# THE NORM RESIDUE SYMBOL FOR FORMAL DRINFELD MODULES 

MARWA ALA EDDINE

#### Abstract

In this paper, we study the Kummer pairing associated with formal Drinfeld modules having stable reduction of height one. We give an explicit description of the pairing à la Kolyvagin, in terms of the logarithm of the formal Drinfeld module, a certain derivation, torsion points and the trace. The results obtained give a generalization of the results of Anglès [1] proved for Carlitz modules, and of Bars and Longhi [2] proved for sign-normalized rank one Drinfeld modules. It also presents an extension of our previous formulas proved in [3] to arbitrary finite extensions of local fields containing enough torsion points.

Keywords: formal Drinfeld modules, explicit reciprocity laws, local fields, class field theory, derivations

## 1. Introduction

Let $K$ be a local field, $p$ be its characteristic, and let $\mu_{K}$ be its normalized discrete valuation. We denote $\mathcal{O}_{K}$ the valuation ring of $K$ and $\mathfrak{p}_{K}$ its maximal ideal. Let $q$ be the order of the residue field $\mathcal{O}_{K} / \mathfrak{p}_{K}$. Then $q$ is a power of $p$. Fix an algebraic closure $\Omega$ of $K$, and let $\mu$ be the unique extension of $\mu_{K}$ to $\Omega$. All the extensions $F$ of $K$ considered in this paper are supposed to be such that $F \subset \Omega$. We also denote $\pi_{F}$ a uniformizer of $F, \mathcal{O}_{F}$ the valuation ring of $F$ and $\mathfrak{p}_{F}$ its maximal ideal. Let $K_{u r} \subset \Omega$ be the maximal unramified extension of $K$ in $\Omega$, and $H \subset K_{u r}$ be a finite unramified extension of $K$.

Let

$$
\begin{aligned}
\rho: \mathcal{O}_{K} & \longrightarrow \mathcal{O}_{H}\{\{\tau\}\} \\
a & \mapsto \rho_{a}
\end{aligned}
$$

be a formal Drinfeld module having stable reduction of height one, as defined by Rosen in [4, §1]. Here, $\tau$ is the $q$-Frobenius element satisfying

$$
\begin{equation*}
\tau x=x^{q} \tau, \quad \forall x \in \Omega . \tag{1.1}
\end{equation*}
$$

The completion $\bar{\Omega}$ of $\Omega$ is an $\mathcal{O}_{K}$-module for the following action of $\rho$

$$
\begin{equation*}
a \cdot{ }_{\rho} x=\rho_{a}(x) \quad \forall x \in \bar{\Omega} . \tag{1.2}
\end{equation*}
$$

For an integer $n \geq 0$, let

$$
V_{\rho}^{n}=\left\{\alpha \in \bar{\Omega} ; \rho_{a}(\alpha)=0 \quad \forall a \in \mathfrak{p}_{K}^{n}\right\}
$$

be the $\mathfrak{p}_{K}^{n}$ torsion submodule of $\bar{\Omega}$ for the action (1.2). It is isomorphic as an $\mathcal{O}_{K^{-}}$module to $\mathcal{O}_{K} / \mathfrak{p}_{K}^{n}$. Any element $v_{0} \in V_{\rho}^{n} \backslash V_{\rho}^{n-1}$ is therefore a generator of $V_{\rho}^{n}$ and the extension $H_{\rho}^{n}=H\left(V_{\rho}^{n}\right)$ is equal to $H\left(v_{0}\right)$. For more details see $[5,6]$.

[^0]Now let $m_{0} \geq 1$ be an integer dividing $[H: K]$, and $\eta \in K$ of valuation $\mu(\eta)=m_{0}$. Let

$$
W_{\rho}^{n}=V_{\rho}^{n m_{0}}=\left\{\alpha \in \mathfrak{p}_{\bar{\Omega}} ; \rho_{\eta^{n}}(\alpha)=0\right\}, \quad \text { and } W_{\rho}=\bigcup_{n} V_{\rho}^{n}=\bigcup_{n} W_{\rho}^{n} .
$$

Fix once and for all a generator $v_{n}$ of $W_{\rho}^{n}$. Let

$$
E_{\rho}^{n}=H\left(W_{\rho}^{n}\right)=H_{\rho}^{n m_{0}} .
$$

Let $\mathcal{O}_{n}$ be the valuation ring of $E_{\rho}^{n}$ and $\mathfrak{p}_{n}$ be its maximal ideal. If $L$ is a finite extension of $E_{\rho}^{n}$, then we denote by

$$
\Phi_{L}: L^{\times} \rightarrow \operatorname{Gal}\left(L^{a b} \mid L\right)
$$

the norm residue map. By [3, Lemma 2.1], for each $\alpha \in \mathfrak{p}_{L}$, there exists $\xi \in L^{a b}$ such that $\rho_{\eta^{n}}(\xi)=\alpha$. Therefore we can define the map (, $)_{\rho, L, n}: \mathfrak{p}_{L} \times L^{\times} \longrightarrow W_{\rho}^{n}$ such that

$$
\begin{equation*}
(\alpha, \beta)_{\rho, L, n}=\Phi_{L}(\beta)(\xi)-\xi ; \quad \rho_{\eta^{n}}(\xi)=\alpha, \tag{1.3}
\end{equation*}
$$

for $\alpha \in \mathfrak{p}_{L}$ and $\beta \in L^{\times}$. We omit $\rho$ in the index when there is no risk of confusion.
The main result in this paper is the following (cf. Theorem 3.8 for the precise formulation).
Theorem 1.1. Suppose that $L \mid K$ is a separable extension, then there exists an $\mathcal{O}_{K}$-derivation $\overline{\mathrm{D}}_{L, v_{n}}$ from $\mathcal{O}_{L}$ into a certain $\mathcal{O}_{L}$-submodule $W$ of $L$ such that

$$
\begin{equation*}
(\alpha, \beta)_{L, n}=T_{L \mid K}\left(\lambda_{\rho}(\alpha) \operatorname{dlog} \overline{\mathrm{D}}_{L, v_{n}}(\beta)\right) \cdot{ }_{\rho} v_{n} \tag{1.4}
\end{equation*}
$$

for all $\beta \in L^{\times}$and $\alpha \in L$ of valuation $\mu(\alpha)>\frac{n m_{0}}{q}+\frac{1}{q-1}+\frac{1}{e(L \mid K)}$. Here, $\lambda_{\rho}$ is the logarithm of $\rho$ and $e(L \mid K)$ is the ramification index of $L \mid K$. For $\beta=u \pi_{L}^{k} \in L^{\times}$, the logarithmic derivative $\mathrm{d} \log \overline{\mathrm{D}}_{L, v_{n}}$ associated with the derivation $\overline{\mathrm{D}}_{L, v_{n}}$ is defined as follows

$$
\begin{equation*}
\operatorname{dlog} \overline{\mathrm{D}}_{L, v_{n}}(\beta)=\frac{\overline{\mathrm{D}}_{L, v_{n}}(u)}{u}+k \frac{\overline{\mathrm{D}}_{L, v_{n}}\left(\pi_{L}\right)}{\pi_{L}} \tag{1.5}
\end{equation*}
$$

An advantage of having a derivation is that it is determined and explicitly constructible in terms of its value at a uniformizer $\pi_{L}$ of L as follows. For $x \in \mathcal{O}_{L}$, we can write

$$
\begin{equation*}
\overline{\mathrm{D}}_{L, v_{n}}(x)=f^{\prime}\left(\pi_{L}\right) \overline{\mathrm{D}}_{L, v_{n}}\left(\pi_{L}\right), \tag{1.6}
\end{equation*}
$$

where $f$ is the unique power series in $\mathbb{F}_{q_{L}}[[X]]$ such that $x=f\left(\pi_{L}\right)$. Here, $\mathbb{F}_{q_{L}}$ denotes the residue field of $L$. In the particular case where $L=E_{\rho}^{m}$ and $\pi_{L}=v_{m}$, our previous work in [3] implies the subsequent proposition.

Proposition 1.2. (Proposition 3.13) Suppose $\rho$ is such that $\rho_{\eta} \equiv \tau^{m_{0}} \bmod \mathfrak{p}_{H}$. For all $m \geq n$, we have

$$
\begin{equation*}
\overline{\mathrm{D}}_{E_{\rho}^{m}, v_{n}}\left(v_{m}\right)=\frac{1}{\eta^{m}} . \tag{1.7}
\end{equation*}
$$

Finally, using invariants attached to the representation $\mathbf{r}: \operatorname{Gal}(\Omega \mid H) \rightarrow \mathrm{GL}_{1}\left(\mathcal{O}_{K}\right)=\mathcal{U}_{K}$, which is induced by the action of $\operatorname{Gal}(\Omega \mid H)$ on the module $\varliminf_{\rightleftarrows} W_{\rho}$, we get the following congruence, of which we do not have a direct proof.

Proposition 1.3. (Corollary 3.14) Suppose $\rho$ is such that $\rho_{\eta} \equiv \tau^{m_{0}} \bmod \mathfrak{p}_{H}$ and let $L=E_{\rho}^{m}$ for $m \geq n$. Let $u$ be a unit of $L$ such that $\mu(1-u)>\max \left\{\frac{n m_{0}}{q}, \frac{1}{q-1}\right\}+\frac{1}{q-1}$. Then

$$
\begin{equation*}
\mathrm{N}_{L \mid K}\left(u^{-1}\right)-1 \equiv \mathrm{~T}_{L \mid K}\left(\left(\frac{1-u}{u}\right)\left(1-\frac{g^{\prime}\left(v_{m}\right)}{u} v_{m}\right)\right) \quad \bmod \mathfrak{p}_{K}^{(n+m) m_{0}} \tag{1.8}
\end{equation*}
$$

where $g(X) \in \mathbb{F}_{q_{L}}[[X]]$ is such that $g\left(v_{m}\right)=u$.

The method used to obtain (1.4) was inspired by the work of Kolyvagin [7], in which he proved explicit formulas for the Kummer pairing in the case of formal groups of finite height in zero characteristic. The results of Kolyvagin extended those of Iwasawa [8] and Wiles [9], who proved explicit laws for the Kummer pairing associated to the multiplicative group and to general LubinTate formal groups respectively. The results obtained here extend those of Anglès [1] proved for Carlitz module, and of Bars and Longhi [2] proved for sign-normalized rank one Drinfeld modules. In his turn, Florez [10, 11] followed Kolyvagin's method to generalize the latter's work and prove explicit laws in the case of formal groups and Lubin-Tate formal groups defined over arbitrary higher local field of mixed characteristic. Whence, one may ask if we can generalize our results as well to local fields of higher dimension.

## 2. Properties of the Kummer pairing

In this section, we state some of the main properties of the pairing $(,)_{L, n}$. Throughout this section, fix a positive integer $n$ and a finite extension $L$ of $E_{\rho}^{n}$.

Proposition 2.1. The map $(,)_{L, n}$ satisfies the following properties
(i) The map $(,)_{L, n}$ is bilinear and $\mathcal{O}$-linear in the first coordinate for the action (1.2).
(ii) We have

$$
(\alpha, \beta)_{L, n}=0 \Longleftrightarrow \beta \text { is a norm from } L(\xi) \text {, where } \rho_{\eta^{n}}(\xi)=\alpha
$$

(iii) Let $M$ be a finite separable extension of $L$, let $\alpha \in \mathfrak{p}_{L}$ and $\beta \in M^{\times}$. Then $(\alpha, \beta)_{M, n}=$ $\left(\alpha, \mathrm{N}_{M \mid L}(\beta)\right)_{L, n}$.
(iv) Let $M$ be a finite separable extension of $L$ of degree $d$, let $\alpha \in \mathfrak{p}_{M}$ and $\beta \in L^{\times}$. Then $(\alpha, \beta)_{M, n}=\left(\mathrm{T}_{M \mid L}(\alpha), \beta\right)_{L, n}$.
(v) Suppose $L \supset E_{\rho}^{m}$ for $m \geq n$. Then

$$
(\alpha, \beta)_{L, n}=\rho_{\eta^{m-n}}\left((\alpha, \beta)_{L, m}\right)=\left(\rho_{\eta^{m-n}}(\alpha), \beta\right)_{L, m}
$$

(vi) Let $\rho^{\prime}$ be a formal Drinfeld $\mathcal{O}$-module isomorphic to $\rho$, i.e there exists a power series $t$ invertible in $\mathcal{O}_{H}\{\{\tau\}\}$ such that $\rho_{a}^{\prime}=t^{-1} \circ \rho_{a} \circ t$ for all $a \in \mathcal{O}$. Then we have $(\alpha, \beta)_{\rho^{\prime}, L, n}=$ $t^{-1}\left((t(\alpha), \beta)_{\rho, L, n}\right)$.

We omit the proof of these properties. The interested reader may find a detailed proof in [7, §3.3]. As mentioned in the introduction, there exists explicit formulas for the pairing ( , $)_{L, n}$ which include the logarithm of the Drinfeld module $\rho$. This so-called logarithm was defined by Rosen in $[4, \S 2]$ as follows.

Lemma 2.2. There exists a unique power series $\lambda_{\rho} \in H\{\{\tau\}\}$, called the logarithm of $\rho$, such that $\lambda_{\rho}(X) \equiv X \bmod \operatorname{deg} 2$ and $\lambda_{\rho} \rho_{a}=a \lambda_{\rho}$ for all $a \in \mathcal{O}$. Moreover, we have
(i) If $\lambda_{\rho}=\sum_{i \geq 0} c_{i} \tau^{i}$, then $\mu\left(c_{i}\right) \geq-i$ for all $i \geq 0$. Thus the element $\lambda_{\rho}(x)=\sum_{i \geq 0} c_{i} x^{q^{i}}$ is well defined in $L$ for any $x \in \mathfrak{p}_{L}$.
(ii) If $x \in \mathfrak{p}_{\Omega}$, then $\lambda_{\rho}(X)=0$ if and only if $x \in V_{\rho}$. Put $W_{L}=L \cap W_{\rho} \subset \mathfrak{p}_{L}$. Then the map $\lambda_{\rho}: \mathfrak{p}_{L} / W_{L} \longrightarrow \lambda_{\rho}\left(\mathfrak{p}_{L}\right)$ is an isomorphism of $\mathcal{O}$-modules.
(iii) Let $\mathfrak{p}_{\Omega, 1}$ denote the set of all the elements $x$ of $\mathfrak{p}_{\Omega}$ such that $\mu(x)>1 /(q-1)$. The logarithm $\lambda_{\rho}$ gives an isomorphism of $\mathcal{O}$-modules from $\mathfrak{p}_{\Omega, 1}$, viewed as an $\mathcal{O}$-module under the action (1.2), to itself, viewed as an $\mathcal{O}$-module under the multiplication in $\Omega$. In particular, if we denote $\mathfrak{p}_{L, 1}=\mathfrak{p}_{L} \cap \mathfrak{p}_{\Omega, 1}$, the logarithm $\lambda_{\rho}$ also induces an isomorphism from the ideal $\mathfrak{p}_{L, 1}$ to itself. This follows from the fact that $\mu\left(\lambda_{\rho}(x)\right)=\mu(x)$ for all $x \in \mathfrak{p}_{\Omega, 1}$.

Inspired by [7], we proved in [3, §3] the following explicit formula for $(,)_{L, n}$. We denote by $\mathfrak{X}_{L, 1} \subset L$ the fractional ideal of all elements $y$ such that $\mathrm{T}_{L \mid K}(x y) \in \mathcal{O}_{K}$ for all $x \in \lambda_{\rho}\left(\mathfrak{p}_{L, 1}\right)$. We have

$$
\begin{align*}
\mathfrak{X}_{L, 1} & =\left\{y \in L ; \quad \mathrm{T}_{L \mid K}\left(\lambda_{\rho}(\alpha) y\right) \in \mathcal{O}_{K} \quad \forall \alpha \in \mathfrak{p}_{L, 1}\right\} \\
& =\left\{y \in L ; \quad \mathrm{T}_{L \mid K}\left(\alpha^{\prime} y\right) \in \mathcal{O}_{K} \quad \forall \alpha^{\prime} \in \mathfrak{p}_{L, 1}\right\}  \tag{2.1}\\
& =\left\{y \in L ; \quad \mu(y) \geq-\frac{1}{q-1}-\frac{1}{e(L \mid K)}-\mu\left(\mathcal{D}_{L \mid K}\right)\right\}
\end{align*}
$$

Proposition 2.3. Suppose that the extension $L \mid K$ is separable. Then, there exists a unique map $\Psi_{L, v_{n}}: L^{\times} \longrightarrow \mathfrak{X}_{L, 1} / \eta^{n} \mathfrak{X}_{L, 1}$ such that

$$
\begin{equation*}
(\alpha, \beta)_{L, n}=T_{L \mid K}\left(\lambda_{\rho}(\alpha) \Psi_{L, v_{n}}(\beta)\right) \cdot{ }_{\rho} v_{n} \tag{2.2}
\end{equation*}
$$

for all $\alpha \in \mathfrak{p}_{L, 1}$ and $\beta \in L^{\times}$. Furthermore, $\Psi_{L, v_{n}}$ is a continuous group homomorphism.
Remark 2.4. (i) In (2.2), we view $\Psi_{L, v_{n}}(\beta)$ as an element of $\mathfrak{X}_{L, 1}$. It it easy to see that for any $\alpha \in \mathfrak{p}_{L, 1}$, the value of $T_{L \mid K}\left(\lambda_{\rho}(\alpha) \Psi_{L, v_{n}}(\beta)\right) \cdot{ }_{\rho} v_{n}$ does not depend on the choice of the representative of the class of $\Psi_{L, v_{n}}(\beta)$ in $\mathfrak{X}_{L, 1} / \eta^{n} \mathfrak{X}_{L, 1}$.
(ii) Let $v_{n}^{\prime}$ be another generator of $W_{\rho}^{n}$, then $v_{n}^{\prime}=\rho_{u}\left(v_{n}\right)$ for a unit $u$ of $K$. We have

$$
\begin{equation*}
\Psi_{L, v_{n}}=u \Psi_{L, v_{n}^{\prime}} \tag{2.3}
\end{equation*}
$$

Exactly as in $[7, \S 3.5]$, our $\Psi_{L, v_{n}}$ satisfies the properties $\varphi_{1}, \varphi_{2}, \varphi_{3}, \varphi_{4}, \varphi_{5}$ and $\varphi_{6}$ of loc. cit. The equality (2.2) gives an expression of the pairing (, $)_{L, n}$ in terms of the trace of $L \mid K$, the logarithm of $\rho$, and the map $\Psi_{L, v_{n}}$. However, we do not have an explicit expression of $\Psi_{L, v_{n}}$. Therefore, we will use $\Psi_{L, v_{n}}$ to construct a derivation $\overline{\mathrm{D}}_{L, v_{n}}$ (see $\S 3.2$ below), which will help us prove an explicit formula for $(,)_{L, n}$. In fact, we will see that $\overline{\mathrm{D}}_{L, v_{n}}$ is determined by its value at a prime $\pi_{L}$, which is, by its turn, determined by invariants from representation theory.

Proposition 2.5. There exists a unique power series $r=r_{n} \in \mathcal{O}_{H}\{\{\tau\}\}$ such that

$$
\prod_{\omega \in W_{\rho}^{n}}(X-\omega)=r \circ \rho_{\eta^{n}}(X)
$$

Furthermore, the power series $r$ is invertible in $\mathcal{O}_{H}\{\{\tau\}\}$ and satisfies

$$
(x, r(x))_{L, n}=0, \quad \forall x \in \mathfrak{p}_{L}
$$

Proof. See [3, Proposition 4.2].
Lemma 2.6. Let $r=r_{n}$ be the power series defined in Proposition 2.5. Let $\rho^{\prime}$ be defined by

$$
\begin{equation*}
\rho_{a}^{\prime}=r \circ \rho_{a} \circ r^{-1} \tag{2.4}
\end{equation*}
$$

for all $a \in \mathcal{O}$. Then $\rho^{\prime}$ is a formal Drinfeld module having a stable reduction of height 1 , and we have

$$
\begin{equation*}
(x, x)_{\rho^{\prime}, L, n}=0 \text { for all } x \in \mathfrak{p}_{L} \tag{2.5}
\end{equation*}
$$

Proof. See [3, Lemma 4.3].
As we will see in the sequel, it will be easier to deal with formal Drinfeld modules satisfying the property (2.5). Lemma 2.6 will ensure that, starting any formal Drinfeld module having a stable reduction of height 1, we will be able to reach, by isomorphism, a formal Drinfeld module having a stable reduction of height 1 , satisfying (2.5).

## 3. Derivations

3.1. Recall on Derivations. In this paragraph, we give a brief recall on derivations and their main properties that will be useful for us in the sequel. Let $R$ be a commutative ring with unit, and $O$ be a subring of $R$. If $W$ is an $R$-module, a map $D: R \rightarrow W$ is said to be an $O$-derivation of $R$ into $W$ if it is $O$-linear and satisfies the Leibniz rule

$$
\begin{equation*}
D(x y)=x D(y)+y D(x) \quad \forall x, y \in R \tag{3.1}
\end{equation*}
$$

In particular, a derivation $D: R \rightarrow W$ also fulfills the following:
(i) $D(x+y)=D(x)+D(y) \quad \forall x, y \in R$,
(ii) $D(a)=0 \quad \forall a \in O$.

The set of all such derivations $\mathrm{D}_{O}(R, W)$ is an $R$-module, where $a D$ is defined by $(a D)(x)=a D(x)$ for all $a, x \in R$. We will show that there exists a universal derivation, in other words, an $R$-module $\Omega_{O}(R)$, and a derivation

$$
\begin{equation*}
d: R \rightarrow \Omega_{O}(R) \tag{3.2}
\end{equation*}
$$

such that for every derivation $D: R \rightarrow W$, there exists a unique homomrphism of $R$-modules $f: \Omega_{O}(R) \rightarrow W$ such that the diagram

commuts. Let $\mathcal{R}$ be the direct sum of the modules $(R)_{x \in R}$. Then $\mathcal{R}$ is the submodule of $\prod_{x \in R} R$ which consists of families $\left(a_{x}\right)_{x \in R}$ having finite support. For each element $x \in R$, we associate a symbol $\mathrm{d} x$, so that an element $\left(a_{x}\right)_{x \in R}$ in $\mathcal{R}$ can be written as a finite sum $\sum_{x \in R} a_{x} \mathrm{~d} x$. Here, the symbols $\mathrm{d} x$ are supposed to be distinct for distinct elements of $R$. Consider the submodule of $\mathcal{R}$ generated by the set

$$
\begin{equation*}
\{\mathrm{d}(x y)-y \mathrm{~d} x-x \mathrm{~d} y, \quad \mathrm{~d}(x+y)-\mathrm{d} x-\mathrm{d} y, \quad \mathrm{~d} a ; \quad x, y \in R, a \in O\} \tag{3.3}
\end{equation*}
$$

The quotient of $\mathcal{R}$ by this submodule, which we denote by $\Omega_{O}(R)$, together with the derivation $\mathrm{d}: R \rightarrow \Omega_{O}(R)$ that sends $x$ to the class of $\mathrm{d} x$ in $\Omega_{O}(R)$, form the universal derivation we are looking for. Indeed, let $W$ be an $R$-module and $D: R \rightarrow W$ be a derivation, and consider the unique homomorphism of $R$-modules from $\mathcal{R}$ to $W$ that maps $\mathrm{d} a$ to $D(a)$. This homomorphism is trivial on the submodule of $\mathcal{R}$ generated by the set (3.3), thus it factors through $\Omega_{O}(R)$, whence the universal property. We call $\Omega_{O}(R)$ the module of differentials of $R$ over $O$.

The universal derivation yields an isomorphism of $R$-modules

$$
\begin{equation*}
\mathrm{D}_{O}(R, W) \simeq \operatorname{Hom}_{R}\left(\Omega_{O}(R), W\right) \tag{3.4}
\end{equation*}
$$

Let $M$ be a local field and $N$ be a finite separable extension of $M$. We denote by $\mathcal{D}(N \mid M)$ the different of $N \mid M$. In the special case where $R=\mathcal{O}_{N}$ and $O=\mathcal{O}_{M}$, we have the following results.

Proposition 3.1. There exists an isomorphism of $\mathcal{O}_{N}$-modules

$$
\begin{equation*}
\Omega_{\mathcal{O}_{M}}\left(\mathcal{O}_{N}\right) \simeq \mathcal{O}_{N} / \mathcal{D}(N \mid M) \tag{3.5}
\end{equation*}
$$

Furthermore, if $\pi_{N}$ is a prime of $N$, then $d \pi_{N}$ is a generator of $\Omega_{\mathcal{O}_{M}}\left(\mathcal{O}_{N}\right)$.
Proof. Kolyvagin proved this proposition in the case of zero characteristic [7, Proposition 5.1]. His proof is suitable for our case.

Corollary 3.2. Let $W$ be an $\mathcal{O}_{N}$-module and $\pi_{N}$ be a prime of $N$. Let

$$
\begin{equation*}
S:=\{x \in W, \quad a x=0 \quad \forall a \in \mathcal{D}(N \mid M)\} \tag{3.6}
\end{equation*}
$$

be the $\mathcal{D}(N \mid M)$-torsion submodule of $W$. Then, the map

$$
\begin{align*}
\mathrm{D}_{\mathcal{O}_{M}}\left(\mathcal{O}_{N}, W\right) & \rightarrow S  \tag{3.7}\\
D & \mapsto D\left(\pi_{N}\right)
\end{align*}
$$

is an isomorphism of $\mathcal{O}_{N}$-modules.
Proof. The proof of [7, Corollary 5.2] is convenient for our case as well.
Remark 3.3. With the notations of Corollary 3.2, the inverse homomorphism of (3.7) associates to an element $x \in S$ a derivation $\mathrm{D}_{x}$ satisfying

$$
\begin{equation*}
D_{x}\left(t\left(\pi_{N}\right)\right)=t^{\prime}\left(\pi_{N}\right) x \tag{3.8}
\end{equation*}
$$

for all $t \in \mathcal{O}_{\tilde{N}}[[X]]$, where $\tilde{N}$ is the inertia field of $N \mid M$. This follows from the fact that a derivation in $\mathrm{D}_{\mathcal{O}_{M}}\left(\mathcal{O}_{N}, W\right)$ is continuous for the discrete topology on $W$.
3.2. The derivation $\overline{\mathrm{D}}_{L, v_{n}}$. In this section, we assume that $L \mid K$ is a separable extension. We define the map $\mathrm{D}_{L, v_{n}}: \mathcal{O}_{L} \longrightarrow \mathfrak{X}_{L, 1} / \eta^{n} \mathfrak{X}_{L, 1}$ by $\mathrm{D}_{L, v_{n}}(0)=0$ and $D_{L, v_{n}}(\alpha)=\alpha \Psi_{L, v_{n}}(\alpha)$ for $\alpha \in \mathcal{O}_{L} \backslash\{0\}$, where $\Psi_{L, v_{n}}$ is the homomorphism defined in (2.3). In this section we will prove that $\mathrm{D}_{L, v_{n}}$, reduced modulo a convenient submodule of $\mathfrak{X}_{L, 1}$, is a derivation, and it satisfies (1.4).

It is clear that the map $\mathrm{D}_{L, v_{n}}$ satisfies the Leibniz rule

$$
\begin{equation*}
\mathrm{D}_{L, v_{n}}(x y)=x \mathrm{D}_{L, v_{n}}(y)+y \mathrm{D}_{L, v_{n}}(x) \quad \forall x, y \in \mathcal{O}_{L} \tag{3.9}
\end{equation*}
$$

This follows from the fact that $\Psi_{L, v_{n}}$ is a group homomorphism. Using this rule, we can prove by induction that

$$
\begin{equation*}
\mathrm{D}_{L, v_{n}}\left(x^{m}\right)=m x^{m-1} \mathrm{D}_{L, v_{n}}(x) \quad \forall x \in \mathcal{O}_{L} \text { and } \quad \forall m \geq 1 . \tag{3.10}
\end{equation*}
$$

We will now prove that $\mathrm{D}_{L, v_{n}}$ is additive.
Lemma 3.4. Suppose $\rho$ is such that $(x, x)_{\rho, L, n}=0$ for all $x \in \mathfrak{p}_{L}$. Let $\alpha \in \mathfrak{p}_{L} \backslash\{0\}$ and let $u$ be a unit of $L$ such that $\mu(\alpha(1-u))>\frac{n m_{0}}{q}+\frac{1}{q-1}$. We have

$$
\begin{equation*}
(\alpha u, u)_{L, n}=\mathrm{T}_{L \mid K}\left((1-u) \mathrm{D}_{L, v_{n}}(\alpha)\right) \cdot \rho v_{n} . \tag{3.11}
\end{equation*}
$$

Proof. We have

$$
\begin{aligned}
(\alpha u, u)_{L, n} & =\left(\alpha u, \frac{\alpha u}{\alpha}\right)_{L, n} \\
& =(\alpha u, \alpha u)_{L, n}-(\alpha u, \alpha)_{L, n} \\
& =(\alpha, \alpha)_{L, n}-(\alpha u, \alpha)_{L, n} \\
& =(\alpha-\alpha u, \alpha)_{L, n} \\
& =\mathrm{T}_{L \mid K}\left(\lambda_{\rho}(\alpha-\alpha u) \Psi_{L, v_{n}}(\alpha)\right) \cdot{ }_{\rho} v_{n}
\end{aligned}
$$

by Proposition 2.3. Let $\gamma=\alpha(1-u)$, we will show that

$$
\begin{equation*}
\mathrm{T}_{L \mid K}\left(\lambda_{\rho}(\gamma) \Psi_{L, v_{n}}(\alpha)\right) \cdot \rho v_{n}=\mathrm{T}_{L \mid K}\left(\gamma \Psi_{L, v_{n}}(\alpha)\right) \cdot \rho v_{n} \tag{3.12}
\end{equation*}
$$

By the hypothesis on the valuations, we have $\mu(\gamma)>\frac{n m_{0}}{q}+\frac{1}{q-1}$. Hence

$$
\begin{aligned}
\mu\left(\lambda_{\rho}(\gamma)-\gamma\right) & =\mu\left(\sum_{i \geq 1} c_{i} \gamma^{q^{i}}\right) \\
& \geq \min _{i \geq 1}\left\{\mu\left(c_{i}\right)+q^{i} \mu(\gamma)\right\} \\
& >\min _{i \geq 1}\left\{-i+q^{i}\left(\frac{n m_{0}}{q}+\frac{1}{q-1}\right)\right\} \\
& \geq n m_{0}+\frac{1}{q-1}
\end{aligned}
$$

Therefore, we can write $\lambda_{\rho}(\gamma)-\gamma=\eta^{n} \delta$, where $\delta$ is an element of $\mathfrak{p}_{L, 1}$. Thus, by (2.1),

$$
\mathrm{T}_{L \mid K}\left(\left(\lambda_{\rho}(\gamma)-\gamma\right) \Psi_{L, v_{n}}(\alpha)\right) \cdot{ }_{\rho} v_{n}=0
$$

because $\Psi_{L, v_{n}}(\alpha) \in \mathfrak{X}_{L, 1}$. This concludes the proof.
Proposition 3.5. Suppose $\rho$ is such that $(x, x)_{\rho, L, n}=0$ for all $x \in \mathfrak{p}_{L}$. Let $\gamma$ be an element of $\mathcal{O}_{L} \backslash\{0\}$ of valuation $\mu(\gamma)=\max \left\{\frac{n m_{0}}{q}, \frac{1}{q-1}\right\}$, that is $\mu(\gamma)=\frac{n m_{0}}{q}$ if $n m_{0} \geq 2$, and $\mu(\gamma)=\frac{1}{q-1}$ if $n m_{0}=1$. Then

$$
\begin{equation*}
\mathrm{D}_{L, v_{n}}(x+y) \equiv \mathrm{D}_{L, v_{n}}(x)+\mathrm{D}_{L, v_{n}}(y) \quad \bmod \frac{\eta^{n}}{\gamma} \mathfrak{X}_{L, 1} \tag{3.13}
\end{equation*}
$$

for all $x, y \in \mathcal{O}_{L}$.
Proof. Let us prove first why such a $\gamma$ exists. Since $E_{\rho}^{n} \subset L$, the ramification index of $L \mid K$ is a multiple of the ramification index of $E_{\rho}^{n} \mid K$, which is equal to $q^{n m_{0}-1}(q-1)$. Hence, there exists elements in $L$ of valuation $\frac{1}{q^{n m_{0}-1}(q-1)}$, whence the existence of $\gamma$. Now let us prove (3.13). Let $x, y \in \mathcal{O}_{L}$, then, by Lemma 3.4, we have

$$
\begin{align*}
(\gamma(x+y) u, u)_{L, n} & =\mathrm{T}_{L \mid K}\left((1-u) \mathrm{D}_{L, v_{n}}(\gamma(x+y))\right) \cdot \rho v_{n} \\
& =\mathrm{T}_{L \mid K}\left((1-u)\left((x+y) \mathrm{D}_{L, v_{n}}(\gamma)+\gamma \mathrm{D}_{L, v_{n}}((x+y))\right) \cdot \rho v_{n}\right. \tag{3.14}
\end{align*}
$$

for all $u \in 1+\mathfrak{p}_{L, 1}$. However, again by Lemma 3.4, we have

$$
\begin{align*}
(\gamma(x+y) u, u)_{L, n} & =(\gamma x u, u)_{L, n}+(\gamma y u, u)_{L, n} \\
& =\mathrm{T}_{L \mid K}\left((1-u) \mathrm{D}_{L, v_{n}}(\gamma x)\right) \cdot \rho v_{n}+\mathrm{T}_{L \mid K}\left((1-u) \mathrm{D}_{L, v_{n}}(\gamma y)\right) \cdot \rho_{\rho} v_{n} \\
& =\mathrm{T}_{L \mid K}\left((1-u)\left(\mathrm{D}_{L, v_{n}}(\gamma x)+\mathrm{D}_{L, v_{n}}(\gamma y)\right)\right) \cdot \rho v_{n} \\
& =\mathrm{T}_{L \mid K}\left((1-u)\left((x+y) \mathrm{D}_{L, v_{n}}(\gamma)+\gamma\left(\mathrm{D}_{L, v_{n}}(x)+\mathrm{D}_{L, v_{n}}(y)\right)\right) \cdot \rho_{\rho} v_{n}\right. \tag{3.15}
\end{align*}
$$

for all $u \in 1+\mathfrak{p}_{L, 1}$. Therefore, (3.14) and (3.15) being equal, we conclude that

$$
\begin{equation*}
\gamma \mathrm{D}_{L, v_{n}}(x+y) \equiv \gamma\left(\mathrm{D}_{L, v_{n}}(x)+\mathrm{D}_{L, v_{n}}(y)\right) \quad \bmod \eta^{n} \mathfrak{X}_{L, 1} \tag{3.16}
\end{equation*}
$$

by the very definition (2.1) of $\mathfrak{X}_{L, 1}$. Hence, we have

$$
\begin{equation*}
\mathrm{D}_{L, v_{n}}(x+y) \equiv \mathrm{D}_{L, v_{n}}(x)+\mathrm{D}_{L, v_{n}}(y) \quad \bmod \frac{\eta^{n}}{\gamma} \mathfrak{X}_{L, 1} . \tag{3.17}
\end{equation*}
$$

Corollary 3.6. Let $\gamma$ be as in Proposition 3.5. Then

$$
\begin{equation*}
\mathrm{D}_{L, v_{n}}(x+y) \equiv \mathrm{D}_{L, v_{n}}(x)+\mathrm{D}_{L, v_{n}}(y) \quad \bmod \frac{\eta^{n}}{\gamma} \mathfrak{X}_{L, 1} \tag{3.18}
\end{equation*}
$$

for all $x, y \in \mathcal{O}_{L}$.

Proof. Let $r$ be the series defined in Proposition 2.5 and let $\rho^{\prime}$ the Drinfeld module defined by

$$
\rho_{a}^{\prime}=r \circ \rho_{a} \circ r^{-1} .
$$

Then $r$ defines an isomorphism of $\mathcal{O}_{K}$-modules $r: W_{\rho}^{n} \rightarrow W_{\rho^{\prime}}^{n}$. Furthermore, if we denote by $\mathrm{D}_{\rho, L, v_{n}}$ (respectively $\mathrm{D}_{\rho^{\prime}, L, r\left(v_{n}\right)}$ ) the map defined in the beginning of $\S 3.2$ associated to $\rho$ (respectively $\rho^{\prime}$ ), we have

$$
\begin{equation*}
\mathrm{D}_{\rho, L, v_{n}}=r^{\prime}(0) \mathrm{D}_{\rho^{\prime}, L, r\left(v_{n}\right)} . \tag{3.19}
\end{equation*}
$$

Here, $r^{\prime}(0)$ is a unit in $H$ because $r(X) \in \mathcal{O}_{H}[[X]]$ is invertible. Since $(x, x)_{\rho^{\prime}, L, n}=0$ for all $x \in \mathfrak{p}_{L}$ by Lemma 2.6, we can apply Proposition 3.5 for $\rho^{\prime}$ so that

$$
\begin{equation*}
\mathrm{D}_{\rho^{\prime}, L, r\left(v_{n}\right)}(x+y) \equiv \mathrm{D}_{\rho^{\prime}, L, r\left(v_{n}\right)}(x)+\mathrm{D}_{\rho^{\prime}, L, r\left(v_{n}\right)}(y) \quad \bmod \frac{\eta^{n}}{\gamma} \mathfrak{X}_{L, 1} \tag{3.20}
\end{equation*}
$$

for all $x, y \in \mathcal{O}_{L}$. Thus, using (3.19), we conclude that

$$
\begin{equation*}
\mathrm{D}_{\rho, L, v_{n}}(x+y) \equiv \mathrm{D}_{\rho, L, v_{n}}(x)+\mathrm{D}_{\rho, L, v_{n}}(y) \quad \bmod \frac{\eta^{n}}{\gamma} \mathfrak{X}_{L, 1} \tag{3.21}
\end{equation*}
$$

for all $x, y \in \mathcal{O}_{L}$.
Proposition 3.7. Let

$$
\begin{equation*}
\mathfrak{X}_{L, 1}^{(n)}=\left\{y \in L ; \mu(y) \geq n m_{0}-\max \left\{\frac{n m_{0}}{q}, \frac{1}{q-1}\right\}-\frac{1}{q-1}-\frac{1}{e(L \mid K)}-\mu(\mathcal{D}(L \mid K))\right\} \subset \mathfrak{X}_{L, 1} . \tag{3.22}
\end{equation*}
$$

The reduction of $\mathrm{D}_{L, v_{n}}$ modulo $\mathfrak{X}_{L, 1}^{(n)}$, denoted by $\overline{\mathrm{D}}_{L, v_{n}}: \mathcal{O}_{L} \longrightarrow \mathfrak{X}_{L, 1} / \mathfrak{X}_{L, 1}^{(n)}$, is an $\mathcal{O}_{K}$-derivation.
Proof. Let $\gamma \in \mathcal{O}_{L} \backslash\{0\}$ be as in Proposition 3.5, then

$$
\begin{equation*}
\mathfrak{X}_{L, 1}^{(n)}=\frac{\eta^{n}}{\gamma} \mathfrak{X}_{L, 1} . \tag{3.23}
\end{equation*}
$$

Let $\pi_{L}$ be a prime of $L$ and let $w=\overline{\mathrm{D}}_{L, v_{n}}\left(\pi_{L}\right) \in \mathfrak{X}_{L, 1} / \mathfrak{X}_{L, 1}^{(n)}$. Since $\mu\left(\frac{\eta^{n}}{\gamma}\right)=n m_{0}-\mu(\gamma) \leq$ $n m_{0}-\frac{1}{q-1} \leq \mu(\mathcal{D}(L \mid K))$, we have $\mathcal{D}(L \mid K) w=0$. Hence, by Corollary 3.2, there exists a derivation $\mathrm{D}: \mathcal{O}_{L} \longrightarrow \mathfrak{X}_{L, 1} / \frac{\eta^{n}}{\gamma} \mathfrak{X}_{L, 1}$ such that $\mathrm{D}\left(\pi_{L}\right)=w$ and

$$
\begin{equation*}
\mathrm{D}\left(g\left(\pi_{L}\right)\right)=g^{\prime}\left(\pi_{L}\right) w \tag{3.24}
\end{equation*}
$$

for every power series $g \in \mathcal{O}_{\tilde{L}}[[X]]$, where $\tilde{L}$ is the maximal subextension of $L$ unramified over $K$. In particular, (3.24) is true for all the power series defined over the residue field of $\tilde{L}$, which is equal to the residue field of $L$. We will prove that $D$ and $\overline{\mathrm{D}}_{L, v_{n}}$ are equal. Indeed, let $x \in \mathcal{O}_{L}$, and let $g(X)=\sum_{i \geq 0} a_{i} X^{i}$ be the unique power series defined over the residue field $\mathbb{F}_{L}$ of $L$ such that $g\left(\pi_{L}\right)=x$. We have

$$
\begin{equation*}
\overline{\mathrm{D}}_{L, v_{n}}(x)=\overline{\mathrm{D}}_{L, v_{n}}\left(g\left(\pi_{L}\right)\right)=\sum_{i \geq 0} \overline{\mathrm{D}}_{L, v_{n}}\left(a_{i} \pi_{L}^{i}\right) \tag{3.25}
\end{equation*}
$$

because $\overline{\mathrm{D}}_{L, v_{n}}$ is additive by Proposition 3.6, and continuous by Proposition 2.3. Let $q_{L}$ be the cardinal of $\mathbb{F}_{q_{L}}$, then $q_{L}$ is a power of $p$. Hence, for all $i \geq 0$, we have

$$
\overline{\mathrm{D}}_{L, v_{n}}\left(a_{i}\right)=\overline{\mathrm{D}}_{L, v_{n}}\left(a_{i}^{q_{L}}\right)=0
$$

by (3.10). Therefore, applying the Leibniz rule (3.9) to (3.25), we get

$$
\begin{equation*}
\overline{\mathrm{D}}_{L, v_{n}}(x)=\sum_{i \geq 0} a_{i} \overline{\mathrm{D}}_{L, v_{n}}\left(\pi_{L}^{i}\right)=\sum_{i \geq 0} a_{i} \times i \times \pi_{L}^{i-1} \times \overline{\mathrm{D}}_{L, v_{n}}\left(\pi_{L}\right) \tag{3.26}
\end{equation*}
$$

again by (3.10). However, this is equal to $g^{\prime}\left(\pi_{L}\right) \overline{\mathrm{D}}_{L, v_{n}}\left(\pi_{L}\right)$, which is, by (3.24), equal to $\mathrm{D}(x)$.

Now, we will define the logarithmic derivative d $\log \overline{\mathrm{D}}_{L, v_{n}}$ associated to the derivation $\overline{\mathrm{D}}_{L, v_{n}}$ as follows. Let

$$
\begin{equation*}
f: \mathfrak{X}_{L, 1} / \mathfrak{X}_{L, 1}^{(n)} \rightarrow \pi_{L}^{-1} \mathfrak{X}_{L, 1} / \pi_{L}^{-1} \mathfrak{X}_{L, 1}^{(n)} \tag{3.27}
\end{equation*}
$$

be the natural map induced by the inclusion $\mathfrak{X}_{L, 1} \hookrightarrow \pi_{L}^{-1} \mathfrak{X}_{L, 1}$, and

$$
\begin{equation*}
g_{\pi_{L}}: \mathfrak{X}_{L, 1} / \mathfrak{X}_{L, 1}^{(n)} \rightarrow \pi_{L}^{-1} \mathfrak{X}_{L, 1} / \pi_{L}^{-1} \mathfrak{X}_{L, 1}^{(n)} \tag{3.28}
\end{equation*}
$$

be the multiplication by $\pi_{L}^{-1}$ map. For $x=u \pi_{L}^{k} \in L^{\times}$, where $u$ is a unit in $L$, we define

$$
\begin{equation*}
\operatorname{dlog} \overline{\mathrm{D}}_{L, v_{n}}(x)=f\left(u^{-1} \overline{\mathrm{D}}_{L, v_{n}}(u)\right)+k g_{\pi_{L}}\left(\overline{\mathrm{D}}_{L, v_{n}}\left(\pi_{L}\right)\right) \tag{3.29}
\end{equation*}
$$

The map $\operatorname{dlog} \overline{\mathrm{D}}_{L, v_{n}}: L^{\times} \rightarrow \pi_{L}^{-1} \mathfrak{X}_{L, 1} / \pi_{L}^{-1} \mathfrak{X}_{L, 1}^{(n)}$ is a group homomorphism. Furthermore, its definition does not depend on the choice of the uniformizer $\pi_{L}$. Indeed, let $\pi_{L}^{\prime}$ be another uniformizer of $L$ and let $x=u \pi_{L}^{k}=u^{\prime} \pi_{L}^{\prime}{ }^{k} \in L^{\times}$, where $u$ and $u^{\prime}$ are units of $L$. Let $u_{0}$ be the unit of $L$ such that $\pi_{L}^{\prime}=u_{0} \pi_{L}$. Then,

$$
\begin{align*}
f\left(u^{-1} \overline{\mathrm{D}}_{L, v_{n}}(u)\right)+k g_{\pi_{L}}\left(\overline{\mathrm{D}}_{L, v_{n}}\left(\pi_{L}\right)\right) & =f\left(u^{\prime-1} u_{0}^{-k} \overline{\mathrm{D}}_{L, v_{n}}\left(u^{\prime} u_{0}^{k}\right)\right)+k g_{\pi_{L}}\left(\overline{\mathrm{D}}_{L, v_{n}}\left(\pi_{L}\right)\right) \\
& =f\left(u^{\prime-1} \overline{\mathrm{D}}_{L, v_{n}}\left(u^{\prime}\right)+u_{0}^{-k} \overline{\mathrm{D}}_{L, v_{n}}\left(u_{0}^{k}\right)\right)+k g_{\pi_{L}}\left(\overline{\mathrm{D}}_{L, v_{n}}\left(\pi_{L}\right)\right) \\
& =f\left(u^{\prime-1} \overline{\mathrm{D}}_{L, v_{n}}\left(u^{\prime}\right)\right)+f\left(u_{0}^{-k} \overline{\mathrm{D}}_{L, v_{n}}\left(u_{0}^{k}\right)\right)+k g_{\pi_{L}}\left(\overline{\mathrm{D}}_{L, v_{n}}\left(\pi_{L}\right)\right) \\
& =f\left(u^{\prime-1} \overline{\mathrm{D}}_{L, v_{n}}\left(u^{\prime}\right)\right)+k f\left(u_{0}^{-1} \overline{\mathrm{D}}_{L, v_{n}}\left(u_{0}\right)\right)+k g_{\pi_{L}}\left(\overline{\mathrm{D}}_{L, v_{n}}\left(\pi_{L}\right)\right) . \tag{3.30}
\end{align*}
$$

On the other hand, we have

$$
\begin{align*}
g_{\pi_{L}^{\prime}}\left(\overline{\mathrm{D}}_{L, v_{n}}\left(\pi_{L}^{\prime}\right)\right) & =g_{\pi_{L}^{\prime}}\left(\overline{\mathrm{D}}_{L, v_{n}}\left(u_{0} \pi_{L}\right)\right) \\
& =g_{\pi_{L}^{\prime}}\left(u_{0} \overline{\mathrm{D}}_{L, v_{n}}\left(\pi_{L}\right)+\pi_{L} \overline{\mathrm{D}}_{L, v_{n}}\left(u_{0}\right)\right) \\
& \equiv \pi_{L}^{\prime-1}\left(u_{0} \overline{\mathrm{D}}_{L, v_{n}}\left(\pi_{L}\right)+\pi_{L} \overline{\mathrm{D}}_{L, v_{n}}\left(u_{0}\right)\right) \quad \bmod \pi_{L}^{-1} \mathfrak{X}_{L, 1}^{(n)} \\
& \equiv u_{0}^{-1} \pi_{L}^{-1}\left(u_{0} \overline{\mathrm{D}}_{L, v_{n}}\left(\pi_{L}\right)+\pi_{L} \overline{\mathrm{D}}_{L, v_{n}}\left(u_{0}\right)\right) \quad \bmod \pi_{L}^{-1} \mathfrak{X}_{L, 1}^{(n)} \\
& \equiv \pi_{L}^{-1} \overline{\mathrm{D}}_{L, v_{n}}\left(\pi_{L}\right)+u_{0}^{-1} \overline{\mathrm{D}}_{L, v_{n}}\left(u_{0}\right) \quad \bmod \pi_{L}^{-1} \mathfrak{X}_{L, 1}^{(n)} \\
& =f\left(u_{0}^{-1} \overline{\mathrm{D}}_{L, v_{n}}\left(u_{0}\right)\right)+g_{\pi_{L}}\left(\overline{\mathrm{D}}_{L, v_{n}}\left(\pi_{L}\right)\right) . \tag{3.31}
\end{align*}
$$

Therefore, (3.30) and (3.31) yield that $\operatorname{dog} \overline{\mathrm{D}}_{L, v_{n}}$ does not depend on the choice of $\pi_{L}$.
Theorem 3.8. The derivation $\overline{\mathrm{D}}_{L, v_{n}}: \mathcal{O}_{L} \longrightarrow \mathfrak{X}_{L, 1} / \mathfrak{X}_{L, 1}^{(n)}$ satisfies

$$
\begin{equation*}
(\alpha, \beta)_{L, n}=T_{L \mid K}\left(\lambda_{\rho}(\alpha) \operatorname{dlog} \overline{\mathrm{D}}_{L, v_{n}}(\beta)\right) \cdot{ }_{\rho} v_{n} \tag{3.32}
\end{equation*}
$$

for all $\alpha$ such that $\mu(\alpha)>\max \left\{\frac{n m_{0}}{q}, \frac{1}{q-1}\right\}+\frac{1}{q-1}+\frac{1}{e(L \mid K)}$ and for all $\beta \in L^{\times}$.
Proof. To prove (3.32) is equivalent to prove that

$$
\begin{equation*}
\operatorname{dlog} \overline{\mathrm{D}}_{L, v_{n}}(\beta)-\Psi_{L, v_{n}}(\beta) \in \pi_{L}^{-1} \mathfrak{X}_{L, 1}^{(n)} \tag{3.33}
\end{equation*}
$$

for all $\beta \in L^{\times}$, where $\operatorname{dlog} \overline{\mathrm{D}}_{L, v_{n}}(\beta)$ and $\Psi_{L, v_{n}}(\beta)$ are regarded as elements of $\pi_{L}^{-1} \mathfrak{X}_{L, 1}$. Indeed, let $\beta \in L^{\times}$. Since Proposition 2.3 shows that

$$
\begin{equation*}
(\alpha, \beta)_{L, n}=T_{L \mid K}\left(\lambda_{\rho}(\alpha) \Psi_{L, v_{n}}(\beta)\right) \cdot \rho v_{n} \tag{3.34}
\end{equation*}
$$

for all $\alpha \in \mathfrak{p}_{L, 1}$, then (3.32) is equivalent to say that

$$
\begin{equation*}
T_{L \mid K}\left(\lambda_{\rho}(\alpha) d \log \overline{\mathrm{D}}_{L, v_{n}}(\beta)\right) \cdot \rho v_{n}=T_{L \mid K}\left(\lambda_{\rho}(\alpha) \Psi_{L, v_{n}}(\beta)\right) \cdot{ }_{\rho} v_{n} \tag{3.35}
\end{equation*}
$$

for all $\alpha$ in $L$ such that $\mu(\alpha)>\max \left\{\frac{n m_{0}}{q}, \frac{1}{q-1}\right\}+\frac{1}{q-1}+\frac{1}{e(L \mid K)}$. Obviously, (3.35) is equivalent to

$$
\begin{equation*}
T_{L \mid K}\left(\lambda_{\rho}(\alpha)\left(\operatorname{dlog} \overline{\mathrm{D}}_{L, v_{n}}(\beta)-\Psi_{L, v_{n}}(\beta)\right) \in \eta^{n} \mathcal{O}_{K}\right. \tag{3.36}
\end{equation*}
$$

for all $\alpha \in \gamma \pi_{L} \mathfrak{p}_{L, 1}$, where $\gamma \in L$ is of valuation $\mu(\gamma)=\max \left\{\frac{n m_{0}}{q}, \frac{1}{q-1}\right\}$. However, since $\mathfrak{p}_{L, 1}=$ $\lambda_{\rho}\left(\mathfrak{p}_{L, 1}\right)$ and $\mu\left(\lambda_{\rho}(\alpha)\right)=\mu(\alpha)$ whenever $\alpha \in \mathfrak{p}_{L, 1}$ (see Lemma 2.2), then (3.36) is in turn equivalent to

$$
\begin{equation*}
T_{L \mid K}\left(\gamma \pi_{L} \alpha\left(\mathrm{dlog} \overline{\mathrm{D}}_{L, v_{n}}(\beta)-\Psi_{L, v_{n}}(\beta)\right) \in \eta^{n} \mathcal{O}_{K}\right. \tag{3.37}
\end{equation*}
$$

for all $\alpha \in \mathfrak{p}_{L, 1}$. Finally, by the very definition of $\mathfrak{X}_{L, 1},(3.37)$ is equivalent to

$$
\begin{equation*}
\operatorname{d} \log \overline{\mathrm{D}}_{L, v_{n}}(\beta)-\Psi_{L, v_{n}}(\beta) \in \pi_{L}^{-1} \frac{\eta^{n}}{\gamma} \mathfrak{X}_{L, 1}=\pi_{L}^{-1} \mathfrak{X}_{L, 1}^{(n)} . \tag{3.38}
\end{equation*}
$$

Let us now prove (3.38). Let $\beta=u \pi_{L}^{k} \in L^{\times}$, then $\operatorname{dlog} \overline{\mathrm{D}}_{L, v_{n}}(\beta)-\Psi_{L, v_{n}}(\beta)$ is equal to $u^{-1} \overline{\mathrm{D}}_{L, v_{n}}(u)+$ $k \pi_{L}^{-1} \overline{\mathrm{D}}_{L, v_{n}}\left(\pi_{L}\right)-\Psi_{L, v_{n}}(u)-k \Psi_{L, v_{n}}\left(\pi_{L}\right)$ modulo $\pi_{L}^{-1} \mathfrak{X}_{L, 1}^{(n)}$. However, by the very definition of $\overline{\mathrm{D}}_{L, v_{n}}$, we have

$$
\begin{equation*}
\overline{\mathrm{D}}_{L, v_{n}}(u) \equiv u \Psi_{L, v_{n}}(u) \quad \bmod \mathfrak{X}_{L, 1}^{(n)} . \tag{3.39}
\end{equation*}
$$

But as $\mathfrak{X}_{L, 1}^{(n)} \subset \pi_{L}^{-1} \mathfrak{X}_{L, 1}^{(n)}$, the congruence (3.39) implies that

$$
\begin{equation*}
\overline{\mathrm{D}}_{L, v_{n}}(u) \equiv u \Psi_{L, v_{n}}(u) \quad \bmod \pi_{L}^{-1} \mathfrak{X}_{L, 1}^{(n)} \tag{3.40}
\end{equation*}
$$

Thus, we have

$$
\begin{equation*}
u^{-1} \overline{\mathrm{D}}_{L, v_{n}}(u) \equiv \Psi_{L, v_{n}}(u) \quad \bmod \pi_{L}^{-1} \mathfrak{X}_{L, 1}^{(n)} . \tag{3.41}
\end{equation*}
$$

Moreover, we have

$$
\begin{equation*}
\overline{\mathrm{D}}_{L, v_{n}}\left(\pi_{L}\right) \equiv \pi_{L} \Psi_{L, v_{n}}\left(\pi_{L}\right) \quad \bmod \mathfrak{X}_{L, 1}^{(n)}, \tag{3.42}
\end{equation*}
$$

and thus,

$$
\begin{equation*}
\pi_{L}^{-1} \overline{\mathrm{D}}_{L, v_{n}}\left(\pi_{L}\right) \equiv \Psi_{L, v_{n}}\left(\pi_{L}\right) \quad \bmod \pi_{L}^{-1} \mathfrak{X}_{L, 1}^{(n)} \tag{3.43}
\end{equation*}
$$

This concludes the proof.
3.3. Values of $\overline{\mathrm{D}}_{L, v_{n}}$ in terms of representation theory. Let $\mathcal{U}_{K}$ be the group of units of $K$. In this section, we will consider the continuous representation $\mathbf{r}: \operatorname{Gal}(\Omega \mid H) \rightarrow \mathrm{GL}_{1}\left(\mathcal{O}_{K}\right)=\mathcal{U}_{K}$ defined in [6, Proposition 2.5]. The image $\mathbf{r}(\sigma)$ of an element $\sigma \in \operatorname{Gal}(\Omega \mid H)$ is the unique unit $u$ of $K$ such that $\sigma(\alpha)=\rho_{u}(\alpha)$ for all $\alpha \in W_{\rho}$. This representation is induced by the action of $\operatorname{Gal}(\Omega \mid H)$ on the module $\varliminf_{\mathrm{lim}} W_{\rho}$. We will show that we can obtain explicit formulas in terms of invariants of this representation. It is obvious that the kernel of $\mathbf{r}$ is $\operatorname{Gal}\left(\Omega \mid H_{\rho}\right)$. Thus, $\mathbf{r}$ induces an imbedding $\operatorname{Gal}\left(H_{\rho} \mid H\right) \rightarrow \mathcal{U}_{K}$. Reducing modulo $\mathcal{U}_{K, n}=1+\mathfrak{p}_{K}^{n}$, we get the map $\mathbf{r}_{n}$, which, restricted to $\operatorname{Gal}\left(H_{\rho}^{n} \mid H\right)$, defines an isomorphism

$$
\begin{equation*}
\mathbf{r}_{n}: \operatorname{Gal}\left(H_{\rho}^{n} \mid H\right) \rightarrow \mathcal{U}_{K} / \mathcal{U}_{K, n} . \tag{3.44}
\end{equation*}
$$

For an algebraic extension $F$ of $H$, we also denote by $\mathbf{r}: \operatorname{Gal}(\Omega \mid F) \rightarrow \mathcal{U}_{K}$ the restriction of $\mathbf{r}$ to $\operatorname{Gal}(\Omega \mid F)$, and by $\mathbf{r}_{n}: \operatorname{Gal}\left(F\left(V_{\rho}^{n}\right) \mid F\right) \rightarrow \mathcal{U}_{K} / \mathcal{U}_{K, n}$ the restriction to $\operatorname{Gal}\left(F\left(V_{\rho}^{n}\right) \mid F\right)$.
Proposition 3.9. Let $m \geq n$ and suppose $L \supset E_{\rho}^{m}$. There exists a character $\chi_{L, m, n}: L^{\times} \rightarrow$ $\mathcal{O}_{K} / \mathfrak{p}_{K}^{n m_{0}}$ such that

$$
\begin{equation*}
\mathbf{r}_{m_{0}(m+n)}\left(\Phi_{L}(\beta)\right)=1+\eta^{m} \chi_{L, m, n}(\beta) \in \mathcal{U}_{K} / \mathcal{U}_{K,(m+n) m_{0}} \tag{3.45}
\end{equation*}
$$

for all $\beta \in L^{\times}$. Furthermore, $\chi_{L, m, n}$ satisfies the following.
(i) $\chi_{L, m, n}(\beta)=\chi_{E_{\rho}^{m}, m, n}\left(\mathrm{~N}_{L \mid E_{\rho}^{m}}(\beta)\right)$.
(ii) Let $v=\rho_{a}\left(v_{m}\right) \in W_{\rho}^{m}$, where $v_{m}$ is a generator of $W_{\rho}^{m}$ such that $\rho_{\eta^{m-n}}\left(v_{m}\right)=v_{n}$. Then

$$
(v, \beta)_{L, n}=\left(a \chi_{L, m, n}(\beta)\right) \cdot{ }_{\rho} v_{n}
$$

for all $\beta \in L^{\times}$. In particular if $v=v_{m}$, then for every $\beta \in L^{\times}$, we have

$$
\begin{equation*}
\left(v_{m}, \beta\right)_{L, n}=\chi_{L, m, n}(\beta) \cdot \rho v_{n} \tag{3.46}
\end{equation*}
$$

Proof. Let $\beta \in L^{\times}$. As $\Phi_{L}(\beta)$ fixes $L$, thus in particular fixes $E_{\rho}^{m}$, we have

$$
\begin{equation*}
\mathbf{r}_{m_{0}(m+n)}\left(\Phi_{L}(\beta)\right) \equiv 1 \quad \bmod \eta^{m} . \tag{3.47}
\end{equation*}
$$

Thus, there exists an element $\chi_{L, m, n}(\beta) \in \mathcal{O}_{K} / \mathfrak{p}_{K}^{n m_{0}}$ such that (3.45) holds. It is easy to check that $\chi_{L, m, n}: L^{\times} \rightarrow \mathcal{O}_{K} / \mathfrak{p}_{K}^{n m_{0}}$ is a group homomorphism. Moreover, the properties of the reciprocity map $\Phi_{L}$ imply (i). To prove (ii), let $\xi \in \mathfrak{p}_{\Omega}$ be such that $\rho_{\eta^{n}}(\xi)=v$. Such a $\xi$ exists by [3, Lemma 2.1]. Since $v \in W_{\rho}^{m}$, then $\xi \in W_{\rho}^{m+n}$ and

$$
\begin{aligned}
(v, \beta)_{L, n} & =\Phi_{L}(\beta)(\xi)-\xi \\
& =\mathbf{r}_{m_{0}(m+n)}\left(\Phi_{L}(\beta)\right) \cdot \rho_{\rho} \xi-\xi \\
& =\left(\mathbf{r}_{m_{0}(m+n)}\left(\Phi_{L}(\beta)\right)-1\right) \cdot{ }_{\rho} \xi \\
& =\left(\eta^{m} \chi_{L, m, n}(\beta)\right) \cdot{ }_{\rho} \xi \\
& =\left(\eta^{m-n} \chi_{L, m, n}(\beta)\right) \cdot{ }_{\rho} v \\
& =\left(\eta^{m-n} \chi_{L, m, n}(\beta)\right) \cdot{ }_{\rho}\left(a \cdot{ }_{\rho} v_{m}\right) \\
& =\left(a \chi_{L, m, n}(\beta)\right) \cdot \rho v_{n} .
\end{aligned}
$$

Lemma 3.10. The character $\chi_{L, m, n}: L^{\times} \rightarrow \mathcal{O}_{K} / \mathfrak{p}_{K}^{n m_{0}}$ is stable by isomorphism class of $\rho$. In other words, if $t$ is an invertible power series in $\mathcal{O}_{H}\{\{\tau\}\}$ such that $\rho_{a}^{\prime}=t^{-1} \circ \rho_{a} \circ t$ for all $a \in \mathcal{O}_{K}$, then the characters defined in Proposition 3.9 associated to $\rho$ and $\rho^{\prime}$ are equal.
Proof. Let $v_{m}$ be such that $\rho_{\eta^{m-n}}\left(v_{m}\right)=v_{n}$ and let $v_{i}^{\prime}=t^{-1}\left(v_{i}\right)$ for $i=m, n$. Denote by $\chi_{L, m, n}$ (respectively $\chi_{L, m, n}^{\prime}$ ) the character defined in Proposition 3.9 associated to $\rho$ (respectively $\rho^{\prime}$ ). Then by (3.46), we have $\chi_{L, m, n}^{\prime}(\beta) \cdot \rho^{\prime} v_{n}^{\prime}=\left(v_{m}^{\prime}, \beta\right)_{\rho^{\prime}, L, n}$ which is equal to $t^{-1}\left(\left(t\left(v_{m}^{\prime}\right), \beta\right)_{\rho, L, n}\right)=$ $t^{-1}\left(\left(v_{m}, \beta\right)_{\rho, L, n}\right)$ by Proposition 2.1 (vi). Again from (3.46), we conclude that

$$
\begin{aligned}
\chi_{L, m, n}^{\prime}(\beta) \cdot \rho^{\prime} v_{n}^{\prime} & =t^{-1}\left(\left(v_{m}, \beta\right)_{\rho, L, n}\right) \\
& =t^{-1}\left(\chi_{L, m, n}(\beta) \cdot{ }_{\rho} v_{n}\right) \\
& =\chi_{L, m, n}(\beta) \cdot \rho^{\prime} t^{-1}\left(v_{n}\right) \\
& =\chi_{L, m, n}(\beta) \cdot \rho^{\prime} v_{n}^{\prime} .
\end{aligned}
$$

Proposition 3.11. Let $m \geq n$ and suppose $L \supset E_{\rho}^{m}$ is such that $p$ does not divide the ramification index of the extension $L \mid E_{\rho}^{m}$. Let $u$ be a unit in $L$ such that $\mu(1-u)>\max \left\{\frac{n m_{0}}{q}, \frac{1}{q-1}\right\}+\frac{1}{q-1}$. Let $f(X)$ and $g(X)$ be power series in $\mathbb{F}_{q_{L}}[[X]]$ such that $f\left(\pi_{L}\right)=v_{m}$ and $g\left(\pi_{L}\right)=u$. Then,

$$
\begin{equation*}
\frac{\frac{g^{\prime}\left(\pi_{L}\right)}{u}}{\frac{f^{\prime}\left(v_{L}\right)}{v_{m}}} \in \mathfrak{p}_{L} \tag{3.48}
\end{equation*}
$$

and

$$
\begin{equation*}
\chi_{L, m, n}(u) \equiv \mathrm{T}_{L \mid K}\left(\left(\frac{1-u}{u}\right)\left(1-\frac{\frac{g^{\prime}\left(\pi_{L}\right)}{u}}{\frac{f^{\prime}\left(\pi_{L}\right)}{v_{m}}}\right) \overline{\mathrm{D}}_{L, v_{n}}\left(v_{m}\right)\right) \quad \bmod \mathfrak{p}_{K}^{n m_{0}} . \tag{3.49}
\end{equation*}
$$

Proof. Since $p$ does not divide the ramification index of $L \mid E_{\rho}^{m}$, we have $\mu\left(f^{\prime}\left(\pi_{L}\right)\right)=\mu\left(f\left(\pi_{L}\right)\right)-$ $\mu\left(\pi_{L}\right)=\mu\left(v_{m}\right)-\mu\left(\pi_{L}\right)$. Furthermore, since $\mu(1-u)>\max \left\{\frac{n m_{0}}{q}, \frac{1}{q-1}\right\}+\frac{1}{q-1}$, we can write $g(X)=1+\sum a_{i} X^{i}$, where $i \geq 2$ and $a_{i} \in \mathbb{F}_{q_{L}}$. Hence, $\mu\left(g^{\prime}\left(\pi_{L}\right)\right)>\mu\left(\pi_{L}\right)$ and therefore, we have (3.48). Now, let us prove (3.49). By Lemma 2.6 and Lemma 3.10, we can suppose that $\rho$ is such that $(x, x)_{\rho, L, n}=0$ for all $x \in \mathfrak{p}_{L}$. For such a $\rho$ and for $u \in L^{\times}$such that $\mu(1-u)>\max \left\{\frac{n m_{0}}{q}, \frac{1}{q-1}\right\}+\frac{1}{q-1}$, we have

$$
\begin{equation*}
(\alpha u, u)_{L, n}=\mathrm{T}_{L \mid K}\left((1-u) \mathrm{D}_{L, v_{n}}(\alpha)\right) \cdot \rho v_{n} \tag{3.50}
\end{equation*}
$$

for all $\alpha \in \mathfrak{p}_{L} \backslash\{0\}$ by Lemma 3.4. We note that the hypothesis on the valuation of $1-u$ allows us to replace $\mathrm{D}_{L, v_{n}}(\alpha)$ by $\overline{\mathrm{D}}_{L, v_{n}}(\alpha)$ in (3.50). Let $\alpha$ be such that $\alpha u=v_{m}$, where $v_{m}$ is a generator of $W_{\rho}^{m}$ such that $\rho_{\eta^{m-n}}\left(v_{m}\right)=v_{n}$. Hence, (3.50) together with (3.46) give us

$$
\begin{equation*}
\chi_{L, m, n}(u) \cdot \rho v_{n}=\left(v_{m}, u\right)_{L, n}=\mathrm{T}_{L \mid K}\left((1-u) \overline{\mathrm{D}}_{L, v_{n}}\left(v_{m} u^{-1}\right)\right) \cdot \rho v_{n} . \tag{3.51}
\end{equation*}
$$

However, $\overline{\mathrm{D}}_{L, v_{n}}\left(\frac{v_{m}}{u}\right)=\frac{1}{u^{2}}\left(u \overline{\mathrm{D}}_{L, v_{n}}\left(v_{m}\right)-v_{m} \overline{\mathrm{D}}_{L, v_{n}}(u)\right)$. Moreover, we have

$$
\overline{\mathrm{D}}_{L, v_{n}}(u)=g^{\prime}\left(\pi_{L}\right) \overline{\mathrm{D}}_{L, v_{n}}\left(\pi_{L}\right) \quad \text { and } \quad \overline{\mathrm{D}}_{L, v_{n}}\left(v_{m}\right)=f^{\prime}\left(\pi_{L}\right) \overline{\mathrm{D}}_{L, v_{n}}\left(\pi_{L}\right)
$$

This implies that

$$
f^{\prime}\left(\pi_{L}\right) \overline{\mathrm{D}}_{L, v_{n}}(u)-f^{\prime}\left(\pi_{L}\right) g^{\prime}\left(\pi_{L}\right) \overline{\mathrm{D}}_{L, v_{n}}\left(\pi_{L}\right) \in \mathfrak{X}_{L, 1}^{(n)}
$$

and

$$
g^{\prime}\left(\pi_{L}\right) \overline{\mathrm{D}}_{L, v_{n}}\left(v_{m}\right)-f^{\prime}\left(\pi_{L}\right) g^{\prime}\left(\pi_{L}\right) \overline{\mathrm{D}}_{L, v_{n}}\left(\pi_{L}\right) \in \mathfrak{X}_{L, 1}^{(n)}
$$

so that

$$
\begin{equation*}
f^{\prime}\left(\pi_{L}\right) \overline{\mathrm{D}}_{L, v_{n}}(u)-g^{\prime}\left(\pi_{L}\right) \overline{\mathrm{D}}_{L, v_{n}}\left(v_{m}\right) \in \mathfrak{X}_{L, 1}^{(n)} . \tag{3.52}
\end{equation*}
$$

Now, since the calculation in the beginning of this proof shows that $\frac{v_{m}}{f^{\prime}\left(\pi_{L}\right)} \in \mathfrak{p}_{L}$, we can multiply (3.52) by $\frac{v_{m}}{f^{\prime}\left(\pi_{L}\right)}$ in the fractional ideal $\mathfrak{X}_{L, 1}^{(n)}$. Therefore, we get

$$
v_{m} \overline{\mathrm{D}}_{L, v_{n}}(u)=v_{m} \frac{g^{\prime}\left(\pi_{L}\right)}{f^{\prime}\left(\pi_{L}\right)} \overline{\mathrm{D}}_{L, v_{n}}\left(v_{m}\right) \in \mathfrak{X}_{L, 1} / \mathfrak{X}_{L, 1}^{(n)}
$$

Finally, we can write

$$
\begin{aligned}
\chi_{L, m, n}(u) & \equiv \mathrm{T}_{L \mid K}\left(\frac{1-u}{u^{2}}\left(u \overline{\mathrm{D}}_{L, v_{n}}\left(v_{m}\right)-v_{m} \frac{g^{\prime}\left(\pi_{L}\right)}{f^{\prime}\left(\pi_{L}\right)} \overline{\mathrm{D}}_{L, v_{n}}\left(v_{m}\right)\right) \quad \bmod \mathfrak{p}_{K}^{n m_{0}}\right. \\
& \equiv \mathrm{T}_{L \mid K}\left(\left(\frac{1-u}{u}\right)\left(1-\frac{\frac{g^{\prime}\left(\pi_{L}\right)}{u}}{\frac{f^{\prime}\left(\pi_{L}\right)}{v_{m}}}\right) \overline{\mathrm{D}}_{L, v_{n}}\left(v_{m}\right)\right) \quad \bmod \mathfrak{p}_{K}^{n m_{0}} .
\end{aligned}
$$

Lemma 3.12. Let $m \geq n$ and suppose $L \supset E_{\rho}^{m}$ is such that $p$ does not divide the ramification index of the extension $L \mid E_{\rho}^{m}$. Then, $\overline{\mathrm{D}}_{L, v_{n}}\left(v_{m}\right) \in \mathfrak{X}_{L, 1} / \frac{\eta^{n}}{\gamma} \mathfrak{X}_{L, 1}$ is uniquely determined by (3.49).
Proof. Let $x$ and $x^{\prime}$ be two elements in $\mathfrak{X}_{L, 1}$ such that

$$
\begin{equation*}
\mathrm{T}_{L \mid K}\left(\left(\frac{1-u}{u}\right)\left(1-\frac{\frac{g^{\prime}\left(\pi_{L}\right)}{u}}{\frac{f^{\prime}\left(\pi_{L}\right)}{v_{m}}}\right) x\right) \equiv \mathrm{T}_{L \mid K}\left(\left(\frac{1-u}{u}\right)\left(1-\frac{\frac{g^{\prime}\left(\pi_{L}\right)}{u}}{\frac{f^{\prime}\left(\pi_{L}\right)}{v_{m}}}\right) x^{\prime}\right) \quad \bmod \mathfrak{p}_{K}^{n m_{0}}, \tag{3.53}
\end{equation*}
$$

for all $u \in \mathcal{U}_{L}$ such that $\mu(1-u)>\max \left\{\frac{n m_{0}}{q}, \frac{1}{q-1}\right\}+\frac{1}{q-1}$. This means that

$$
\begin{equation*}
\mathrm{T}_{L \mid K}\left(\left(\frac{1-u}{u}\right)\left(1-\frac{\frac{g^{\prime}\left(\pi_{L}\right)}{u}}{\frac{f^{\prime}\left(\pi_{L}\right)}{v_{m}}}\right)\left(x-x^{\prime}\right)\right) \in \mathfrak{p}_{K}^{n m_{0}} \tag{3.54}
\end{equation*}
$$

for all units $u \in L$ such that $\mu(1-u)>\max \left\{\frac{n m_{0}}{q}, \frac{1}{q-1}\right\}+\frac{1}{q-1}$. We need to prove that $x-x^{\prime} \in \mathfrak{X}_{L, 1}^{(n)}$. Since we are considering any $u$ such that $\mu(1-u)>\max \left\{\frac{n m_{0}}{q}, \frac{1}{q-1}\right\}+\frac{1}{q-1}$, then we can write $1-u=\gamma \alpha$, where $\gamma \in L$ is of valuation $\max \left\{\frac{n m_{0}}{q}, \frac{1}{q-1}\right\}$ and $\alpha$ varies in $\mathfrak{p}_{L, 1}=\lambda_{\rho}\left(\mathfrak{p}_{L, 1}\right)$. Furthermore, the element $1-\frac{\frac{g^{\prime}\left(\pi_{L}\right)}{u}}{\frac{f^{\prime}\left(\pi_{L}\right)}{v_{m}}}$ is a unit in $L$. Therefore, $x$ and $x^{\prime}$ are such that

$$
\begin{equation*}
\mathrm{T}_{L \mid K}\left(\gamma \alpha\left(x-x^{\prime}\right)\right) \in \mathfrak{p}_{K}^{n m_{0}} \tag{3.55}
\end{equation*}
$$

for all $\alpha \in \mathfrak{p}_{L, 1}$. This yields that $x-x^{\prime} \in \frac{\eta^{n}}{\gamma} \mathfrak{X}_{L, 1}=\mathfrak{X}_{L, 1}^{(n)}$.
3.4. Explicit formulas in a particular case. In this section, we place ourselves in the case where $\rho_{\eta} \equiv \tau^{m_{0}} \bmod \mathfrak{p}_{H}$ and $L=E_{\rho}^{m} \supset E_{\rho}^{n}$ for an integer $m \geq n$. As previously shown in Theorem 3.8, we have

$$
\begin{equation*}
\left(\alpha, v_{m}\right)_{L, n}=T_{L \mid K}\left(\lambda_{\rho}(\alpha) \frac{1}{v_{m}} \overline{\mathrm{D}}_{L, v_{n}}\left(v_{m}\right)\right) \cdot \rho v_{n} \tag{3.56}
\end{equation*}
$$

for all $\alpha \in \mathfrak{p}_{L}$ such that $\mu(\alpha) \geq \max \left\{\frac{n m_{0}}{q}, \frac{1}{q-1}\right\}+\frac{1}{q-1}+\frac{1}{q^{n m}(q-1)}$. On the other hand, we can prove using [3], that for the same condition on $\alpha$, we have

$$
\begin{equation*}
\left(\alpha, v_{m}\right)_{L, n}=\frac{1}{\eta^{m}} T_{L \mid K}\left(\lambda_{\rho}(\alpha) \frac{1}{v_{m}}\right) \cdot \rho v_{n} . \tag{3.57}
\end{equation*}
$$

Indeed,

$$
\begin{array}{rlrl}
\left(\alpha, v_{m}\right)_{L, n} & =\left(\rho_{\eta^{m-n}}(\alpha), v_{m}\right)_{L, m} & & \text { (by [3, Proposition 2.2]) } \\
& =\frac{1}{\eta^{m}} T_{L \mid K}\left(\lambda_{\rho}\left(\rho_{\eta^{m-n}}(\alpha)\right) \frac{1}{v_{m}}\right) \cdot{ }_{\rho} v_{m} & & (\text { by }[3, \text { Theorem 5.7]) } \\
& =\frac{1}{\eta^{m}} T_{L \mid K}\left(\eta^{m-n} \lambda_{\rho}(\alpha) \frac{1}{v_{m}}\right) \cdot{ }_{\rho} v_{m} & \\
& =\frac{1}{\eta^{m}} T_{L \mid K}\left(\lambda_{\rho}(\alpha) \frac{1}{v_{m}}\right) \cdot{ }_{\rho} v_{n} . &
\end{array}
$$

Here, we can apply [3, Theorem 5.7] for $\left(\rho_{\eta^{m-n}}(\alpha), v_{m}\right)_{L, m}$ because $\mu\left(\rho_{\eta^{m-n}}(\alpha)\right) \geq \max \left\{\frac{m m_{0}}{q}, \frac{1}{q-1}\right\}+$ $\frac{1}{q-1}+\frac{1}{q^{m m_{0}}(q-1)}$ for all $m \geq n$ (see proof of [3, Lemma 4.1]).
Proposition 3.13. We have

$$
\begin{equation*}
\overline{\mathrm{D}}_{E_{\rho}^{m}, v_{n}}\left(v_{m}\right)=\frac{1}{\eta^{m}} . \tag{3.58}
\end{equation*}
$$

Proof. This is a direct consequence of the explicit formulas (3.56) and (3.57).
Corollary 3.14. Let $u$ be a unit of $L$ such that $\mu(1-u)>\max \left\{\frac{n m_{0}}{q}, \frac{1}{q-1}\right\}+\frac{1}{q-1}$. Then

$$
\begin{equation*}
\mathrm{N}_{L \mid K}\left(u^{-1}\right)-1 \equiv \mathrm{~T}_{L \mid K}\left(\left(\frac{1-u}{u}\right)\left(1-\frac{g^{\prime}\left(v_{m}\right)}{u} v_{m}\right)\right) \quad \bmod \mathfrak{p}_{K}^{(n+m) m_{0}} \tag{3.59}
\end{equation*}
$$

where $g(X) \in \mathbb{F}_{q_{L}}[[X]]$ is such that $g\left(v_{m}\right)=u$.
Proof. Since we proved in Lemma 3.12 that $\overline{\mathrm{D}}_{L, v_{n}}\left(v_{m}\right)=\frac{1}{\eta^{m}} \in \mathfrak{X}_{L, 1} / \mathfrak{X}_{L, 1}^{(n)}$ is uniquely determined by (3.49), we have

$$
\begin{equation*}
\chi_{L, m, n}(u) \equiv \frac{1}{\eta^{m}} \mathrm{~T}_{L \mid K}\left(\left(\frac{1-u}{u}\right)\left(1-\frac{g^{\prime}\left(v_{m}\right)}{u} v_{m}\right)\right) \quad \bmod \mathfrak{p}_{K}^{n m_{0}} \tag{3.60}
\end{equation*}
$$

for all units $u$ of $L$ such that $\mu(1-u)>\max \left\{\frac{n m_{0}}{q}, \frac{1}{q-1}\right\}+\frac{1}{q-1}$. Moreover, we know by (3.46) that

$$
\begin{equation*}
\left(v_{m}, u\right)_{L, n}=\chi_{L, m, n}(u) \cdot \rho v_{n}=\eta^{m} \chi_{L, m, n}(u) \cdot \rho v_{m+n} \tag{3.61}
\end{equation*}
$$

where $v_{m+n} \in W_{\rho}^{m+n}$ is such that $\rho_{\eta^{n}}\left(v_{m+n}\right)=v_{m}$. On the other hand, by the definition of $(,)_{L, n}$, we have

$$
\begin{equation*}
\left(v_{m}, u\right)_{L, n}=\Phi_{L}(u)\left(v_{m+n}\right)-v_{m+n}=\Phi_{K}\left(\mathrm{~N}_{L \mid K}(u)\right)\left(v_{m+n}\right)-v_{m+n} . \tag{3.62}
\end{equation*}
$$

But $\Phi_{K}\left(\mathrm{~N}_{L \mid K}(u)\right)\left(v_{m+n}\right)=\rho_{\mathrm{N}_{L \mid K}(u)^{-1}}\left(v_{m+n}\right)$ by [3, Proposition 5.1]. Therefore, $\left(v_{m}, u\right)_{L, n}=$ $\left(\mathrm{N}_{L \mid K}\left(u^{-1}\right)-1\right) \cdot \rho v_{m+n}$ and hence,

$$
\begin{equation*}
\mathrm{N}_{L \mid K}\left(u^{-1}\right)-1 \equiv \eta^{m} \chi_{L, m, n}(u) \quad \bmod \mathfrak{p}_{K}^{(n+m) m_{0}} . \tag{3.63}
\end{equation*}
$$

Finally, (3.59) follows from (3.60) and (3.63).
