#### Abstract

In the present paper, we examine a Crouzeix-Raviart approximation of the $p(\cdot)$-Dirichlet problem. We derive a medius error estimate, i.e., a best-approximation result, which holds for uniformly continuous exponents and implies a priori error estimates, which apply for Hölder continuous exponents and are optimal for Lipschitz continuous exponents. Numerical experiments are carried out to review the theoretical findings.

Keywords: $p(\cdot)$-Dirichlet problem; Crouzeix-Raviart element; a priori error analysis; medius error analysis. AMS MSC (2020): 49M29; 65N15; 65N30; 35J60; 46E30.

## 1. Introduction

We examine the numerical approximation of a non-linear system of $p(\cdot)$-Dirichlet type, i.e.,

$$
\begin{align*}
-\operatorname{div}(\mathcal{A}(\cdot, \nabla u))=f & \text { in } \Omega, \\
u=0 & \text { on } \Gamma_{D},  \tag{1.1}\\
\mathcal{A}(\cdot, \nabla u) \cdot n=0 & \text { on } \Gamma_{N},
\end{align*}
$$

using the Crouzeix-Raviart element (cf. [23]). More precisely, for given $f \in L^{p^{\prime}(\cdot)}(\Omega)$, where $p^{\prime}(x):=$ $\frac{p(x)}{p(x)-1}$ for all $x \in \Omega$, and $p \in C^{0}(\bar{\Omega})$ with $p^{-}:=\min _{x \in \bar{\Omega}} p(x)>1$, we seek $u \in W_{D}^{1, p(\cdot)}(\Omega)$ solving (1.1). Here, $\Omega \subseteq \mathbb{R}^{d}, d \in \mathbb{N}$, is a bounded simplicial Lipschitz domain whose topological boundary $\partial \Omega$ is disjointly divided into a Dirichlet part $\Gamma_{D}$ and a Neumann part $\Gamma_{N}$, and $W_{D}^{1, p(\cdot)}(\Omega):=$ $\left\{v \in W^{1, p(\cdot)}(\Omega) \mid \operatorname{tr} v=0\right.$ a.e. on $\left.\Gamma_{D}\right\}$. The non-linear operator $\mathcal{A}: \Omega \times \mathbb{R}^{d} \rightarrow \mathbb{R}^{d}$, for every $(x, a)^{\top} \in \Omega \times \mathbb{R}^{d}$, is defined by

$$
\begin{equation*}
\mathcal{A}(x, a):=(\delta+|a|)^{p(x)-2} a . \tag{1.2}
\end{equation*}
$$

Since $\mathcal{A}: \Omega \times \mathbb{R}^{d} \rightarrow \mathbb{R}^{d}$ possesses a potential with respect to its second component, i.e., there exists a function $\varphi: \Omega \times \mathbb{R}_{\geq 0} \rightarrow \mathbb{R}_{\geq 0}$, which is strictly convex with respect to its second component, such that $\left(\partial_{a} \varphi\right)(x, a)=\mathcal{A}(x, a)$ for all $(x, a)^{\top} \in \Omega \times \mathbb{R}^{d}$, each solution $u \in W_{D}^{1, p(\cdot)}(\Omega)$ of (1.1) is the unique minimizer of the functional $I: W_{D}^{1, p(\cdot)}(\Omega) \rightarrow \mathbb{R}_{\geq 0}$, for every $v \in W_{D}^{1, p(\cdot)}(\Omega)$ defined by

$$
\begin{equation*}
I(v):=\int_{\Omega} \varphi(\cdot,|\nabla v|) \mathrm{d} x-\int_{\Omega} f v \mathrm{~d} x \tag{1.3}
\end{equation*}
$$

and vice-versa, leading to a primal and a dual formulation of (1.1), and to convex duality relations.

[^0]The $p(\cdot)$-Dirichlet problem (1.1) is a prototypical example of a non-linear system with variable growth conditions. Regularity results for this models go back to the seminal papers by Acerbi and Mingione, $[4,3]$. It appears in physical models for smart fluids, e.g., electro-rheological fluids (cf. $[48,50])$, micro-polar electro-rheological fluids (cf. [33, 35]), chemically reacting fluids (cf. [43, 38]), and thermo-rheological fluids ( $c f$. [55, 5]). In these models, the variable exponent depends on physical quantities such as, e.g., an electric field, a concentration field or a temperature field. In addition, the $p(\cdot)$-Dirichlet problem (1.1) has applications in the field of image reconstruction (cf. $[1,22,44]$ ). The main difficulty in the treatment of models of type (1.1) is the non-autonomous structure (i.e., the dependency on the space variable). In general, without additional assumptions on the space variable, there can be difficulties in the numerical treatment of such problems. In this paper, we consider the situation with additional regularity assumption on the variable exponent, i.e., we assume that $p \in C^{0, \alpha}(\bar{\Omega})$ for some $\alpha \in(0,1]$. The obtained convergence rate result is new for the non-conforming Crouzeix-Raviart method.

Remark 1.4. The essential feature of such models is the possibility of so-called energy gap (or Lavrentiev phenomenon), which could lead to the disconvergence of conforming schemes to the global minimizer of the problem. In comparison to the Lagrange elements, non-conforming methods, in particular, the Crouzeix-Raviart method, converges, see, e.g., [6].

### 1.1 Related contributions

The numerical approximation of (1.1) in the case of a constant exponent $p \in(1, \infty)$ has already been subject of numerous contributions: the best approximation property in terms of the natural distance has first been established in [8]. This has been extended in [29] to the functionals with Orlicz growth. A priori error estimates in terms of the mesh-size were obtained in [32, 29]. This was done in [29] by extending the approximation properties of standard interpolation operators to Orlicz spaces. Results for generalized Newtonian fluids can be found [52]. The $p$ Dirichlet problem with Discontinuous Galerkin (DG) methods was studied in [19] and [18]; for the Orlicz problems in [30]. In [12], it has been shown that the adaptive finite element method with element-wise affine functions and Dörfler marking converges with quasi-optimal rates. As the problem is non-linear, it has to be solved by iterative methods. A stable procedure, that is efficient in the experiments, was introduced in [26] for the case $p<2$ and in [6] for the case $p>2$. In [39], an error analysis for a Crouzeix-Raviart approximation of the $p$-Dirichlet problem was carried out, including optimal a priori error estimates, a medius error estimate, i.e., a best-approximation result, and a posteriori error estimates.

However, there exist only a few contributions in the case of a variable exponent $p \in C^{0}(\bar{\Omega})$. The paper [20] is concerned with the (weak) convergence of a conforming, discretely inf-sup stable finite element approximation of the model for electro-rheological fluids. The first contribution addressing a priori error estimates for finite element approximations of (1.1) can be found in [15]; see also [13], for a extension to the model for electro-rheological fluids.

In [25], the (weak) convergence of DG type methods is studied; the result contains no convergence rates. In [41, 42], the (weak) convergence of a conforming, discretely inf-sup stable finite element approximation of the model for chemically reacting fluids is proved. In [7], the weak convergence of an approximation using the Crouzeix-Raviart element was established. To the best of the authors' knowledge, however, no a priori error analysis for (1.1) for approximations using non-conforming ansatz classes -in particular, the Crouzeix-Raviart element, which is usually the first step towards a fully-non-conforming a priori error analysis- has been carried out yet.

### 1.2 New contributions

Deriving local efficiency estimates in terms of shifted $N$-functions and deploying the so-called node-averaging quasi-interpolation operator (cf. [47, 16]), we generalize the medius error analysis in [17] from $p=2$ and $\delta=0$ in (1.2), i.e., $\mathcal{A}=\operatorname{id}_{\mathbb{R}^{d}}: \mathbb{R}^{d} \rightarrow \mathbb{R}^{d}$, and of [39] from $p \in(1, \infty)$ and $\delta \geq$ 0 in (1.2) to variable exponents $p \in C^{0}(\bar{\Omega})$ with $p^{-}>1$. This medius error analysis implies that
the performances of the conforming Lagrange finite element method applied to (1.1) and the nonconforming Crouzeix-Raviart finite element method applied to (1.1) are comparable. As a result, we obtain a priori error estimates for the approximation of (1.1) using the Crouzeix-Raviart element, which apply for Hölder continuous variable exponents $p \in C^{0, \alpha}(\bar{\Omega})$, where $\alpha \in(0,1]$ and $p^{-}>1$, and $\delta \geq 0$, and are quasi-optimal for Lipschitz continuous variable exponents $p \in C^{0,1}(\bar{\Omega})$ and $\delta>0$. Since $\mathcal{A}: \Omega \times \mathbb{R}^{d} \rightarrow \mathbb{R}^{d}$ has a potential and, therefore, (1.1) admits an equivalent formulation as a convex minimization problem ( $c f .(1.3)$ ), we have access to a (discrete) convex duality theory $(c f .[45,10,11])$ and (1.1) as well as the approximation of (1.1) employing the Crouzeix-Raviart element admit dual formulations with a dual solution as well as a discrete dual solution, respectively. We derive a priori error estimates for the dual solution and the discrete dual solution.

### 1.3 Outline

This article is organized as follows: In Section 2, we introduce the employed notation, the basic properties of non-linear operator $\mathcal{A}: \Omega \times \mathbb{R}^{d} \rightarrow \mathbb{R}^{d}$ and its consequences, the relevant finite element spaces, and give brief review of the continuous and the discrete $p(\cdot)$-Dirichlet problem. In Section 3, we establish a medius error analysis, i.e., best-approximation result, for the Crouzeix-Raviart finite element method applied to (1.1). In Section 4, by means of this medius error analysis, we derive a priori error estimates for the Crouzeix-Raviart finite element method applied to (1.1), which are optimal for all Lipschitz continuous exponents $p \in C^{0,1}(\bar{\Omega})$ with $p^{-}>1$ and all $\delta>0$. In Section 5, we review our theoretical findings via numerical experiments.

## 2. Preliminaries

Throughout the article, let $\Omega \subseteq \mathbb{R}^{d}, d \in \mathbb{N}$, always be a bounded simplicial Lipschitz domain, whose topological boundary $\partial \Omega$ is disjointly divided into a (relatively) closed Dirichlet part $\Gamma_{D}$, for which we assume that $\left|\Gamma_{D}\right|>0$, and a Neumann part $\Gamma_{N}$, i.e., $\partial \Omega=\Gamma_{D} \cup \Gamma_{N}$ and $\emptyset=\Gamma_{D} \cap \Gamma_{N}$. The integral mean of an integrable function $f: M \rightarrow \mathbb{R}$ over a (Lebesgue) measurable set $M \subseteq \mathbb{R}^{d}$, $d \in \mathbb{N}$, with $|M|>0$, is denoted by $\langle f\rangle_{M}:=\frac{1}{|M|} \int_{M} f \mathrm{~d} x$. For (Lebesgue) measurable functions $f, g: M \rightarrow \mathbb{R}$ and a (Lebesgue) measurable set $M \subseteq \mathbb{R}^{d}, d \in \mathbb{N}$, we write $(f, g)_{M}:=\int_{M} f g \mathrm{~d} x$, whenever the right-hand side is well-defined. We employ the notation $\wedge$ and $\vee$, for the minimum and maximum, respectively.

### 2.1 Variable Lebesgue spaces and variable Sobolev spaces

Let $M \subseteq \mathbb{R}^{d}, d \in \mathbb{N}$, be a (Lebesgue) measurable set and $p: M \rightarrow[1,+\infty]$ (Lebesgue) measurable; a variable exponent. By $\mathcal{P}(M)$, we denote the set of variable exponents. Then, for $p \in \mathcal{P}(M)$, we denote by $p^{+}:=\operatorname{ess}_{\sup }^{x \in M} \bar{p}(x)$ and $p^{-}:=\operatorname{ess}_{\inf }^{x \in M}$ $p(x)$ its constant limit exponents. Then, by $\mathcal{P}^{\infty}(M):=\left\{p \in \mathcal{P}(M) \mid p^{+}<\infty\right\}$, we denote the set of bounded variable exponents. For $p \in \mathcal{P}^{\infty}(M)$ and $l \in \mathbb{N}$, we denote by $L^{p(\cdot)}\left(M ; \mathbb{R}^{l}\right)$, the variable Lebesgue space, i.e., the vector space of (Lebesgue) measurable functions $v: M \rightarrow \mathbb{R}^{l}$ for which the modular $\rho_{p(\cdot), M}(v):=\int_{M}|v|^{p(\cdot)} \mathrm{d} x<\infty$. Then, the Luxembourg norm $\|v\|_{p(\cdot), M}:=\inf \left\{\lambda>0 \left\lvert\, \rho_{p(\cdot), M}\left(\frac{v}{\lambda}\right) \leq 1\right.\right\}$ turns $L^{p(\cdot)}\left(M ; \mathbb{R}^{l}\right)$ into a Banach space.

Moreover, for $p \in \mathcal{P}^{\infty}(\Omega)$ and $l \in \mathbb{N}$, we define the spaces
$W_{D}^{1, p(\cdot)}\left(\Omega ; \mathbb{R}^{l}\right):=\left\{v \in L^{p(\cdot)}\left(\Omega ; \mathbb{R}^{l}\right) \mid \nabla v \in L^{p(\cdot)}\left(\Omega ; \mathbb{R}^{l \times d}\right), \operatorname{tr} v=0\right.$ in $\left.L^{p^{-}}\left(\Gamma_{D} ; \mathbb{R}^{l}\right)\right\}$,
$W_{N}^{p(\cdot)}(\operatorname{div} ; \Omega):=\left\{y \in L^{p(\cdot)}\left(\Omega ; \mathbb{R}^{d}\right) \mid \operatorname{div} y \in L^{p(\cdot)}(\Omega)\right.$,
$\left\langle\operatorname{tr}_{n} y, v\right\rangle_{W^{1-}} \frac{1}{\left(p^{-}\right)^{\prime}},\left(p^{-}\right)^{\prime}(\partial \Omega)=0$ for all $\left.v \in W_{D}^{1,\left(p^{-}\right)^{\prime}}(\Omega)\right\}$,
$W^{1, p(\cdot)}\left(\Omega ; \mathbb{R}^{l}\right):=W_{D}^{1, p(\cdot)}\left(\Omega ; \mathbb{R}^{l}\right)$ if $\Gamma_{D}=\emptyset$, and $W^{p(\cdot)}(\operatorname{div} ; \Omega):=W_{N_{1}}^{p(\cdot)}(\operatorname{div} ; \Omega)$ if $\Gamma_{N}=\emptyset$. Here,
$\operatorname{tr}: W^{1, p(\cdot)}\left(\Omega ; \mathbb{R}^{l}\right) \rightarrow L^{p^{-}}\left(\partial \Omega ; \mathbb{R}^{l}\right)$ and by $\operatorname{tr}_{n}: W^{p(\cdot)}(\operatorname{div} ; \Omega) \rightarrow W^{-\frac{1}{p^{-}, p^{-}}}(\partial \Omega)$ denote the trace
operator and the normal trace operator, respectively. In particular, we will always omit $\operatorname{tr}$ and $\operatorname{tr}_{n}$.
We write $L^{p(\cdot)}(\Omega):=L^{p(\cdot)}\left(\Omega ; \mathbb{R}^{1}\right), W^{1, p(\cdot)}(\Omega):=W^{1, p(\cdot)}\left(\Omega ; \mathbb{R}^{1}\right)$, and $W_{D}^{1, p(\cdot)}(\Omega):=W_{D}^{1, p(\cdot)}\left(\Omega ; \mathbb{R}^{1}\right)$.

## 2.2 (Generalized) N-functions

A convex function $\psi: \mathbb{R}_{\geq 0} \rightarrow \mathbb{R}_{\geq 0}$ is called an $N$-function, if $\psi(0)=0, \psi(t)>0$ for all $t>0$, $\lim _{t \rightarrow 0} \psi(t) / t=0$, and $\lim _{t \rightarrow \infty} \psi(t) / t=\infty$. If, in addition, $\psi \in C^{1}\left(\mathbb{R}_{\geq 0}\right) \cap C^{2}\left(\mathbb{R}_{>0}\right)$ and $\psi^{\prime \prime}(t)>0$ for all $t>0$, we call $\psi$ a regular $N$-function. For a regular $N$-function $\psi: \mathbb{R}_{\geq 0} \rightarrow \mathbb{R}_{\geq 0}$, we have that $\psi(0)=\psi^{\prime}(0)=0, \psi^{\prime}: \mathbb{R}_{\geq 0} \rightarrow \mathbb{R}_{\geq 0}$ is increasing and $\lim _{t \rightarrow \infty} \psi^{\prime}(t)=\infty$. For a given $N$-function $\psi: \mathbb{R}_{\geq 0} \rightarrow \mathbb{R}_{\geq 0}$, we define the (Fenchel) conjugate $N$-function $\psi^{*}: \mathbb{R}_{\geq 0} \rightarrow \mathbb{R}_{\geq 0}$, for every $t \geq 0$, by $\psi^{*}(t):=\sup _{s \geq 0}(s t-\psi(s))$, which satisfies $\left(\psi^{*}\right)^{\prime}=\left(\psi^{\prime}\right)^{-1}$ in $\mathbb{R}_{\geq 0}$. An $N$-function $\psi: \mathbb{R}_{\geq 0} \rightarrow \mathbb{R}_{\geq 0}$ satisfies the $\Delta_{2}^{-}$-condition (in short, $\psi \in \Delta_{2}$ ), if there exists $K>2$ such that for all $t \geq 0$, it holds that $\psi(2 t) \leq K \psi(t)$. Then, we denote the smallest such constant by $\Delta_{2}(\psi)>0$. We say that an $N$-function $\psi: \mathbb{R}_{\geq 0} \rightarrow \mathbb{R}_{\geq 0}$ satisfies the $\nabla_{2}$-condition (in short, $\psi \in \nabla_{2}$ ), if its (Fenchel) conjugate $\psi^{*}: \mathbb{R}_{\geq 0} \rightarrow \mathbb{R}_{\geq 0}$ is an $\bar{N}$-function satisfying the $\Delta_{2}$-condition. If $\psi: \mathbb{R}_{\geq 0} \rightarrow \mathbb{R}_{\geq 0}$ satisfies the $\Delta_{2^{-}}$ and the $\nabla_{2}$-condition (in short, $\psi \in \Delta_{2} \cap \nabla_{2}$ ), then, it holds the $\varepsilon$-Young inequality: for every $\varepsilon>0$, there exists a constant $c_{\varepsilon}>0$, depending only on $\Delta_{2}(\psi), \Delta_{2}\left(\psi^{*}\right)<\infty$, such that for every $s, t \geq 0$, it holds that

$$
\begin{equation*}
s t \leq c_{\varepsilon} \psi^{*}(s)+\varepsilon \psi(t) \tag{2.2}
\end{equation*}
$$

For a (Lebesgue) measurable set $M \subseteq \mathbb{R}^{d}, d \in \mathbb{N}, \psi: M \times \mathbb{R}_{\geq 0} \rightarrow \mathbb{R}_{\geq 0}$ is called generalized $N$ function if it is Carathéodory mapping and $\psi(x, \cdot): \mathbb{R}_{\geq 0} \rightarrow \mathbb{R}_{\geq 0}$ is for a.e. $x \in M$ an $N$-function. For a generalized $N$-function $\psi: M \times \mathbb{R}_{\geq 0} \rightarrow \mathbb{R}_{\geq 0}$ and a (Lebesgue) measurable function $f: M \rightarrow \mathbb{R}$, we write

$$
\rho_{\psi, M}(f):=\int_{M} \psi(\cdot,|f|) \mathrm{d} x
$$

whenever the right-hand side is well-defined.

### 2.3 Basic properties of the non-linear operators

Throughout the entire article, we always assume that $\mathcal{A}: \Omega \times \mathbb{R}^{d} \rightarrow \mathbb{R}^{d}$ has $(p(\cdot), \delta)$-structure, where $p \in \mathcal{P}^{\infty}(\Omega)$ with $p^{-}>1$ and $\delta \geq 0$, i.e., for every $a \in \mathbb{R}^{d}$ and a.e. $x \in \Omega$, it holds that

$$
\begin{equation*}
\mathcal{A}(x, a):=(\delta+|a|)^{p(x)-2} a \tag{2.3}
\end{equation*}
$$

For given $p \in \mathcal{P}^{\infty}(\Omega)$ with $p^{-}>1$ and $\delta \geq 0$, we introduce the special generalized $N$-function $\varphi:=\varphi_{p, \delta}: \Omega \times \mathbb{R}_{\geq 0} \rightarrow \mathbb{R}_{\geq 0}$, for every $t \geq 0$ and a.e. $x \in \Omega$, defined by

$$
\begin{equation*}
\varphi(x, t):=\int_{0}^{t} \varphi^{\prime}(x, s) \mathrm{d} s, \quad \text { where } \quad \varphi^{\prime}(x, t):=(\delta+t)^{p(x)-2} t \tag{2.4}
\end{equation*}
$$

For (Lebesgue) measurable functions $f, g: \Omega \rightarrow \mathbb{R}_{\geq 0}$, we write $f \sim g$ (or $f \lesssim g$ ) if there exists a constant $c>0$ such that $c^{-1} g \leq f \leq c g$ (or $f \leq c g$ ) a.e. in $\Omega$. In particular, if not otherwise specified, we always assume that the hidden constant in $\sim$ and $\lesssim$ depends only on $p^{-}, p^{+}>1$ and $\delta \geq 0$.

Then, $\varphi: \Omega \times \mathbb{R}_{\geq 0} \rightarrow \mathbb{R}_{\geq 0}$ satisfies, uniformly in $\delta \geq 0$ and a.e. $x \in \Omega$, the $\Delta_{2}$-condition with ess $\sup _{x \in \Omega} \Delta_{2}(\varphi(x, \cdot)) \lesssim 2^{\max \left\{2, p^{+}\right\}}$. In addition, the (Fenchel) conjugate function (with respect to the second argument) $\varphi^{*}: \Omega \times \mathbb{R}_{\geq 0} \rightarrow \mathbb{R}_{\geq 0}$ satisfies, uniformly in both $t \geq 0, \delta \geq 0$, and a.e. $x \in \Omega$,

$$
\varphi^{*}(x, t) \sim\left(\delta^{p(x)-1}+t\right)^{p^{\prime}(x)-2} t^{2}
$$

and the $\Delta_{2}$-condition with ess $\sup _{x \in \Omega} \Delta_{2}\left(\varphi^{*}(x, \cdot)\right) \lesssim 2^{\max \left\{2,\left(p^{-}\right)^{\prime}\right\}}$.
For a generalized $N$-function $\psi: \Omega \times \mathbb{R}_{\geq 0} \rightarrow \mathbb{R}_{\geq 0}$, we introduce shifted generalized $N$-functions $\psi_{a}: \Omega \times \mathbb{R}_{\geq 0} \rightarrow \mathbb{R}_{\geq 0}, a \geq 0$, for every $a, t \geq 0$ and a.e. $x \in \Omega$, defined by

$$
\begin{equation*}
\psi_{a}(x, t):=\int_{0}^{t} \psi_{a}^{\prime}(x, s) \mathrm{d} s, \quad \text { where } \quad \psi_{a}^{\prime}(x, t):=\psi^{\prime}(x, a+t) \frac{t}{a+t} \tag{2.5}
\end{equation*}
$$

Remark 2.6. For the above defined $N$-function $\varphi: \Omega \times \mathbb{R}_{\geq 0} \rightarrow \mathbb{R}_{\geq 0}$ (cf. (2.4)) uniformly in $a, t \geq 0$ and a.e. $x \in \Omega$, it holds that

$$
\begin{aligned}
\varphi_{a}(x, t) & \sim(\delta+a+t)^{p(x)-2} t^{2} \\
\left(\varphi_{a}\right)^{*}(x, t) & \sim\left((\delta+a)^{p(x)-1}+t\right)^{p^{\prime}(x)-2} t^{2}
\end{aligned}
$$

The families $\left\{\varphi_{a}\right\}_{a \geq 0},\left\{\left(\varphi_{a}\right)^{*}\right\}_{a \geq 0}: \Omega \times \mathbb{R}_{\geq 0} \rightarrow \mathbb{R}_{\geq 0}$ satisfy, uniformly in $a \geq 0$, the $\Delta_{2}$-condition with ess $\sup _{x \in \Omega} \Delta_{2}\left(\varphi_{a}(x, \cdot)\right) \lesssim 2^{\max \left\{2, p^{+}\right\}}$and $\operatorname{ess} \sup _{x \in \Omega} \Delta_{2}\left(\left(\varphi_{a}\right)^{*}(x, \cdot)\right) \lesssim 2^{\max \left\{2,\left(p^{-}\right)^{\prime}\right\}}$, respectively.

Closely related to non-linear operator $\mathcal{A}: \Omega \times \mathbb{R}^{d} \rightarrow \mathbb{R}^{d}$, defined by (2.3), are the non-linear operators $F, F^{*}: \Omega \times \mathbb{R}^{d} \rightarrow \mathbb{R}^{d}$, for every $a \in \mathbb{R}^{d}$ and a.e. $x \in \Omega$ defined by

$$
\begin{align*}
F(x, a) & :=(\delta+|a|)^{\frac{p(x)-2}{2}} a  \tag{2.7}\\
F^{*}(x, a) & :=\left(\delta^{p(x)-1}+|a|\right)^{\frac{p^{\prime}(x)-2}{2}} a . \tag{2.8}
\end{align*}
$$

The relations between $\mathcal{A}, F, F^{*}: \Omega \times \mathbb{R}^{d} \rightarrow \mathbb{R}^{d}$ and $\varphi_{a},\left(\varphi^{*}\right)_{a},\left(\varphi_{a}\right)^{*}: \Omega \times \mathbb{R}_{\geq 0} \rightarrow \mathbb{R}_{\geq 0}, a \geq 0$, are presented in the following proposition.
Proposition 2.9. Uniformly in $t \geq 0, a, b \in \mathbb{R}^{d}$, and a.e. $x, y \in \Omega$, we have that

$$
\begin{align*}
&(\mathcal{A}(x, a)-\mathcal{A}(x, b)) \cdot(a-b) \sim|F(x, a)-F(x, b)|^{2}  \tag{2.10}\\
& \sim \varphi_{|a|}(x,|a-b|) \\
&\left|F^{*}(x, a)-F^{*}(x, b)\right|^{2} \sim\left(\varphi^{*}| | a \mid\right.  \tag{2.11}\\
&(x,|a-b|),  \tag{2.12}\\
&\left(\varphi^{*}\right)|\mathcal{A}(x, a)|(x, t) \sim\left(\varphi_{|a|}\right)^{*}(x, t),  \tag{2.13}\\
&\left|F^{*}(x, \mathcal{A}(x, a))-F^{*}(x, \mathcal{A}(y, b))\right|^{2} \sim\left(\varphi_{|a|}\right)^{*}(x,|\mathcal{A}(x, a)-\mathcal{A}(y, b)|) .
\end{align*}
$$

Proof. For the equivalences (2.10)-(2.12), we refer to [15, Rem. A.9]. The equivalence (2.13) follows from the equivalences (2.11) and (2.12).

In addition, we need the following shift change result.
Lemma 2.14. For every $\varepsilon>0$, there exists $c_{\varepsilon} \geq 1$ (depending only on $\varepsilon>0, p^{-}, p^{+}>1$, and $\delta \geq 0$ ) such that for every $t \geq 0, a, b \in \mathbb{R}^{d}$, and a.e. $x \in \Omega$, it holds that

$$
\begin{align*}
\varphi_{|a|}(x, t) & \leq c_{\varepsilon} \varphi_{|b|}(x, t)+\varepsilon|F(x, a)-F(x, b)|^{2}  \tag{2.15}\\
\left(\varphi_{|a|}\right)^{*}(x, t) & \leq c_{\varepsilon}\left(\varphi_{|b|}\right)^{*}(x, t)+\varepsilon|F(x, a)-F(x, b)|^{2} \tag{2.16}
\end{align*}
$$

Proof. See [15, Rem. A.9].
Remark 2.17 (Natural distance). Due to (2.10), uniformly in $u, v \in W^{1, p(\cdot)}(\Omega)$, it holds that

$$
\begin{aligned}
(\mathcal{A}(\cdot, \nabla u)-\mathcal{A}(\cdot, \nabla v), \nabla u-\nabla v)_{\Omega} & \sim\|F(\cdot, \nabla u)-F(\cdot, \nabla v)\|_{2, \Omega}^{2} \\
& \sim \rho_{\varphi_{|\nabla u|}, \Omega}(\nabla u-\nabla v)
\end{aligned}
$$

We refer to all three equivalent quantities as the natural distance. In particular, note that $\varphi_{|\nabla v|}: \Omega \times \mathbb{R}_{\geq 0} \rightarrow \mathbb{R}_{\geq 0}$ for every $v \in W^{1, p(\cdot)}(\Omega)$ is a generalized $N$-function.

Remark 2.18 (Conjugate natural distance). For a.e. $x \in \Omega, \mathcal{A}(x, \cdot): \mathbb{R}^{d} \rightarrow \mathbb{R}^{d}$ is a continuous, strictly monotone and coercive operator, so that from the theory of monotone operators (cf. [54]), it follows that $\mathcal{A}(x, \cdot): \mathbb{R}^{d} \rightarrow \mathbb{R}^{d}$ for a.e. $x \in \Omega$ is bijective and its inverse $\mathcal{A}^{-1}(x, \cdot): \mathbb{R}^{d} \rightarrow \mathbb{R}^{d}$ continuous. Due to (2.10), uniformly in $z, y \in L^{p^{\prime}(\cdot)}\left(\Omega ; \mathbb{R}^{d}\right)$, it holds that

$$
\begin{aligned}
\left(\mathcal{A}^{-1}(\cdot, z)-\mathcal{A}^{-1}(\cdot, y), z-y\right)_{\Omega} & \sim\left\|F^{*}(\cdot, z)-F^{*}(\cdot, y)\right\|_{2, \Omega}^{2} \\
& \sim \rho_{\left(\varphi^{*}\right)_{|z|}, \Omega}(z-y)
\end{aligned}
$$

We refer to all three equivalent quantities as the conjugate natural distance. In particular, note that $\left(\varphi^{*}\right)_{|y|}: \Omega \times \mathbb{R}_{\geq 0} \rightarrow \mathbb{R}_{\geq 0}$ for every $y \in L^{p^{\prime}(\cdot)}\left(\Omega ; \mathbb{R}^{d}\right)$ is a generalized $N$-function.

### 2.4 Triangulations and standard finite element spaces

In what follows, let $\left\{\mathcal{T}_{h}\right\}_{h>0}$ be family of triangulations of $\Omega \subseteq \mathbb{R}^{d}, d \in \mathbb{N},(c f$. [36]). Here, the parameter $h>0$ denotes the averaged mesh-size, i.e., we have that

$$
h:=\left(\frac{|\Omega|}{\operatorname{card}\left(\mathcal{N}_{h}\right)}\right)^{\frac{1}{d}}
$$

where $\mathcal{N}_{h}$ is the set of vertices. We assume there exists a constant $\omega_{0}>0$, independent of $h>0$, such that $\max _{T \in \mathcal{T}_{h}} h_{T} \rho_{T}^{-1} \leq \omega_{0}$, where $h_{T}:=\operatorname{diam}(T)$ and $\rho_{T}:=\sup \left\{r>0 \mid \exists x \in T: B_{r}^{d}(x) \subseteq T\right\}$ for all $T \in \mathcal{T}_{h}$. The smallest such constant is called the chunkiness of $\left\{\mathcal{T}_{h}\right\}_{h>0}$. For every $T \in \mathcal{T}_{h}$, let $\omega_{T}:=\bigcup\left\{T^{\prime} \in \mathcal{T}_{h} \mid T^{\prime} \cap T \neq \emptyset\right\}$ denote the element patch of $T$. Then, we assume that int $\left(\omega_{T}\right)$ is connected for all $T \in \mathcal{T}_{h}$, so that $\operatorname{card}\left(\bigcup\left\{T^{\prime} \in \mathcal{T}_{h} \mid T^{\prime} \subseteq \omega_{T}\right\}\right)+\operatorname{card}\left(\bigcup\left\{T^{\prime} \in \mathcal{T}_{h} \mid T \subseteq \omega_{T^{\prime}}\right\}\right) \leq c$, where $c>0$ depends only on the chunkiness $\omega_{0}>0$, and $|T| \sim\left|\omega_{T}\right|$ for all $T \in \mathcal{T}_{h}$. Eventually, we define the maximum mesh-size by $h_{\max }:=\max _{T \in \mathcal{T}_{h}} h_{T}>0$.

We define interior and boundary sides of $\mathcal{T}_{h}$ in the following way: an interior side is the closure of the non-empty relative interior of $\partial T \cap \partial T^{\prime}$, where $T, T^{\prime} \in \mathcal{T}_{h}$ are two adjacent elements. For an interior side $S:=\partial T \cap \partial T^{\prime} \in \mathcal{S}_{h}$, where $T, T^{\prime} \in \mathcal{T}_{h}$, the side patch is defined by $\omega_{S}:=T \cup T^{\prime}$. A boundary side is the closure of the non-empty relative interior of $\partial T \cap \partial \Omega$, where $T \in \mathcal{T}_{h}$ denotes a boundary element of $\mathcal{T}_{h}$. For a boundary side $S:=\partial T \cap \partial \Omega$, the side patch is defined by $\omega_{S}:=T$. Eventually, by $\mathcal{S}_{h}^{i}$, we denote the set of interior sides, by $\mathcal{S}_{h}^{\partial}$, we denote the set of boundary sides, and by $\mathcal{S}_{h}$, we denote the set of all sides.

For (Lebesgue) measurable functions $u, v: \mathcal{S}_{h} \rightarrow \mathbb{R}$ and $\mathcal{M}_{h} \subseteq \mathcal{S}_{h}$, we write

$$
(u, v)_{\mathcal{M}_{h}}:=\sum_{S \in \mathcal{M}_{h}}(u, v)_{S}, \quad \text { where }(u, v)_{S}:=\int_{S} u v \mathrm{~d} s
$$

whenever all integrals are well-defined. Analogously, for (Lebesgue) measurable vector fields $z, y: \mathcal{S}_{h} \rightarrow \mathbb{R}^{d}$ and $\mathcal{M}_{h} \subseteq \mathcal{S}_{h}$, we write $(z, y)_{\mathcal{M}_{h}}:=\sum_{S \in \mathcal{M}_{h}}(z, y)_{S}$, where $(z, y)_{S}:=\int_{S} z \cdot y \mathrm{~d} s$.

For $k \in \mathbb{N} \cup\{0\}$ and $T \in \mathcal{T}_{h}$, let $\mathcal{P}_{k}(T)$ denote the set of polynomials of maximal degree $k$ on $T$. Then, for $k \in \mathbb{N} \cup\{0\}$ and $l \in \mathbb{N}$, the sets of continuous and element-wise polynomial functions or vector fields, respectively, are defined by

$$
\begin{aligned}
& \mathcal{S}^{k}\left(\mathcal{T}_{h}\right)^{l}:=\left\{v_{h} \in C^{0}\left(\bar{\Omega} ; \mathbb{R}^{l}\right)\left|v_{h}\right|_{T} \in \mathcal{P}_{k}(T)^{l} \text { for all } T \in \mathcal{T}_{h}\right\} \\
& \mathcal{L}^{k}\left(\mathcal{T}_{h}\right)^{l}:=\left\{v_{h} \in L^{\infty}\left(\Omega ; \mathbb{R}^{l}\right)\left|v_{h}\right|_{T} \in \mathcal{P}_{k}(T)^{l} \text { for all } T \in \mathcal{T}_{h}\right\}
\end{aligned}
$$

The element-wise constant mesh-size function $h_{\mathcal{T}} \in \mathcal{L}^{0}\left(\mathcal{T}_{h}\right)$ is defined by $\left.h_{\mathcal{T}}\right|_{T}:=h_{T}$ for all $T \in \mathcal{T}_{h}$. The side-wise constant mesh-size function $h_{\mathcal{S}} \in \mathcal{L}^{0}\left(\mathcal{S}_{h}\right)$ is defined by $\left.h_{\mathcal{S}}\right|_{S}:=h_{S}$ for all $S \in \mathcal{S}_{h}$, where $h_{S}:=\operatorname{diam}(S)$ for all $S \in \mathcal{S}_{h}$. For every $T \in \mathcal{T}_{h}$ and $S \in \mathcal{S}_{h}$, we denote by

$$
x_{T}:=\frac{1}{d+1} \sum_{\nu \in \mathcal{N}_{h} \cap T} \nu \quad \text { and } \quad x_{S}:=\frac{1}{d} \sum_{\nu \in \mathcal{N}_{h} \cap S} \nu
$$

the barycenters of $T$ and $S$, respectively. The (local) $L^{2}$-projection operator onto element-wise constant functions or vector fields, respectively, $\Pi_{h}: L^{1}\left(\Omega ; \mathbb{R}^{l}\right) \rightarrow \mathcal{L}^{0}\left(\mathcal{T}_{h}\right)^{l}$, for every $v \in L^{1}\left(\Omega ; \mathbb{R}^{l}\right)$ is defined by

$$
\Pi_{h} v:=\sum_{T \in \mathcal{T}_{h}}\langle v\rangle_{T} \chi_{T}
$$

The element-wise gradient $\nabla_{h}: \mathcal{L}^{1}\left(\mathcal{T}_{h}\right)^{l} \rightarrow \mathcal{L}^{0}\left(\mathcal{T}_{h}\right)^{l \times d}$, for every $v_{h} \in \mathcal{L}^{1}\left(\mathcal{T}_{h}\right)^{l}$ is defined by

$$
\nabla_{h} v_{h}:=\sum_{T \in \mathcal{T}_{h}} \nabla\left(\left.v_{h}\right|_{T}\right) \chi_{T}
$$

For every $v_{h} \in \mathcal{L}^{k}\left(\mathcal{T}_{h}\right)$ and $S \in \mathcal{S}_{h}$, the jump across $S$ is defined by

$$
\llbracket v_{h} \rrbracket_{S}:= \begin{cases}\left.v_{h}\right|_{T_{+}}-\left.v_{h}\right|_{T_{-}} & \text {if } S \in \mathcal{S}_{h}^{i}, \text { where } T_{+}, T_{-} \in \mathcal{T}_{h} \text { satisfy } \partial T_{+} \cap \partial T_{-}=S \\ \left.v_{h}\right|_{T} & \text { if } S \in \mathcal{S}_{h}^{\partial}, \text { where } T \in \mathcal{T}_{h} \text { satisfies } S \subseteq \partial T\end{cases}
$$

For every $y_{h} \in\left(\mathcal{L}^{k}\left(\mathcal{T}_{h}\right)\right)^{d}$ and $S \in \mathcal{S}_{h}$, the normal jump across $S$ is defined by
$\llbracket y_{h} \cdot n \rrbracket_{S}:= \begin{cases}\left.y_{h}\right|_{T_{+}} \cdot n_{T_{+}}+\left.y_{h}\right|_{T_{-}} \cdot n_{T_{-}} & \text {if } S \in \mathcal{S}_{h}^{i}, \text { where } T_{+}, T_{-} \in \mathcal{T}_{h} \text { satisfy } \partial T_{+} \cap \partial T_{-}=S, \\ \left.y_{h}\right|_{T} \cdot n & \text { if } S \in \mathcal{S}_{h}^{\partial}, \text { where } T \in \mathcal{T}_{h} \text { satisfies } S \subseteq \partial T,\end{cases}$ where, for every $T \in \mathcal{T}_{h}, n_{T}: \partial T \rightarrow \mathbb{S}^{d-1}$ denotes the outward unit normal vector field to $T$.

### 2.4.1 Crouzeix-Raviart element

The Crouzeix-Raviart finite element space (cf. [23]) is defined as the space of element-wise affine functions that are continuous in the barycenters of interior element sides, i.e.,

$$
\mathcal{S}^{1, c r}\left(\mathcal{T}_{h}\right):=\left\{v_{h} \in \mathcal{L}^{1}\left(\mathcal{T}_{h}\right) \mid \llbracket v_{h} \rrbracket_{S}\left(x_{S}\right)=0 \text { for all } S \in \mathcal{S}_{h}^{i}\right\}
$$

The Crouzeix-Raviart finite element space with homogeneous Dirichlet boundary condition is defined as the space of Crouzeix-Raviart functions that vanish in the barycenters of boundary sides that belong to $\Gamma_{D}$, i.e.,

$$
\mathcal{S}_{D}^{1, c r}\left(\mathcal{T}_{h}\right):=\left\{v_{h} \in \mathcal{S}^{1, c r}\left(\mathcal{T}_{h}\right) \mid v_{h}\left(x_{S}\right)=0 \text { for all } S \in \mathcal{S}_{h} \cap \Gamma_{D}\right\}
$$

### 2.4.2 Raviart-Thomas element

The lowest order Raviart-Thomas finite element space (cf. [49]) is defined as the space of element-wise affine vector fields that have continuous constant normal components on interior elements sides, i.e.,

$$
\begin{gathered}
\mathcal{R} T^{0}\left(\mathcal{T}_{h}\right):=\left\{y_{h} \in \mathcal{L}^{1}\left(\mathcal{T}_{h}\right)^{d}\left|y_{h}\right|_{T} \cdot n_{T}=\text { const on } \partial T \text { for all } T \in \mathcal{T}_{h}\right. \\
\left.\llbracket y_{h} \cdot n \rrbracket S=0 \text { on } S \text { for all } S \in \mathcal{S}_{h}^{i}\right\}
\end{gathered}
$$

The Raviart-Thomas finite element space with homogeneous slip boundary condition is defined as the space of Raviart-Thomas functions that have vanishing normal components on $\Gamma_{N}$, i.e.,

$$
\mathcal{R} T_{N}^{0}\left(\mathcal{T}_{h}\right):=\left\{y_{h} \in \mathcal{R} T^{0}\left(\mathcal{T}_{h}\right) \mid y_{h} \cdot n=0 \text { on } \Gamma_{N}\right\}
$$

### 2.4.3 Discrete integration-by-parts formula

For every $v_{h} \in \mathcal{S}^{1, c r}\left(\mathcal{T}_{h}\right)$ and $y_{h} \in \mathcal{R} T^{0}\left(\mathcal{T}_{h}\right)$, we have the discrete integration-by-parts formula

$$
\begin{equation*}
\left(\nabla_{h} v_{h}, \Pi_{h} y_{h}\right)_{\Omega}+\left(\Pi_{h} v_{h}, \operatorname{div} y_{h}\right)_{\Omega}=\left(v_{h}, y_{h} \cdot n\right)_{\partial \Omega} \tag{2.19}
\end{equation*}
$$

which follows from the fact that for every $y_{h} \in \mathcal{R} T^{0}\left(\mathcal{T}_{h}\right)$, it holds that $\left.y_{h}\right|_{T} \cdot n_{T}=$ const on $\partial T$ for all $T \in \mathcal{T}_{h}$ and $\llbracket y_{h} \cdot n \rrbracket_{S}=0$ on $S$ for all $S \in \mathcal{S}_{h}^{i}$, and for every $v_{h} \in \mathcal{S}^{1, c r}\left(\mathcal{T}_{h}\right)$, it holds that $\int_{S} \llbracket v_{h} \rrbracket_{S} \mathrm{~d} s=\llbracket v_{h} \rrbracket_{S}\left(x_{S}\right)=0$ for all $S \in \mathcal{S}_{h}^{i}$. For every $v_{h} \in \mathcal{S}_{D}^{1, c r}\left(\mathcal{T}_{h}\right)$ and $y_{h} \in \mathcal{R} T_{N}^{0}\left(\mathcal{T}_{h}\right)$, (2.19) reads

$$
\begin{equation*}
\left(\nabla_{h} v_{h}, \Pi_{h} y_{h}\right)_{\Omega}=-\left(\Pi_{h} v_{h}, \operatorname{div} y_{h}\right)_{\Omega} \tag{2.20}
\end{equation*}
$$

In addition, appealing to [9, Sec. 2.4], there holds the discrete Helmholtz decomposition

$$
\begin{equation*}
\mathcal{L}^{0}\left(\mathcal{T}_{h}\right)^{d}=\operatorname{ker}\left(\left.\operatorname{div}\right|_{\mathcal{R} T_{N}^{0}\left(\mathcal{T}_{h}\right)}\right) \oplus \nabla_{h}\left(\mathcal{S}_{D}^{1, c r}\left(\mathcal{T}_{h}\right)\right) \tag{2.21}
\end{equation*}
$$

which shows that for every $y_{h} \in \mathcal{L}^{0}\left(\mathcal{T}_{h}\right)^{d}$, the following implication applies:

$$
\begin{equation*}
\left(y_{h}, \nabla_{h} v_{h}\right)_{\Omega}=0 \quad \text { for all } v_{h} \in \mathcal{S}_{D}^{1, c r}\left(\mathcal{T}_{h}\right) \quad \Rightarrow \quad y_{h} \in \mathcal{R} T_{N}^{0}\left(\mathcal{T}_{h}\right) \cap \mathcal{L}^{0}\left(\mathcal{T}_{h}\right)^{d} \tag{2.22}
\end{equation*}
$$

The implication (2.22) is of crucial importance in the derivation of discrete strong duality relations and a discrete recontruction formula in Proposition 2.37.

## $2.5 p(\cdot)$-Dirichlet problem

In this section, we briefly review the variational formulation, the primal formulation, and the dual formulation of the $p(\cdot)$-Dirichlet problem (1.1).

### 2.5.1 Variational problem

Given a right-hand side $f \in L^{p^{\prime}(\cdot)}(\Omega)$, where $p \in \mathcal{P}^{\infty}(\Omega)$ with $p^{-}>1$, the $p(\cdot)$-Dirichlet problem seeks for a function $u \in W_{D}^{1, p(\cdot)}(\Omega)$ such that for every $v \in W_{D}^{1, p(\cdot)}(\Omega)$, it holds that

$$
\begin{equation*}
(\mathcal{A}(\cdot, \nabla u), \nabla v)_{\Omega}=(f, v)_{\Omega} \tag{2.23}
\end{equation*}
$$

The theory of monotone operators (cf. [54]) proves the existence of a unique solution to (2.23). In what follows, we reserve the notation $u \in W_{D}^{1, p(\cdot)}(\Omega)$ for this solution.

### 2.5.2 Minimization problem and convex duality relations

The variational problem (2.23) emerges as an optimality condition of an equivalent convex minimization problem, leading to a primal and a dual formulation, and convex duality relations.

Primal problem. The problem (2.23) is equivalent to the minimization of the $p(\cdot)$-Dirichlet energy $I: W_{D}^{1, p(\cdot)}(\Omega) \rightarrow \mathbb{R}$, for every $v \in W_{D}^{1, p(\cdot)}(\Omega)$ defined by

$$
\begin{equation*}
I(v):=\rho_{\varphi, \Omega}(\nabla v)-(f, v)_{\Omega} \tag{2.24}
\end{equation*}
$$

We will always refer to the minimization of the $p(\cdot)$-Dirichlet energy (2.24) as the primal problem. Since the $p(\cdot)$-Dirichlet energy (2.24) is proper, strictly convex, weakly coercive, and lower semicontinuous, the existence of a unique minimizer of (2.24), called primal solution, follows using the direct method in the calculus of variations $(c f .[24])$. In particular, since the $p(\cdot)$-Dirichlet energy is Fréchet differentiable and for every $v, w \in W_{D}^{1, p(\cdot)}(\Omega)$, it holds that

$$
\langle D I(v), w\rangle_{W_{D}^{1, p(\cdot)}(\Omega)}=(\mathcal{A}(\cdot, \nabla v), \nabla w)_{\Omega}
$$

the optimality condition of the primal problem and the strict convexity of the $p(\cdot)$-Dirichlet energy imply that $u \in W_{D}^{1, p(\cdot)}(\Omega)$ is the unique minimizer of the $p(\cdot)$-Dirichlet energy.

Dual problem. Generalizing in [34, p. 113 ff.$]$ to the spaces (2.1), one finds that the (Fenchel) dual problem consists in the maximization of the functional $D: W_{N}^{p^{\prime}(\cdot)}(\operatorname{div} ; \Omega) \rightarrow \mathbb{R} \cup\{-\infty\}$, for every $y \in W_{N}^{p^{\prime}(\cdot)}(\operatorname{div} ; \Omega)$ defined by

$$
\begin{equation*}
D(y):=-\rho_{\varphi^{*}, \Omega}(y)-I_{\{-f\}}(\operatorname{div} y) \tag{2.25}
\end{equation*}
$$

where $I_{\{-f\}}: L^{p^{\prime}(\cdot)}(\Omega) \rightarrow \mathbb{R} \cup\{+\infty\}$ for every $g \in L^{p^{\prime}(\cdot)}(\Omega)$ is defined by

$$
I_{\{-f\}}(g):= \begin{cases}0 & \text { if } g=-f \text { a.e. in } \Omega  \tag{2.26}\\ +\infty & \text { else }\end{cases}
$$

Due to [34, Rem. 4.1 (4.21), p. 60], the dual problem admits a unique solution $z \in W_{N}^{p^{\prime}(\cdot)}(\operatorname{div} ; \Omega)$, i.e., a maximizer of (2.25), called dual solution, and a strong duality relation applies, i.e.,

$$
I(u)=D(z)
$$

In addition, there hold the convex optimality relations (cf. [34, Rem. 4.1 (4.22)-(4.25), p. 60])

$$
\begin{align*}
\operatorname{div} z & =-f & & \text { a.e. in } \Omega  \tag{2.27}\\
z & =\mathcal{A}(\cdot, \nabla u) & & \text { a.e. in } \Omega \tag{2.28}
\end{align*}
$$

By the Fenchel-Young identity (cf. [34, Prop. 5.1, p. 21]), the relation (2.28) is equivalent to

$$
\begin{equation*}
z \cdot \nabla u=\varphi^{*}(\cdot,|z|)+\varphi(\cdot,|\nabla u|) \quad \text { a.e. in } \Omega . \tag{2.29}
\end{equation*}
$$

### 2.6 Discrete $p_{h}(\cdot)$-Dirichlet problem

One important aspect in the numerical approximation of the $p(\cdot)$-Dirichlet problem (2.23) consists in the discretization of the $x$-dependent non-linearity. Here, it is convenient to use a simple one-point quadrature rule. More precisely, if $p \in C^{0}(\bar{\Omega})$ with $p^{-}>1$, then we define the elementwise constant variable exponent $p_{h} \in \mathcal{L}^{0}\left(\mathcal{T}_{h}\right)$, the generalized $N$-function $\varphi_{h}: \Omega \times \mathbb{R}_{\geq 0} \rightarrow \mathbb{R}_{\geq 0}$, and the non-linear operators $\mathcal{A}_{h}, F_{h}, F_{h}^{*}: \Omega \times \mathbb{R}^{d} \rightarrow \mathbb{R}^{d}$ for every $a \in \mathbb{R}^{d}, T \in \mathcal{T}_{h}$, and a.e. $x \in T$ by

$$
\begin{align*}
p_{h}(x) & :=p\left(\xi_{T}\right), & \varphi_{h}(x,|a|) & :=\varphi\left(\xi_{T},|a|\right), \\
\mathcal{A}_{h}(x, a) & :=\mathcal{A}\left(\xi_{T}, a\right), & F_{h}(x, a) & :=F\left(\xi_{T}, a\right), \tag{2.30}
\end{align*} \quad F_{h}^{*}(x, a):=F^{*}\left(\xi_{T}, a\right),
$$

where $\xi_{T} \in T$ is an arbitrary quadrature point, e.g., the barycenter of the element $T$.
Remark 2.31. Since the hidden constants in all equivalences in Section 2.3 depend only on $p^{-}, p^{+}>1$ and $\delta \geq 0$ and since $p^{-} \leq p_{h}^{-} \leq p_{h}^{+} \leq p^{+}$a.e. in $\Omega$ for all $h>0$, the same equivalences apply to the discretizations (2.30) with the hidden constants depending only on $p^{-}, p^{+} \in(1, \infty)$.

### 2.6.1 $\mathcal{S}_{D}^{1}\left(\mathcal{T}_{h}\right)$-approximation of the $p(\cdot)$-Dirichlet problem

Given a right-hand side $f \in L^{p^{\prime}(\cdot)}(\Omega)$, where $p \in C^{0}(\bar{\Omega})$ with $p^{-}>1$, the $\mathcal{S}_{D}^{1}\left(\mathcal{T}_{h}\right)$-approximation of the $p(\cdot)$-Dirichlet problem, where $\mathcal{S}_{D}^{1}\left(\mathcal{T}_{h}\right):=\mathcal{S}^{1}\left(\mathcal{T}_{h}\right) \cap W_{D}^{1, p(\cdot)}(\Omega)$, seeks for $u_{h}^{c} \in \mathcal{S}_{D}^{1}\left(\mathcal{T}_{h}\right)$ such that for every $v_{h} \in \mathcal{S}_{D}^{1}\left(\mathcal{T}_{h}\right)$, it holds that

$$
\begin{equation*}
\left(\mathcal{A}_{h}\left(\cdot, \nabla u_{h}^{c}\right), \nabla v_{h}\right)_{\Omega}=\left(f, v_{h}\right)_{\Omega} \tag{2.32}
\end{equation*}
$$

The theory of monotone operators (cf. [54]) proves the existence of a unique solution to (2.32). In what follows, we reserve the notation $u_{h}^{c} \in \mathcal{S}_{D}^{1}\left(\mathcal{T}_{h}\right)$ for this solution.

In [15], the following best-approximation result was derived:
Theorem 2.1 (Best-approximation). Let $p \in C^{0, \alpha}(\bar{\Omega})$ with $\alpha \in(0,1]$ and $p^{-}>1$ and let $\delta \geq 0$. Then, there exists some $s>1$, which can chosen to be close to 1 if $h_{\max }>0$ is close to 0 , such that if $u \in W^{1, p(\cdot) s}(\Omega)$, then
$\left\|F_{h}\left(\cdot, \nabla u_{h}^{c}\right)-F_{h}(\cdot, \nabla u)\right\|_{2, \Omega}^{2} \lesssim \inf _{v_{h} \in \mathcal{S}_{D}^{1}\left(\mathcal{T}_{h}\right)}\left\|F_{h}\left(\cdot, \nabla v_{h}\right)-F_{h}(\cdot, \nabla u)\right\|_{2, \Omega}^{2}+h_{\max }^{2 \alpha}\left(1+\rho_{p(\cdot) s, \Omega}(\nabla u)\right)$,
where the hidden constant in $\lesssim$ also depends on $s>1$ and the chunkiness $\omega_{0}>0$.
Proof. In [15, Lem. 4.7], only the case $\xi_{T}:=\arg \min _{x \in T} p(x)$ for all $T \in \mathcal{T}_{h}$ has been considered. However, an analysis of the proof of [15, Lem. 4.7] reveals that this particular quadrature rule is not needed there.

Resorting in Theorem 2.1 to the approximation properties of the Scott-Zhang quasi-interpolation operator $\Pi_{h}^{s z}: W_{D}^{1, p(\cdot)}(\Omega) \rightarrow \mathcal{S}_{D}^{1}\left(\mathcal{T}_{h}\right)(c f .[51])$, one arrives at the following a priori error estimate for the $\mathcal{S}_{D}^{1}\left(\mathcal{T}_{h}\right)$-approximation (2.32) of the $p(\cdot)$-Dirichlet problem (2.23).
Theorem 2.2 ( a priori error estimate). Let $p \in C^{0, \alpha}(\bar{\Omega})$ with $\alpha \in(0,1]$ and $p^{-}>1$ and let $\delta \geq 0$. Moreover, let $F(\cdot, \nabla u) \in W^{1,2}\left(\Omega ; \mathbb{R}^{d}\right)$. Then, there exists some $s>1$, which can chosen to be close to 1 if $h_{\max }>0$ is close to 0 , such that

$$
\left\|F_{h}\left(\cdot, \nabla u_{h}^{c}\right)-F_{h}(\cdot, \nabla u)\right\|_{2, \Omega}^{2} \lesssim h_{\max }^{2}\|\nabla F(\cdot, \nabla u)\|_{2, \Omega}^{2}+h_{\max }^{2 \alpha}\left(1+\rho_{p(\cdot) s, \Omega}(\nabla u)\right)
$$

where the hidden constant in $\lesssim$ also depends on $s>1$ and the chunkiness $\omega_{0}>0$.
Proof. See [15, Thm. 4.8].
Remark 2.33. If $F(\cdot, \nabla u) \in W^{1,2}\left(\Omega ; \mathbb{R}^{d}\right)$, then $F(\cdot, \nabla u) \in L^{2^{*}}\left(\Omega ; \mathbb{R}^{d}\right)$, where $2^{*}:=\frac{2 d}{d-2}$ if $2<d$ and $2^{*} \in[1, \infty)$ if $2 \geq d$. As a result, for $s>1$ close to 1 , i.e., $h_{\max }>0$ close to 0 , it holds that $\nabla u \in L^{p(\cdot) s}\left(\Omega ; \mathbb{R}^{d}\right)$. Similarly, if $F^{*}(\cdot, z) \in W^{1,2}\left(\Omega ; \mathbb{R}^{d}\right)$, then for $s>1$ close to 1 , i.e., $h_{\max }>0$ close to 0 , it holds that $z \in L^{p^{\prime}(\cdot) s}\left(\Omega ; \mathbb{R}^{d}\right)$.

## 2.7 $\mathcal{S}_{D}^{1, c r}\left(\mathcal{T}_{h}\right)$-approximation of the $p(\cdot)$-Dirichlet problem

Given a right-hand side $f \in L^{p^{\prime}(\cdot)}(\Omega), p \in C^{0}(\bar{\Omega})$ with $p^{-}>1$, and setting $f_{h}:=\Pi_{h} f \in \mathcal{L}^{0}\left(\mathcal{T}_{h}\right)$, the $\mathcal{S}_{D}^{1, c r}\left(\mathcal{T}_{h}\right)$-approximation of the $p(\cdot)$-Dirichlet problem seeks for $u_{h}^{c r} \in \mathcal{S}_{D}^{1, c r}\left(\mathcal{T}_{h}\right)$ such that for every $v_{h} \in \mathcal{S}_{D}^{1, c r}\left(\mathcal{T}_{h}\right)$, it holds that

$$
\begin{equation*}
\left(\mathcal{A}_{h}\left(\cdot, \nabla_{h} u_{h}^{c r}\right), \nabla_{h} v_{h}\right)_{\Omega}=\left(f_{h}, \Pi_{h} v_{h}\right)_{\Omega} \tag{2.34}
\end{equation*}
$$

The theory of monotone operators (cf. [54]) proves the existence of a unique solution to (2.34). In what follows, we reserve the notation $u_{h}^{c r} \in \mathcal{S}_{D}^{1, c r}\left(\mathcal{T}_{h}\right)$ for this solution.

### 2.7.1 Discrete minimization problem and discrete convex duality relations

The discrete variational problem (2.34) emerges as an optimality condition of an equivalent convex minimization problem.

Discrete primal problem. The problem (2.34) is equivalent to the minimization of the discrete $p_{h}(\cdot)$-Dirichlet energy $I_{h}^{c r}: \mathcal{S}_{D}^{1, c r}\left(\mathcal{T}_{h}\right) \rightarrow \mathbb{R}$, for every $v_{h} \in \mathcal{S}_{D}^{1, c r}\left(\mathcal{T}_{h}\right)$ defined by

$$
\begin{equation*}
I_{h}^{c r}\left(v_{h}\right):=\rho_{\varphi_{h}, \Omega}\left(\nabla_{h} v_{h}\right)-\left(f_{h}, \Pi_{h} v_{h}\right)_{\Omega} \tag{2.35}
\end{equation*}
$$

Hereinafter, we refer to the minimization of the discrete $p_{h}(\cdot)$-Dirichlet energy (2.35) as the discrete primal problem. Since the discrete $p_{h}(\cdot)$-Dirichlet energy (2.35) is proper, strictly convex, weakly coercive, and lower semi-continuous, the existence of a unique minimizer of (2.35), called discrete primal solution, follows using the direct method in the calculus of variations (cf. [24]). More precisely, since the discrete $p_{h}(\cdot)$-Dirichlet energy (2.35) is Fréchet differentiable and for every $v_{h}, w_{h} \in \mathcal{S}_{D}^{1, c r}\left(\mathcal{T}_{h}\right)$, it holds that

$$
\left\langle D I_{h}^{c r}\left(v_{h}\right), w_{h}\right\rangle_{\mathcal{S}_{D}^{1, c r}\left(\mathcal{T}_{h}\right)}=\left(\mathcal{A}_{h}\left(\cdot, \nabla_{h} v_{h}\right), \nabla_{h} w_{h}\right)_{\Omega}
$$

the optimality condition of the discrete primal problem and convexity of the discrete $p_{h}(\cdot)$-Dirichlet energy (2.35) imply that $u_{h}^{c r} \in \mathcal{S}_{D}^{1, c r}\left(\mathcal{T}_{h}\right)$ solves the discrete primal problem, i.e., is the unique minimizer of the discrete $p_{h}(\cdot)$-Dirichlet energy (2.35).

Discrete dual problem. The discrete dual problem consists in the maximization of the functional $D_{h}^{r t}: \mathcal{R} T_{N}^{0}\left(\mathcal{T}_{h}\right) \rightarrow \mathbb{R} \cup\{-\infty\}$, for every $y_{h} \in \mathcal{R} T_{N}^{0}\left(\mathcal{T}_{h}\right)$ defined by

$$
\begin{equation*}
D_{h}^{r t}\left(y_{h}\right):=-\rho_{\varphi_{h}^{*}, \Omega}\left(\Pi_{h} y_{h}\right)-I_{\left\{-f_{h}\right\}}\left(\operatorname{div} y_{h}\right) \tag{2.36}
\end{equation*}
$$

The following proposition establishes the well-posedness of the discrete dual problem, i.e., the existence of a maximizer, called discrete dual solution, and discrete strong duality. In addition, it provides a reconstruction formula for this maximizer from the discrete primal solution.

Proposition 2.37. The following statements apply:
(i) There holds a discrete weak duality relation, i.e., it holds that

$$
\begin{equation*}
\inf _{v_{h} \in \mathcal{S}_{D}^{1, c r}\left(\mathcal{T}_{h}\right)} I_{h}^{c r}\left(v_{h}\right) \geq \sup _{y_{h} \in \mathcal{R} T_{N}^{0}\left(\mathcal{T}_{h}\right)} D_{h}^{r t}\left(y_{h}\right) \tag{2.38}
\end{equation*}
$$

(ii) The discrete flux $z_{h}^{r t} \in \mathcal{L}^{1}\left(\mathcal{T}_{h}\right)^{d}$, defined via the generalized Marini formula

$$
\begin{equation*}
z_{h}^{r t}=\mathcal{A}_{h}\left(\cdot, \nabla_{h} u_{h}^{c r}\right)-\frac{f_{h}}{d}\left(\mathrm{id}_{\mathbb{R}^{d}}-\Pi_{h} \mathrm{id}_{\mathbb{R}^{d}}\right) \quad \text { in } \mathcal{R} T_{N}^{0}\left(\mathcal{T}_{h}\right) \tag{2.39}
\end{equation*}
$$

satisfies $z_{h}^{r t} \in \mathcal{R} T_{N}^{0}\left(\mathcal{T}_{h}\right)$ and the discrete convex optimality relations

$$
\begin{align*}
\operatorname{div} z_{h}^{r t} & =-f_{h} & \text { a.e. in } \Omega  \tag{2.40}\\
\Pi_{h} z_{h}^{r t} & =\mathcal{A}_{h}\left(\cdot, \nabla_{h} u_{h}^{r r}\right) & \text { a.e. in } \Omega \tag{2.41}
\end{align*}
$$

(iii) The discrete flux $z_{h}^{r t} \in \mathcal{R} T_{N}^{0}\left(\mathcal{T}_{h}\right)$ is the unique maximizer of (2.36) and a discrete strong duality relation applies, i.e., it holds that

$$
\begin{equation*}
I_{h}^{c r}\left(u_{h}^{c r}\right)=D_{h}^{r t}\left(z_{h}^{r t}\right) \tag{2.42}
\end{equation*}
$$

By the Fenchel-Young identity ( $c f$. [34, Prop. 5.1, p. 21]), the relation (2.41) is equivalent to

$$
\begin{equation*}
\Pi_{h} z_{h}^{r t} \cdot \nabla_{h} u_{h}^{c r}=\varphi_{h}^{*}\left(\cdot,\left|\Pi_{h} z_{h}^{r t}\right|\right)+\varphi_{h}\left(\cdot,\left|\nabla_{h} u_{h}^{c r}\right|\right) \quad \text { a.e. in } \Omega . \tag{2.43}
\end{equation*}
$$

Proof. ad (i). Using element-wise for each $T \in \mathcal{T}_{h}$ that $\varphi\left(\xi_{T}, \cdot\right)=\varphi^{* *}\left(\xi_{T}, \cdot\right)$, the definition of the convex conjugate, and the discrete integration-by-parts formula (2.20), we find that

$$
\begin{aligned}
\inf _{v_{h} \in \mathcal{S}_{D}^{1, c r}\left(\mathcal{T}_{h}\right)} I_{h}^{c r}\left(v_{h}\right) & =\inf _{v_{h} \in \mathcal{S}_{D}^{1, c r}\left(\mathcal{T}_{h}\right)} \rho_{\varphi_{h}^{* *}, \Omega}\left(\nabla_{h} v_{h}\right)-\left(f_{h}, \Pi_{h} v_{h}\right)_{\Omega} \\
& =\inf _{v_{h} \in \mathcal{S}_{D}^{1, c r}\left(\mathcal{T}_{h}\right)} \sup _{\bar{y}_{h} \in \mathcal{L}^{0}\left(\mathcal{T}_{h}\right)^{d}}\left(\bar{y}_{h}, \nabla_{h} v_{h}\right)_{\Omega}-\rho_{\varphi_{h}^{*}, \Omega}\left(\bar{y}_{h}\right)-\left(f_{h}, \Pi_{h} v_{h}\right)_{\Omega} \\
& \geq \inf _{v_{h} \in \mathcal{S}_{D}^{1, c r}\left(\mathcal{T}_{h}\right)} \sup _{y_{h} \in \mathcal{R} T_{N}^{0}\left(\mathcal{T}_{h}\right)}-\rho_{\varphi_{h}^{*}, \Omega}\left(\Pi_{h} y_{h}\right)+\left(\Pi_{h} y_{h}, \nabla_{h} v_{h}\right)_{\Omega}-\left(f_{h}, \Pi_{h} v_{h}\right)_{\Omega} \\
& =\inf _{v_{h} \in \mathcal{S}_{D}^{1, c r}\left(\mathcal{T}_{h}\right)} \sup _{y_{h} \in \mathcal{R} T_{N}^{0}\left(\mathcal{T}_{h}\right)}-\rho_{\varphi_{h}^{*}, \Omega}\left(\Pi_{h} y_{h}\right)-\left(\operatorname{div} y_{h}+f_{h}, \Pi_{h} v_{h}\right)_{\Omega} \\
& \geq \inf _{\bar{v}_{h} \in \mathcal{L}^{0}\left(\mathcal{T}_{h}\right)} \sup _{y_{h} \in \mathcal{R} T_{N}^{0}\left(\mathcal{T}_{h}\right)}-\rho_{\varphi_{h}^{*}, \Omega}\left(\Pi_{h} y_{h}\right)-\left(\operatorname{div} y_{h}+f_{h}, \bar{v}_{h}\right)_{\Omega} \\
& \geq \sup _{y_{h} \in \mathcal{R} T_{N}^{0}\left(\mathcal{T}_{h}\right)} \inf _{\bar{v}_{h} \in \mathcal{L}^{0}\left(\mathcal{T}_{h}\right)}-\rho_{\varphi_{h}^{*}, \Omega}\left(\Pi_{h} y_{h}\right)-\left(\operatorname{div} y_{h}+f_{h}, \bar{v}_{h}\right)_{\Omega} \\
& =\sup _{y_{h} \in \mathcal{R} T_{N}^{0}\left(\mathcal{T}_{h}\right)}-\rho_{\varphi_{h}^{*}, \Omega}\left(\Pi_{h} y_{h}\right)-\sup _{\bar{v}_{h} \in \mathcal{L}^{0}\left(\mathcal{T}_{h}\right)}\left(\operatorname{div} y_{h}+f_{h}, \bar{v}_{h}\right)_{\Omega} \\
& =\sup _{y_{h} \in \mathcal{R} T_{N}^{0}\left(\mathcal{T}_{h}\right)}-\rho_{\varphi_{h}^{*}, \Omega}\left(\Pi_{h} y_{h}\right)-I_{\left\{-f_{h}\right\}}\left(\operatorname{div} y_{h}\right) \\
& =\sup _{y_{h} \in \mathcal{R} T_{N}^{0}\left(\mathcal{T}_{h}\right)} D_{h}^{r t}\left(y_{h}\right) .
\end{aligned}
$$

$a d$ (ii). By definition, the discrete flux $z_{h}^{r t} \in \mathcal{L}^{1}\left(\mathcal{T}_{h}\right)^{d}$, defined by (2.39), satisfies the discrete convex optimality condition (2.41) and $\operatorname{div}\left(\left.z_{h}^{r t}\right|_{T}\right)=-\left.f_{h}\right|_{T}$ in $T$ for all $T \in \mathcal{T}_{h}$. Due to $\left|\Gamma_{D}\right|>0$, the divergence operator div: $\mathcal{R} T_{N}^{0}\left(\mathcal{T}_{h}\right) \rightarrow \mathcal{L}^{0}\left(\mathcal{T}_{h}\right)$ is surjective. Hence, there exists $y_{h} \in \mathcal{R} T_{N}^{0}\left(\mathcal{T}_{h}\right)$ such that $\operatorname{div} y_{h}=-f_{h}$ in $\mathcal{L}^{0}\left(\mathcal{T}_{h}\right)$. Then, we have that $\operatorname{div}\left(\left.\left(z_{h}^{r t}-y_{h}\right)\right|_{T}\right)=0$ in $T$ for all $T \in \mathcal{T}_{h}$, i.e., $z_{h}^{r t}-y_{h} \in \mathcal{L}^{0}\left(\mathcal{T}_{h}\right)^{d}$. In addition, for every $v_{h} \in \mathcal{S}_{D}^{1, c r}\left(\mathcal{T}_{h}\right)$, it holds that

$$
\begin{aligned}
\left(\Pi_{h} y_{h}, \nabla_{h} v_{h}\right)_{\Omega} & =-\left(\operatorname{div} y_{h}, \Pi_{h} v_{h}\right)_{\Omega} \\
& =\left(f_{h}, \Pi_{h} v_{h}\right)_{\Omega} \\
& =\left(\mathcal{A}_{h}\left(\cdot, \nabla_{h} u_{h}^{c r}\right), \nabla_{h} v_{h}\right)_{\Omega} \\
& =\left(\Pi_{h} z_{h}^{r t}, \nabla_{h} v_{h}\right)_{\Omega} .
\end{aligned}
$$

In other words, for every $v_{h} \in \mathcal{S}_{D}^{1, c r}\left(\mathcal{T}_{h}\right)$, it holds that

$$
\left(y_{h}-z_{h}^{r t}, \nabla_{h} v_{h}\right)_{\Omega}=\left(\Pi_{h} y_{h}-\Pi_{h} z_{h}^{r t}, \nabla_{h} v_{h}\right)_{\Omega}=0,
$$

i.e., $y_{h}-z_{h}^{r t} \in \nabla_{h}\left(\mathcal{S}_{D}^{1, c r}\left(\mathcal{T}_{h}\right)\right)^{\perp}$. By the decomposition (2.21), we have that $\nabla_{h}\left(\mathcal{S}_{D}^{1, c r}\left(\mathcal{T}_{h}\right)\right)^{\perp}=$ $\operatorname{ker}\left(\left.\operatorname{div}\right|_{\mathcal{R} T_{N}^{0}\left(\mathcal{T}_{h}\right)}\right) \subseteq \mathcal{R} T_{N}^{0}\left(\mathcal{T}_{h}\right)$. As a result, we have that $y_{h}-z_{h}^{r t} \in \mathcal{R} T_{N}^{0}\left(\mathcal{T}_{h}\right)$. Due to $y_{h} \in \mathcal{R} T_{N}^{0}\left(\mathcal{T}_{h}\right)$, we conclude that $z_{h}^{r t} \in \mathcal{R} T_{N}^{0}\left(\mathcal{T}_{h}\right)$. In particular, now from $\operatorname{div}\left(\left.z_{h}^{r t}\right|_{T}\right)=-\left.f_{h}\right|_{T}$ in $T$ for all $T \in \mathcal{T}_{h}$, it follows the discrete optimality condition (2.40).
ad (iii). Using (2.43), (2.27), and the discrete integration-by-parts formula (2.20), we find that

$$
\begin{aligned}
I_{h}^{c r}\left(u_{h}^{c r}\right) & =\rho_{\varphi_{h}, \Omega}\left(\nabla_{h} u_{h}^{c r}\right)-\left(f_{h}, \Pi_{h} u_{h}^{c r}\right)_{\Omega} \\
& =-\rho_{\varphi_{h}^{*}, \Omega}\left(\Pi_{h} z_{h}^{r t}\right)+\left(\Pi_{h} z_{h}^{r t}, \nabla_{h} u_{h}^{c r}\right)_{\Omega}+\left(\operatorname{div} z_{h}^{r t}, \Pi_{h} u_{h}^{c r}\right)_{\Omega} \\
& =-\rho_{\varphi_{h}^{*}, \Omega}\left(\Pi_{h} z_{h}^{r t}\right)-I_{\left\{-f_{h}\right\}}\left(\operatorname{div} z_{h}^{r t}\right) \\
& =D_{h}^{r t}\left(z_{h}^{r t}\right),
\end{aligned}
$$

i.e., the discrete strong duality relation applies, which in conjunction with the discrete weak duality relation (2.38) implies the maximality of $z_{h}^{r t} \in \mathcal{R} T_{N}^{0}\left(\mathcal{T}_{h}\right)$ for (2.36). Since (2.36) is strictly convex, $z_{h}^{r t} \in \mathcal{R} T_{N}^{0}\left(\mathcal{T}_{h}\right)$ is unique.

### 2.8 Natural regularity assumption in the case $p \in C^{0,1}(\bar{\Omega})$

In this section, for $p \in C^{0,1}(\bar{\Omega})$, we briefly examine the natural regularity assumption

$$
\begin{equation*}
F(\cdot, \nabla u) \in W^{1,2}\left(\Omega ; \mathbb{R}^{d}\right) \tag{2.44}
\end{equation*}
$$

on the solution $u \in W_{D}^{1, p(\cdot)}(\Omega)$ of (2.23), which is satisfied under mild assumptions on the domain $\Omega \subseteq \mathbb{R}^{d}, d \in \mathbb{N}$, the exponent $p \in C^{0,1}(\bar{\Omega})$ with $p^{-}>1$ and the right-hand side $f \in L^{p^{\prime}(\cdot)}(\Omega)(c f .[37] ;$ see also [15, Rem. 4.5]).
Lemma 2.45. Let $p \in C^{0,1}(\bar{\Omega})$ with $p^{-}>1$ and $\delta>0$. Then, for every $v \in W^{1, p(\cdot)}(\Omega)$ with $F(\cdot, \nabla v) \in W^{1,2}\left(\Omega ; \mathbb{R}^{d}\right)$, for $\mu(v):=|\ln (\delta+|\nabla v|)|^{2}(\delta+|\nabla v|)^{p(\cdot)-2}|\nabla p \otimes \nabla v|^{2} \in L^{1}(\Omega)$, it holds that

$$
(\delta+|\nabla v|)^{p(\cdot)-2}\left|\nabla^{2} v\right|^{2}+\mu(v) \sim|\nabla F(\cdot, \nabla v)|^{2}+\mu(v) \quad \text { a.e. in } \Omega .
$$

Proof. Since the claimed equivalence reads $0 \sim 0$ on $\{|\nabla v|=0\}$, we restrict to the case $|\nabla v|>0$. Here, by Rademacher's theorem, the product rule, and the chain rule, we find that

$$
\nabla F(\cdot, \nabla v)=(\delta+|\nabla v|)^{\frac{p-2}{2}}\left(\frac{\nabla p \otimes \nabla v}{2} \ln (\delta+|\nabla v|)+\frac{p-2}{2} \frac{\nabla|\nabla v| \otimes \nabla v}{\delta+|\nabla v|}+\nabla^{2} v\right) \quad \text { a.e. in }\{|\nabla v|>0\} .
$$

Since $\nabla p \in L^{\infty}\left(\Omega ; \mathbb{R}^{d}\right)$ as well as $(\delta+|\nabla v|)^{p-2}\left|\nabla^{2} v\right|^{2} \sim(\delta+|\nabla v|)^{p-4}|\nabla| \nabla v|\otimes \nabla v|^{2}$ a.e. in $\Omega$ (cf. [39, Lem. 2.8]), we conclude the claimed equivalence on $\{|\nabla v|>0\}$.

The following lemma translates the natural regularity assumption (2.44) to the flux $z:=$ $\mathcal{A}(\cdot, \nabla u) \in W_{N}^{p^{\prime}(\cdot)}(\operatorname{div} ; \Omega)$ and vice versa.
Lemma 2.46. Let $p \in C^{0,1}(\bar{\Omega})$ with $p^{-}>1$ and $\delta \geq 0$. Then, for every $v \in W^{1, p(\cdot)}(\Omega)$ and $y:=\mathcal{A}(\cdot, \nabla v) \in L^{p^{\prime}(\cdot)}\left(\Omega ; \mathbb{R}^{d}\right)$, it holds that $F(\cdot, \nabla v) \in W^{1,2}\left(\Omega ; \mathbb{R}^{d}\right)$ if and only if $F^{*}(\cdot, y) \in$ $W^{1,2}\left(\Omega ; \mathbb{R}^{d}\right)$. In particular, it holds that $|F(\cdot, \nabla v)|^{2} \sim\left|F^{*}(\cdot, y)\right|^{2}$ a.e. in $\Omega$ and $|\nabla F(\cdot, \nabla v)|^{2}+(1+$ $\left.|\nabla v|^{p(\cdot) s}\right) \sim\left|\nabla F^{*}(\cdot, y)\right|^{2}+\left(1+|y|^{p^{\prime}(\cdot) s}\right)$ a.e. in $\Omega$ for some $s>1$ with can chosen to be close to 1 .
Proof. The first equivalence is evident. For the second equivalence, we denote by $\tau_{h} f:=|h|^{-1}(f(\cdot+$ $h)-f)$ the difference quotient and exploit that, by Lemma A.5, for all $h \in \mathbb{R}^{d}$ small enough

$$
\begin{aligned}
\left|\tau_{h}[F(\cdot, \nabla v)]\right|^{2} \lesssim & |F(\cdot+h,(\nabla v)(\cdot+h))-F(\cdot+h, \nabla v)|^{2}+|F(\cdot+h, \nabla v)-F(\cdot, \nabla v)|^{2} \\
\lesssim & \mid F^{*}\left(\cdot+h, \mathcal{A}(\cdot+h,(\nabla v)(\cdot+h))-\left.F^{*}(\cdot+h, \mathcal{A}(\cdot+h, \nabla v))\right|^{2}+\left|\tau_{h} p\right|\left(1+|\nabla v|^{p(\cdot) s}\right)\right. \\
\lesssim & \left|\tau_{h}\left[F^{*}(\cdot, \mathcal{A}(\cdot, \nabla v))\right]\right|^{2}+\left|\tau_{h} p\right|\left(1+|\nabla v|^{p(\cdot) s}\right) \\
& +\left|F^{*}(\cdot+h, \mathcal{A}(\cdot, \nabla v))-F^{*}(\cdot+h, \mathcal{A}(\cdot+h, \nabla v))\right|^{2} \\
& +\left|F^{*}(\cdot+h, \mathcal{A}(\cdot, \nabla v))-F^{*}(\cdot, \mathcal{A}(\cdot, \nabla v))\right|^{2} \\
\lesssim & \left|\tau_{h}\left[F^{*}(\cdot, y)\right]\right|^{2}+\left|\tau_{h} p\right|\left(1+|y|^{p^{\prime}(\cdot) s}\right) \quad \text { a.e. in }\{x \in \Omega|\operatorname{dist}(x, \partial \Omega)>|h|\}
\end{aligned}
$$

Similarly, we find that $\left|\tau_{h}\left[F^{*}(\cdot, y)\right]\right| \lesssim\left|\tau_{h}[F(\cdot, \nabla v)]\right|+\left(1+|\nabla v|^{p(\cdot) s}\right)$ a.e. in $\{x \in \Omega|\operatorname{dist}(x, \partial \Omega)>|h|\}$. Passing to the limit $|h| \rightarrow 0$ proves the claim.

Lemma 2.46, in turn, motivates to prove the following dual counterparts of Lemma 2.45.
Lemma 2.47. Let $p \in C^{0,1}(\bar{\Omega})$ with $p^{-}>1$ and $\delta>0$. Then, for every $y \in L^{p^{\prime}(\cdot)}\left(\Omega ; \mathbb{R}^{d}\right)$ with $F^{*}(\cdot, y) \in W^{1,2}\left(\Omega ; \mathbb{R}^{d}\right)$, for $\mu^{*}(y):=\left|\ln \left(\delta^{p(\cdot)-1}+|y|\right)\right|^{2}\left(\delta^{p(\cdot)-1}+|y|\right)^{p^{\prime}(\cdot)-2}\left|\nabla p^{\prime} \otimes y\right|^{2} \in L^{1}(\Omega)$, it holds that

$$
\left(\delta^{p(\cdot)-1}+|y|\right)^{p^{\prime}(\cdot)-2}|\nabla y|^{2}+\mu^{*}(y) \sim\left|\nabla F^{*}(\cdot, y)\right|^{2}+\mu^{*}(y) \quad \text { a.e. in } \Omega .
$$

Proof. Since the claimed equivalence reads $0 \sim 0$ on $\{|y|=0\}$, we restrict to the case $|y|>0$. Here, by Rademacher's theorem, the product rule, and the chain rule, we find that
$\nabla F^{*}(\cdot, y)=\left(\delta^{p-1}+|y|\right)^{\frac{p^{\prime}-2}{2}}\left(\frac{\nabla p^{\prime} \otimes y}{2} \ln \left(\delta^{p-1}+|y|\right)+\frac{p^{\prime}-2}{2} \frac{\left(\nabla p \ln (\delta) \delta^{p-1}+\nabla|y|\right) \otimes y}{\delta^{p-1}+|y|}+\nabla y\right)$ a.e. in $\{|y|>0\}$.
Since $\nabla p^{\prime} \in L^{\infty}\left(\Omega ; \mathbb{R}^{d}\right)$ as well as $\left(\delta^{p-1}+|y|\right)^{p^{\prime}-2}|\nabla y|^{2} \sim\left(\delta^{p-1}+|y|\right)^{p^{\prime}-4}|\nabla| y|\otimes y|^{2}$ a.e. in $\Omega$ (cf. [39, Lem. 2.11]), we conclude the claimed equivalence on $\{|y|>0\}$.

## 3. Medius ERROR ANALYSIS

In this section, we prove a best-approximation result for the $\mathcal{S}_{D}^{1, c r}\left(\mathcal{T}_{h}\right)$-approximation (2.34) of (2.23).
Theorem 3.1. Let $p \in C^{0}(\bar{\Omega})$ with $p^{-}>1$ and $\delta \geq 0$ and let $f \in L^{p^{\prime}(\cdot)}(\Omega) \cap \bigcap_{h \in\left(0, h_{0}\right]} L^{p_{h}^{\prime}(\cdot)}(\Omega)$ for some $h_{0}>0$. Then, there exists some $s>1$, which can chosen to be close to 1 if $h>0$ is close to 0 , such that if $u \in W_{D}^{1, p(\cdot) s}(\Omega)$, then for every $h \in\left(0, h_{0}\right]$, it holds that

$$
\begin{aligned}
\left\|F_{h}\left(\cdot, \nabla_{h} u_{h}^{c r}\right)-F_{h}(\cdot, \nabla u)\right\|_{2, \Omega}^{2} & \lesssim \inf _{v_{h} \in \mathcal{S}_{D}^{1}\left(\mathcal{T}_{h}\right)}\left[\left\|F_{h}\left(\cdot, \nabla v_{h}\right)-F_{h}(\cdot, \nabla u)\right\|_{2, \Omega}^{2}+\operatorname{osc}_{h}^{2}\left(f, v_{h}\right)\right. \\
& \left.+\left\|\omega_{p}\left(h_{\mathcal{T}}\right)^{2}\left(1+|\nabla u|^{p(\cdot) s}+\left(\left|\nabla v_{h}\right|+\left|\nabla v_{h}-\nabla_{h} u_{h}^{c r}\right|\right)^{p_{h}(\cdot) s}\right)\right\|_{1, \Omega}\right]
\end{aligned}
$$

where the hidden constant in $\lesssim$ also depends on $s>1$ and the chunkiness $\omega_{0}>0$, and for $v_{h} \in \mathcal{S}_{D}^{1}\left(\mathcal{T}_{h}\right)$ and $\mathcal{M}_{h} \subseteq \mathcal{T}_{h}$, we define $\operatorname{osc}_{h}^{2}\left(f, v_{h}, \mathcal{M}_{h}\right):=\sum_{T \in \mathcal{M}_{h}} \operatorname{osc}_{h}^{2}\left(f, v_{h}, T\right)$, where we define $\operatorname{osc}_{h}^{2}\left(f, v_{h}, T\right)$ $:=\rho_{\left(\left(\varphi_{h}\right)_{\left|\nabla v_{h}\right|}\right)^{*}, T}\left(h_{T}\left(f-f_{h}\right)\right)$ for all $T \in \mathcal{T}_{h}$ and $\operatorname{osc}_{h}^{2}\left(f, v_{h}\right):=\operatorname{osc}_{h}^{2}\left(f, v_{h}, \mathcal{T}_{h}\right)$.

The proof of Theorem 3.1 involves three tools.

### 3.1 Node-averaging quasi-interpolation operator

The first tool is the node-averaging quasi-interpolation operator $\Pi_{h}^{a v}: \mathcal{L}^{1}\left(\mathcal{T}_{h}\right) \rightarrow \mathcal{S}_{D}^{1}\left(\mathcal{T}_{h}\right)$, that, denoting for every $\nu \in \mathcal{N}_{h}$, by $\mathcal{T}_{h}(\nu):=\left\{T \in \mathcal{T}_{h} \mid \nu \in T\right\}$, the set of elements sharing $\nu$, for every $v_{h} \in \mathcal{L}^{1}\left(\mathcal{T}_{h}\right)$, is defined by

$$
\Pi_{h}^{a v} v_{h}:=\sum_{\nu \in \mathcal{N}_{h}}\left\langle v_{h}\right\rangle_{\nu} \varphi_{\nu}, \quad\left\langle v_{h}\right\rangle_{\nu}:= \begin{cases}\frac{1}{\operatorname{card}\left(\mathcal{T}_{h}(\nu)\right)} \sum_{T \in \mathcal{T}_{h}(\nu)}\left(\left.v_{h}\right|_{T}\right)(\nu) & \text { if } \nu \in \Omega \cup \Gamma_{N} \\ 0 & \text { if } \nu \in \Gamma_{D}\end{cases}
$$

where we denote by $\left(\varphi_{\nu}\right)_{\nu \in \mathcal{N}_{h}}$, the nodal basis of $\mathcal{S}^{1}\left(\mathcal{T}_{h}\right)$. If $p \in C^{0}(\bar{\Omega})$ with $p^{-}>1$ and $\delta \geq 0$, then there exists some $s>1$, which can chosen to be close to 1 if $h_{T}>0$ is close to 1 , such that for every $a \geq 0, v_{h} \in \mathcal{S}_{D}^{1, c r}\left(\mathcal{T}_{h}\right), T \in \mathcal{T}_{h}$, and $m \in\{0,1\}$, it holds that (cf. [11, Cor. A.2])

$$
\begin{align*}
& \int_{T} \varphi_{a}\left(\xi_{T}, h_{T}^{m}\left|\nabla_{h}^{m}\left(v_{h}-\Pi_{h}^{a v} v_{h}\right)\right|\right) \mathrm{d} x \lesssim \int_{\omega_{T}} \varphi_{a}\left(\xi_{T}, h_{T}\left|\nabla_{h} v_{h}\right|\right) \mathrm{d} x  \tag{3.1}\\
& \quad \lesssim \int_{\omega_{T}}\left(\varphi_{h}\right)_{a}\left(\cdot, h_{T}\left|\nabla_{h} v_{h}\right|\right) \mathrm{d} x+h_{T}^{\min \left\{2, p^{-}\right\}} \omega_{p, \omega_{T}}\left(h_{T}\right)\left\|1+a^{p_{h}(\cdot) s}+\left|\nabla_{h} v_{h}\right|^{p_{h}(\cdot) s}\right\|_{1, \omega_{T}}
\end{align*}
$$

where we use that $\varphi_{a}\left(\xi_{T}, h_{T} t\right) \lesssim \varphi_{a}\left(\xi_{T^{\prime}}, h_{T} t\right)+h_{T}^{\min \left\{2, p^{-}\right\}}\left|p\left(\xi_{T}\right)-p\left(\xi_{T^{\prime}}\right)\right|\left(1+a^{p\left(\xi_{T^{\prime}}\right) s}+t^{p\left(\xi_{T^{\prime}}\right) s}\right)$ for all $T^{\prime} \in \mathcal{T}_{h}$ with $T^{\prime} \subseteq \omega_{T}$ for the second inequality, which follows analogously to (A.9).

### 3.2 Local efficiency estimates

The second tool are local efficiency estimates that are based on standard bubble function techniques.
Lemma 3.2. Let $p \in C^{0}(\bar{\Omega})$ with $p^{-}>1$ and $\delta \geq 0$ and let $f \in L^{p^{\prime}(\cdot)}(\Omega) \cap \bigcap_{h \in\left(0, h_{0}\right]} L^{p_{h}^{\prime}(\cdot)}(\Omega)$ for some $h_{0}>0$. Then, there exists some $s>1$, which can chosen to be close to 1 if $h_{T}>0$ is close to 0 , such that if $u \in W_{D}^{1, p(\cdot) s}(\Omega)$, then for every $h \in\left(0, h_{0}\right], v_{h} \in \mathcal{S}_{D}^{1}\left(\mathcal{T}_{h}\right), T \in \mathcal{T}_{h}$, and $S \in \mathcal{S}_{h}^{i}$, it holds that

$$
\begin{align*}
\rho_{\left(\left(\varphi_{h}\right)_{\left|\nabla v_{h}\right|}\right)^{*}, T}\left(h_{T} f_{h}\right) \lesssim & \left\|F_{h}\left(\cdot, \nabla v_{h}\right)-F_{h}(\cdot, \nabla u)\right\|_{2, T}^{2}  \tag{3.3}\\
& +\left\|\omega_{p, T}\left(h_{T}\right)^{2}\left(1+|\nabla u|^{p(\cdot) s}\right)\right\|_{1, T}+\operatorname{osc}_{h}^{2}\left(f, v_{h}, T\right) \\
h_{S}\left\|\llbracket F_{h}\left(\cdot, \nabla v_{h}\right) \rrbracket_{S}\right\|_{2, S}^{2} \lesssim & \left\|F_{h}\left(\cdot, \nabla v_{h}\right)-F_{h}(\cdot, \nabla u)\right\|_{2, \omega_{S}}^{2}  \tag{3.4}\\
& +\left\|\omega_{p, \omega_{S}}\left(h_{S}\right)^{2}\left(1+|\nabla u|^{p(\cdot) s}+\left|\nabla v_{h}\right|^{p_{h}(\cdot) s}\right)\right\|_{1, \omega_{S}}+\operatorname{osc}_{h}^{2}\left(f, v_{h}, \omega_{S}\right)
\end{align*}
$$

where the hidden constants in (3.3) and (3.4) also depend on $s>1$ and the chunkiness $\omega_{0}>0$, and for every $\mathcal{M}_{h} \subseteq \mathcal{T}_{h}$, we define $\left.\omega_{p, \cup \mathcal{M}_{h}}(t)\right|_{T}:=\omega_{p, T}(t)$ for all $t \geq 0$ and $T \in \mathcal{T}_{h}$ and $\omega_{p}:=\omega_{p, \mathcal{T}_{h}}$.

Proof. We generalize the procedure in the proof of [39, Lem. 3.2].
ad (3.3). Let $T \in \mathcal{T}_{h}$ be fixed, but arbitrary. Then, there exists a bubble function $b_{T} \in W_{0}^{1, \infty}(T)$ such that $0 \leq b_{T} \lesssim 1$ in $T,\left|\nabla b_{T}\right| \lesssim h_{T}^{-1}$ in $T$, and $\left\langle b_{T}\right\rangle_{T}=1$, where the hidden constant in $\lesssim$ depends only on the chunkiness $\omega_{0}>0$. Using (2.23) and integration-by-parts, taking into account that $\mathcal{A}_{h}\left(\cdot, \nabla v_{h}\right) \in \mathcal{L}^{0}\left(\mathcal{T}_{h}\right)^{d}$ and $b_{T} \in W_{0}^{1, \infty}(T)$, for every $\lambda \in \mathbb{R}$, we find that

$$
\begin{equation*}
\left(\mathcal{A}(\cdot, \nabla u)-\mathcal{A}_{h}\left(\cdot, \nabla v_{h}\right), \nabla\left(\lambda b_{T}\right)\right)_{T}=\left(f, \lambda b_{T}\right)_{T} \tag{3.5}
\end{equation*}
$$

For the special choice $\lambda_{T}:=\operatorname{sgn}\left(f_{h}\right) \partial_{a}\left(\left(\varphi_{\left|\nabla v_{h}\right|}\right)^{*}\right)\left(\xi_{T}, h_{T}\left|f_{h}\right|\right) \in \mathbb{R}$, by the Fenchel-Young identity (cf. [34, Prop. 5.1, p. 21]), we obtain

$$
\begin{equation*}
\left(h_{T} f_{h}\right) \lambda_{T}=\left(\varphi_{\left|\nabla v_{h}\right|}\right)^{*}\left(\xi_{T}, h_{T}\left|f_{h}\right|\right)+\varphi_{\left|\nabla v_{h}\right|}\left(\xi_{T},\left|\lambda_{T}\right|\right) \tag{3.6}
\end{equation*}
$$

Then, choosing $\lambda=h_{T} \lambda_{T} \in \mathbb{R}$ (cf. (3.6)) in (3.5), we observe that

$$
\begin{align*}
& \rho_{\left(\left(\varphi_{h}\right)_{\left.\left|\nabla v_{h}\right|\right)^{*}, T}\left(h_{T} f_{h}\right)+\rho_{\left(\varphi_{h}\right)_{\left|\nabla v_{h}\right|, T}}\left(\lambda_{T}\right)=\right.}\left(f, h_{T} \lambda_{T} b_{T}\right)_{T} \\
&+\left(f_{h}-f, h_{T} \lambda_{T} b_{T}\right)_{T} \\
&=\left(\mathcal{A}_{h}(\cdot, \nabla u)-\mathcal{A}_{h}\left(\cdot, \nabla v_{h}\right), \nabla\left(h_{T} \lambda_{T} b_{T}\right)\right)_{T}  \tag{3.7}\\
&+\left(\mathcal{A}(\cdot, \nabla u)-\mathcal{A}_{h}(\cdot, \nabla u), \nabla\left(h_{T} \lambda_{T} b_{T}\right)\right)_{T} \\
&+\left(f_{h}-f, h_{T} \lambda_{T} b_{T}\right)_{T} \\
&= I_{h}^{1}+I_{h}^{2}+I_{h}^{3}
\end{align*}
$$

Applying the $\varepsilon$-Young inequality (2.2) with $\psi=\varphi_{\left|\nabla v_{h}\right|}\left(\xi_{T}, \cdot\right)$ together with (2.10), also using that $\left|b_{T}\right|+h_{T}\left|\nabla b_{T}\right| \lesssim 1$ in $T$, we find that

$$
\begin{align*}
& I_{h}^{1} \leq c_{\varepsilon}\left\|F_{h}\left(\cdot, \nabla v_{h}\right)-F_{h}(\cdot, \nabla u)\right\|_{2, T}^{2}+\varepsilon \rho_{\left(\varphi_{h}\right)_{\left|\nabla v_{h}\right|, T}}\left(\lambda_{T}\right),  \tag{3.8}\\
& I_{h}^{3} \leq c_{\varepsilon} \operatorname{osc}_{h}^{2}\left(f, v_{h}, T\right)+\varepsilon \rho_{\left(\varphi_{h}\right)_{\left|\nabla v_{h}\right|, T}}\left(\lambda_{T}\right)
\end{align*}
$$

Applying the $\varepsilon$-Young inequality (2.2) with $\psi=\varphi_{|\nabla u|}\left(\xi_{T}, \cdot\right)$ together with (2.13), $\left|b_{T}\right|+h_{T}\left|\nabla b_{T}\right| \lesssim 1$ in $T$, the shift change (2.15), and Lemma A.1(A.3), we obtain

$$
\begin{align*}
I_{h}^{2} & \leq c_{\varepsilon}\left\|F_{h}^{*}\left(\cdot, \mathcal{A}_{h}(\cdot, \nabla u)\right)-F_{h}^{*}(\cdot, \mathcal{A}(\cdot, \nabla u))\right\|_{2, T}^{2}+\varepsilon \rho_{\left(\varphi_{h}\right)_{|\nabla u|, T}\left(\lambda_{T}\right)} \\
& \lesssim c_{\varepsilon}\left\|\omega_{p, T}\left(h_{T}\right)^{2}(1+|\nabla u|)^{p(\cdot) s}\right\|_{1, T}+\varepsilon\left[\rho_{\left(\varphi_{h}\right)_{\left|\nabla v_{h}\right|, T}}\left(\lambda_{T}\right)+\left\|F_{h}\left(\cdot, \nabla v_{h}\right)-F_{h}(\cdot, \nabla u)\right\|_{2, T}^{2}\right] \tag{3.9}
\end{align*}
$$

Taking into account (3.8) and (3.9) in (3.7), for sufficiently small $\varepsilon>0$, we conclude that

$$
\begin{align*}
\rho_{\left(\left(\varphi_{h}\right)_{\left|\nabla v_{h}\right|}\right)^{*}, T}\left(h_{T} f_{h}\right) \lesssim & \left\|F_{h}\left(\cdot, \nabla v_{h}\right)-F_{h}(\cdot, \nabla u)\right\|_{2, T}^{2}  \tag{3.10}\\
& +\left\|\omega_{p, T}\left(h_{T}\right)^{2}\left(1+|\nabla u|^{p(\cdot) s}\right)\right\|_{1, T}+\operatorname{osc}_{h}^{2}\left(f, v_{h}, T\right)
\end{align*}
$$

ad (3.4). Let $S \in \mathcal{S}_{h}^{i}$ be fixed, but arbitrary. Then, there exists a bubble function $b_{S} \in W_{0}^{1, \infty}\left(\omega_{S}\right)$ such that $0 \leq b_{S} \lesssim 1$ in $\omega_{S},\left|\nabla b_{S}\right| \lesssim h_{S}^{-1}$ in $\omega_{S}$, and $\left\langle b_{S}\right\rangle_{S}=1$, where the hidden constant in $\lesssim$ depends only on the chunkiness $\omega_{0}>0$. Using (2.23) and integration-by-parts, taking into account that $\mathcal{A}_{h}\left(\cdot, \nabla v_{h}\right) \in \mathcal{L}^{0}\left(\mathcal{T}_{h}\right)^{d}$ and $b_{S} \in W_{0}^{1, \infty}\left(\omega_{S}\right)$ with $\left\langle b_{S}\right\rangle_{S}=1$, for every $\lambda \in \mathbb{R}$, we find that

$$
\begin{equation*}
\left(\mathcal{A}(\cdot, \nabla u)-\mathcal{A}_{h}\left(\cdot, \nabla v_{h}\right), \nabla\left(\lambda b_{S}\right)\right)_{\omega_{S}}=\left(f, \lambda b_{S}\right)_{\omega_{S}}-|S| \llbracket \mathcal{A}_{h}\left(\cdot, \nabla v_{h}\right) \cdot n \rrbracket_{S} \lambda \tag{3.11}
\end{equation*}
$$

Let $T \in \mathcal{T}_{h}$ be such that $T \subseteq \omega_{S}$. Then, using the notation $\nabla v_{h}(T):=\left.\nabla v_{h}\right|_{T}{ }^{1}$, for the choice

$$
\lambda_{S, T}:=\operatorname{sgn}\left(\llbracket \mathcal{A}_{h}\left(\cdot, \nabla v_{h}\right) \cdot n \rrbracket_{S}\right) \partial_{a}\left(\left(\varphi_{\left|\nabla v_{h}(T)\right|}\right)^{*}\right)\left(\xi_{T},\left|\llbracket \mathcal{A}_{h}\left(\cdot, \nabla v_{h}\right) \cdot n \rrbracket_{S}\right|\right) \in \mathbb{R}
$$

by the Fenchel-Young identity (cf. [34, Prop. 5.1, p. 21]), it holds that

$$
\begin{equation*}
\llbracket \mathcal{A}_{h}\left(\cdot, \nabla v_{h}\right) \cdot n \rrbracket_{S} \lambda_{S, T}=\left(\varphi_{\left|\nabla v_{h}(T)\right|}\right)^{*}\left(\xi_{T},\left|\llbracket \mathcal{A}_{h}\left(\cdot, \nabla v_{h}\right) \cdot n \rrbracket_{S}\right|\right)+\varphi_{\left|\nabla v_{h}(T)\right|}\left(\xi_{T},\left|\lambda_{S, T}\right|\right) . \tag{3.12}
\end{equation*}
$$

Next, let $T^{\prime} \in \mathcal{T}_{h} \backslash\{T\}$ be such that $T^{\prime} \subseteq \omega_{S}$. Then, due to the convexity of $\left(\varphi_{\left|\nabla v_{h}(T)\right|}\right)^{*}\left(\xi_{T}, \cdot\right)$ and

[^1]$\Delta_{2}\left(\left(\varphi_{\left|\nabla v_{h}(T)\right|}\right)^{*}\left(\xi_{T}, \cdot\right)\right) \lesssim 2^{\max \left\{2,\left(p^{-}\right)^{\prime}\right\}}$, also using the shift change (2.16) and (2.13), we have that
\[

$$
\begin{align*}
\left(\varphi_{\left|\nabla v_{h}(T)\right|}\right)^{*}( & \left.\xi_{T},\left|\llbracket \mathcal{A}_{h}\left(\cdot, \nabla v_{h}\right) \cdot n \rrbracket_{S}\right|\right) \\
\gtrsim & \left(\varphi_{\left|\nabla v_{h}(T)\right|}\right)^{*}\left(\xi_{T},\left|\llbracket \mathcal{A}\left(\xi_{T}, \nabla v_{h}\right) \rrbracket_{S} \cdot n_{T}\right|\right) \\
& -\left(\varphi_{\left|\nabla v_{h}(T)\right|}\right)^{*}\left(\xi_{T},\left|\left(\mathcal{A}\left(\xi_{T}, \nabla v_{h}\left(T^{\prime}\right)\right)-\mathcal{A}\left(\xi_{T^{\prime}}, \nabla v_{h}\left(T^{\prime}\right)\right)\right) \cdot n_{T}\right|\right) \\
\gtrsim & \left(\varphi_{\left.\left|\nabla v_{h}(T)\right|\right)^{*}\left(\xi_{T},\left|\llbracket \mathcal{A}\left(\xi_{T}, \nabla v_{h}\right) \rrbracket_{S} \cdot n_{T}\right|\right)}\right. \\
& -c_{\varepsilon}\left(\varphi_{\left|\nabla v_{h}\left(T^{\prime}\right)\right|}\right)^{*}\left(\xi_{T},\left|\mathcal{A}\left(\xi_{T}, \nabla v_{h}\left(T^{\prime}\right)\right)-\mathcal{A}\left(\xi_{T^{\prime}}, \nabla v_{h}\left(T^{\prime}\right)\right)\right|\right)  \tag{3.13}\\
& -\varepsilon\left|F\left(\xi_{T}, \nabla v_{h}\left(T^{\prime}\right)\right)-F\left(\xi_{T}, \nabla v_{h}(T)\right)\right|^{2} \\
\gtrsim & \left(\varphi_{\left.\left|\nabla v_{h}(T)\right|\right)^{*}\left(\xi_{T},\left|\llbracket \mathcal{A}\left(\xi_{T}, \nabla v_{h}\right) \rrbracket \rrbracket_{S} \cdot n_{T}\right|\right)}\right. \\
& -c_{\varepsilon}\left|F^{*}\left(\xi_{T}, \mathcal{A}\left(\xi_{T}, \nabla v_{h}\left(T^{\prime}\right)\right)\right)-F^{*}\left(\xi_{T}, \mathcal{A}\left(\xi_{T^{\prime}}, \nabla v_{h}\left(T^{\prime}\right)\right)\right)\right|^{2} \\
& -\varepsilon\left|\llbracket F\left(\xi_{T}, \nabla v_{h}\right) \rrbracket_{S}\right|^{2}=: I_{h}^{1}-c_{\varepsilon} I_{h}^{2}-\varepsilon I_{h}^{3}
\end{align*}
$$
\]

Resorting to Lemma A.5(A.8), we deduce that

$$
\begin{equation*}
I_{h}^{2} \lesssim \omega_{p, \omega_{S}}\left(h_{S}\right)^{2}\left(1+\left|\nabla_{h} v_{h}\left(T^{\prime}\right)\right|^{p\left(\xi_{T^{\prime}}\right) s}\right) \tag{3.14}
\end{equation*}
$$

Using that $n_{T}= \pm \frac{\llbracket \nabla v_{h} \rrbracket_{S}}{\llbracket \llbracket v_{h} \rrbracket_{S} \mid}$ since $v_{h} \in \mathcal{S}_{D}^{1}\left(\mathcal{T}_{h}\right)(c f .[28$, p. 12] $)$, and (2.10), we find that

$$
\left|\llbracket \mathcal{A}\left(\xi_{T}, \nabla v_{h}\right) \rrbracket_{S} \cdot n_{T}\right| \sim \frac{\varphi_{\left|\nabla v_{h}(T)\right|}\left(\xi_{T},\left|\llbracket \nabla v_{h} \rrbracket_{S}\right|\right)}{\left|\llbracket \nabla v_{h} \rrbracket_{S}\right|} \sim \partial_{a}\left(\varphi_{\left|\nabla v_{h}(T)\right|}\right)\left(\xi_{T},\left|\llbracket \nabla v_{h} \rrbracket_{S}\right|\right)
$$

and, thus, using $\left(\varphi_{\left|\nabla v_{h}(T)\right|}\right)^{*}\left(\xi_{T}, \cdot\right) \circ \partial_{a}\left(\varphi_{\left|\nabla v_{h}(T)\right|}\right)\left(\xi_{T}, \cdot\right) \sim\left|F\left(\xi_{T}, \cdot\right)\right|^{2}(c f .[28,(2.6)])$, we get $I_{h}^{1} \sim I_{h}^{3}$. Therefore, for sufficiently small $\varepsilon>0$, resorting to Lemma A.5(A.6), we deduce that

$$
\begin{align*}
I_{h}^{1}-\varepsilon I_{h}^{3} & \gtrsim\left|\llbracket F_{h}\left(\cdot, \nabla v_{h}\right) \rrbracket_{S}\right|^{2}-\left|F\left(\xi_{T^{\prime}}, \nabla v_{h}\left(T^{\prime}\right)\right)-F\left(\xi_{T}, \nabla v_{h}\left(T^{\prime}\right)\right)\right|^{2}  \tag{3.15}\\
& \gtrsim\left|\llbracket F_{h}\left(\cdot, \nabla v_{h}\right) \rrbracket_{S}\right|^{2}-\omega_{p, \omega_{S}}\left(h_{S}\right)^{2}\left(1+\left|\nabla v_{h}\left(T^{\prime}\right)\right|^{p\left(\xi_{T^{\prime}}\right) s}\right)
\end{align*}
$$

Combining (3.14) and (3.15) in (3.13), we arrive at
$\left|\llbracket F_{h}\left(\cdot, \nabla v_{h}\right) \rrbracket_{S}\right|^{2} \lesssim\left(\varphi_{\left|\nabla v_{h}(T)\right|}\right)^{*}\left(\xi_{T},\left|\llbracket \mathcal{A}_{h}\left(\cdot, \nabla v_{h}\right) \cdot n \rrbracket \rrbracket_{S}\right|\right)+\omega_{p, \omega_{S}}\left(h_{S}\right)^{2}\left(1+\left|\nabla v_{h}\left(T^{\prime}\right)\right|^{p\left(\xi_{T^{\prime}}\right) s}\right)$.
For $\lambda=\frac{\left|\omega_{S}\right|}{|S|} \lambda_{S, T} \in \mathbb{R}(c f .(3.12))$ in (3.11), also using (3.16), we observe that

$$
\begin{align*}
h_{S}\left\|\llbracket F_{h}\left(\cdot, \nabla v_{h}\right) \rrbracket_{S}\right\|_{2, S}^{2}+ & \rho_{\left(\varphi_{h}\right)_{\left|\nabla v_{h}(T)\right|}, \omega_{S}}\left(\lambda_{S, T}\right)-\left\|\omega_{p, \omega_{S}}\left(h_{S}\right)^{2}\left(1+\left|\nabla v_{h}\right|^{p_{h}(\cdot) s}\right)\right\|_{1, \omega_{S}} \\
\lesssim & \left|\omega_{S}\right| \llbracket \mathcal{A}_{h}\left(\cdot, \nabla v_{h}\right) \cdot n \rrbracket \rrbracket_{S} \lambda_{S, T} \\
= & \frac{\left|\omega_{S}\right|}{|S|}\left(\mathcal{A}_{h}\left(\cdot, \nabla v_{h}\right)-\mathcal{A}_{h}(\cdot, \nabla u), \nabla\left(\lambda_{S, T} b_{S}\right)\right)_{\omega_{S}}  \tag{3.17}\\
& +\frac{\left|\omega_{S}\right|}{|S|}\left(\mathcal{A}_{h}(\cdot, \nabla u)-\mathcal{A}(\cdot, \nabla u), \nabla\left(\lambda_{S, T} b_{S}\right)\right)_{\omega_{S}} \\
& +\frac{\left|\omega_{S}\right|}{|S|}\left(f_{h}, \lambda_{S, T} b_{S}\right)_{\omega_{S}}+\frac{\left|\omega_{S}\right|}{|S|}\left(f-f_{h}, \lambda_{S, T} b_{S}\right)_{\omega_{S}} \\
= & I_{h}^{1}+I_{h}^{2}+I_{h}^{3}+I_{h}^{4}
\end{align*}
$$

Applying the $\varepsilon$-Young inequality (2.2) with $\psi=\varphi_{\left|\nabla v_{h}\left(T^{\prime}\right)\right|}\left(\xi_{T^{\prime}}, \cdot\right)$ together with (2.10) for all $T^{\prime} \in \mathcal{T}_{h}$ with $T^{\prime} \subseteq \omega_{S}$, and $\left|b_{S}\right|+h_{S}\left|\nabla b_{S}\right| \lesssim 1$ in $\omega_{S}$, we obtain

$$
\begin{align*}
& I_{h}^{1} \leq c_{\varepsilon}\left\|F_{h}\left(\cdot, \nabla v_{h}\right)-F_{h}(\cdot, \nabla u)\right\|_{2, \omega_{S}}^{2}+\varepsilon \rho_{\left(\varphi_{h}\right)_{\left|\nabla v_{h}\right|}, \omega_{S}}\left(\lambda_{S, T}\right) \\
& I_{h}^{3} \leq c_{\varepsilon} \rho_{\left(\left(\varphi_{h}\right)_{\left|\nabla v_{h}\right|}\right)^{*}, \omega_{S}}\left(h_{\mathcal{T}} f\right)+\varepsilon \rho_{\left(\varphi_{h}\right)_{\left|\nabla v_{h}\right|}, \omega_{S}}\left(\lambda_{S, T}\right)  \tag{3.18}\\
& I_{h}^{4} \leq c_{\varepsilon} \operatorname{osc}\left(f, v_{h}, \omega_{S}\right)+\varepsilon \rho_{\left(\varphi_{h}\right)_{\left|\nabla v_{h}\right|}, \omega_{S}}\left(\lambda_{S, T}\right)
\end{align*}
$$

Applying the $\varepsilon$-Young inequality (2.2) with $\psi=\varphi_{|\nabla u|}\left(\xi_{T^{\prime}}, \cdot\right)$ together with (2.13) for all $T^{\prime} \in \mathcal{T}_{h}$ with $T^{\prime} \subseteq \omega_{S},\left|b_{S}\right|+h_{S}\left|\nabla b_{S}\right| \lesssim 1$ in $\omega_{S}$, the shift change (2.15), and Lemma A.1(A.3), we obtain

$$
\begin{align*}
I_{h}^{2} & \leq c_{\varepsilon}\left\|F_{h}^{*}\left(\cdot, \mathcal{A}_{h}(\cdot, \nabla u)\right)-F_{h}^{*}(\cdot, \mathcal{A}(\cdot, \nabla u))\right\|_{2, \omega_{S}}^{2}+\varepsilon \rho_{\left(\varphi_{h}\right)_{|\nabla u|}, \omega_{S}}\left(\lambda_{S, T}\right)  \tag{3.19}\\
& \lesssim c_{\varepsilon}\left\|\omega_{p}\left(h_{\mathcal{T}}\right)^{2}\left(1+|\nabla u|^{p(\cdot) s}\right)\right\|_{1, \omega_{S}}+\varepsilon\left[\rho_{\left(\varphi_{h}\right)_{\left|\nabla v_{h}\right|, \omega_{S}}}\left(\lambda_{S, T}\right)+\left\|F_{h}\left(\cdot, \nabla v_{h}\right)-F_{h}(\cdot, \nabla u)\right\|_{2, \omega_{S}}^{2}\right] .
\end{align*}
$$

The shift change (2.15) on $T^{\prime} \in \mathcal{T}_{h} \backslash\{T\}$ with $T^{\prime} \subseteq \omega_{S}$ further yields that

$$
\begin{align*}
& \rho_{\left(\varphi_{h}\right)_{\left|\nabla v_{h}\right|, \omega_{S}}\left(\lambda_{T}^{S}\right)}^{\lesssim} \rho_{\left(\varphi_{h}\right)_{\left|\nabla v_{h}(T)\right|}, \omega_{S}}\left(\lambda_{T}^{S}\right)+h_{S}\left\|\llbracket F\left(\xi_{T^{\prime}}, \nabla v_{h}\right) \rrbracket_{S}\right\|_{2, S}^{2} \\
& \lesssim \rho_{\left(\varphi_{h}\right)_{\left|\nabla v_{h}(T)\right|,}, \omega_{S}}\left(\lambda_{T}^{S}\right)+h_{S}\left\|\llbracket F_{h}\left(\cdot, \nabla v_{h}\right) \rrbracket_{S}\right\|_{2, S}^{2}  \tag{3.20}\\
&+\left\|\omega_{p, \omega_{S}}\left(h_{S}\right)^{2}\left(1+\left|\nabla v_{h}\right|^{p_{h}(\cdot) s}\right)\right\|_{1, \omega_{S}} .
\end{align*}
$$

Combining (3.17)-(3.20), for sufficiently small $\varepsilon>0$, we conclude that (3.4) applies.

### 3.3 Patch-shift-to-element-shift inequality

The third tool is an estimate that enables to pass from element-patch-shifts to element-shifts. This is essential in the application of quasi-interpolation operators that are only element-to-patch stable, e.g., the node-averaging quasi-interpolation operator $\Pi_{h}^{a v}: \mathcal{S}_{D}^{1, c r}\left(\mathcal{T}_{h}\right) \rightarrow \mathcal{S}_{D}^{1}\left(\mathcal{T}_{h}\right)(c f$. (3.1)).
Lemma 3.21. Let $p \in C^{0}(\bar{\Omega})$ with $p^{-}>1$ and let $\delta \geq 0$. Then, there exists some $s>1$, which can chosen to be close to 1 if $h_{T}>0$ is close to 0 , such that for every $y_{h} \in L^{p_{h}(\cdot)}\left(\Omega ; \mathbb{R}^{d}\right)$, $v_{h} \in \mathcal{L}^{1}\left(\mathcal{T}_{h}\right)$, and $T \in \mathcal{T}_{h}$, it holds that

$$
\begin{aligned}
\rho_{\left(\varphi_{h}\right)_{\left|\nabla_{h} v_{h}(T)\right|}, \omega_{T}}\left(y_{h}\right) \lesssim & \rho_{\left(\varphi_{h}\right)_{\left|\nabla_{h} v_{h}\right|}, \omega_{T}}\left(y_{h}\right)+\left\|h_{\mathcal{S}}^{1 / 2} \llbracket F_{h}\left(\cdot, \nabla_{h} v_{h}\right) \rrbracket\right\|_{2, \mathcal{S}_{h}^{i}(T)}^{2} \\
& +\left\|\omega_{p, \omega_{T}}\left(h_{T}\right)^{2}\left(1+\left|\nabla_{h} v_{h}\right|^{p_{h}(\cdot) s}\right)\right\|_{1, T}
\end{aligned}
$$

where $\mathcal{S}_{h}^{i}(T):=\mathcal{S}_{h}(T) \cap \mathcal{S}_{h}^{i}$ and $\mathcal{S}_{h}(T):=\left\{S \in \mathcal{S}_{h} \mid S \cap T \neq \emptyset\right\}$.
Proof. Applying for every $T^{\prime} \in \mathcal{T}_{h}$ with $T^{\prime} \subseteq \omega_{T}$, the shift change (2.15), we arrive at

Since each $T^{\prime} \in \mathcal{T}_{h}$ with $T^{\prime} \subseteq \omega_{T}$ can be reached by passing through a uniformly bounded number (depending on $\omega_{0}>0$ ) of sides $S \in \mathcal{S}_{h}^{i}(T)$, for every $T^{\prime} \in \mathcal{T}_{h}$ with $T^{\prime} \subseteq \omega_{T}$, using (A.10), it holds that

$$
\begin{align*}
& \left|F\left(\xi_{T^{\prime}}, \nabla_{h} v_{h}(T)\right)-F\left(\xi_{T^{\prime}}, \nabla_{h} v_{h}\left(T^{\prime}\right)\right)\right|^{2} \\
& \quad \lesssim\left|F\left(\xi_{T}, \nabla_{h} v_{h}(T)\right)-F\left(\xi_{T^{\prime}}, \nabla_{h} v_{h}\left(T^{\prime}\right)\right)\right|^{2}+\left|F\left(\xi_{T^{\prime}}, \nabla_{h} v_{h}(T)\right)-F\left(\xi_{T}, \nabla_{h} v_{h}(T)\right)\right|^{2}  \tag{3.23}\\
& \quad \lesssim|T|^{-1}\left\|h_{\mathcal{S}}^{1 / 2} \llbracket F_{h}\left(\cdot, \nabla_{h} v_{h}\right) \rrbracket_{S}\right\|_{2, \mathcal{S}_{h}^{i}(T)}^{2}+|T|^{-1}\left\|\omega_{p, \omega_{T}}\left(h_{T}\right)^{2}\left(1+\left|\nabla_{h} v_{h}\right|^{p_{h}(\cdot) s}\right)\right\|_{1, T}
\end{align*}
$$

Eventually, multiplying (3.23) by $\left|T^{\prime}\right|$ for all $T^{\prime} \in \mathcal{T}_{h}$ with $T^{\prime} \subseteq \omega_{T}$, due to $\left|T^{\prime}\right| \sim|T|$, we arrive at the claimed estimate.
Proof (of Theorem 3.1). Abbreviating $e_{h}:=v_{h}-u_{h}^{c r} \in \mathcal{S}_{D}^{1, c r}\left(\mathcal{T}_{h}\right)$ and resorting to (2.23) and (2.34) as well as that $f-f_{h} \perp \Pi_{h} e_{h}$ in $L^{2}(\Omega)$, we arrive at

$$
\begin{align*}
\left(\mathcal{A}_{h}\left(\cdot, \nabla v_{h}\right)-\mathcal{A}_{h}\left(\cdot, \nabla_{h} u_{h}^{c r}\right), \nabla_{h} e_{h}\right)_{\Omega}= & \left(\mathcal{A}_{h}\left(\cdot, \nabla v_{h}\right), \nabla_{h}\left(e_{h}-\Pi_{h}^{a v} e_{h}\right)\right)_{\Omega} \\
& +\left(f, \Pi_{h}^{a v} e_{h}-e_{h}\right)_{\Omega} \\
& +\left(\mathcal{A}_{h}\left(\cdot, \nabla v_{h}\right)-\mathcal{A}_{h}(\cdot, \nabla u), \nabla \Pi_{h}^{a v} e_{h}\right)_{\Omega}  \tag{3.24}\\
& +\left(f-f_{h}, e_{h}-\Pi_{h} e_{h}\right)_{\Omega} \\
= & I_{h}^{1}+I_{h}^{2}+I_{h}^{3}+I_{h}^{4}
\end{align*}
$$

ad $I_{h}^{1}$. An element-wise integration-by-parts, $\llbracket \mathcal{A}_{h}\left(\cdot, \nabla v_{h}\right) \cdot n\left(e_{h}-\Pi_{h}^{a v} e_{h}\right) \rrbracket_{S}=\llbracket \mathcal{A}_{h}\left(\cdot, \nabla v_{h}\right) \cdot n \rrbracket_{S}$ $\left\{e_{h}-\Pi_{h}^{a v} e_{h}\right\}_{S}+\left\{\mathcal{A}_{h}\left(\cdot, \nabla v_{h}\right) \cdot n\right\}_{S} \llbracket e_{h}-\Pi_{h}^{a v} e_{h} \rrbracket_{S}$ on $S, \int_{S} \llbracket e_{h}-\Pi_{h}^{a v} e_{h} \rrbracket_{S} \mathrm{~d} s=0$ and $\left\{\mathcal{A}_{h}\left(\cdot, \nabla v_{h}\right) \cdot n\right\}_{S}$ $=$ const on $S$ for all $S \in \mathcal{S}_{h}^{i}$, the discrete trace inequality [36, Lem. 12.8], and (3.1) with $\psi=|\cdot|$ and $a=0$ yield

$$
\begin{align*}
I_{h}^{1} & =\sum_{S \in \mathcal{S}_{h}^{i}} \llbracket \mathcal{A}_{h}\left(\cdot, \nabla v_{h}\right) \cdot n \rrbracket_{S} \int_{S}\left\{e_{h}-\Pi_{h}^{a v} e_{h}\right\}_{S} \mathrm{~d} s \\
& \lesssim \sum_{S \in \mathcal{S}_{h}^{i}} \sum_{T \in \mathcal{T}_{h} ; T \subseteq \omega_{S}} \int_{\omega_{T}}\left|\llbracket \mathcal{A}_{h}\left(\cdot, \nabla v_{h}\right) \cdot n \rrbracket \rrbracket_{S}\right|\left|\nabla_{h} e_{h}\right| \mathrm{d} x \tag{3.25}
\end{align*}
$$

Next, let $T^{\prime} \in \mathcal{T}_{h} \backslash\{T\}$ with $T^{\prime} \subseteq \omega_{S}$. Then, resorting to the convexity of $\left(\varphi_{\left|\nabla v_{h}(T)\right|}\right)^{*}\left(\xi_{T}, \cdot\right)$ and $\Delta_{2}\left(\left(\varphi_{\left|\nabla v_{h}(T)\right|}\right)^{*}\left(\xi_{T}, \cdot\right)\right) \lesssim 2^{\max \left\{2,\left(p^{-}\right)^{\prime}\right\}}$, also using the shift change (2.16) and (2.13), we have that

$$
\begin{align*}
\left(\varphi_{\left|\nabla v_{h}(T)\right|}\right)^{*}( & \left.\xi_{T},\left|\llbracket \mathcal{A}_{h}\left(\cdot, \nabla v_{h}\right) \cdot n \rrbracket_{S}\right|\right) \\
\lesssim & \left(\varphi_{\left|\nabla v_{h}(T)\right|}\right)^{*}\left(\xi_{T},\left|\llbracket \mathcal{A}\left(\xi_{T}, \nabla v_{h}\right) \cdot n_{T} \rrbracket \rrbracket_{S}\right|\right) \\
& +\left(\varphi_{\left.\left|\nabla v_{h}(T)\right|\right)^{*}\left(\xi_{T},\left|\left(\mathcal{A}\left(\xi_{T}, \nabla v_{h}\left(T^{\prime}\right)\right)-\mathcal{A}\left(\xi_{T^{\prime}}, \nabla v_{h}\left(T^{\prime}\right)\right)\right) \cdot n_{T}\right|\right)}^{\lesssim}\left(\varphi_{\left|\nabla v_{h}(T)\right|}\right)^{*}\left(\xi_{T},\left|\llbracket \mathcal{A}\left(\xi_{T}, \nabla v_{h}\right) \cdot n_{T} \rrbracket_{S}\right|\right)\right. \\
& +\left|F\left(\xi_{T}, \nabla v_{h}\left(T^{\prime}\right)\right)-F\left(\xi_{T}, \nabla v_{h}(T)\right)\right|^{2} \\
& +\left|F^{*}\left(\xi_{T}, \mathcal{A}\left(\xi_{T}, \nabla v_{h}\left(T^{\prime}\right)\right)\right)-F^{*}\left(\xi_{T}, \mathcal{A}\left(\xi_{T^{\prime}}, \nabla v_{h}\left(T^{\prime}\right)\right)\right)\right|^{2} \\
\lesssim & \left|\llbracket F\left(\xi_{T}, \nabla v_{h}\right) \rrbracket_{S}\right|^{2}+\omega_{p, \omega_{S}}\left(h_{S}\right)^{2}\left(1+\left|\nabla v_{h}\left(T^{\prime}\right)\right|^{p\left(\xi_{T^{\prime}}\right) s}\right)  \tag{3.26}\\
\lesssim & \left|\llbracket F_{h}\left(\cdot, \nabla v_{h}\right) \rrbracket_{S}\right|^{2}+\left|F\left(\xi_{T^{\prime}}, \nabla v_{h}\left(T^{\prime}\right)\right)-F\left(\xi_{T}, \nabla v_{h}\left(T^{\prime}\right)\right)\right|^{2} \\
& +\omega_{p, \omega_{S}}\left(h_{S}\right)^{2}\left(1+\left|\nabla v_{h}\left(T^{\prime}\right)\right|^{p\left(\xi_{T^{\prime}}\right) s}\right) \\
\lesssim & \left|\llbracket F_{h}\left(\cdot, \nabla v_{h}\right) \rrbracket_{S}\right|^{2}+\omega_{p, \omega_{S}}^{2}\left(1+\left|\nabla v_{h}\left(T^{\prime}\right)\right|^{p\left(\xi_{T^{\prime}}\right) s}\right)
\end{align*}
$$

Applying for every $T^{\prime} \in \mathcal{T}_{h}$ with $T^{\prime} \subseteq \omega_{T}$, the $\varepsilon$-Young inequality $(2.2)$ with $\psi=\varphi_{\left|\nabla v_{h}(T)\right|}\left(\xi_{T^{\prime}}, \cdot\right)$, (3.26), and the finite overlapping of the element patches $\omega_{T}, T \in \mathcal{T}_{h}$, in (3.25), for every $\varepsilon>0$, we conclude that

$$
\begin{align*}
I_{h}^{1} \lesssim & c_{\varepsilon} \sum_{S \in \mathcal{S}_{h}^{i}} \sum_{T \in \mathcal{T}_{h} ; T \subseteq \omega_{S}} \int_{\omega_{T}}\left(\left(\varphi_{h}\right)_{\left|\nabla v_{h}(T)\right|}\right)^{*}\left(\cdot,\left|\llbracket \mathcal{A}_{h}\left(\cdot, \nabla v_{h}\right) \cdot n \rrbracket \rrbracket_{S}\right|\right) \mathrm{d} x \\
& +\varepsilon \sum_{S \in \mathcal{S}_{h}^{i}} \sum_{T \in \mathcal{T}_{h} ; T \subseteq \omega_{S}} \int_{\omega_{T}}\left(\varphi_{h}\right)_{\left|\nabla v_{h}(T)\right|}\left(\cdot,\left|\nabla_{h} e_{h}\right|\right) \mathrm{d} x  \tag{3.27}\\
\lesssim & c_{\varepsilon}\left[\left\|h_{\mathcal{S}}^{1 / 2} \llbracket F_{h}\left(\cdot, \nabla v_{h}\right) \rrbracket\right\|_{2, \mathcal{S}_{h}^{i}}^{2}+\left\|\omega_{p}(h \mathcal{T})^{2}\left(1+\left|\nabla_{h} v_{h}\right|^{p_{h}(\cdot) s}\right)\right\|_{1, \Omega}\right] \\
& +\varepsilon \sum_{T \in \mathcal{T}_{h}} \rho_{\left(\varphi_{h}\right)_{\left|\nabla v_{h}(T)\right|, \omega_{T}}\left(\nabla_{h} e_{h}\right) .}
\end{align*}
$$

Appealing to Lemma 3.21 with $y_{h}=\nabla_{h} e_{h} \in L^{p_{h}(\cdot)}\left(\Omega ; \mathbb{R}^{d}\right)$, we have that

$$
\begin{align*}
\sum_{T \in \mathcal{T}_{h}} \rho_{\left(\varphi_{h}\right)_{\left|\nabla v_{h}(T)\right|}, \omega_{T}}\left(\nabla_{h} e_{h}\right) \lesssim & \rho_{\left(\varphi_{h}\right)_{\left|\nabla v_{h}\right|, \Omega}\left(\nabla_{h} e_{h}\right)+\left\|h_{\mathcal{S}}^{1 / 2} \llbracket F_{h}\left(\cdot, \nabla v_{h}\right) \rrbracket\right\|_{2, \mathcal{S}_{h}^{i}}^{2}}+\left\|\omega_{p}\left(h_{\mathcal{T}}\right)^{2}\left(1+\left|\nabla v_{h}\right|^{p_{h}(\cdot) s}\right)\right\|_{1, \Omega} \tag{3.28}
\end{align*}
$$

Thus, resorting in (3.27) to (3.4) and (2.10), we deduce that

$$
\begin{align*}
I_{h}^{1} \lesssim & c_{\varepsilon}\left[\left\|F_{h}\left(\cdot, \nabla v_{h}\right)-F_{h}(\cdot, \nabla u)\right\|_{2, \Omega}^{2}\right] \\
& \left.+\left\|\omega_{p}\left(h_{\mathcal{T}}\right)^{2}\left(1+|\nabla u|^{p(\cdot) s}+\left|\nabla v_{h}\right|^{p_{h}(\cdot) s}\right)\right\|_{1, \Omega}+\operatorname{osc}_{h}^{2}\left(f, v_{h}\right)\right]  \tag{3.29}\\
& +\varepsilon\left\|F_{h}\left(\cdot, \nabla v_{h}\right)-F_{h}\left(\cdot, \nabla_{h} u_{h}^{c r}\right)\right\|_{2, \Omega}^{2}
\end{align*}
$$

ad $I_{h}^{2}$. Applying for every $T \in \mathcal{T}_{h}$ the $\varepsilon$-Young inequality $(2.2)$ with $\psi=\varphi_{\left|\nabla v_{h}(T)\right|}\left(\xi_{T}, \cdot\right)$, for every $\varepsilon>0$, we obtain

$$
\begin{equation*}
I_{h}^{2} \leq c_{\varepsilon} \rho_{\left(\left(\varphi_{h}\right)_{\left|\nabla v_{h}\right|}\right)^{*}, \Omega}\left(h_{\mathcal{T}} f\right)+\varepsilon \rho_{\left(\varphi_{h}\right)_{\left|\nabla v_{h}\right|}, \Omega}\left(h_{\mathcal{T}}^{-1}\left(e_{h}-\Pi_{h}^{a v} e_{h}\right)\right) \tag{3.30}
\end{equation*}
$$

Then, using for every $T \in \mathcal{T}_{h}$ the Orlicz-approximation property of $\Pi_{h}^{a v}: \mathcal{S}_{D}^{1, c r}\left(\mathcal{T}_{h}\right) \rightarrow \mathcal{S}_{D}^{1}\left(\mathcal{T}_{h}\right)(c f$. (3.1) with $\psi=\varphi_{h}\left(\xi_{T}, \cdot\right)$ and $\left.a=\left|\nabla v_{h}(T)\right|\right)$, we find that

$$
\begin{align*}
\rho_{\left(\varphi_{h}\right)_{\left|\nabla v_{h}\right|, \Omega}}\left(h_{\mathcal{T}}^{-1}\left(e_{h}-\Pi_{h}^{a v} e_{h}\right)\right) \lesssim & \sum_{T \in \mathcal{T}_{h}} \rho_{\left(\varphi_{h}\right)_{\left|\nabla v_{h}(T)\right|, \omega_{T}}\left(\nabla_{h} e_{h}\right)}  \tag{3.31}\\
& +\left\|\omega_{p}\left(h_{\mathcal{T}}\right)^{2}\left(1+\left|\nabla v_{h}\right|^{p_{h}(\cdot) s}+\left|\nabla_{h} e_{h}\right|^{p_{h}(\cdot) s}\right)\right\|_{1, \Omega}
\end{align*}
$$

Thus, using (3.31) and (3.28) in conjunction with (3.3) and (3.4) in (3.30), we arrive at

$$
\begin{align*}
I_{h}^{2} \lesssim & c_{\varepsilon}\left[\left\|F_{h}\left(\cdot, \nabla v_{h}\right)-F_{h}(\cdot, \nabla u)\right\|_{2, \Omega}^{2}\right. \\
& \left.\quad+\left\|\omega_{p}\left(h_{\mathcal{T}}\right)^{2}\left(1+|\nabla u|^{p(\cdot) s}+\left|\nabla v_{h}\right|^{p_{h}(\cdot) s}+\left|\nabla_{h} e_{h}\right|^{p_{h}(\cdot) s}\right)\right\|_{1, \Omega}+\operatorname{osc}_{h}^{2}\left(f, v_{h}\right)\right]  \tag{3.32}\\
& +\varepsilon\left\|F_{h}\left(\cdot, \nabla v_{h}\right)-F_{h}\left(\cdot, \nabla_{h} u_{h}^{c r}\right)\right\|_{2, \Omega}^{2}
\end{align*}
$$

ad $I_{h}^{3}$. Applying for every $T \in \mathcal{T}_{h}$ the $\varepsilon$-Young inequality (2.2) with $\psi=\varphi_{\left|\nabla v_{h}(T)\right|}\left(\xi_{T}, \cdot\right)$ together with (2.10), for every $\varepsilon>0$, we obtain

$$
\begin{equation*}
I_{h}^{3} \leq c_{\varepsilon}\left\|F_{h}\left(\cdot, \nabla v_{h}\right)-F_{h}(\cdot, \nabla u)\right\|_{2, \Omega}^{2}+\varepsilon \rho_{\left(\varphi_{h}\right)_{\left|\nabla v_{h}\right|, \Omega}}\left(\nabla \Pi_{h}^{a v} e_{h}\right) \tag{3.33}
\end{equation*}
$$

Then, using for every $T \in \mathcal{T}_{h}$ the Orlicz-stability property of $\Pi_{h}^{a v}: \mathcal{S}_{D}^{1, c r}\left(\mathcal{T}_{h}\right) \rightarrow \mathcal{S}_{D}^{1}\left(\mathcal{T}_{h}\right)(c f .(3.1)$ with $\psi=\varphi\left(\xi_{T}, \cdot\right)$ and $\left.a=\left|\nabla v_{h}(T)\right|\right)$, we find that

$$
\begin{align*}
\rho_{\left(\varphi_{h}\right)_{\left|\nabla v_{h}\right|, \Omega}}\left(\nabla \Pi_{h}^{a v} e_{h}\right) \lesssim & \sum_{T \in \mathcal{T}_{h}} \rho_{\left(\varphi_{h}\right)_{\left|\nabla v_{h}(T)\right|}, \omega_{T}}\left(\nabla_{h} e_{h}\right)  \tag{3.34}\\
& +\left\|\omega_{p}\left(h_{\mathcal{T}}\right)^{2}\left(1+\left|\nabla v_{h}\right|^{p_{h}(\cdot) s}+\left|\nabla_{h} e_{h}\right|^{p_{h}(\cdot) s}\right)\right\|_{1, \Omega}
\end{align*}
$$

Thus, using (3.34) and (3.28) in conjunction with (3.4) in (3.33), we arrive at

$$
\begin{align*}
I_{h}^{3} \lesssim c_{\varepsilon} & {\left[\left\|F_{h}\left(\cdot, \nabla v_{h}\right)-F_{h}(\cdot, \nabla u)\right\|_{2, \Omega}^{2}\right.} \\
& \left.+\left\|\omega_{p}\left(h_{\mathcal{T}}\right)^{2}\left(1+\left|\nabla v_{h}\right|^{p_{h}(\cdot) s}+\left|\nabla_{h} e_{h}\right|^{p_{h}(\cdot) s}\right)\right\|_{1, \Omega}+\operatorname{osc}_{h}^{2}\left(f, v_{h}\right)\right]  \tag{3.35}\\
+ & \varepsilon\left\|F_{h}\left(\cdot, \nabla v_{h}\right)-F_{h}\left(\cdot, \nabla_{h} u_{h}^{c r}\right)\right\|_{2, \Omega}^{2}
\end{align*}
$$

ad $I_{h}^{4}$. Applying for every $T \in \mathcal{T}_{h}$ the $\varepsilon$-Young inequality (2.2) with $\psi=\varphi_{\left|\nabla v_{h}\right|}$, for every $\varepsilon>0$, we obtain

$$
\begin{equation*}
I_{h}^{4} \leq c_{\varepsilon} \operatorname{osc}_{h}^{2}\left(f, v_{h}\right)+\varepsilon \rho_{\varphi_{\left|\nabla v_{h}\right|, \Omega}}\left(h_{\mathcal{T}}^{-1}\left(e_{h}-\Pi_{h}^{a v} e_{h}\right)\right) \tag{3.36}
\end{equation*}
$$

Thus, using (3.31) and (3.28) in conjunction with (3.4) in (3.36), we arrive at

$$
\begin{align*}
I_{h}^{4} \lesssim c_{\varepsilon} & {\left[\left\|F_{h}\left(\cdot, \nabla v_{h}\right)-F_{h}(\cdot, \nabla u)\right\|_{2, \Omega}^{2}\right.} \\
& \left.+\left\|\omega_{p}(h \mathcal{T})^{2}\left(1+\left|\nabla v_{h}\right|^{p_{h}(\cdot) s}+\left|\nabla_{h} e_{h}\right|^{p_{h}(\cdot) s}\right)\right\|_{1, \Omega}+\operatorname{osc}_{h}^{2}\left(f, v_{h}\right)\right]  \tag{3.37}\\
& +\varepsilon\left\|F_{h}\left(\cdot, \nabla v_{h}\right)-F_{h}\left(\cdot, \nabla_{h} u_{h}^{c r}\right)\right\|_{2, \Omega}^{2}
\end{align*}
$$

Then, combining (2.10), (3.29), (3.32), (3.35), and (3.37) in (3.24), for every $\varepsilon>0$, we arrive at

$$
\begin{aligned}
& \left\|F_{h}\left(\cdot, \nabla v_{h}\right)-F_{h}\left(\cdot, \nabla_{h} u_{h}^{c r}\right)\right\|_{2, \Omega}^{2} \lesssim c_{\varepsilon}\left[\left\|F_{h}\left(\cdot, \nabla v_{h}\right)-F_{h}(\cdot, \nabla u)\right\|_{2, \Omega}^{2}+\operatorname{osc}_{h}^{2}\left(f, v_{h}\right)\right. \\
& \left.+\left\|\omega_{p}\left(h_{\mathcal{T}}\right)^{2}\left(1+|\nabla u|^{p(\cdot) s}+\left(\left|\nabla v_{h}\right|+\left|\nabla_{h} e_{h}\right|\right)^{p_{h}(\cdot) s}\right)\right\|_{1, \Omega}\right] \\
& +\varepsilon\left\|F_{h}\left(\cdot, \nabla v_{h}\right)-F_{h}\left(\cdot, \nabla_{h} u_{h}^{c r}\right)\right\|_{2, \Omega}^{2} .
\end{aligned}
$$

Next, choosing $\varepsilon>0$ sufficiently small, for every $v_{h} \in \mathcal{S}_{D}^{1, c r}\left(\mathcal{T}_{h}\right)$, we obtain

$$
\begin{align*}
\left\|F_{h}\left(\cdot, \nabla v_{h}\right)-F_{h}\left(\cdot, \nabla_{h} u_{h}^{c r}\right)\right\|_{2, \Omega}^{2} \lesssim & \left\|F_{h}\left(\cdot, \nabla v_{h}\right)-F_{h}(\cdot, \nabla u)\right\|_{2, \Omega}^{2}+\operatorname{osc}_{h}^{2}\left(f, v_{h}\right) \\
& +\left\|\omega_{p}\left(h_{\mathcal{T}}\right)^{2}\left(1+|\nabla u|^{p(\cdot) s}+\left(\left|\nabla v_{h}\right|+\left|\nabla_{h} e_{h}\right|\right)^{p_{h}(\cdot) s}\right)\right\|_{1, \Omega} \tag{3.38}
\end{align*}
$$

From (3.38), in turn, we deduce that

$$
\begin{align*}
\left\|F_{h}\left(\cdot, \nabla_{h} u_{h}^{c r}\right)-F_{h}(\cdot, \nabla u)\right\|_{2, \Omega}^{2} \lesssim & \left\|F_{h}\left(\cdot, \nabla v_{h}\right)-F_{h}\left(\cdot, \nabla_{h} u_{h}^{c r}\right)\right\|_{2, \Omega}^{2} \\
& +\left\|F_{h}\left(\cdot, \nabla v_{h}\right)-F_{h}(\cdot, \nabla u)\right\|_{2, \Omega}^{2}  \tag{3.39}\\
\lesssim & \left\|F_{h}\left(\cdot, \nabla v_{h}\right)-F_{h}(\cdot, \nabla u)\right\|_{2, \Omega}^{2}+\operatorname{osc}_{h}^{2}\left(f, v_{h}\right) \\
& +\left\|\omega_{p}\left(h_{\mathcal{T}}\right)^{2}\left(1+|\nabla u|^{p(\cdot) s}+\left(\left|\nabla v_{h}\right|+\left|\nabla_{h} e_{h}\right|\right)^{p_{h}(\cdot) s}\right)\right\|_{1, \Omega}
\end{align*}
$$

Taking in (3.39) the infimum with respect to $v_{h} \in \mathcal{S}_{D}^{1}\left(\mathcal{T}_{h}\right)$, we conclude the claimed estimate.
Adding oscillation terms on the right-hand side measuring the regularity of $F(\cdot, \nabla u) \in L^{p(\cdot)}\left(\Omega ; \mathbb{R}^{d}\right)$, it is possible to extend the best-approximation result in Theorem 3.2 to $\mathcal{S}_{D}^{1, c r}\left(\mathcal{T}_{h}\right)$.

Theorem 3.2. Let $p \in C^{0}(\bar{\Omega})$ with $p^{-}>1$ and $\delta \geq 0$ and let $f \in L^{p^{\prime}(\cdot)}(\Omega) \cap \bigcap_{h \in\left(0, h_{0}\right]} L^{p_{h}^{\prime} \cdot(\cdot)}(\Omega)$ for some $h_{0}>0$. Then, there exists some $s>1$, which can chosen to be close to 1 if $h>0$ is close to 0 , such that if $u \in W_{D}^{1, p(\cdot) s}(\Omega)$, then for every $h \in\left(0, h_{0}\right]$, it holds that

$$
\begin{aligned}
\left\|F_{h}\left(\cdot, \nabla_{h} u_{h}^{c r}\right)-F_{h}(\cdot, \nabla u)\right\|_{2, \Omega}^{2} & \lesssim \inf _{v_{h} \in \mathcal{S}_{D}^{1, c r}}\left(\mathcal{T}_{h}\right) \\
& +\sum_{T \in \mathcal{T}_{h}}\left\|F F(\cdot, \nabla u)-\langle F(\cdot, \nabla u)\rangle_{\omega_{T}}\right\|_{2, \omega_{T}}^{2} \\
& \left.+\left\|\omega_{p}\left(h_{\mathcal{T}}\right)^{2}\left(1+|\nabla u|^{p(\cdot) s}+\left(\left|\nabla_{h} v_{h}\right|+\left|\nabla_{h} v_{h}-\nabla_{h} u_{h}^{c r}\right|\right)^{p_{h}(\cdot) s}\right)\right\|_{1, \Omega}\right]
\end{aligned}
$$

where the hidden constant also depends on $s>1$ and the chunkiness $\omega_{0}>0$.
Proof. Using Theorem 3.2, for every $v_{h} \in \mathcal{S}_{D}^{1, c r}\left(\mathcal{T}_{h}\right)$, we find that

$$
\begin{align*}
\left\|F_{h}\left(\cdot, \nabla_{h} u_{h}^{c r}\right)-F_{h}(\cdot, \nabla u)\right\|_{2, \Omega}^{2} \lesssim & \left\|F_{h}\left(\cdot, \nabla \Pi_{h}^{a v} v_{h}\right)-F_{h}(\cdot, \nabla u)\right\|_{2, \Omega}^{2}+\operatorname{osc}_{h}^{2}\left(f, \Pi_{h}^{a v} v_{h}\right) \\
& +\left\|\omega_{p}\left(h_{\mathcal{T}}\right)^{2}\left(1+|\nabla u|^{p(\cdot) s}\right)\right\|_{1, \Omega} \\
& \left.+\| \omega_{p}\left(h_{\mathcal{T}}\right)^{2}\left(\left|\nabla_{h} \Pi_{h}^{a v} v_{h}\right|+\left|\nabla_{h} \Pi_{h}^{a v} v_{h}-\nabla_{h} u_{h}^{c r}\right|\right)^{p_{h}(\cdot) s}\right) \|_{1, \Omega}  \tag{3.40}\\
= & I_{h}^{1}+I_{h}^{2}+I_{h}^{3}+I_{h}^{4},
\end{align*}
$$

so it is left to estimate $I_{h}^{1}, I_{h}^{2}$, and $I_{h}^{4}$ :
ad $I_{h}^{1}$. Using [39, Lem. 3.8] and Lemma A.1(A.2) (or Lemma A.5(A.6)), for every $T \in \mathcal{T}_{h}$, we find that

$$
\begin{align*}
\left\|F_{h}\left(\cdot, \nabla_{h} v_{h}\right)-F_{h}\left(\cdot, \nabla \Pi_{h}^{a v} v_{h}\right)\right\|_{2, T}^{2} \lesssim & \left\|F\left(\xi_{T}, \nabla_{h} v_{h}\right)-F\left(\xi_{T}, \nabla u\right)\right\|_{2, \omega_{T}}^{2} \\
& +\left\|h_{\mathcal{S}}^{1 / 2} \llbracket F\left(\xi_{T}, \nabla_{h} v_{h}\right) \rrbracket\right\|_{2, \mathcal{S}_{h}^{i}(T)}^{2} \\
\lesssim & \left\|F_{h}\left(\cdot, \nabla_{h} v_{h}\right)-F_{h}(\cdot, \nabla u)\right\|_{2, \omega_{T}}^{2}  \tag{3.41}\\
& +\left\|h_{\mathcal{S}}^{1 / 2} \llbracket F_{h}\left(\cdot, \nabla_{h} v_{h}\right)-\langle F(\cdot, \nabla u)\rangle_{\omega_{T}}\right\|_{2, \mathcal{S}_{h}(T)}^{2} \\
& +\left\|\omega_{p, \omega_{T}}\left(h_{\mathcal{T}}\right)^{2}\left(1+|\nabla u|^{p(\cdot) s}+\left|\nabla_{h} v_{h}\right|^{p_{h}(\cdot) s}\right)\right\|_{1, \omega_{T}},
\end{align*}
$$

where, due to the discrete trace inequality ( $c f .[36$, Lem. 12.8]), it holds that

$$
\begin{align*}
\left\|F_{h}\left(\cdot, \nabla_{h} v_{h}\right)-\langle F(\cdot, \nabla u)\rangle_{\omega_{T}}\right\|_{2, S_{h}^{i}(T)}^{2} \lesssim & \left\|F_{h}\left(\cdot, \nabla_{h} v_{h}\right)-\langle F(\cdot, \nabla u)\rangle_{\omega_{T}}\right\|_{2, \omega_{T}}^{2} \\
\lesssim & \left\|F_{h}\left(\cdot, \nabla_{h} v_{h}\right)-F(\cdot, \nabla u)\right\|_{2, \omega_{T}}^{2}  \tag{3.42}\\
& +\left\|F(\cdot, \nabla u)-\langle F(\cdot, \nabla u)\rangle_{\omega_{T}}\right\|_{2, \omega_{T}}^{2} .
\end{align*}
$$

Therefore, using (3.42) in (3.41) and subsequent summation with respect to $T \in \mathcal{T}_{h}$ yield that

$$
\begin{align*}
I_{h}^{1} \lesssim & \left\|F_{h}\left(\cdot, \nabla_{h} v_{h}\right)-F_{h}(\cdot, \nabla u)\right\|_{2, \Omega}^{2}+\sum_{T \in \mathcal{T}_{h}}\left\|F(\cdot, \nabla u)-\langle F(\cdot, \nabla u)\rangle_{\omega_{T}}\right\|_{2, \omega_{T}}^{2}  \tag{3.43}\\
& +\left\|\omega_{p}\left(h_{\mathcal{T}}\right)^{2}\left(1+|\nabla u|^{p(\cdot) s}+\left|\nabla_{h} v_{h}\right|^{p_{h}(\cdot) s}\right)\right\|_{1, \Omega} .
\end{align*}
$$

ad $I_{h}^{2}$. Using the shift-change (2.16), we find that

$$
\begin{equation*}
I_{h}^{2} \lesssim \operatorname{osc}_{h}^{2}\left(f, v_{h}\right)+\left\|F_{h}\left(\cdot, \nabla_{h} v_{h}\right)-F_{h}(\cdot, \nabla u)\right\|_{2, \Omega}^{2} . \tag{3.44}
\end{equation*}
$$

ad $I_{h}^{4}$. Using stability properties of $\Pi_{h}^{a v}: \mathcal{S}_{D}^{1, c r}\left(\mathcal{T}_{h}\right) \rightarrow \mathcal{S}_{D}^{1}\left(\mathcal{T}_{h}\right)\left(c f .(3.1)\right.$ with $\psi=\left.|\cdot|\right|^{p^{\prime}\left(\xi_{T}\right) s}$ and $a=0$ ) and Lemma A.1(A.2) (or Lemma A.5(A.6)), for every $T \in \mathcal{T}_{h}$, we find that

$$
\begin{equation*}
\rho_{p^{\prime}\left(\xi_{T}\right) s, T}\left(\nabla_{h} \Pi_{h}^{a v} v_{h}\right) \lesssim \rho_{p_{h}^{\prime}(\cdot) s, \omega_{T}}\left(\nabla_{h} v_{h}\right)+\left\|\omega_{p, \omega_{T}}\left(h_{\mathcal{T}}\right)^{2}\left(1+\left|\nabla_{h} v_{h}\right|^{p_{h}^{\prime}(\cdot) s}\right)\right\|_{1, \omega_{T}} . \tag{3.45}
\end{equation*}
$$

Therefore, summation of (3.45) with respect to $T \in \mathcal{T}_{h}$ yields that

$$
\begin{equation*}
I_{h}^{4} \lesssim\left\|\omega_{p, \omega_{T}}\left(h_{\mathcal{T}}\right)^{2}\left(1+\left|\nabla_{h} v_{h}\right|^{p_{h}^{\prime}(\cdot) s}\right)\right\|_{1, \omega_{T}} \tag{3.46}
\end{equation*}
$$

Combining (3.41), (3.44), and (3.46) in (3.40), we arrive at the claimed best-approximation result.

## 4. A priori ERROR ANALYSIS

In this section, we establish a priori error estimates for the $S_{D}^{1, c r}\left(\mathcal{T}_{h}\right)$-approximation (2.34) of the $p(\cdot)$-Dirichlet problem (2.23). To this end, we resort to the medius error analysis of Section 3, which allows us to tranfer the approximation rate capabilities of the $S_{D}^{1}\left(\mathcal{T}_{h}\right)$-approximation (2.32) ( $c f$. Theorem 2.2) to the $S_{D}^{1, c r}\left(\mathcal{T}_{h}\right)$-approximation (2.34).

Theorem 4.1. Let $p \in C^{0, \alpha}(\bar{\Omega})$ with $\alpha \in(0,1]$ and $p^{-}>1$ and let $\delta \geq 0$. Moreover, let $F(\cdot, \nabla u) \in$ $W^{1,2}\left(\Omega ; \mathbb{R}^{d}\right),\left(\delta^{p(\cdot)-1}+|z|\right)^{p^{\prime}(\cdot)-2}|f|^{2} \in L^{1}(\{p>2\})$, and $f \in L^{\left(p^{-}\right)^{\prime}}(\Omega)$ or $\Gamma_{D}=\partial \Omega$. Then, assuming that $h_{\max } \sim h_{\mathcal{T}}$, there exists some $s>1$, which can chosen to be close to 1 if $h_{\max }>0$ is close to 0 , such that if $f \in L^{p^{\prime}(\cdot) s}(\Omega)$, then

$$
\begin{aligned}
\left\|F_{h}\left(\cdot, \nabla_{h} u_{h}^{c r}\right)-F_{h}(\cdot, \nabla u)\right\|_{2, \Omega}^{2} \lesssim & h_{\max }^{2 \alpha}\left(1+\|\nabla F(\cdot, \nabla u)\|_{2, \Omega}^{2}+\left\|\left(\delta^{p(\cdot)-1}+|z|\right)^{p^{\prime}(\cdot)-2}|f|^{2}\right\|_{1,\{p>2\}}\right. \\
& \left.+\sigma(f, s)+\rho_{p^{\prime}(\cdot) s, \Omega}(f)+\rho_{p(\cdot) s, \Omega}(\nabla u)\right)^{s}
\end{aligned}
$$

where the hidden constants also depend on $s>1$ and $\sigma(f, s):=1+\rho_{\left(p^{-}\right)^{\prime}, \Omega}(f)$ if $f \in L^{\left(p^{-}\right)^{\prime}}(\Omega)$ and $\sigma(f, s):=1+\rho_{p^{\prime}(\cdot) s, \Omega}(f)^{\left(p^{-}\right)^{\prime} /\left(p^{+}\right)^{\prime}}$ if $\Gamma_{D}=\partial \Omega$.

Remark 4.1 (Comments on the regularity assumptions in Theorem 4.1).
(i) If $p \in C^{0, \alpha}(\bar{\Omega})$ with $\alpha \in(0,1)$, one cannot expect that $F(\cdot, \nabla u) \in W^{1,2}\left(\Omega ; \mathbb{R}^{d}\right)$, even locally. However, appealing to [15, Rem. 4.5], one can expect that $F(\cdot, \nabla u) \in \mathcal{N}^{\alpha, 2}(\Omega)^{d}$, where $\mathcal{N}^{\alpha, 2}(\Omega)$ is the Nikolskiu space with order of differentiability $\alpha \in(0,1)$, which should still be enough the justify the arguments below, but is beyond the scope of this article.
(ii) If $p \leq 2$ in $\bar{\Omega}$ in Theorem 4.1, then the assumption $\left(\delta^{p(\cdot)-1}+|z|\right)^{p^{\prime}(\cdot)-2}|f|^{2} \in L^{1}(\{p>2\})$ is trivially satisfied.
(iii) If $\left(\delta^{p(\cdot)-1}+|z|\right)^{p^{\prime}(\cdot)-2}|\nabla z|^{2} \in L^{1}(\{p>2\})$ in Theorem 4.1, then, due to $f=-\operatorname{div} z$ in $L^{p^{\prime}(\cdot)}(\Omega)$, it holds that $\left(\delta^{p(\cdot)-1}+|z|\right)^{p^{\prime}(\cdot)-2}|f|^{2} \in L^{1}(\{p>2\})$.
(iv) If $f \in L^{2}(\{p>2\})$ and $\delta>0$, then $\left(\delta^{p(\cdot)-1}+|z|\right)^{p^{\prime}(\cdot)-2}|f|^{2} \leq \delta^{2-p(\cdot)}|f|^{2}$ a.e. in $\{p>2\}$, i.e., it holds that $\left(\delta^{p(\cdot)-1}+|z|\right)^{p^{\prime}(\cdot)-2}|f|^{2} \in L^{1}(\{p>2\})$.
(v) If $p \in(1, \infty)$, then it holds that $F(\nabla u) \in W^{1,2}\left(\Omega ; \mathbb{R}^{d}\right)$ if and only if $F^{*}(z) \in W^{1,2}\left(\Omega ; \mathbb{R}^{d}\right)$ with $|F(\nabla u)| \sim\left|F^{*}(z)\right|$ a.e. in $\Omega$ and $|\nabla F(\nabla u)| \sim\left|\nabla F^{*}(z)\right|$ a.e. in $\Omega$ (cf. [31, Lem. 2.3]). In addition, due to [39, Lem. 2.11], it holds that $\left|\nabla F^{*}(z)\right| \sim\left(\delta^{p-1}+|z|\right)^{\left(p^{\prime}-2\right) / 2}|\nabla z|$ a.e. in $\Omega$. Thus, Theorem 4.1 extends the a priori error analysis in [39].

Since the right-hand side in Theorem 3.1 still involves the discrete primal solution, before proving Theorem 4.1, we first derive the following a priori estimate.

Lemma 4.2. Let the assumptions of Theorem 4.1 be satisfied. Then, there exists some $s>1$, which can chosen to be close to 1 if $h_{\max }>0$ is close to 0 , such that if $f \in L^{p^{\prime}(\cdot) s}(\Omega)$, then

$$
\rho_{\varphi_{h}, \Omega}\left(\nabla_{h} u_{h}^{c r}\right) \lesssim \sigma(f, s)
$$

where the hidden constants also depend on $s>1$ and $\sigma(f, s)$ is defined as in Theorem 4.1.
Proof. We distinguish the cases $f \in L^{\left(p^{-}\right)^{\prime}}(\Omega)$ and $\Gamma_{D}=\partial \Omega$ :
Case $f \in L^{\left(p^{-}\right)^{\prime}}(\Omega)$. Since $I_{h}^{c r}\left(u_{h}^{c r}\right) \leq I_{h}^{c r}(0)$, applying the $\varepsilon$-Young inequality (2.2) with $\psi=|\cdot|^{p^{-}}$, the $L^{p^{-}}$-stability of $\Pi_{h}$, the discrete Poincaré inequality in $\mathcal{S}_{D}^{1, c r}\left(\mathcal{T}_{h}\right)$ (cf. [53, Prop. I.4.13]), and $p^{-} \lesssim p_{h}$ a.e. in $\Omega$, we find that

$$
\begin{aligned}
\rho_{\varphi_{h}, \Omega}\left(\nabla_{h} u_{h}^{c r}\right) & \lesssim\left(f_{h}, \Pi_{h} u_{h}^{c r}\right)_{\Omega} \\
& \lesssim c_{\varepsilon} \rho_{\left(p^{-}\right)^{\prime}, \Omega}\left(f_{h}\right)+\varepsilon \rho_{p^{-}, \Omega}\left(\nabla_{h} u_{h}^{c r}\right) \\
& \lesssim c_{\varepsilon} \rho_{\left(p^{-}\right)^{\prime}, \Omega}(f)+\varepsilon\left(1+\rho_{p_{h}(\cdot), \Omega}\left(\nabla_{h} u_{h}^{c r}\right)\right) .
\end{aligned}
$$

For $\varepsilon>0$ sufficiently small, using $p_{h} \lesssim 1+\varphi_{h}$, we conclude that $\rho_{\varphi_{h}, \Omega}\left(\nabla_{h} u_{h}^{c r}\right) \lesssim 1+\rho_{\left(p^{-}\right)^{\prime}, \Omega}(f)$.

Case $\Gamma_{D}=\partial \Omega$. Let $R>0$ be such that $\Omega \subseteq B_{R}^{d}(0)$. If $f \in L^{p^{\prime}(\cdot) s}(\Omega)$, by [27, Thm. 14.1.2], the vector field $G:=\left.(-\nabla u)\right|_{\Omega}$, where $u \in W^{2, p(\cdot)}\left(B_{R}^{d}(0)\right) \cap W_{0}^{1, p(\cdot)}\left(B_{R}^{d}(0)\right)$ denotes the unique solution of $-\Delta u=\bar{f}$ a.e. in $B_{R}^{d}(0)$, where $\bar{f}:=f$ a.e. in $\Omega$ and $\bar{f}:=0$ a.e. in $B_{R}^{d}(0) \backslash \Omega$, satisfies $G \in W^{1, p^{\prime}(\cdot) s}\left(\Omega ; \mathbb{R}^{d}\right), \operatorname{div} G=f$ a.e. in $\Omega$, and $\|G\|_{p^{\prime}(\cdot) s, \Omega}+\|\nabla G\|_{p^{\prime}(\cdot) s, \Omega} \lesssim\|f\|_{p^{\prime}(\cdot) s, \Omega}$, with a constant depending on $s, p$, and $\Omega$. Using [27, Lem. 3.2.5], we find that

$$
\begin{equation*}
\rho_{p^{\prime}(\cdot) s, \Omega}(G)+\rho_{p^{\prime}(\cdot) s, \Omega}(\nabla G) \lesssim \rho_{p^{\prime}(\cdot) s, \Omega}(f)^{\left(p^{-}\right)^{\prime} /\left(p^{+}\right)^{\prime}} \tag{4.3}
\end{equation*}
$$

Denote by $\Pi_{h}^{r t}: W^{1,1}\left(\Omega ; \mathbb{R}^{d}\right) \rightarrow \mathcal{R} T^{0}\left(\mathcal{T}_{h}\right)$, the Raviart-Thomas quasi-iterpolation operator. Then, $\operatorname{div} \Pi_{h}^{r t} G=\Pi_{h} \operatorname{div} G=f_{h}$ a.e. in $\Omega$. Appealing to [36, Thm. 16.4], for every $T \in \mathcal{T}_{h}$, we have that

$$
\begin{equation*}
\rho_{p^{\prime}\left(\xi_{T}\right), T}\left(\Pi_{h}^{r t} G\right) \lesssim \rho_{p^{\prime}\left(\xi_{T}\right), T}(G)+\rho_{p^{\prime}\left(\xi_{T}\right), T}(\nabla G) \tag{4.4}
\end{equation*}
$$

Since $\Pi_{h}^{c r}\left(u_{h}^{c r}\right) \leq I_{h}^{c r}(0)$, using $\operatorname{div} \Pi_{h}^{r t} G=f_{h}$ a.e. in $\Omega$, the discrete integration-by-parts formula (2.20), for every $T \in \mathcal{T}_{h}$ the $\varepsilon$-Young inequality (2.2) with $\psi=|\cdot|^{p\left(\xi_{T}\right)}$, (4.4), and (4.3), we find that

$$
\begin{aligned}
\rho_{\varphi_{h}, \Omega}\left(\nabla_{h} u_{h}^{c r}\right) & \lesssim\left(f_{h}, \Pi_{h} u_{h}^{c r}\right)_{\Omega}=\left(\operatorname{div} \Pi_{h}^{r t} G, \Pi_{h} u_{h}^{c r}\right)_{\Omega}=-\left(\Pi_{h} \Pi_{h}^{r t} G, \nabla_{h} u_{h}^{c r}\right)_{\Omega} \\
& \lesssim c_{\varepsilon} \rho_{p_{h}^{\prime}(\cdot), \Omega}\left(\Pi_{h}^{r t} G\right)+\varepsilon \rho_{p_{h}(\cdot), \Omega}\left(\nabla_{h} u_{h}^{c r}\right), \\
& \lesssim c_{\varepsilon}\left(\rho_{p_{h}^{\prime}(\cdot)}(G)+\rho_{p_{h}^{\prime}(\cdot), \Omega}(\nabla G)\right)+\varepsilon \rho_{p_{h}(\cdot), \Omega}\left(\nabla_{h} u_{h}^{c r}\right) \\
& \lesssim c_{\varepsilon}\left(1+\rho_{p^{\prime}(\cdot) s, \Omega}(G)+\rho_{p^{\prime}(\cdot) s, \Omega}(\nabla G)\right)+\varepsilon \rho_{p_{h}(\cdot), \Omega}\left(\nabla_{h} u_{h}^{c r}\right) \\
& \lesssim c_{\varepsilon}\left(1+\rho_{p^{\prime}(\cdot) s, \Omega}(f)^{\left(p^{-}\right)^{\prime} /\left(p^{+}\right)^{\prime}}\right)+\varepsilon \rho_{p_{h}(\cdot), \Omega}\left(\nabla_{h} u_{h}^{c r}\right) .
\end{aligned}
$$

For $\varepsilon>0$ sufficiently small, using $p_{h} \lesssim 1+\varphi_{h}$, we conclude that $\rho_{\varphi_{h}}\left(\nabla_{h} u_{h}^{c r}\right) \lesssim 1+\rho_{p^{\prime}(\cdot) s}(f)^{\left(p^{-}\right)^{\prime} /\left(p^{+}\right)^{\prime}}$.

Proof (of Theorem 4.1). The convexity of $\left(\varphi_{\left|\nabla_{h} v_{h}(T)\right|}\right)^{*}\left(\xi_{T}, \cdot\right)$ and that $\Delta_{2}\left(\left(\varphi_{\left|\nabla_{h} v_{h}(T)\right|}\right)^{*}\left(\xi_{T}, \cdot\right)\right) \lesssim$ $2^{\max \left\{2,\left(p^{-}\right)^{\prime}\right\}}$ for all $T \in \mathcal{T}_{h}$, the Orlicz-stability of $\Pi_{h}$ (cf. [40, Cor. A.8, (A.12)]), and the shift change (2.16), for every $v_{h} \in \mathcal{S}_{D}^{1}\left(\mathcal{T}_{h}\right)$, yield

$$
\begin{equation*}
\operatorname{osc}_{h}^{2}\left(f, v_{h}\right) \lesssim \rho_{\left(\left(\varphi_{h}\right)_{|\nabla u|}\right)^{*}, \Omega}\left(h_{\mathcal{T}} f\right)+\left\|F_{h}\left(\cdot, \nabla v_{h}\right)-F_{h}(\cdot, \nabla u)\right\|_{2, \Omega}^{2} \tag{4.5}
\end{equation*}
$$

Using (4.5) in Theorem 3.1, for every $v_{h} \in \mathcal{S}_{D}^{1}\left(\mathcal{T}_{h}\right)$, we find that

$$
\begin{align*}
\left\|F_{h}\left(\cdot, \nabla_{h} u_{h}^{c r}\right)-F_{h}(\cdot, \nabla u)\right\|_{2, \Omega}^{2} \lesssim & \left\|F_{h}\left(\cdot, \nabla v_{h}\right)-F_{h}(\cdot, \nabla u)\right\|_{2, \Omega}^{2} \\
& +h_{\max }^{2 \alpha} \rho_{p_{h}(\cdot) s, \Omega}\left(\nabla v_{h}\right)+h_{\max }^{2 \alpha} \rho_{p_{h}(\cdot) s, \Omega}\left(\nabla_{h} u_{h}^{c r}\right)  \tag{4.6}\\
& +h_{\max }^{2 \alpha}\left(1+\rho_{p(\cdot) s, \Omega}(\nabla u)\right)+\rho_{\left(\left(\varphi_{h}\right)_{|\nabla u|}\right)^{*}, \Omega}\left(h_{\mathcal{T}} f\right)
\end{align*}
$$

Using that, appealing to [15, Lem. $4.3 \&$ Corollary 3.6], it holds that

$$
\begin{align*}
\left\|F_{h}\left(\cdot, \nabla \Pi_{h}^{s z} u\right)-F_{h}(\cdot, \nabla u)\right\|_{2, \Omega}^{2} & \lesssim h_{\max }^{2}\|\nabla F(\cdot, \nabla u)\|_{2, \Omega}^{2}+h_{\max }^{2 \alpha}\left(1+\rho_{p(\cdot) s, \Omega}(\nabla u)\right)  \tag{4.7}\\
\rho_{p_{h}(\cdot) s, \Omega}\left(\nabla \Pi_{h}^{s z} u\right) & \lesssim 1+\rho_{p(\cdot) s, \Omega}\left(\nabla \Pi_{h}^{s z} u\right) \lesssim 1+\rho_{p(\cdot) s, \Omega}(\nabla u)
\end{align*}
$$

choosing $v_{h}=\Pi_{h}^{s z} u \in \mathcal{S}_{D}^{1}\left(\mathcal{T}_{h}\right)$ in (4.6), we arrive at

$$
\begin{align*}
\left\|F_{h}\left(\cdot, \nabla_{h} u_{h}^{c r}\right)-F_{h}(\cdot, \nabla u)\right\|_{2, \Omega}^{2} \lesssim & h_{\max }^{2}\|\nabla F(\cdot, \nabla u)\|_{2, \Omega}^{2}+h_{\max }^{2 \alpha}\left(1+\rho_{p(\cdot) s, \Omega}(\nabla u)\right)  \tag{4.8}\\
& +h_{\max }^{2 \alpha} \rho_{p_{h}(\cdot) s, \Omega}\left(\nabla_{h} u_{h}^{c r}\right)+\rho_{\left(\left(\varphi_{h}\right)_{|\nabla u|}\right)^{*}, \Omega}\left(h_{\mathcal{T}} f\right)
\end{align*}
$$

By the aid of Lemma A.1(A.4), also using that $2 \alpha \leq 2 \wedge\left(p^{+}\right)^{\prime}+\alpha$, it holds that

$$
\begin{equation*}
\rho_{\left(\left(\varphi_{h}\right)_{|\nabla u|}\right)^{*}, \Omega}\left(h_{\mathcal{T}} f\right) \lesssim \rho_{\left(\varphi_{|\nabla u|}\right)^{*}, \Omega}\left(h_{\mathcal{T}} f\right)+h_{\max }^{2 \alpha}\left(1+\rho_{p^{\prime}(\cdot) s, \Omega}(f)+\rho_{p(\cdot) s, \Omega}(\nabla u)\right) \tag{4.9}
\end{equation*}
$$

Next, for every $T \in \mathcal{T}_{h}$ and $x \in T$, we need to distinguish the cases $p(x) \in(1,2)$ and $p(x) \in[2, \infty)$ :
Case $p(x) \in(1,2]$. If $p(x) \in(1,2]$, then, there holds the elementary inequality

$$
\left(\varphi_{|a|}\right)^{*}(x, h t) \lesssim \lambda^{2}\left(\varphi^{*}(x, t)+\varphi(x,|a|)\right) \quad \text { for all } a \in \mathbb{R}^{d}, t \geq 0, \lambda \in[0,1]
$$

which follows from the definition of shifted $N$-functions ( $c f$. (2.5)) and the shift change (2.16) (i.e., with $b=0$ and using that $|F(x, a)|^{2}=\varphi(x,|a|)$ for all $\left.a \in \mathbb{R}^{d}\right)$, so that

$$
\begin{equation*}
\left(\varphi_{|\nabla u(x)|}\right)^{*}\left(x, h_{T}|f(x)|\right) \lesssim h_{T}^{2}\left(\varphi^{*}(x,|f(x)|)+\varphi(x,|\nabla u(x)|)\right) \tag{4.10}
\end{equation*}
$$

Case $p(x) \in(2, \infty)$. Since $\left(\varphi_{|a|}\right)^{*}(x, \lambda t) \lesssim \lambda^{2}\left(\delta^{p(x)-1}+|a|\right)^{p^{\prime}(x)-2} t^{2}$ for all $a \in \mathbb{R}^{d}$ and $t, \lambda \geq 0$, we have that

$$
\begin{equation*}
\left(\varphi_{|\nabla u(x)|}\right)^{*}\left(x, h_{T}|f(x)|\right) \lesssim h_{T}^{2}\left(\delta^{p(x)-1}+|z(x)|\right)^{p^{\prime}(x)-2}|f(x)|^{2} \tag{4.11}
\end{equation*}
$$

Combining (4.10) and (4.11), we deduce that

$$
\begin{equation*}
\rho_{(\varphi|\nabla u|)^{*}, \Omega}\left(h_{\mathcal{T}} f\right) \lesssim h_{\max }^{2}\left(\rho_{\varphi^{*}, \Omega}(f)+\rho_{\varphi, \Omega}(\nabla u)+\left\|\left(\delta^{p(\cdot)-1}+|z|\right)^{p^{\prime}(\cdot)-2}|f|^{2}\right\|_{1,\{p>2\}}\right) . \tag{4.12}
\end{equation*}
$$

Using (4.12) in (4.9), we find that

$$
\begin{align*}
\rho_{\left(\left(\varphi_{h}\right)_{|\nabla u|}\right)^{*}, \Omega}\left(h_{\mathcal{T}} f\right) \lesssim & h_{\max }^{2 \alpha}\left(1+\rho_{p^{\prime}(\cdot) s, \Omega}(f)+\rho_{p(\cdot) s, \Omega}(\nabla u)\right) \\
& +h_{\max }^{2}\left\|\left(\delta^{p(\cdot)-1}+|z|\right)^{p^{\prime}(\cdot)-2}|f|^{2}\right\|_{1,\{p>2\}} \tag{4.13}
\end{align*}
$$

In addition, due to Lemma 4.2, [36, Lem. 12.1], $h_{\max } \sim h_{\mathcal{T}}$, and $p_{h} \lesssim 1+\varphi_{h}$, we have that

$$
\begin{equation*}
\rho_{p_{h}(\cdot) s, \Omega}\left(\nabla_{h} u_{h}^{c r}\right) \lesssim h_{\max }^{d(1-s)} \rho_{p_{h}(\cdot), \Omega}\left(\nabla_{h} u_{h}^{c r}\right)^{s} \lesssim h_{\max }^{d(1-s)}(1+\sigma(f ; s))^{s} \tag{4.14}
\end{equation*}
$$

Next, abbreviating

$$
\begin{aligned}
\Theta(s):= & 1+\|\nabla F(\cdot, \nabla u)\|_{2, \Omega}^{2}+\left\|\left(\delta^{p(\cdot)-1}+|z|\right)^{p^{\prime}(\cdot)-2}|f|^{2}\right\|_{1,\{p>2\}} \\
& +\sigma(f ; s)+\rho_{p^{\prime}(\cdot) s, \Omega}(f)+\rho_{p(\cdot) s, \Omega}(\nabla u)
\end{aligned}
$$

using (4.13) and (4.14) in (4.8), we arrive at

$$
\begin{equation*}
\left\|F_{h}\left(\cdot, \nabla_{h} u_{h}^{c r}\right)-F_{h}(\cdot, \nabla u)\right\|_{2, \Omega}^{2} \lesssim h_{\max }^{2 \alpha+d(1-s)} \Theta(s)^{s} \tag{4.15}
\end{equation*}
$$

Using the a priori error estimate (4.15), we can improve the a priori estimate (4.14) and, in turn, the a priori error estimate (4.15). First, due to $(4.7)_{2}, h_{\max } \sim h_{\mathcal{T}}$, and [36, Lem. 12.1], we have that

$$
\begin{align*}
\rho_{p_{h}(\cdot) s, \Omega}\left(\nabla_{h} u_{h}^{c r}\right) & \lesssim \rho_{p_{h}(\cdot) s, \Omega}\left(\nabla_{h} u_{h}^{c r}-\nabla \Pi_{h}^{s z} u\right)+\rho_{p_{h}(\cdot) s, \Omega}\left(\nabla \Pi_{h}^{s z} u\right) \\
& \lesssim 1+\rho_{p_{h}(\cdot) s, \Omega}\left(\nabla_{h} u_{h}^{c r}-\nabla \Pi_{h}^{s z} u\right)+\rho_{p(\cdot) s, \Omega}(\nabla u)  \tag{4.16}\\
& \lesssim 1+h_{\max }^{d(1-s)} \rho_{p_{h}(\cdot), \Omega}\left(\nabla_{h} u_{h}^{c r}-\nabla \Pi_{h}^{s z} u\right)^{s}+\rho_{p(\cdot) s, \Omega}(\nabla u)
\end{align*}
$$

Next, we need to distinguish the cases $p_{h} \geq 2$ and $p_{h}<2$ :
Case $p_{h} \geq 2$. Due to (2.10), $\left(\varphi_{h}\right)_{a}(x, t) \gtrsim t^{p_{h}(x)}$ for all $a, t \geq 0$ and $x \in\left\{p_{h} \geq 2\right\}$, (4.15), and (4.8) $)_{1}$, we have that

$$
\begin{align*}
\rho_{p_{h}(\cdot),\left\{p_{h} \geq 2\right\}}\left(\nabla_{h} u_{h}^{c r}-\nabla \Pi_{h}^{s z} u\right) \lesssim & \left\|F_{h}\left(\cdot, \nabla_{h} u_{h}^{c r}\right)-F_{h}\left(\cdot, \nabla \Pi_{h}^{s z} u\right)\right\|_{2,\left\{p_{h} \geq 2\right\}}^{2} \\
\lesssim & \left\|F_{h}\left(\cdot, \nabla_{h} u_{h}^{c r}\right)-F_{h}(\cdot, \nabla u)\right\|_{2, \Omega}^{2} \\
& +\left\|F_{h}(\cdot, \nabla u)-F_{h}\left(\cdot, \nabla \Pi_{h}^{s z} u\right)\right\|_{2, \Omega}^{2}  \tag{4.17}\\
\lesssim & h_{\max }^{2 \alpha+d(1-s)} \Theta(s)^{s}
\end{align*}
$$

Case $p_{h}<2$. Due to [14, Lem. B.1], $\rho_{p_{h}(\cdot)}\left(\left|\nabla_{h} u_{h}^{c r}\right|+|\nabla u|\right) \leq c(c f . \text { Lemma 4.2), (4.15), and (4.8) })_{1}$, we have that

$$
\begin{aligned}
\left\|\nabla_{h} u_{h}^{c r}-\nabla \Pi_{h}^{s z} u\right\|_{p_{h}(\cdot),\left\{p_{h}<2\right\}}^{2} \lesssim & \left\|F_{h}\left(\cdot, \nabla_{h} u_{h}^{c r}\right)-F_{h}\left(\cdot, \nabla \Pi_{h}^{s z} u\right)\right\|_{2,\left\{p_{h}<2\right\}}^{2} \\
& \times\left(1+\rho_{p_{h}(\cdot)}\left(\left|\nabla_{h} u_{h}^{c r}\right|+|\nabla u|\right)\right)^{1 / p^{-}} \\
\lesssim & \left\|F_{h}\left(\cdot, \nabla_{h} u_{h}^{c r}\right)-F_{h}(\cdot, \nabla u)\right\|_{2, \Omega}^{2} \\
& +\left\|F_{h}(\cdot, \nabla u)-F_{h}\left(\cdot, \nabla \Pi_{h}^{s z} u\right)\right\|_{2, \Omega}^{2} \\
\lesssim & h_{\max }^{2 \alpha+d(1-s)} \Theta(s)^{s}
\end{aligned}
$$

which, resorting to [27, Lem. 3.2.4], implies that

$$
\begin{equation*}
\rho_{p_{h}(\cdot),\left\{p_{h}<2\right\}}\left(\nabla u_{h}-\nabla \Pi_{h}^{s z} u\right) \lesssim\left\|\nabla u_{h}-\nabla \Pi_{h}^{s z} u\right\|_{p_{h}(\cdot),\left\{p_{h}<2\right\}} \lesssim h_{\max }^{\alpha+d(1-s) / 2} \Theta(s)^{s / 2} \tag{4.18}
\end{equation*}
$$

Eventually, using (4.17) and (4.18) in (4.16), for $s>1$ sufficiently small, from (4.7) and (4.13), we conclude the claimed a priori error estimate.

Aided by the (discrete) convex optimality relations (2.29) and (2.43), together with the generalized Marini formula ( $c f$. (2.39)), we can derive from Corollary 4.1 an a priori error estimate for the error between the dual solution and the discrete dual solution.

Lemma 4.19. Let $p \in C^{0}(\bar{\Omega})$ with $p^{-}>1$ and $\delta \geq 0$ and let $f \in L^{p^{\prime}(\cdot)}(\Omega) \cap \bigcap_{h \in\left(0, h_{0}\right]} L^{p_{h}^{\prime}(\cdot)}(\Omega)$ for some $h_{0}>0$. Then, there exists some $s>1$, which can chosen to be close to 1 if $h>0$ is close to 0 , such that if $u \in W_{D}^{1, p(\cdot) s}(\Omega)$, then for every $h \in\left(0, h_{0}\right]$, it holds that

$$
\begin{aligned}
\left\|F_{h}^{*}\left(\cdot, z_{h}^{r t}\right)-F_{h}^{*}(\cdot, z)\right\|_{2, \Omega}^{2} \lesssim & \left\|F_{h}\left(\cdot, \nabla_{h} u_{h}^{c r}\right)-F_{h}(\cdot, \nabla u)\right\|_{2, \Omega}^{2}+h_{\max }^{2 \alpha}\left(1+\rho_{p(\cdot) s, \Omega}(\nabla u)\right) \\
& +\rho_{\left(\left(\varphi_{h}\right)_{|\nabla u|}\right)^{*}, \Omega}\left(h_{\mathcal{T}} f\right),
\end{aligned}
$$

where the hidden constant in $\lesssim$ also depends on $s>1$.
Proof. Using the discrete convex optimality relations (2.29) and (2.43), two equivalences in (2.10), the generalized Marini formula (2.39), again, the discrete convex optimality relations (2.43), and the Orlicz-stability of $\Pi_{h}$ (cf. [40, Cor. A.8, (A.12)]), we find that

$$
\begin{align*}
\left\|F_{h}^{*}\left(\cdot, z_{h}^{r t}\right)-F_{h}^{*}(\cdot, z)\right\|_{2, \Omega}^{2} \lesssim & \left\|F_{h}^{*}\left(\cdot, \Pi_{h} z_{h}^{r t}\right)-F_{h}^{*}(\cdot, z)\right\|_{2, \Omega}^{2}+\left\|F_{h}^{*}\left(\cdot, z_{h}^{r t}\right)-F_{h}^{*}\left(\cdot, \Pi_{h} z_{h}^{r t}\right)\right\|_{2, \Omega}^{2} \\
\lesssim & \left\|F_{h}^{*}\left(\cdot, \mathcal{A}_{h}\left(\cdot, \nabla_{h} u_{h}^{c r}\right)\right)-F_{h}^{*}\left(\cdot, \mathcal{A}_{h}(\cdot, \nabla u)\right)\right\|_{2, \Omega}^{2} \\
& +\| F_{h}^{*}\left(\cdot, \mathcal{A}_{h}(\cdot, \nabla u)-F_{h}^{*}(\cdot, \mathcal{A}(\cdot, \nabla u)) \|_{2, \Omega}^{2}\right. \\
& +\rho_{\left(\left(\varphi_{h}\right)^{*}\right)\left|\Pi_{h} z_{h}^{r t}\right|, \Omega}\left(z_{h}^{r t}-\Pi_{h} z_{h}^{r t}\right)  \tag{4.20}\\
\lesssim & \left\|F_{h}\left(\cdot, \nabla_{h} u_{h}^{c r}\right)-F_{h}(\cdot, \nabla u)\right\|_{2, \Omega}^{2}+h_{\max }^{2 \alpha}\left(1+\rho_{p(\cdot) s}(\nabla u)\right) \\
& +\rho_{\left(\left(\varphi_{h}\right)^{*}\right)_{\left|\mathcal{A}_{h}\left(\cdot, \nabla_{h} u_{h}^{c r}\right)\right|, \Omega}\left(h_{\mathcal{T}} f\right) .}
\end{align*}
$$

Using that $\left(\varphi^{*}\right)_{\left|\mathcal{A}\left(\xi_{T}, a\right)\right|}\left(\xi_{T}, \cdot\right) \sim\left(\varphi_{|a|}\right)^{*}\left(\xi_{T}, \cdot\right)$ for all $T \in \mathcal{T}_{h}$ and $a \in \mathbb{R}^{d}(c f$. Lemma 2.9(2.12)) and the shift change (2.16), we observe that

Eventually, combining (4.20) and (4.21), we arrive at the claimed inequality.
Theorem 4.2. Let $p \in C^{0, \alpha}(\bar{\Omega})$ with $\alpha \in(0,1]$ and $p^{-}>1$ and $\delta \geq 0$. Moreover, let $F(\cdot, \nabla u) \in$ $W^{1,2}\left(\Omega ; \mathbb{R}^{d}\right),\left(\delta^{p(\cdot)-1}+|z|\right)^{p^{\prime}(\cdot)-2}|f|^{2} \in L^{1}(\{p>2\})$, and $f \in L^{\left(p^{-}\right)^{\prime}}(\Omega)$ or $\Gamma_{D}=\partial \Omega$. Then, assuming that $h_{\max } \sim h_{\mathcal{T}}$, there exists some $s>1$, which can chosen to be close to 1 if $h_{\max }>0$ is close to 0 , such that if $f \in L^{p^{\prime}(\cdot) s}(\Omega)$, then

$$
\begin{aligned}
\left\|F_{h}^{*}\left(\cdot, z_{h}^{r t}\right)-F_{h}^{*}(\cdot, z)\right\|_{2, \Omega}^{2} \lesssim & h_{\max }^{2}\left(1+\|\nabla F(\cdot, \nabla u)\|_{2, \Omega}^{2}+\left\|\left(\delta^{p(\cdot)-1}+|z|\right)^{p^{\prime}(\cdot)-2}|f|^{2}\right\|_{1,\{p>2\}}\right. \\
& \left.+\sigma(f ; s)+\rho_{p^{\prime}(\cdot) s, \Omega}(f)+\rho_{p(\cdot) s, \Omega}(\nabla u)\right)^{s}
\end{aligned}
$$

where the hidden constant in $\lesssim$ also depends on $s>1$ and $\sigma(f ; s)$ is defined as in Theorem 4.1. Proof. Immediate consequence of Lemma 4.19 in conjunction with Theorem 4.1.

Corollary 4.22. Let $p \in C^{0,1}(\bar{\Omega})$ with $p^{-}>1$ and $\delta>0$. Moreover, let $F(\cdot, \nabla u) \in W^{1,2}\left(\Omega ; \mathbb{R}^{d}\right)$ and $f \in L^{\left(p^{-}\right)^{\prime}}(\Omega)$ or $\Gamma_{D}=\partial \Omega$. Then, assuming that $h_{\max } \sim h_{\mathcal{T}}$, there exists some $s>1$, which can chosen to be close to 1 if $h_{\max }>0$ is close to 0 , such that if $f \in L^{p^{\prime}(\cdot) s}(\Omega)$, then

$$
\begin{aligned}
& \left\|F_{h}\left(\cdot, \nabla_{h} u_{h}^{c r}\right)-F_{h}(\cdot, \nabla u)\right\|_{2, \Omega}^{2}+\left\|F_{h}^{*}\left(\cdot, z_{h}^{r t}\right)-F_{h}^{*}(\cdot, z)\right\|_{2, \Omega}^{2} \\
& \quad \lesssim h_{\max }^{2}\left(1+\|\nabla F(\cdot, \nabla u)\|_{2, \Omega}^{2}+\sigma(f ; s)+\rho_{p^{\prime}(\cdot) s, \Omega}(f)+\rho_{p(\cdot) s, \Omega}(\nabla u)\right)^{s}
\end{aligned}
$$

where the hidden constant in $\lesssim$ also depends on $s>1$ and $\sigma(f ; s)$ is defined as in Theorem 4.1.
Proof. Due to Lemma 2.46, from $F(\cdot, \nabla u) \in W^{1,2}\left(\Omega ; \mathbb{R}^{d}\right)$, it follows that $F^{*}(\cdot, z) \in W^{1,2}\left(\Omega ; \mathbb{R}^{d}\right)$ and $|\nabla F(\cdot, \nabla u)|^{2}+\left(1+|\nabla v|^{p(\cdot) s}\right) \sim\left|\nabla F^{*}(\cdot, z)\right|^{2}+\left(1+|z|^{p^{\prime}(\cdot) s}\right)$ a.e. in $\Omega$ for some $s>1$ which can chosen to be close to 1 . In addition, due to Lemma 2.47, it holds that $\left|\nabla F^{*}(\cdot, z)\right|^{2}+\left(1+|z|^{p^{\prime}(\cdot) s}\right) \sim$ $\left(\delta^{p(\cdot)-1}+|z|\right)^{p^{\prime}(\cdot)-2}|\nabla z|^{2}$ a.e. in $\Omega$. As a result, the claimed a priori error estimate follows from Theorem 4.1 together with Theorem 4.2.

## 5. Numerical experiments

In this section, we review the theoretical findings of Section 4 via numerical experiments. All experiments were carried out using the finite element software package FEniCS (version 2019.1.0, $c f$. [46]).

We apply the $\mathcal{S}_{D}^{1, c r}\left(\mathcal{T}_{h}\right)$-approximation (2.34) of the variational $p(\cdot)$-Dirichlet problem (2.23) with $\delta:=1.0 \times 10^{-4}$ and $p \in C^{0, \alpha}(\bar{\Omega})$, where $\alpha \in(0,1]$ and $p^{-}>1$, for every $x \in \bar{\Omega}$ defined by

$$
p(x):=p^{-}+\varepsilon|x|^{\alpha},
$$

where $\varepsilon>0$. As quadrature points of the one-point quadrature rule used to discretize $p \in C^{0, \alpha}(\bar{\Omega})$, we employ barycenters of elements, i.e., for every $T \in \mathcal{T}_{h}$, we employ $\xi_{T}:=x_{T}=\frac{1}{d+1} \sum_{z \in \mathcal{N}_{h} \cap T} z$.

Then, we approximate the discrete primal solution $u_{h}^{c r} \in \mathcal{S}_{D}^{1, c r}\left(\mathcal{T}_{h}\right)$ deploying the Newton line search algorithm of PETSc (version 3.17.3, cf. [46]), with an absolute tolerance of $\tau_{a b s}=1.0 \times 10^{-8}$ and a relative tolerance of $\tau_{r e l}=1.0 \times 10^{-10}$. The linear system emerging in each Newton step is solved using a sparse direct solver from MUMPS (version 5.5.0, cf. [2]).

For our numerical experiments, we choose $\Omega=(-1,1)^{2}, \Gamma_{D}=\partial \Omega$, and as a manufactured solution of (1.1), the function $u \in W_{D}^{1, p(\cdot)}(\Omega)$, for every $x:=\left(x_{1}, x_{2}\right)^{\top} \in \Omega$ defined by

$$
u(x):=d(x)|x|^{\beta}
$$

i.e., $f:=-\operatorname{div} \mathcal{A}(\cdot, \nabla u)$, where $d \in C^{\infty}(\bar{\Omega})$, defined by $d(x):=\left(1-x_{1}^{2}\right)\left(1-x_{2}^{2}\right)$ for every $x:=$ $\left(x_{1}, x_{2}\right)^{\top} \in \bar{\Omega}$, is a smooth cut-off function enforcing homogeneous Dirichlet boundary conditions. Moreover, we choose $\beta=1.01$, which just yields that $u \in W_{D}^{1, p(\cdot)}(\Omega)$ satisfies

$$
F(\cdot, \nabla u), F^{*}(\cdot, z) \in W^{1,2}\left(\Omega ; \mathbb{R}^{2}\right) \quad \text { and } \quad\left(\delta^{p(\cdot)-1}+|z|\right)^{p^{\prime}(\cdot)-2}|\nabla z|^{2} \in L^{1}(\Omega)
$$

By Theorem 4.1 and Theorem 4.2, we expect the convergence rate $\alpha$ for the error quantities (5.1).
An initial triangulation $\mathcal{T}_{h_{0}}, h_{0}=\frac{3}{2 \sqrt{2}}$, is constructed by subdividing a rectangular Cartesian grid into regular triangles with different orientations. Refined triangulations $\mathcal{T}_{h_{k}}, k=1, \ldots, 10$, where $h_{k+1}=\frac{h_{k}}{2}$ for all $k=1, \ldots, 10$, are obtained by applying the red-refinement rule (cf. [21]).

Then, for the resulting series of triangulations $\mathcal{T}_{k}:=\mathcal{T}_{h_{k}}, k=1, \ldots, 10$, we apply the above Newton scheme to compute the discrete primal solution $u_{k}^{c r}:=u_{h_{k}}^{c r} \in \mathcal{S}_{D}^{1, c r}\left(\mathcal{T}_{k}\right), k=1, \ldots, 10$, and, resorting to the generalized Marini formula (2.39), the discrete dual solution $z_{k}^{r t}:=z_{h_{k}}^{r t} \in \mathcal{R} T_{N}^{0}\left(\mathcal{T}_{k}\right)$, $k=1, \ldots, 10$. Subsequently, we compute the error quantities

$$
\left.\begin{array}{rl}
e_{F, k} & :=\left\|F_{h}\left(\cdot, \nabla_{h_{k}} u_{k}^{c r}\right)-F_{h}(\cdot, \nabla u)\right\|_{2, \Omega}^{2},  \tag{5.1}\\
e_{F^{*}, k} & :=\left\|F_{h}^{*}\left(\cdot, z_{k}^{c r}\right)-F_{h}^{*}(\cdot, z)\right\|_{2, \Omega}^{2},
\end{array}\right\} \quad k=1, \ldots, 10
$$

For the determination of the convergence rates, the experimental order of convergence (EOC)

$$
\operatorname{EOC}_{k}\left(e_{k}\right):=\frac{\log \left(e_{k} / e_{k-1}\right)}{\log \left(h_{k} / h_{k-1}\right)}, \quad k=1, \ldots, 10
$$

where for every $k=1, \ldots, 10$, we denote by $e_{k}$, either $e_{F, k}$ or $e_{F^{*}, k}$, respectively, is recorded.
For different values of $p^{-} \in\{1.5,2,2.5\}, \alpha \in\{0.1,0.25,0.5,1.0\}, \varepsilon \in\{0.5,1.0\}$, and a series of triangulations $\mathcal{T}_{k}, k=1, \ldots, 10$, obtained by uniform mesh refinement as described above, the EOC is computed and for $k=5, \ldots, 10$ presented in Table 1, Table 2, Table 3 and Table 4, respectively. In each case, we report a convergence ratio of about $\mathrm{EOC}_{k}\left(e_{k}\right) \approx 1, k=5, \ldots, 10$, conforming the quasi-optimality of the a priori error estimates in Corollary 4.22 and but not indicating the quasi-optimality of the a priori error estimates in Theorem 4.1 and Theorem 4.2 for $\alpha \in(0,1)$. We believe that this can be traced back to an imbalance of between the regularity assumptions $F(\cdot, \nabla u) \in W^{1,2}\left(\Omega ; \mathbb{R}^{d}\right)$ and $p \in C^{0, \alpha}(\bar{\Omega})$ with $\alpha \in(0,1)$ in Theorem 4.1 and Theorem 4.2; and expect that the assumptions $F(\cdot, \nabla u) \in \mathcal{N}^{\alpha, 2}(\Omega)^{d}$ and $p \in C^{0, \alpha}(\bar{\Omega})$ with $\alpha \in(0,1)$ are more balanced and may lead to optimal a priori error estimates. The examination of this hypothesis, however, is beyond the scope of this article and, therefore, left open for follow-up research.

## A. Discrete-To-CONTINUOUS-AND-VICE-VERSA INEQUALITIES

The following lemma is of crucial importance for the hereinafter analysis; it bounds the error resulting from switching from $\mathcal{A}_{h}: \Omega \times \mathbb{R}^{d} \rightarrow \mathbb{R}^{d}, h>0$, to $\mathcal{A}: \Omega \times \mathbb{R}^{d} \rightarrow \mathbb{R}^{d}$ or from switching from $F_{h}: \Omega \times \mathbb{R}^{d} \rightarrow \mathbb{R}^{d}, h>0$, to $F: \Omega \times \mathbb{R}^{d} \rightarrow \mathbb{R}^{d}$ and vice versa, respectively.
Proposition A.1. Let $p \in C^{0}(\bar{\Omega})$ with $p^{-}>1$ and let $\delta \geq 0$. Then, there exists some $s>1$, which can chosen to be close to 0 if $h_{T}>0$ is close to 0 , such that for every $T \in \mathcal{T}_{h}, g \in L^{p^{\prime}(\cdot) s}(T)$, $v \in W^{1, p(\cdot) s}(T)$, and $\lambda \in[0,1]$, it holds that

$$
\begin{align*}
\left\|F_{h}(\cdot, \nabla v)-F(\cdot, \nabla v)\right\|_{2, T}^{2} & \lesssim\left\|\omega_{p, T}\left(h_{T}\right)^{2}\left(1+|\nabla v|^{p(\cdot) s}\right)\right\|_{1, T},  \tag{A.2}\\
\left\|F_{h}^{*}\left(\cdot, \mathcal{A}_{h}(\cdot, \nabla v)\right)-F_{h}^{*}(\cdot, \mathcal{A}(\cdot, \nabla v))\right\|_{2, T}^{2} & \lesssim\left\|\omega_{p, T}\left(h_{T}\right)^{2}\left(1+|\nabla v|^{p(\cdot) s}\right)\right\|_{1, T},  \tag{A.3}\\
\rho_{\left(\left(\varphi_{h}\right)_{|\nabla v|}\right)^{*}, T}(\lambda g) & \lesssim \rho_{\left(\varphi_{|\nabla v|)^{*}, T}(\lambda g)\right.}  \tag{A.4}\\
& +\lambda^{2 \wedge\left(p^{+}\right)^{\prime}}\left\|\omega_{p, T}\left(h_{T}\right)\left(1+|\nabla v|^{p(\cdot) s}+|g|^{p^{\prime}(\cdot) s}\right)\right\|_{1, T},
\end{align*}
$$

where the hidden constants in $\lesssim$ also depend on $s>1$ and the chunkiness $\omega_{0}>0$.
Proposition A. 1 is based on the following point-wise estimates.
Lemma A.5. Let $p \in C^{0}(\bar{\Omega})$ with $p^{-}>1$ and let $\delta \geq 0$. Then, there exists some $s>1$, which can chosen to be close to 1 if $|x-y|$ is close to 0 , such that for every $x, y \in \bar{\Omega}, t \geq 0, a, b \in \mathbb{R}^{d}$, and $\lambda \in[0,1]$, it holds that

$$
\begin{align*}
|F(x, a)-F(y, a)|^{2} & \lesssim|p(x)-p(y)|^{2}\left(1+|a|^{p(x) s}\right)  \tag{A.6}\\
\left|F^{*}(x, a)-F^{*}(y, a)\right|^{2} & \lesssim|p(x)-p(y)|^{2}\left(1+|a|^{p(x) s}\right)  \tag{A.7}\\
\left|F^{*}(x, \mathcal{A}(x, a))-F^{*}(x, \mathcal{A}(y, a))\right|^{2} & \lesssim|p(x)-p(y)|^{2}\left(1+|a|^{p(x) s}\right)  \tag{A.8}\\
\left(\varphi_{|b|}\right)^{*}(x, \lambda t) & \lesssim\left(\varphi_{|b|}\right)^{*}(y, \lambda t) \\
& +\lambda^{2 \wedge\left(p^{+}\right)^{\prime}}|p(x)-p(y)|\left(1+|b|^{p(y) s}+t^{p^{\prime}(y) s}\right), \tag{A.9}
\end{align*}
$$

where the hidden constants in $\lesssim$ also depend on $s>1$ and the chunkiness $\omega_{0}>0$.
Proof. ad (A.6). The Newton-Leibniz formula yields for all $x, y \in \bar{\Omega}$ and $a \in \mathbb{R}^{d}$ that

$$
\begin{align*}
|F(x, a)-F(y, a)|^{2} & \lesssim|p(x)-p(y)|^{2} \ln (\delta+|a|)^{2}(\varphi(x,|a|)+\varphi(y,|a|)) \\
& \lesssim|p(x)-p(y)|^{2} \ln (\delta+|a|)^{2}\left(1+(\delta+|a|)^{p(y)-p(x)}\right) \varphi(x,|a|)  \tag{A.10}\\
& \lesssim|p(x)-p(y)|^{2}\left(1+|a|^{p(x) s}\right)
\end{align*}
$$

for some $s>1$, which can chosen to be close to 1 if $|x-y|$ is close to 0 .
$a d$ (A.8). The Newton-Leibniz formula yields for all $x, y \in \bar{\Omega}$ and $a \in \mathbb{R}^{d}$ that

$$
\begin{align*}
|\mathcal{A}(x, a)-\mathcal{A}(y, a)| & \lesssim|p(x)-p(y)||\ln (\delta+|a|)|\left(\varphi^{\prime}(x,|a|)+\varphi^{\prime}(y,|a|)\right) \\
& \lesssim|p(x)-p(y)||\ln (\delta+|a|)|\left(1+(\delta+|a|)^{p(y)-p(x)}\right) \varphi^{\prime}(x,|a|) \tag{A.11}
\end{align*}
$$

Using (A.11), (2.11), (2.12), the monotonicity of $\left(\varphi_{|a|}\right)^{*}(x, \cdot)$, that $\Delta_{2}\left(\left(\varphi_{|a|}\right)^{*}(x, \cdot)\right) \lesssim 2^{\max \left\{2,\left(p^{-}\right)^{\prime}\right\}}$, ( cf. Remark 2.6),

$$
\begin{align*}
\left(\varphi_{|a|}\right)^{*}(x, \lambda t) & \lesssim \max \left\{\lambda^{p^{\prime}(x)}, \lambda^{2}\right\}\left(\varphi_{|a|}\right)^{*}(x, t)  \tag{A.12}\\
\left(\varphi_{|a|}\right)^{*}\left(x, \lambda \varphi^{\prime}(x,|a|)\right) & \sim \lambda^{2} \varphi(x,|a|) \tag{A.13}
\end{align*}
$$

( $c f$. [15, Lem. A. $7 \&$ Lem. A.8]), in conjunction with Remark 2.31, we deduce that

$$
\begin{aligned}
\mid F^{*}(x, & \mathcal{A}(x, a))-\left.F^{*}(x, \mathcal{A}(y, a))\right|^{2} \lesssim\left(\varphi_{|a|}\right)^{*}(x,|\mathcal{A}(x, a)-\mathcal{A}(y, a)|) \\
& \lesssim\left((1+|\ln (\delta+|a|)|)\left(1+(\delta+|a|)^{p(y)-p(x)}\right)\right)^{\max \left\{2, p^{\prime}(x)\right\}}\left(\varphi_{|a|}\right)^{*}\left(x,|p(x)-p(y)| \varphi^{\prime}(x,|a|)\right) \\
& \lesssim|p(x)-p(y)|^{2}\left((1+|\ln (\delta+|a|)|)\left(1+(\delta+|a|)^{p(y)-p(x)}\right)\right)^{\max \left\{2, p^{\prime}(x)\right\}} \varphi(x,|a|) \\
& \lesssim|p(x)-p(y)|^{2}\left(1+|a|^{p(x) s}\right)
\end{aligned}
$$

for some $s>1$, which can chosen to be close to 1 if $|x-y|$ is close to 0 .
$a d$ (A.9). Using twice the Newton-Leibniz formula yields for all $x, y \in \bar{\Omega}$ and $a \in \mathbb{R}^{d}$ that

$$
\begin{align*}
& \left(\varphi_{|b|}\right)^{*}(x, \lambda t) \lesssim\left((\delta+|b|)^{p(x)-1}+\lambda t\right)^{p^{\prime}(x)-2}(\lambda t)^{2} \\
& =\left((\delta+|b|)^{p(y)-1}+\lambda t\right)^{p^{\prime}(x)-2}(\lambda t)^{2} \\
& \quad+\int_{p(x) \wedge p(y)}^{p(x) \vee p(y)}\left(p^{\prime}(x)-2\right)(\delta+|b|)^{r-1} \ln (\delta+|b|)\left((\delta+|b|)^{r-1}+\lambda t\right)^{p^{\prime}(x)-3}(\lambda t)^{2} \mathrm{~d} r \\
& =\left((\delta+|b|)^{p(y)-1}+\lambda t\right)^{p^{\prime}(y)-2}(\lambda t)^{2}  \tag{A.14}\\
& \quad+\int_{p(x) \wedge p(y)}^{p(x) \vee p(y)}\left(p^{\prime}(x)-2\right)(\delta+|b|)^{r-1} \ln (\delta+|b|)\left((\delta+|b|)^{r-1}+\lambda t\right)^{p^{\prime}(x)-3}(\lambda t)^{2} \mathrm{~d} r \\
& \quad+\int_{p^{\prime}(x) \wedge p^{\prime}(y)}^{p^{\prime}(x) \vee p^{\prime}(y)} \ln \left((\delta+|b|)^{p(y)-1}+\lambda t\right)\left((\delta+|b|)^{p(y)-1}+\lambda t\right)^{r-2}(\lambda t)^{2} \mathrm{~d} r \\
& =:\left((\delta+|b|)^{p(y)-1}+\lambda t\right)^{p^{\prime}(y)-2}(\lambda t)^{2}+I_{h}^{1}+I_{h}^{2}
\end{align*}
$$

Next, we need to estimate the terms $I_{h}^{1}$ and $I_{h}^{2}$ :
ad $I_{h}^{1}$. Using $\left((\delta+|b|)^{r-1}+\lambda t\right)^{p^{\prime}(x)-2}(\lambda t)^{2} \lesssim \lambda^{\min \left\{2, p^{\prime}(x)\right\}}\left((\delta+|b|)^{r-1}+t\right)^{p^{\prime}(x)-2} t^{2}$, we obtain $I_{h}^{1} \lesssim|\ln (\delta+|b|)| \int_{p(x) \wedge p(y)}^{p(x) \vee p(y)}\left((\delta+|b|)^{r-1}+\lambda t\right)^{p^{\prime}(x)-2}(\lambda t)^{2} \mathrm{~d} r$
$\lesssim \lambda^{2 \wedge p^{\prime}(x)}|p(x)-p(y)||\ln (\delta+|b|)|\left((\delta+|b|)^{p(x)-1}+(\delta+|b|)^{p(y)-1}+t\right)^{p^{\prime}(x)}$
$\lesssim \lambda^{2 \wedge\left(p^{+}\right)^{\prime}}|p(x)-p(y)|\left(1+(\delta+|b|)^{p(x)-1}+(\delta+|b|)^{p(y)-1}+t\right)^{p^{\prime}(x) s}$
$\lesssim \lambda^{2 \wedge\left(p^{+}\right)^{\prime}}|p(x)-p(y)|\left(1+(\delta+|b|)^{p(x) s}+(\delta+|b|)^{p(y)\left(p^{\prime}(x) / p^{\prime}(y)\right) s}+t^{p^{\prime}(y)\left(p^{\prime}(x) / p^{\prime}(y)\right) s}\right)$
$\lesssim \lambda^{2 \wedge\left(p^{+}\right)^{\prime}}|p(x)-p(y)|\left(1+|b|^{p(y) s}+t^{p^{\prime}(y) s}\right)$,
for some $s>1$, which can chosen to be close to 1 if $|x-y|$ is close to 0 .
ad $I_{h}^{2}$. Using $\left((\delta+|b|)^{p(y)-1}+\lambda t\right)^{r-2}(\lambda t)^{2} \lesssim \lambda^{\min \{2, r\}}\left((\delta+|b|)^{p(y)-1}+t\right)^{r-2} t^{2}$, we obtain

$$
\begin{aligned}
I_{h}^{2} \lesssim & \lambda^{2 \wedge\left(p^{+}\right)^{\prime}}\left|p^{\prime}(x)-p^{\prime}(y)\right|\left|\ln \left((\delta+|b|)^{p(y)-1}+t\right)\right|\left(1+(\delta+|b|)^{p(y)-1}+t\right)^{p^{\prime}(x)-2} t^{2} \\
& +\lambda^{2 \wedge\left(p^{+}\right)^{\prime}}\left|p^{\prime}(x)-p^{\prime}(y)\right|\left|\ln \left((\delta+|b|)^{p(y)-1}+t\right)\right|\left(1+(\delta+|b|)^{p(y)-1}+t\right)^{p^{\prime}(y)-2} t^{2} \\
\lesssim & \lambda^{2 \wedge\left(p^{+}\right)^{\prime}} \frac{|p(x)-p(y)|}{(p(x)-1)(p(y)-1)}\left|\ln \left((\delta+|b|)^{p(y)-1}+t\right)\right|\left(1+(\delta+|b|)^{p(y)-1}+t\right)^{p^{\prime}(x)} \\
& +\lambda^{2 \wedge\left(p^{+}\right)^{\prime}} \frac{|p(x)-p(y)|}{(p(x)-1)(p(y)-1)}\left|\ln \left((\delta+|b|)^{p(y)-1}+t\right)\right|\left(1+(\delta+|b|)^{p(y)-1}+t\right)^{p^{\prime}(y)} \\
\lesssim & \lambda^{2 \wedge\left(p^{+}\right)^{\prime}}|p(x)-p(y)|\left|\ln \left((\delta+|b|)^{p(y)-1}+t\right)\right|\left(1+(\delta+|b|)^{p(y)-1}+t\right)^{p^{\prime}(y)\left(p^{\prime}(x) / p^{\prime}(y)\right)} \\
& +\lambda^{2 \wedge\left(p^{+}\right)^{\prime}}|p(x)-p(y)|\left|\ln \left((\delta+|b|)^{p(y)-1}+t\right)\right|\left(1+(\delta+|b|)^{p(y)-1}+t\right)^{p^{\prime}(y)} \\
\lesssim & \lambda^{2 \wedge\left(p^{+}\right)^{\prime}}|p(x)-p(y)|\left(1+|b|^{p(y) s}+t^{p^{\prime}(y) s}\right),
\end{aligned}
$$

for some $s>1$, which can chosen to be close to 1 if $|x-y|$ is close to 0 .
Eventually, combining (A.15) and (A.16) in (A.14), appealing to Remark 2.6, we conclude that

$$
\left(\varphi_{|b|}\right)^{*}(x, \lambda t) \lesssim\left(\varphi_{|b|}\right)^{*}(y, \lambda t)+\lambda^{2 \wedge\left(p^{+}\right)^{\prime}}|p(x)-p(y)|\left(1+|b|^{p(y) s}+t^{p^{\prime}(y) s}\right) .
$$

$a d$ (A.7). Using the Newton-Leibniz formula and proceeding as for (A.7) and (A.16) yields for all $x, y \in \bar{\Omega}$ and $a \in \mathbb{R}^{d}$ that

$$
\begin{aligned}
\left|F^{*}(x, a)-F^{*}(y, a)\right|^{2} \lesssim & \left|\left(\delta^{p(x)-1}+|a|\right)^{\frac{p^{\prime}(x)-2}{2}} a-\left(\delta^{p(x)-1}+|a|\right)^{\frac{p^{\prime}(y)-2}{2}} a\right|^{2} \\
& +\int_{p(x) \wedge p(y)}^{p(x) \vee p(y)}|\ln (\delta)|\left(\delta^{r-1}+|a|\right)^{p^{\prime}(x)-2}|a|^{2} \mathrm{~d} r \\
\lesssim & |p(x)-p(y)|\left(1+|a|^{p(y) s}\right)
\end{aligned}
$$

The authors would like to thank the reviewer for careful reading of our paper, valuable remarks and suggestions.
