_{i}, y_{i}\right) \neq\left(v_{i}, y_{i}\right)$ or $\phi\left(v_{j}, y_{j}\right) \neq\left(v_{j}, y_{j}\right)$. We may assume that $\phi\left(v_{i}, y_{i}\right) \neq\left(v_{i}, y_{i}\right)$. Thus, $v_{i}=b_{p}$ for some $p \in[r], y_{i} \notin\left[w\left(v_{i}\right)\right]$, and $\phi\left(v_{i}, y_{i}\right)=$ $\left(a_{p}, y\right)$ for some $y \in\left[w\left(a_{p}\right)\right]$. If $v_{j}=b_{p}$, then $\phi\left(v_{j}, y_{j}\right) \in\left(\left\{a_{p}\right\} \times\left[w\left(a_{p}\right)\right]\right) \cup\left(\left\{b_{p}\right\} \times\left[w\left(b_{p}\right)\right]\right)$,
and hence, since $a_{p} b_{p} \in E(G), \phi\left(v_{i}, y_{i}\right) \phi\left(v_{j}, y_{j}\right) \in E(G(w))$. Suppose $v_{j} \neq b_{p}$. Since $\left(v_{i}, y_{i}\right)\left(v_{j}, y_{j}\right) \in E\left(G\left(w^{\prime}\right)\right), v_{i} v_{j} \in E(G)$. Thus, $v_{j} \notin B$ as $v_{i} \in B$ and $B$ is an independent set of $G$. Since $\left(v_{j}, y_{j}\right) \in V\left(G\left(w^{\prime}\right)\right)$, we have $w^{\prime}\left(v_{j}\right) \neq 0$, so $v_{j} \notin A$. Since $v_{j} \notin A \cup B$, we have $\phi\left(v_{j}, y_{j}\right)=\left(v_{j}, y_{j}\right), y_{j} \in\left[w\left(v_{j}\right)\right]$, and hence $w\left(v_{j}\right) \neq 0$. Given that $N_{G}\left(b_{p}\right) \backslash$ $(A \cup\{v \in V(G): w(v)=0\}) \subseteq N_{G}\left(a_{p}\right), v_{j} \in N_{G}\left(a_{p}\right)\left(\right.$ as $\left.b_{p} v_{j}=v_{i} v_{j} \in E(G)\right)$. Thus, since $\phi\left(v_{i}, y_{i}\right) \phi\left(v_{j}, y_{j}\right)=\left(a_{p}, y\right)\left(v_{j}, y_{j}\right), \phi\left(v_{i}, y_{i}\right) \phi\left(v_{j}, y_{j}\right) \in E(G(w))$.

Let $\Phi: \mathcal{K}_{k}\left(G\left(w^{\prime}\right)\right) \rightarrow \mathcal{K}_{k}(G(w))$ such that $\Phi(X)=\phi(X)$ for each $X \in \mathcal{K}_{k}\left(G\left(w^{\prime}\right)\right)$. Suppose $\Phi\left(X_{1}\right)=\Phi\left(X_{2}\right)$ for some $X_{1}, X_{2} \in \mathcal{K}_{k}\left(G\left(w^{\prime}\right)\right)$. Let $\left(v_{1}, y_{1}\right), \ldots,\left(v_{k}, y_{k}\right)$ be the members of $X_{2}$. For each $i \in[k]$, let $\left(v_{i}^{\prime}, y_{i}^{\prime}\right)$ be the member of $X_{1}$ such that $\phi\left(v_{i}^{\prime}, y_{i}^{\prime}\right)=$ $\phi\left(v_{i}, y_{i}\right)$. Since $\phi$ is injective, $\left(v_{i}^{\prime}, y_{i}^{\prime}\right)=\left(v_{i}, y_{i}\right)$ for each $i \in[k]$. Thus, $X_{1}=X_{2}$. Therefore, $\Phi$ is injective, and hence the size of its domain $\mathcal{K}_{k}\left(G\left(w^{\prime}\right)\right)$ is at most the size of its codomain $\mathcal{K}_{k}(G(w))$.

We remark that the condition in Lemma 3 that $B$ is an independent set can be generalized to condition 2 in the next lemma, using the same argument.

Lemma 4. If $m \geq 1, k \geq 2, w$ is an $m$-weighting of a graph $G, A=\left\{a_{1}, \ldots, a_{r}\right\}$ and $B=\left\{b_{1}, \ldots, b_{r}\right\}$ are disjoint $r$-element subsets of $V(G)$ such that

1. $a_{i} b_{i} \in E(G)$ for each $i \in[r]$,
2. $a_{i} a_{j}, a_{i} b_{j}, a_{j} b_{i} \in E(G)$ for every $i, j \in[r]$ with $b_{i} b_{j} \in E(G)$, and
3. $N_{G}\left(b_{i}\right) \backslash(A \cup\{v \in V(G): w(v)=0\}) \subseteq N_{G}\left(a_{i}\right)$ for each $i \in[r]$,
and $w^{\prime}$ is the $m$-weighting of $G$ given by

$$
w^{\prime}(v)= \begin{cases}0 & \text { if } v \in A, \\ w\left(b_{i}\right)+w\left(a_{i}\right) & \text { if } v=b_{i} \text { for some } i \in[r], \\ w(v) & \text { otherwise }\end{cases}
$$

for each $v \in V(G)$, then $\pi_{k}\left(G\left(w^{\prime}\right)\right) \leq \pi_{k}(G(w))$.
We now provide the proofs of Theorems 6 and 7 , immediately demonstrating the applicability of Lemma 3. The lemma also has a crucial role in the proof of Theorem 5.

Proof of Theorem 6. Let $I_{1}, \ldots, I_{r}$ be the distinct maximal partite sets of $G$ such that $\left|I_{1}\right| \geq \cdots \geq\left|I_{r}\right|$. Note that $I_{1}, \ldots, I_{r}$ are independent sets of $G$. For each $j \in[r]$, let $n_{j}=\left|I_{j}\right|$ and let $a_{j, 1}, \ldots, a_{j, n_{j}}$ be the distinct vertices in $I_{j}$.

Let $W$ be the set of $m$-weightings of $G$. For each $w \in W$, let $h(w)=\max \{j \in$ $[r]: w(v) \neq 0$ for some $\left.v \in I_{j}\right\}$. Let $W^{*}=\left\{w^{*} \in W: \pi_{k}\left(G\left(w^{*}\right)\right) \leq \pi_{k}(G(w))\right.$ for each $w \in$ $W\}$. Let $w_{0} \in W^{*}$ such that $h\left(w_{0}\right) \leq h(w)$ for each $w \in W^{*}$.

Suppose $h\left(w_{0}\right)>1$. Let $s=h\left(w_{0}\right)$. Let $J=\left\{a_{s-1,1}, \ldots, a_{s-1, n_{s}}\right\}$. Since $J \subseteq I_{s-1}, J$ is an independent set of $G$. Since $G$ is a complete multipartite graph, $a_{s, i} a_{s-1, i} \in E(G)$ and $N_{G}\left(a_{s-1, i}\right) \backslash I_{s} \subseteq N_{G}\left(a_{s, i}\right)$ for each $i \in\left[n_{s}\right]$. Let $w_{1}$ be the $m$-weighting of $G$ such that $w_{1}\left(a_{s, i}\right)=0$ for each $i \in\left[n_{s}\right], w_{1}\left(a_{s-1, i}\right)=w_{0}\left(a_{s-1, i}\right)+w_{0}\left(a_{s, i}\right)$ for each $i \in\left[n_{s}\right]$, and
$w_{1}(v)=w_{0}(v)$ for each $v \in V(G) \backslash\left(I_{s} \cup J\right)$. By Lemma 3, $\pi_{k}\left(G\left(w_{1}\right)\right) \leq \pi_{k}\left(G\left(w_{0}\right)\right)$. We have $h\left(w_{1}\right)=h\left(w_{0}\right)-1$, contradicting the choice of $w_{0}$. Therefore, $s=1$.

We have shown that $w_{0}(v)=0$ for each $v \in V(G) \backslash I_{1}$. By Lemma 2, $\pi_{k}\left(G\left(w^{\prime}\right)\right) \leq$ $\pi_{k}\left(G\left(w_{0}\right)\right)$. Consequently, $w^{\prime} \in W^{*}$.

Proof of Theorem 7. We use induction on $|V(G)|+|E(G)|$. Let $n=|V(G)|$. The result is trivial if $n=1$ (the base case). Suppose $n \geq 2$. If $E(G)=\varnothing$, then the result is given by Lemma [1. Suppose $E(G) \neq \varnothing$. Since $G$ is chordal, there exists a sequence $v_{1}, \ldots, v_{n}$ such that $V(G)=\left\{v_{1}, \ldots, v_{n}\right\}$ and $N_{G}\left[v_{i}\right] \backslash\left\{v_{j}: j \in[i-1]\right\} \in \mathcal{K}(G)$ for each $i \in[n]$.

Suppose $N_{G}\left(v_{1}\right)=\varnothing$. Let $G_{1}=G\left[V(G) \backslash\left\{v_{1}\right\}\right]$ and $m_{1}=m-w\left(v_{1}\right)$. Let $w_{1}$ be the $m_{1}$-weighting of $G_{1}$ such that $w_{1}(v)=w(v)$ for each $v \in V\left(G_{1}\right)$. Let $w_{1}^{\prime}$ be a uniform- $\alpha$ $m_{1}$-weighting of $G_{1}$. Then, for some largest independent set $I_{1}$ of $G_{1}, w_{1}^{\prime}(v)=0$ for each $v \in V\left(G_{1}\right) \backslash I_{1}$ and, for each $u \in I_{1}, w_{1}^{\prime}(u)=\left\lfloor m_{1} /\left|I_{1}\right|\right\rfloor$ or $w_{1}^{\prime}(u)=\left\lceil m_{1} /\left|I_{1}\right|\right\rceil$. By the induction hypothesis, $\pi_{k}\left(G_{1}\left(w_{1}^{\prime}\right)\right) \leq \pi_{k}\left(G_{1}\left(w_{1}\right)\right)$. Let $w^{\prime \prime}$ be the $m$-weighting of $G$ such that $w^{\prime \prime}\left(v_{1}\right)=w\left(v_{1}\right)$ and $w^{\prime \prime}(v)=w_{1}^{\prime}(v)$ for each $v \in V\left(G_{1}\right)$. We have $\pi_{k}\left(G\left(w^{\prime \prime}\right)\right)=$ $\binom{w\left(v_{1}\right)}{k}+\pi_{k}\left(G_{1}\left(w_{1}^{\prime}\right)\right) \leq\binom{ w\left(v_{1}\right)}{k}+\pi_{k}\left(G_{1}\left(w_{1}\right)\right)=\pi_{k}(G(w))$. Since $N_{G}\left(v_{1}\right)=\varnothing,\left\{v_{1}\right\} \cup I_{1}$ is an independent set of $G$, so $\pi_{k}\left(G\left(w^{\prime}\right)\right) \leq \pi_{k}\left(G\left(w^{\prime \prime}\right)\right)$ by Lemma 2, Thus, $\pi_{k}\left(G\left(w^{\prime}\right)\right) \leq$ $\pi_{k}(G(w))$.

Now suppose $N_{G}\left(v_{1}\right) \neq \varnothing$. Let $h=\min \left\{i \in[n] \backslash\{1\}: v_{i} \in N_{G}\left(v_{1}\right)\right\}$. Let $w^{*}$ be the $m$-weighting of $G$ such that $w^{*}\left(v_{1}\right)=w\left(v_{1}\right)+w\left(v_{h}\right), w^{*}\left(v_{h}\right)=0$, and $w^{*}(v)=w(v)$ for each $v \in V(G) \backslash\left\{v_{1}, v_{h}\right\}$. By Lemma 3, $\pi_{k}\left(G\left(w^{*}\right)\right) \leq \pi_{k}(G(w))$. Let $G_{2}=G\left[V(G) \backslash\left\{v_{h}\right\}\right]$. Let $w_{2}$ be the $m$-weighting of $G_{2}$ such that $w_{2}(v)=w^{*}(v)$ for each $v \in V\left(G_{2}\right)$. Let $w_{2}^{\prime}$ be a uniform- $\alpha m$-weighting of $G_{2}$. By the induction hypothesis, $\pi_{k}\left(G_{2}\left(w_{2}^{\prime}\right)\right) \leq \pi_{k}\left(G_{2}\left(w_{2}\right)\right)$. Let $w^{\prime \prime}$ be the $m$-weighting of $G$ such that $w^{\prime \prime}\left(v_{h}\right)=0$ and $w^{\prime \prime}(v)=w_{2}^{\prime}(v)$ for each $v \in V\left(G_{2}\right)$. By Lemma 2, $\pi_{k}\left(G\left(w^{\prime}\right)\right) \leq \pi_{k}\left(G\left(w^{\prime \prime}\right)\right)$. Since $\pi_{k}\left(G\left(w^{\prime \prime}\right)\right)=\pi_{k}\left(G_{2}\left(w_{2}^{\prime}\right)\right) \leq \pi_{k}\left(G_{2}\left(w_{2}\right)\right)=$ $\pi_{k}\left(G\left(w^{*}\right)\right) \leq \pi_{k}(G(w))$, it follows that $\pi_{k}\left(G\left(w^{\prime}\right)\right) \leq \pi_{k}(G(w))$.

## 4 Proofs of the main results

In the proof of Theorem [5] we use the following well-known consequence of the Kőnig-Hall Theorem [10, 7]; see, for example, [3, page 7, Corollary 4].

Lemma 5. Let $r$ and $n$ be integers such that $0 \leq r \leq n$. If $r<n / 2$, then there exists an injection $f:\binom{[n]}{r} \rightarrow\binom{[n]}{r+1}$ such that $A \subset f(A)$ for each $A \in\binom{[n]}{r}$. If $r>n / 2$, then there exists an injection $f:\binom{[n]}{r} \rightarrow\binom{[n]}{r-1}$ such that $f(A) \subset A$ for each $A \in\binom{[n]}{r}$.
Proof of Theorem 5. Let $W$ be the set of $m$-weightings of $B_{n}$. For any $w \in W$, let $g(w)=\min \left\{i \in\{0\} \cup[n]: w(v) \neq 0\right.$ for some $\left.v \in\binom{[n]}{i}\right\}$ and $g^{\prime}(w)=\max \{i \in\{0\} \cup$ $[n]: w(v) \neq 0$ for some $\left.v \in\binom{[n]}{i}\right\}$, and let

$$
h(w)=\min \{\lceil n / 2\rceil, g(w)\} \quad \text { and } \quad h^{\prime}(w)=\max \left\{\lceil n / 2\rceil, g^{\prime}(w)\right\}
$$

Let $W^{*}=\left\{w^{*} \in W: \pi_{k}\left(G\left(w^{*}\right)\right) \leq \pi_{k}(G(w))\right.$ for each $\left.w \in W\right\}$. Let $w_{0} \in W^{*}$ such that $h^{\prime}\left(w_{0}\right)-h\left(w_{0}\right) \leq h^{\prime}(w)-h(w)$ for each $w \in W^{*}$. It suffices to show that $\pi_{k}\left(B_{n}\left(w^{\prime}\right)\right) \leq$ $\pi_{k}\left(B_{n}\left(w_{0}\right)\right)$.

Suppose $h\left(w_{0}\right)<\lceil n / 2\rceil$. Let $a_{1}, \ldots, a_{r}$ be the distinct members of $\binom{[n]}{h\left(w_{0}\right)}$. By Lemma号, there exist $r$ distinct members $b_{1}, \ldots, b_{r}$ of $\binom{[n]}{h\left(w_{0}\right)+1}$ such that $a_{1} b_{1}, \ldots, a_{r} b_{r} \in E\left(B_{n}\right)$. Let $I=\left\{a_{1}, \ldots, a_{r}\right\}$ and $J=\left\{b_{1}, \ldots, b_{r}\right\}$. For each $i \in\{0\} \cup[n],\binom{[n]}{i}$ is an independent set of $B_{n}$. Thus, $I$ and $J$ are independent sets of $B_{n}$. For any $i \in[r]$ and $c \in V\left(B_{n}\right)$ with $b_{i} \subset c$, we have $a_{i} \subset c$ as $a_{i} \subset b_{i}$. Thus, $N_{B_{n}}\left(b_{i}\right) \backslash\left(I \cup\left\{v \in V\left(B_{n}\right): w_{0}(v)=0\right\}\right) \subseteq N_{B_{n}}\left(a_{i}\right)$ for each $i \in[r]$. Let $w_{1}$ be the $m$-weighting of $B_{n}$ such that $w_{1}\left(a_{i}\right)=0$ for each $i \in[r]$, $w_{1}\left(b_{i}\right)=w_{0}\left(b_{i}\right)+w_{0}\left(a_{i}\right)$ for each $i \in[r]$, and $w_{1}(v)=w_{0}(v)$ for each $v \in V\left(B_{n}\right) \backslash(I \cup J)$. By Lemma 3, $\pi_{k}\left(B_{n}\left(w_{1}\right)\right) \leq \pi_{k}\left(B_{n}\left(w_{0}\right)\right)$. We have $h^{\prime}\left(w_{1}\right)-h\left(w_{1}\right)=h^{\prime}\left(w_{0}\right)-h\left(w_{0}\right)-1$, contradicting the choice of $w_{0}$. Therefore, $h\left(w_{0}\right)=\lceil n / 2\rceil$.

Suppose $h^{\prime}\left(w_{0}\right)>\lceil n / 2\rceil$. Let $a_{1}, \ldots, a_{r}$ be the distinct members of $\binom{[n]}{h^{\prime}\left(w_{0}\right)}$. By Lemma 5. there exist $r$ distinct members $b_{1}, \ldots, b_{r}$ of $\binom{[n]}{h^{\prime}\left(w_{0}\right)-1}$ such that $a_{1} b_{1}, \ldots, a_{r} b_{r} \in$ $E\left(B_{n}\right)$. Let $I=\left\{a_{1}, \ldots, a_{r}\right\}$ and $J=\left\{b_{1}, \ldots, b_{r}\right\}$. For any $i \in[r]$ and $c \in V\left(B_{n}\right)$ with $c \subset b_{i}$, we have $c \subset a_{i}$ as $b_{i} \subset a_{i}$. Thus, $N_{B_{n}}\left(b_{i}\right) \backslash\left(I \cup\left\{v \in V\left(B_{n}\right): w_{0}(v)=0\right\}\right) \subseteq N_{B_{n}}\left(a_{i}\right)$ for each $i \in[r]$. Let $w_{1}$ be the $m$-weighting of $B_{n}$ such that $w_{1}\left(a_{i}\right)=0$ for each $i \in[r]$, $w_{1}\left(b_{i}\right)=w_{0}\left(b_{i}\right)+w_{0}\left(a_{i}\right)$ for each $i \in[r]$, and $w_{1}(v)=w_{0}(v)$ for each $v \in V\left(B_{n}\right) \backslash(I \cup J)$. By Lemma 3, $\pi_{k}\left(B_{n}\left(w_{1}\right)\right) \leq \pi_{k}\left(B_{n}\left(w_{0}\right)\right)$. We have $h^{\prime}\left(w_{1}\right)-h\left(w_{1}\right)=h^{\prime}\left(w_{0}\right)-h\left(w_{0}\right)-1$, contradicting the choice of $w_{0}$. Therefore, $h^{\prime}\left(w_{0}\right)=\lceil n / 2\rceil$.

We have shown that $w_{0}(v)=0$ for each $v \in V\left(B_{n}\right) \backslash\binom{[n]}{[n / 2\rceil}$. By Lemma 2, $\pi_{k}\left(B_{n}\left(w^{\prime}\right)\right) \leq$ $\pi_{k}\left(B_{n}\left(w_{0}\right)\right)$. Consequently, $w^{\prime} \in W^{*}$.

We now show that, as stated in Remark [1, the answer to Problem [1 for $G=B_{n}$ is negative if $n \geq 2, k \geq 3$, and $m \geq k \alpha_{k}\left(B_{n}\right)$.

Theorem 9. If $n \geq 2, k \geq 3, m \geq k \alpha_{k}\left(B_{n}\right)$, $w$ and $w^{\prime}$ are $m$-weightings of $B_{n}$, $w$ is uniform- $\alpha$, and $w^{\prime}$ is uniform on a largest $k$-clique independent set of $G$, then $\pi_{k}(G(w))<$ $\pi_{k}\left(G\left(w^{\prime}\right)\right)$.

Proof. We build on the proof of Theorem 5. Let $w_{0}$ be an $m$-weighting of $B_{n}$ that is uniform on a largest $k$-clique independent set $I$ of $B_{n}$. For a contradiction, suppose $w_{0} \in W^{*}$. Since $m \geq k \alpha_{k}\left(B_{n}\right)=k|I|, w_{0}(v) \geq k$ for each $v \in I$. Let $M=\binom{[n]}{[n / 2\rceil}$ and $M^{\prime}=\binom{[n]}{[n / 2\rceil-1}$. Since $k \geq 3$ and $M \cup M^{\prime}$ is a 3 -clique independent set of $B_{n}$, $|I| \geq|M|+\left|M^{\prime}\right|$. Thus, $I \nsubseteq M$, and hence $h\left(w_{0}\right)<h^{\prime}\left(w_{0}\right)$.

Suppose $h\left(w_{0}\right)<\lceil n / 2\rceil$. Let $p=h^{\prime}\left(w_{0}\right)-\lceil n / 2\rceil$. Thus, $p \geq 0$. If $p>0$, then, as shown in the proof of Theorem 5, we can define a sequence $w_{1}, \ldots, w_{p}$ of $m$-weightings of $B_{n}$ such that, for each $i \in[p], h^{\prime}\left(w_{i}\right)=h^{\prime}\left(w_{i-1}\right)-1, \pi_{k}\left(B_{n}\left(w_{i}\right)\right) \leq \pi_{k}\left(B_{n}\left(w_{i-1}\right)\right)$, and hence $w_{i} \in W^{*}$. Note that $h^{\prime}\left(w_{p}\right)=\lceil n / 2\rceil$ and $h\left(w_{p}\right)=h\left(w_{0}\right)$. Let $q=p+\lceil n / 2\rceil-h\left(w_{0}\right)$. Since $h\left(w_{0}\right) \leq\lceil n / 2\rceil-1, q \geq p+1$. As shown in the proof of Theorem [5, we can define a sequence $w_{p+1}, \ldots, w_{q}$ of $m$-weightings of $B_{n}$ such that, for each $i \in[q-p], h\left(w_{p+i}\right)=h\left(w_{p+i-1}\right)+1$,
$h^{\prime}\left(w_{p+i}\right)=h^{\prime}\left(w_{p}\right)=\lceil n / 2\rceil, \pi_{k}\left(B_{n}\left(w_{p+i}\right)\right) \leq \pi_{k}\left(B_{n}\left(w_{p+i-1}\right)\right)$, and hence $w_{p+i} \in W^{*}$. Since $h\left(w_{q}\right)=\lceil n / 2\rceil=h^{\prime}\left(w_{q}\right)$,

$$
\begin{equation*}
w_{q}(v)=0 \text { for each } v \in V\left(B_{n}\right) \backslash M . \tag{2}
\end{equation*}
$$

Suppose $w_{q}(u)=0$ for some $u \in M$. Since $m \geq k|I|>k|M|$, $w_{q}\left(u^{\prime}\right)>k$ for some $u^{\prime} \in M$. Let $w_{q}^{\prime}$ be the $m$-weighting of $B_{n}$ such that $w_{q}^{\prime}(u)=1, w_{q}^{\prime}\left(u^{\prime}\right)=w_{q}\left(u^{\prime}\right)-1$, and $w_{q}^{\prime}(v)=w_{q}(v)$ for each $v \in V\left(B_{n}\right) \backslash\left\{u, u^{\prime}\right\}$. This gives us $\pi_{k}\left(B_{n}\left(w_{q}^{\prime}\right)\right)<\pi_{k}\left(B_{n}\left(w_{q}\right)\right)$, contradicting $w_{q} \in W^{*}$. Thus, $w_{q}(v)>0$ for each $v \in M$. Note that, since $w_{0}(v) \geq k$ for each $v \in I$, and $w_{0}(v)=0$ for each $v \in V\left(B_{n}\right) \backslash I$, we have

$$
w_{i}(v) \geq k \text { for each } i \in[q] \text { and each } v \in V\left(B_{n}\right) \text { such that } w_{i}(v) \neq 0 .
$$

Let $a_{1}, \ldots, a_{r}$ be the distinct members of $\left\{v \in M^{\prime}: w_{q-1}(v) \neq 0\right\}$. There exist $r$ distinct elements $b_{1}, \ldots, b_{r}$ of $M$ such that $a_{i} b_{i} \in E\left(B_{n}\right)$ and $w_{q}\left(b_{i}\right)=w_{q-1}\left(b_{i}\right)+w_{q-1}\left(a_{i}\right) \geq 2 k$ for each $i \in[r]$, and we have $w_{q}\left(a_{i}\right)=0$ and $w_{q-1}\left(a_{i}\right) \geq k$ for each $i \in[r], w_{q}(v)=w_{q-1}(v) \geq k$ for each $v \in M \backslash\left\{b_{1}, \ldots, b_{r}\right\}$, and $w_{q}(v)=w_{q-1}(v)=0$ for each $v \in V\left(B_{n}\right) \backslash(M \cup$ $\left.\left\{a_{1}, \ldots, a_{r}\right\}\right)$. Let $X=\left\{a_{1}, \ldots, a_{r}\right\}, Y=\left\{b_{1}, \ldots, b_{r}\right\}$, and $Y^{\prime}=\bigcup_{i=1}^{r}\left(N_{B_{n}}\left(a_{i}\right) \cap M\right)$. Thus, $Y \subseteq Y^{\prime}$. Each member of $X$ is a set of size $\lceil n / 2\rceil-1$ and has exactly $n-(\lceil n / 2\rceil-1)$ supersets in $M$, and each member of $M$ has exactly $\lceil n / 2\rceil$ subsets in $M^{\prime}$. We have

$$
\begin{aligned}
(n-\lceil n / 2\rceil+1) r & =\sum_{x \in X}\left|N_{B_{n}}(x) \cap M\right|=\left\{x y \in E\left(B_{n}\right): x \in X, y \in Y^{\prime}\right\} \\
& =\sum_{y \in Y^{\prime}}\left|N_{B_{n}}(y) \cap X\right| \leq\lceil n / 2\rceil\left|Y^{\prime}\right|,
\end{aligned}
$$

so $r \leq\left|Y^{\prime}\right|$, and equality holds only if $n$ is odd. Suppose $r<\left|Y^{\prime}\right|$. Then, $y \notin Y$ for some $y \in Y^{\prime}$. Now $y \in N_{B_{n}}\left(a_{j}\right)$ for some $j \in[r]$, so $a_{j} y \in E(G)$ and $y \neq b_{j}$. Let $S=\left\{A \in \mathcal{K}_{k}\left(B_{n}\left(w_{q-1}\right)\right): A \cap\left\{\left(a_{j}, i\right): i \in\left[w_{q-1}\left(a_{j}\right)\right]\right\} \neq \varnothing \neq A \cap\left\{(y, i): i \in\left[w_{q-1}(y)\right]\right\}\right\}$. Then, $S \neq \varnothing$ as $k \geq 3, w_{q-1}\left(a_{j}\right) \geq k$, and $w_{q-1}(y) \geq k$. We have

$$
\begin{equation*}
\pi_{k}\left(B_{n}\left(w_{q-1}\right)\right) \geq \sum_{v \in M \backslash Y}\binom{w_{q-1}(v)}{k}+\sum_{i=1}^{r}\binom{w_{q-1}\left(a_{i}\right)+w_{q-1}\left(b_{i}\right)}{k}+|S|=\pi_{k}\left(B_{n}\left(w_{q}\right)\right)+|S|, \tag{3}
\end{equation*}
$$

contradicting $w_{q-1} \in W^{*}$. Therefore, $r=\left|Y^{\prime}\right|$, and hence $Y^{\prime}=Y$ and $n$ is odd. Thus, no member of $X$ is a subset of a member of $M \backslash Y$, and hence $X \cup(M \backslash Y)$ is an antichain of size $|M|$. By Theorem [1, $X \cup(M \backslash Y)$ is $M$ or $M^{\prime}$. Since $\varnothing \neq X \subseteq M^{\prime}$, we obtain $X=M^{\prime}$ and $Y=M$. Suppose $w_{q-1}\left(b_{i}\right)>0$ for some $i \in[r]$. Since $n \geq 2, n$ is odd, and $X=M^{\prime}$, we have $a_{j} b_{i} \in E\left(B_{n}\right)$ for some $j \in[r] \backslash\{i\}$. Let $y=b_{i}$ and define $S$ as above. As in (3), we obtain $\pi_{k}\left(B_{n}\left(w_{q-1}\right)\right) \geq \pi_{k}\left(B_{n}\left(w_{q}\right)\right)+|S|>\pi_{k}\left(B_{n}\left(w_{q}\right)\right)$, contradicting $w_{q-1} \in W^{*}$. Thus, since $M=Y=\left\{b_{1}, \ldots, b_{r}\right\}, w_{q-1}(v)=0$ for each $v \in V\left(B_{n}\right) \backslash M^{\prime}$. This implies that $\max \left\{i \in\{0\} \cup[n]: w_{0}(v) \neq 0\right.$ for some $\left.v \in\binom{[n]}{i}\right\} \leq\lceil n / 2\rceil-1$, so $p=0$ and, since $|I|>\left|M^{\prime}\right|$, we have $h\left(w_{0}\right) \leq\lceil n / 2\rceil-2, q \geq 2$, and $h\left(w_{q-2}\right)=\lceil n / 2\rceil-2$. Let $M^{\prime \prime}=\binom{[n]}{[n / 2\rceil-2}$. We apply the argument starting after (24) for $M^{\prime}, M^{\prime \prime}, w_{q-1}$, and $w_{q-2}$
instead of $M, M^{\prime}, w_{q}$, and $w_{q-1}$, respectively, and the inequality corresponding to $r \leq\left|Y^{\prime}\right|$ that we obtain is strict. Similarly to the above, this contradicts $w_{q-2} \in W^{*}$.

Therefore, we must have $h\left(w_{0}\right) \geq\lceil n / 2\rceil$. For any $v \in V\left(B_{n}\right)$, let $v^{\prime}=[n] \backslash v$. Let $I^{\prime}=\left\{v^{\prime}: v \in I\right\}$, and let $w_{0}^{\prime}$ be the $m$-weighting of $B_{n}$ such that $w_{0}^{\prime}(v)=w_{0}\left(v^{\prime}\right)$ for each $v \in V\left(B_{n}\right)$. For any $u, v \in V\left(B_{n}\right), u^{\prime} \subseteq v^{\prime}$ if and only if $v \subseteq u$, so $u^{\prime} v^{\prime} \in E\left(B_{n}\right)$ if and only if $u v \in E\left(B_{n}\right)$. Thus, $\pi_{k}\left(B_{n}\left(w_{0}^{\prime}\right)\right)=\pi_{k}\left(B_{n}\left(w_{0}\right)\right)$. Recall that $h\left(w_{0}\right)<h^{\prime}\left(w_{0}\right)$. We have $h\left(w_{0}^{\prime}\right)=n-h^{\prime}\left(w_{0}\right)<\lceil n / 2\rceil$ as $h\left(w_{0}\right) \geq\lceil n / 2\rceil$. By applying the argument for $I$ to $I^{\prime}$, we obtain a contradiction.

Therefore, $w_{0} \notin W^{*}$. By Theorem [5, the result follows.
We next show that, as stated in Remark 2, the answer to Problem 1 is also negative if $G, k$, and $m$ are as in Remark 2.

Theorem 10. If $I_{1}, I_{2}, \ldots, I_{r}$ are the distinct maximal partite sets of a complete multipartite graph $G,\left|I_{1}\right|>\left|I_{2}\right| \geq \cdots \geq\left|I_{r}\right|, k \geq 3, m \geq k \alpha_{k}(G)$, $w$ and $w^{\prime}$ are m-weightings of $G$, $w$ is uniform- $\alpha$, and $w^{\prime}$ is uniform on a largest $k$-clique independent set of $G$, then $\pi_{k}(G(w))<\pi_{k}\left(G\left(w^{\prime}\right)\right)$.

Proof. We build on the proof of Theorem 6. We use the same idea in the proof of Theorem 9, which is to shift weights from one end to a largest independent set and shift weights from the other end to a second largest independent set. The proof for the current setting is similar but simpler.

Let $M=I_{1}$ and $M^{\prime}=I_{2}$. For each $w \in W$, let $h(w)$ be as in the proof of Theorem 6. and let $h^{\prime}(w)=\min \left\{j \in[r]: w(v) \neq 0\right.$ for some $\left.v \in I_{j}\right\}$. Let $w_{0}$ be an $m$-weighting of $G$ that is uniform on a largest $k$-clique independent set $I$ of $G$. Then, $|I| \geq|M|+\left|M^{\prime}\right|$, so $h^{\prime}\left(w_{0}\right)<h\left(w_{0}\right)$. Since $m \geq k \alpha_{k}(G)=k|I|, w_{0}(v) \geq k$ for each $v \in I$. For a contradiction, suppose $w_{0} \in W^{*}$.

Let $p=h^{\prime}\left(w_{0}\right)-1$. If $p>0$, then, as shown in the proof of Theorem 6, we can define a sequence $w_{1}, \ldots, w_{p}$ of $m$-weightings of $G$ such that, for each $i \in[p], h^{\prime}\left(w_{i}\right)=h^{\prime}\left(w_{i-1}\right)-1$, $\pi_{k}\left(G\left(w_{i}\right)\right) \leq \pi_{k}\left(G\left(w_{i-1}\right)\right)$, and hence $w_{i} \in W^{*}$. Note that $h^{\prime}\left(w_{p}\right)=1$ and $h\left(w_{p}\right)=h\left(w_{0}\right)>$ 1. Let $q=p+h\left(w_{0}\right)-1$. Since $h\left(w_{0}\right) \geq 2, q \geq p+1$. We can define a sequence $w_{p+1}, \ldots, w_{q}$ of $m$-weightings of $G$ such that, for each $i \in[q-p], h\left(w_{p+i}\right)=h\left(w_{p+i-1}\right)-1$, $h^{\prime}\left(w_{p+i}\right)=h^{\prime}\left(w_{p}\right)=1, \pi_{k}\left(G\left(w_{p+i}\right)\right) \leq \pi_{k}\left(G\left(w_{p+i-1}\right)\right)$, and hence $w_{p+i} \in W^{*}$. Since $h\left(w_{q}\right)=1=h^{\prime}\left(w_{q}\right)$,

$$
w_{q}(v)=0 \text { for each } v \in V(G) \backslash M
$$

As in the proof of Theorem 9, $w_{q}(v)>0$ for each $v \in M$, and

$$
w_{i}(v) \geq k \text { for each } i \in[q] \text { and each } v \in V(G) \text { such that } w_{i}(v) \neq 0
$$

Let $a_{1}, \ldots, a_{s}$ be the distinct members of $\left\{v \in M^{\prime}: w_{q-1}(v) \neq 0\right\}$. Let $a_{1,1}, \ldots, a_{1, n_{1}}, \ldots$, $a_{r, 1}, \ldots, a_{r, n_{r}}$ be as in the proof of Theorem [6] For each $i \in[s], a_{i}=a_{2, j_{i}}$ for some $j_{i} \in\left[n_{2}\right]$. For each $i \in[s]$, let $b_{i}=a_{1, j_{i}}$. We have $w_{q}\left(b_{i}\right)=w_{q-1}\left(b_{i}\right)+w_{q-1}\left(a_{i}\right) \geq 2 k$ for each $i \in[s]$. Let $Y=\left\{b_{1}, \ldots, b_{s}\right\}$. Let $y=a_{1, n_{1}}$. Since $n_{1}>n_{2}, y \notin Y$. As in the proof of Theorem 9 ,
we obtain $\pi_{k}\left(G\left(w_{q-1}\right)\right)>\pi_{k}\left(G\left(w_{q}\right)\right)$ (as $y \in M \subseteq N_{G}(x)$ for each $x \in M^{\prime}$ ), contradicting $w_{q-1} \in W^{*}$.

Therefore, $w_{0} \notin W^{*}$. By Theorem 6, the result follows.
Proof of Theorem $\mathbf{8}$. For any $n \in \mathbb{N}$, let $G_{n}$ be a triangle-free $n$-vertex graph and let $I_{n}$ be a largest independent set of $G_{n}$. Let $\alpha_{n}=\left|I_{n}\right|$, let $w_{n}$ be a $3 n$-weighting of $G_{n}$ that is uniform on $V\left(G_{n}\right)$ (so $w(v)=3$ for each $v \in V\left(G_{n}\right)$ ), and let $w_{n}^{\prime}$ be a $3 n$-weighting of $G_{n}$ that is uniform on $I_{n}$. It suffices to show that $\pi_{3}\left(G_{n}\left(w_{n}\right)\right)<\pi_{3}\left(G_{n}\left(w_{n}^{\prime}\right)\right)$ for some $n \in \mathbb{N}$. We have

$$
\pi_{3}\left(G_{n}\left(w_{n}\right)\right)=\binom{3}{3} n+2\binom{3}{1}\binom{3}{2}\left|E\left(G_{n}\right)\right|=n+18\left|E\left(G_{n}\right)\right|
$$

and

$$
\pi_{3}\left(G_{n}\left(w_{n}^{\prime}\right)\right) \geq\binom{\left\lfloor 3 n / \alpha_{n}\right\rfloor}{ 3} \alpha_{n}
$$

Bohman [2] showed that we can choose the sequence $\left\{G_{n}\right\}_{n \in \mathbb{N}}$ so that $\alpha_{n}=\mathrm{O}(\sqrt{n \log n})$ and the maximum degree $\Delta\left(G_{n}\right)\left(\max \left\{\left|N_{G_{n}}(v)\right|: v \in V\left(G_{n}\right)\right\}\right)$ of $G_{n}$ satisfies $\Delta\left(G_{n}\right)=$ $\Theta(\sqrt{n \log n})$ (see [1, Theorem 2.5]). Since $I_{n}$ is maximal, $V\left(G_{n}\right)=I_{n} \cup \bigcup_{v \in I_{n}} N_{G_{n}}(v)$, so

$$
n=\left|I_{n} \cup \bigcup_{v \in I_{n}} N_{G_{n}}(v)\right| \leq\left|I_{n}\right|+\sum_{v \in I_{n}}\left|N_{G_{n}}(v)\right| \leq\left(1+\Delta\left(G_{n}\right)\right) \alpha_{n}
$$

and hence $\alpha_{n} \geq n /\left(1+\Delta\left(G_{n}\right)\right)$. Thus, for $n$ sufficiently large, we have

$$
\alpha_{n} \geq \frac{n}{a \sqrt{n \log n}} \quad \text { and } \quad \frac{1}{\alpha_{n}} \geq \frac{1}{b \sqrt{n \log n}}
$$

for some positive real numbers $a$ and $b$, and hence

$$
\pi_{3}\left(G_{n}\left(w_{n}^{\prime}\right)\right) \geq\binom{\lfloor 3 n / b \sqrt{n \log n}\rfloor}{ 3} \frac{n}{a \sqrt{n \log n}}
$$

Since $\binom{p}{3} \sim p^{3} / 6$, we obtain

$$
\binom{\lfloor 3 n / b \sqrt{n \log n}\rfloor}{ 3}=\Theta\left(\frac{n^{3 / 2}}{(\log n)^{3 / 2}}\right)
$$

so $\pi_{3}\left(G_{n}\left(w_{n}^{\prime}\right)\right)=\Omega\left(n^{2} /(\log n)^{2}\right)$. By the handshaking lemma, $2\left|E\left(G_{n}\right)\right| \leq n \Delta\left(G_{n}\right)$, so

$$
\left|E\left(G_{n}\right)\right|=\mathrm{O}\left(\frac{n}{2} \sqrt{n \log n}\right)=\mathrm{O}\left(n^{3 / 2} \sqrt{\log n}\right)
$$

Thus, $\pi_{3}\left(G_{n}\left(w_{n}\right)\right)=\mathrm{O}\left(n^{3 / 2} \sqrt{\log n}\right)$. Since $n^{3 / 2} \sqrt{\log n}=\mathrm{o}\left(n^{2} /(\log n)^{2}\right), \pi_{3}\left(G_{n}\left(w_{n}\right)\right)<$ $\pi_{3}\left(G_{n}\left(w_{n}^{\prime}\right)\right)$ for $n$ sufficiently large.
