# Second order error bounds for POD-ROM methods based on first order divided differences 

Bosco García-Archilla ${ }^{\text {a }}$, Volker John ${ }^{\text {b,c }}$, Julia Novo ${ }^{\text {d,* }}$<br>${ }^{a}$ Departamento de Matemática Aplicada II, Universidad de Sevilla, Sevilla, Spain<br>${ }^{b}$ Weierstrass Institute for Applied Analysis and Stochastics (WIAS), Mohrenstr. 39, 10117 Berlin, Germany<br>${ }^{c}$ Freie Universität Berlin, Dept. of Mathematics and Computer Science, Arnimallee 6, 14195 Berlin, Germany<br>${ }^{d}$ Departamento de Matemáticas, Universidad Autónoma de Madrid, Spain

#### Abstract

This note proves, for simplicity for the heat equation, that using BDF2 as time stepping scheme in POD-ROM methods with snapshots based on difference quotients gives both the optimal second order error bound in time and pointwise estimates.

Keywords: Heat equation; POD-ROM methods; BDF2; Pointwise error estimates

## 1. Introduction

Most numerical methods using reduced order models based on proper orthogonal decomposition (POD-ROM methods) apply basis functions based on the snapshots (or values at different times) of the full order model (FOM). Recently, it has been shown that adding their first divided differences to the snapshots, or even using only these divided differences to obtain the basis functions, allows for pointwise-in-time error bounds 1, 2, 4, 6]. However, all pointwise-in-time error bounds in the literature are only first order with respect to time.

Although the first divided differences are only first order approximations to the time derivatives of the snapshots, we show in this note that for POD-ROM methods based only on them it is possible to obtain pointwise-in-time second order error bounds if the two step backward differentiation formula (BDF2) is used to integrate the POD-ROM equations. This result is a theoretical support for the observation that second order methods allow for larger step sizes than first order ones without spoiling the error, thus resulting in more efficient POD-ROM simulations.

## 2. Model problem and proper orthogonal decomposition

Throughout this note, standard notations for Sobolev spaces and their norms will be used. As a model problem problem, we consider the heat equation

$$
\begin{aligned}
\partial_{t} u(t, \boldsymbol{x})-\nu \Delta u(t, \boldsymbol{x}) & =f(t, \boldsymbol{x}), & & (t, \boldsymbol{x}) \in(0, T] \times \Omega \\
u(t, \boldsymbol{x}) & =0, & & (t, \boldsymbol{x}) \in(0, T] \times \partial \Omega \\
u(0, \boldsymbol{x}) & =u^{0}(\boldsymbol{x}), & & \boldsymbol{x} \in \Omega
\end{aligned}
$$

[^0]in a bounded domain $\Omega \subset \mathbb{R}^{d}, d \in\{2,3\}$. Let $C_{p}$ be the constant in the Poincaré inequality
\[

$$
\begin{equation*}
\|v\|_{0} \leq C_{p}\|\nabla v\|_{0}, \quad v \in H_{0}^{1}(\Omega) \tag{1}
\end{equation*}
$$

\]

Let us denote by $X_{h}^{l}$ a finite element method based on piece-wise continuous polynomials of degree $l$ that satisfies the homogeneous Dirichlet boundary conditions. The semi-discrete Galerkin approximation, the FOM, consists in finding $u_{h}:[0, T] \rightarrow X_{h}^{l}$ such that

$$
\left(\partial_{t} u_{h}, v_{h}\right)+\nu\left(\nabla u_{h}, \nabla v_{h}\right)=\left(f, v_{h}\right), \quad \forall v_{h} \in X_{h}^{l}
$$

The following error estimation is well-known:

$$
\begin{equation*}
\max _{0 \leq s \leq T}\left(\left\|\left(u-u_{h}\right)(s)\right\|_{0}+h\left\|\left(u-u_{h}\right)(s)\right\|_{1}\right) \leq C(u) h^{l+1} . \tag{2}
\end{equation*}
$$

Fix $T>0$ and set $\Delta t=T / M$. Let $t^{n}=n \Delta t, n=0, \ldots, M, N=M+1$, and define the space

$$
\boldsymbol{U}=\operatorname{span}\left\{\sqrt{N} w_{0}, \tau \frac{u_{h}\left(t^{1}\right)-u_{h}\left(t^{0}\right)}{\Delta t}, \tau \frac{u_{h}\left(t^{2}\right)-u_{h}\left(t^{1}\right)}{\Delta t} \ldots, \tau \frac{u_{h}\left(t^{M}\right)-u_{h}\left(t^{M-1}\right)}{\Delta t}\right\}
$$

where $w_{0}$ is either $w_{0}=u_{h}\left(t^{0}\right)$ or $w_{0}=\bar{u}_{h}=\sum_{j=0}^{M} u_{h}\left(t^{j}\right) /(M+1)$, and $\tau$ is a time scale to make the snapshots dimensionally correct. Denote $\boldsymbol{U}=\operatorname{span}\left\{y_{h}^{1}, y_{h}^{2}, \ldots, y_{h}^{N}\right\}$. Let $X$ be either $X=L^{2}(\Omega)$ or $X=H_{0}^{1}(\Omega)$, and denote the correlation matrix by $K=\left(\left(k_{i, j}\right)\right) \in \mathbb{R}^{N \times N}$ with $k_{i, j}=\left(y_{h}^{i}, y_{h}^{j}\right)_{X} / N, i, j=1, \ldots, N$, and $(\cdot, \cdot)_{X}$ being the inner product in $X$. We denote by $\lambda_{1} \geq$ $\lambda_{2} \ldots \geq \lambda_{d}>0$ the positive eigenvalues of $K$ and by $\boldsymbol{v}_{1}, \ldots, \boldsymbol{v}_{d} \in \mathbb{R}^{N}$ the associated eigenvectors. The orthonormal POD basis functions of $\boldsymbol{U}$ are given by $\varphi_{k}=\left(\sum_{j=1}^{N} v_{k}^{k} y_{h}^{j}\right) /\left(\sqrt{N} \sqrt{\lambda_{k}}\right)$, where $v_{k}^{j}$ is the $j$-th component of $\boldsymbol{v}_{k}$. For any $1 \leq r \leq d$ denote by $\boldsymbol{U}^{r}=\operatorname{span}\left\{\varphi_{1}, \varphi_{2}, \ldots, \varphi_{r}\right\}$, and denote by $P^{r}: X_{h}^{l} \rightarrow \boldsymbol{U}^{r}$ the $X$-orthogonal projection onto $\boldsymbol{U}^{r}$. Then, it holds

$$
\begin{equation*}
\frac{1}{N} \sum_{j=1}^{N}\left\|y_{h}^{j}-P^{r} y_{h}^{j}\right\|_{X}^{2}=\sum_{k=r+1}^{d} \lambda_{k} \tag{3}
\end{equation*}
$$

The stiffness matrix of the POD basis is given by $S=\left(\left(s_{i, j}\right)\right) \in \mathbb{R}^{d \times d}$, with $s_{i, j}=\left(\nabla \varphi_{i}, \nabla \varphi_{j}\right)_{X}$. If $X=L^{2}(\Omega)$ the following inequality holds for all $v \in \boldsymbol{U}$, see [5, Lemma 2],

$$
\begin{equation*}
\|\nabla v\|_{0} \leq \sqrt{\|S\|_{2}}\|v\|_{0} \tag{4}
\end{equation*}
$$

## 3. Error analysis

Let us denote by $D^{1} v^{n}=\left(v^{n}-v^{n-1}\right) / \Delta t$ and by $D^{2} v^{n}=\left((3 / 2) v^{n}-2 v^{n-1}+(1 / 2) v^{n-2}\right) / \Delta t$, then the POD-ROM method is defined in the following way: Find $u_{r}^{n} \in \boldsymbol{U}^{r}$ such that

$$
\left(D u_{r}^{n}, v\right)+\nu\left(\nabla u_{r}^{n}, \nabla v\right)=\left(f^{n}, v\right), \quad \forall v \in \boldsymbol{U}^{r}
$$

where $D=D^{1}$ for $n=1$ and $D=D^{2}$ for $2 \leq n \leq M$.
Lemma 1. Let $T>0$, let $X$ be a Banach space, $z^{n}=z\left(t^{n}\right) \in X$, then

$$
\begin{align*}
\max _{0 \leq k \leq M}\left\|z^{k}\right\|_{X}^{2} & \leq 2\left\|z^{0}\right\|_{X}^{2}+\frac{2 T^{2}}{M} \sum_{n=1}^{M}\left\|D^{1} z_{n}\right\|_{X}^{2}  \tag{5}\\
\max _{0 \leq k \leq M}\left\|z^{k}\right\|_{X}^{2} & \leq 2\|\bar{z}\|_{X}^{2}+\frac{8 T^{2}}{M} \sum_{n=1}^{M}\left\|D^{1} z_{n}\right\|_{X}^{2}, \quad \text { with } \quad \bar{z}=\sum_{j=0}^{M} z^{j} /(M+1) . \tag{6}
\end{align*}
$$

Proof . The proof of (5) can be found in [1, Lemma 3.3]. For proving (6), we observe that

$$
\begin{equation*}
z^{k}=z^{0}+\Delta t \sum_{n=1}^{k} D^{1} z^{n}, \quad \bar{z}=z^{0}+\frac{1}{M+1}\left(\Delta t D^{1} z^{1}+\ldots+\Delta t \sum_{n=1}^{M} D^{1} z^{n}\right) \tag{7}
\end{equation*}
$$

Taking norms yields $\left\|z^{k}\right\|_{X} \leq\left\|z^{0}\right\|_{X}+\Delta t \sum_{n=1}^{M}\left\|D^{1} z^{n}\right\|_{X}$ and $\left\|z^{0}\right\|_{X} \leq\|\bar{z}\|_{X}+\Delta t \sum_{n=1}^{M}\left\|D^{1} z^{n}\right\|_{X}$, so that

$$
\left\|z^{k}\right\|_{X} \leq\|\bar{z}\|_{X}+2 \Delta t \sum_{n=1}^{M}\left\|D^{1} z^{n}\right\|_{X} \leq\|\bar{z}\|_{X}+2 T^{1 / 2}(\Delta t)^{1 / 2}\left(\sum_{n=1}^{M}\left\|D^{1} z^{n}\right\|_{X}^{2}\right)^{1 / 2}
$$

from which we reach (6).
In the sequel we define $\tilde{C}=1$ if $w_{0}=u_{h}\left(t^{0}\right)$ and $\tilde{C}=4$ if $w_{0}=\bar{u}_{h}$, and $C_{X}=1$ if $X=L^{2}(\Omega)$ and $C_{X}=C_{p}^{2}$ f $X=H_{0}^{1}(\Omega)$.

Lemma 2. The following bound holds

$$
\begin{equation*}
\max _{0 \leq n \leq M}\left\|u_{h}^{n}-P^{r} u_{h}^{n}\right\|_{0}^{2} \leq\left(2+4 \tilde{C} \frac{T^{2}}{\tau^{2}}\right) C_{X} \sum_{k=r+1}^{d} \lambda_{k} \tag{8}
\end{equation*}
$$

Proof . Taking $z=u_{h}-P^{r} u_{h}$ in (5) or (6), depending on the selection of the first element in $\boldsymbol{U}$, and applying (3) and $N \leq 2 M$, we reach (8).

Lemma 3. Let $\left\{z^{n}\right\}_{n=0}^{N} \in \boldsymbol{U}^{r}$ and $\left\{\tau_{1}^{n}\right\}_{n=1}^{N},\left\{\tau_{2}^{n}\right\}_{n=1}^{N} \in X_{h}^{l}$ satisfying

$$
\begin{equation*}
\left(D z^{n}, v\right)+\nu\left(\nabla z^{n}, \nabla v\right)=\left(\tau_{1}^{n}, v\right)+\nu\left(\nabla \tau_{2}^{n}, \nabla v\right), \quad \forall v \in \boldsymbol{U}^{r} \tag{9}
\end{equation*}
$$

where $D=D^{1}$ for $n=1$ and $D=D^{2}$ for $2 \leq n \leq M$. Then, it holds for $\Delta t<T / 4$ and $n \geq 1$

$$
\begin{align*}
\left\|z^{n}\right\|_{0}^{2}+2 \nu \sum_{j=1}^{n} \Delta t\left\|\nabla z^{j}\right\|_{0}^{2} \leq & e^{4}\left(17\left\|z^{0}\right\|_{0}^{2}+28(\Delta t)^{2}\left\|\tau_{1}^{1}\right\|_{0}^{2}+2 \Delta t T \sum_{j=2}^{N}\left\|\tau_{1}^{n}\right\|_{0}^{2}\right. \\
& \left.+14 \nu \Delta t\left\|\nabla \tau_{2}^{1}\right\|_{0}^{2}+2 \nu \Delta t \sum_{j=2}^{N}\left\|\nabla \tau_{2}^{n}\right\|_{0}^{2}\right) \tag{10}
\end{align*}
$$

Proof . We take $v=\Delta t z^{n}$ in (9). If $n=1$ then $D=D^{1}$ and Young's inequality yields

$$
\begin{equation*}
\frac{1}{2}\left\|z^{1}\right\|_{0}^{2}-\frac{1}{2}\left\|z^{0}\right\|_{0}^{2}+\nu \Delta t\left\|\nabla z^{1}\right\|_{0}^{2} \leq \Delta t\left(\tau_{1}^{1}, z^{1}\right)+\nu \Delta t\left(\nabla \tau_{2}^{1}, \nabla z^{1}\right) \tag{11}
\end{equation*}
$$

For $n \geq 2$ then $D=D^{2}$ and one gets

$$
\frac{1}{4}\left\|z^{n}\right\|_{0}^{2}+\frac{1}{4}\left\|\hat{z}^{n}\right\|_{0}^{2}-\frac{1}{4}\left\|z^{n-1}\right\|_{0}^{2}-\frac{1}{4}\left\|\hat{z}^{n-1}\right\|_{0}^{2}+\nu \Delta t\left\|\nabla z^{n}\right\|_{0}^{2} \leq \Delta t\left(\tau_{1}^{n}, z^{n}\right)+\nu \Delta t\left(\nabla \tau_{2}^{n}, \nabla z^{n}\right)
$$

where $\hat{z}^{n}=2 z^{n}-z^{n-1}$. The Cauchy-Schwarz and Young inequality give

$$
\begin{equation*}
\Delta t\left(\tau_{1}^{n}, z^{n}\right)+\nu \Delta t\left(\nabla \tau_{2}^{n}, \nabla z^{n}\right) \leq \frac{\Delta t}{2 T}\left\|z^{n}\right\|_{0}^{2}+\frac{T}{2}\left\|\tau_{1}^{n}\right\|_{0}^{2}+\Delta t \frac{\nu}{2}\left\|\nabla z^{n}\right\|_{0}^{2}+\Delta t \frac{\nu}{2}\left\|\nabla \tau_{2}^{n}\right\|_{0}^{2} \tag{12}
\end{equation*}
$$

Multiplying by 4 , applying (12), and summing from 2 to $n$, one gets
$\left\|z^{n}\right\|_{0}^{2}+2 \nu \sum_{j=2}^{n} \Delta t\left\|\nabla z^{j}\right\|_{0}^{2} \leq\left\|z^{1}\right\|_{0}^{2}+\left\|\hat{z}^{1}\right\|_{0}^{2}+2 \sum_{j=2}^{n} \frac{\Delta t}{T}\left\|z^{j}\right\|_{0}^{2}+2 T \sum_{j=2}^{n} \Delta t\left\|\tau_{1}^{j}\right\|_{0}^{2}+2 \nu \sum_{j=2}^{n} \Delta t\left\|\nabla \tau_{2}^{j}\right\|_{0}^{2}$.
Young's inequality yields $\left\|\hat{z}^{1}\right\|_{0}^{2} \leq 6\left\|z^{1}\right\|_{0}^{2}+3\left\|z^{0}\right\|^{2}$, so that $\left\|z^{1}\right\|_{0}^{2}+\left\|\hat{z}^{1}\right\|_{0}^{2} \leq 7\left\|z^{1}\right\|_{0}^{2}+3\left\|z^{0}\right\|^{2}$. Using again Young's inequality gives

$$
\Delta t\left(\tau_{1}^{1}, z^{1}\right)+\nu \Delta t\left(\nabla \tau_{2}^{1}, \nabla z^{1}\right) \leq \frac{1}{4}\left\|z^{1}\right\|_{0}^{2}+(\Delta t)^{2}\left\|\tau_{1}^{1}\right\|_{0}^{2}+\Delta t \frac{\nu}{2}\left\|\nabla z^{1}\right\|_{0}^{2}+\Delta t \frac{\nu}{2}\left\|\nabla \tau_{2}^{1}\right\|_{0}^{2}
$$

so that we obtain from (11)

$$
\left\|z^{1}\right\|_{0}^{2}+2 \nu \Delta t\left\|\nabla z^{1}\right\|_{0}^{2} \leq 2\left\|z^{0}\right\|_{0}^{2}+4(\Delta t)^{2}\left\|\tau_{1}^{1}\right\|_{0}^{2}+2 \Delta t \nu\left\|\nabla \tau_{2}^{1}\right\|_{0}^{2}
$$

Together with (13), it follows that for $n \geq 1$

$$
\begin{gathered}
\left\|z^{n}\right\|_{0}^{2}+2 \nu \sum_{j=1}^{n} \Delta t\left\|\nabla z^{j}\right\|_{0}^{2} \leq \\
\hline 17\left\|z^{0}\right\|_{0}^{2}+28(\Delta t)^{2}\left\|\tau_{1}^{1}\right\|_{0}^{2}+2 \sum_{j=2}^{n} \frac{\Delta t}{T}\left\|z^{j}\right\|_{0}^{2}+2 T \sum_{j=2}^{n} \Delta t\left\|\tau_{1}^{j}\right\|_{0}^{2} \\
\\
+14 \Delta t \nu\left\|\nabla \tau_{2}^{1}\right\|_{0}^{2}+2 \nu \sum_{j=1}^{n} \Delta t\left\|\nabla \tau_{2}^{j}\right\|_{0}^{2}
\end{gathered}
$$

from where (10) follows by applying Gronwall's Lemma [3, Lemma 5.1] for $\Delta t \leq T / 4$.
Let $X=L^{2}(\Omega)$ and let us denote by $e_{r}^{n}=u_{r}^{n}-P^{r} u_{h}^{n}$ and by $\eta_{h}^{n}=P^{r} u_{h}^{n}-u_{h}^{n}$. Arguing as in the proof of [2, Theorem 4.6], one gets

$$
\begin{equation*}
\left(D e_{r}^{n}, v\right)+\nu\left(\nabla e_{r}^{n}, \nabla v\right)=\left(\partial_{t} u_{h}^{n}-D u_{h}^{n}, v\right)-\nu\left(\nabla \eta_{h}^{n}, \nabla v\right), \quad \forall v \in \boldsymbol{U}^{r} \tag{14}
\end{equation*}
$$

Lemma 4. The following bounds hold

$$
\begin{align*}
& \left\|\partial_{t} u_{h}^{1}-D^{1} u_{h}^{1}\right\|_{j} \leq \frac{\Delta t}{2} \max _{0 \leq t \leq t_{1}}\left\|\partial_{t t} u_{h}\right\|_{j}, \quad j=0,1  \tag{15}\\
& \left\|\partial_{t} u_{h}^{n}-D^{2} u_{h}^{n}\right\|_{j} \leq \sqrt{5}(\Delta t)^{3 / 2}\left(\int_{t_{n-2}}^{t_{n}}\left\|\partial_{t t t} u_{h}(t)\right\|_{j}^{2} d t\right)^{1 / 2}, \quad n=2, \ldots, N, j=0,1 \tag{16}
\end{align*}
$$

Proof . For $D=D^{1}$, (15) follows easily from

$$
\partial_{t} u_{h}^{n}-D u_{h}^{n}=\frac{1}{\Delta t} \int_{t_{n-1}}^{t_{n}}\left(\partial_{t} u_{h}\left(t_{n}\right)-\partial_{t} u_{h}(s)\right) d s=\frac{1}{\Delta t} \int_{t_{n-1}}^{t_{n}}\left(\int_{s}^{t_{n}} \partial_{t t} u_{h}(t) d t\right) d s
$$

For $D=D^{2}$, Taylor series expansion with integral reminder reveals that

$$
\partial_{t} u_{h}^{n}-D u_{h}^{n}=\frac{1}{\Delta t} \int_{t_{n-2}}^{t_{n}}\left(2\left(t-t_{n-1}\right)_{+}^{2}-\frac{1}{2}\left(t-t_{n-2}\right)^{2}\right) \partial_{t t t} u_{h} d t
$$

where $x_{+}=\max (0, x)$, for $x \in \mathbb{R}$. Then, a straightforward calculation shows that

$$
\left\|\partial_{t} u_{h}^{n}-D u_{h}^{n}\right\|_{j} \leq\left(\frac{2}{\sqrt{5}}+\frac{2 \sqrt{2}}{\sqrt{5}}\right)(\Delta t)^{3 / 2}\left(\int_{t_{n-2}}^{t_{n}}\left\|\partial_{t t t} u_{h}(t)\right\|_{j}^{2} d t\right)^{1 / 2}
$$

and then (16) follows by noticing that $2+2 \sqrt{2}<5$.

Lemma 5. Let $X=L^{2}(\Omega)$. It holds

$$
\begin{equation*}
\nu \sum_{j=1}^{n} \Delta t\left\|\nabla \eta_{h}^{j}\right\|_{0}^{2} \leq \nu T\|S\|_{2}\left(2+4 \tilde{C} \frac{T^{2}}{\tau^{2}}\right) \sum_{k=r+1}^{d} \lambda_{k} \tag{17}
\end{equation*}
$$

Proof . The proof of (17) follows easily by applying (4) and (8).
Theorem 1 (Bound for $\left.X=L^{2}(\Omega)\right)$. Let $X=L^{2}(\Omega)$, then it holds for $\Delta t \leq T / 4$

$$
\begin{align*}
\max _{1 \leq n \leq M}\left\|u_{r}^{n}-u^{n}\right\|_{0}^{2} \leq & 60 e^{4}\left(\left\|e_{r}^{0}\right\|_{0}^{2}+(\Delta t)^{4} \max _{0 \leq s \leq \Delta t}\left\|\partial_{t t} u_{h}(s)\right\|_{0}^{2}+T(\Delta t)^{4} \int_{0}^{T}\left\|\partial_{t t t} u_{h}(s)\right\|_{0}^{2} d s\right) \\
& +3\left(1+14 T \nu e^{4}\|S\|_{2}\right)\left(2+4 \tilde{C} \frac{T^{2}}{\tau^{2}}\right) \sum_{k=r+1}^{d} \lambda_{k}+3 C(u)^{2} h^{2(l+1)} \tag{18}
\end{align*}
$$

Proof . From (14) and (10), applying (15), (16) (noting that most integrals over time intervals $\left[t_{j-1}, t_{j}\right]$ appear twice when summing over $n$ ), and (17), we obtain

$$
\begin{aligned}
& \left\|e_{r}^{n}\right\|_{0}^{2}+\nu \sum_{j=1}^{n} \Delta t\left\|\nabla e_{r}^{j}\right\|_{0}^{2} \leq e^{4}\left(17\left\|e_{r}^{0}\right\|_{0}^{2}+7(\Delta t)^{4} \max _{0 \leq s \leq \Delta t}\left\|\partial_{t t} u_{h}(s)\right\|_{0}^{2}\right. \\
& \left.\quad+20 T(\Delta t)^{4} \int_{0}^{T}\left\|\partial_{t t t} u_{h}(s)\right\|_{0}^{2} d s+14 \nu T\|S\|_{2}\left(2+4 \tilde{C} \frac{T^{2}}{\tau^{2}}\right) \sum_{k=r+1}^{d} \lambda_{k}\right) .
\end{aligned}
$$

To simplify, we replace the factors 17 and 7 by 20 . To finish the proof, apply the decomposition $u_{r}^{n}-u^{n}=\left(u_{r}^{n}-P_{h} u_{h}^{n}\right)+\left(P_{h} u_{h}^{n}-u_{h}^{n}\right)+\left(u_{h}^{n}-u^{n}\right)$, followed by (8) and (22).

Let $X=H_{0}^{1}(\Omega)$. Arguing as in the proof of [2, Theorem 4.1] yields

$$
\left(D e_{r}^{n}, v\right)+\nu\left(\nabla e_{r}^{n}, \nabla v\right)=\left(\partial_{t} u_{h}^{n}-P_{r}\left(D u_{h}^{n}\right), v\right), \quad \forall v \in \boldsymbol{U}^{r}
$$

Applying Lemma 3 with $z^{n}=e_{r}^{n}, \tau_{1}^{n}=\partial_{t} u_{h}^{n}-P_{r} D u_{h}^{n}$ and $\tau_{2}=0$ we get

$$
\begin{equation*}
\left\|e_{r}^{n}\right\|_{0}^{2}+2 \nu \sum_{j=1}^{n} \Delta t\left\|\nabla e_{r}^{j}\right\|_{0}^{2} \leq e^{4}\left(17\left\|e_{r}^{0}\right\|_{0}^{2}+28(\Delta t)^{2}\left\|\tau_{1}^{1}\right\|_{0}^{2}+2 \Delta t T \sum_{j=2}^{N}\left\|\tau_{1}^{n}\right\|_{0}^{2}\right) \tag{19}
\end{equation*}
$$

Theorem 2 (Bound for $\left.X=H_{0}^{1}(\Omega)\right)$. Let $X=H_{0}^{1}(\Omega), \Delta t \leq T / 4$, and $C_{1}=4 e^{4}(10+\Delta t / T)+$ $2+4 \tilde{C}$. Then it holds

$$
\begin{gather*}
\max _{1 \leq n \leq M}\left\|u_{r}^{n}-u^{n}\right\|_{0}^{2} \leq 60 e^{4}\left(\left\|e_{r}^{0}\right\|_{0}^{2}+(\Delta t)^{4} \max _{0 \leq s \leq \Delta t}\left\|\partial_{t t} u_{h}(s)\right\|_{0}^{2}+2(\Delta t)^{4} \int_{0}^{T}\left\|\partial_{t t t} u_{h}(t)\right\|_{0}^{2} d t\right) \\
+3 C_{1} C_{p}^{2}\left(\frac{T}{\tau}\right)^{2} \sum_{j=r+1}^{d} \lambda_{k}+3 C^{2}(u) h^{2(l+1)} \tag{20}
\end{gather*}
$$

Proof. The last two terms on the right-hand side of (19) are bounded by the triangle inequality

$$
\begin{equation*}
\left\|\tau_{1}^{n}\right\|_{0}^{2}=\left\|\partial_{t} u_{h}^{n}-P^{r}\left(D u_{h}^{n}\right)\right\|_{0}^{2} \leq 2\left\|\partial_{t} u_{h}^{n}-\left(D u_{h}^{n}\right)\right\|_{0}^{2}+2\left\|\left(I-P^{r}\right)\left(D u_{h}^{n}\right)\right\|_{0}^{2} \tag{21}
\end{equation*}
$$

For $n=1$, the first term is bounded by (15) and the second one by (11) and (3), giving

$$
(\Delta t)^{2}\left\|\tau_{1}^{1}\right\|_{0}^{2} \leq \frac{(\Delta t)^{4}}{2} \max _{0 \leq s \leq \Delta t}\left\|\partial_{t t} u_{h}(s)\right\|_{0}^{2}+\frac{4 T}{\tau^{2}} C_{p}^{2} \Delta t \sum_{k=r+1}^{d} \lambda_{k}
$$

For $n \geq 2$, the first term of (21) is estimated by (16). To bound the other term observe that

$$
D^{2} u_{h}^{n}=(3 / 2) D^{1} u^{n}-(1 / 2) D^{1} u^{n-1}
$$

and, consequently,

$$
2\left\|\left(I-P^{r}\right)\left(D^{2} u_{h}^{n}\right)\right\|_{0}^{2} \leq \frac{9}{2}\left\|\left(I-P^{r}\right)\left(D^{1} u_{h}^{n}\right)\right\|_{0}^{2}+\frac{1}{2}\left\|\left(I-P^{r}\right)\left(D^{1} u_{h}^{n}\right)\right\|_{0}^{2}
$$

so that, by using (11) and (3), one obtains

$$
2 T \sum_{j=2}^{n} \Delta t\left\|\left(I-P^{r}\right)\left(D^{2} u_{h}^{n}\right)\right\|_{0}^{2} \leq 10 T \sum_{j=1}^{n} \Delta t\left\|\left(I-P^{r}\right)\left(D^{1} u_{h}^{n}\right)\right\|_{0}^{2} \leq 20 C_{p}^{2}\left(\frac{T}{\tau}\right)^{2} \sum_{j=r+1}^{d} \lambda_{k}
$$

Collecting the estimates for $n=1$ and $n \geq 2$ leads to

$$
\begin{aligned}
\left\|e_{r}^{n}\right\|_{0}^{2}+2 \nu \sum_{j=1}^{n} \Delta t\left\|\nabla e_{r}^{j}\right\|_{0}^{2} \leq & e^{4}\left(17\left\|e_{r}^{0}\right\|_{0}^{2}+14(\Delta t)^{4} \max _{0 \leq s \leq \Delta t}\left\|\partial_{t t} u_{h}(s)\right\|_{0}^{2}\right. \\
& \left.+40(\Delta t)^{4} \int_{0}^{T}\left\|\partial_{t t t} u_{h}(t)\right\|_{0}^{2} d t+4\left(10+\frac{\Delta t}{T}\right) C_{p}^{2} \frac{T^{2}}{\tau^{2}} \sum_{j=r+1}^{d} \lambda_{k}\right)
\end{aligned}
$$

Now, the proof is finished in the same way as the proof of Theorem 1
Second order error bounds in time of form (18) and (20) can be derived if the finite differences in $\boldsymbol{U}$ are replaced with the temporal derivatives $\left\{\partial_{t} u_{h}^{n}\right\}_{n=0}^{M}$, with only slight modifications in the analysis. If the set of snapshots is $\left\{u_{h}^{n}\right\}_{n=0}^{M}$, then a second order estimate for $\sum_{j=1}^{M} \Delta t\left\|u_{r}^{n}-u^{n}\right\|_{0}^{2}$ can be shown along the lines of the presented analysis but neither pointwise estimates nor optimal estimates in the $H^{1}$ norm can be obtained.
