# Local Method for Compositional Inverses of Permutational Polynomials * 

Pingzhi Yuan ${ }^{\dagger}$

#### Abstract

In this paper, we provide a local method to find compositional inverses of all PPs, some new PPs and their compositional inverses are given.

Keywords: Finite fields, permutation polynomials, compositional inverses, surjection.

## 1 Introduction

Let $q$ be a prime power, $\mathbb{F}_{q}$ be the finite field of order $q$, and $\mathbb{F}_{q}[x]$ be the ring of polynomials in a single indeterminate $x$ over $\mathbb{F}_{q}$. A polynomial $f \in \mathbb{F}_{q}[x]$ is called a permutation polynomial (PP for short) of $\mathbb{F}_{q}$ if it induces a bijective map from $\mathbb{F}_{q}$ to itself.

Constructing PPs and explicitly determining the compositional inverse of a PP are useful because a PP and its inverse are required in many applications. For example, involutions are particularly useful ( as a part of a block ciper) in devices with limited resources. However, it is difficult to determine whether a given polynomial over a finite field is a PP or not, and it is not easy to find the explicit compositional inverse of a random PP, except for several well-known classes of PPs, which have very nice structure. See [2, 3, 4, 5, 6, 7, 9, 10, 11, 12, 13, 14, 15, 18, 19, 20, 21, 22, for more details.

In 2011, Akbrary, Ghioca and Wang [1] proposed a powerful method called the AGW criterion for constructing PPs. In the present paper, we will present a local method to find the compositional inverses of PPs.

The rest of this paper is organized as follows. In Section 2, we present the local criteria for a polynomial to be a PP. In Section 3, we present some known PPs and their compositional inverses by applying the results in Section 2. In Section 4, we use the method developed in Section 2 to give necessary and sufficient conditions for two kinds of polynomials to be PPs, and we also give their compositional inverses.

We know that every map from $\mathbb{F}_{q}$ to $\mathbb{F}_{q}$ can be viewed as a polynomial in the ring $\left(\mathbb{F}_{q}[x] /\left(x^{q}-x\right),+, \circ\right)$, where the two operations are the addition and the composition of two polynomials modulo $x^{q}-x$. For a polynomial, $f(x)$ is a PP over $\mathbb{F}_{q}$ if and only if $f(x)$ is an unit in the $\operatorname{ring}\left(\mathbb{F}_{q}[x] /\left(x^{q}-x\right),+, \circ\right)$, and we use $f^{-1}(x)$ to denote the compositional inverse of $f(x)$. Hence we view the polynomials over $\mathbb{F}_{q}$ as elements in the ring $\left(\mathbb{F}_{q}[x] /\left(x^{q}-x\right),+, \circ\right)$ thorough the paper.

[^0]
## 2 Local criteria for a polynomial to be a PP

To begin with, we give the following simple and useful result for a map to be a bijection. We have
Lemma 2.1. (Local criterion) Let $A$ and $S$ be finite sets and let $f: A \rightarrow A$ be a map. Then $f$ is a bijection if and only if for any surjection $\psi: A \rightarrow S, \varphi=\psi \circ f$ is a surjection and $f$ is injective on $\varphi^{-1}(s)$ for each $s \in S$.

Proof. The necessity is obvious.
Now we prove the sufficiency. If $f(a)=f(b)$ for some $a, b \in A$, then

$$
\psi(f(a))=\psi(f(b))
$$

That is $\varphi(a)=\varphi(b)=s, s \in S$. Hence

$$
a, b \in \varphi^{-1}(s)
$$

Since $f$ is injective on $\varphi^{-1}(s)$ for each $s \in S$ and $f(a)=f(b)$, we get $a=b$. Therefore $f$ is a bijection.
Applying Lemma 2.1 we get the following result, which is called AGW criterion now.
Lemma 2.2. ( AGW criterion) Let $A, S$ and $\bar{S}$ be finite sets with $\sharp S=\sharp \bar{S}$, and let $f: A \rightarrow A, h: S \rightarrow \bar{S}$, $\lambda: A \rightarrow S$, and $\bar{\lambda}: A \rightarrow \bar{S}$ be maps such that $\bar{\lambda} \circ f=h \circ \lambda$. If both $\lambda$ and $\bar{\lambda}$ are surjective, then the following statements are equivalent:
(i) $f$ is a bijective (a permutation of A); and
(ii) $h$ is a bijective from $S$ to $\bar{S}$ and if $f$ is injective on $\lambda^{-1}(s)$ for each $s \in S$.

Proof. Applying Lemma 2.1 to $\psi=\bar{\lambda}$ and $\varphi=\bar{\lambda} \circ f=h \circ \lambda$. Since $\lambda$ is a surjection and $\sharp S=\sharp \bar{S}$, we have $\varphi=h \circ \lambda$ is a surjection if and only if $h$ is a bijection. On the other hand, if $h$ is a bijection, then we have

$$
\left\{\lambda^{-1}(s), s \in S\right\}=\left\{\varphi^{-1}(\bar{s}), \bar{s} \in \bar{S}\right\} .
$$

Hence we have the result.

We also have the following corollary.
Corollary 2.1. Let $A, S$ and $\bar{S}$ be finite sets with $\sharp S=\sharp \bar{S}$, and let $f: A \rightarrow A, h: S \rightarrow \bar{S}, \lambda: A \rightarrow S$, and $\bar{\lambda}: A \rightarrow \bar{S}$ be maps such that $\bar{\lambda} \circ f=h \circ \lambda$. If $\bar{\lambda}$ is a surjection and $h$ is a bijection, then the following statements are equivalent:
(i) $f$ is a bijective (a permutation of A); and
(ii) $\lambda$ is a surjection and $f$ is injective on $\lambda^{-1}(s)$ for each $s \in S$.

We now prove the following general result on PP.

Theorem 2.1. A polynomial $f(x) \in \mathbb{F}_{q}[x]$ is a PP if and only if for any maps $\psi_{i}, i=1, \ldots, t, t \in \mathbb{N}$ (we also denote them as $\psi_{i}(x) \in \mathbb{F}_{q}[x] /\left(x^{q}-x\right)$ ) such that $F\left(\psi_{1}(x), \ldots, \psi_{t}(x)\right)=x$ for some polynomial $F\left(x_{1}, \ldots, x_{t}\right) \in \mathbb{F}_{q}\left[x_{1}, \ldots, x_{t}\right]$, there exists a polynomial $G\left(x_{1}, \ldots, x_{t}\right) \in \mathbb{F}_{q}\left[x_{1}, \ldots, x_{t}\right]$ satisfies $G\left(\psi_{1}(f(x)), \ldots, \psi_{t}(f(x))\right)=x$. Moreover, if $f(x)$ is a $P P$, then

$$
f^{-1}(x)=G\left(\psi_{1}(x), \ldots, \psi_{t}(x)\right)
$$

where $f^{-1}(x)$ denotes the compositional inverse of $f(x)$.
Proof. We first prove the necessity. Assume that $f(x)$ is a PP, let

$$
\varphi_{i}(x)=\psi_{i}(f(x)), i=1, \ldots, t
$$

then we have

$$
\psi_{i}(x)=\varphi_{i}\left(f^{-1}(x)\right), i=1, \ldots, t
$$

where $f^{-1}(x)$ denotes the compositional inverse of $f(x)$. Since $F\left(\psi_{1}(x), \ldots, \psi_{t}(x)\right)=x$, we get

$$
F\left(\varphi_{1}\left(f^{-1}(x)\right), \ldots, \varphi_{t}\left(f^{-1}(x)\right)\right)=x
$$

It follows that

$$
F\left(\varphi_{1}(x), \ldots, \varphi_{t}(x)\right)=f(x) \text { and } f^{-1}\left(F\left(\varphi_{1}(x), \ldots, \varphi_{t}(x)\right)\right)=x
$$

Let $G\left(x_{1}, \ldots, x_{t}\right)=f^{-1} \circ F\left(x_{1}, \ldots, x_{t}\right)$, then we have $G\left(\varphi_{1}(x), \ldots, \varphi_{t}(x)\right)=x$, that is

$$
G\left(\psi_{1}(f(x)), \ldots, \psi_{t}(f(x))\right)=x
$$

Next, we prove the sufficiency. Since for any maps $\psi_{i}, i=1, \ldots, t, t \in \mathbb{N}$ such that $F\left(\psi_{1}(x), \ldots, \psi_{t}(x)\right)=$ $x$ for some polynomial $F\left(x_{1}, \ldots, x_{t}\right) \in \mathbb{F}_{q}\left[x_{1}, \ldots, x_{t}\right]$, there exists a polynomial $G\left(x_{1}, \ldots, x_{t}\right) \in \mathbb{F}_{q}\left[x_{1}, \ldots, x_{t}\right]$ satisfies $G\left(\psi_{1}(f(x)), \ldots, \psi_{t}(f(x))\right)=x$. Let

$$
g(x)=G\left(\psi_{1}(x), \ldots, \psi_{t}(x)\right)
$$

then $g \circ f(x)=x$, which implies that $g(x)=f^{-1}(x)$, i.e., $f(x)$ is a PP. We are done.
We also have the following alternative result.
Theorem 2.2. Let $q$ be a prime power and $f(x)$ be a polynomial over $\mathbb{F}_{q}$. Then $f(x)$ is a $P P$ if and only if there exist nonempty finite subsets $S_{i}, i=1, \ldots, t$ of $\mathbb{F}_{q}$ and maps $\psi_{i}: \mathbb{F}_{q} \rightarrow S_{i}, i=1, \ldots, t$ such that $\psi_{i} \circ f=\varphi_{i}, i=1, \ldots, t$ and $x=F\left(\varphi_{1}(x), \ldots, \varphi_{t}(x)\right)$, where $F\left(x_{1}, \ldots, x_{t}\right) \in \mathbb{F}_{q}\left[x_{1}, \ldots, x_{t}\right]$. Moreover, we have

$$
f^{-1}(x)=F\left(\psi_{1}(x), \ldots, \psi_{t}(x)\right)
$$

Proof. If there exist nonempty finite subsets $S_{i}, i=1, \ldots, t$ of $\mathbb{F}_{q}$ and maps $\psi_{i}: \mathbb{F}_{q} \rightarrow S_{i}, i=1, \ldots, t$ such that $\psi_{i} \circ f=\varphi_{i}, i=1, \ldots, t$ and $x=F\left(\varphi_{1}(x), \ldots, \varphi_{t}(x)\right)$, then we the following diagram commutes.

Hence

$$
F\left(\psi_{1}(f(x)), \ldots, \psi_{t}(f(x))\right)=x
$$

which implies that

$$
f^{-1}(x)=F\left(\psi_{1}(x), \ldots, \psi_{t}(x)\right)
$$

If $f(x)$ is a permutational polynomial over $\mathbb{F}_{q}$, we can take $S=\mathbb{F}_{q}, i=1, \psi=f^{-1}(x), \varphi(x)=x$ and $F(x)=x$, then all conditions are satisfied, and we have $f^{-1}(x)=\psi(x)$.

## 3 Some old PPs and their compositional inverses

In this section, we give new proofs for some known PPs and their compositional inverses by applying the results in Section 2. To do this, we need to find out two polynomials $\psi_{1}(x)$ and $\psi_{2}(x)$ such that we can find a polynomial $G(x, y) \in \mathbb{F}_{q}[x, y]$ satisfying

$$
x=G\left(\psi_{1}(f(x)), \psi_{2}(f(x))\right)
$$

Now applying Theorem 2.2 we get

$$
f^{-1}(x)=G\left(\psi_{1}(x), \psi_{2}(x)\right)
$$

We give two examples below. The following result was discovered independently by several authors, we will give a new proof of Theorem 11 in [7] by applying Theorem [2.2,

Lemma 3.1. (8, Theorem 2.3] [11, Theorem 1] [23, Lemma 2.1]) Let $q$ be a prime power and $f(x)=$ $x^{r} h\left(x^{s}\right) \in \mathbb{F}_{q}[x]$, where $s=\frac{q-1}{\ell}$ and $\ell$ is an integer. Then $f(x)$ permutes $\mathbb{F}_{q}$ if and only if
(1) $\operatorname{gcd}(r, s)=1$ and
(2) $g(x)=x^{r} h(x)^{s}$ permutes $\mu_{\ell}$.

Proposition 3.1. ([7, Theorem 11]) Let $f(x)=x^{r} h\left(x^{s}\right) \in \mathbb{F}_{q}[x]$ defined in Lemma 3.1 be a permutation over $\mathbb{F}_{q}$ and $g^{-1}(x)$ be the compositional inverse of $g(x)=x^{r} h(x)^{s}$ over $\mu_{\ell}$. Suppose $a$ and $b$ are two integers satisfying as $+b r=1$. Then the compositional inverse of $f(x)$ in $\mathbb{F}_{q}[x]$ is given by

$$
f^{-1}(x)=g^{-1}\left(x^{s}\right)^{a} x^{b} h\left(g^{-1}\left(x^{s}\right)\right)^{-b}
$$

Proof. By the assumptions, we have the following commutative diagrams

where

$$
\psi_{1}(x)=g^{-1}\left(x^{s}\right), \varphi_{1}(x)=x^{s}, \quad \psi_{2}(x)=x, \quad \varphi_{2}(x)=f(x)=x^{r} h\left(x^{s}\right)
$$

We have

$$
\varphi_{1}(x)^{a} \cdot\left(\frac{\varphi_{2}(x)}{h\left(\varphi_{1}(x)\right)}\right)^{b}=x
$$

it follows from Theorem 2.2 that

$$
f^{-1}(x)=\psi_{1}(x)^{a} \cdot\left(\frac{\psi_{2}(x)}{h\left(\psi_{1}(x)\right)}\right)^{b}=\left(g^{-1}\left(x^{s}\right)\right)^{a} x^{b}\left(h\left(g^{-1}\left(x^{s}\right)\right)\right)^{-b}
$$

This completes the proof.
Next, we give another proof of the following result.
Proposition 3.2. [16, Theorem 3.1] Let $q$ be a prime power, and $S, \bar{S}$ subsets of $\mathbb{F}_{q}^{*}$ with $\sharp S=\sharp \bar{S}$. Let $f: \mathbb{F}_{q}^{*} \rightarrow \mathbb{F}_{q}^{*}, g: S \rightarrow \bar{S}, \lambda: \mathbb{F}_{q}^{*} \rightarrow S$, and $\bar{\lambda}: \mathbb{F}_{q}^{*} \rightarrow \bar{S}$ be maps such that both $\lambda$ and $\bar{\lambda}$ are surjective maps and $\bar{\lambda} \circ f=g \circ \lambda$.

Let $f_{1}(x)$ and $f(x)=f_{1}(x) h(\lambda(x))$ are PPs over $\mathbb{F}_{q}^{*}$, and let $f_{1}^{-1}(x), f^{-1}(x)$ and $g^{-1}(x)$ be the compositional inverses of $f_{1}(x), f(x)$ and $g(x)$, respectively. Then we have

$$
f^{-1}(x)=f_{1}^{-1}\left(\frac{x}{h\left(g^{-1}(\bar{\lambda}(x))\right)}\right)
$$

Proof. By the assumptions of the theorem, we have

where

$$
\psi_{1}(x)=g^{-1}(\bar{\lambda}), \varphi_{1}(x)=\lambda, \quad \psi_{2}(x)=x, \varphi_{2}(x)=f(x)
$$

It is easy to check that

$$
x=f_{1}^{-1}\left(\frac{\varphi_{2}(x)}{h\left(\varphi_{1}(x)\right)}\right),
$$

by Theorem 2.2 we have

$$
f^{-1}(x)=f_{1}^{-1}\left(\frac{x}{h\left(g^{-1}(\bar{\lambda}(x))\right)}\right)
$$

And we are done.
Remark: We can also obtain the compositional inverses of many known PPs by the method above. We stop to do this here.

## 4 Some new PPs and their compositional inverses

For more applications of the results in Section 2, we will present some new PPs and their compositional inverses in this section.

Let $d>1$ be a positive integer, $q$ a prime power with $q \equiv 1(\bmod d)$ and $\omega$ a $d$-th primitive root of unity over $\mathbb{F}_{q}$. For $0 \leq i \leq d-1$, let

$$
A_{i}(x)=x^{q^{d-1}}+\omega^{i} x^{q^{d-2}}+\cdots+\omega^{i(d-1)} x
$$

Most results in the following two lemmas are proved in [17, for completeness and self-contained, we present the full proof. We have

Lemma 4.1. Let the notations be as above and let $g(x) \in \mathbb{F}_{q}[x]$ be a polynomial, then we have
(i) $A_{i}^{q}(x)=\omega^{i} A_{i}(x), 0 \leq i \leq d-1$.
(ii) For any positive integer $m$ and integers $i, j$ with $0 \leq i, j \leq d-1$, we have

$$
A_{j}(x) \circ A_{i}^{m}(x)= \begin{cases}d \omega^{-j} A_{i}^{m}(x), & \text { if } j \equiv i m \quad(\bmod d), \\ 0, & \text { otherwise } .\end{cases}
$$

(iii) For any positive integer $j$ with $1 \leq j \leq d-1$, we have

$$
A_{j}(x) \circ g\left(A_{0}(x)\right)=0
$$

Proof. For (i), we have

$$
\left(A_{i}(x)\right)^{q}=x+\omega^{i} x^{q^{d-1}}+\cdots+\omega^{i(d-1)} x^{q}=\omega^{i} A_{i}(x)
$$

This proves (i). Now we prove (ii), repeating the procedure in (i), we get

$$
\left(A_{i}(x)\right)^{q^{t}}=\omega^{i t} A_{i}(x)
$$

Hence

$$
\left(A_{i}^{m}(x)\right)^{q^{t}}=\left(A_{i}(x)^{q^{t}}\right)^{m}=\omega^{i m t} A_{i}^{m}(x)
$$

Therefore

$$
\begin{aligned}
A_{j}(x) \circ A_{i}^{m}(x) & =A_{i}^{m}(x) \sum_{t=0}^{d-1} \omega^{(j t+i(d-1-t) m)}=A_{i}^{m}(x) \omega^{i m(d-1)} \sum_{t=0}^{d-1} \omega^{(j-i m) t} \\
& = \begin{cases}d \omega^{-j} A_{i}^{m}(x), & \text { if } j \equiv i m \quad(\bmod d) \\
0, & \text { otherwise }\end{cases}
\end{aligned}
$$

(iii) Let $g(x)=b_{0}+b_{1} x+\cdots+b_{t} x^{t}, b_{i} \in \mathbb{F}_{q}, 0 \leq i \leq t$, since $A_{j}(x)$ is a $q$-polynomial and $b_{i} \in \mathbb{F}_{q}, 0 \leq i \leq t$, by (ii), we have

$$
\begin{aligned}
& A_{j}(x) \circ g\left(A_{0}(x)\right)=A_{j}\left(b_{0}\right)+\sum_{i=1}^{t} A_{j}(x) \circ A_{0}^{i}(x) \\
& \quad=A_{j}\left(b_{0}\right)=b_{0}\left(1+\omega^{j}+\cdots+\omega^{j(d-1)}\right)=0
\end{aligned}
$$

Lemma 4.2. Let the notations be as in Lemma 4.1, and let

$$
B_{i}=\left\{A_{i}(x), x \in \mathbb{F}_{q^{d}}\right\}, 0 \leq i \leq d-1
$$

Then $B_{i}=\{0\} \cup y_{i} \mathbb{F}_{q}^{*}$, where $y_{i}$ is a fixed nonzero element of $B_{i}, 1 \leq i \leq d-1$ and $B_{0}=\mathbb{F}_{q}$.
Proof. Obviously, $0 \in B_{i}$ and $B_{0}=\mathbb{F}_{q}$. For any elements $y_{1}, y_{2} \in B_{i}$ with $y_{1} y_{2} \neq 0$, by Lemma 4.1 (i), we have

$$
y_{j}^{q}=\omega^{i} y_{j}, j=1,2 .
$$

Hence $\left(y_{1} / y_{2}\right)^{q}=y_{1} / y_{2}$, which implies that $y_{1} / y_{2} \in \mathbb{F}_{q}^{*}$, and the assertion follows.

Theorem 4.1. Let $d>1$ be a positive integer, $q$ a prime power with $q \equiv 1(\bmod d)$ and $\omega$ a d-th primitive root of unity over $\mathbb{F}_{q}$. Let

$$
A_{i}(x)=x^{q^{d-1}}+\omega^{i} x^{q^{d-2}}+\cdots+\omega^{i(d-1)} x, 0 \leq i \leq d-1
$$

Let $m_{1}, \ldots, m_{d-1}$ be positive integers and $u_{1}, \ldots, u_{d-1} \in \mathbb{F}_{q}$, and let $g(x) \in \mathbb{F}_{q}[x]$ be a polynomial. Then the polynomial

$$
f(x)=g\left(A_{0}(x)\right)+\sum_{t=1}^{d-1} u_{i} A_{i}^{m_{i}}(x)
$$

is a $P P$ over $\mathbb{F}_{q^{d}}$ if and only if $\{0\} \cup\left\{\right.$ im $\left._{i}, 1 \leq i \leq d-1\right\}$ is a complete residue modulo $d$, $u_{1} \cdots \cdots u_{d-1} \in \mathbb{F}_{q}^{*}$, $\operatorname{gcd}\left(m_{1} \cdots m_{d-1}, q-1\right)=1$ and $g(x)$ is a PP over $\mathbb{F}_{q}$. Furthermore, if $f(x)$ is a PP over $\mathbb{F}_{q^{d}}$, $r_{i}$ are positive integers with $m_{i} r_{i} \equiv 1(\bmod d(q-1))(1 \leq i \leq d-1)$ and $g^{-1}(x)$ is the compositional inverse of $g(x)$, then

$$
f^{-1}(x)=\frac{1}{d}\left(g^{-1}\left(A_{0}(x) / d\right)+\sum_{i=1, j \equiv i m_{i}}^{d-1}(\bmod d) \quad \omega^{i}\left(d u_{i} \omega^{-j}\right)^{-r_{i}} A_{j}(x)^{r_{i}}\right)
$$

Proof. We first prove the necessity. Suppose that there is a positive integer $j, 1 \leq j \leq d-1$ such that $j \not \equiv i m_{i}(\bmod d)$ for any $i \in\{1, \ldots, d-1\}$. By Lemma4.1(ii) and (iii), we have

$$
A_{j}(x) \circ\left(u_{i} A_{i}^{m_{i}}(x)\right)=0, \quad 1 \leq i \leq d-1, \quad A_{j}(x) \circ g\left(A_{0}(x)\right)=0
$$

hence $A_{j}(x) \circ f(x)=0$ and $f(x)$ is not a PP over $\mathbb{F}_{q^{d}}$. On the other hand, if $u_{i}=0$ for some $i, 1 \leq i \leq d-1$, then it is trivial that $\{0\} \cup\left\{\operatorname{tm}_{t}, 1 \leq t \leq d-1, t \neq i\right\}$ is not a complete residue modulo $d$, so $f(x)$ is not a PP over $\mathbb{F}_{q^{d}}$. As for $g(x)$, by (ii) and a direct computation we have

$$
A_{0}(x) \circ(f(x))=d g\left(A_{0}(x)\right)
$$

It follows from Lemma 2.1 that $f(x)$ is a PP only if $d g\left(A_{0}(x)\right)$ is a surjective map from $\mathbb{F}_{q}$ to $\mathbb{F}_{q}$, which implies that $g(x)$ is a PP over $\mathbb{F}_{q}$ since $A_{0}\left(\mathbb{F}_{q^{d}}\right)=B_{0}=\mathbb{F}_{q}$.

Now we assume that $u_{1} \cdots \cdots u_{d-1} \in \mathbb{F}_{q}^{*},\{0\} \cup\left\{i m_{i}, 1 \leq i \leq d-1\right\}$ is a complete residue modulo $d$ and $g(x)$ is a PP over $\mathbb{F}_{q}$. Then

$$
A_{j}(x) \circ f(x)=d u_{i} \omega^{-j} A_{i}^{m_{i}}(x), i m_{i} \equiv j \quad(\bmod d), 1 \leq j \leq d-1
$$

so we have the following commutative diagram

for each $j, 1 \leq j \leq d-1$, where $i$ is the integer with $i m_{i} \equiv j(\bmod d), B_{i}=\left\{A_{i}(x), x \in \mathbb{F}_{q^{d}}\right\}, 1 \leq i \leq d-1$. By Lemma 4.2, the map

$$
h_{i j}: B_{i} \rightarrow B_{j}, a \mapsto d u_{i} \omega^{-j} a^{m_{i}}
$$

is bijective if and only if $\operatorname{gcd}\left(m_{i}, q-1\right)=1$. If $\operatorname{gcd}\left(m_{i}, q-1\right)=1$, then the compositional inverse of $d u_{i} \omega^{-j} x^{m_{i}}$ is $\left(d u_{i} \omega^{-j}\right)^{-r_{i}} x^{r_{i}}$, where $m_{i} r_{i} \equiv 1(\bmod d(q-1))$. Hence we have the following commutative diagrams

where $\varphi_{i}(x)=A_{i}(x), i=0,1, \ldots, d-1, \psi_{0}(x)=g^{-1}\left(A_{0}(x) / d\right)$ and $\psi_{i}(x)=\left(d u_{i} \omega^{-j}\right)^{-r_{i}} A_{j}^{r_{i}}(x), i=$ $1, \ldots, d-1$.

Note that

$$
x=\frac{1}{d} \sum_{i=0}^{d-1} \omega^{i} A_{i}(x)=\frac{1}{d} \sum_{i=0}^{d-1} \omega^{i} \varphi_{i}(x)
$$

by Theorem 2.2 we have

$$
f^{-1}(x)=\frac{1}{d}\left(g^{-1}\left(A_{0}(x) / d\right)+\sum_{i=1, j \equiv i m_{i}}^{d-1}(\bmod d) \quad \omega^{i}\left(d u_{i} \omega^{-j}\right)^{-r_{i}} A_{j}(x)^{r_{i}}\right)
$$

This completes the proof.
A polynomial $f(x) \in \mathbb{F}_{q}[x]$ is called a complete permutation polynomial (CPP) if both $f(x)$ and $f(x)+x$ are permutation polynomials of $\mathbb{F}_{q}$. By applying the above theorem, we have

Corollary 4.1. Let the notations be as in Theorem 4.1, then

$$
f(x)=g\left(A_{0}(x)\right)+\sum_{i=0}^{d-1} u_{i} A_{i}(x)
$$

is a CPP over $\mathbb{F}_{q^{d}}$ if and only if $\prod_{i=1}^{d-1} u_{i}\left(1+d u_{i} \omega^{-i}\right) \neq 0$ and both $g(x)$ and $d g(x)+x$ are PPs over $\mathbb{F}_{q}$.
Proof. We have
and

Hence both $f(x)$ and $f(x)+x$ are PPs over $\mathbb{F}_{q^{d}}$ if and only if $\prod_{i=1}^{d-1} u_{i}\left(1+d u_{i} \omega^{-i}\right) \neq 0$ and both $g(x)$ and $d g(x)+x$ are PPs over $\mathbb{F}_{q}$. We are done.

Theorem 4.1 extends Theorem 6.1 in 17 greatly. We also have the following result, which improves Theorem 6.2 in [17.

Theorem 4.2. Let $n>1$ be a positive integer, $q$ a prime power and $g(x) \in \mathbb{F}_{q}[x]$. Then the the polynomial

$$
f(x)=x^{q}-x+g(\operatorname{Tr}(x))
$$

where $\operatorname{Tr}(x)=x+x^{q}+\cdots+x^{q^{n-1}}$ is a $P P$ over $\mathbb{F}_{q^{n}}$ if and only if $\operatorname{gcd}(n, q)=1$ and $g(x)$ is a PP over $\mathbb{F}_{q}$. Moreover, if $f(x)$ is a $P P$ over $\mathbb{F}_{q^{n}}$ and $g^{-1}(x)$ is the compositional inverse of $g(x)$, then

$$
f^{-1}(x)=\frac{1}{n}\left(g^{-1}(\operatorname{Tr}(x) / n)-\frac{(n+1)}{2} \operatorname{Tr}(x)+\sum_{i=1}^{n} i x^{q^{i}}\right) .
$$

Proof. By the assumptions, we have the following diagram

Hence $f(x)$ is a PP over $\mathbb{F}_{q^{n}}$ only if $\operatorname{gcd}(n, q)=1$ and $g(x)$ is a PP over $\mathbb{F}_{q}$. Moreover we have the following commutative diagrams

where $\varphi_{1}(x)=\operatorname{Tr}(x), \psi_{1}(x)=g^{-1}(\operatorname{Tr}(x) / n), \psi_{2}(x)=x$ and $\varphi_{2}(x)=f(x)=x^{q}-x+g(\operatorname{Tr}(x))$.
Note that $\varphi_{2}(x)-g\left(\varphi_{1}(x)\right)=x^{q}-x$ and

$$
\sum_{i=1}^{n} i\left(x^{q}-x\right)^{q^{i}}=n x^{q^{n}}-\operatorname{Tr}(x)=n x-\varphi_{1}(x)
$$

It follows that

$$
x=\frac{1}{n}\left(\varphi_{1}(x)+\sum_{i=1}^{n} i\left(\varphi_{2}(x)-g\left(\varphi_{1}(x)\right)\right)^{q^{i}}\right) .
$$

Therefore the polynomial $f(x)$ is a PP over $\mathbb{F}_{q^{n}}$ if and only if $\operatorname{gcd}(n, q)=1$ and $g(x)$ is a PP over $\mathbb{F}_{q}$. By Theorem 2.2. we have

$$
\begin{aligned}
& f^{-1}(x)=\frac{1}{n}\left(\psi_{1}(x)+\sum_{i=1}^{n} i\left(\psi_{2}(x)-g\left(\psi_{1}(x)\right)\right)^{q^{i}}\right) \\
& =\frac{1}{n}\left(g^{-1}(\operatorname{Tr}(x) / n)+\sum_{i=1}^{n} i(x-\operatorname{Tr}(x) / n)^{q^{i}}\right) \\
& =\frac{1}{n}\left(g^{-1}(\operatorname{Tr}(x) / n)-\frac{(n+1)}{2} \operatorname{Tr}(x)+\sum_{i=1}^{n} i x^{q^{i}}\right)
\end{aligned}
$$

This completes the proof.

## 5 Concluding remarks

If it is difficult to find enough surjections $\varphi_{i}, \psi_{i}, 1 \leq i \leq t$ such that the following diagrams commute

and there exists a polynomial $F\left(x_{1}, \ldots, x_{t}\right) \in \mathbb{F}_{q}\left[X_{1}, \ldots, X_{t}\right]$ with

$$
F\left(\varphi_{1}(x), \ldots, \varphi_{t}(x)\right)=x
$$

We can use the dual diagrams of the related diagrams

as we did in [16]. In [16], we obtained the compositional inverses of some PPs by using one diagram and its dual diagram. Now we can make use of a new local method to find the compositional inverses of some specified PPs. We believe, more PPs and their compositional inverses will be found or constructed by the method of this paper. We will continue the work in the further paper.
