#### Abstract

An equivalent definition of hypermatrices is introduced. The matrix expression of hypermatrices is proposed. Using permutation matrices, the conversion of different matrix expressions is revealed. The various contracted products of hypermatrices are realized by semi-tensor products (STP) of matrices via matrix expressions of hypermatrices.

Keywords: $\boldsymbol{d}$-hypermatrix, matrix expression, permutation matrix, contracted product, semi-tensor product (STP)

[^0]
## 1 Introduction

The hypermatrix is an extension of the matrix to the higher order case (order $d \geq 3$ ). It has found wide application in many fields, including computer science [24], signal processing [17], statistics [16], etc. We refer to [21] for a systematic introduction to the hypermatrices, and to $[1,18]$ for some later developments.

A generalized matrix product, called the semi-tensor product (STP), was proposed two decades ago [2]. Since then it has been rapidly developed both in theoretical aspects and in various applications $[4,5]$. For example, it has been applied to the study of Boolean and finite-valued networks (see survey papers [19, 20, 22, 23]); finite games (see survey paper [11]); finite automata (see survey paper [25]); dimension-varying systems [7, 8], etc.

Later, in addition to the original matrix-matrix STP, the matrix-vector STP was proposed [9] and applied to dimension-varying dynamic (control) systems [8]. Recently, the STP of hypermatrices has also been introduced [14]. It seems possible that some new unknown STPs will appear in the future. In the early days, the (matrix-matrix) STP is said to be a generalization of the conventional matrix product. With the appearance of new STPs, this explanation does not seem to be sufficient.

The purpose of this article is to show that in essence, STPs are representations of multilinear mappings over hypermatrices. More precisely, the hypermatrices are first expressed in their matrix forms. Then the multilinear mappings over them can be executed by STP over their matrix expressions. For this purpose, the conversion of different matrix expressions of hypermatrices plays an important role.

The rest of this paper is organized as follows: Section 2 considers how to transform a hypermatrix into its distinct matrix expressions. The permutation matrix is also introduced for transforming among different matrix expressions. Section 3 shows how to realize the contracted product of hypermatrices over their matrix expressions. In Section 4, the STP is used to perform the contraction product of hypermatrices, which shows that STPs are essentially multilinear operators over hypermatrices.

Before ending this section, we give a list of the notations used in this paper.

1. $\mathbb{N}$ : the set of positive integers.
2. $\mathbb{R}$ : the set of real numbers.
3. $\mathbb{C}$ : the set of complex numbers.
4. $\mathbb{F}^{n}$ : the $n$ dimensional Euclidean space over $\mathbb{F}$, where $\mathbb{F}$ is a field (Particularly, $\mathbb{F}=\mathbb{R}$ or $\mathbb{F}=\mathbb{C})$.
5. $\operatorname{lcm}(a, b)$ : the least common multiple of $a$ and $b,(a, b \in \mathbb{N})$.
6. $\mathbb{F}^{n_{1} \times n_{2} \times \cdots \times n_{d}}$ : the $d$-th order hypermatrices of dimensions $n_{1}, n_{2}, \cdots, n_{d}$.
7. $[a, b]$ : the set of integers $a \leq i \leq b$.
8. $\langle b\rangle:=[1, b]$.
9. $\operatorname{ID}\left(i_{1}, \cdots, i_{d} ; n_{1}, \cdots, n_{d}\right)$ : A set of ordered $d$ indices.
10. $\delta_{n}^{i}$ : the $i$-th column of the identity matrix $I_{n}$.
11. $\delta_{n}^{I}:=\left[\left(\delta_{n}^{1}\right)^{T},\left(\delta_{n}^{2}\right)^{T}, \cdots,\left(\delta_{n}^{n}\right)^{T}\right]^{T}$.
12. $\Delta_{n}:=\left\{\delta_{n}^{i} \mid i=1, \cdots, n\right\}$.
13. $L \in \mathbb{R}^{m \times n}$ is a logical matrix, if its column set $\operatorname{Col}(L) \subset \Delta_{m}$. Denote by $\mathcal{L}_{m \times n}$ the set of $m \times n$ logical matrices.
14. $\delta_{m}\left[i_{1}, \cdots, i_{n}\right]:=\left[\delta_{m}^{i_{1}}, \cdots, \delta_{m}^{i_{n}}\right]$.
15. $\mathbf{1}_{\ell}:=(\underbrace{1,1, \cdots, 1}_{\ell})^{\mathrm{T}}$.
16. $\mathbf{V}_{r}(A)$ : the row stacking form of $A$.
17. $\mathbf{V}_{c}(A)$ : the column stacking form of $A$.
18. $\mathbf{V}_{r}^{s}(A)$ : the s-row stacking form of $A$.
19. $\mathbf{V}_{c}^{s}(A)$ : the s-column stacking form of $A$.
20. $\mathbf{S}_{d}$ : the $d$-th order permutation group.
21. $\ltimes:$ the STP of matrices.
22. $\times_{\mathbf{s}}^{\mathbf{r}}$ : the contracted product of hypermatrices.
23. $\ltimes_{\mathbf{s}}^{\mathbf{r}}$ : the contracted STP of hypermatrices.

## 2 Matrix Expression of Hypermatrices

### 2.1 Set-based Hypermatrix

Definition 1. [21] For $n_{1}, \cdots, n_{d} \in \mathbb{N}$, a function $f:\left\langle n_{1}\right\rangle \times \cdots \times\left\langle n_{d}\right\rangle \rightarrow \mathbb{F}$ is called a hypermatrix (over $\mathbb{F}$ ), or an order d hypermatrix or a d-hypernatrix. A d-hypermatrix is also denoted by $A=\left[a_{i_{1}}, \cdots, i_{d}\right]$.

From a set point of view, a hypermatrix consists of two ingredients:
(i) a set of data

$$
\begin{equation*}
D_{A}:=\left\{a_{i_{1}, \cdots, i_{d}} \mid i_{s} \in\left\langle n_{s}\right\rangle, s \in\langle d\rangle\right\} ; \tag{1}
\end{equation*}
$$

(ii) an order over $D_{A}$, which makes $D_{A}$ a totally ordered set. In other words, each element in $D_{A}$ has a fixed position, just as in the case of a matrix.

To make the order of $D_{A}$ precise, we introduce a set of ordered indices, ID, as follows:

$$
\operatorname{ID}\left(i_{\alpha_{1}}, \cdots, i_{\alpha_{d}} ; n_{\alpha_{1}}, \cdots, n_{a_{d}}\right)
$$

which stands for a set of data as in (1), where $\left(\alpha_{1}, \cdots, \alpha_{d}\right)$ is a permutation of $\langle d\rangle$. The order of ID is determined as follows: $a_{p_{1}, \cdots, p_{d}} \prec a_{q_{1}, \cdots, q_{d}}$ if and only if there is an $s \in\langle d\rangle$, such that $p_{i}=q_{i}, i<s$ and $p_{s}<q_{s}$.

If $\left(\alpha_{1}, \cdots, \alpha_{d}\right)=(1,2, \cdots, d)$, the corresponding ordered set of indices is called a natural order, denoted by $\mathbf{i}_{\langle d\rangle}$.

Based on the above argument, a hypermatrix can be defined alternatively as follows.
Definition 2. For $n_{1}, \cdots, n_{d} \in \mathbb{N}$, a hypermatrix (over $\mathbb{F}$ ), is a set of order d data as in (1) with an ID as $\operatorname{ID}\left(\mathbf{i}_{\langle d\rangle} ; n_{1}, \cdots, n_{d}\right)$.

To apply classical matrix analysis to hypermatrices, the matrix expression of hypermatrices is a key issue.

Let $\mathbf{r}=\left(r_{1}, r_{2}, \cdots, r_{d}\right)$ be a set of indices, and

$$
\begin{equation*}
\mathbf{r}=\left(r_{i_{1}}, r_{i_{2}}, \cdots, r_{i_{p}}\right) \cup\left(r_{j_{1}}, r_{j_{2}}, \cdots, r_{j_{q}}\right):=\mathbf{r}_{1} \cup \mathbf{r}_{2} \tag{2}
\end{equation*}
$$

be a partition, where $\mathbf{r}_{1} \cap \mathbf{r}_{2}=\emptyset$, and $p+q=d$. For ease of notation, we will assume that the elements in two subsets inherit the element order of the original set, unless otherwise stated.
Definition 3. Given a hypermatrix $A=\left[a_{r_{1}, r_{2}, \cdots, r_{d}}\right]$. For each partition

$$
\begin{equation*}
\mathbf{r}_{\langle d\rangle}=\left\{r_{i_{1}}, r_{i_{2}}, \cdots, r_{i_{p}}\right\} \cup\left\{r_{j_{1}}, r_{j_{2}}, \cdots, r_{j_{q}}\right\}:=\mathbf{r}_{1} \cup \mathbf{r}_{2}, \tag{3}
\end{equation*}
$$

there is a matrix expression of $A$, denoted by

$$
\begin{equation*}
M_{A}^{\mathbf{r}_{1} \times \mathbf{r}_{2}} \in \mathbb{F}^{s \times t} \tag{4}
\end{equation*}
$$

where

$$
s=\prod_{k=1}^{p} n_{i_{k}}, \quad t=\prod_{\ell=1}^{q} n_{j_{\ell}} .
$$

Moreover, the elements in $M_{A}^{\mathbf{r}_{1} \times \mathbf{r}_{2}}$ are $\left\{a_{\left.r_{1}, r_{2}, \cdots, r_{d}\right\} \text {, which are arranged by }}\right.$ $\operatorname{ID}\left(\mathbf{r}_{1} ; n_{r_{i_{1}}}, n_{r_{i_{2}}}, \cdots, n_{r_{i_{p}}}\right)$ for rows, and by $\operatorname{ID}\left(\mathbf{r}_{2} ; n_{r_{j_{1}}}, n_{r_{j_{2}}}, \cdots, n_{r_{j_{q}}}\right)$ for columns.
Remark 1.(i) $p$ is called the contra-variant order of $M_{A}^{\mathbf{r}_{1} \times \mathbf{r}_{2}}$ and $q$ is called the covariant order of $M_{A}^{\mathbf{r}_{1} \times \mathbf{r}_{2}}$.
(ii) If $p=0$, then we set $s=1$, and if $q=0$, then we set $t=1$.
(iii) Particularly, in (3) we require a natural order unless elsewhere is stated. That is,

$$
\begin{aligned}
& r_{i_{1}}<r_{i_{2}}<\cdots<r_{i_{p}}, \\
& r_{j_{1}}<r_{j_{2}}<\cdots<r_{j_{q}} .
\end{aligned}
$$

Thus a d-hypermatrix has $2^{d}$ different matrix expressions with the natural order. The matrix expressions $M_{A}^{\mathbf{r}_{1} \times \mathbf{r}_{2}}$ can be briefly expressed as $M_{A}^{\mathbf{r}_{1}}$, if there is no possible confusion.
Example 1. Given $A=\left[a_{i_{1} i_{2} i_{3}}\right] \in \mathbb{F}^{2 \times 3 \times 2}$. Then
(i)

$$
M_{A}^{\emptyset}=\left[\begin{array}{llllllllllll}
a_{111} & a_{112} & a_{121} & a_{122} & a_{131} & a_{132} & a_{211} & a_{212} & a_{221} & a_{222} & a_{231} & a_{232}
\end{array}\right] ;
$$

(ii)

$$
\begin{aligned}
M_{A}^{(1)} & =\left[\begin{array}{llllll}
a_{111} & a_{112} & a_{121} & a_{122} & a_{131} & a_{132} \\
a_{211} & a_{212} & a_{221} & a_{222} & a_{231} & a_{232}
\end{array}\right] ; \\
M_{A}^{(2)} & =\left[\begin{array}{llll}
a_{111} & a_{112} & a_{211} & a_{212} \\
a_{121} & a_{122} & a_{221} & a_{222} \\
a_{131} & a_{132} & a_{231} & a_{232}
\end{array}\right] ; \quad \text { etc. }
\end{aligned}
$$

(iii)

$$
M_{A}^{(1,2)}=\left[\begin{array}{cc}
a_{111} & a_{112} \\
a_{121} & a_{122} \\
a_{131} & a_{132} \\
a_{211} & a_{212} \\
a_{221} & a_{222} \\
a_{231} & a_{232}
\end{array}\right] ; \quad \text { etc. }
$$

$$
M_{A}^{(1,3)}=\left[\begin{array}{lll}
a_{111} & a_{121} & a_{131} \\
a_{112} & a_{122} & a_{132} \\
a_{211} & a_{221} & a_{231} \\
a_{212} & a_{222} & a_{232}
\end{array}\right] ; \quad \text { etc. }
$$

(iv)

$$
M_{A}^{(1,2,3)}=\left(M_{A}^{\emptyset}\right)^{\mathrm{T}}
$$

Definition 4.(i) $V_{A}:=M_{A}^{\emptyset}$ is called the (row) vector expression of hypermatrix $A$.
(ii) $M_{A}:=M_{A}^{(1)}$ is called the contra-variant one matrix expression (briefly, matrix-1 expression) of hypermatrix $A$.
Definition 5. Let $x_{i} \in \mathbb{F}^{n_{i}}, i \in\langle d\rangle$.
(i)

$$
\begin{equation*}
x:=\ltimes_{i=1}^{d} x_{i} \tag{5}
\end{equation*}
$$

is called a hypervector of order $d$.
(ii) The set of order d hypervectors with corresponding dimensions is denoted by $\mathbb{F}^{n_{1} \ltimes \cdots \ltimes n_{d}}$.

Note that the components of $x$ can be expressed as

$$
\operatorname{com}(x):=\left\{x_{i_{1}, \cdots, i_{d}}=x_{1}^{i_{1}} x_{2}^{i_{2}} \cdots x_{d}^{i_{d}} \mid i_{j} \in\left\langle n_{j}\right\rangle, j \in\langle d\rangle\right\},
$$

where $x_{r}^{i_{r}}$ is the $i_{r}$-th component of $x_{r}$. Hence it is clear that $\operatorname{com}(x)$ (or briefly hypervector $x$ ) is a hypermatrix of order $d$. Moreover, it is obvious that
Proposition 1.

$$
\begin{equation*}
\mathbb{F}^{n_{1} \ltimes \cdots \ltimes n_{d}} \subset \mathbb{F}^{n_{1} \times \cdots \times n_{d}} \tag{6}
\end{equation*}
$$

is a subset of hypermatrices.

## $2.2 \sigma$-transpose of Hypermatrices

Definition 6. [21]
(i) Given a d-hypermatrix $A=\left[a_{j_{1}, j_{2}, \cdots, j_{d}}\right] \in \mathbb{F}^{n_{1} \times n_{2} \times \cdots \times n_{d}}$, and assume $\sigma \in \mathbf{S}_{d}$. The $\sigma$-transpose of $A$ is

$$
\begin{equation*}
A^{\sigma}:=\left[a_{j_{\sigma(1)} \cdots j_{\sigma(d)}}\right] \in \mathbb{F}^{n_{\sigma(1)} \times \cdots \times n_{\sigma(d)}} . \tag{7}
\end{equation*}
$$

(ii) If a d-hypermatrix $A \in \overbrace{\mathbb{F} \times \cdots \times n}^{d}$, then $A$ is said to be d-hypercubic.
(iii) A d-hypercubic $A \in \mathbb{F}_{n \times \cdots \times n}^{d}$ is said to be symmetric if $\forall \sigma \in \mathbf{S}_{d}, A^{\sigma}=A$; $A$ is said to be skew-symmetric if $\forall \sigma \in \mathbf{S}_{d}, A^{\sigma}=\operatorname{sgn}(\sigma) A$.

It is obvious that a matrix is a 2-hypermatrix, so the above general definitions coincide with the corresponding definitions for matrices.
Proposition 2. A 2-hypercubic $A \in \mathbb{F}^{n \times n}$ is (skew-)symmetric, if and only if, $M_{A}$ is (skew-)symmetric.
Proposition 3. Let $A \in \mathbb{F}^{n_{1} \times \cdots \times n_{d}}$ and $\mathbf{r} \subset \mathbf{d}=\langle d\rangle$. Then

$$
\begin{equation*}
\left[M_{A}^{\mathbf{r} \times(\mathbf{d} \backslash \mathbf{r})}\right]^{T}=M_{A}^{(\mathbf{d} \backslash \mathbf{r}) \times \mathbf{r}} \tag{8}
\end{equation*}
$$

Remark 2. The above arguments stand true even when $\mathbb{F}$ is a set of perfect hypercomplex numbers (PHNs) [12]. In fact, most of arguments throughout this paper also hold for PHNs.

Next, we recall the permutation matrix [10], which is a generalization of swap matrix.
Definition 7. Let $n=\prod_{i=1}^{d} n_{i}, n_{i} \geq 2, \sigma \in \mathbf{S}_{n}$. A logical matrix $W_{\left[n_{1}, n_{2}, \cdots, n_{d}\right]}^{\sigma} \in$ $\mathcal{L}_{n \times n}$, called a $\sigma$-permutation matrix, is constructed as follows:

- Step 1: Define

$$
D=D_{\left[n_{1}, n_{2}, \cdots, n_{d}\right]}^{\sigma}:=\left\{\delta_{n_{\sigma(1)}}^{j_{1}} \delta_{n_{\sigma(2)}}^{j_{2}} \cdots \delta_{n_{\sigma(d)}}^{j_{d}} \mid j_{i} \in\left\langle n_{\sigma(i)}\right\rangle, i=1,2, \cdots, d\right\}
$$

- Step 2: Arrange $\{\sigma(i) \mid i \in[1, d]\}$ into an increasing sequence as

$$
1=\sigma\left(i_{1}\right)<\sigma\left(i_{2}\right)<\cdots<\sigma\left(i_{d}\right)=d
$$

That is,

$$
i_{j}=\sigma^{-1}(j), \quad j \in[1, d] .
$$

Set an index order as

$$
\begin{aligned}
& \mathrm{ID}:=\operatorname{ID}\left(j_{i_{1}}, j_{i_{2}}, \cdots, j_{i_{d}} ; n_{\sigma\left(i_{1}\right)}, n_{\sigma\left(i_{2}\right)}, \cdots, n_{\sigma\left(i_{d}\right)}\right) \\
& \quad=\operatorname{ID}\left(j_{\sigma^{-1}(1)}, j_{\sigma^{-1}(2)}, \cdots, j_{\sigma^{-1}(d)} ; n_{1}, n_{2}, \cdots, n_{d}\right)
\end{aligned}
$$

- Step 3:

$$
\begin{equation*}
W_{\left[n_{1}, n_{2}, \cdots, n_{d}\right]}^{\sigma}:=\left[\delta_{n_{\sigma(1)}}^{j_{1}} \delta_{n_{\sigma(2)}}^{j_{2}} \cdots \delta_{n_{\sigma(d)}}^{j_{d}} \mid \text { arranged by the order of ID }\right] . \tag{9}
\end{equation*}
$$

Example 2. Consider $d=3, n_{1}=2, n_{2}=3$, and $n_{3}=5$. We construct $W^{\sigma}:=$ $W_{[2,3,5]}^{\sigma}$.
(1) $\sigma_{1}=$ identity (i.e., $[1,2,3] \rightarrow[1,2,3]$ ): We have $W^{\sigma_{1}}=I_{30}$.
(2) $\sigma_{2}=(2,3)($ i.e., $[1,2,3] \rightarrow[1,3,2])$ : Then

$$
D=\left\{\delta_{2}^{j_{1}} \delta_{5}^{j_{2}} \delta_{3}^{j_{3}} \mid j_{1} \in[1,2], j_{2} \in[1,5], j_{3} \in[1,3]\right\}
$$

$W^{\sigma_{2}}=\left[\delta_{2}^{1} \delta_{5}^{1} \delta_{3}^{1}, \delta_{2}^{1} \delta_{5}^{2} \delta_{3}^{1}, \delta_{2}^{1} \delta_{5}^{3} \delta_{3}^{1}, \delta_{2}^{1} \delta_{5}^{4} \delta_{3}^{1}, \delta_{2}^{1} \delta_{5}^{5} \delta_{3}^{1}, \delta_{2}^{1} \delta_{5}^{1} \delta_{3}^{2}, \delta_{2}^{1} \delta_{5}^{2} \delta_{3}^{2}, \delta_{2}^{1} \delta_{5}^{3} \delta_{3}^{2}, \delta_{2}^{1} \delta_{5}^{4} \delta_{3}^{2}, \delta_{2}^{1} \delta_{5}^{5} \delta_{3}^{2}\right.$, $\delta_{2}^{1} \delta_{5}^{1} \delta_{3}^{3}, \delta_{2}^{1} \delta_{5}^{2} \delta_{3}^{3}, \delta_{2}^{1} \delta_{5}^{3} \delta_{3}^{3}, \delta_{2}^{1} \delta_{5}^{4} \delta_{3}^{3}, \delta_{2}^{1} \delta_{5}^{5} \delta_{3}^{3}, \delta_{2}^{2} \delta_{5}^{1} \delta_{3}^{1}, \delta_{2}^{2} \delta_{5}^{2} \delta_{3}^{1}, \delta_{2}^{2} \delta_{5}^{3} \delta_{3}^{1}, \delta_{2}^{2} \delta_{5}^{4} \delta_{3}^{1}, \delta_{2}^{2} \delta_{5}^{5} \delta_{3}^{1}$,
$\left.\delta_{2}^{2} \delta_{5}^{1} \delta_{3}^{2}, \delta_{2}^{2} \delta_{5}^{2} \delta_{3}^{2}, \delta_{2}^{2} \delta_{5}^{3} \delta_{3}^{2}, \delta_{2}^{2} \delta_{5}^{4} \delta_{3}^{2}, \delta_{2}^{2} \delta_{5}^{5} \delta_{3}^{2}, \delta_{2}^{2} \delta_{5}^{1} \delta_{3}^{3}, \delta_{2}^{2} \delta_{5}^{2} \delta_{3}^{3}, \delta_{2}^{2} \delta_{5}^{3} \delta_{3}^{3}, \delta_{2}^{2} \delta_{5}^{4} \delta_{3}^{3}, \delta_{2}^{2} \delta_{5}^{5} \delta_{3}^{3}\right]$
$=\delta_{30}[1,4,7,10,13,2,5,8,11,14,3,6,9,12,15$,
$16,19,22,25,28,17,20,23,26,29,18,21,24,27,30]$.
(3) $\sigma_{3}=(1,2)($ i.e., $[1,2,3] \rightarrow[2,1,3])$ :

Similarly, we have

$$
\begin{aligned}
& D=\left\{\delta_{3}^{j_{1}} \delta_{2}^{j_{2}} \delta_{5}^{j_{3}} \mid j_{1} \in[1,3], j_{2} \in[1,2], j_{3} \in[1,5]\right\} \\
& W^{\sigma_{3}}=\left[\delta_{3}^{1} \delta_{2}^{1} \delta_{5}^{1}, \delta_{3}^{1} \delta_{2}^{1} \delta_{5}^{2}, \cdots, \delta_{3}^{2} \delta_{2}^{1} \delta_{5}^{1}, \cdots, \delta_{3}^{2} \delta_{2}^{1} \delta_{5}^{5}, \cdots, \delta_{3}^{3} \delta_{2}^{2} \delta_{5}^{5}\right] \\
& =\delta_{30}[1,2,3,4,5,11,12,13,14,15,21,22,23,24 \\
& 25,6,7,8,9,10,16,17,18,19,20,26,27,28,29,30]
\end{aligned}
$$

(4) $\sigma_{4}=(1,2,3)$ (i.e., $[1,2,3] \rightarrow[2,3,1]$ ):

We have

$$
\begin{aligned}
& W^{\sigma_{4}}=\left[\delta_{3}^{1} \delta_{5}^{1} \delta_{2}^{1}, \cdots, \delta_{3}^{3} \delta_{5}^{5} \delta_{2}^{2}\right] \\
& \quad=\delta_{30}[1,3,5,7,9,11,13,15,17,19,21,23,25,27 \\
& 29,2,4,6,8,10,12,14,16,18,20,22,24,26,28,30]
\end{aligned}
$$

(5) $\sigma_{5}=(1,3,2)$ (i.e., $\left.[1,2,3] \rightarrow[3,1,2]\right)$ :

Then

$$
\begin{aligned}
& W^{\sigma_{5}}=\left[\delta_{5}^{1} \delta_{2}^{1} \delta_{3}^{1}, \cdots, \delta_{5}^{5} \delta_{2}^{2} \delta_{3}^{3}\right] \\
& \quad=\delta_{30}[1,7,13,19,25,2,8,14,20,26,3,9,15,21,27 \\
& 4,10,16,22,28,5,11,17,23,29,6,12,18,24,30]
\end{aligned}
$$

(6) $\sigma_{6}=(1,3)$ (i.e., $[1,2,3] \rightarrow[3,2,1]$ ):

Then

$$
\begin{aligned}
& W^{\sigma_{6}}=\left[\delta_{5}^{1} \delta_{3}^{1} \delta_{2}^{1}, \cdots, \delta_{5}^{5} \delta_{3}^{3} \delta_{2}^{2}\right] \\
& \quad=\delta_{30}[1,7,13,19,25,3,9,15,21,27,5,11,17,23 \\
& 29,2,8,14,20,26,4,10,16,22,28,6,12,18,24,30]
\end{aligned}
$$

When $n_{1}=n_{2}=\cdots=n_{d}:=n$ the corresponding permutation is briefly denoted by

$$
W_{n}^{\sigma}:=W_{\left[n_{1}, n_{2}, \cdots, n_{d}\right]}^{\sigma} .
$$

Since this kind of permutation matrices are of particular importance, some of them are listed in the Appendix.

Some basic properties of permutation matrices are presented in the following proposition, which follows from definition immediately.
Proposition 4.(i)

$$
\begin{equation*}
\left[W_{\left[n_{1}, \cdots, n_{d}\right]}^{\sigma}\right]^{T}=\left[W_{\left[n_{1}, \cdots, n_{d}\right]}^{\sigma}\right]^{-1}=W_{\left[n_{1}, \cdots, n_{d}\right]}^{\sigma^{-1}} \tag{10}
\end{equation*}
$$

(ii) Let $\sigma, \mu \in \mathbf{S}_{d}$. Then

$$
\begin{equation*}
W_{\left[n_{1}, n_{2}, \cdots, n_{d}\right]}^{\sigma} W_{\left[n_{1}, n_{2}, \cdots, n_{d}\right]}^{\mu}=W_{\left[n_{1}, n_{2}, \cdots, n_{d}\right]}^{\sigma \circ \mu} \tag{11}
\end{equation*}
$$

The following proposition shows the basic function of permutation matrices.

Proposition 5. [10] Assume $x_{i} \in \mathbb{F}^{n_{i}}, i \in\langle d\rangle, \sigma \in \mathbf{S}_{d}$. Then

$$
\begin{equation*}
\ltimes_{i=1}^{d} x_{\sigma(i)}=W_{\left[n_{1}, n_{2}, \cdots, n_{d}\right]}^{\sigma} \ltimes_{i=1}^{d} x_{i} \tag{12}
\end{equation*}
$$

As an immediate consequence we have the following result, which shows how to calculate $A^{\sigma}$.
Proposition 6. Let $A \in \mathbb{F}^{n_{1} \times \cdots \times n_{d}}$ be a hypermatrix of order d. Then

$$
\begin{equation*}
V_{A^{\sigma}}=V_{A}\left[W_{\left[n_{1}, \cdots, n_{d}\right]}^{\sigma}\right]^{T}=V_{A} W_{\left[n_{1}, \cdots, n_{d}\right]}^{\sigma^{-1}} . \tag{13}
\end{equation*}
$$

Proof. Proposition 5 implies that

$$
V_{A^{\sigma}}^{T}=W_{\left[n_{1}, \cdots, n_{d}\right]}^{\sigma} V_{A} .
$$

Taking transpose on both sides yields (13).

### 2.3 Conversion of Matrix Expressions

Definition 8.(i) Let $A=\left[a_{i, j}\right] \in \mathbb{F}^{m \times n}$ be a matrix. Then

$$
\begin{equation*}
\mathbf{V}_{r}(A):=\left[a_{1,1}, a_{1,2}, \cdots, a_{1, n}, a_{2,1}, \cdots, a_{m, n}\right] \tag{14}
\end{equation*}
$$

is called the row stacking form of $A$;

$$
\begin{equation*}
\mathbf{V}_{c}(A):=\left[a_{1,1}, a_{2,1}, \cdots, a_{m, 1}, a_{1,2}, \cdots, a_{m, n}\right] \tag{15}
\end{equation*}
$$

is called the column stacking form of $A$.
(ii) Let $x \in \mathbb{F}^{n}$ and $s \mid n$. Say, $n=s t$. Then

$$
\begin{align*}
\mathbf{V}_{r}^{s}(x) & :=\left[\begin{array}{cccc}
x_{1} & x_{2} & \cdots & x_{s} \\
x_{s+1} & x_{s+2} & \cdots & x_{2 s} \\
\vdots & & \ddots & \vdots \\
x_{(t-1) s+1} & x_{(t-1) s+2} & \cdots & x_{t s}
\end{array}\right]  \tag{16}\\
\mathbf{V}_{c}^{s}(x) & :=\left[\begin{array}{cccc}
x_{1} & x_{s+1} & \cdots & x_{(t-1) s+1} \\
x_{2} & x_{s+2} & \cdots & x_{(t-1) s+2} \\
\vdots & & \ddots & \vdots \\
x_{s} & x_{2 s} & \cdots & x_{t s}
\end{array}\right] \tag{17}
\end{align*}
$$

(iii) Let $A \in \mathbb{F}^{m \times n}$ and $s \mid(m n)$. Then

$$
\begin{equation*}
\mathbf{V}_{r}^{s}(A):=\mathbf{V}_{r}^{s}\left(\mathbf{V}_{r}(A)\right) \tag{18}
\end{equation*}
$$

is called the s-row stacking form.

$$
\begin{equation*}
\mathbf{V}_{c}^{s}(A):=\mathbf{V}_{c}^{s}\left(\mathbf{V}_{c}(A)\right) \tag{19}
\end{equation*}
$$

is called the s-column stacking form.
Proposition 7. [3] Let $A \in \mathbb{F}^{m \times n}, X \in \mathbb{F}^{n \times q}$, and $Y \in \mathbb{F}^{p \times m}$. Then

$$
\begin{align*}
& \mathbf{V}_{r}(A X)=A \ltimes \mathbf{V}_{r}(X),  \tag{20}\\
& \mathbf{V}_{c}(Y A)=A^{T} \ltimes \mathbf{V}_{c}(Y) . \tag{21}
\end{align*}
$$

Denote by

$$
\delta_{n}^{I}:=\mathbf{V}_{r}\left(I_{n}\right)=\mathbf{V}_{c}\left(I_{n}\right)=\left[\left(\delta_{n}^{1}\right)^{T},\left(\delta_{n}^{2}\right)^{T}, \cdots,\left(\delta_{n}^{n}\right)^{T}\right]^{T} .
$$

Proposition 8. Let $A \in \mathbb{F}^{m \times n}$. Then

$$
\begin{gather*}
\mathbf{V}_{r}(A)=A \ltimes \delta_{n}^{I} .  \tag{22}\\
\mathbf{V}_{c}(A)=A^{T} \ltimes \delta_{m}^{I} . \tag{23}
\end{gather*}
$$

Conversely,

$$
\begin{equation*}
A=\mathbf{V}_{r}^{n}\left(\mathbf{V}_{r}(A)\right)=\mathbf{V}_{c}^{m}\left(\mathbf{V}_{c}(A)\right) \tag{24}
\end{equation*}
$$

Proof. (22) and (23) come from Proposition 7 immediately. (24) follows from the definition.

By definition and (24), we have

$$
\begin{equation*}
A=\mathbf{V}_{r}^{n}(A)=\mathbf{V}_{c}^{m}(A) \tag{25}
\end{equation*}
$$

Set $\mathbf{i}_{\mathbf{r}}=\left(i_{1}, \cdots, i_{r}\right) \subset \mathbf{d}=\langle d\rangle$, and denote

$$
\begin{equation*}
\sigma_{\mathbf{i}_{\mathbf{r}}}: \mathbf{d} \rightarrow\left(\mathbf{i}_{\mathbf{r}}, \mathbf{d} \backslash \mathbf{i}_{\mathbf{r}}\right) \tag{26}
\end{equation*}
$$

The following proposition shows how to convert a matrix expression to a vector form and vise versa for a hypermatrix.
Proposition 9. Given $A=\left[a_{i_{1}, \cdots, i_{d}}\right] \in \mathbb{F}^{n_{1} \times \cdots \times n_{d}}, \mathbf{i}_{\mathbf{r}}=\left(i_{1}, \cdots, i_{r}\right) \subset \mathbf{d}=\langle d\rangle$, and $\sigma_{\mathbf{i}_{\mathbf{r}}}$ is as in (26),

$$
n_{\mathbf{i}_{\mathbf{r}}}=\prod_{s=1}^{r} n_{i_{s}}, \quad n_{\mathbf{d} \backslash \mathbf{i}_{\mathbf{r}}}=\prod_{i_{j} \in \mathbf{d} \backslash \mathbf{i}_{\mathbf{r}}} n_{i_{j}} .
$$

Then
(i) (Vector Form to Matrix Form)

$$
\begin{equation*}
M_{A}^{\mathbf{i}_{\mathbf{r}} \times\left(\mathbf{d} \backslash \mathbf{i}_{\mathbf{r}}\right)}=\mathbf{V}_{r}^{n_{\mathbf{d} \backslash \mathbf{i}_{\mathbf{r}}}}\left(V_{A} W_{\left[n_{1}, \cdots, n_{d}\right]}^{\sigma_{\mathbf{i}_{\mathbf{r}}}^{-1}}\right) . \tag{27}
\end{equation*}
$$

(ii) (Matrix Form to Vector Form)

$$
\begin{equation*}
V_{A}=\left(M_{A}^{\mathbf{i}_{\mathbf{r}} \times\left(\mathbf{d} \backslash \mathbf{i}_{\mathbf{r}}\right)} \ltimes \delta_{n_{\mathbf{d} \backslash \mathbf{i}_{\mathbf{r}}}}^{I}\right)^{T} W_{\left[n_{1}, \cdots, n_{d}\right]}^{\sigma_{\mathrm{i}_{\mathbf{r}}}} . \tag{28}
\end{equation*}
$$

Proof. For (i), we have

$$
M_{A}^{\mathbf{i}_{\mathbf{r}} \times\left(\mathbf{d} \backslash \mathbf{i}_{\mathbf{r}}\right)}=\mathbf{V}_{r}^{n_{\mathbf{d} \backslash \mathbf{i}_{\mathbf{r}}}}\left(V_{A^{\sigma_{\mathrm{i}_{\mathbf{r}}}}}\right)=\mathbf{V}_{r}^{n_{\mathbf{d} \backslash \mathbf{i}_{\mathbf{r}}}}\left(V_{A} W_{\left[n_{1}, \cdots, n_{d}\right]}^{\sigma_{\mathrm{i}_{\mathbf{r}}}^{-1}}\right) .
$$

As for (ii), using (13) and (22), we have

$$
V_{A}=V_{A^{\sigma_{\mathbf{i}_{\mathbf{r}}}}} W_{\left[n_{1}, \cdots, n_{d}\right]}^{\sigma_{\mathbf{i}_{\mathbf{r}}}}=\left(M_{A}^{\mathbf{i}_{\mathbf{r}} \times\left(\mathbf{d} \backslash \mathbf{i}_{\mathbf{r}}\right)} \ltimes \delta_{n_{\mathbf{d} \backslash \mathbf{i}_{\mathbf{r}}}}^{I}\right)^{T} W_{\left[n_{1}, \cdots, n_{d}\right]}^{\sigma_{\mathbf{i}_{\mathbf{r}}}} .
$$

Using (27) and (28), the formula transforming one matrix form to another can be obtained.
Corollary 10. Let $\mathbf{i}_{\mathbf{r}}$, $\sigma_{\mathbf{i}_{\mathbf{r}}}$ be as in Proposition 9, and $\mathbf{j}_{\mathbf{s}}=\left(j_{1}, \cdots, j_{s}\right)$ and $\sigma_{\mathbf{j}_{\mathbf{s}}}: \mathbf{d} \rightarrow$ $\left(\mathbf{j}_{\mathrm{s}}, \mathbf{d} \backslash \mathbf{j}_{\mathbf{s}}\right)$. Then

$$
\begin{equation*}
M_{A}^{\mathbf{j}_{\mathbf{s}} \times\left(\mathbf{d} \backslash \mathbf{j}_{\mathbf{s}}\right)}=\mathbf{V}_{r}^{n_{\mathbf{d} \backslash \mathbf{j}_{\mathbf{s}}}}\left[\left(M_{A}^{\mathbf{i}_{\mathbf{r}} \times\left(\mathbf{d} \backslash \mathbf{i}_{\mathbf{r}}\right)} \ltimes \delta_{\mathbf{d} \backslash \mathbf{i}_{\mathbf{r}}}^{I}\right)^{T} \times W_{\left[n_{1}, \cdots, n_{d}\right]}^{\sigma_{\mathbf{i}_{\mathbf{r}}}} W_{\left[n_{1}, \cdots, n_{d}\right]}^{\sigma_{\mathbf{j}_{\mathbf{s}}}^{-1}}\right] . \tag{29}
\end{equation*}
$$

## 3 Contracted Product of Hypermatrices

Definition 9. [21] Let $A=\left[a_{i_{1}, \cdots, i_{d}}\right] \in \mathbb{F}^{n_{1} \times \cdots \times n_{d-1} \times n}$, $B=\left[b_{j_{1}, \cdots, j_{r}}\right] \in$ $\mathbb{F}^{n \times m_{2} \times \cdots \times m_{r}}$. Then the contracted product of $A$ and $B$, denoted by

$$
\begin{equation*}
C=A \times_{j_{1}}^{i_{d}} B, \tag{30}
\end{equation*}
$$

is s hypermatrix $C=\left[c_{i_{1}, \cdots, i_{d-1}, j_{2}, \cdots, j_{r}}\right] \in \mathbb{F}^{n_{1} \times \cdots \times n_{d-1} \times m_{2} \times \cdots \times m_{r}}$, where

$$
\begin{equation*}
c_{i_{1}, \cdots, i_{d-1}, j_{2}, \cdots, j_{r}}=\sum_{k=1}^{n} a_{i_{1}, \cdots, i_{d-1}, k} b_{k, j_{2}, \cdots, j_{r}} . \tag{31}
\end{equation*}
$$

Proposition 11. Let $M_{A}^{\left(i_{1}, \cdots, i_{d-1}\right) \times i_{d}}$ and $M_{B}^{j_{1} \times\left(j_{2}, \cdots, j_{r}\right)}$ be the corresponding matrix expressions of $A$ and $B$ respectively. Then

$$
\begin{equation*}
M_{C}^{\left(i_{1}, \cdots, i_{d-1}\right) \times\left(j_{2}, \cdots, j_{r}\right)}=M_{A}^{\left(i_{1}, \cdots, i_{d-1}\right) \times i_{d}} \times M_{B}^{j_{1} \times\left(j_{2}, \cdots, j_{r}\right)}, \tag{32}
\end{equation*}
$$

where the $\times$ between $M_{A}$ and $M_{B}$ is the conventional matrix product.
Definition 9 can be extended to the case of multiple common indices.
Definition 10. Let $A=\left[a_{i_{1}, \cdots, i_{d}}\right] \in \mathbb{F}^{n_{1} \times \cdots \times n_{d}}, B=\left[b_{j_{1}, \cdots, j_{r}}\right] \in \mathbb{F}^{m_{1} \times \cdots \times m_{r}}$ with

$$
n_{\alpha_{t}}=m_{\beta_{t}}:=\ell_{t}, \quad \alpha_{t} \in\langle d\rangle, \beta_{t} \in\langle r\rangle, t \in\langle s\rangle,
$$

where $s \leq \min (d, r)$ is the number of equal dimension indexes. Define

$$
\begin{align*}
& A \times{ }_{j_{\beta_{1}}}^{i_{\alpha_{1}}, \cdots, i_{\alpha_{s}}} B:=C  \tag{33}\\
& \quad \in \mathbb{F}_{\beta_{s}} n_{1} \times \cdots \times \hat{n}_{\alpha_{1}} \times \cdots \times \hat{n}_{\alpha_{s}} \times \cdots \times n_{d} \times m_{1} \times \cdots \times \hat{m}_{\beta_{1}} \times \cdots \times \hat{m}_{\beta_{s}} \times \cdots \times m_{r}
\end{align*}
$$

where

$$
\begin{aligned}
& c_{i_{1}, \cdots, \hat{i}_{\alpha_{1}}, \cdots, \hat{i}_{\alpha_{s}}, \cdots, i_{d}, j_{1}, \cdots, \hat{j}_{\beta_{1}}, \cdots, \hat{j}_{s_{s}}, \cdots, j_{j}} \\
& =\sum_{k_{1}=1}^{\ell_{1}} \cdots \sum_{k_{s}=1}^{\ell_{s}} a_{i_{1} \cdots k_{1} \cdots k_{s} \cdots i_{d}} b_{j_{1} \cdots k_{1} \cdots k_{s} \cdots j_{d}},
\end{aligned}
$$

where a caret over any entry means that the respective entry is omitted.

## Proposition 12.

$$
\begin{align*}
& M_{C}^{\left(i_{1}, \cdots, \hat{i}_{\alpha_{1}}, \cdots, \hat{i}_{\alpha_{s}}, \cdots, i_{d}\right) \times\left(j_{1}, \cdots, \hat{j}_{\beta_{1}}, \cdots, \hat{j}_{\beta_{s}}, \cdots, j_{r}\right)} \\
& =M_{A}^{\left(i_{1}, \cdots, \hat{i}_{\alpha_{1}}, \cdots, \hat{i}_{\alpha_{s}}, \cdots, i_{d}\right) \times\left(i_{\alpha_{1}}, \cdots, i_{\alpha_{s}}\right)}  \tag{34}\\
& \quad \times M_{B}^{\left(j_{\beta_{1}}, \cdots, j_{\beta_{s}}\right) \times\left(j_{1}, \cdots, \hat{j}_{\beta_{1}}, \cdots, \hat{j}_{\beta_{s}}, \cdots, j_{r}\right)},
\end{align*}
$$

where the $\times$ between $M_{A}$ and $M_{B}$ is the conventional matrix product.
Example 3. Assume $A=\left[a_{i_{1}, i_{2}, i_{3}}\right] \in \mathbb{F}^{2 \times 3 \times 4}, B=\left[b_{j_{1}, j_{2}, j_{3}}\right] \in \mathbb{F}^{4 \times 5 \times 3}$ with natural ID, calculate

$$
C=A \times \times_{\left(j_{3}, j_{1}\right)}^{\left(i_{2}, i_{3}\right)} B
$$

We have

$$
M_{A}^{i_{1} \times\left(i_{2}, i_{3}\right)}=\left[\begin{array}{llllllllllll}
a_{111} & a_{112} & a_{113} & a_{114} & a_{121} & a_{122} & a_{211} & a_{212} & a_{213} & a_{214} & a_{221} & a_{222} \\
a_{123} & a_{124} & a_{131} & a_{132} & a_{133} & a_{134} & a_{223} & a_{224} & a_{231} & a_{232} & a_{233} & a_{234}
\end{array}\right]
$$

$$
M_{B}^{\left(j_{3}, j_{1}\right) \times j_{2}}=\left[\begin{array}{lllll}
b_{111} & b_{121} & b_{131} & b_{141} & b_{151} \\
b_{211} & b_{221} & b_{231} & b_{241} & b_{251} \\
b_{311} & b_{321} & b_{331} & b_{341} & b_{351} \\
b_{411} & b_{421} & b_{431} & b_{441} & b_{451} \\
b_{112} & b_{122} & b_{132} & b_{142} & b_{152} \\
b_{212} & b_{222} & b_{232} & b_{242} & b_{252} \\
b_{312} & b_{322} & b_{332} & b_{342} & b_{352} \\
b_{412} & b_{422} & b_{432} & b_{442} & b_{452} \\
b_{113} & b_{123} & b_{133} & b_{143} & b_{153} \\
b_{213} & b_{223} & b_{233} & b_{243} & b_{253} \\
b_{313} & b_{323} & b_{333} & b_{343} & b_{353} \\
b_{413} & b_{423} & b_{433} & b_{443} & b_{453}
\end{array}\right]
$$

Then $C \in \mathbb{F}^{2 \times 5}$ with

$$
M_{C}^{i_{1} \times j_{2}}=M_{A}^{i_{1} \times\left(i_{2}, i_{3}\right)} M_{B}^{\left(j_{3}, j_{1}\right) \times j_{2}} .
$$

A particular case is $A=\left[a_{i_{1}, \cdots, i_{d}}\right] \in \mathbb{F}^{n_{1} \times \cdots \times n_{d}}, B=\left[b_{i_{r_{1}}}, \cdots, i_{r_{s}}\right] \in \mathbb{F}^{n_{r_{1}} \times \cdots \times n_{r_{s}}}$, and $\mathbf{r}_{\mathbf{s}}:=\left\{r_{1}, \cdots, r_{s}\right\} \subset \mathbf{d}:=\langle d\rangle$. Then we briefly denote

$$
A \times_{\mathbf{r}_{\mathbf{s}}} B:=A \times_{\mathbf{r}_{\mathbf{s}}}^{\mathbf{r}_{\mathbf{s}}} B .
$$

We call this kind of product the onto contracted product. They are of particular importance.

In the onto contracted product, $A$ can be considered as a multilinear mapping from $\mathbb{F}^{n_{r_{1}} \times \cdots \times n_{r_{s}}}$ to $\mathbb{F}^{n_{1} \times \cdots \times \hat{n}_{r_{1}} \times \cdots \times \hat{n}_{r_{s}} \times \cdots \times n_{d}}$.
Proposition 13. Assume $A \in \mathbb{F}^{n_{1} \times \cdots \times n_{d}}$ and $B \in \mathbb{F}^{n_{r_{1}} \times \cdots \times n_{r_{s}}}$, where $\mathbf{r}_{\mathbf{s}}:=$ $\left\{r_{1}, \cdots, r_{s}\right\} \subset \mathbf{d}$. The contracted product of $A$ and $B$, denoted by

$$
C=A \times_{\mathbf{r}_{\mathbf{s}}} B
$$

can be obtained by one of the following two equivalent formulas:
(i) Let

$$
M^{A}:=M_{A}^{\left(\mathbf{d} \backslash \mathbf{r}_{\mathbf{s}}\right) \times \mathbf{r}_{\mathbf{s}}}
$$

Then

$$
\begin{equation*}
V_{C}^{T}=M^{A} V_{B}^{T} \tag{35}
\end{equation*}
$$

(ii) Let $\sigma \in \mathbf{S}_{d}$ be the permutation

$$
\sigma: \mathbf{d} \rightarrow\left(\mathbf{d} \backslash \mathbf{r}_{\mathbf{s}}, \mathbf{r}_{\mathbf{s}}\right)
$$

Then

$$
\begin{equation*}
V_{C}=V_{A} W^{\sigma^{-1}} V_{B}^{T} \tag{36}
\end{equation*}
$$

Definition 11.(i) Let $A \in \mathbb{F}^{n_{1} \times \cdots \times n_{d} \times n_{d+1} \times \cdots \times n_{2 d}}, B \in \mathbb{F}^{n_{1} \times \cdots \times n_{d}}$, where $n_{d+i}=n_{i}$,
$i \in\langle d\rangle$. Then $A: \mathbb{F}^{n_{1} \times \cdots \times n_{d}} \rightarrow \mathbb{F}^{n_{1} \times \cdots \times n_{d}}$ is defined by

$$
\begin{equation*}
A(B):=A \times_{1,2, \cdots, d}^{d+1, \cdots, 2 d} B \in \mathbb{F}^{n_{1} \times \cdots \times n_{d}} . \tag{37}
\end{equation*}
$$

This contracted product is called a unary operator on $\mathbb{F}^{n_{1} \times \cdots \times n_{d}}$.
(ii) Let $A \in \mathbb{F}^{n_{1} \times \cdots \times n_{3 d}}, B, C \in \mathbb{F}^{n_{1} \times \cdots \times n_{d}}$, where $n_{2 d+i}=n_{d+i}=n_{i}, i \in\langle d\rangle$. Then $A: \mathbb{F}^{n_{1} \times \cdots \times n_{d}} \times \mathbb{F}^{n_{1} \times \cdots \times n_{d}} \rightarrow \mathbb{F}^{n_{1} \times \cdots \times n_{d}}$ is defined by

$$
\begin{equation*}
A(B, C):=\left[A \times_{1,2, \cdots, d}^{2 d+1, \cdots, 3 d} B\right] \times{ }_{1, \cdots, d}^{d+1, \cdots, 2 d} C \in \mathbb{F}^{n_{1} \times \cdots \times n_{d}} \tag{38}
\end{equation*}
$$

This contracted product is called a binary operator on $\mathbb{F}^{n_{1} \times \cdots \times n_{d}}$.
(iii) Similarly, we can define $k$ argument (i.e., $k$ hypermatrix) operators for $k \geq 3$.

Fig. 1 STP-Realization of Contracted Product

## 4 STP Realization of Contracted Product of Hypermatrices

This section shows that a fundamental role of STP is to realize the contracted product of hypermatrices. This factor may help us to understand what is the essential meaning of STP. For this purpose, the hypermatrices are first expressed in their matrix expressions. The STPs are operators on matrices. When the hypermatrices are transformed into their matrix forms, the action of operators (especially certain contracted products) on their objective hypermatrices can be realized by the action of STPs on the matrix expressions of the corresponding hypermatrices. Figure 1 shows this process.

Since there are many possible multilinear operators, including contracted products, over different hypermatrices, the corresponding operators over their matrix expressions are also diverse. To express these operators, the STPs are also diverse.

### 4.1 Classical STPs

From linear algebra one sees that the matrix product has two fundamental types: (1) Matrix-Matrix Product: It represents the composition of two linear mappings. (2) Matrix-Vector Product: It realizes a linear mapping over a vector space (or between two vector spaces). Fortunately, when the dimension-matching condition is satisfied, the classical matrix product can realize these two functions simultaneously.

When the conventional matrix product is extended to STP, where the dimensionmatching condition is not satisfied, an STP cannot realize these two functions simultaneously. Therefore, we need to distinguish between M-M STP and M-V products. First, we review the classical STPs [8]:
Definition 12.(i) Let $A \in \mathbb{F}^{m \times n}, B \in \mathbb{F}^{p \times q}$ and $t=\operatorname{lcm}(n, p)$. The matrix-matrix $(M-M) S T P$ of $A$ and $B$ is defined as

$$
\begin{equation*}
A \ltimes B:=\left(A \otimes I_{t / n}\right)\left(B \otimes I_{t / p}\right) . \tag{39}
\end{equation*}
$$

(ii) Let $A \in \mathbb{F}^{m \times n}, x \in \mathbb{F}^{p}$ and $t=\operatorname{lcm}(n, p)$. The matrix-vector $(M-V) S T P$ of $A$ and $x$ is defined as

$$
\begin{equation*}
A \vec{\ltimes} x:=\left(A \otimes I_{t / n}\right)\left(x \otimes \mathbf{1}_{t / p}\right) . \tag{40}
\end{equation*}
$$

(iii) Let $x \in \mathbb{F}^{m}, y \in \mathbb{F}^{n}$ and $t=\operatorname{lcm}(m, n)$. The vector-vector $(V-V) S T P$ of $x$ and $y$ is defined as

$$
\begin{equation*}
\overrightarrow{x \cdot y}:=\left(x \otimes \mathbf{1}_{t / m}\right)^{T}\left(y \otimes \mathbf{1}_{t / n}\right) \in \mathbb{F}, \tag{41}
\end{equation*}
$$

Define

$$
\mathcal{M}=\bigcup_{m=1}^{\infty} \bigcup_{n=1}^{\infty} \mathcal{M}_{m \times n}, \quad \mathbb{R}^{\infty}=\bigcup_{n=1}^{\infty} \mathbb{R}^{n}
$$

Then the M-M STP can be considered as the product over $\mathcal{M}$; the M-V STP can be considered as the action of $\mathcal{M}$ on $\mathbb{R}^{\infty}$; and the V-V STP can be considered as an inner product over $\mathbb{R}^{\infty}$. It is obvious that they are the generalizations of the corresponding matrices with matrix-matrix or matrix-vector product, or vectors with vector product. Furthermore, they satisfy the following general properties.
Proposition 14.(i) (Associativity)

$$
\begin{gathered}
(A \ltimes B) \ltimes C=A \ltimes(B \ltimes C), \quad A, B, C \in \mathcal{M} . \\
(A \ltimes B) \vec{\ltimes} x=A \vec{\ltimes}(B \vec{\ltimes} x), \quad x \in \mathbb{R}^{\infty} .
\end{gathered}
$$

(ii) (Distributivity) For $A, B, C \in \mathcal{M}, x, y, z \in \mathbb{R}^{\infty}$,

$$
\begin{aligned}
& (A+B) \ltimes C=A \ltimes C+B \ltimes C, \\
& C \ltimes(A+B)=C \ltimes A+C \ltimes B ; \\
& (A+B) \vec{\ltimes} x=A \vec{\ltimes} x+B \vec{\ltimes} x, \\
& A \vec{\ltimes}(x+y)=A \vec{\ltimes} x+A \vec{\ltimes} y ; \\
& (x+y) \vec{\triangleleft} z=x \vec{\bullet} z+y \cdot z, \\
& z \vec{\bullet}(x+y)=z \vec{\cdot} x+z \vec{\bullet} y .
\end{aligned}
$$

Remark 3. $M-V$ and $V$ - V STPs are not so commonly used as $M-M$ STP. We explain it a little bit more.

- Topology on $\mathbb{R}^{\infty}$ :

Consider $x \in \mathbb{R}^{p}, y \in \mathbb{R}^{q},\left(x, y \in \mathbb{R}^{\infty}\right), t=\operatorname{lcm}(p, q)$. Define

$$
x \overrightarrow{ \pm} y:=\left(x \otimes \mathbf{1}_{t / p}\right) \pm\left(y \otimes \mathbf{1}_{t / q}\right),
$$

then $\mathbb{R}^{\infty}$ becomes a (pseudo-) vector space.
Furthermore, we define
(i) (Inner Product):

$$
\langle x, y\rangle_{\mathcal{V}}:=\frac{1}{t}(x \vec{\bullet} y)
$$

(ii) (Norm):

$$
\|x\|_{\mathcal{V}}:=\sqrt{\langle x, x\rangle_{\mathcal{V}}}
$$

(iii) (Distance):

$$
d(x, y)=\|x \overrightarrow{-} y\|_{\mathcal{V}}
$$

With this distance $\mathbb{R}^{\infty}$ becomes a topological space [8].

- Linear Dynamic Systems over $\mathbb{R}^{\infty}$ :

A linear dynamic system over $\mathbb{R}^{\infty}$ is defined by

$$
x(t+1)=A \vec{\ltimes} x(t) .
$$

It is a cross-dimensional system [13].

### 4.2 STP for Vector Expression of Hypermatrices

Consider a multilinear mapping $\pi: \prod_{i=1}^{d} V_{i} \rightarrow \mathbb{F}$, where $V_{i}=\mathbb{F}^{n_{i}}, i \in\langle d\rangle$. Assume

$$
\pi\left(\delta_{n_{1}}^{i_{1}}, \cdots, \delta_{n_{d}}^{i_{d}}\right)=c_{i_{1}, \cdots, i_{d}}, \quad i_{s} \in\left\langle n_{s}\right\rangle, s \in\langle d\rangle .
$$

Let $\Pi:=\left[c_{i_{1}, \cdots, i_{d}}\right]$ with ID $=\operatorname{ID}\left(i_{1}, \cdots, i_{d} ; n_{1}, \cdots, n_{d}\right)$ be a hypermatrix of order $d$. Then the following result is well known.
Proposition 15. The multilinear mapping $\pi$ can be calculated by

$$
\begin{equation*}
\pi\left(x_{1}, \cdots, x_{d}\right)=V_{\Pi} \ltimes_{i=1}^{d} x_{i}, \quad x_{i} \in V_{i}, i \in\langle d\rangle . \tag{42}
\end{equation*}
$$

Example 4. Consider a finite game of $n$ players [6]. Assume player $i$ has $k_{i}$ strategies, denoted by $\delta_{k_{i}}^{j_{i}}, j_{i} \in\left\langle k_{i}\right\rangle, i \in\langle n\rangle$. Let

$$
c_{i}\left(\delta_{k_{1}}^{j_{1}}, \cdots, \delta_{k_{n}}^{j_{n}}\right)=r_{j_{i}, \cdots, j_{n}}^{i}, \quad i \in\langle n\rangle .
$$

Then

$$
D_{i}=\left\{r_{j_{i}, \cdots, j_{n}}^{i}\right\} \in \mathbb{R}^{k_{1} \times \cdots k_{n}} .
$$

Finally, we have

$$
c_{i}=V_{D_{i}} \ltimes_{t=1}^{n} x_{t}, \quad i \in\langle n\rangle .
$$

### 4.3 STP for Matrix-1 Expression of Hypermatrices

Consider a multilinear mapping $\pi: \prod_{i=1}^{d} V_{i} \rightarrow V_{0}$, where $V_{i}=\mathbb{F}^{n_{i}}, i \in[0, d]$. Assume

$$
\pi\left(\delta_{n_{1}}^{i_{1}}, \cdots, \delta_{n_{d}}^{i_{d}}\right)=\sum_{i_{0}=1}^{n_{0}} c_{i_{1}, \cdots, i_{d}}^{i_{0}} \delta_{n_{0}}^{i_{0}}, \quad i_{s} \in\left\langle n_{s}\right\rangle, s \in\langle d\rangle .
$$

Then $\Pi:=\left[c_{i_{1}, \ldots, i_{d}}^{i_{0}}\right]$ is a hypermatrix of order $d+1$ with matrix expression $M_{\Pi}^{\mathrm{ID}}$, where $\operatorname{ID}=\operatorname{ID}\left(i_{0} ; n_{0}\right) \times \mathrm{ID}\left(i_{1}, \cdots, i_{d} ; n_{1}, \cdots, n_{d}\right)$. Then the following result is well known.

Proposition 16. The multilinear mapping $\pi$ can be calculated by

$$
\begin{equation*}
\pi\left(x_{1}, \cdots, x_{d}\right)=M_{\Pi}^{\mathrm{ID}} \ltimes_{i=1}^{d} x_{i}, \quad x_{i} \in V_{i}, i \in\langle d\rangle . \tag{43}
\end{equation*}
$$

Example 5.(i) Cross Product on $\mathbb{R}^{3}$ :
Consider the cross product on $R^{3}$, denoted by $\overrightarrow{\times}$. Denote by

$$
\delta_{3}^{i} \overrightarrow{\times} \delta_{3}^{j}=\sum_{k=1}^{3} c_{i, j}^{k}, \quad i, j \in\langle 3\rangle .
$$

Then we have

$$
M_{C}^{3 \times(1,2)}=\left[\begin{array}{ccccccccc}
0 & 0 & 0 & 0 & 0 & 1 & 0 & -1 & 0 \\
0 & 0 & -1 & 0 & 0 & 0 & 1 & 0 & 0 \\
0 & 1 & 0 & -1 & 0 & 0 & 0 & 0 & 0
\end{array}\right]
$$

It follows that

$$
Z=X \overrightarrow{\times} Y=M_{C}^{3 \times(1,2)} \ltimes X \ltimes Y, \quad X, Y \in \mathbb{R}^{3}
$$

(ii) General Linear Algebra gl $(2, \mathbb{R})$. Denote by

$$
\begin{aligned}
& A_{1}=\left[\begin{array}{ll}
1 & 0 \\
0 & 0
\end{array}\right] \sim \vec{A}_{1}=\delta_{4}^{1} \\
& A_{2}=\left[\begin{array}{ll}
0 & 1 \\
0 & 0
\end{array}\right] \sim \vec{A}_{2}=\delta_{4}^{2} \\
& A_{3}=\left[\begin{array}{ll}
0 & 0 \\
1 & 0
\end{array}\right] \sim \vec{A}_{3}=\delta_{4}^{3} \\
& A_{4}=\left[\begin{array}{ll}
0 & 0 \\
0 & 1
\end{array}\right] \sim \vec{A}_{4}=\delta_{4}^{4}
\end{aligned}
$$

Then $\delta_{4}^{i}, i \in\langle 4\rangle$ form a basis of $\operatorname{gl}(2, \mathbb{R})$. Denote by

$$
\left[A_{i}, A_{j}\right]=\sum_{k=1}^{4} c_{i, j}^{k} A_{k}, \quad i, j \in\langle 4\rangle
$$

Then $C=\left[c_{i, j}^{k}\right] \in \mathbb{R}^{4 \times 4 \times 4}$. Express $C$ into matrix form

$$
\begin{aligned}
M_{C}^{k,(i . j)}= & \delta_{4}[0,2,-3,0,-2,0,1-4,0 \\
& 3,-1+4,0,-3,0,0,3,0]
\end{aligned}
$$

where

$$
\begin{aligned}
& \delta_{4}^{0}=[0,0,0,0]^{T}, \\
& \delta_{4}^{-3}=[0,0,-1,0]^{T}, \\
& \delta_{4}^{1-4}=[1,0,0,-4]^{T}, \quad \text { etc. }
\end{aligned}
$$

Let $X \in \operatorname{gl}(2, R)$ with $\vec{X}=\mathbf{V}_{c}(X)$. Then

$$
\overrightarrow{[X, Y]}=M_{C}^{k,(i . j)} \ltimes \vec{X} \ltimes \vec{Y} .
$$

Remark 4.(i) Roughly speaking, in classical sense, an STP of matrices is a multilinear operator over hypermatrices. To be precise, when the hypermatrices are expressed into their matrix forms, the STP works as a matrix product.
(ii) Since multilinear mappings over hypermatrices can be various, there can also be various STPs.
(iii) When partial arguments are known, an operator becomes a restricted operator over the remaining arguments. In this case, STP combined with permutation matrices becomes more powerful.

### 4.4 STP for General Matrix Expression of Hypermatrices

We give two examples for this.
Example 6. Assume $V$ is an n-dimensional vector space over $\mathbb{F} . T: V^{r} \times\left(V^{*}\right)^{s} \rightarrow \mathbb{F}$ is a tensor of covariant order $r$ and contra-variant order $s$. Let $\delta_{n}^{i}, i \in\langle n\rangle$ be a basis of $V$ and $\omega_{i}=\left(\delta_{n}^{i}\right)^{T}, i \in\langle n\rangle$ be the dual basis of dual space $V^{*}$, and set

$$
\begin{aligned}
& T\left(\delta_{n}^{i_{1}}, \cdots, \delta_{n}^{i_{r}},\left(\delta_{n}^{j_{1}}\right)^{*}, \cdots,\left(\delta_{n}^{j_{s}}\right)^{*}\right)=\mu_{j_{1}, \cdots, j_{s}}^{i_{1}, \cdots, i_{r}}, \\
& \quad i_{p} \in\langle n\rangle, p \in\langle r\rangle, j_{q} \in\langle n\rangle, q \in\langle s\rangle .
\end{aligned}
$$

Then

$$
\Omega:=\left\{\mu_{j_{1}, \cdots, j_{s}}^{i_{1}, \cdots, i_{r}} \mid i_{p} \in\langle n\rangle, p \in\langle r\rangle, j_{q} \in\langle n\rangle, q \in\langle s\rangle\right\} \in \mathbb{R}^{n \times \cdots \times n}
$$

is a hypermatrix of order $r+s$.
Construct $M_{\Omega}^{\mathbf{j}_{\mathbf{s}} \times \mathbf{i}_{\mathbf{r}}}$, where $\mathbf{j}_{\mathrm{s}}:=\left(j_{1}, \cdots, j_{s}\right), \mathbf{i}_{\mathbf{r}}:=\left(i_{1}, \cdots, i_{r}\right)$.
For $\omega_{1}, \cdots, \omega_{s} \in V^{*}, x_{1}, \cdots, x_{r} \in V$, we have

$$
T\left(x_{1}, \cdots, x_{r} ; \omega_{1}, \cdots, \omega_{s}\right)=\ltimes_{j=1}^{q} \omega_{s+1-j} M_{\Omega}^{\mathbf{j}_{\mathbf{s}} \times \mathbf{i}_{\mathbf{r}}} \ltimes_{i=1}^{p} x_{i} .
$$

Example 7. [21] In statistical mechanics, the Yang-Baxter equation is given as follows: Let $R=\left[r_{i_{1}, i_{2}, i_{3}, i_{4}}\right] \in \mathbb{F}^{N \times N \times N \times N}$. Then we have (in our notation):

$$
\begin{equation*}
\left(R \times_{1}^{4} R\right) \times{ }_{(3,4)}^{(2,4)} R=R \times_{(3,4)}^{(1,2)} \times\left(R \times_{1}^{4} R\right) . \tag{44}
\end{equation*}
$$

We express (44) into matrix form as follows:
Expressing $R \times{ }_{1}^{4} R$ into matrix form, we have

$$
\begin{equation*}
M_{T}:=M_{R}^{(1,2,3) \times 4} M_{R}^{1 \times(2,3,4)} \in \mathbb{F}^{N^{3} \times N^{3}} \tag{45}
\end{equation*}
$$

where its rows are indexed by $\operatorname{ID}\left(i_{1}, i_{2}, i_{3} ; N, N, N\right)$, which represents the original $\left(i_{1}, i_{2}, i_{3}\right)$ of $R$; its columns are indexed by $\operatorname{ID}\left(i_{4}, i_{5}, i_{6} ; N, N, N\right)$, which represents the original $\left(i_{2}, i_{3}, i_{4}\right)$ of $R$.

For the product on the LHS of (44), we convert $M_{T}$ into $M_{T}^{\left(i_{1}, i_{3}, i_{4}, i_{5}\right) \times\left(i_{2}, i_{6}\right)}$. Define

$$
\sigma_{s}:\langle 6\rangle \rightarrow(1,3,4,5,2,6) .
$$

Then we have

$$
M_{T}^{(1,3,4,5) \times(2,6)}=\mathbf{V}_{r}^{N^{2}}[\left(M_{T} \delta_{N^{3}}^{I}\right)^{T} W_{\underbrace{(N \cdots N]}_{6}}^{\sigma_{s}^{-1}}]
$$

Hence, the LHS of (44) becomes

$$
\begin{equation*}
L H S=(\mathbf{V}_{r}^{N^{2}}[\left(M_{T} \delta_{N^{3}}^{I}\right)^{T} W_{\underbrace{[N \cdots N]}}^{\sigma_{s}^{-1}}]) M_{R}^{(34) \times(12)} . \tag{46}
\end{equation*}
$$

Similarly, for the product on the LHS of (44), we convert $M_{T}$ into $M_{T}^{\left(i_{3}, i_{4}\right) \times\left(i_{1}, i_{2}, i_{5}, i_{6}\right)}$. Define

$$
\sigma_{t}:\langle 6\rangle \rightarrow(3,4,1,2,5,6)
$$

Then we have

$$
M_{T}^{(3,4) \times(1,2,5,6)}=\mathbf{V}_{r}^{N^{4}}[\left(M_{T} \delta_{N^{3}}^{I}\right)^{T} W_{\underbrace{(N \cdots N]}_{6}}^{\sigma_{t}^{-1}}]
$$

Hence, the RHS of (44) becomes

$$
\begin{equation*}
R H S=M_{R}^{(34) \times(12)}(\mathbf{V}_{r}^{N^{4}}[\left(M_{T} \delta_{N^{3}}^{I}\right)^{T} W^{W^{\sigma_{t}^{-1}} \underbrace{[N \cdots N]}_{6}}]) \tag{47}
\end{equation*}
$$

Fig. $2 \times$ vs $\ltimes$

Hence, (44) implies that

$$
\begin{aligned}
& (\mathbf{V}_{r}^{N^{2}}[\left(M_{T} \delta_{N^{3}}^{I}\right)^{T} W^{W^{\sigma_{s}^{-1}} \underbrace{}_{6} N \cdots N]}]) M_{R}^{(34) \times(12)} \\
& =M_{R}^{(34) \times(12)}(\mathbf{V}_{r}^{N^{4}}[\left(M_{T} \delta_{N^{3}}^{I}\right)^{T} W^{W^{\sigma_{t}^{-1}}} \underbrace{[N \cdots N]}_{6}]) .
\end{aligned}
$$

## 5 Conclusion

In this paper, the matrix expression of hypermatrices was first proposed. As an auxiliary tool, the permutation matrices have also been discussed in detail. It is used to reveal certain properties of the matrix expression of hypermatrices. Then it was shown that the STPs of matrices are essentially the multilinear operators of hypermatrices (including hypervectors). The operators over hypermatrices including contracted products, are realized by STPs through the matrix expression of hypermatrices. In fact, the actions of STP over hypermatrices can be considered as a generalization of the actions of the conventional matrix product over matrices. This fact can be demonstrated by Figure 2.

## Appendix

In the following some permutation matrices are listed.

1. $d=3, n=2$ :
(i) $\sigma_{1}:[1,2,3] \rightarrow[1,2,3]:$

$$
W_{2}^{\sigma_{1}}=\delta_{8}[1,2,3,4,5,6,7,8] .
$$

(ii) $\sigma_{2}:[1,2,3] \rightarrow[1,3,2]$ :

$$
W_{2}^{\sigma_{2}}=\delta_{8}[1,3,2,4,5,7,6,8]
$$

(iii) $\sigma_{3}:[1,2,3] \rightarrow[2,1,3]:$

$$
W_{2}^{\sigma_{3}}=\delta_{8}[1,2,5,6,3,4,7,8]
$$

(iv) $\sigma_{4}:[1,2,3] \rightarrow[2,3,1]$ :

$$
W_{2}^{\sigma_{4}}=\delta_{8}[1,3,5,7,2,4,6,8] . .
$$

(v) $\sigma_{5}:[1,2,3] \rightarrow[3,1,2]$ :

$$
W_{2}^{\sigma_{5}}=\delta_{8}[1,5,2,6,3,7,4,8]
$$

(vi) $\sigma_{6}:[1,2,3] \rightarrow[3,2,1]:$

$$
W_{2}^{\sigma_{6}}=\delta_{8}[1,5,3,7,2,6,4,8]
$$

2. $d=3, n=3$ :
(i) $\sigma_{1}:[1,2,3] \rightarrow[1,2,3]:$
$W_{3}^{\sigma_{1}}=\delta_{27}[1,2,3,4,5,6,7,8,9,10,11,12,13,14,15,16,17,18,19,20,21,22,23,24,25,26,27]$.
(ii) $\sigma_{2}:[1,2,3] \rightarrow[1,3,2]$ :
$W_{3}^{\sigma_{2}}=\delta_{27}[1,4,7,2,5,8,3,6,9,10,13,16,11,14,17,12,15,18,19,22,25,20,23,26,21,24,27]$.
(iii) $\sigma_{3}:[1,2,3] \rightarrow[2,1,3]:$
$W_{3}^{\sigma_{3}}=\delta_{27}[1,2,3,10,11,12,19,20,21,4,5,6,13,14,15,22,23,24,7,8,9,16,17,18,25,26,27]$.
(iv) $\sigma_{4}:[1,2,3] \rightarrow[2,3,1]$ :
$W_{3}^{\sigma_{4}}=\delta_{27}[1,10,19,2,11,20,3,12,21,4,13,22,5,14,23,6,15,24,7,16,25,8,17,26,9,18,27]$.
(v) $\sigma_{5}:[1,2,3] \rightarrow[3,1,2]$ :

$$
W_{3}^{\sigma_{5}}=\delta_{27}[1,4,7,10,13,16,19,22,25,2,5,8,11,14,17,20,23,26,3,6,9,12,15,18,21,24,27]
$$

(vi) $\sigma_{6}:[1,2,3] \rightarrow[3,2,1]:$
$W_{3}^{\sigma_{6}}=\delta_{27}[1,10,19,4,13,22,7,16,25,2,11,20,5,14,23,8,17,26,3,12,21,6,15,24,9,18,27]$.
3. $d=3, n=4$ :
(i) $\sigma_{1}:[1,2,3] \rightarrow[1,2,3]$ :
$W_{4}^{\sigma_{1}}=\delta_{64}[1,2,3,4,5,6,7,8,9,10,11,12,13,14,15,16,17,18,19,20,21,22$,
$23,24,25,26,27,28,29,30,31,32,33,34,35,36,37,38,39,40,41,42,43$, $44,45,46,47,48,49,50,51,52,53,54,55,56,57,58,59,60,61,62,63,64]$.
(ii) $\sigma_{2}:[1,2,3] \rightarrow[1,3,2]$ :

$$
\begin{aligned}
& W_{4}^{\sigma_{2}}=\delta_{64}[1,5,9,13,2,6,10,14,3,7,11,15,4,8,12,16,17,21,25,29,18,22, \\
& \quad 26,30,19,23,27,31,20,24,28,32,33,37,41,45,34,38,42,46,35,39,43, \\
& \quad 47,36,40,44,48,49,53,57,61,50,54,58,62,51,55,59,63,52,56,60,64] .
\end{aligned}
$$

(iii) $\sigma_{3}:[1,2,3] \rightarrow[2,1,3]$ :
$W_{4}^{\sigma_{3}}=\delta_{64}[1,2,3,4,17,18,19,20,33,34,35,36,49,50,51,52,5,6,7,8,21,22$,
$\quad 23,24,37,38,39,40,53,54,55,56,9,10,11,12,25,26,27,28,41,42,43,44$
$\quad 57,58,59,60,13,14,15,16,29,30,31,32,45,46,47,48,61,62,63,64]$.
(iv) $\sigma_{4}:[1,2,3] \rightarrow[2,3,1]:$
$W_{4}^{\sigma_{4}}=\delta_{64}[1,17,33,49,2,18,34,50,3,19,35,51,4,20,36,52,5,21,37,53,6$, $22,38,54,7,23,39,55,8,24,40,56,9,25,41,57,10,26,42,58,11,27,43$, $59,12,28,44,60,13,29,45,61,14,30,46,62,15,31,47,63,16,32,48,64]$.
(v) $\sigma_{5}:[1,2,3] \rightarrow[3,1,2]$ :
$W_{5}^{\sigma_{4}}=\delta_{64}[1,5,9,13,17,21,25,29,33,37,41,45,49,53,57,61,2,6,10,14$, $18,22,26,30,34,38,42,46,50,54,58,62,3,7,11,15,19,23,27,31,35,39$, $43,47,51,55,59,63,4,8,12,16,20,24,28,32,36,40,44,48,52,56,60,64]$.
(vi) $\sigma_{6}:[1,2,3] \rightarrow[3,2,1]:$
$W_{6}^{\sigma_{4}}=\delta_{64}[1,17,33,49,5,21,37,53,9,25,41,57,13,29,45,61,2,18,34,50$, $6,22,38,54,10,26,42,58,14,30,46,62,3,19,35,51,7,23,39,55,11,27$, $43,59,15,31,47,63,4,20,36,52,8,24,40,56,12,28,44,60,16,32,48,64]$.
4. $d=4, n=2$ :
(i) $\sigma_{1}:[1,2,3,4] \rightarrow[1,2,3,4]$ :

$$
W_{2}^{\sigma_{1}}=\delta_{16}[1,2,3,4,5,6,7,8,9,10,11,12,13,14,15,16]
$$

(ii) $\sigma_{2}:[1,2,3,4] \rightarrow[1,2,4,3]$ :

$$
W_{2}^{\sigma_{2}}=\delta_{16}[1,3,2,4,5,7,6,8,9,11,10,12,13,15,14,16] .
$$

(iii) $\sigma_{3}:[1,2,3,4] \rightarrow[1,3,2,4]$ :

$$
W_{2}^{\sigma_{3}}=\delta_{16}[1,2,5,6,3,4,7,8,9,10,13,14,11,12,15,16] .
$$

(iv) $\sigma_{4}:[1,2,3,4] \rightarrow[1,3,4,2]$ :
$W_{2}^{\sigma_{4}}=\delta_{16}[1,5,2,6,3,7,4,8,9,13,10,14,11,15,12,16]$.
(v) $\sigma_{5}:[1,2,3,4] \rightarrow[1,4,2,3]:$

$$
W_{2}^{\sigma_{5}}=\delta_{16}[1,3,5,7,2,4,6,8,9,11,13,15,10,12,14,16] .
$$

(vi) $\sigma_{6}:[1,2,3,4] \rightarrow[1,4,3,2]$ :

$$
