A NEW REGULARISATION FOR TIME-FRACTIONAL BACKWARD HEAT CONDUCTION PROBLEM

M.THAMBAN NAIR AND P. DANUMJAYA

ABSTRACT. It is well-known that the backward heat conduction problem of recovering the temperature $u(\cdot, t)$ at a time $t \geq 0$ from the knowledge of the temperature at a later time, namely $g := u(\cdot, \tau)$ for $\tau > t$, is ill-posed, in the sense that small error in g can lead to large deviation in $u(\cdot, t)$. However, in the case of a time fractional backward heat conduction problem (TFBHCP), the above problem is well-posed for $t > 0$ and ill-posed for $t = 0$. We use this observation to obtain stable approximate solutions for the TFBHCP for $t = 0$, and derive error estimates under suitable source conditions. We shall also provide some numerical examples to illustrate the approximation properties of the regularized solutions.

1. INTRODUCTION

For $0 < \alpha < 1$, consider the time-fractional heat equation

$$(1) \quad \frac{\partial^\alpha u}{\partial t^\alpha} = \frac{\partial^2 u}{\partial x^2}, \quad 0 < x < \pi.$$

In the above, we used the α -derivative of u with respect to t in the *Caputo sense*. That is, if φ is a real valued differentiable function on an open interval of the form $(0, a)$ for some $a > 0$,

$$\frac{d^\alpha \varphi}{dt^\alpha}(t) = \frac{1}{\Gamma(1-\alpha)} \int_0^t \frac{\varphi'(s)}{(t-s)^\alpha} ds, \quad 0 < t < a.$$

It is to be observed that for $\alpha = 1$, the equation (1) reduces to the ordinary heat equation

$$\frac{\partial u}{\partial t} = \frac{\partial^2 u}{\partial x^2}, \quad 0 < x < \pi,$$

and in that case, under the boundary condition

$$(2) \quad u(0, t) = 0 = u(\pi, t), \quad t > 0,$$

and initial condition

$$(3) \quad u(0, x) = f_0(x), \quad 0 < x < \pi$$

for $f_0 \in L^2[0, \pi]$, the solution $u(\cdot, \cdot)$ is given by

$$(4) \quad u(\cdot, t) = \sum_{n=1}^{\infty} E(-\lambda_n^2 t) \langle f_0, \varphi_n \rangle \varphi_n,$$

where $E(\cdot)$ is the exponential function $E(s) := e^s$ and

$$\lambda_n := n, \quad \varphi_n(x) = \sqrt{\frac{2}{\pi}} \sin(kx).$$

We know that $\{\varphi_n : n \in \mathbb{N}\}$ is an orthonormal basis of $L^2[0, \pi]$.

It is known (cf. [3]) that, for the time-fractional heat equation (1) along with the boundary and initial conditions (2)-(3), similar representation for its solution is possible by replacing $E(-\lambda_n^2 t)$ in (4) by $E_\alpha(-\lambda_n^2 t^\alpha)$, where $E_\alpha(\cdot)$ is the *Mittag-Leffler function* defined by

$$(5) \quad E_\alpha(z) = \sum_{k=0}^{\infty} \frac{z^k}{\Gamma(k\alpha + 1)}, \quad z \in \mathbb{C},$$

with $\Gamma(\cdot)$ being the gamma function

$$\Gamma(s) := \int_0^{\infty} e^{-t} t^{s-1} dt, \quad s > 0.$$

Clearly, $E_1(z) = E(z)$ for $z \in \mathbb{C}$. In fact, for any $f_0 \in L^2[0, \pi]$, the solution $u_\alpha(\cdot, \cdot)$ of (1) along with the boundary and initial conditions (2)-(3), is given by

$$(6) \quad u_\alpha(\cdot, t) = \sum_{n=1}^{\infty} E_\alpha(-\lambda_n^2 t^\alpha) \langle f_0, \varphi_n \rangle \varphi_n$$

with $\langle \cdot, \cdot \rangle$ being the L^2 -inner product (cf. [3, 11]). Throughout, by $\|\cdot\|$ we shall mean the norm induced by the L^2 -inner product.

With regard to the Mittag-Leffler function defined in (5), we have the following result which we shall make use of throughout the paper.

Lemma 1.1. (cf. [6, 9]) *Given real numbers α_0, α_1 such that $0 < \alpha_0 < \alpha_1 < 1$, there exist $C_1 > 0$ and $C_2 > 0$ such that*

$$\frac{C_1}{\Gamma(1-\alpha)(1+x)} \leq E_\alpha(-x) \leq \frac{C_2}{\Gamma(1-\alpha)(1+x)}$$

for all $x > 0$ and for all $\alpha \in [\alpha_0, \alpha_1]$.

In view of the above lemma, it can be seen that $u_\alpha(\cdot, t)$ in (6) is a C^∞ -function for each $t > 0$.

Analogous to the well-studied ordinary *backward heat conduction problem*, let us consider the following inverse problem, the *time-fractional backward heat conduction problem* (TFBHCP) associated with (1) and (2):

Problem (P_t): Knowing $g := u_\alpha(\cdot, \tau)$ for some $\tau > 0$, find $u_\alpha(\cdot, t)$ for $0 \leq t < \tau$.

Many studies have shown that fractional diffusion equation model is appropriate for investigating problems arising in the areas of spatially disordered systems, porous media, fractal media, turbulent fluids and plasmas, biological media with traps, and stock price movements and so on (see [9, 11], and the references therein). The regularization theory for the inverse problems associated with fractional-order PDEs is still in its infancy.

We shall see that the inverse problem P_t is well-posed if $0 < t < \tau$ and ill-posed if $t = 0$. This observation and the subsequent analysis lead us to the conclusion that $\{P_t : 0 < t < \tau\}$ gives a *regularization family* for obtaining stable approximate solutions for the ill-posed inverse problem (P_0). To our knowledge, no study is carried out using the above observation, though various regularization methods are discussed recently (see, e.g. [11, 1, 3, 5], and the references there in). We shall also provide estimates for the error $\|u_\alpha(t, \cdot) - u_\alpha(0, \cdot)\|_2$ under certain a priori source condition.

An outline of this paper is as follows. In section 2, we discuss the ill-posedness of the time fractional backward heat conduction problem (TFBHCP). Section 3 deals an operator theoretic formulation of the inverse problems. The new regularization family for the ill-posed inverse problem P_0 is introduced and its convergence is proved in Section 4. In Section 5 and 6, we derive the error estimates for the noisy data and source conditions, respectively. Finally, we perform some numerical experiments to validate the theoretical results in Section 7.

2. ILL-POSEDNESS OF THE INVERSE PROBLEM

Let $g = u_\alpha(\cdot, \tau)$. Then, from equation (6), we have

$$(7) \quad g = \sum_{n=1}^{\infty} E_\alpha(-\lambda_n^2 \tau^\alpha) \langle f_0, \varphi_n \rangle \varphi_n.$$

Hence,

$$(8) \quad \langle f_0, \varphi_n \rangle = \frac{\langle g, \varphi_n \rangle}{E_\alpha(-\lambda_n^2 \tau^\alpha)} \quad \forall n \in \mathbb{N}.$$

This shows that $g := u_\alpha(\cdot, \tau)$ must satisfy the *Picard condition*:

$$(9) \quad \sum_{n=1}^{\infty} \frac{|\langle g, \varphi_n \rangle|^2}{E_\alpha(-\lambda_n^2 \tau^\alpha)^2} < \infty.$$

By Lemma 1.1, it is to be observed that

$$\frac{1}{C_2} \Gamma(1-\alpha)(1 + \lambda_n^2 \tau^\alpha) \leq \frac{1}{E_\alpha(-\lambda_n^2 \tau^\alpha)^2} \leq \frac{1}{C_1} \Gamma(1-\alpha)(1 + \lambda_n^2 \tau^\alpha).$$

Therefore, Picard condition (9) on g is equivalent to the requirement

$$(10) \quad \sum_{n=1}^{\infty} (1 + \lambda_n^2 \tau^\alpha) |\langle g, \varphi_n \rangle|^2 < \infty$$

which is again equivalent to

$$\sum_{n=1}^{\infty} n^2 |\langle g, \varphi_n \rangle|^2 < \infty.$$

Using (8), the representation of $u_\alpha(\cdot, t)$ in (6) takes the form

$$(11) \quad u_\alpha(\cdot, t) = \sum_{n=1}^{\infty} \frac{E_\alpha(-\lambda_n^2 t^\alpha)}{E_\alpha(-\lambda_n^2 \tau^\alpha)} \langle g, \varphi_n \rangle \varphi_n$$

so that

$$(12) \quad \|u_\alpha(\cdot, t)\|^2 = \sum_{n=1}^{\infty} \left| \frac{E_\alpha(-\lambda_n^2 t^\alpha)}{E_\alpha(-\lambda_n^2 \tau^\alpha)} \right|^2 |\langle g, \varphi_n \rangle|^2.$$

Again, using Lemma 1.1, we have

$$(13) \quad \frac{C_1 (1 + \lambda_n^2 \tau^\alpha)}{C_2 (1 + \lambda_n^2 t^\alpha)} \leq \frac{E_\alpha(-\lambda_n^2 t^\alpha)}{E_\alpha(-\lambda_n^2 \tau^\alpha)} \leq \frac{C_2 (1 + \lambda_n^2 \tau^\alpha)}{C_1 (1 + \lambda_n^2 t^\alpha)}$$

Note that,

$$\frac{(1 + \lambda_n^2 \tau^\alpha)}{(1 + \lambda_n^2 t^\alpha)} \geq \frac{\lambda_n^2 \tau^\alpha}{(\lambda_n^2 + \lambda_n^2 t^\alpha)} = \frac{\tau^\alpha}{(1 + t^\alpha)},$$

and for $0 < t \leq \tau$,

$$\frac{(1 + \lambda_n^2 \tau^\alpha)}{(1 + \lambda_n^2 t^\alpha)} \leq \frac{(\lambda_n^2 + \lambda_n^2 \tau^\alpha)}{\lambda_n^2 t^\alpha} = \frac{(1 + \tau^\alpha)}{t^\alpha}.$$

Hence, for $0 < t \leq \tau$,

$$(14) \quad \frac{C_1}{C_2} \frac{\tau^\alpha}{(1 + t^\alpha)} \leq \frac{E_\alpha(-\lambda_n^2 t^\alpha)}{E_\alpha(-\lambda_n^2 \tau^\alpha)} \leq \frac{C_2}{C_1} \frac{(1 + \tau^\alpha)}{t^\alpha}.$$

Hence, the representation (12) together with (14) imply that if $0 < t \leq \tau$, then

$$(15) \quad \frac{C_1}{C_2} \frac{\tau^\alpha}{(1 + t^\alpha)} \|g\| \leq \|u_\alpha(\cdot, t)\| \leq \frac{C_2}{C_1} \frac{(1 + \tau^\alpha)}{t^\alpha} \|g\|$$

and if $t = 0$, then (12) and (13) imply

$$(16) \quad \|u_\alpha(\cdot, 0)\|^2 \geq \left(\frac{C_1}{C_2}\right)^2 \sum_{n=1}^{\infty} (1 + \lambda_n^2 \tau^\alpha)^2 |\langle g, \varphi_n \rangle|^2.$$

Note that, by (10) the series on the right hand side of the above inequality converges. However, corresponding to an initial temperature $\tilde{u}_\alpha(\cdot, 0)$, if the temperature at time τ is \tilde{g} , then the above arguments lead to

$$\|u_\alpha(\cdot, 0) - \tilde{u}_\alpha(\cdot, 0)\|^2 \geq \left(\frac{C_1}{C_2}\right)^2 \sum_{n=1}^{\infty} (1 + \lambda_n^2 \tau^\alpha)^2 |\langle g - \tilde{g}, \varphi_n \rangle|^2.$$

From this we obtain

$$(17) \quad \|u_\alpha(\cdot, 0) - \tilde{u}_\alpha(\cdot, 0)\| \geq (1 + \lambda_n^2 \tau^\alpha) \left(\frac{C_1}{C_2}\right) \|g - \tilde{g}\| \quad \forall n \in \mathbb{N}.$$

This shows that small error in g can lead to large deviation in the solution $u_\alpha(\cdot, 0)$, even when the data satisfy the Picard condition as in (9). Thus, from the inequalities in (15) and (17), we can infer the following.

Theorem 2.1. *Let C_1, C_2 and α be as in Lemma 1.1. Then the TFBHCP (P_t) is well-posed for $0 < t < \tau$ and the problem (P_0) is ill-posed.*

What we are interested in is to find stable approximate solutions for the ill-posed inverse problem (P_0) .

3. OPERATOR THEORETIC FORMULATION OF THE INVERSE PROBLEMS

For a few observations on operators that appear in this section, we shall make use of the following proposition based on basic results from functional analysis. For the sake of completeness of the exposition, we provide its proof as well.

Proposition 3.1. *Let \mathcal{H} be an infinite dimensional separable Hilbert space and let $\{v_n : n \in \mathbb{N}\}$ be an orthonormal basis of \mathcal{H} . Let (μ_n) be a bounded sequence of real numbers and $A : \mathcal{H} \rightarrow \mathcal{H}$ be defined by*

$$Av = \sum_{n=1}^{\infty} \mu_n \langle v, v_n \rangle_{\mathcal{H}} v_n, \quad v \in \mathcal{H},$$

where $\langle \cdot, \cdot \rangle_{\mathcal{H}}$ denotes the inner product on \mathcal{H} . Then A is a self-adjoint, bounded linear operator. Further, we have the following:

- (i) If $\mu_n \rightarrow 0$, then A is a compact operator.
- (ii) If $\mu_n \neq 0$ for all $n \in \mathbb{N}$, then A is injective and range of A is dense.

- (iii) *If there exists $c_0 > 0$ such that $|\mu_n| \geq c_0$ for all $n \in \mathbb{N}$, then A is injective, range of A is closed, and its inverse from the range is continuous.*

In particular, if assumptions in (ii) and (iii) are satisfied, then A is bijective and its inverse is continuous.

Proof. Using the boundedness of (μ_n) it follows from Riesz-Fischer theorem (cf. [7]) that A bounded linear operator on \mathcal{H} with $\|A\| \leq \sup\{|\mu_n| : n \in \mathbb{N}\}$. Also, since $\mu_n \in \mathbb{R}$, we that A is a self-adjoint operator.

- (i) Suppose $\mu_n \rightarrow 0$. For $n \in \mathbb{N}$, let $A_n : \mathcal{H} \rightarrow \mathcal{H}$ be defined by

$$A_n v = \sum_{j=1}^n \mu_j \langle v, v_j \rangle_{\mathcal{H}} v_j, \quad v \in \mathcal{H}.$$

Then we see that

$$\|A - A_n\| \leq \sup\{|\mu_j| : j > n\} \rightarrow 0.$$

Since each A_n is a finite rank operator, it follows that (cf. Theorem 9.- in [7]) A is a compact operator .

- (ii) Suppose $\mu_n \neq 0$ for all $n \in \mathbb{N}$. Then for $v \in \mathcal{H}$, we have

$$Av = 0 \iff \mu_n \langle v, v_n \rangle_{\mathcal{H}} = 0 \quad \forall n \in \mathbb{N} \iff \langle v, v_n \rangle_{\mathcal{H}} = 0 \quad \forall n \in \mathbb{N} \iff v = 0.$$

Hence, A is injective. Now, to see that $R(A)$, the range of A , is dense in \mathcal{H} , let $w \in \mathcal{H}$ be such that $\langle Av, w \rangle = 0$ for all $v \in \mathcal{H}$. Then, in particular, we have

$$\mu_n \langle \varphi_n, w \rangle = \langle A\varphi_n, w \rangle = 0 \quad \forall n \in \mathbb{N}.$$

From this, using again the fact that $\mu_n \neq 0$ for all $n \in \mathbb{N}$, we have $w = 0$. Thus, we have proved that $R(A)^\perp = \{0\}$, which implies, by projection theorem, that $R(A)$ is dense.

- (iii) Suppose there exists $c_0 > 0$ such that $|\mu_n| \geq c_0$ for all $n \in \mathbb{N}$. Then we have

$$\|Av\|_{\mathcal{H}} \geq c_0 \|v\|_{\mathcal{H}} \quad \forall v \in \mathcal{H}.$$

From this, the conclusions follow.

The last part of the theorem is obvious. □

Now, consider the operator $A_\alpha : L^2[0, \pi] \rightarrow L^2[0, \pi]$ defined by

$$A_\alpha f = \sum_{n=1}^{\infty} E_\alpha(-\lambda_n^2 \tau^\alpha) \langle f, \varphi_n \rangle \varphi_n, \quad f \in L^2[0, \pi].$$

Using Lemma 1.1, we see that

$$E_\alpha(-\lambda_n^2 \tau^\alpha) \rightarrow 0 \quad \text{as } n \rightarrow \infty.$$

Hence, by Proposition 3.1, A_α is a compact operator of infinite rank. Hence, in view of equation (7), the fact that the problem (P_0) is ill-posed also follows from the observation that (7) is same as solving the compact operator equation

$$(18) \quad A_\alpha f = g,$$

which is an ill-posed problem.

Again, by Proposition 3.1, A_α is one-one and its range is dense in $L^2[0, \pi]$. Hence, if $g \in L^2[0, \pi]$ satisfies the the Picard condition (9), then it is in the range of A_α and $f_0 := u_\alpha(\cdot, 0)$ is the the generalized solution of the operator equation (18), that is,

$$f_0 = A_\alpha^\dagger g,$$

where A_α^\dagger denotes the Moore-Penrose inverse of A_α (cf. [8]).

Next, we observe from (6) that

$$\langle f_0, \varphi_n \rangle = \frac{\langle u_\alpha(\cdot, t), \varphi_n \rangle}{E_\alpha(\lambda_n^2 t^\alpha)} \quad \forall n \in \mathbb{N},$$

so that equation (7) leads to

$$(19) \quad g = \sum_{n=1}^{\infty} \frac{E_\alpha(-\lambda_n^2 \tau^\alpha)}{E_\alpha(-\lambda_n^2 t^\alpha)} \langle u_\alpha(\cdot, t), \varphi_n \rangle \varphi_n.$$

Interchanging t and τ in (14), we obtain

$$\frac{C_1}{C_2} \frac{t^\alpha}{(1 + \tau^\alpha)} \leq \frac{E_\alpha(-\lambda_n^2 \tau^\alpha)}{E_\alpha(-\lambda_n^2 t^\alpha)} \leq \frac{C_2}{C_1} \frac{(1 + t^\alpha)}{\tau^\alpha}.$$

Hence, by Proposition 3.1, it follows that for $0 < t < \tau$, $B_{\alpha,t} : L^2[0, \pi] \rightarrow L^2[0, \pi]$ defined by

$$B_{\alpha,t} f = \sum_{n=1}^{\infty} \frac{E_\alpha(-\lambda_n^2 \tau^\alpha)}{E_\alpha(-\lambda_n^2 t^\alpha)} \langle f, \varphi_n \rangle \varphi_n, \quad f \in L^2[0, \pi],$$

is a bijective bounded linear operator with continuous inverse. Thus, the problem (P_t) of recovering $u_\alpha(\cdot, t)$ from g , which corresponds to the equation (19) is same as the problem of solving the operator equation

$$B_{\alpha,t} f = g,$$

which is a well-posed problem.

4. THE REGULARIZATION

In view of the expression (11), for each $\alpha \in (0, 1)$ and $t \in (0, \tau)$, we define the map $R_{t,\alpha} : L^2[0, \pi] \rightarrow L^2[0, \pi]$ as

$$(20) \quad R_{t,\alpha}\psi = \sum_{n=1}^{\infty} \frac{E_{\alpha}(-\lambda_n^2 t^{\alpha})}{E_{\alpha}(-\lambda_n^2 \tau^{\alpha})} \langle \psi, \varphi_n \rangle \varphi_n, \quad \psi \in L^2[0, \pi].$$

In view of (14), we see that $R_{t,\alpha} : L^2[0, \pi] \rightarrow L^2[0, \pi]$ is a well-defined bounded linear operator with

$$\|R_{t,\alpha}\| \leq \frac{C_2}{C_1} \left(\frac{1 + \tau\alpha}{t^{\alpha}} \right).$$

Note that if $g = u_{\alpha}(\cdot, \tau)$, then by (11),

$$R_{t,\alpha}g = u_{\alpha}(\cdot, t), \quad 0 < t < \tau.$$

The following theorem shows that, for each $\alpha \in (0, 1)$, the family $\{R_{t,\alpha} : 0 < t < \tau\}$ of operators defined above is a regularization family for the ill-posed inverse problem P_0 .

Theorem 4.1. *If $g = u_{\alpha}(\cdot, \tau)$, then*

$$\|u_{\alpha}(\cdot, 0) - u_{\alpha}(\cdot, t)\| \rightarrow 0 \quad \text{as } t \rightarrow 0.$$

Proof. By the representation of $u_{\alpha}(\cdot, t)$ in (6), we have

$$u_{\alpha}(\cdot, t) - u_{\alpha}(\cdot, 0) = \sum_{n=1}^{\infty} [E_{\alpha}(-\lambda_n^2 t^{\alpha}) - 1] \langle f_0, \varphi_n \rangle \varphi_n.$$

so that

$$(21) \quad \|u_{\alpha}(\cdot, t) - u_{\alpha}(\cdot, 0)\|^2 = \sum_{n=1}^{\infty} |E_{\alpha}(-\lambda_n^2 t^{\alpha}) - 1|^2 |\langle f_0, \varphi_n \rangle|^2.$$

From the definition of $E_{\alpha}(\cdot)$, we have

$$\begin{aligned} E(z) - 1 &= \sum_{k=1}^{\infty} \frac{z^k}{\Gamma(\alpha k + 1)} = z \sum_{k=1}^{\infty} \frac{z^{k-1}}{\Gamma(\alpha k + 1)} \\ &= z \sum_{k=0}^{\infty} \frac{z^k}{\Gamma(\alpha k + \alpha + 1)} = z E_{\alpha, \alpha+1}(z), \end{aligned}$$

where for $\alpha, \beta > 0$, $E_{\alpha, \beta}(\cdot)$ is the *generalized Mittag-Leffler function* defined by

$$E_{\alpha, \beta}(z) = \sum_{k=0}^{\infty} \frac{z^k}{\Gamma(\alpha k + \beta)}.$$

Hence, we have

$$(22) \quad E_{\alpha}(-\lambda_n^2 t^{\alpha}) - 1 = (-\lambda_n^2 t^{\alpha}) E_{\alpha, \alpha+1}(-\lambda_n^2 t^{\alpha}).$$

It is known that (cf. [10]) that if there exists $C > 0$ such that for $0 < \alpha < 2$ and $\beta \in \mathbb{R}$,

$$|E_{\alpha,\beta}(z)| \leq \frac{C}{1+|z|}$$

for all $z \in \mathbb{C}$ and for $\mu < |\arg(z)| \leq \pi$, where

$$\frac{\pi\alpha}{2} < \mu < \min\{\pi, \pi\alpha\}.$$

Now, taking $z = -\lambda_n^2 t^\alpha$ and $0 < \alpha < 1$, we have $\arg(z) = \pi$ and $\min\{\pi, \pi\alpha\} = \pi\alpha$. Hence, in this case the required conditions on $\arg(z)$ is automatically satisfied. Thus, we have

$$|E_{\alpha,\alpha+1}(-\lambda_n^2 t^\alpha)| \leq \frac{C}{1+\lambda_n^2 t^\alpha}.$$

Hence,

$$(23) \quad |E_\alpha(-\lambda_n^2 t^\alpha) - 1| = |-\lambda_n^2 t^\alpha E_{\alpha,\alpha+1}(-\lambda_n^2 t^\alpha)| \leq \frac{C\lambda_n^2 t^\alpha}{1+\lambda_n^2 t^\alpha} \leq C.$$

In particular, $|E_\alpha(-\lambda_n^2 t^\alpha) - 1| \rightarrow 0$ as $t \rightarrow 0$ for each $n \in \mathbb{N}$. Thus,

$$|E_\alpha(-\lambda_n^2 t^\alpha) - 1|^2 |\langle f_0, \varphi_n \rangle|^2 \rightarrow 0 \text{ as } t \rightarrow 0 \text{ for each } n \in \mathbb{N}$$

and

$$|E_\alpha(-\lambda_n^2 t^\alpha) - 1|^2 |\langle f_0, \varphi_n \rangle|^2 \leq C^2 |\langle f_0, \varphi_n \rangle|^2$$

with $\sum_{n=1}^{\infty} |\langle f_0, \varphi_n \rangle|^2 \leq \|f_0\|^2$. Hence, by the dominated convergence theorem, the relation (21) implies that

$$\|u_\alpha(\cdot, t) - u_\alpha(\cdot, 0)\| \rightarrow 0 \text{ as } t \rightarrow 0.$$

This completes the proof. \square

5. ERROR ESTIMATE UNDER NOISY DATA

If the data is noisy, say we have $\tilde{g} \in L^2[0, \pi]$ in place of g such that

$$\|g - \tilde{g}\| \leq \delta$$

for some known noise level $\delta > 0$, then using the expression in (11), the corresponding solution at t can be taken as

$$\tilde{u}_\alpha(\cdot, t) = R_{\alpha,t} \tilde{g},$$

where $R_{\alpha,t}$ is defined as in (20). Thus,

$$(24) \quad \tilde{u}_\alpha(\cdot, t) = \sum_{n=1}^{\infty} \frac{E_\alpha(-\lambda_n^2 t^\alpha)}{E_\alpha(-\lambda_n^2 \tau^\alpha)} \langle \tilde{g}, \varphi_n \rangle \varphi_n.$$

Hence, we obtain

$$\|u_\alpha(\cdot, t) - \tilde{u}_\alpha(\cdot, t)\|^2 = \sum_{n=1}^{\infty} \left| \frac{E_\alpha(-\lambda_n^2 t^\alpha)}{E_\alpha(-\lambda_n^2 \tau^\alpha)} \right|^2 |\langle g - \tilde{g}, \varphi_n \rangle|^2$$

so that using (14),

$$\|u_\alpha(\cdot, t) - \tilde{u}_\alpha(\cdot, t)\| \leq \frac{C_2}{C_1} \left(\frac{1 + \tau^\alpha}{t^\alpha} \right) \delta.$$

Thus, we have proved:

Theorem 5.1. *For $0 < t < \tau$,*

$$\|u_\alpha(\cdot, t) - \tilde{u}_\alpha(\cdot, t)\| \leq \frac{C_2}{C_1} \left(\frac{1 + \tau^\alpha}{t^\alpha} \right) \delta.$$

Thus we have proved the following theorem.

Theorem 5.2. *For $0 < t < \tau$,*

$$\|u_\alpha(\cdot, 0) - \tilde{u}_\alpha(\cdot, t)\| \leq \|u_\alpha(\cdot, 0) - u_\alpha(\cdot, t)\| + \frac{C_2(1 + \tau^\alpha)}{C_1} \frac{\delta}{t^\alpha},$$

where (by Theorem 4.1) $\|u_\alpha(\cdot, 0) - u_\alpha(\cdot, t)\| \rightarrow 0$ as $t \rightarrow 0$.

6. ERROR ESTIMATES UNDER SOURCE CONDITIONS

Assumption (A): There exists an index function $\varphi : (0, \infty) \rightarrow [0, \infty)$ such that

$$(25) \quad \|u_\alpha(\cdot, t) - f_0\| \leq c_0 \varphi(t)$$

for some $c_0 > 0$.

Theorem 6.1. *Under the Assumption (A), let $\psi(t) := t\varphi(t)$ for $t > 0$, and for $\delta > 0$, let $t_\delta := \psi^{-1}(\delta)$. Then*

$$\|f_0 - \tilde{u}_\alpha(\cdot, t_\delta)\| = O(\varphi(\psi^{-1}(\delta))).$$

Proof. By (25) and Theorem 5.1,

$$\begin{aligned} \|f_0 - \tilde{u}_\alpha(\cdot, t)\| &\leq \|u_\alpha(\cdot, t) - u_\alpha(\cdot, 0)\| + \|u_\alpha(\cdot, t) - \tilde{u}_\alpha(\cdot, t)\| \\ &\leq c_0 \varphi(t) + \frac{C_2(1 + \tau^\alpha)}{C_1} \frac{\delta}{t^\alpha} \end{aligned}$$

Note that

$$\varphi(t) = \frac{\delta}{t^\alpha} \iff \psi(t) := t^\alpha \varphi(t) = \delta.$$

Hence, by choosing $t = t_\delta := \psi^{-1}(\delta)$, we obtain

$$\|f_0 - \tilde{u}_\alpha(\cdot, t)\| = O(\varphi(t_\delta)) = O(\varphi(\psi^{-1}(\delta))).$$

□

Now, we specify an index function φ and a source set M_φ such that (25) is satisfied whenever $f_0 \in M_\varphi$.

Let $K_\alpha : L^2[0, \pi] \rightarrow L^2[0, \pi]$ be defined by

$$K_\alpha \varphi = \sum_{n=1}^{\infty} E_\alpha(-\lambda_n^2 \tau^\alpha) \langle \varphi, \varphi_n \rangle \varphi_n, \quad \varphi \in L^2[0, \pi].$$

Since $E_\alpha(-\lambda_n^2 \tau^\alpha) \in \mathbb{R}$ and $E_\alpha(-\lambda_n^2 \tau^\alpha) \rightarrow 0$ as $n \rightarrow \infty$, it follows that (cf. [7]) K_α is a compact, self-adjoint operator and

$$(26) \quad K_\alpha \varphi_n = E(-\lambda_n^2 \tau^\alpha) \varphi_n \quad \forall n \in \mathbb{N}.$$

In view of (7), we see that $f_0 := u_\alpha(\cdot, 0)$ is the solution of the compact operator equation

$$K_\alpha f = g.$$

Let

$$(27) \quad \mathcal{M}_{\alpha, \rho} := \{K_\alpha u : \|u\| \leq \rho\}.$$

and assume that

$$f_0 \in \mathcal{M}_{\alpha, \rho}.$$

Then $f_0 = K_\alpha u$ for some $u \in L^2[0, \pi]$ with $\|u\| \leq \rho$, and hence by (26), we have

$$\langle f_0, \varphi_n \rangle = \langle K_\alpha u, \varphi_n \rangle = \langle u, K_\alpha \varphi_n \rangle = E_\alpha(-\lambda_n^2 \tau^\alpha) \langle u, \varphi_n \rangle \quad \forall n \in \mathbb{N}.$$

Hence, from (21), we have

$$\begin{aligned} \|u_\alpha(\cdot, t) - f_0\|^2 &= \sum_{n=1}^{\infty} |E_\alpha(-\lambda_n^2 t^\alpha) - 1|^2 |\langle f_0, \varphi_n \rangle|^2 \\ &= \sum_{n=1}^{\infty} |E_\alpha(-\lambda_n^2 t^\alpha) - 1|^2 |E_\alpha(-\lambda_n^2 \tau^\alpha)|^2 |\langle u, \varphi_n \rangle|^2 \end{aligned}$$

Now, (23) and Lemma 1.1 imply that

$$|E_\alpha(-\lambda_n^2 t^\alpha) - 1| |E_\alpha(-\lambda_n^2 \tau^\alpha)| \leq C_\alpha \frac{\lambda_n^2 t^\alpha}{(1 + \lambda_n^2 t^\alpha)(1 + \lambda_n^2 \tau^\alpha)},$$

where

$$(28) \quad C_\alpha := \frac{CC_2}{\Gamma(1 - \alpha)},$$

with C and C_2 as in (22) and Lemma 1.1, respectively. Note that

$$\frac{\lambda_n^2 t^\alpha}{(1 + \lambda_n^2 t^\alpha)(1 + \lambda_n^2 \tau^\alpha)} = \frac{(\lambda_n^2 t^\alpha)/(\lambda_n^2 \tau^\alpha)}{(1 + \lambda_n^2 t^\alpha)} \frac{\lambda_n^2 \tau^\alpha}{(1 + \lambda_n^2 \tau^\alpha)} \leq \frac{t^\alpha}{\tau^\alpha}.$$

Thus, we arrive at the estimate

$$\|u_\alpha(\cdot, t) - f_0\|^2 \leq C_\alpha^2 \left(\frac{t^\alpha}{\tau^\alpha}\right)^2 \sum_{n=1}^{\infty} |\langle u, \varphi_n \rangle|^2.$$

Thus, we have proved the following theorem.

Theorem 6.2. *If $f_0 \in \mathcal{M}_{\alpha, \rho}$, then*

$$\|u_\alpha(\cdot, t) - f_0\| \leq \rho C_\alpha \frac{t^\alpha}{\tau^\alpha},$$

where $\mathcal{M}_{\alpha, \rho}$ and C_α are as in (27) and (28), respectively.

Remark 6.3. Theorem 6.2 shows that the function φ defined by

$$\varphi(t) = t^\alpha, \quad t > 0,$$

satisfies the Assumption (A) with $c_0 = \rho C_\alpha / \tau^\alpha$.

In view of Theorem 6.2 and Theorem 5.2, if $f_0 \in \mathcal{M}_{\alpha, \rho}$, then we have

$$\begin{aligned} \|f_0 - \tilde{u}_\alpha(\cdot, t)\| &\leq \|u_\alpha(\cdot, t) - u_\alpha(\cdot, 0)\| + \|u_\alpha(\cdot, t) - \tilde{u}_\alpha(\cdot, t)\| \\ &\leq \rho C_\alpha \frac{t^\alpha}{\tau^\alpha} + \frac{C_2(1 + \tau^\alpha)}{C_1} \frac{\delta}{t^\alpha}. \end{aligned}$$

Now,

$$\frac{t^\alpha}{\tau^\alpha} = \frac{\delta}{t^\alpha} \iff t^{2\alpha} = \tau^\alpha \delta \iff t^\alpha = \sqrt{\tau^\alpha \delta} \iff \frac{t^\alpha}{\tau^\alpha} = \sqrt{\frac{\delta}{\tau^\alpha}}.$$

Thus, we have proved the following theorem.

Theorem 6.4. *If $f_0 \in \mathcal{M}_{\alpha, \rho}$ and $t_\delta := \sqrt{\tau \delta^{1/\alpha}}$, then*

$$\|\tilde{u}_\alpha(\cdot, t_\delta) - f_0\| \leq \left(\rho C_\alpha + \frac{C_2(1 + \tau)}{C_1} \right) \sqrt{\frac{\delta}{\tau^\alpha}}.$$

where $\mathcal{M}_{\alpha, \rho}$ and C_α are as in (27) and (28), respectively. In particular,

$$\|\tilde{u}_\alpha(\cdot, t_\delta) - f_0\| = O(\sqrt{\delta}).$$

Remark 6.5. By the definition of $\mathcal{M}_{\alpha, \rho}$ and from the standard regularization theory (cf. [2, 8]), it follows that the estimate obtained in Theorem 6.4 is optimal for the source set $\mathcal{M}_{\alpha, \rho}$.

7. NUMERICAL ILLUSTRATIONS

In this section, we shall consider some numerical examples to illustrate the level of approximation of the regularized solutions.

For numerical computations, we divide the given space domain $[0, \pi]$ into a finite number of equal subintervals with step size h where $h = x_{i+1} - x_i$, $i = 0, 1, 2, \dots, N-1$ with $x_0 = 0$, and $x_N = \pi$. All the simulations are carried out using MATLAB R2022a with step size $h = \pi/100$.

We have observed that the problem of finding $u_\alpha(\cdot, t)$, $0 < t \leq \tau$ from the knowledge of $g := u_\alpha(\cdot, \tau)$ is a well-posed problem, and $\|u_\alpha(\cdot, t) - f_0\| \rightarrow 0$ as $t \rightarrow 0$ (see Theorem 3.1).

For computational purpose, we take $\tau = 1$ and consider $g = u_\alpha(\cdot, \tau)$ obtained from (6) by taking $f_0(x) = x(\pi - x)e^{-x}$, $0 \leq x \leq \pi$, and then compute $u_\alpha(\cdot, t)$ according to the formula (11).

To approximate the integrals involved in the computation of g and $u_\alpha(\cdot, t)$, we make use of the composite trapezoidal rule. For the illustration of the convergence $\|u_\alpha(\cdot, t) - f_0\|_{L^2} \rightarrow 0$ as $t \rightarrow 0$, we take $t_i = 10^{-(i+2)}$ for $i = 1, 2, \dots, 7$ and compute the exact expression $f_0(x)$ as well as $u_\alpha(x, t_i)$ and show in Figures 1 to 4 for various $\alpha \in \{0.2, 0.4, 0.6, 0.8\}$.

FIGURE 1. Solution profiles of $f_0(x)$ and $u_\alpha(x, t_i)$ for $\alpha = 0.2$

FIGURE 2. Solution profiles of $f_0(x)$ and $u_\alpha(x, t_i)$ for $\alpha = 0.4$

FIGURE 3. Solution profiles of $f_0(x)$ and $u_\alpha(x, t_i)$ for $\alpha = 0.6$

FIGURE 4. Solution profiles of $f_0(x)$ and $u_\alpha(x, t_i)$ for $\alpha = 0.8$

In Table 1, we show the error $\|u_\alpha(\cdot, t) - f_0\|_{L^2}$ for $t = t_i$, $i = 1, 2, \dots, 7$ for different values of α . We observe that when t decreases, the error $\|u_\alpha(\cdot, t) - f_0\|_{L^2}$ decreases. This validates our theoretical result in Theorem 4.1.

TABLE 1. L^2 -errors between f_0 and $u_\alpha(\cdot, t_i)$ for $\alpha = 0.2, 0.4, 0.6$ and 0.8

t_i value	$\alpha = 0.2$	$\alpha = 0.4$	$\alpha = 0.6$	$\alpha = 0.8$
	$\ u_\alpha(\cdot, t) - f_0\ _{L^2}$	$\ f_0 - u_\alpha(\cdot, t)\ _{L^2}$	$\ u_\alpha(\cdot, t) - f_0\ _{L^2}$	$\ u_\alpha(\cdot, t) - f_0\ _{L^2}$
10^{-3}	3.2829(-1)	1.4958(-1)	5.2366(-2)	1.5080(-2)
10^{-4}	2.5593(-1)	7.5081(-2)	1.5476(-2)	2.6205(-3)
10^{-5}	1.9370(-1)	3.4924(-2)	4.2280(-3)	4.2730(-4)
10^{-6}	1.4253(-1)	1.5401(-2)	1.1058(-3)	6.8572(-5)
10^{-7}	1.0225(-1)	6.5509(-3)	2.8063(-4)	2.6230(-5)
10^{-8}	7.1751(-2)	2.7197(-3)	7.1304(-5)	2.5992(-5)
10^{-9}	4.9403(-2)	1.1102(-3)	2.8563(-5)	2.6255(-5)

For the illustration of the case with the noisy data, we take $\tilde{g}(x) = g(x) + \frac{\delta}{2}$ with some noise level $\delta > 0$. Note that $\|\tilde{g} - g\|_{L^2} \leq \delta$. Now we take $t_\delta := \sqrt{\tau} \delta^{1/\alpha}$ as per Theorem 6.3 and compute $\tilde{u}_\alpha(x, t_\delta)$ using the formula (24) for several values of δ and for some values of α .

Taking $\delta_i = 10^{-(i+2)}$, $i = 1, 2, \dots, 7$ we compute the exact expression f_0 as well as $\tilde{u}_\alpha(x, t_{\delta_i})$ and show them in Figures 5 to 8 for various $\alpha \in \{0.2, 0.4, 0.6, 0.8\}$.

FIGURE 5. Solution profiles of $f_0(x)$ and $\tilde{u}_\alpha(x, t_{\delta_i})$ for $\alpha = 0.2$

FIGURE 6. Solution profiles of $f_0(x)$ and $\tilde{u}_\alpha(x, t_{\delta_i})$ for $\alpha = 0.4$

FIGURE 7. Solution profiles of $f_0(x)$ and $\tilde{u}_\alpha(x, t_{\delta_i})$ for $\alpha = 0.6$

FIGURE 8. Solution profiles of $f_0(x)$ and $\tilde{u}_\alpha(x, t_{\delta_i})$ for $\alpha = 0.8$

In Table 2, we show the error $\|\tilde{u}_\alpha(\cdot, t_\delta) - f_0\|_{L^2}$ for different values of α and $\delta_i, i = 1, 2, \dots, 7$. Note that when δ value decreases, the error $\|\tilde{u}_\alpha(\cdot, t_\delta) - f_0\|_{L^2}$ decreases. This validates our theoretical result in Theorem 6.3.
