# Fractional Crank-Nicolson Galerkin finite element analysis for coupled time-fractional nonlocal parabolic problem 

Pari J. Kundaliya ${ }^{1}$

#### Abstract

In this article we propose a scheme for solving the coupled time-fractional nonlocal diffusion problem. The scheme consist of fractional Crank-Nicolson method with Galerkin finite element method (FEM) and Newton's method. We derive a priori error estimates for fully-discrete solutions in $L^{2}$ and $H_{0}^{1}$ norms. Results based on the usual finite element method are provided to confirm the derive a priori error estimates for fully-discrete solutions in $L^{2}$ and $H_{0}^{1}$ norms. Results based on the usual finite element method are provided to confirm the theoretical estimates.

Keywords: Nonlocal problem, Uniform mesh, Fractional Crank-Nicolson method, Error estimate

## 1 Introduction

Many real world problems are modeled more accurately by fractional differential equations than integer order differential equations [9]. Fractional order partial differential equations (PDEs) have numerous applications in the fields of science and engineering, such as physics, chemistry, biology and finance [6, 8, 16]. In the literature, several numerical methods are available for time discretization of time fractional PDEs. Mainly, these methods can be classified as convolution quadrature (CQ) and $L 1$ type schemes $24 \sqrt[32]{ }$. There are many real-life problems which have more than one unknown function. As a motivation, authors in [15] considered a mathematical model related to two species rabbits and foxes in an island. In this model, the rate of change of the population of one species is depend on the rate of change of the population of other species. In this article, we consider the following coupled time-fractional nonlocal diffusion equation with unknowns $u$ and $v$.
Find $u$ and $v$ such that

$$
\begin{align*}
&{ }^{C} D_{t}^{\alpha} u(x, t)-M_{1}(l(u), l(v)) \Delta u(x, t)=f_{1}(u, v)  \tag{1a}\\
& \text { in }^{C} \Omega \times(0, T],  \tag{1b}\\
&{ }^{C} D_{t}^{\alpha} v(x, t)-M_{2}(l(u), l(v)) \Delta v(x, t)=f_{2}(u, v)  \tag{1c}\\
& \text { in } \Omega \times(0, T],  \tag{1d}\\
& u(x, t)=v(x, t)=0 \\
& u(x, 0)=v(x, 0)=0 \text { in } \Omega \Omega \times(0, T],
\end{align*}
$$

[^0]where $\Omega$ is a bounded domain in $\mathbb{R}^{d}(d=1,2,3)$ with smooth boundary $\partial \Omega, f_{1}(u, v)$ and $f_{2}(u, v)$ represent the forcing terms, $l(u)=\int_{\Omega} u d x, l(v)=\int_{\Omega} v d x,{ }^{C} D_{t}^{\alpha}$ represents the $\alpha^{\text {th }}$ order Caputo fractional derivative [12]. Above problem (1a)-(1d) can be seen as a generalization of the integer order parabolic problem given in [1, 3] to fractional order. Problems of this kind have applications in biology, where $u, v$ can represent the densities of two populations which are interacting through the nonlocal functions $M_{1}$ and $M_{2}$ [13, 14]. In recent years, many researchers have paid attention to the study of nonlocal PDEs [1,4, 10, 11]. In [1,3], author solved coupled nonlocal parabolic problem using FEM. Also, for time discretization, the Backward Euler scheme [1] and the Crank-Nicolson scheme [3] are used. In [5], coupled time fractional nonlinear diffusion system is solved using Galerkin finite element scheme along with fractional Crank-Nicolson method. In [22], authors used FEM with the $L 1$ scheme on uniform mesh to find the numerical solution of the time-fractional nonlocal PDE
\[

$$
\begin{aligned}
{ }^{C} D_{t}^{\alpha} u(x, t)-\nabla\left(a\left(\int_{\Omega} u d x\right) \nabla u(x, t)\right) & =f(x, t) & & \text { in } \Omega \times(0, T], \\
u(x, t) & =0 & & \text { on } \partial \Omega \times(0, T], \\
u(x, 0) & =u_{0} & & \text { in } \Omega .
\end{aligned}
$$
\]

This scheme gives $O\left(\tau^{2-\alpha}\right)$ (where $\tau$ denotes the time step size) convergence in time. In this article, we use the Fractional Crank-Nicolson method on uniform mesh to discretize the Caputo fractional derivative which gives $O\left(\tau^{2}\right)$ convergence in temporal direction. This method is first proposed by Dimitrov [18] under compatibility conditions $u \in C^{3}[0, T]$ and $u(0)=u_{t}(0)=u_{t t}(0)=0$. Here also we assume the same conditions for unknown functions $u$ and $v$. To discretize the space variable, we use the finite element method with linear bases. To handle the nonlocal term and nonlinearity, Newton's method has been used.
Throughout the paper, $C>0$ denotes the generic constant independent of mesh parameters $h$ and $\tau$. Let $(\cdot, \cdot)$ denotes the inner product and $\|\cdot\|$ denotes the norm on space $L^{2}(\Omega)$. For $m \in \mathbb{N}, H^{m}(\Omega)$ represents the standard Sobolev space with the norm $\|\cdot\|_{m}$ and $H_{0}^{1}(\Omega):=\left\{w \in H^{1}(\Omega): w=0\right.$ on $\left.\partial \Omega\right\}$.
The rest of the paper is organized as follows: In section 2 , we write the weak formulation and fully-discrete formulation for the given problem (1). We also derive a numerical scheme to solve (1). The a priori bound and a priori error estimate for fully-discrete solutions are derived in section 3 and 4 , respectively. Finally, the numerical experiments given in section 5 validate the theoretical findings.
For existence and uniqueness results as well as numerical analysis, we make the following hypotheses on the given problem data.

- H1: $M_{i}: \mathbb{R}^{2} \rightarrow \mathbb{R}$ is bounded with $0<m_{1} \leq M_{i}(x, y) \leq m_{2}, x, y \in \mathbb{R}, i=1,2$.
- H2: $M_{i}: \mathbb{R}^{2} \rightarrow \mathbb{R}$ is Lipschitz continuous with Lipschitz constants $L_{i}^{\prime}, K_{i}^{\prime}>0$.

$$
\left|M_{i}\left(x_{1}, y_{1}\right)-M_{i}\left(x_{2}, y_{2}\right)\right| \leq L_{i}^{\prime}\left|x_{1}-x_{2}\right|+K_{i}^{\prime}\left|y_{1}-y_{2}\right|, \quad x_{1}, x_{2}, y_{1}, y_{2} \in \mathbb{R}, \quad i=1,2
$$

- $\mathrm{H} 3: f_{i}: \mathbb{R}^{2} \rightarrow \mathbb{R}$ is Lipschitz continuous with Lipschitz constants $L_{i}, K_{i}>0$.

$$
\left|f_{i}\left(x_{1}, y_{1}\right)-f_{i}\left(x_{2}, y_{2}\right)\right| \leq L_{i}\left\|x_{1}-x_{2}\right\|+K_{i}\left\|y_{1}-y_{2}\right\|, \quad x_{1}, x_{2}, y_{1}, y_{2} \in \mathbb{R}, \quad i=1,2 .
$$

## 2 Fully-discrete formulation

In this section, first we write the weak formulation of (1) and then discretize (1) in both space and time variable. The weak formulation of problem (1) is given below. Find $u(\cdot, t), v(\cdot, t) \in H_{0}^{1}(\Omega)$ for each $t \in(0, T]$ such that

$$
\begin{align*}
\left({ }^{C} D_{t}^{\alpha} u, w\right)+M_{1}(l(u), l(v))(\nabla u, \nabla w) & =\left(f_{1}(u, v), w\right), \quad \forall w \in H_{0}^{1}(\Omega) . \\
\left({ }^{C} D_{t}^{\alpha} v, \omega\right)+M_{2}(l(u), l(v))(\nabla v, \nabla \omega) & =\left(f_{2}(u, v), \omega\right), \quad \forall \omega \in H_{0}^{1}(\Omega) .  \tag{3}\\
u(x, 0)=v(x, 0) & =0 \quad \text { in } \Omega .
\end{align*}
$$

By using Faedo-Galerkin method [22], one can prove under the hypotheses H1 and $H 3$, the problem (1) has a unique solution $\{u, v\}$ for $0<\alpha<1$.
Now, to discretize equation (1a)-1d in space, we use finite element method. For that let $\Omega_{h}$ be a quasi uniform partition of $\Omega$ into disjoint intervals in $\mathbb{R}^{1}$ or triangles in $\mathbb{R}^{2}$ with step size $h$. Consider the $M$-dimensional subspace $X_{h}$ of $H_{0}^{1}(\Omega)$ such that

$$
X_{h}:=\left\{w \in C^{0}(\bar{\Omega}): w_{\mid T_{k}} \in P_{1}\left(T_{k}\right), \forall T_{k} \in \Omega_{h} \text { and } w=0 \text { on } \partial \Omega\right\} .
$$

Now, we partitioned the time interval $[0, T]$ into $N$ number of sub-intervals using uniform step size $\tau=\frac{T}{N}$. Let $\tau_{N}:=\left\{t_{n}: t_{n}=n \tau\right.$, for $\left.n=0,1, \ldots, N\right\}$ be a partition of $[0, T]$. For each $n=1,2, \ldots, N$, we denote $u\left(t_{n}\right)$ and $v\left(t_{n}\right)$ by $u^{n}$ and $v^{n}$, respectively. Let $U^{n} \approx u^{n}$ and $V^{n} \approx v^{n}$. Also, we set $U^{n, \alpha}=\left(1-\frac{\alpha}{2}\right) U^{n}+\frac{\alpha}{2} U^{n-1}$, $V^{n, \alpha}=\left(1-\frac{\alpha}{2}\right) V^{n}+\frac{\alpha}{2} V^{n-1}$.
To approximate the Caputo fractional derivative, we use the fractional Crank-Nicolson method. We know that for any function $w$, if $w(0)=0$ then ${ }^{C} D_{t_{n}}^{\alpha} w={ }^{R} D_{t_{n}}^{\alpha} w$, where ${ }^{R} D_{t_{n}}^{\alpha} w$ is the $\alpha^{t h}$ order Riemann-Liouville fractional derivative of $w$. Authors in 17 derived the following approximation to ${ }^{R} D_{t_{n-\frac{\alpha}{2}}^{\alpha}}^{\alpha} w$ which gives $O\left(\tau^{2}\right)$ convergence in time.

$$
\begin{equation*}
{ }^{C} D_{t_{n-\frac{\alpha}{2}}}^{\alpha} w={ }^{R} D_{t_{n-\frac{\alpha}{2}}}^{\alpha} w \approx D_{\tau}^{\alpha} w^{n}:=\tau^{-\alpha} \sum_{j=0}^{n} b_{n-j} \phi^{j}, \quad n=1,2, \ldots, N, \tag{4}
\end{equation*}
$$

where

$$
\begin{equation*}
b_{k}=(-1)^{k} \frac{\Gamma(\alpha+1)}{\Gamma(k+1) \Gamma(\alpha-k+1)} . \tag{5}
\end{equation*}
$$

Lemma 2.1. 17 20 If $w \in C^{3}[0, T]$ and $w(0)=0, w_{t}(0)=0, w_{t t}(0)=0$, then the error $\left\|^{C} D_{t_{n-\frac{\alpha}{2}}^{\alpha}}^{\alpha} w-D_{\tau}^{\alpha} w^{n}\right\|$ satisfies

$$
\begin{equation*}
\left\|{ }^{C} D_{t_{n-\frac{\alpha}{2}}^{\alpha}}^{\alpha} w-D_{\tau}^{\alpha} w^{n}\right\| \leq C \tau^{2} \tag{6}
\end{equation*}
$$

The fully-discrete scheme for (1) is: For each $n=1,2, \ldots, N$, find $U^{n}$ and $V^{n} \in X_{h}$ such that

$$
\begin{align*}
\left({ }^{C} D_{\tau}^{\alpha} U^{n}, w\right)+M_{1}\left(l\left(U^{n, \alpha}\right), l\left(V^{n, \alpha}\right)\right)\left(\nabla U^{n, \alpha}, \nabla w\right) & =\left(f_{1}\left(U^{n, \alpha}, V^{n, \alpha}\right), w\right), \quad \forall w \in X_{h}, \\
\left({ }^{C} D_{\tau}^{\alpha} V^{n}, \omega\right)+M_{2}\left(l\left(U^{n, \alpha}\right), l\left(V^{n, \alpha}\right)\right)\left(\nabla V^{n, \alpha}, \nabla \omega\right) & =\left(f_{2}\left(U^{n, \alpha}, V^{n, \alpha}\right), \omega\right), \quad \forall \omega \in X_{h}, \\
U^{0} & =0, \quad V^{0}=0 . \tag{7}
\end{align*}
$$

Using the definition of ${ }^{C} D_{\tau}^{\alpha},(7)$ can be rewrite as

$$
\begin{align*}
\tau^{-\alpha} b_{0}\left(U^{n}, w\right)+M_{1}\left(l\left(U^{n, \alpha}\right), l\left(V^{n, \alpha}\right)\right)\left(\nabla U^{n, \alpha}, \nabla w\right) & =\left(f_{1}\left(U^{n, \alpha}, V^{n, \alpha}\right), w\right) \\
& -\tau^{-\alpha} \sum_{j=1}^{n-1} b_{n-j}\left(U^{n, \alpha}, w_{h}\right), \\
\tau^{-\alpha} b_{0}\left(V^{n}, \omega\right)+M_{2}\left(l\left(U^{n, \alpha}\right), l\left(V^{n, \alpha}\right)\right)\left(\nabla V^{n, \alpha}, \nabla \omega\right) & =\left(f_{2}\left(U^{n, \alpha}, V^{n, \alpha}\right), \omega\right)  \tag{8}\\
& -\tau^{-\alpha} \sum_{j=1}^{n-1} b_{n-j}\left(V^{j}, \omega\right) .
\end{align*}
$$

Let $\left\{\psi_{i}(x)\right\}_{1 \leq i \leq M}$ be the $M$ dimensional basis of $X_{h}$ associated with nodes of $\Omega_{h}$. Therefore, for $U^{n}, V^{n} \in X_{h}$, we can find some $\beta_{i}^{n}, \gamma_{i}^{n} \in \mathbb{R}$ such that

$$
\begin{equation*}
U^{n}=\sum_{i=1}^{M} \beta_{i}^{n} \psi_{i}, \quad V^{n}=\sum_{i=1}^{M} \gamma_{i}^{n} \psi_{i} . \tag{9}
\end{equation*}
$$

Define $\beta^{n}:=\left[\beta_{1}^{n}, \beta_{2}^{n}, \ldots, \beta_{M}^{n}\right]^{\prime}$ and $\gamma^{n}:=\left[\gamma_{1}^{n}, \gamma_{2}^{n}, \ldots, \gamma_{M}^{n}\right]^{\prime}$.
Now, substituting the values of $U^{n}, V^{n}$ from (9) into (8), we obtain the nonlinear algebraic equations

$$
\begin{array}{ll}
G_{i}\left(\beta^{n}, \gamma^{n}\right)=G_{i}\left(U^{n}, V^{n}\right)=0, & 1 \leq i \leq M,  \tag{10}\\
H_{i}\left(\beta^{n}, \gamma^{n}\right)=H_{i}\left(U^{n}, V^{n}\right)=0, & 1 \leq i \leq M,
\end{array}
$$

where

$$
\begin{align*}
& G_{i}\left(U^{n}, V^{n}\right)=\tau^{-\alpha} b_{0}\left(U^{n}, \psi_{i}\right)+\tau^{-\alpha} \sum_{j=1}^{n-1} b_{n-j}\left(U^{j}, \psi_{i}\right)-\left(f_{1}\left(U^{n, \alpha}, V^{n, \alpha}\right), \psi_{i}\right) \\
&+M_{1}\left(l\left(U^{n, \alpha}\right), l\left(V^{n, \alpha}\right)\right)\left(\nabla U^{n, \alpha}, \nabla \psi_{i}\right) \\
& H_{i}\left(U^{n}, V^{n}\right)=\tau^{-\alpha} b_{0}\left(V^{n}, \psi_{i}\right)+\tau^{-\alpha} \sum_{j=1}^{n-1} b_{n-j}\left(V^{j}, \psi_{i}\right)-\left(f_{2}\left(U^{n, \alpha}, V^{n, \alpha}\right), \psi_{i}\right) \\
&+M_{2}\left(l\left(U^{n, \alpha}\right), l\left(V^{n, \alpha}\right)\right)\left(\nabla V^{n, \alpha}, \nabla \psi_{i}\right) \tag{11}
\end{align*}
$$

If we apply Newton's method to solve (10), we get the Jacobian matrix $J_{1}$ as follows:

$$
J_{1}=\left[\begin{array}{ll}
A & B  \tag{12}\\
C & D
\end{array}\right]
$$

where the elements of the matrices $A, B, C$ and $D$ take the form

$$
\begin{align*}
(A)_{k i}=\frac{\partial G_{i}}{\partial \beta_{k}^{n}}= & \tau^{-\alpha} b_{0}\left(\psi_{k}, \psi_{i}\right)+\left(1-\frac{\alpha}{2}\right) M_{1}\left(l\left(U^{n, \alpha}\right), l\left(V^{n, \alpha}\right)\right)\left(\nabla \psi_{k}, \nabla \psi_{i}\right) \\
& +\left(1-\frac{\alpha}{2}\right)\left(\frac{\partial M_{1}\left(l\left(U^{n, \alpha}\right), l\left(V^{n, \alpha}\right)\right)}{\partial l\left(U^{n}\right)}\right)\left(\int_{\Omega} \psi_{k} d x\right)\left(\nabla U^{n, \alpha}, \nabla \psi_{i}\right) \\
& -\left(1-\frac{\alpha}{2}\right)\left(\frac{\partial f_{1}\left(U^{n}, V^{n}\right)}{\partial U^{n}} \psi_{k}, \psi_{i}\right),  \tag{13}\\
(B)_{k i}=\frac{\partial G_{i}}{\partial \gamma_{k}^{n}}= & \left(1-\frac{\alpha}{2}\right)\left(\frac{\partial M_{1}\left(l\left(U^{n, \alpha}\right), l\left(V^{n, \alpha}\right)\right)}{\partial l\left(V^{n}\right)}\right)\left(\int_{\Omega} \psi_{k} d x\right)\left(\nabla U^{n, \alpha}, \nabla \psi_{i}\right) \\
& -\left(1-\frac{\alpha}{2}\right)\left(\frac{\partial f_{1}\left(U^{n}, V^{n}\right)}{\partial V^{n}} \psi_{k}, \psi_{i}\right),  \tag{14}\\
(C)_{p i}=\frac{\partial H_{i}}{\partial \beta_{p}^{n}}= & \left(1-\frac{\alpha}{2}\right)\left(\frac{\partial M_{2}\left(l\left(U^{n, \alpha}\right), l\left(V^{n, \alpha}\right)\right)}{\partial l\left(U^{n}\right)}\right)\left(\int_{\Omega} \psi_{p} d x\right)\left(\nabla V^{n, \alpha}, \nabla \psi_{i}\right) \\
& -\left(1-\frac{\alpha}{2}\right)\left(\frac{\partial f_{2}\left(U^{n}, V^{n}\right)}{\partial U^{n}} \psi_{p}, \psi_{i}\right), \tag{15}
\end{align*}
$$

$$
\begin{align*}
(D)_{p i}=\frac{\partial H_{i}}{\partial \gamma_{p}^{n}}= & \tau^{-\alpha} b_{0}\left(\psi_{p}, \psi_{i}\right)+M_{2}\left(l\left(U^{n, \alpha}\right), l\left(V^{n, \alpha}\right)\right)\left(\nabla \psi_{p}, \nabla \psi_{i}\right) \\
& +\left(1-\frac{\alpha}{2}\right)\left(\frac{\partial M_{2}\left(l\left(U^{n, \alpha}\right), l\left(V^{n, \alpha}\right)\right)}{\partial l\left(V^{n}\right)}\right)\left(\int_{\Omega} \psi_{p} d x\right)\left(\nabla V^{n, \alpha}, \nabla \psi_{i}\right) \\
& -\left(1-\frac{\alpha}{2}\right)\left(\frac{\partial f_{2}\left(U^{n}, V^{n}\right)}{\partial V^{n}} \psi_{p}, \psi_{i}\right), \tag{16}
\end{align*}
$$

where $1 \leq i, k, p \leq M$. From equations $(13)-(\sqrt{16)}$, we can observe that none of the matrices $A, B, C, D$ are sparse and therefore Jacobian matrix $J_{1}$ is not sparse [1-4]. We follow the idea given in $[1-4]$ to overcome above issue of sparsity. This idea was first proposed in [21] to solve nonlocal elliptic boundary value problem. The modified problem is defined as follows:
Find $d_{1}, d_{2} \in \mathbb{R}$ and $U^{n}, V^{n} \in X_{h}$ such that

$$
\begin{align*}
& l\left(U^{n, \alpha}\right)-d_{1}=0, \quad l\left(V^{n, \alpha}\right)-d_{2}=0, \\
& \tau^{-\alpha} b_{0}\left(U^{n}, \psi_{i}\right)+M_{1}\left(d_{1}, d_{2}\right)\left(\nabla U^{n, \alpha}, \nabla \psi_{i}\right)-\left(f_{1}\left(U^{n, \alpha}, V^{n, \alpha}\right), \psi_{i}\right) \\
& \quad+\tau^{-\alpha} \sum_{j=0}^{n-1} b_{n-j}\left(U^{j}, \psi_{i}\right)=0
\end{align*} \begin{array}{r}
\tau^{-\alpha} b_{0}\left(V^{n}, \psi_{i}\right)+M_{2}\left(d_{1}, d_{2}\right)\left(\nabla V^{n, \alpha}, \nabla \psi_{i}\right)-\left(f_{2}\left(U^{n, \alpha}, V^{n, \alpha}\right), \psi_{i}\right)  \tag{17}\\
\\
+\tau^{-\alpha} \sum_{j=0}^{n-1} b_{n-j}\left(V^{j}, \psi_{i}\right)=0 .
\end{array}
$$

Note that if $\left(d_{1}, d_{2}, U^{n}, V^{n}\right)$ is the solution of the problem (17), then $\left\{U^{n}, V^{n}\right\}$ is the solution of the problem (8) and the converse is also true (4].
Now, to solve equation (17) by using Newton's method, we rewrite (17) as follows:

$$
\begin{array}{ll}
G_{i}\left(U^{n}, V^{n}, d_{1}, d_{2}\right)=0, & 1 \leq i \leq M+1,  \tag{18}\\
H_{i}\left(U^{n}, V^{n}, d_{1}, d_{2}\right)=0, & 1 \leq i \leq M+1,
\end{array}
$$

where

$$
\begin{align*}
& \begin{array}{l}
G_{i}\left(U^{n}, V^{n}, d_{1}, d_{2}\right)= \\
\tau^{-\alpha} b_{0}\left(U^{n}, \psi_{i}\right)+\tau^{-\alpha} \sum_{j=1}^{n-1} b_{n-j}\left(U^{j}, \psi_{i}\right)-\left(f_{1}\left(U^{n, \alpha}, V^{n, \alpha}\right), \psi_{i}\right) \\
\\
\quad+M_{1}\left(d_{1}, d_{2}\right)\left(\nabla U^{n, \alpha}, \nabla \psi_{i}\right), \quad \text { for } 1 \leq i \leq M, \\
G_{(M+1)}\left(U^{n}, V^{n}, d_{1}, d_{2}\right)=l\left(U^{n, \alpha}\right)-d_{1}=0, \\
H_{i}\left(U^{n}, V^{n}, d_{1}, d_{2}\right)= \\
\\
\quad \tau^{-\alpha} b_{0}\left(V^{n}, \psi_{i}\right)+\tau^{-\alpha} \sum_{j=1}^{n-1} b_{n-j}\left(V^{j}, \psi_{i}\right)-\left(f_{2}\left(U^{n, \alpha}, V^{n, \alpha}\right), \psi_{i}\right) \\
\\
\quad+M_{2}\left(d_{1}, d_{2}\right)\left(\nabla V^{n, \alpha}, \nabla \psi_{i}\right), \quad \text { for } 1 \leq i \leq M,
\end{array} \\
& H_{(M+1)}\left(U^{n}, V^{n}, d_{1}, d_{2}\right)=l\left(V^{n, \alpha}\right)-d_{2}=0 .
\end{align*}
$$

Now, applying Newton's method to the system of equations (18), we get the following matrix equation:

$$
J\left[\begin{array}{c}
\beta^{n}  \tag{20}\\
\gamma^{n} \\
\beta \\
\gamma
\end{array}\right]=\left[\begin{array}{llll}
A_{1} & B_{1} & C_{1} & D_{1} \\
A_{2} & B_{2} & C_{2} & D_{2} \\
A_{3} & B_{3} & C_{3} & D_{3} \\
A_{4} & B_{4} & C_{4} & D_{4}
\end{array}\right]\left[\begin{array}{c}
\beta^{n} \\
\gamma^{n} \\
\beta \\
\gamma
\end{array}\right]=\left[\begin{array}{c}
\bar{G} \\
\bar{H} \\
G_{(M+1)} \\
H_{(M+1)}
\end{array}\right],
$$

where $J$ denotes the Jacobian matrix, $\beta^{n}=\left[\beta_{1}^{n}, \beta_{2}^{n}, \ldots, \beta_{M}^{n}\right]^{\prime}, \gamma^{n}=\left[\gamma_{1}^{n}, \gamma_{2}^{n}, \ldots, \gamma_{M}^{n}\right]^{\prime}$, $\bar{G}=\left[G_{1}, G_{2}, \ldots, G_{M}\right]^{\prime}, \bar{H}=\left[H_{1}, H_{2}, \ldots, H_{M}\right]^{\prime}$ and entries of matrices $A_{r}, B_{r}, C_{r}, D_{r}$, $(r=1,2,3,4)$ are given below. For $1 \leq i, k \leq M$,

$$
\begin{align*}
& \left(A_{1}\right)_{i k}=\tau^{-\alpha} b_{0}\left(\psi_{k}, \psi_{i}\right)+\left(1-\frac{\alpha}{2}\right)\left\{M_{1}\left(d_{1}, d_{2}\right)\left(\nabla \psi_{k}, \nabla \psi_{i}\right)-\left(\frac{\partial f_{1}\left(U^{n}, V^{n}\right)}{\partial U^{n}} \psi_{k}, \psi_{i}\right)\right\}, \\
& \left(B_{1}\right)_{i k}=-\left(1-\frac{\alpha}{2}\right)\left(\frac{\partial f_{1}\left(U^{n}, V^{n}\right)}{\partial V^{n}} \psi_{k}, \psi_{i}\right), \\
& \left(C_{1}\right)_{i 1}=\frac{\partial M_{1}}{\partial d_{1}}\left(d_{1}, d_{2}\right)\left(\nabla U^{n, \alpha}, \nabla \psi_{i}\right), \quad\left(D_{1}\right)_{i 1}=\frac{\partial M_{1}}{\partial d_{2}}\left(d_{1}, d_{2}\right)\left(\nabla U^{n, \alpha}, \nabla \psi_{i}\right) . \tag{21}
\end{align*}
$$

$$
\left(A_{2}\right)_{i k}=-\left(1-\frac{\alpha}{2}\right)\left(\frac{\partial f_{2}\left(U^{n}, V^{n}\right)}{\partial U^{n}} \psi_{k}, \psi_{i}\right)
$$

$$
\left(B_{2}\right)_{i k}=\tau^{-\alpha} b_{0}\left(\psi_{k}, \psi_{i}\right)+\left(1-\frac{\alpha}{2}\right)\left\{M_{2}\left(d_{1}, d_{2}\right)\left(\nabla \psi_{k}, \nabla \psi_{i}\right)-\left(\frac{\partial f_{2}\left(U^{n}, V^{n}\right)}{\partial V^{n}} \psi_{k}, \psi_{i}\right)\right\}
$$

$$
\begin{equation*}
\left(C_{2}\right)_{i 1}=\frac{\partial M_{2}}{\partial d_{1}}\left(d_{1}, d_{2}\right)\left(\nabla V^{n, \alpha}, \nabla \psi_{i}\right), \quad\left(D_{2}\right)_{i 1}=\frac{\partial M_{2}}{\partial d_{2}}\left(d_{1}, d_{2}\right)\left(\nabla V^{n, \alpha}, \nabla \psi_{i}\right) \tag{22}
\end{equation*}
$$

$$
\begin{align*}
& \left(A_{3}\right)_{1 k}=\left(1-\frac{\alpha}{2}\right) \int_{\Omega} \psi_{k} d x, \quad\left(B_{3}\right)_{1 k}=0, \quad\left(C_{3}\right)_{11}=-1, \quad\left(D_{3}\right)_{11}=0 .  \tag{23}\\
& \left(A_{4}\right)_{1 k}=0, \quad\left(B_{4}\right)_{1 k}=\left(1-\frac{\alpha}{2}\right) \int_{\Omega} \psi_{k} d x, \quad\left(C_{4}\right)_{11}=0, \quad\left(D_{4}\right)_{11}=-1 . \tag{24}
\end{align*}
$$

From equations (21)-24), it can be seen that $A_{1}, B_{1}, A_{2}, B_{2}$ are sparse matrices [3] 5 ] and hence $J$ is a sparse matrix.

## 3 A priori bound

In this section, we provide a priori bound for the fully-discrete scheme (7). For this we need following Lemma.

Lemma 3.1. 20] For any function $\phi(\cdot, t)$ defined on $\tau_{N}$, one has

$$
\begin{equation*}
\frac{1}{2}{ }^{C} D_{\tau}^{\alpha}\left\|\phi^{n}\right\|^{2} \leq\left({ }^{C} D_{\tau}^{\alpha} \phi^{n}, \phi^{n, \alpha}\right) \tag{25}
\end{equation*}
$$

where $\phi^{n, \alpha}:=\left(1-\frac{\alpha}{2}\right) \phi^{n}+\frac{\alpha}{2} \phi^{n-1}$, for $n=1,2, \ldots, N$.
For derivation of a priori bound and error estimate, we also use following Discrete fractional Grönwall type inequality.

Lemma 3.2. 20] Suppose the nonnegative sequences $\left\{\omega^{n}, \phi^{n} \mid n=0,1,2, \ldots\right\}$ satisfy

$$
{ }^{C} D_{\tau}^{\alpha} \omega^{n} \leq \lambda_{1} \omega^{n}+\lambda_{2} \omega^{n-1}+\phi^{n}, \quad n \geq 1
$$

where $\lambda_{1}$ and $\lambda_{2}$ are nonnegative constants. Then there exists a positive constant $\tau^{\star}$ such that when $\tau \leq \tau^{\star}$,

$$
\omega^{n} \leq 2\left(\omega^{0}+\frac{t_{n}^{\alpha}}{\Gamma(1+\alpha)} \max _{0 \leq j \leq n} \phi^{j}\right) E_{\alpha}\left(2 \lambda t_{n}^{\alpha}\right), \quad 1 \leq n \leq N
$$

where $E_{\alpha}(z)$ is the Mittag-Leffler function and $\lambda=\lambda_{1}+\frac{\lambda_{2}}{2-2^{(1-\alpha)}}$.
Theorem 3.1. Let $\left(U^{n}, V^{n}\right)($ for $1 \leq n \leq N)$ be the solution of (7). Then there exists a positive constant $\tau^{*}$ (independent of $h$ ) such that when $\tau \leq \tau^{*}, U^{n}$, $V^{n}$ satisfy

$$
\begin{gather*}
\left\|U^{n}\right\|+\left\|V^{n}\right\| \leq C  \tag{26}\\
\left\|\nabla U^{n}\right\|+\left\|\nabla V^{n}\right\| \leq C \tag{27}
\end{gather*}
$$

Proof. For $\forall w \in X_{h}$, from (7), we have

$$
\begin{equation*}
\left({ }^{C} D_{\tau}^{\alpha} U^{n}, w\right)+M_{1}\left(l\left(U^{n, \alpha}\right), l\left(V^{n, \alpha}\right)\right)\left(\nabla U^{n, \alpha}, \nabla w\right)=\left(f_{1}\left(U^{n, \alpha}, V^{n, \alpha}\right), w\right) \tag{28}
\end{equation*}
$$

Choosing $w=U^{n, \alpha}$ and then using the Cauchy-Schwarz inequality along with the inequality $a b \leq \frac{1}{2} a^{2}+\frac{1}{2} b^{2}$, we can obtain

$$
\begin{equation*}
\left({ }^{C} D_{\tau}^{\alpha} U^{n}, U^{n, \alpha}\right)+M_{1}\left(l\left(U^{n, \alpha}\right), l\left(V^{n, \alpha}\right)\right)\left\|\nabla U^{n, \alpha}\right\|^{2} \leq \frac{1}{2}\left(\left\|f_{1}\left(U^{n, \alpha}, V^{n, \alpha}\right)\right\|^{2}+\left\|U^{n, \alpha}\right\|^{2}\right) . \tag{29}
\end{equation*}
$$

Since $f_{1}$ is Lipschitz continuous, we have

$$
\begin{aligned}
\left|\left\|f_{1}\left(U^{n, \alpha}, V^{n, \alpha}\right)\right\|-\left\|f_{1}(0,0)\right\|\right| & \leq\left\|f_{1}\left(U^{n, \alpha}, V^{n, \alpha}\right)-f_{1}(0,0)\right\| \\
& \leq L_{1}\left\|U^{n, \alpha}\right\|+K_{1}\left\|V^{n, \alpha}\right\| .
\end{aligned}
$$

Therefore,
$\left\|f_{1}\left(U^{n, \alpha}, V^{n, \alpha}\right)\right\| \leq\left\|f_{1}(0,0)\right\|+L_{1}\left\|U^{n, \alpha}\right\|+K_{1}\left\|V^{n, \alpha}\right\| \leq C\left(1+\left\|U^{n, \alpha}\right\|+\left\|V^{n, \alpha}\right\|\right)$.

By using the bound of $M_{1}$ and from equation (30), we can write equation (29) as

$$
\begin{align*}
\left({ }^{C} D_{\tau}^{\alpha} U^{n}, U^{n, \alpha}\right)+m_{1}\left\|\nabla U^{n, \alpha}\right\|^{2} & \leq C\left(\left(1+\left\|U^{n, \alpha}\right\|+\left\|V^{n, \alpha}\right\|\right)^{2}+\left\|U^{n, \alpha}\right\|^{2}\right), \\
\left({ }^{C} D_{\tau}^{\alpha} U^{n, \alpha}, U^{n, \alpha}\right) & \leq C\left(1+\left\|U^{n, \alpha}\right\|^{2}+\left\|V^{n, \alpha}\right\|^{2}\right) \tag{31}
\end{align*}
$$

An application of Lemma 3.1 in (31), gives

$$
\begin{equation*}
{ }^{C} D_{\tau}^{\alpha}\left\|U^{n}\right\|^{2} \leq C\left(1+\left\|U^{n, \alpha}\right\|^{2}+\left\|V^{n, \alpha}\right\|^{2}\right) \tag{32}
\end{equation*}
$$

Similarly, we can get the estimate for $V^{n}$ as follows:

$$
\begin{equation*}
{ }^{C} D_{\tau}^{\alpha}\left\|V^{n}\right\|^{2} \leq C\left(1+\left\|V^{n, \alpha}\right\|^{2}+\left\|U^{n, \alpha}\right\|^{2}\right) \tag{33}
\end{equation*}
$$

Adding (32) and (33), we get

$$
\begin{equation*}
{ }^{C} D_{\tau}^{\alpha}\left(\left\|U^{n}\right\|^{2}+\left\|V^{n}\right\|^{2}\right) \leq C\left(1+\left\|U^{n, \alpha}\right\|^{2}+\left\|V^{n, \alpha}\right\|^{2}\right) \tag{34}
\end{equation*}
$$

Using Lemma 3.2 in (34), we can arrive at

$$
\begin{equation*}
\left\|U^{n}\right\|^{2}+\left\|V^{n}\right\|^{2} \leq C \tag{35}
\end{equation*}
$$

For $a, b \geq 0$, using $\frac{1}{2}(a+b)^{2} \leq a^{2}+b^{2}$ in (35), we obtain

$$
\left\|U^{n}\right\|+\left\|V^{n}\right\| \leq C
$$

Now, we choose $w={ }^{C} D_{\tau}^{\alpha} U^{n}$ and then use Cauchy-Schwarz inequality in (28) to obtain

$$
\begin{equation*}
\left\|{ }^{C} D_{\tau}^{\alpha} U^{n}\right\|^{2}+M_{1}\left(l\left(U^{n, \alpha}\right), l\left(V^{n, \alpha}\right)\right)\left(\nabla U^{n, \alpha}, \nabla^{C} D_{\tau}^{\alpha} U^{n}\right) \leq\left\|f_{1}\left(U^{n, \alpha}, V^{n, \alpha}\right)\right\|\left\|^{C} D_{\tau}^{\alpha} U^{n}\right\| \tag{36}
\end{equation*}
$$

We divide both sides of (36) by $M_{1}\left(l\left(U^{n, \alpha}\right), l\left(V^{n, \alpha}\right)\right)$ and then use bound of $M_{1}$ to get

$$
\begin{equation*}
\frac{1}{m_{2}}\left\|{ }^{C} D_{\tau}^{\alpha} U^{n}\right\|^{2}+\left(\nabla U^{n, \alpha}, \nabla^{C} D_{\tau}^{\alpha} U^{n}\right) \leq \frac{1}{m_{1}}\left(\left\|f_{1}\left(U^{n, \alpha}, V^{n, \alpha}\right)\right\|\left\|^{C} D_{\tau}^{\alpha} U^{n}\right\|\right) \tag{37}
\end{equation*}
$$

An application of inequality $a b \leq \frac{\epsilon}{2} a^{2}+\frac{1}{2 \epsilon} b^{2}$ (with $\epsilon=m_{2}$ ) gives

$$
\begin{equation*}
\frac{1}{m_{2}}\left\|^{C} D_{\tau}^{\alpha} U^{n}\right\|^{2}+\left(\nabla U^{n, \alpha}, \nabla^{C} D_{\tau}^{\alpha} U^{n}\right) \leq \frac{m_{2}}{2 m_{1}^{2}}\left\|f_{1}\left(U^{n, \alpha}, V^{n, \alpha}\right)\right\|^{2}+\frac{1}{2 m_{2}}\left\|^{C} D_{\tau}^{\alpha} U^{n}\right\| \tag{38}
\end{equation*}
$$

Using Lemma 3.1 and (30) with Poincaré inequality in (38), we can arrive at

$$
\begin{equation*}
{ }^{C} D_{\tau}^{\alpha}\left\|\nabla U^{n}\right\|^{2} \leq C\left(1+\left\|\nabla U^{n, \alpha}\right\|^{2}+\left\|\nabla V^{n, \alpha}\right\|^{2}\right) \tag{39}
\end{equation*}
$$

Similarly, we get an estimate for $V^{n}$ as

$$
\begin{equation*}
{ }^{C} D_{\tau}^{\alpha}\left\|\nabla V^{n}\right\|^{2} \leq C\left(1+\left\|\nabla V^{n, \alpha}\right\|^{2}+\left\|\nabla U^{n, \alpha}\right\|^{2}\right) \tag{40}
\end{equation*}
$$

On adding (39) and (40), we get

$$
\begin{equation*}
{ }^{C} D_{\tau}^{\alpha}\left(\left\|\nabla U^{n}\right\|^{2}+\left\|\nabla V^{n}\right\|^{2}\right) \leq C\left(1+\left\|\nabla U^{n, \alpha}\right\|^{2}+\left\|\nabla V^{n, \alpha}\right\|^{2}\right) \tag{41}
\end{equation*}
$$

An application of Lemma 3.2 to (41) gives required result

$$
\left\|\nabla U^{n}\right\|+\left\|\nabla V^{n}\right\| \leq C
$$

This completes the proof.
Theorem 3.2. Let $U^{0}, U^{1}, \ldots, U^{n-1}$ and $V^{0}, V^{1}, \ldots, V^{n-1}$ are given. Then there exists a positive constant $\tau^{*}$ (independent of $h$ ) such that when $\tau \leq \tau^{*}$, the problem (7) has a unique solution $U^{n}, V^{n} \in X_{h}$, for all $1 \leq n \leq N$.

Proof. The proof follows in similar lines as given in of [5, Theorem 1].

## 4 A priori error estimate

In order to derive convergence estimate, we use Ritz projection operator [23] given by

$$
\begin{equation*}
(\nabla \phi, \nabla w)=\left(\nabla R_{h} \phi, \nabla w\right), \quad \forall \phi \in H_{0}^{1}(\Omega), w \in X_{h} \tag{42}
\end{equation*}
$$

In following Theorem, we state an approximation property for the operator $R_{h}$ which will be useful in the derivation of a priori error estimate.

Theorem 4.1. [23] There exists $C>0$, independent of $h$ such that

$$
\begin{equation*}
\left\|\phi-R_{h} \phi\right\|_{L^{2}(\Omega)}+h\left\|\nabla\left(\phi-R_{h} \phi\right)\right\|_{L^{2}(\Omega)} \leq C h^{2}\|\Delta \phi\|_{L^{2}(\Omega)}, \quad \forall \phi \in H^{2}(\Omega) \cap H_{0}^{1}(\Omega) . \tag{43}
\end{equation*}
$$

Using the intermediate projection $R_{h}$, we split the error into two parts as

$$
\begin{aligned}
& u\left(x, t_{n}\right)-U^{n}=u^{n}-U^{n}=\left(u^{n}-R_{h} u^{n}\right)+\left(R_{h} u^{n}-U^{n}\right)=\zeta_{1}^{n}+\chi_{1}^{n}, \\
& v\left(x, t_{n}\right)-V^{n}=v^{n}-V^{n}=\left(v^{n}-R_{h} v^{n}\right)+\left(R_{h} v^{n}-V^{n}\right)=\zeta_{2}^{n}+\chi_{2}^{n} .
\end{aligned}
$$

Theorem 4.2. Let $\left(U^{n}, V^{n}\right)$ be the solution of fully-discrete scheme (7). Then under the sufficient regularity assumptions on the solution $u, v \in C^{3}\left([0, T] ; L^{2}(\Omega)\right) \cap$ $C^{2}\left([0, T] ; H^{2}(\Omega) \cap H_{0}^{1}(\Omega)\right),\left(\frac{\partial^{i} u}{\partial t^{i}}\right)_{t=0}=\left(\frac{\partial^{i} v}{\partial t^{i}}\right)_{t=0}=0$, for $i=0,1,2$ of $\left.1 a\right)-1 d$, there exists a positive constant $\tau^{*}$ (independent of $\stackrel{t=0}{h}$ ) such that when $\tau \leq \tau^{*}$, the following estimates hold.

$$
\begin{align*}
\left\|u^{n}-U^{n}\right\|+\left\|v^{n}-V^{n}\right\| & \leq C\left(h^{2}+\tau^{2}\right) \\
\left\|\nabla u^{n}-\nabla U^{n}\right\|+\left\|\nabla v^{n}-\nabla V^{n}\right\| & \leq C\left(h+\tau^{2}\right), \tag{44}
\end{align*}
$$

where $n=1,2, \ldots, N$.
Proof. For any $w \in X_{h}$, we have

$$
\begin{align*}
\left({ }^{C}\right. & \left.D_{\tau}^{\alpha} \chi_{1}^{n}, w\right)+M_{1}\left(l\left(U^{n, \alpha}\right), l\left(V^{n, \alpha}\right)\right)\left(\nabla \chi_{1}^{n, \alpha}, \nabla w\right) \\
= & \left({ }^{C} D_{\tau}^{\alpha} R_{h} u^{n}, w\right)+M_{1}\left(l\left(U^{n, \alpha}\right), l\left(V^{n, \alpha}\right)\right)\left(\nabla R_{h} u^{n, \alpha}, \nabla w\right)-\left({ }^{C} D_{\tau}^{\alpha} U^{n}, w\right) \\
& \quad-M_{1}\left(l\left(U^{n, \alpha}\right), l\left(V^{n, \alpha}\right)\right)\left(\nabla U^{n, \alpha}, \nabla w\right) . \\
= & \left({ }^{C} D_{\tau}^{\alpha} R_{h} u^{n}, w\right)+M_{1}\left(l\left(U^{n, \alpha}\right), l\left(V^{n, \alpha}\right)\right)\left(\nabla u^{n, \alpha}, \nabla w\right)-\left(f_{1}\left(U^{n, \alpha}, V^{n, \alpha}\right), w\right) \\
& +\left(f_{1}\left(u^{n-\frac{\alpha}{2}}, v^{n-\frac{\alpha}{2}}\right), w\right)-\left({ }^{C} D_{t_{n-\frac{\alpha}{2}}^{\alpha}} u, w\right)-M_{1}\left(l\left(u^{n-\frac{\alpha}{2}}\right), l\left(v^{n-\frac{\alpha}{2}}\right)\right)\left(\nabla u^{n-\frac{\alpha}{2}}, \nabla w\right) \\
& +M_{1}\left(l\left(u^{n-\frac{\alpha}{2}}\right), l\left(v^{n-\frac{\alpha}{2}}\right)\right)\left(\nabla u^{n, \alpha}, \nabla w\right)-M_{1}\left(l\left(u^{n-\frac{\alpha}{2}}\right), l\left(v^{n-\frac{\alpha}{2}}\right)\right)\left(\nabla u^{n, \alpha}, \nabla w\right) \\
= & \left({ }^{C} D_{\tau}^{\alpha} R_{h} u^{n}-{ }^{C} D_{t_{n-\frac{\alpha}{2}}^{\alpha}} u, w\right)+M_{1}\left(l\left(u^{n-\frac{\alpha}{2}}\right), l\left(v^{n-\frac{\alpha}{2}}\right)\right)\left(\nabla u^{n, \alpha}-\nabla u^{n-\frac{\alpha}{2}}, \nabla w\right) \\
& +\left\{M_{1}\left(l\left(U^{n, \alpha}\right), l\left(V^{n, \alpha}\right)\right)-M_{1}\left(l\left(u^{n-\frac{\alpha}{2}}\right), l\left(v^{n-\frac{\alpha}{2}}\right)\right)\right\}\left(\nabla u^{n, \alpha}, \nabla w\right) \\
& +\left(f_{1}\left(u^{n-\frac{\alpha}{2}}, v^{n-\frac{\alpha}{2}}\right)-f_{1}\left(U^{n, \alpha}, V^{n, \alpha}\right), w\right) . \tag{45}
\end{align*}
$$

Setting $w=\chi_{1}^{n, \alpha}$ in (45) to get

$$
\begin{align*}
& \left({ }^{C} D_{\tau}^{\alpha} \chi_{1}^{n}, \chi_{1}^{n, \alpha}\right)+M_{1}\left(l\left(U^{n, \alpha}\right), l\left(V^{n, \alpha}\right)\right)\left(\nabla \chi_{1}^{n, \alpha}, \nabla \chi_{1}^{n, \alpha}\right) \\
& =\left({ }^{C} D_{\tau}^{\alpha} R_{h} u^{n}-{ }^{C} D_{t_{n-\frac{\alpha}{2}}^{\alpha}} u, \chi_{1}^{n, \alpha}\right)+M_{1}\left(l\left(u^{n-\frac{\alpha}{2}}\right), l\left(v^{n-\frac{\alpha}{2}}\right)\right)\left(\nabla u^{n, \alpha}-\nabla u^{n-\frac{\alpha}{2}}, \nabla \chi_{1}^{n, \alpha}\right) \\
& \quad+\left\{M_{1}\left(l\left(U^{n, \alpha}\right), l\left(V^{n, \alpha}\right)\right)-M_{1}\left(l\left(u^{n-\frac{\alpha}{2}}\right), l\left(v^{n-\frac{\alpha}{2}}\right)\right)\right\}\left(\nabla u^{n, \alpha}, \nabla \chi_{1}^{n, \alpha}\right) \\
& \quad+\left(f_{1}\left(u^{n-\frac{\alpha}{2}}, v^{n-\frac{\alpha}{2}}\right)-f_{1}\left(U^{n, \alpha}, V^{n, \alpha}\right), \chi_{1}^{n, \alpha}\right) . \tag{46}
\end{align*}
$$

Also, from the assumptions on solution $u$ and $v$, we can find $R_{u}, R_{v}>0$ such that

$$
\begin{equation*}
\left\|u^{n, \alpha}\right\|_{H^{2}(\Omega)} \leq R_{u}, \quad\left\|v^{n, \alpha}\right\|_{H^{2}(\Omega)} \leq R_{v} . \tag{47}
\end{equation*}
$$

Using the bound of $M_{1}$, 47) and Cauchy-Schwarz inequality in (46), we get

$$
\begin{align*}
& \left({ }^{C} D_{\tau}^{\alpha} \chi_{1}^{n}, \chi_{1}^{n, \alpha}\right)+m_{1}\left\|\nabla \chi_{1}^{n, \alpha}\right\|^{2} \\
& \leq\left\|^{C} D_{\tau}^{\alpha} R_{h} u^{n}-{ }^{C} D_{t_{n-\frac{\alpha}{2}}^{\alpha}} u\right\|\left\|\chi_{1}^{n, \alpha}\right\|+m_{2}\left\|\nabla u^{n, \alpha}-\nabla u^{n-\frac{\alpha}{2}}\right\|\left\|\nabla \chi_{1}^{n, \alpha}\right\|  \tag{48}\\
& \quad+R_{u}\left|M_{1}\left(l\left(U^{n, \alpha}\right), l\left(V^{n, \alpha}\right)\right)-M_{1}\left(l\left(u^{n-\frac{\alpha}{2}}\right), l\left(v^{n-\frac{\alpha}{2}}\right)\right)\right|\left\|\nabla \chi_{1}^{n, \alpha}\right\| \\
& \quad+\left\|f_{1}\left(u^{n-\frac{\alpha}{2}}, v^{n-\frac{\alpha}{2}}\right)-f_{1}\left(U^{n, \alpha}, V^{n, \alpha}\right)\right\|\left\|\chi_{1}^{n, \alpha}\right\| .
\end{align*}
$$

Applying Poincaré inequality and the inequality $a b \leq \frac{\epsilon}{2} a^{2}+\frac{1}{2 \epsilon} b^{2}$ (with $\epsilon=\frac{4}{m_{1}}$ ) to (48), we can obtain

$$
\begin{align*}
& \left({ }^{C} D_{\tau}^{\alpha} \chi_{1}^{n}, \chi_{1}^{n, \alpha}\right)+m_{1}\left\|\nabla \chi_{1}^{n, \alpha}\right\|^{2} \\
& \leq \frac{2}{m_{1}}\left\|^{C} D_{\tau}^{\alpha} R_{h} u^{n}-{ }^{C} D_{t_{n-\frac{\alpha}{2}}^{\alpha}} u\right\|^{2}+\frac{2}{m_{1}}\left\|f_{1}\left(u^{n-\frac{\alpha}{2}}, v^{n-\frac{\alpha}{2}}\right)-f_{1}\left(U^{n, \alpha}, V^{n, \alpha}\right)\right\|^{2} \\
& \quad+\frac{2 R_{u}^{2}}{m_{1}}\left|M_{1}\left(l\left(U^{n, \alpha}\right), l\left(V^{n, \alpha}\right)\right)-M_{1}\left(l\left(u^{n-\frac{\alpha}{2}}\right), l\left(v^{n-\frac{\alpha}{2}}\right)\right)\right|^{2}  \tag{49}\\
& \quad+\frac{2 m_{2}^{2}}{m_{1}}\left\|\nabla u^{n, \alpha}-\nabla u^{n-\frac{\alpha}{2}}\right\|^{2}+\frac{m_{1}}{2}\left\|\nabla \chi_{1}^{n, \alpha}\right\|^{2} .
\end{align*}
$$

Lipschitz continuity of functions $M_{1}$ and $f_{1}$ gives

$$
\begin{align*}
& \left|M_{1}\left(l\left(U^{n, \alpha}\right), l\left(V^{n, \alpha}\right)\right)-M_{1}\left(l\left(u^{n-\frac{\alpha}{2}}\right), l\left(v^{n-\frac{\alpha}{2}}\right)\right)\right| \\
& \leq L_{1}^{\prime}\left|l\left(U^{n, \alpha}\right)-l\left(u^{n-\frac{\alpha}{2}}\right)\right|+K_{1}^{\prime}\left|l\left(V^{n, \alpha}\right)-l\left(v^{n-\frac{\alpha}{2}}\right)\right| \\
& \leq L_{1}^{\prime} C\left\|U^{n, \alpha}-u^{n-\frac{\alpha}{2}}\right\|+K_{1}^{\prime} C\left\|V^{n, \alpha}-v^{n-\frac{\alpha}{2}}\right\|  \tag{50}\\
& \leq C\left\{\left\|\zeta_{1}^{n, \alpha}\right\|+\left\|\chi_{1}^{n, \alpha}\right\|+\left\|\zeta_{2}^{n, \alpha}\right\|+\left\|\chi_{2}^{n, \alpha}\right\|+\left\|u^{n, \alpha}-u^{n-\frac{\alpha}{2}}\right\|+\left\|v^{n, \alpha}-v^{n-\frac{\alpha}{2}}\right\|\right\}
\end{align*}
$$

and

$$
\begin{align*}
& \left\|f_{1}\left(u^{n-\frac{\alpha}{2}}, v^{n-\frac{\alpha}{2}}\right)-f_{1}\left(U^{n, \alpha}, V^{n, \alpha}\right)\right\| \\
& \leq L_{1} C\left\|U^{n, \alpha}-u^{n-\frac{\alpha}{2}}\right\|+K_{1} C\left\|V^{n, \alpha}-v^{n-\frac{\alpha}{2}}\right\|  \tag{51}\\
& \leq C\left\{\left\|\zeta_{1}^{n, \alpha}\right\|+\left\|\chi_{1}^{n, \alpha}\right\|+\left\|\zeta_{2}^{n, \alpha}\right\|+\left\|\chi_{2}^{n, \alpha}\right\|+\left\|u^{n, \alpha}-u^{n-\frac{\alpha}{2}}\right\|+\left\|v^{n, \alpha}-v^{n-\frac{\alpha}{2}}\right\|\right\} .
\end{align*}
$$

Thus, from equations (49)-(51) and Lemma 3.1, we have

$$
\begin{align*}
{ }^{C} D_{\tau}^{\alpha}\left\|\chi_{1}^{n}\right\|^{2} \leq & C\left\{\left\|^{C} D_{\tau}^{\alpha} R_{h} u^{n}-{ }^{C} D_{t_{n-\frac{\alpha}{2}}^{\alpha}} u\right\|^{2}+\left\|\nabla u^{n, \alpha}-\nabla u^{n-\frac{\alpha}{2}}\right\|^{2}+\left\|\zeta_{1}^{n, \alpha}\right\|^{2}\right. \\
& \left.+\left\|\chi_{1}^{n, \alpha}\right\|^{2}+\left\|\zeta_{2}^{n, \alpha}\right\|^{2}+\left\|\chi_{2}^{n, \alpha}\right\|^{2}+\left\|u^{n, \alpha}-u^{n-\frac{\alpha}{2}}\right\|^{2}+\left\|v^{n, \alpha}-v^{n-\frac{\alpha}{2}}\right\|^{2}\right\}, \tag{52}
\end{align*}
$$

where $C$ is dependent on $m_{1}, m_{2}, R_{u}, L_{1}^{\prime}, K_{1}^{\prime}, L_{1}, K_{1}$.
Now, it follows from Taylor's theorem that

$$
\begin{equation*}
\left\|u^{n, \alpha}-u^{n-\frac{\alpha}{2}}\right\| \leq \frac{\alpha}{2}\left(1-\frac{\alpha}{2}\right) \tau \int_{t_{n-1}}^{t_{n}}\left\|u_{t t}(\eta)\right\| d \eta \leq C \tau^{2} \tag{53}
\end{equation*}
$$

Similarly,

$$
\begin{equation*}
\left\|v^{n, \alpha}-v^{n-\frac{\alpha}{2}}\right\| \leq C \tau^{2}, \quad\left\|\nabla u^{n, \alpha}-\nabla u^{n-\frac{\alpha}{2}}\right\| \leq C \tau^{2} \tag{54}
\end{equation*}
$$

From Lemma 2.1 and (43), we have

$$
\begin{align*}
\left\|{ }^{C} D_{\tau}^{\alpha} R_{h} u^{n}-{ }^{C} D_{t_{n-\frac{\alpha}{2}}^{\alpha}}^{\alpha} u\right\| & \leq\left\|^{C} D_{\tau}^{\alpha} R_{h} u^{n}-{ }^{C} D_{t_{n-\frac{\alpha}{2}}^{\alpha}}^{\alpha} R_{h} u\right\|+\left\|^{C} D_{t_{n-\frac{\alpha}{2}}^{\alpha}}^{\alpha} R_{h} u-{ }^{C} D_{t_{n-\frac{\alpha}{2}}^{\alpha}}^{\alpha} u\right\| \\
& \leq C\left(\tau^{2}+h^{2}\right) \tag{55}
\end{align*}
$$

Using (43) and (53)-(55) in (52), we get

$$
\begin{equation*}
{ }^{C} D_{\tau}^{\alpha}\left\|\chi_{1}^{n}\right\|^{2} \leq C\left(\left\|\chi_{1}^{n, \alpha}\right\|^{2}+\left\|\chi_{2}^{n, \alpha}\right\|^{2}+\left(h^{2}+\tau^{2}\right)^{2}\right) \tag{56}
\end{equation*}
$$

Similarly, we can get an estimate for $\left\|\chi_{2}^{n, \alpha}\right\|$ as follows:

$$
\begin{equation*}
{ }^{C} D_{\tau}^{\alpha}\left\|\chi_{2}^{n}\right\|^{2} \leq C\left(\left\|\chi_{1}^{n, \alpha}\right\|^{2}+\left\|\chi_{2}^{n, \alpha}\right\|^{2}+\left(h^{2}+\tau^{2}\right)^{2}\right) \tag{57}
\end{equation*}
$$

Therefore, from (56) and (57)

$$
\begin{align*}
{ }^{C} D_{\tau}^{\alpha}\left(\left\|\chi_{1}^{n}\right\|^{2}+\left\|\chi_{2}^{n}\right\|^{2}\right) \leq & C\left(1-\frac{\alpha}{2}\right)^{2}\left(\left\|\chi_{1}^{n}\right\|^{2}+\left\|\chi_{2}^{n}\right\|^{2}\right)+\frac{C \alpha^{2}}{4}\left(\left\|\chi_{1}^{n-1}\right\|^{2}+\left\|\chi_{2}^{n-1}\right\|^{2}\right) \\
& +C\left(h^{2}+\tau^{2}\right)^{2} \tag{58}
\end{align*}
$$

An application of Lemma $3.2\left(\right.$ with $\left.\lambda_{1}=C\left(1-\frac{\alpha}{2}\right)^{2}, \lambda_{2}=\frac{C \alpha^{2}}{4}, \phi^{n}=C\left(h^{2}+\tau^{2}\right)^{2}\right)$ gives

$$
\begin{equation*}
\left\|\chi_{1}^{n}\right\|^{2}+\left\|\chi_{2}^{n}\right\|^{2} \leq C\left(h^{2}+\tau^{2}\right)^{2} \tag{59}
\end{equation*}
$$

where $C$ is dependent on $\lambda_{1}, \lambda_{2}, \alpha, T$.
Therefore,

$$
\begin{equation*}
\left\|\chi_{1}^{n}\right\|+\left\|\chi_{2}^{n}\right\| \leq C\left(h^{2}+\tau^{2}\right) \tag{60}
\end{equation*}
$$

Finally, applying the triangle inequality, we can get

$$
\begin{align*}
\left\|u^{n}-U^{n}\right\|+\left\|v^{n}-V^{n}\right\| & \leq\left\|\zeta_{1}^{n}\right\|+\left\|\chi_{1}^{n}\right\|+\left\|\zeta_{2}^{n}\right\|+\left\|\chi_{2}^{n}\right\|  \tag{61}\\
& \leq C\left(h^{2}+\tau^{2}\right) .
\end{align*}
$$

In order to derive an error estimate in $H_{0}^{1}(\Omega)$ norm, we rewrite (45) as

$$
\begin{align*}
& \left({ }^{C} D_{\tau}^{\alpha} \chi_{1}^{n}, w\right)+M_{1}\left(l\left(U^{n, \alpha}\right), l\left(V^{n, \alpha}\right)\right)\left(\nabla \chi_{1}^{n, \alpha}, \nabla w\right) \\
& =\left({ }^{C} D_{\tau}^{\alpha} R_{h} u^{n}-{ }^{C} D_{t_{n-\frac{\alpha}{2}}^{\alpha}} u, w\right)+M_{1}\left(l\left(u^{n-\frac{\alpha}{2}}\right), l\left(v^{n-\frac{\alpha}{2}}\right)\right)\left(\Delta u^{n, \alpha}-\Delta u^{n-\frac{\alpha}{2}}, w\right) \\
& \quad+\left\{M_{1}\left(l\left(U^{n, \alpha}\right), l\left(V^{n, \alpha}\right)\right)-M_{1}\left(l\left(u^{n-\frac{\alpha}{2}}\right), l\left(v^{n-\frac{\alpha}{2}}\right)\right)\right\}\left(\Delta u^{n, \alpha}, w\right)  \tag{62}\\
& \quad+\left(f_{1}\left(u^{n-\frac{\alpha}{2}}, v^{n-\frac{\alpha}{2}}\right)-f_{1}\left(U^{n, \alpha}, V^{n, \alpha}\right), w\right) .
\end{align*}
$$

We choose $w={ }^{C} D_{\tau}^{\alpha} \chi_{1}^{n}$ in (62) to get

$$
\begin{align*}
& \left({ }^{C} D_{\tau}^{\alpha} \chi_{1}^{n},{ }^{C} D_{\tau}^{\alpha} \chi_{1}^{n}\right)+M_{1}\left(l\left(U^{n, \alpha}\right), l\left(V^{n, \alpha}\right)\right)\left(\nabla \chi_{1}^{n, \alpha}, \nabla^{C} D_{\tau}^{\alpha} \chi_{1}^{n}\right) \\
& =\left({ }^{C} D_{\tau}^{\alpha} R_{h} u^{n}-{ }^{C} D_{t_{n-\frac{\alpha}{2}}^{\alpha}} u{ }^{C} D_{\tau}^{\alpha} \chi_{1}^{n}\right)+\left(f_{1}\left(u^{n-\frac{\alpha}{2}}, v^{n-\frac{\alpha}{2}}\right)-f_{1}\left(U^{n, \alpha}, V^{n, \alpha}\right),{ }^{C} D_{\tau}^{\alpha} \chi_{1}^{n}\right) \\
& \quad+\left\{M_{1}\left(l\left(U^{n, \alpha}\right), l\left(V^{n, \alpha}\right)\right)-M_{1}\left(l\left(u^{n-\frac{\alpha}{2}}\right), l\left(v^{n-\frac{\alpha}{2}}\right)\right)\right\}\left(\Delta u^{n, \alpha},{ }^{C} D_{\tau}^{\alpha} \chi_{1}^{n}\right) \\
& \quad+M_{1}\left(l\left(u^{n-\frac{\alpha}{2}}\right), l\left(v^{n-\frac{\alpha}{2}}\right)\right)\left(\Delta u^{n, \alpha}-\Delta u^{n-\frac{\alpha}{2}},{ }^{C} D_{\tau}^{\alpha} \chi_{1}^{n}\right) . \tag{63}
\end{align*}
$$

Now, dividing (63) by $M_{1}\left(l\left(U^{n, \alpha}\right), l\left(V^{n, \alpha}\right)\right)$ and then using bound of $M_{1}$, CauchySchwarz inequality, we can arrive at

$$
\begin{align*}
& \frac{1}{m_{2}}\left\|{ }^{C} D_{\tau}^{\alpha} \chi_{1}^{n}\right\|^{2}+\left(\nabla \chi_{1}^{n, \alpha}, \nabla^{C} D_{\tau}^{\alpha} \chi_{1}^{n}\right) \\
& \leq \frac{1}{m_{1}}\left\|{ }^{C} D_{\tau}^{\alpha} R_{h} u^{n}-{ }^{C} D_{t_{n-\frac{\alpha}{2}}^{\alpha}}^{\alpha} u\right\|\left\|^{C} D_{\tau}^{\alpha} \chi_{1}^{n}\right\|+\frac{m_{2}}{m_{1}}\left\|\Delta u^{n, \alpha}-\Delta u^{n-\frac{\alpha}{2}}\right\|\left\|^{C} D_{\tau}^{\alpha} \chi_{1}^{n}\right\| \\
& \quad+\frac{1}{m_{1}}\left|M_{1}\left(l\left(U^{n, \alpha}\right), l\left(V^{n, \alpha}\right)\right)-M_{1}\left(l\left(u^{n-\frac{\alpha}{2}}\right), l\left(v^{n-\frac{\alpha}{2}}\right)\right)\right|\left\|\Delta u^{n, \alpha}\right\|\left\|^{C} D_{\tau}^{\alpha} \chi_{1}^{n}\right\| \\
& \quad+\frac{1}{m_{1}}\left\|f_{1}\left(u^{n-\frac{\alpha}{2}}, v^{n-\frac{\alpha}{2}}\right)-f_{1}\left(U^{n, \alpha}, V^{n, \alpha}\right)\right\|\left\|{ }^{C} D_{\tau}^{\alpha} \chi_{1}^{n}\right\| . \tag{64}
\end{align*}
$$

Further for $a, b>0$, using the inequality $a b \leq \frac{a^{2}}{2 \epsilon}+\frac{\epsilon b^{2}}{2}$, with $\epsilon=4 m_{2}$ and from (47), we have

$$
\begin{align*}
& \frac{1}{m_{2}}\left\|^{C} D_{\tau}^{\alpha} \chi_{1}^{n}\right\|^{2}+\left(\nabla \chi_{1}^{n, \alpha}, \nabla^{C} D_{\tau}^{\alpha} \chi_{1}^{n}\right) \\
& \leq \frac{2 m_{2}}{m_{1}^{2}}\left\|{ }^{C} D_{\tau}^{\alpha} R_{h} u^{n}-{ }^{C} D_{t_{n-\frac{\alpha}{2}}^{\alpha}}^{\alpha} u\right\|^{2}+\frac{2 m_{2}^{2}}{m_{1}^{2}}\left\|\Delta u^{n, \alpha}-\Delta u^{n-\frac{\alpha}{2}}\right\|^{2} \\
& \quad+\frac{2 R_{u}^{2} m_{2}}{m_{1}^{2}}\left|M_{1}\left(l\left(U^{n, \alpha}\right), l\left(V^{n, \alpha}\right)\right)-M_{1}\left(l\left(u^{n-\frac{\alpha}{2}}\right), l\left(v^{n-\frac{\alpha}{2}}\right)\right)\right|^{2}  \tag{65}\\
& \quad+\frac{2 m_{2}}{m_{1}^{2}}\left\|f_{1}\left(u^{n-\frac{\alpha}{2}}, v^{n-\frac{\alpha}{2}}\right)-f_{1}\left(U^{n, \alpha}, V^{n, \alpha}\right)\right\|^{2}+\frac{1}{2 m_{2}}\left\|{ }^{C} D_{\tau}^{\alpha} \chi_{1}^{n}\right\|^{2}
\end{align*}
$$

Using (50) and (51) along with Poincaré inequality in (65), we get

$$
\begin{array}{r}
\left(\nabla \chi_{1}^{n, \alpha}, \nabla^{C} D_{\tau}^{\alpha} \chi_{1}^{n}\right) \leq C\{
\end{array} \|^{C} D_{\tau}^{\alpha} R_{h} u^{n}-{ }^{C} D_{t_{n-\frac{\alpha}{2}}^{\alpha} u\left\|^{2}+\right\| \Delta u^{n, \alpha}-\Delta u^{n-\frac{\alpha}{2}} \|^{2}}^{+\left\|\nabla \zeta_{1}^{n, \alpha}\right\|^{2}+\left\|\nabla \chi_{1}^{n, \alpha}\right\|^{2}+\left\|\nabla \zeta_{2}^{n, \alpha}\right\|^{2}+\left\|\nabla \chi_{2}^{n, \alpha}\right\|^{2}} \begin{array}{r}
\left.+\left\|u^{n, \alpha}-u^{n-\frac{\alpha}{2}}\right\|^{2}+\left\|v^{n, \alpha}-v^{n-\frac{\alpha}{2}}\right\|^{2}\right\}
\end{array}
$$

where $C$ is dependent on $m_{1}, m_{2}, L_{1}^{\prime}, K_{1}^{\prime}, L_{1}, K_{1}, R_{u}$.
Also, from Taylor's theorem, we have

$$
\begin{equation*}
\left\|\Delta u^{n, \alpha}-\Delta u^{n-\frac{\alpha}{2}}\right\| \leq C \tau^{2} . \tag{67}
\end{equation*}
$$

Using Lemma 3.1, (43), (53)-(55) and (67) in (66), we can obtain

$$
\begin{equation*}
{ }^{C} D_{\tau}^{\alpha}\left\|\nabla \chi_{1}^{n}\right\|^{2} \leq C\left(\left\|\nabla \chi_{1}^{n, \alpha}\right\|^{2}+\left\|\nabla \chi_{2}^{n, \alpha}\right\|^{2}+\left(h+\tau^{2}\right)^{2}\right) \tag{68}
\end{equation*}
$$

Similarly, one can obtain an estimate for $\left\|\nabla \chi_{2}^{n, \alpha}\right\|$ as follows:

$$
\begin{equation*}
{ }^{C} D_{\tau}^{\alpha}\left\|\nabla \chi_{2}^{n}\right\|^{2} \leq C\left(\left\|\nabla \chi_{1}^{n, \alpha}\right\|^{2}+\left\|\nabla \chi_{2}^{n, \alpha}\right\|^{2}+\left(h+\tau^{2}\right)^{2}\right) \tag{69}
\end{equation*}
$$

Adding (68) and (69), we get

$$
\begin{align*}
{ }^{C} D_{\tau}^{\alpha}\left(\left\|\nabla \chi_{1}^{n}\right\|^{2}+\left\|\nabla \chi_{2}^{n}\right\|^{2}\right) \leq & C\left(h+\tau^{2}\right)^{2}+C\left(1-\frac{\alpha}{2}\right)^{2}\left(\left\|\nabla \chi_{1}^{n}\right\|^{2}+\left\|\nabla \chi_{2}^{n}\right\|^{2}\right) \\
& +\frac{C \alpha^{2}}{4}\left(\left\|\nabla \chi_{1}^{n-1}\right\|^{2}+\left\|\nabla \chi_{2}^{n-1}\right\|^{2}\right) \tag{70}
\end{align*}
$$

Applying Lemma $3.2\left(\right.$ with $\left.\lambda_{1}=C\left(1-\frac{\alpha}{2}\right)^{2}, \lambda_{2}=\frac{C \alpha^{2}}{4}, \phi^{n}=C\left(h+\tau^{2}\right)^{2}\right)$, we can get

$$
\begin{equation*}
\left\|\nabla \chi_{1}^{n}\right\|^{2}+\left\|\nabla \chi_{2}^{n}\right\|^{2} \leq C\left(h+\tau^{2}\right)^{2} \tag{71}
\end{equation*}
$$

where $C$ is dependent on $\lambda_{1}, \lambda_{2}, \alpha, T$.
Finally, we use the Triangle inequality together with the estimates (71), (43) to obtain

$$
\begin{align*}
\left\|\nabla u^{n}-\nabla U^{n}\right\|+\left\|\nabla v^{n}-\nabla V^{n}\right\| & \leq\left\|\nabla \zeta_{1}^{n}\right\|+\left\|\nabla \chi_{1}^{n}\right\|+\left\|\nabla \zeta_{2}^{n}\right\|+\left\|\nabla \chi_{2}^{n}\right\|  \tag{72}\\
& \leq C\left(h+\tau^{2}\right)
\end{align*}
$$

This completes the proof.
Remark 4.1. In present work, the convergence of the proposed scheme is proved without considering the weak singularity of the solution. We leave the convergence analysis of weak singularity case as a future work.

## 5 Numerical experiments

In this section, we perform some numerical experiments by considering two different problems with known exact solutions. In both problems, we take the final time $T=1$ and tolerance $\epsilon=10^{-7}$ for stopping Newton's iteration. We denote the number of sub-intervals in time by $N$. Moreover, let $\left(M_{s}+1\right)$ be the number of node points in each spatial direction. In order to obtain the order of convergence in spatial direction in $L^{2}(\Omega)$ and $H_{0}^{1}(\Omega)$ norms, we take $N=M_{s}$ for different values of $M_{s}$. Similarly, to calculate the convergence rate in temporal direction in $L^{2}(\Omega)$ norm, we take $M_{s}=N$ for different values of $N$.

Example 1. For our first example, in (1), we consider the spatial domain $\Omega=(0,1)$, $M_{1}(z, w)=3+\sin z+\cos w, M_{2}(z, w)=5+\cos z+\sin w$. The functions $f_{1}$ and $f_{2}$ are chosen such that the analytical solutions of the equation (1) be $u(x, t)=t^{2+\alpha} \sin 2 \pi x$ and $v(x, t)=t^{3-\alpha} \sin \pi x$.

Error and convergence rate in the spatial direction in $L^{2}(\Omega)$ and $H_{0}^{1}(\Omega)$ norms are given in Tables 1 and 2, respectively. Furthermore, Table 3 shows errors and convergence rates in the temporal direction in $L^{2}(\Omega)$ norm.
