# On the mean average of integer partition as the sum of powers 

Pengyong Ding ${ }^{1, *}$

#### Abstract

This paper is concerned with the function $r_{k, s}(n)$, the number of (ordered) representations of $n$ as the sum of $s$ positive $k$-th powers, where integers $k, s \geq 2$. We examine the mean average of the function, or equivalently, $$
\sum_{m=1}^{n} r_{k, s}(m)
$$

Keywords: mean average, partition, sum of powers, lattice points 2020 MSC: 11P05, 11P21, 11D45

## 1. Introduction

This paper is concerned with the function $r_{k, s}(n)$, the number of (ordered) representations of $n$ as the sum of $s$ positive $k$-th powers, where integers $k, s \geq 2$ :

$$
\begin{equation*}
r_{k, s}(n)=\sum_{\substack{x_{1}, x_{2}, \cdots x_{s} \\ x_{1}^{k}+x_{2}^{k}+\cdots+x_{s}^{k}=n}} 1 . \tag{1}
\end{equation*}
$$

The function is important in the study of Waring's problem, which is to find the least $s$ for a given $k$, such that $r_{k, s}(n)>0$ for every sufficiently large $n$. Besides Waring's problem, the function is also useful in the study of Diophantine equations. However, the property of $r_{k, s}(n)$ is only poorly understood even when $k$ and $s$ are small. For example, when both $k$ and $s$ are as small as 3 , the asymptotic formula for the second moment sum

[^0]of $r_{3,3}(n)$ is still unknown. The best result that we have already known is provided by Vaughan [1]:
$$
\sum_{m=1}^{n} r_{3,3}(n)^{2} \ll n^{\frac{7}{6}}(\log n)^{\varepsilon-\frac{5}{2}}
$$
although we may conjecture that
$$
\sum_{m=1}^{n} r_{3,3}(n)^{2} \sim C n
$$
for some positive constant $C$. The mean average of $r_{k, s}(n)$, or equivalently, the sum
\[

$$
\begin{equation*}
\sum_{m=1}^{n} r_{k, s}(m) \tag{2}
\end{equation*}
$$

\]

is not as badly known as the other properties. In fact, similar to the argument by Vaughan [1], if we let

$$
\Delta_{k, s}(n)=\sum_{m=1}^{n} r_{k, s}(m)-\frac{\Gamma\left(\frac{k+1}{k}\right)^{s}}{\Gamma\left(\frac{k+s}{k}\right)} n^{\frac{s}{k}},
$$

then it represents the difference between the number of lattice points in an $s$-dimensional convex body and its volume, which is bounded by its $(s-1)$ dimensional surface volume. So we have

$$
\Delta_{k, s}(n) \ll n^{\frac{s-1}{k}}
$$

and thus

$$
\begin{equation*}
\sum_{m=1}^{n} r_{k, s}(m)=\frac{\Gamma\left(\frac{k+1}{k}\right)^{s}}{\Gamma\left(\frac{k+s}{k}\right)} n^{\frac{s}{k}}+O\left(n^{\frac{s-1}{k}}\right) \tag{3}
\end{equation*}
$$

However, we can improve that result by applying van der Corput's method. For example, Vaughan [1] have shown that

$$
\sum_{m=1}^{n} r_{3,2}(m)=\frac{\Gamma\left(\frac{4}{3}\right)^{2}}{\Gamma\left(\frac{5}{3}\right)} n^{\frac{2}{3}}+O\left(n^{\frac{2}{9}}(\log n)^{\frac{1}{3}}\right)
$$

and

$$
\sum_{m=1}^{n} r_{3,3}(m)=\Gamma\left(\frac{4}{3}\right)^{3} n-\frac{\Gamma\left(\frac{4}{3}\right)^{2}}{2 \Gamma\left(\frac{5}{3}\right)} n^{\frac{2}{3}}+O\left(n^{\frac{5}{9}}(\log n)^{\frac{1}{3}}\right)
$$

which is more precise than (3) when $k=3$ and $s=2$ or 3 . Hence we can follow a similar argument and calculate the mean average of $r_{k, s}(n)$ when $k \geq 4$ and $s \geq 2$. The following theorem shows the result:
Theorem 1.1. If $k \geq 4$ and $s$ are integers, and $2 \leq s \leq k+1$, then

$$
\begin{equation*}
\sum_{m=1}^{n} r_{k, s}(m)=\frac{\Gamma\left(\frac{k+1}{k}\right)^{s}}{\Gamma\left(\frac{k+s}{k}\right)} n^{\frac{s}{k}}-\frac{s}{2} \cdot \frac{\Gamma\left(\frac{k+1}{k}\right)^{s-1}}{\Gamma\left(\frac{k+s-1}{k}\right)} n^{\frac{s-1}{k}}+O\left(n^{\frac{(s-1) k-1}{k^{2}}}\right) \tag{4}
\end{equation*}
$$

or equivalently,

$$
\begin{equation*}
\sum_{m \leq x} r_{k, s}(m)=\frac{\Gamma\left(\frac{k+1}{k}\right)^{s}}{\Gamma\left(\frac{k+s}{k}\right)} x^{\frac{s}{k}}-\frac{s}{2} \cdot \frac{\Gamma\left(\frac{k+1}{k}\right)^{s-1}}{\Gamma\left(\frac{k+s-1}{k}\right)} x^{\frac{s-1}{k}}+O\left(x^{\frac{(s-1) k-1}{k^{2}}}\right) \tag{5}
\end{equation*}
$$

## 2. The proof of Theorem 1.1

We state the following two results without proof. The first one is the van der Corput Lemma, which is Theorem 2.2 of Graham and Kolesnik [2].
Lemma 2.1. Suppose that $a<b$ and $f$ has a continuous second derivative on $[a, b]$. Suppose also that $\mu>0, \eta>1$ and that for every $\alpha \in[a, b]$, we have $\mu \leq\left|f^{\prime \prime}(\alpha)\right| \leq \eta \mu$. Then

$$
\sum_{a<n \leq b} e(f(n)) \ll \mu^{-\frac{1}{2}}+(b-a) \eta \mu^{\frac{1}{2}}
$$

The second result is Lemma 2.2 of Vaughan [1]. For any $\alpha \in \mathbb{R}$, define

$$
B_{1}(\alpha)=\alpha-\lfloor\alpha\rfloor-\frac{1}{2}, \quad B_{2}(\alpha)=\int_{0}^{\alpha} B_{1}(\beta) \mathrm{d} \beta
$$

then we have
Lemma 2.2. Let $H, \alpha \in \mathbb{R}$ and $H \geq 2$. Then

$$
B_{1}(\alpha)=-\sum_{0<|h| \leq H} \frac{e(\alpha h)}{2 \pi i h}+O\left(\min \left(1, \frac{1}{H\|\alpha\|}\right)\right)
$$

and

$$
\min \left(1, \frac{1}{H\|\alpha\|}\right)=\sum_{h=-\infty}^{\infty} c(h) e(\alpha h)
$$

where

$$
c(0)=\frac{2}{H}\left(1+\log \frac{H}{2}\right), \quad c(h) \ll \min \left(\frac{\log 2 H}{H}, \frac{1}{|h|}, \frac{H}{h^{2}}\right)(h \neq 0) .
$$

We can use these results to prove the following lemma.
Lemma 2.3. If $k \geq 4$ is an integer and $x>1$, then

$$
\begin{equation*}
\sum_{m \leq(x / 2)^{1 / k}} B_{1}\left(\left(x-m^{k}\right)^{\frac{1}{k}}\right) \ll x^{\frac{k-1}{k^{2}}} . \tag{6}
\end{equation*}
$$

Proof. We use a similar method to the proof given by Vaughan [1]. First, for convenience, we define

$$
M^{\prime}=\min \left(2 M,\left(\frac{x}{2}\right)^{\frac{1}{k}}\right)
$$

for every $M$. Then let $\nu$ be a parameter such that $1 \leq \nu \leq(x / 2)^{1 / k}$, and define the set

$$
\mathcal{M}=\left\{\nu \cdot 2^{j} \mid j \geq 0, \nu \cdot 2^{j} \leq\left(\frac{x}{2}\right)^{\frac{1}{k}}\right\}
$$

So we have

$$
\begin{equation*}
\sum_{m \leq(x / 2)^{1 / k}} B_{1}\left(\left(x-m^{k}\right)^{\frac{1}{k}}\right)=\sum_{M \in \mathcal{M}} \sum_{M<m \leq M^{\prime}} B_{1}\left(\left(x-m^{k}\right)^{\frac{1}{k}}\right)+O(\nu) . \tag{7}
\end{equation*}
$$

By Lemma 2.2, let $\alpha=\left(x-m^{k}\right)^{1 / k}$, we have

$$
\begin{aligned}
\sum_{M<m \leq M^{\prime}} B_{1}\left(\left(x-m^{k}\right)^{\frac{1}{k}}\right)= & -\sum_{0<|h| \leq H} \frac{T(M, h)}{2 \pi i h} \\
& +O\left(\sum_{M<m \leq M^{\prime}} \min \left(1, \frac{1}{H\left\|\left(x-m^{k}\right)^{\frac{1}{k}}\right\|}\right)\right),
\end{aligned}
$$

where

$$
T(M, h)=\sum_{M<m \leq M^{\prime}} e\left(\left(x-m^{k}\right)^{\frac{1}{k}} h\right) .
$$

Regarding the error term, still by Lemma 2.2, we have

$$
\sum_{M<m \leq M^{\prime}} \min \left(1, \frac{1}{H\left\|\left(x-m^{k}\right)^{\frac{1}{k}}\right\|}\right)=\sum_{h=-\infty}^{\infty} c(h) T(M, h),
$$

so

$$
\begin{equation*}
\sum_{M<m \leq M^{\prime}} B_{1}\left(\left(x-m^{k}\right)^{\frac{1}{k}}\right)=-\sum_{0<|h| \leq H} \frac{T(M, h)}{2 \pi i h}+O\left(\sum_{h=-\infty}^{\infty} c(h) T(M, h)\right) . \tag{8}
\end{equation*}
$$

Now consider $T(M, h)$ when $h \neq 0$. First, for convenience let

$$
f(\alpha)=h\left(x-\alpha^{k}\right)^{\frac{1}{k}},
$$

then for $\alpha<x^{1 / k}$,

$$
f^{\prime \prime}(\alpha)=-(k-1) h x \alpha^{k-2}\left(x-\alpha^{k}\right)^{\frac{1}{k}-2} .
$$

So when $\alpha \in\left[M, M^{\prime}\right]$, we have

$$
(k-1)|h| x^{\frac{1}{k}-1} M^{k-2} \leq\left|f^{\prime \prime}(\alpha)\right| \leq 2^{k-\frac{1}{k}}(k-1)|h| x^{\frac{1}{k}-1} M^{k-2} .
$$

Therefore, the function $f(\alpha)$ satisfies the conditions in Lemma 2.1, where $a$, $b, \mu$, and $\eta$ are replaced by $M, M^{\prime},(k-1)|h| x^{\frac{1}{k}-1} M^{k-2}$, and $2^{k-\frac{1}{k}}$ respectively. By that lemma, when $h \neq 0$, we have

$$
\begin{aligned}
T(M, h) & \ll\left((k-1)|h| x^{\frac{1}{k}-1} M^{k-2}\right)^{-\frac{1}{2}}+\left(M^{\prime}-M\right) 2^{k-\frac{1}{k}}\left((k-1)|h| x^{\frac{1}{k}-1} M^{k-2}\right)^{\frac{1}{2}} \\
& \ll|h|^{-\frac{1}{2}} x^{\frac{k-1}{2 k}} M^{\frac{2-k}{2}}+|h|^{\frac{1}{2}} x^{\frac{1-k}{2 k}} M^{\frac{k}{2}}
\end{aligned}
$$

Finally, if $h=0$, then obviously $T(M, 0) \ll M$. Hence by (8) and Lemma 2.2, we have

$$
\begin{align*}
& \sum_{M<m \leq M^{\prime}} B_{1}\left(\left(x-m^{k}\right)^{\frac{1}{k}}\right) \\
\ll & \sum_{0<|h| \leq H} \frac{|T(M, h)|}{|h|}+\sum_{\substack{h=-\infty \\
h \neq 0}}^{\infty}|c(h)||T(M, h)|+|c(0)||T(M, 0)| \\
\ll & \sum_{0<|h| \leq H}\left(|h|^{-\frac{3}{2}} x^{\frac{k-1}{2 k}} M^{\frac{2-k}{2}}+|h|^{-\frac{1}{2}} x^{\frac{1-k}{2 k}} M^{\frac{k}{2}}\right) \\
& +\sum_{\substack{h=-\infty \\
h \neq 0}}^{\infty}\left(\frac{1}{|h|}|h|^{-\frac{1}{2}} x^{\frac{k-1}{2 k}} M^{\frac{2-k}{2}}+\min \left(\frac{1}{|h|}, \frac{H}{h^{2}}\right)|h|^{\frac{1}{2}} x^{\frac{1-k}{2 k}} M^{\frac{k}{2}}\right) \\
& +\frac{2}{H}\left(1+\log \frac{H}{2}\right) M \\
\ll & x^{\frac{k-1}{2 k}} M^{\frac{2-k}{2}}+H^{\frac{1}{2}} x^{\frac{1-k}{2 k}} M^{\frac{k}{2}}+M H^{-1} \log (2 H) . \tag{9}
\end{align*}
$$

To minimize the size of the error terms, we need an optimal choice for $H$. A possible option is

$$
\begin{equation*}
H=x^{\frac{3}{2 k^{2}}} \tag{10}
\end{equation*}
$$

so that (9) becomes

$$
\sum_{M<m \leq M^{\prime}} B_{1}\left(\left(x-m^{k}\right)^{\frac{1}{k}}\right) \ll x^{\frac{k-1}{2 k}} M^{\frac{2-k}{2}}+x^{\frac{3+2 k-2 k^{2}}{4 k^{2}}} M^{\frac{k}{2}}+M x^{-\frac{3}{2 k^{2}}} \log x
$$

Therefore, by (7),

$$
\begin{align*}
& \sum_{m \leq(x / 2)^{1 / k}} B_{1}\left(\left(x-m^{k}\right)^{\frac{1}{k}}\right) \\
& \ll \sum_{M \in \mathcal{M}}\left(x^{\frac{k-1}{2 k}} M^{\frac{2-k}{2}}\right)+\sum_{M \in \mathcal{M}}\left(x^{\frac{3+2 k-2 k^{2}}{4 k^{2}}} M^{\frac{k}{2}}\right)+\sum_{M \in \mathcal{M}}\left(M x^{-\frac{3}{2 k^{2}}} \log x\right)+\nu \\
& \ll x^{\frac{k-1}{2 k}} \nu^{\frac{2-k}{2}}+x^{\frac{2 k+3}{4 k^{2}}}+x^{\frac{2 k-3}{2 k^{2}}}(\log x)+\nu . \tag{11}
\end{align*}
$$

From the first and the last terms, the only optimal choice for $\nu$ such that the error terms have the minimal size is

$$
\begin{equation*}
\nu=x^{\frac{k-1}{k^{2}}}, \tag{12}
\end{equation*}
$$

which gives the conclusion.
We notice that in the proof of Lemma 2.3, the first and the last terms of (11) are independent from the choice for $H$, so the optimal choice for $\nu$ does not depend on $H$ as well, and it is always supposed to be (12). However, we do have plenty of choices for $H$ to replace (10). For example, if $H=x^{A}$ where

$$
\frac{1}{k^{2}}<A<\frac{k-2}{k^{2}}
$$

then we can also prove the lemma in a similar way.
Now we use Lemma 2.3 to prove Theorem 1.1. We start from the case when $s=2$.

Lemma 2.4. If $k \geq 4$ is an integer and $x>1$, then

$$
\begin{equation*}
\sum_{n \leq x} r_{k, 2}(n)=\frac{\Gamma\left(\frac{k+1}{k}\right)^{2}}{\Gamma\left(\frac{k+2}{k}\right)} x^{\frac{2}{k}}-x^{\frac{1}{k}}+O\left(x^{\frac{k-1}{k^{2}}}\right) \tag{13}
\end{equation*}
$$

Proof. The LHS of (13) is the number of lattice points in Quadrant I under the curve $X^{k}+Y^{k}=x$. By separating the lattice points according to whether one or both coordinates are no more than $(x / 2)^{1 / k}$, we have

$$
\sum_{n \leq x} r_{k, 2}(n)=2 \sum_{m \leq(x / 2)^{1 / k}}\left\lfloor\left(x-m^{k}\right)^{\frac{1}{k}}\right\rfloor-\left\lfloor\left(\frac{x}{2}\right)^{\frac{1}{k}}\right\rfloor^{2}
$$

By definition of $B_{1}(\alpha)$ and Lemma 2.3, we have

$$
\begin{align*}
\sum_{n \leq x} r_{k, 2}(n) & =2 \sum_{m \leq(x / 2)^{1 / k}}\left(\left(x-m^{k}\right)^{\frac{1}{k}}-\frac{1}{2}-B_{1}\left(\left(x-m^{k}\right)^{\frac{1}{k}}\right)\right)-\left\lfloor\left(\frac{x}{2}\right)^{\frac{1}{k}}\right\rfloor^{2} \\
& =2 \sum_{m \leq(x / 2)^{1 / k}}\left(x-m^{k}\right)^{\frac{1}{k}}-\left\lfloor\left(\frac{x}{2}\right)^{\frac{1}{k}}\right\rfloor-\left\lfloor\left(\frac{x}{2}\right)^{\frac{1}{k}}\right\rfloor^{2}+O\left(x^{\frac{k-1}{k^{2}}}\right) \tag{14}
\end{align*}
$$

We write $\left(x-m^{k}\right)^{1 / k}$ as an integral, and change the order of summation. The first term above is

$$
\begin{align*}
2 \sum_{m \leq(x / 2)^{1 / k}}\left(x-m^{k}\right)^{\frac{1}{k}}= & 2 \sum_{m \leq(x / 2)^{1 / k}} \int_{m}^{x^{1 / k}} \alpha^{k-1}\left(x-\alpha^{k}\right)^{-\frac{k-1}{k}} \mathrm{~d} \alpha \\
= & 2 \int_{0}^{x^{1 / k}} \min \left(\lfloor\alpha\rfloor,\left\lfloor\left(\frac{x}{2}\right)^{\frac{1}{k}}\right\rfloor\right) \alpha^{k-1}\left(x-\alpha^{k}\right)^{-\frac{k-1}{k}} \mathrm{~d} \alpha \\
= & \int_{0}^{(x / 2)^{1 / k}} 2\left(\alpha-\frac{1}{2}\right) \alpha^{k-1}\left(x-\alpha^{k}\right)^{-\frac{k-1}{k}} \mathrm{~d} \alpha \\
& -\int_{0}^{(x / 2)^{1 / k}} 2 B_{1}(\alpha) \alpha^{k-1}\left(x-\alpha^{k}\right)^{-\frac{k-1}{k}} \mathrm{~d} \alpha \\
& +2 \int_{(x / 2)^{1 / k}}^{x^{1 / k}}\left\lfloor\left(\frac{x}{2}\right)^{\frac{1}{k}}\right\rfloor \alpha^{k-1}\left(x-\alpha^{k}\right)^{-\frac{k-1}{k}} \mathrm{~d} \alpha \tag{15}
\end{align*}
$$

A straightforward calculation on the last integral shows that

$$
\begin{equation*}
\int_{(x / 2)^{1 / k}}^{x^{1 / k}}\left\lfloor\left(\frac{x}{2}\right)^{\frac{1}{k}}\right\rfloor \alpha^{k-1}\left(x-\alpha^{k}\right)^{-\frac{k-1}{k}} \mathrm{~d} \alpha=\left\lfloor\left(\frac{x}{2}\right)^{\frac{1}{k}}\right\rfloor\left(\frac{x}{2}\right)^{\frac{1}{k}} \tag{16}
\end{equation*}
$$

Then we integrate the other two integrals by parts. The first integral is

$$
\begin{align*}
& \left.(1-2 \alpha)\left(x-\alpha^{k}\right)^{\frac{1}{k}}\right|_{0} ^{(x / 2)^{1 / k}}-\int_{0}^{(x / 2)^{1 / k}}\left(x-\alpha^{k}\right)^{\frac{1}{k}} \mathrm{~d}(1-2 \alpha) \\
= & -2\left(\frac{x}{2}\right)^{\frac{2}{k}}+\left(\frac{x}{2}\right)^{\frac{1}{k}}-x^{\frac{1}{k}}+2 \int_{0}^{(x / 2)^{1 / k}}\left(x-\alpha^{k}\right)^{\frac{1}{k}} \mathrm{~d} \alpha, \tag{17}
\end{align*}
$$

while the second one is

$$
\begin{aligned}
& \int_{0}^{(x / 2)^{1 / k}} 2 \alpha^{k-1}\left(x-\alpha^{k}\right)^{-\frac{k-1}{k}} \mathrm{~d}\left(B_{2}(\alpha)\right) \\
= & 2 B_{2}\left(\left(\frac{x}{2}\right)^{\frac{1}{k}}\right)-2 \int_{0}^{(x / 2)^{1 / k}} B_{2}(\alpha) \mathrm{d}\left(\alpha^{k-1}\left(x-\alpha^{k}\right)^{-\frac{k-1}{k}}\right) .
\end{aligned}
$$

Since $B_{2}(\alpha) \ll 1$, and

$$
\frac{\mathrm{d}}{\mathrm{~d} \alpha}\left(\alpha^{k-1}\left(x-\alpha^{k}\right)^{-\frac{k-1}{k}}\right)=x \alpha^{k-2}\left(x-\alpha^{k}\right)^{-\frac{2 k-1}{k}}>0
$$

when $0<\alpha<(x / 2)^{1 / k}$, we have

$$
\begin{equation*}
\int_{0}^{(x / 2)^{1 / k}} 2 B_{1}(\alpha) \alpha^{k-1}\left(x-\alpha^{k}\right)^{-\frac{k-1}{k}} \mathrm{~d} \alpha=O(1) \tag{18}
\end{equation*}
$$

By (14), (15), (16), (17) and (18), and the fact that

$$
\left(\frac{x}{2}\right)^{\frac{1}{k}}-\left\lfloor\left(\frac{x}{2}\right)^{\frac{1}{k}}\right\rfloor \ll 1
$$

and its square

$$
\left(\frac{x}{2}\right)^{\frac{2}{k}}-2\left\lfloor\left(\frac{x}{2}\right)^{\frac{1}{k}}\right\rfloor\left(\frac{x}{2}\right)^{\frac{1}{k}}+\left\lfloor\left(\frac{x}{2}\right)^{\frac{1}{k}}\right\rfloor^{2} \ll 1
$$

we have

$$
\sum_{n \leq x} r_{k, 2}(n)=2 \int_{0}^{(x / 2)^{1 / k}}\left(x-\alpha^{k}\right)^{\frac{1}{k}} \mathrm{~d} \alpha-\left(\frac{x}{2}\right)^{\frac{2}{k}}-x^{\frac{1}{k}}+O\left(x^{\frac{k-1}{k^{2}}}\right)
$$

Finally, the integral above represents the area of the set of points $(X, Y)$ in Quadrant I such that $X^{k}+Y^{k} \leq x$ and $X \leq(x / 2)^{1 / k}$, or equivalently, such that $Y^{k}+X^{k} \leq x$ and $Y \leq(x / 2)^{1 / k}$ when interchanging the variables $X$ and $Y$. Therefore, twice the integral represents the area of the whole region $X^{k}+Y^{k} \leq x$ plus the area of the square $0 \leq X \leq(x / 2)^{1 / k}, 0 \leq Y \leq(x / 2)^{1 / k}$. Hence

$$
2 \int_{0}^{(x / 2)^{1 / k}}\left(x-\alpha^{k}\right)^{\frac{1}{k}} \mathrm{~d} \alpha-\left(\frac{x}{2}\right)^{\frac{2}{k}}=\int_{0}^{x^{1 / k}}\left(x-\alpha^{k}\right)^{\frac{1}{k}} \mathrm{~d} \alpha=\frac{1}{k} B\left(\frac{1}{k}, \frac{1}{k}+1\right) x^{\frac{2}{k}}
$$

The lemma is then proved according to the relationship between the beta function and the gamma function.

To finalize the proof of Theorem 1.1, we use induction on $s$. By Lemma 2.4. the statement holds for the initial case $s=2$. Hence we only need to prove that if the statement is true for a particular $s$ where $2 \leq s \leq k$, then it is also true for $s+1$. First, we notice that

$$
\sum_{m \leq x} r_{k, s+1}(m)=\sum_{l \leq x^{1 / k}} \sum_{n \leq x-l^{k}} r_{k, s}(n),
$$

since both sides represent the number of $(s+1)$-tuples $\left(x_{1}, x_{2}, \cdots, x_{s}, l\right)$ such that all coordinates are positive integers and

$$
x_{1}^{k}+x_{2}^{k}+\cdots+x_{s}^{k}+l^{k} \leq x .
$$

Hence from assumption, we have

$$
\begin{equation*}
\sum_{m \leq x} r_{k, s+1}(m)=\frac{\Gamma\left(\frac{k+1}{k}\right)^{s}}{\Gamma\left(\frac{k+s}{k}\right)} \sum_{l \leq x^{1 / k}}\left(x-l^{k}\right)^{\frac{s}{k}}-\frac{s}{2} \cdot \frac{\Gamma\left(\frac{k+1}{k}\right)^{s-1}}{\Gamma\left(\frac{k+s-1}{k}\right)} \sum_{l \leq x^{1 / k}}\left(x-l^{k}\right)^{\frac{s-1}{k}}+O\left(x^{\frac{s k-1}{k^{2}}}\right) \tag{19}
\end{equation*}
$$

Now we calculate the first sum on RHS. We have

$$
\begin{align*}
\sum_{l \leq x^{1 / k}}\left(x-l^{k}\right)^{\frac{s}{k}}= & \sum_{l \leq x^{1 / k}} \int_{l}^{x^{1 / k}} s \alpha^{k-1}\left(x-\alpha^{k}\right)^{\frac{s}{k}-1} \mathrm{~d} \alpha \\
= & \int_{0}^{x^{1 / k}}\lfloor\alpha\rfloor \cdot s \alpha^{k-1}\left(x-\alpha^{k}\right)^{\frac{s}{k}-1} \mathrm{~d} \alpha \\
= & \int_{0}^{x^{1 / k}}\left(\alpha-\frac{1}{2}\right) s \alpha^{k-1}\left(x-\alpha^{k}\right)^{\frac{s}{k}-1} \mathrm{~d} \alpha \\
& -\int_{\eta}^{x^{1 / k}} B_{1}(\alpha) s \alpha^{k-1}\left(x-\alpha^{k}\right)^{\frac{s}{k}-1} \mathrm{~d} \alpha \\
& -\int_{0}^{\eta} B_{1}(\alpha) s \alpha^{k-1}\left(x-\alpha^{k}\right)^{\frac{s}{k}-1} \mathrm{~d} \alpha \tag{20}
\end{align*}
$$

where

$$
\eta=\left(x-x^{\frac{k-1}{k}}\right)^{\frac{1}{k}} .
$$

Integrating the first integral on RHS of (20) by parts, it is

$$
\int_{0}^{x^{1 / k}}\left(\frac{1}{2}-\alpha\right) \mathrm{d}\left(\left(x-\alpha^{k}\right)^{\frac{s}{k}}\right)=-\frac{1}{2} x^{\frac{s}{k}}+\int_{0}^{x^{1 / k}}\left(x-\alpha^{k}\right)^{\frac{s}{k}} \mathrm{~d} \alpha
$$

while the latter integral is

$$
\int_{0}^{x^{1 / k}}\left(x-\alpha^{k}\right)^{\frac{s}{k}} \mathrm{~d} \alpha=\frac{1}{k} B\left(\frac{1}{k}, \frac{s}{k}+1\right) x^{\frac{s+1}{k}}=\frac{\Gamma\left(\frac{k+1}{k}\right) \Gamma\left(\frac{k+s}{k}\right)}{\Gamma\left(\frac{k+s+1}{k}\right)} x^{\frac{s+1}{k}} .
$$

Since $B_{1}(\alpha) \ll 1$, we have

$$
\int_{\eta}^{x^{1 / k}} B_{1}(\alpha) s \alpha^{k-1}\left(x-\alpha^{k}\right)^{\frac{s}{k}-1} \mathrm{~d} \alpha \ll \int_{\eta}^{x^{1 / k}} \mathrm{~d}\left(-\left(x-\alpha^{k}\right)^{\frac{s}{k}}\right)=x^{\frac{s(k-1)}{k^{2}}} .
$$

Finally, we integrate the last integral of (20) by parts. As $B_{1}(\alpha)=\mathrm{d}\left(B_{2}(\alpha)\right)$, the integral is

$$
B_{2}(\eta) s \eta^{k-1}\left(x-\eta^{k}\right)^{\frac{s}{k}-1}-\int_{0}^{\eta} B_{2}(\alpha) \mathrm{d}\left(s \alpha^{k-1}\left(x-\alpha^{k}\right)^{\frac{s}{k}-1}\right)
$$

Since $B_{2}(\alpha) \ll 1$, we have

$$
B_{2}(\eta) s \eta^{k-1}\left(x-\eta^{k}\right)^{\frac{s}{k}-1} \ll\left(x^{\frac{1}{k}}\right)^{k-1}\left(x^{\frac{k-1}{k}}\right)^{\frac{s}{k}-1}=x^{\frac{s(k-1)}{k^{2}}}
$$

and

$$
\int_{0}^{\eta} B_{2}(\alpha) \mathrm{d}\left(s \alpha^{k-1}\left(x-\alpha^{k}\right)^{\frac{s}{k}-1}\right) \ll \int_{0}^{\eta}\left|\frac{\mathrm{d}}{\mathrm{~d} \alpha}\left(s \alpha^{k-1}\left(x-\alpha^{k}\right)^{\frac{s}{k}-1}\right)\right| \mathrm{d} \alpha .
$$

We notice that if $0 \leq \alpha \leq \eta, k \geq 4$ and $2 \leq s \leq k$, then

$$
\begin{equation*}
\frac{\mathrm{d}}{\mathrm{~d} \alpha}\left(s \alpha^{k-1}\left(x-\alpha^{k}\right)^{\frac{s}{k}-1}\right)=s \alpha^{k-2}\left(x-\alpha^{k}\right)^{\frac{s}{k}-2}\left((k-1) x+(1-s) \alpha^{k}\right) \geq 0 \tag{21}
\end{equation*}
$$

so

$$
\int_{0}^{\eta} B_{2}(\alpha) \mathrm{d}\left(s \alpha^{k-1}\left(x-\alpha^{k}\right)^{\frac{s}{k}-1}\right) \ll s \eta^{k-1}\left(x-\eta^{k}\right)^{\frac{s}{k}-1} \ll x^{\frac{s(k-1)}{k^{2}}} .
$$

Hence

$$
\begin{equation*}
\sum_{l \leq x^{1 / k}}\left(x-l^{k}\right)^{\frac{s}{k}}=\frac{\Gamma\left(\frac{k+1}{k}\right) \Gamma\left(\frac{k+s}{k}\right)}{\Gamma\left(\frac{k+s+1}{k}\right)} x^{\frac{s+1}{k}}-\frac{1}{2} x^{\frac{s}{k}}+O\left(x^{\frac{s(k-1)}{k^{2}}}\right) \tag{22}
\end{equation*}
$$

Similarly,

$$
\begin{equation*}
\sum_{l \leq x^{1 / k}}\left(x-l^{k}\right)^{\frac{s-1}{k}}=\frac{\Gamma\left(\frac{k+1}{k}\right) \Gamma\left(\frac{k+s-1}{k}\right)}{\Gamma\left(\frac{k+s}{k}\right)} x^{\frac{s}{k}}-\frac{1}{2} x^{\frac{s-1}{k}}+O\left(x^{\frac{(s-1)(k-1)}{k^{2}}}\right) \tag{23}
\end{equation*}
$$

Therefore, by (19), (22) and (23), we have

$$
\begin{equation*}
\sum_{m \leq x} r_{k, s+1}(m)=\frac{\Gamma\left(\frac{k+1}{k}\right)^{s+1}}{\Gamma\left(\frac{k+s+1}{k}\right)} x^{\frac{s+1}{k}}-\frac{(s+1)}{2} \cdot \frac{\Gamma\left(\frac{k+1}{k}\right)^{s}}{\Gamma\left(\frac{k+s}{k}\right)} x^{\frac{s}{k}}+O\left(x^{\frac{s k-1}{k^{2}}}\right) \tag{24}
\end{equation*}
$$

which means that the statement is also true for $s+1$ under the assumption. Hence Theorem 1.1 is proved by induction.

## 3. Several Notes

Sometimes, we are particularly interested in the case when $s=k$. For convenience, we rewrite $r_{k, k}(n)$ as $r_{k}(n)$. Then we have

Corollary 3.1. If $k \geq 4$ is an integer, then

$$
\begin{equation*}
\sum_{m=1}^{n} r_{k}(m)=\Gamma\left(\frac{k+1}{k}\right)^{k} n-\frac{k}{2} \cdot \frac{\Gamma\left(\frac{k+1}{k}\right)^{k-1}}{\Gamma\left(\frac{2 k-1}{k}\right)} n^{1-\frac{1}{k}}+O\left(n^{\frac{k^{2}-k-1}{k^{2}}}\right) \tag{25}
\end{equation*}
$$

or equivalently,

$$
\begin{equation*}
\sum_{m \leq x} r_{k}(m)=\Gamma\left(\frac{k+1}{k}\right)^{k} x-\frac{k}{2} \cdot \frac{\Gamma\left(\frac{k+1}{k}\right)^{k-1}}{\Gamma\left(\frac{2 k-1}{k}\right)} x^{1-\frac{1}{k}}+O\left(x^{\frac{k^{2}-k-1}{k^{2}}}\right) \tag{26}
\end{equation*}
$$

We also notice that the inequality (21) is not necessarily true when $s \geq$ $k+1$ and $0 \leq \alpha \leq \eta$. Therefore, we can not have any further induction from $s$ to $s+1$ when $s \geq k+1$. Hence Theorem 1.1 may not be true when $s$ is large.
